Features

The Cisco Firepower 2100 series security appliance is a standalone modular security services platform. The series includes the Firepower 2110, 2120, 2130, and 2140. See Product ID Numbers, on page 32 for a list of the product IDs (PIDs) associated with the 2100 series.

The Firepower 2100 series supports Cisco Firepower Threat Defense and Cisco ASA software. See the Cisco Firepower Compatibility Guide and the Cisco ASA Compatibility guide, which provide Cisco software and hardware compatibility, including operating system and hosting environment requirements, for each supported version.

The following figures show the Firepower 2100 series.
The following table lists the features for the Firepower 2100 series.

## Deployment Options

Here are some examples of how you can deploy the Firepower 2100:

- As a firewall:
  - At the enterprise Internet edge deployed in a high availability configuration
  - At branch offices in either a high availability pair or standalone

</tbody>
</table>
- As a device that provides additional application control, URL filtering, or IPS/threat-centric capabilities:
  - Behind an enterprise internet edge firewall in an inline in a transparent bump-in-the-wire configuration or as a standalone (requires hardware fail open network module support)
  - Deployed passively off a SPAN port on a switch or a tap on a network, or standalone

- As a VPN device:
  - For remote access VPN
  - For site-to-site VPN

## Package Contents

The following figure shows the package contents for the Firepower 2110 and 2120. The contents are subject to change and your exact contents will contain additional or fewer items depending on whether you order the optional parts. See Product ID Numbers, on page 32 for a list of the PIDs associated with the 2110 and 2120 package contents.

### Management Port

The Firepower 2100 chassis has an RJ-45 copper management port.

### RJ-45 Console Port

The Firepower 2100 chassis has a standard RJ-45 console port. You can use the CLI to configure your 2100 through the RJ-45 serial console port by using a terminal server or a terminal emulation program on a computer.
The RJ-45 (8P8C) port supports RS-232 signaling to an internal UART controller. The console port does not have any hardware flow control, and does not support a remote dial-in modem. The baud rate is 9600. You can use the standard cable found in your accessory kit to convert the RJ-45 to DB-9 if necessary.

**Type A USB Port**

You can use the external Type A USB port to attach a data-storage device. The external USB drive identifier is `usbA:`. The Type A USB port supports the following:

- Hot swapping
- USB drive formatted with FAT32
- Boot kickstart image from ROMMON for discovery recovery purposes
- Copy files to and from workspace:/ and volatile:/ within local-mgmt. The most relevant files are:
  - Core files
  - Ethalyzer packet captures
  - Tech-support files
  - Security module log files
- Platform bundle image upload using `download image usbA:`

The Type A USB port does not support Cisco Secure Package (CSP) image upload support.

**Network Ports**

The Firepower 2100 chassis has 12 fixed RJ-45 1 G/100 M/10 M) ports. They are numbered from top to bottom, left to right starting with 1 and are named Ethernet 1/1 through Ethernet 1/12.

The 2110 and 2120 also have four fixed SFP (1 Gb) ports, and the 2130 and 2140 have four fixed SFP+ (1 Gb/10 Gb) ports. They are fiber ports numbered left to right (1/13 through 1/16).

Each port has LEDs that represent Link/Activity status.

**Front Panel LEDs**

The following figure shows the Firepower 2110 and 2120 front panel LEDs.
### Front Panel LEDs

Power Switch

The power switch is located to the left of power supply module 1 on the rear of the chassis. It is a toggle switch that controls power to the system. If the power switch is in standby position, only the 3.3-V standby power is enabled from the power supply module and the 12-V main power is OFF. When the switch is in the ON position, the 12-V main power is turned on and the system boots.

Before you move the power switch to the OFF position, use the `shutdown` commands so that the system can perform a graceful shutdown. This may take several minutes to complete. After the graceful shutdown is complete, the console displays *It is safe to power off now.* The front panel blue locator beacon LED lights up indicating the system is ready to be powered off. You can now move the switch to the OFF position. The front panel PWR LED flashes momentarily and turns off.

See Front Panel LEDs, on page 10 for the PWR LED description. See the FXOS Configuration Guide for more information on using the `shutdown` commands.

**Note**

On the Firepower 2130 and 2140, the OK LEDs on the rear power supplies flash after the switch is turned off; this is expected behavior.

**Caution**

If you move the power switch to the OFF position before the `shutdown` command sequence is complete or if you remove the system power cords before the graceful shutdown is complete, disk corruption can occur.

**Note**

After removing power from the chassis by unplugging the power cord, wait at least 10 seconds before turning power back ON.

For More Information

- See Remove and Replace the Power Supply Module, on page 70 for the procedure for removing and replacing the power supply module in the Firepower 2130 and 2140.
- See Remove and Replace the Fan Tray, on page 78 for the procedure for removing and replacing the fan tray in the Firepower 2130 and 2140.
- See Ground the Chassis, on page 64 for the procedure for using the grounding lug to ground the chassis.
- See Power Supply Modules, on page 24 for a description of the power supply module LEDs.
- See Front Panel LEDs, on page 10 for a description of the fan LEDs.

Network Modules

The Firepower 2130 and 2140 contain one network module slot that provides optical or electrical network interfaces. Network modules are optional, removable I/O modules that provide either additional ports or different interface types. The Firepower network module plugs into the chassis on the front panel.

For More Information
10-Gb Network Module

The following figure shows the front panel of the 10-Gb network module (FPR2K-NM-8X10G). The FPR2K-NM-8X10G is a single-wide module that supports hot swapping. The eight ports are numbered from top to bottom, left to right.

Note
Make sure you have the correct firmware package and software version installed to support this network module.

Note
The FPR2K-NM-8X10G is NEBS-compliant.

Note
You can fit four copper SFPs in either the top row of ports or the bottom row of ports. Both rows cannot be populated at the same time, because of the port row spacing.

- Green, flashing—Network activity.
Hardware Bypass Network Modules

Hardware bypass (also known as fail-to-wire) is a physical layer (Layer 1) bypass that allows paired interfaces to go into bypass mode so that the hardware forwards packets between these port pairs without software intervention. Hardware bypass provides network connectivity when there are software or hardware failures. Hardware bypass is useful on ports where the Firepower security appliance is only monitoring or logging traffic. The hardware bypass network modules have an optical switch that is capable of connecting the two ports when needed. The hardware bypass network modules have built-in SFPs.

Hardware bypass is supported only on a fixed set of ports. You can pair Port 1 with Port 2, Port 3 with Port 4, but you cannot pair Port 1 with Port 4 for example.

**Note**

Hardware bypass is only supported in inline mode. Also, hardware bypass support depends on your software application.

**Note**

When the appliance switches from normal operation to hardware bypass or from hardware bypass back to normal operation, traffic may be interrupted for several seconds. A number of factors can affect the length of the interruption; for example, behavior of the optical link partner such as how it handles link faults and debounce timing; spanning tree protocol convergence; dynamic routing protocol convergence; and so on. During this time, you may experience dropped connections.

There are three configuration options for hardware bypass network modules:

- **Passive interfaces**—Connection to a single port.
  
  For each network segment you want to monitor passively, connect the cables to one interface. This is how the nonhardware bypass network modules operate.

- **Inline interfaces**—Connection to any two like ports (10 Gb to 10 Gb for example) on one network module, across network modules, or fixed ports.
  
  For each network segment you want to monitor inline, connect the cables to pairs of interfaces.

- **Inline with hardware bypass interfaces**—Connection of a hardware bypass paired set.

### Network activity LEDs

- Unlit—No connection or port is not in use.
- Amber—No link or network failure.
- Green—Link up.
- Green, flashing—Network activity.
For each network segment that you want to configure inline with fail-open, connect the cables to the paired interface set.

For the 40-Gb network module, you connect the two ports to form a paired set. For the 1/10-Gb network modules, you connect the top port to the bottom port to form a hardware bypass paired set. This allows traffic to flow even if the security appliance fails or loses power.

**Note**
If you have an inline interface set with a mix of hardware bypass and nonhardware bypass interfaces, you cannot enable hardware bypass on this inline interface set. You can only enable hardware bypass on an inline interface set if all the pairs in the inline set are valid hardware bypass pairs.

**For More Information**
- See 1-Gb SX/10-Gb SR/10-Gb LR Network Module with Hardware Bypass, on page 20 for a description of the 1-G SX, 10-G SR, and LR network modules.
- See 1-Gb Network Module with Hardware Bypass, on page 23 for a description of the 1-G network module.
- See Remove and Replace the Network Module, on page 67 for the procedure for removing and replacing single-wide network modules.

### 1-Gb SX/10-Gb SR/10-Gb LR Network Module with Hardware Bypass

The following figure shows the front panel of the 1-Gb SX, 10-Gb SR and 10-Gb LR hardware bypass network modules FPR2K-NM-6X1SX-F, FPR2K-NM-6X10SR-F, FPR2K-NM-6X10LR-F). This is a single-wide module that does not support hot swapping. The six ports are numbered from top to bottom, left to right. Pair ports 1 and 2, 3 and 4, and 5 and 6 to form hardware bypass paired sets.

**Note** Make sure you have the correct firmware package and software version installed to support this network module. See Cisco FXOS Troubleshooting Guide for the Firepower 1000/2100 with Firepower Threat Defense for the procedure to verify your firmware package and software version. See Cisco Firepower 2100 ASA Platform Mode FXOS Configuration Guide for the procedure to upgrade the firmware package for the Firepower 2100 running ASA with FXOS.
Figure 15: FPR2K-NM-6X1SX-F, FPR2K-NM-6X10SR-F, FPR2K-NM-6X10LR-F

1 Captive screw/handle

2 Six network activity LEDs
   - Amber—No connection, or port is not in use, or no link or network failure.
   - Green—Link up, no network activity.
   - Green, flashing—Network activity.

3 Bypass LEDs B1 through B3:
   - Green—In standby mode.
   - Amber, flashing—Port is in hardware bypass mode, failure event.

4 Ethernet X/1 (top port)
   Ethernet X/2 (bottom port)
   Ports 1 and 2 are paired together to form a hardware bypass pair.

5 Ethernet X/3 (top port)
   Ethernet X/4 (bottom port)
   Ports 3 and 4 are paired together to form a hardware bypass pair.

6 Ethernet X/5 (top port)
   Ethernet X/6 (bottom port)
   Ports 5 and 6 are paired together to form a hardware bypass pair.

The 1-Gb SX/10-Gb SR/10-Gb LR network modules have the following insertion loss measurements. Insertion loss measurements help you to troubleshoot the network by verifying cable installation and performance.

- **Core diameter (microns):** G.652
- **Modal bandwidth (MHz/km):** Single mode
- **Cable distance:** 5 km

- **Note:** Half the distance specified by the IEEE standard.
### Power Supply Modules

The Firepower 2110 and 2120 have one fixed AC power supply that is not field-replaceable. If the power supply fails, you must get a return material authorization (RMA) for the entire chassis. See the [Cisco Returns Portal](#) for more information.

The Firepower 2130 and 2140 support two AC power supply modules so that dual power supply redundancy protection is available. The Firepower 2130 ships with one AC power supply and the Firepower 2140 ships with two AC power supplies. You can also install DC power supply modules instead of AC power on the 2130 and 2140. Facing the back of the chassis, the power supply modules are numbered left to right, for example, PSU1 and PSU2.

The power supply module is hot-swappable.

See [Product ID Numbers, on page 32](#) for a list of the PIDs associated with the 2100 series power supply modules.

<td></td>
</tr>
</tbody>
</table>

**Note**  
You *cannot* mix AC and DC power supply modules in the chassis.

**Note**  
After removing power from the chassis by unplugging the power cord, wait at least 10 seconds before turning power back ON.

**Attention**  
Make sure that one power supply module is always active.
The system power requirements are lower than the power supply module capabilities. See the following table.

**AC Power Supply**

The dual power supplies can supply up to 800-W power across the input voltage range. The load is shared when both power supply modules are plugged in and running at the same time.

<table>
<thead>
<tr>

#### Power Supply Module LEDs

The following figure shows the bicolor power supply LEDs on the power supply module. The figure shows the AC power supply module. The DC power supply module has the same LEDs.

*Figure 17: Power Supply Module LEDs*

1. Green OK LED
   - Off—Input power not present.
   - Green, flashing—Input power present, but system is not powered up (power switch is off).
   - Green—The power supply module is enabled and running.

2. Amber FAIL LED
   - Off—No fault detected.
   - Amber, flashing—Fault warning, power supply may still work but could fail due to high temperature, failing fan, or over current.
   - Amber—Fault detected; power supply not working properly. Includes over voltage, over current, over temperature, and fan failure.

#### For More Information

- See *Remove and Replace the Power Supply Module, on page 70* for the procedure for removing and replacing the power supply module in the Firepower 2130 and 2140.
Fan Modules

The Firepower 2110 and 2120 have four fixed fans. If the fans fail, you must send your 2110 or 2120 for RMA.

The Firepower 2130 and 2140 have a removable fan tray with 3 + 1 redundant fans that are hot-swappable. The fan tray is installed in the rear of the chassis. Any one fan can fail indefinitely and the system continues to function. When a fan fails, the remaining fans automatically spin up to full speed.

The fan LED is located on the front of the chassis. See Product ID Numbers, on page 32 for a list of the PIDs associated with the 2100 series fans.

For More Information

• See Front Panel LEDs, on page 10 for the location and description of the fan LED.
  • See Remove and Replace the Fan Tray, on page 78 for the procedure for removing and replacing the fan tray.

SSDs

The Firepower 2110 and 2120 have two SSD slots. These models ship with one 100-GB SSD installed in slot 1. The Firepower 2130 and 2140 have two SSD slots. These models ship with one 200-GB SSD installed in slot 1. See Product ID Numbers, on page 32 for a list of the PIDs associated with the 2100 series SSDs. The SSD drive identifiers are disk1 and disk2.

You can use the second SSD slot to upgrade to the MSP. The MSP must be installed in the second slot. The second SSD slot remains empty unless you install the MSP in the second slot. The MSP stores threat detection results for use in future analysis. It supports the Advanced Malware Protection (AMP) software feature. It is used as both storage and as the Malware application repository. RAID is not supported.

You cannot swap SSDs between different Firepower platforms. For example, you cannot use a 4100 series SSD in a 2100 series security appliance.

The 100-GB SSD is restricted to the 2110 and 2120 models. The 200-GB SSD is restricted to the 2130 and 2140 models. Do not mix them.

Although the hardware supports hot swapping for the SSDs, the software does not, so you must power down the chassis before removing and replacing them.

For More Information

• See Front Panel LEDs, on page 10 for the location and description of the SSD LEDs on the front panel.
  • See Remove and Replace the SSD, on page 68 for the procedure for removing and replacing the SSD.
Supported SFP/SFP+ Transceivers

Take note of the following warnings:

---

**Statement 1055**—Class 1/1M Laser

---

**Statement 1056**—Unterminated Fiber Cable

Invisible laser radiation may be emitted from the end of the unterminated fiber cable or connector. Do not view directly with optical instruments. Viewing the laser output with certain optical instruments (for example, eye loupes, magnifiers, and microscopes) within a distance of 100 mm may pose an eye hazard.

---

**Statement 1057**—Hazardous Radiation Exposure

Use of controls or adjustments or performance of procedures other than those specified may result in hazardous radiation exposure.

The SFP/SFP+ transceiver is a bidirectional device with a transmitter and receiver in the same physical package. It is a hot-swappable optical or electrical (copper) interface that plugs into the SFP/SFP+ ports on the fixed ports and the network module ports, and provides Ethernet connectivity.
Use appropriate ESD procedures when inserting the transceiver. Avoid touching the contacts at the rear, and keep the contacts and ports free of dust and dirt. Keep unused transceivers in the ESD packing that they were shipped in.

**Warning**

The 1-Gb transceivers are limited to 1-GB operation only (no auto-negotiation support). 100-M/10-M modes are not supported.

**Note**

Although non-Cisco SFPs are allowed, we do not recommend using them because they have not been tested and validated by Cisco. Cisco TAC may refuse support for any interoperability problems that result from using an untested third-party SFP transceiver.

The following table lists the supported transceivers.

**Table 7: Supported SFPs**

# Product ID Numbers

The following table lists the PIDs associated with the Firepower 2100 series. All of the PIDs in the table are field-replaceable. See the `show inventory` and `show inventory expand` commands in the Cisco FXOS Troubleshooting Guide for the Firepower 2100 Series to display a list of the PIDs for your Firepower 2100. Or see the `show inventory` command in the Cisco Firepower Threat Defense Command Reference or the Cisco ASA Series Command Reference to display a list of the PIDs for your Firepower 2100.

Power Cord Specifications

Each power supply has a separate power cord. Standard power cords or jumper power cords are available for connection to the security appliance. The jumper power cords for use in racks are available as an optional alternative to the standard power cords.

If you do not order the optional power cord with the system, you are responsible for selecting the appropriate power cord for the product. Using an incompatible power cord with this product may result in electrical safety hazard. Orders delivered to Argentina, Brazil, and Japan must have the appropriate power cord ordered with the system.

Note

Only the approved power cords or jumper power cords provided with the security appliance are supported.

The following power cords are supported.

Installation Preparation

• Installation Warnings, on page 41
• Safety Recommendations, on page 44
• Maintain Safety with Electricity, on page 44
• Prevent ESD Damage, on page 45
• Site Environment, on page 45
• Site Considerations, on page 46
• Power Supply Considerations, on page 46
• Rack Configuration Considerations, on page 46

Installation Warnings

Read the Regulatory Compliance and Safety Information document before installing the security appliance.

Take note of the following warnings:

Statement 1071—Warning Definition

IMPORTANT SAFETY INSTRUCTIONS

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device.

SAVE THESE INSTRUCTIONS
Warning Statement 12—Power Supply Disconnection Warning

Before working on a chassis or working near power supplies, unplug the power cord on AC units; disconnect the power at the circuit breaker on DC units.

Warning Statement 43—Jewelry Removal Warning

Before working on equipment that is connected to power lines, remove jewelry (including rings, necklaces, and watches). Metal objects will heat up when connected to power and ground and can cause serious burns or weld the metal object to the terminals.

Warning Statement 94—Wrist Strap Warning

During this procedure, wear grounding wrist straps to avoid ESD damage to the card. Do not directly touch the backplane with your hand or any metal tool, or you could shock yourself.

Warning Statement 1004—Installation Instructions

Read the installation instructions before using, installing or connecting the system to the power source.

Warning Statement 1005—Circuit Breaker

This product relies on the building's installation for short-circuit (overcurrent) protection. Ensure that the protective device is rated not greater than: 20 A, 120 V, and 16 A, 250 V

Warning Statement 1007—TN and IT Power Systems

This equipment has been designed for connection to TN and IT power systems.

Warning Statement 1015—Battery Handling

To reduce risk of fire, explosion or leakage of flammable liquid or gas:

- Replace the battery only with the same or equivalent type recommended by the manufacturer.
- Do not dismantle, crush, puncture, use sharp tool to remove, short external contacts, or dispose of in fire.
- Do not use if battery is warped or swollen.
- Do not store or use battery in a temperature > 60° C.
- Do not store or use battery in low air pressure environment < 69.7 kPa.
Statement 1017—Restricted Area
This unit is intended for installation in restricted access areas. A restricted access area can be accessed by skilled, instructed or qualified personnel.

Statement 1021—SELV Circuit
To avoid electric shock, do not connect safety extra-low voltage (SELV) circuits to telephone-network voltage (TNV) circuits. LAN ports contain SELV circuits, and WAN ports contain TNV circuits. Some LAN and WAN ports both use RJ-45 connectors. Use caution when connecting cables.

Statement 1024—Ground Conductor
This equipment must be grounded. To reduce the risk of electric shock, never defeat the ground conductor or operate the equipment in the absence of a suitably installed ground conductor. Contact the appropriate electrical inspection authority or an electrician if you are uncertain that suitable grounding is available.

Statement 1028—More Than One Power Supply
This unit might have more than one power supply connection. To reduce risk of electric shock, all connections must be removed to de-energize the unit.

Statement 1029—Blank Faceplates and Cover Panels
Blank faceplates and cover panels serve three important functions: they prevent exposure to hazardous voltages and currents inside the chassis; they contain electromagnetic interference (EMI) that might disrupt other equipment; and they direct the flow of cooling air through the chassis. Do not operate the system unless all cards, faceplates, front covers, and rear covers are in place.

Statement 1030—Equipment Installation
Only trained and qualified personnel should be allowed to install, replace, or service this equipment.
Warning Statement 1040—Product Disposal
Ultimate disposal of this product should be handled according to all national laws and regulations.

Warning Statement 1073—No User-Serviceable Parts
No serviceable parts inside. To avoid risk of electric shock, do not open.

Warning Statement 1045—Short-Circuit Protection
This product requires short-circuit (overcurrent) protection to be provided as part of the building installation. Install only in accordance with national and local wiring regulations.

Warning Statement 1074—Comply with Local and National Electrical Codes
To reduce risk of electric shock or fire, installation of the equipment must comply with local and national electrical codes.

Safety Recommendations

Observe these safety guidelines:

• Keep the area clear and dust-free before, during, and after installation.
• Keep tools away from walkways, where you and others might trip over them.
• Do not wear loose clothing or jewelry, such as earrings, bracelets, or chains that could get caught in the chassis.
• Wear safety glasses if you are working under any conditions that might be hazardous to your eyes.
• Do not perform any action that creates a potential hazard to people or makes the equipment unsafe.
• Never attempt to lift an object that is too heavy for one person.

Maintain Safety with Electricity

Warning Before working on a chassis, be sure the power cord is unplugged.

Read the document before installing the security appliance.

Follow these guidelines when working on equipment powered by electricity:
• Before beginning procedures that require access to the interior of the chassis, locate the emergency power-off switch for the room in which you are working. Then, if an electrical accident occurs, you can act quickly to turn off the power.

• Do not work alone if potentially hazardous conditions exist anywhere in your work space.

• Never assume that power is disconnected; always check.

• Look carefully for possible hazards in your work area, such as moist floors, ungrounded power extension cables, frayed power cords, and missing safety grounds.

• If an electrical accident occurs:
  • Use caution; do not become a victim yourself.
  • Disconnect power from the system.
  • If possible, send another person to get medical aid. Otherwise, assess the condition of the victim, and then call for help.
  • Determine whether the person needs rescue breathing or external cardiac compressions; then take appropriate action.

• Use the chassis within its marked electrical ratings and product usage instructions.

**Prevent ESD Damage**

ESD occurs when electronic components are improperly handled, and it can damage equipment and impair electrical circuitry, resulting in intermittent or complete failure.

Always follow ESD-prevention procedures when removing and replacing components. Ensure that the chassis is electrically connected to an earth ground. Wear an ESD-preventive wrist strap, ensuring that it makes good skin contact. Connect the grounding clip to an unpainted surface of the chassis frame to safely ground ESD voltages. To properly guard against ESD damage and shocks, the wrist strap and cord must operate effectively. If no wrist strap is available, ground yourself by touching the metal part of the chassis.

For safety, periodically check the resistance value of the antistatic strap, which should be between one and 10 megohms.

**Site Environment**

See **Hardware Specifications, on page 31** for information about physical specifications.

When planning the site layout and equipment locations, consider the information in the next sections to help avoid equipment failures and reduce the possibility of environmentally caused shutdowns. If you are currently experiencing shutdowns or unusually high error rates with your existing equipment, these considerations may help you isolate the cause of failures and prevent future problems.
Site Considerations

Considering the following helps you plan an acceptable operating environment for the chassis, and avoid environmentally caused equipment failures.

- Electrical equipment generates heat. Ambient air temperature might not be adequate to cool equipment to acceptable operating temperatures without adequate circulation. Ensure that the room in which you operate your system has adequate air circulation.
- Ensure that the chassis cover is secure. The chassis is designed to allow cooling air to flow effectively within it. An open chassis allows air leaks, which may interrupt and redirect the flow of cooling air from the internal components.
- Always follow the ESD-prevention procedures described previously to avoid damage to equipment. Damage from static discharge can cause immediate or intermittent equipment failure.

Power Supply Considerations

See Power Supply Modules, on page 24 for more detailed information about the power supply modules for your model.

When installing the chassis, consider the following:

- Check the power at the site before installing the chassis to ensure that it is “clean” (free of spikes and noise). Install a power conditioner, if necessary, to ensure proper voltages and power levels in the appliance input voltage.
- Install proper grounding for the site to avoid damage from lightning and power surges.
- The chassis does not have a user-selectable operating range. Refer to the label on the chassis for the correct appliance input-power requirement.
- Several styles of AC-input power supply cords are available; make sure that you have the correct style for your site.
- Install an uninterruptible power source for your site, if possible.
- If you are using dual redundant (1+1) power supplies, we recommend that you use independent electrical circuits for each power supply.

Rack Configuration Considerations

See Rack-Mount the Chassis Using Slide Rails, on page 52 and Rack-Mount the Chassis Using Brackets, on page 50 for the procedure for rack-mounting the chassis.

Consider the following when planning a rack configuration:

- Standard 19-in. (48.3 cm) 4-post EIA rack with mounting rails that conform to English universal hole spacing according to section 1 of ANSI/EIA-310-D-1992.
- The rack-mounting posts need to be 2 to 3.5 mm thick to work with the slide rail rack mounting.
• If you are mounting a chassis in an open rack, make sure that the rack frame does not block the intake or exhaust ports.

• If your rack includes closing front and rear doors, the doors must have 65 percent open perforated area evenly distributed from top to bottom to permit adequate airflow.

• Be sure enclosed racks have adequate ventilation. Make sure that the rack is not overly congested as each chassis generates heat. An enclosed rack should have louvered sides and a fan to provide cooling air.

• In an enclosed rack with a ventilation fan in the top, heat generated by equipment near the bottom of the rack can be drawn upward and into the intake ports of the equipment above it in the rack. Ensure that you provide adequate ventilation for equipment at the bottom of the rack.

• Baffles can help to isolate exhaust air from intake air, which also helps to draw cooling air through the chassis. The best placement of the baffles depends on the airflow patterns in the rack. Experiment with different arrangements to position the baffles effectively.
CHAPTER 3

Mount the Chassis

- Unpack and Inspect the Chassis, on page 49
- Rack-Mount the Chassis Using Brackets, on page 50
- Rack-Mount the Chassis Using Slide Rails, on page 52
- Install the FIPS Opacity Shield in a Two-Post Rack, on page 58
- Install the FIPS Opacity Shield in a Four-Post Rack, on page 61
- Ground the Chassis, on page 64

Unpack and Inspect the Chassis

Keep the shipping container in case the chassis requires shipping in the future.

The chassis is thoroughly inspected before shipment. If any damage occurred during transportation or any items are missing, contact your customer service representative immediately.

See Package Contents, on page 5 for a list of what shipped with the chassis.

Step 1
Remove the chassis from its cardboard container and save all packaging material.

Step 2
Compare the shipment to the equipment list provided by your customer service representative. Verify that you have all items.

Step 3
Check for damage and report any discrepancies or damage to your customer service representative. Have the following information ready:

- Invoice number of shipper (see the packing slip)
- Model and serial number of the damaged unit
- Description of damage
- Effect of damage on the installation
Rack-Mount the Chassis Using Brackets

This procedure describes how to install the Firepower 2100 in a rack using the rack-mount brackets. It also describes how to install the optional cable management brackets. See Product ID Numbers, on page 32 for a list of the PIDs associated with rack-mounting the chassis.

Before you begin

You need the following to install the Firepower 2100 in a rack (4-post EIA-310-D rack):

- Phillips head screwdriver
- Two rack-mount brackets with six 8-32, 0.81-in. screws (ships with the Firepower 2110/2120, orderable for the Firepower 2130/2140)
- Rack-mount screws (ships with the Firepower 2110/2120, orderable for the Firepower 2130/2140)
  - Four 12-24, 0.75 in.
  - Four 10-32, 0.75 in.
  - Four M6, 19 mm
- Two cable management brackets with four 8-32 x 0.375-in. screws (optional)

Step 1

Attach a rack-mount bracket to each side of the chassis using the six 8-32 x .375-in. countersink Phillips head screws (three per side).
Figure 35: Attach the Rack-Mount Bracket to the Side of the Chassis

<td>8-32 x 0.25-in. countersink Phillip head screws (3 per side)</td>
</tr>
</tbody>
</table>

**Step 2** (Optional) Attach the cable management bracket to the rack-mount bracket:

a) Install the cable management studs into the rack-mount bracket.
b) Install two 8-32-in. screws through the inside of the rack-mount bracket to secure the cable management bracket to the rack-mount bracket.

**Step 3**

Attach the chassis with the installed rack-mount bracket to the rack using the screws that work for your rack.

---

**What to do next**

- See *Ground the Chassis, on page 64* for the procedure to ground the Firepower 2100.
- Install the cables according to your default software configuration as described in the *quick start guide* for your version.

---

**Rack-Mount the Chassis Using Slide Rails**

Take note of the following warnings:

---

**Warning**  
**Statement 1006**—Chassis Warning for Rack-Mounting and Servicing

To prevent bodily injury when mounting or servicing this unit in a rack, you must take special precautions to ensure that the system remains stable. The following guidelines are provided to ensure your safety:

- This unit should be mounted at the bottom of the rack if it is the only unit in the rack.
- When mounting this unit in a partially filled rack, load the rack from the bottom to the top with the heaviest component at the bottom of the rack.
- If the rack is provided with stabilizing devices, install the stabilizers before mounting or servicing the unit in the rack.
Warning Statement 1024—Ground Conductor
This equipment must be grounded. To reduce the risk of electric shock, never defeat the ground conductor or operate the equipment in the absence of a suitably installed ground conductor. Contact the appropriate electrical inspection authority or an electrician if you are uncertain that suitable grounding is available.

Warning Statement 1030—Equipment Installation
Only trained and qualified personnel should be allowed to install, replace, or service this equipment.

Warning Statement 1073—No User-Serviceable Parts
No serviceable parts inside. To avoid risk of electric shock, do not open.

Warning Statement 1047—Overheating Prevention
To prevent the system from overheating, do not operate it in an area that exceeds the maximum recommended ambient temperature of: 40°C.

This procedure describes how to install the Firepower 2100 series in a rack using slide rails. It applies to all models of the 2100 series. It ships with the Firepower 2130 and 2140 chassis; it is optional for the 2110 and 2120. For the 2110 and 2120, you install three screws on the chassis to secure the slide rail. For the 2130 and 2140, you use the pegs on the chassis to secure the slide rail. See Product ID Numbers, on page 32 for a list of the PIDs associated with racking the chassis.

You can install the optional cable management bracket on all models of the 2100 series. The optional cable management bracket kit comes with two cable management brackets and four 8-32 x 0.375-in. screws.

Before you begin
You need the following to install the Firepower 2100 in a rack (4-post EIA-310-D rack) using slide rails:

- Phillips head screwdriver
- One slide rail kit that contains the following:

  Note The slide rail kit ships with the Firepower 2130/2140. You can order it for the Firepower 2110/2120.

  - Left and right slides rails with two M3x6 mm wafer-head screws
  - Two slide rail locking brackets with six 8-32 x .25-in. screws
  - (Optional) Two cable management brackets with four 8-32 x 0.375-in. screws
Slide rail assemblies work with four-post racks and cabinets with square slots, round 7.1mm holes, #10-32 threaded holes, and #12-24 threaded holes on the rack post front. The slide rail works with front to back spacing of rack posts from 24 to 36 inches. The rack-mounting posts need to be 2 to 3.5 mm thick to work with the slide rail rack mounting.

**Step 1**
Attach the slide-rail locking brackets to each side of the chassis using the six 8-32 x .375-in. countersink Phillips head screws (three per side).

*Figure 37: Attach the Slide-Rail Locking Bracket to the Side of the Chassis*

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Chassis</td>
</tr>
<tr>
<td>2</td>
<td>Slide-rail locking bracket</td>
</tr>
<tr>
<td>3</td>
<td>8-32 x 0.25-in. countersink Phillips head screws (3 per side)</td>
</tr>
</tbody>
</table>

**Step 2**
(Optional) Attach the cable management bracket to the slide-rail locking bracket:

a) Install the cable management studs into the slide-rail locking bracket.
b) Install two 8-32-in. screws through the inside of the slide-rail locking bracket to secure the cable management bracket to slide-rail locking bracket.

**Step 3** Attach the inner rails to the sides of the chassis:

a) Remove the inner rails from the slide rail assemblies.

b) Align an inner rail with each side of the chassis:

- (2110/2120) Install the three 8-32-in. screws into each side of the chassis, and align the inner rail so that the three slots on the rail line up with the screws on the chassis.
• (2130/2140) Align the inner rail so that the three slots on the rail line up with the three pegs on the side of the chassis.

*Figure 40: Line up the Inner Rail with the Pegs on the 2130/2140 Chassis*

<table>
<thead>
<tr>
<th>1</th>
<th>Mounting peg on the chassis for the keyed slot</th>
<th>2</th>
<th>Inner rail</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>M3x6mm screw (one per side)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

c) Set the keyed slots over the screws/pegs, and then slide the rail toward the front to lock it in place on the screw/pegs. The rear key slot has a metal clip that locks over the screw/peg.
d) Using one M3x6mm screw, secure the inner rail to the side of the chassis to prevent sliding.
e) Install the second inner rail to the opposite side of the chassis and secure with the other M3x6mm screw.

**Step 4**

Open the front securing plate on both slide-rail assemblies. The front end of the slide-rail assembly has a spring-loaded securing plate that must be open before you can insert the mounting pegs into the rack-post holes.

On the outside of the assembly, push the green arrow button toward the rear to open the securing plate.

*Figure 41: Front Securing Mechanism Inside the Front End*

<table>
<thead>
<tr>
<th>1</th>
<th>Front mounting pegs</th>
<th>2</th>
<th>Securing plate shown pulled back to open position</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Note</strong></td>
<td></td>
<td>Works with square slots, 7.1 mm holes, and 10-32 threaded holes.</td>
</tr>
</tbody>
</table>
Step 5

Install the slide rails into the rack:

a) Align one slide-rail assembly front end with the front rack-post holes that you want to use.

   The slide rail front-end wraps around the outside of the rack post and the mounting pegs enter the rack-post holes from the outside-front.

   **Note** The rack post must be between the mounting pegs and the open securing plate.

b) Push the mounting pegs into the rack-post holes from the outside-front.

c) Press the securing plate release button marked 'PUSH.' The spring-loaded securing plate closes to lock the pegs in place.

d) Adjust the slide-rail length, and then push the rear mounting pegs into the corresponding rear rack-post holes. The slide rail must be level front-to-rear.

   The rear mounting pegs enter the rear rack-post holes from the inside of the rack post.

e) Attach the second slide-rail assembly to the opposite side of the rack. Make sure that the two slide-rail assemblies are at the same height with each other and are level front-to-back.

f) Pull the inner slide rails on each assembly out toward the rack front until they hit the internal stops and lock in place.

Step 6

Insert the chassis into the slide rails.

a) Align the rear of the inner rails that are attached to the chassis sides with the front ends of the empty slide rails on the rack.

b) Push the inner rails into the slide rails on the rack until they stop at the internal stops.

c) Slide the release clip toward the rear on both inner rails, and then continue pushing the chassis into the rack until the mounting brackets meet the front of the slide rail.

*Figure 42: Inner Rail Release Clip*
Step 7  
Use the captive screws on the front of the mounting brackets to fully secure the chassis to the rack.

What to do next

- See Ground the Chassis, on page 64 for the procedure to ground the Firepower 2100.
- Install the cables according to your default software configuration as described in the quick start guide for your version.

Install the FIPS Opacity Shield in a Two-Post Rack

**Caution**

This procedure should be performed only by the Crypto Officer (CO).

**Note**

Because the FIPS opacity shield covers the serial number on the chassis, the CO should copy the serial number and store it in a secure place. The serial number is needed when you call Cisco TAC.

Before you begin

You need the following to install the FIPS opacity shield:

- #1 Phillips head screwdriver
- The following items from the FIPS kit:
  - One FIPS opacity shield
  - Four 8-32 x .375-in. countersink screws used to attach the FIPS opacity shield to the cable management brackets
  - Seven Tamper Evidence Labels (TEL)

**Note**

The TELs are made of a special thin gauge vinyl with self-adhesive backing. Once the CO attaches them on the chassis, any attempt to open the chassis damages the TELs or the chassis cover. Because the TELs have nonrepeated serial numbers, the CO can inspect them for damage and compare them against the applied serial numbers to verify whether the chassis has been tampered with. TELs with curled corners, rips, and slices indicate tampering. The word “FIPS” or “OPEN” may appear if the label has been peeled back.

Step 1  
Copy the serial number and store in a secure place. To find the serial number, see Serial Number Location.
Step 2: Perform the steps described in Rack-Mount the Chassis Using Brackets including installing the cable management bracket (Step 2).

Step 3: Connect the cables to the ports. Make sure that the cables have enough slack to route them through the cable mounting brackets.

**Note** If you are installing the FIPS opacity shield after the initial product installation, the cables are connected. If the attached cables do not have enough slack to route them through the cable mounting brackets (as shown in the figure below), you will have to turn the power off on the appliance, remove the cables, route the cables through the cable mounting brackets, reattach the cables, and continue with step 5 below.

**Note** When you toggle the power switch from ON to OFF, it takes several seconds for the system to power down. Do not remove the power cable until the power LED is off. After removing power from the chassis, either by moving the power switch to OFF or unplugging the power cord, wait at least 10 seconds before turning power back ON.

Step 4: Route the cables through the openings in the cable management brackets as shown in the figure below.

Step 5: Attach the FIPS opacity shield to the cable management brackets using the four 8-32 x .375-in. countersink Phillips head screws provided in the FIPS kit as shown in the figure below.

*Figure 43: Route the Cables and Attach the Screws*

<table>
<thead>
<tr>
<th>1</th>
<th>FIPS opacity shield</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>8-32 x .375-in. countersink Phillips head screws (two per side)</td>
</tr>
<tr>
<td>3</td>
<td>Cable management bracket</td>
</tr>
</tbody>
</table>

Step 6: Before you attach the TELs, clean the chassis of any grease, dirt, or oil with alcohol-based cleaning pads.

Step 7: Attach the 7 TELs. See the figure below for the correct placement. Allow the TELs to cure for a minimum of 12 hours.

**Caution** Any deviation in the placement of the TELs means the chassis is not in FIPS mode.
**Figure 44: TELs Placement on the Chassis**

1. TEL 1 on the left side and top of chassis
2. TEL 2 on the right side and top of chassis
3. TEL 3 on the top and back of chassis
4. TEL 4 across the FIPS shield and the chassis (towards the left of the chassis)
5. TEL 5 across the FIPS shield and the chassis (towards the right of the chassis)
6. TEL 6 on the bottom of the chassis towards the left side of the chassis
7. TEL 7 on the bottom of the chassis towards the right side of the chassis

**Step 8**
Attach the power cable to the chassis and connect it to an electrical outlet.

**Step 9**
Press the power switch on the rear panel.

**Step 10**
Check the power LED on the front panel. See Front Panel LEDs for a description of the power LED. Solid green indicates that the chassis is powered on.

**Step 11**
Place the chassis in FIPS mode.

See the following procedures for how to place the chassis in FIPS mode:

- ASA in Platform Mode
- ASA in Appliance mode
- FTD managed by FMC

---

**What to do next**
See the quick start guide for your operating system for further configuration information.
Install the FIPS Opacity Shield in a Four-Post Rack

⚠️ Caution
This procedure should be performed only by the Crypto Officer.

⚠️ Note
Because the FIPS opacity shield covers the serial number on the chassis, the CO should copy the serial number and store it in a secure place. The serial number is needed when you call Cisco TAC.

Before you begin
You need the following to install the FIPS opacity shield:

- #1 Phillips head screwdriver
- The following items from the FIPS kit:
  - One FIPS opacity shield
  - Four 8-32 x .375-in. countersink screws used to attach the FIPS opacity shield to the cable management brackets
  - Seven Tamper Evidence Labels (TEL)

⚠️ Note
The TELs are made of a special thin gauge vinyl with self-adhesive backing. Once the CO attaches them on the chassis, any attempt to open the chassis damages the TELs or the chassis cover. Because the TELs have nonrepeated serial numbers, the CO can inspect them for damage and compare them against the applied serial numbers to verify whether the chassis has been tampered with. TELs with curled corners, rips, and slices indicate tampering. The word “FIPS” or “OPEN” may appear if the label has been peeled back.

Step 1
Copy the serial number and store it in a secure place. To find the serial number, see Serial Number Location.

Step 2
Perform the steps described in Rack-Mount the Chassis Using Slide Rails.

Step 3
Connect the cables to the ports. Make sure the cables have enough slack to route them through the cable mounting brackets.

⚠️ Note
If you are installing the FIPS opacity shield after the initial product installation, the cables are connected. If the attached cables do not have enough slack to route them through the cable mounting brackets (as shown below), you will have to turn the power off on the appliance, remove the cables, route the cables through the cable mounting brackets, reattach the cables, and continue with Step 5 below.
When you toggle the power switch from ON to OFF, it takes several seconds for the system to power down. Do not remove the power cable until the power LED is off. After removing power from the chassis either by moving the power switch to OFF or unplugging the power cord, wait at least 10 seconds before turning power back ON.

**Step 4** Route the cables through the openings in the cable management brackets (see figure below).

**Step 5** Attach the FIPS opacity shield to the cable management brackets using the four 8-32 x .375-in. countersink Phillips head screws provided in the FIPS kit.

*Figure 45: Route the Cables and Attach the Screws*

| 1 | FIPS opacity shield |
| 2 | 8-32 x .375-in. countersink Phillips head screws (two per side) |
| 3 | Cable management bracket |

**Step 6** Before you attach the TELs, clean the chassis of any grease, dirt, or oil with alcohol-based cleaning pads.

**Step 7** Attach the 7 TELs. See the figure below for the correct placement. Allow the TELs to cure for a minimum of 12 hours.

*Caution* Any deviation in the placement of the TELs means the chassis is not in FIPS mode.
### Figure 46: TELs Placement on the Chassis

</tr>
<tr>
<td>7</td>
<td>TEL 7 on the bottom of the chassis towards the right side of the chassis</td>
</tr>
</tbody>
</table>

**Step 8**
Attach the power cable to the chassis and connect it to an electrical outlet.

**Step 9**
Press the power switch on the rear panel.

**Step 10**
Check the power LED on the front panel. See Front Panel LEDs for a description of the power LED. Solid green indicates that the chassis is powered on.

**Step 11**
Place the chassis in FIPS mode.

See the following procedures for how to place the chassis in FIPS mode:

- ASA in Platform Mode
- ASA in Appliance mode
- FTD managed by FMC

**What to do next**
See the quick start guide for your operating system for further configuration information.
Ground the Chassis

Take note of the following warnings:

⚠️  Warning

**Statement 1024**—Ground Conductor

This equipment must be grounded. To reduce the risk of electric shock, never defeat the ground conductor or operate the equipment in the absence of a suitably installed ground conductor. Contact the appropriate electrical inspection authority or an electrician if you are uncertain that suitable grounding is available.

⚠️  Warning

**Statement 1046**—Installing or Replacing the Unit

To reduce risk of electric shock, when installing or replacing the unit, the ground connection must always be made first and disconnected last.

⚠️  Warning

**Statement 1025**—Use Copper Conductors Only

To reduce risk of fire, use copper conductors only.

⚠️  Caution

Grounding the chassis is required, even if the rack is already grounded. A grounding pad with 2 threaded M4 holes is provided on the chassis for attaching a grounding lug. The ground lug must be NRTL-listed. In addition, a copper conductor (wires) must be used and the copper conductor must comply with NEC code for ampacity.

**Before you begin**

- You need the following items that you provide:
  - Wire-stripping tool
  - Crimping tool
  - Grounding cable
  - Two star lock washers for the 10-32 x .375-in. screws used to secure the ground lug

- You need the following items from the accessory kit:
  - Ground lug #6 AWG, 90 degree, #10 post
  - Two 10-32 x .375-in. screws used to secure the ground lug

**Step 1**

Use a wire-stripping tool to remove approximately 0.75 in. (19 mm) of the covering from the end of the grounding cable.
Step 2 Insert the stripped end of the grounding cable into the open end of the grounding lug.

*Figure 47: Insert the Cable into the Grounding Lug*

Step 3 Use the crimping tool to secure the grounding cable in the grounding lug.

Step 4 Remove the adhesive label from the grounding pad on the chassis.

Step 5 Place the grounding lug against the grounding pad so that there is solid metal-to-metal contact, and insert the 2 screws with washers through the holes in the grounding lug and into the grounding pad.

*Figure 48: Attach the Grounding Lug*

Step 6 Make sure that the lug and cable do not interfere with other equipment.

Step 7 Prepare the other end of the grounding cable and connect it to an appropriate grounding point in your site to ensure adequate earth ground.
What to do next

Install the cables according to your default software configuration as described in the quick start guide for your version.
Maintenance and Upgrade

- Remove and Replace the Network Module, on page 67
- Remove and Replace the SSD, on page 68
- Remove and Replace the Power Supply Module, on page 70
- Connect the DC Power Supply Module, on page 72
- Secure the Power Cord on the Power Supply Module, on page 76
- Remove and Replace the Fan Tray, on page 78

Remove and Replace the Network Module

Take note of the following warnings:

⚠️ Warning

Statement 1030—Equipment Installation

Only trained and qualified personnel should be allowed to install, replace, or service this equipment.

⚠️ Warning

Statement 1073—No User-Serviceable Parts

No serviceable parts inside. To avoid risk of electric shock, do not open.

You can remove and replace the network module in the Firepower 2130 and 2140. Although the hardware supports removing and replacing the network module while the system is running, the software does not currently support hot swapping. You must power down the chassis to remove and replace network modules. See Network Modules, on page 16 for more information about Firepower network modules.

**Step 1**  
Save your configuration.

**Step 2**  
Power down the appliance by moving the power switch to the OFF position. See Rear Panel, on page 15 for more information about the power switch.

**Step 3**  
To remove a network module, loosen the captive screw on the lower left side of the network module and pull out the handle that is connected to the screw. This mechanically ejects the network module from the slot.
Remove and Replace the SSD

If the slot is to remain empty, install a blank faceplate to ensure proper airflow and to keep dust out of the chassis; otherwise, install another network module.

**Step 4**
To replace a network module, hold the network module in front of the network module slot on the right of the chassis and pull the network module handle out.

**Step 5**
Slide the network module into the slot and push it firmly into place until the handle is flush with the front of the network module.

**Step 6**
Tighten the captive screw on the lower left side of the network module.

**Step 7**
Power on the chassis so that the new network module is recognized.

**What to do next**
Follow the procedures in the FXOS configuration guide to connect to the network module and make sure that it has been discovered correctly by the security appliance.

Remove and Replace the SSD

Take note of the following warnings:

---

**Warning**  
**Statement 1030**—Equipment Installation

Only trained and qualified personnel should be allowed to install, replace, or service this equipment.
Warning  
**Statement 1073**—No User-Serviceable Parts

No serviceable parts inside. To avoid risk of electric shock, do not open.

Although the hardware supports removing and replacing SSDs while the system is running, the software does not currently support hot swapping. You must power down the chassis to remove and replace SSDs.

Note

The 100-GB SSD is restricted to the 2110 and 2120 models. The 200-GB SSD is restricted to the 2130 and 2140 models. Do not mix them.

You can install a Malware Storage Pack (MSP) in slot 2. The MSP stores threat detection data for use in future analysis. It supports the Advanced Malware Protection (AMP) software feature. It is used as both storage and as the Malware application repository. RAID is not supported.

Caution

Do not switch the two SSDs. You must install the MSP in slot 2. If you remove it and install it in slot 1, all stored capture data are lost.

**Step 1**  
Save your configuration.

**Step 2**  
Power down the chassis by moving the power switch to the OFF position. See Rear Panel, on page 15 for more information on the power switch.

**Step 3**  
To remove the SSD in slot 1, face the front of the chassis, loosen the two captive screws on the SSD, and gently pull it out of the chassis.
Step 4  To replace the SSD in slot 1, make sure the power switch is still in the OFF position, and then hold the SSD in front of slot 1 and push it in gently until it is seated.

Step 5  To install the MSP SSD, make sure the power switch is still in the OFF position, and then remove the blank faceplate in Slot 2 by loosening the captive screws on either side of the faceplate.

Step 6  Hold the MSP SSD in front of slot 2 and push it in gently until it is seated.

Caution  Do not switch the two SSDs. The MSP must be installed in slot 2. If you remove it and install it in slot 1, all stored file capture data are lost.

Step 7  Tighten the captive screws on either side of the SSD.

Step 8  Check the SSD LED to make sure the SSD is operative. See Front Panel LEDs, on page 10 for a description of the SSD LEDs.

---

Remove and Replace the Power Supply Module

Take note of the following warnings:

⚠️ Warning  Statement 1002—DC Power Supply

When stranded wiring is required, use approved wiring terminations, such as closed-loop or spade-type with upturned lugs. These terminations should be the appropriate size for the wires and should clamp both the insulation and conductor.
Warning Statement 1003—DC Power Disconnection
Before performing any of the following procedures, ensure that power is removed from the DC circuit.

Warning Statement 1015—Battery Handling
To reduce risk of fire, explosion or leakage of flammable liquid or gas:
• Replace the battery only with the same or equivalent type recommended by the manufacturer.
• Do not dismantle, crush, puncture, use sharp tool to remove, short external contacts, or dispose of in fire.
• Do not use if battery is warped or swollen.
• Do not store or use battery in a temperature > 60° C.
• Do not store or use battery in low air pressure environment < 69.7 kPa.

Warning Statement 1022—Disconnect Device
To reduce risk of electric shock and fire, a readily accessible two-poled disconnect device must be incorporated in the fixed wiring.

Warning Statement 1025—Use Copper Conductors Only
To reduce risk of fire, use copper conductors only.

Warning Statement 1030—Equipment Installation
Only trained and qualified personnel should be allowed to install, replace, or service this equipment.

Warning Statement 1046—Installing or Replacing the Unit
To reduce risk of electric shock, when installing or replacing the unit, the ground connection must always be made first and disconnected last.

Warning Statement 1073—No User-Serviceable Parts
No serviceable parts inside. To avoid risk of electric shock, do not open.

Power supply modules are hot swappable. You can remove and replace power supply modules while the system is running.
**Step 1**
Unplug the power supply cable before removing the power supply module. You cannot disengage the power supply module latch without first removing the cable.

**Step 2**
To remove a power supply module, face the back of the chassis and grasp the handle.

**Step 3**
Press the latch found on the middle of the power supply to disengage the power supply.

**Step 4**
Place your other hand under the power supply module to support it while you slide it out of the chassis.

*Figure 51: Remove the Power Supply Module*

If the slot is to remain empty, install a blank faceplate to ensure proper airflow and to keep dust out of the chassis; otherwise, install another power supply module.

**Step 5**
To replace a power supply module, hold the power supply module with both hands and slide it into the power supply module bay.

**Step 6**
Push in the power supply module gently until you hear the latch engage and it is seated.

**Step 7**
Plug in the power supply cable.

**Step 8**
Check the LED on the power supply to make sure the power supply is operative. See *Power Supply Modules, on page 24.*

---

**Connect the DC Power Supply Module**

Take note of the following warnings:

---

**Warning**

**Statement 1030**—Equipment Installation

Only trained and qualified personnel should be allowed to install, replace, or service this equipment.

---

**Warning**

**Statement 1073**—No User-Serviceable Parts

No serviceable parts inside. To avoid risk of electric shock, do not open.

---

*Cisco Firepower 2100 Series Hardware Installation Guide*
For the Cisco 2130 and 2140, the input connector and plug must be UL recognized under UL 486 for field wiring. The connection polarity is from left to right: negative (–), positive (+), and ground.

Use the handle on the power supply installation and removal. You must support the module with one hand because of its length.

*Figure 52: Firepower 2100 DC Power Supply Module*

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Handle</td>
</tr>
<tr>
<td>2</td>
<td>FAIL and OK LEDs</td>
</tr>
<tr>
<td>3</td>
<td>DC power connector</td>
</tr>
<tr>
<td>4</td>
<td>Ejector latch</td>
</tr>
</tbody>
</table>

**Before you begin**

- The color coding of the DC input power supply leads depends on the color coding of the DC power source at your site. Make sure that the lead color coding you choose for the DC input power supply matches the lead color coding used at the DC power source and verify that the power source is connected to the negative (–) terminal and to the positive (+) terminal on the power supply.

- Make sure that the chassis ground is connected on the chassis before you begin installing the DC power supply. See *Ground the Chassis, on page 64* for the procedure.

**Step 1** Verify that the power is off to the DC circuit on the power supply module that you are installing.

**Step 2** While supporting the power supply module with one hand, insert the power supply module into the power supply bay and gently push it in. See the illustration above for the location of the handle.

**Step 3** Use a wire-stripping tool to strip each of the 2 wires coming from the DC input power source. Strip the wires to approximately 0.39 inch (10 mm) + 0.02 inch (0.5 mm). We recommend you use 14 AWG insulated wire.
Note  Do not strip more than the recommended length of wire because doing so could leave the wire exposed from the terminal block.

Figure 53: Stripped DC Input Source Wire

Step 4  Insert the exposed wire into the terminal block. Ensure that you cannot see any wire lead outside the plastic cover. Only wires with insulation should extend from the terminal block.

Step 5  Use a screwdriver to tighten the terminal block captive screws.

Caution  Do not overtighten the terminal block captive screws. Make sure that the connection is snug, but the wire is not crushed. Verify by tugging lightly on each wire to make sure they do not move.
Step 6: Repeat these steps for the remaining DC input power source wire as applicable.

Step 7: Use a tie wrap so secure the wires to the rack, so that the wires are not pulled from the terminal block.

Step 8: Set the DC disconnect switch in the circuit to ON. In a system with multiple power supplies, connect each power supply to a separate DC power source. In the event of a power source failure, if the second source is still available, it can maintain system operation.

Step 9: Verify power supply operation by checking the power supply LED on the front of the chassis. See Front Panel LEDs, on page 10 for the LED values.
Secure the Power Cord on the Power Supply Module

To secure the power supply module against accidental removal and thus prevent disrupting system performance, use the tie wrap and clamp provided in the accessories kit that ships with your Firepower 2100.

Take note of the following warnings:

**Statement 1030—Equipment Installation**
Only trained and qualified personnel should be allowed to install, replace, or service this equipment.

**Statement 1073—No User-Serviceable Parts**
No serviceable parts inside. To avoid risk of electric shock, do not open.

**Step 1**
Attach the clamp to the tie wrap by holding the clamp with the loop side on the bottom and sliding the tie wrap through the box-shaped channel above the clamp (see the following figure). One side of the tie wrap has evenly spaced ridges and the other is smooth. Be sure the ridged side is face up and that you slide it through the open side of the channel. You will hear a click as the tie slides through—it moves in one direction only. To remove the tie wrap from the clamp, push the lever on the closed side of the box-shaped channel and slide out the tie wrap.

**Step 2**
Attach the clamp to the power supply module:

a) Locate the hexagonal ventilation hole on the power supply module at the center of the plug just below the power connector body (see the following figures).
b) Plug the snapping portion of the tie wrap into the hexagonal hole.
c) With the clamp side facing up, push the tie wrap in until it is fully engaged.

**Caution**  Make sure you have the correct location because you cannot remove the tie wrap from the power supply module once you have installed it without damaging the tie wrap.

*Figure 56: Connect the Tie Wrap*

| 1 | Tie wrap            | 2 | Hexagonal hole |

**Step 3**  Secure the clamp:

a) Plug in the power supply power cord and wrap the clamp around the over mold portion of the power cord.
b) Squeeze the clamp ends together to the power supply so that the annular teeth engage with the mate on the clamp.
c) Make sure the clamp fits snugly into the over mold.
d) Adjust the clamp position on the tie wrap so that the clamp is tight against the front of the over mold and the power cord cannot be removed by lightly pulling on it.
**Step 4**

If you need to remove the power cord, push the release tab on the clamp to force the annular clamp teeth to disengage and the clamp opens up. You can then remove the clamp from the power cord.

---

**Remove and Replace the Fan Tray**

You can remove and replace the fan tray while the 2130 and 2140 are running. The airflow moves from front to back. All fan modules are integrated in a single fan tray.

---

**Caution**

Removing the fan tray exposes the appliance to no airflow. Replace the fan tray within 30 seconds after removal to avoid overheating the appliance. If you wait longer than 30 seconds, the appliance may power off automatically to prevent damage to components. The appliance does not power up and boot properly if the fan tray is missing.

Take note of the following warnings:

---

**Warning**

Statement 1030—Equipment Installation

Only trained and qualified personnel should be allowed to install, replace, or service this equipment.

---

**Warning**

Statement 1073—No User-Serviceable Parts

No serviceable parts inside. To avoid risk of electric shock, do not open.
Step 1  Have the fan tray ready for immediate insertion and near the appliance so that you can reinstall the fan tray within 30 seconds.

Step 2  To remove a fan tray, face the rear of the chassis, and loosen the two captive screws on the fan tray.

Step 3  Pull the fan tray out of the chassis.

Figure 58: Remove the Fan Tray

Step 4  To replace a fan tray, hold the fan tray in front of the fan slot.

Step 5  Push the fan tray into the chassis until it is properly seated, and tighten the captive screws. If the system is powered on, listen for the fans. You should immediately hear the fans operating. If you do not hear the fans, make sure the fan tray is inserted completely into the chassis and the faceplate is flush with the outside surface of the chassis.

Step 6  Verify that the fan is operational by checking the fan tray LED. See Front Panel LEDs, on page 10 for a description of the fan LEDs.
Remove and Replace the Fan Tray
