If your deployment includes a terminal server and you have a realm configured for one or more servers connected to the terminal server, you must deploy the Cisco Terminal Services (TS) Agent to accurately report user logins in terminal server environments. When installed and configured, the TS Agent assigns unique ports to individual users so the Firepower System can uniquely identify those users in the web interface.

For more information about the TS Agent, see the *Cisco Terminal Services (TS) Agent Guide*.

### About Identity Policies

Identity policies contain identity rules. Identity rules associate sets of traffic with a realm and an authentication method: passive authentication, active authentication, or no authentication.

With the exception noted at the end of this topic, you must configure realms and authentication methods you plan to use before you can invoke them in your identity rules:

- You configure realms outside of your identity policy, at **System > Integration > Realms**. For more information, see [Create a Realm](#).

- You configure the User Agent and ISE, passive authentication identity sources, at **System > Integration > Identity Sources**. For more information, see [Configure the User Agent for User Control](#) and [Configure ISE for User Control](#).

- You configure the TS Agent, a passive authentication identity source, outside the Firepower System. For more information, see the *Cisco Terminal Services (TS) Agent Guide*.

- You configure captive portal, the active authentication identity source, in the identity policy. For more information, see [How to Configure the Captive Portal for User Control](#).

After you add multiple identity rules to a single identity policy, order the rules. The system matches traffic to rules in top-down order by ascending rule number. The first rule that traffic matches is the rule that handles the traffic.
After you configure one or more identity policies, you must associate one identity policy with your access
control policy. When traffic on your network matches the conditions in your identity rule, the system associates
the traffic with the specified realm and authenticates the users in the traffic using the specified identity source.

If you do not configure an identity policy, the system does not perform user authentication.

**Exception to creating an identity policy**

An identity policy is not required if all of the following are true:

- You use the ISE identity source.
- You do not use users or groups in access control policies.
- You use Security Group Tags (SGT) in access control policies. For more information, see ISE SGT vs
Custom SGT Rule Conditions, on page 380.

YouTube video on creating an identity policy and rule.

<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Administrator, Access Admin, Network Admin</td>
</tr>
</tbody>
</table>

For more information about realm configuration fields, see Realm Fields, on page 1873.

---

**Note**

You must specify a unique **AD Primary Domain** for every Microsoft Active Directory (AD) realm. Although
the system allows you to specify the same **AD Primary Domain** for different AD realms, the system won't
function properly. This happens because system assigns a unique ID to every user and group in each realm;
therefore, the system cannot definitively identify any particular user or group.

---

**Procedure**

**Step 1** Log in to the Firepower Management Center.

**Step 2** Click **System > Integration**.

**Step 3** Click **Realms**.

**Step 4** To create a new realm, click **New Realm**.

**Step 5** To perform other tasks (such as enable, disable, or delete a realm), see Manage a Realm, on page 1883.

**Step 6** Enter realm information as discussed in Realm Fields, on page 1873.

**Step 7** Click **OK**.
Step 8  Configure at least one directory as discussed in Configure a Realm Directory, on page 1876.

Step 9  Configure user and user group download (required for access control) as discussed in Download Users and Groups, on page 1877.

Step 10  Click **Realm Configuration**.

Step 11  Enter user session timeout values, in minutes, for **Authenticated Users**, **Failed Authentication Users**, and **Guest Users**.

---

**What to do next**

- Configure a Realm Directory, on page 1876
- Edit, delete, enable, or disable a realm; see Manage a Realm, on page 1883.
- Compare Realms, on page 1883.
- Optionally, monitor the task status; see Viewing Task Messages, on page 317.

---

**Realm Fields**

The following fields are used to configure a realm.

**Realm Configuration Fields**

These settings apply to all Active Directory servers or domain controllers (also referred to as directories) in a realm.

**Name**

A unique name for the realm. The system supports alphanumeric and special characters.

**Description**

(Optional.) Enter a description of the realm.

**AD Primary Domain**

For Microsoft Active Directory realms only. Domain for the Active Directory server where users should be authenticated.

---

**Note**

You must specify a unique **AD Primary Domain** for every Microsoft Active Directory (AD) realm. Although the system allows you to specify the same **AD Primary Domain** for different AD realms, the system won't function properly. This happens because system assigns a unique ID to every user and group in each realm; therefore, the system cannot definitively identify any particular user or group.

**AD Join Username and AD Join Password**

For Microsoft Active Directory realms intended for Kerberos captive portal active authentication, the distinguished username and password of any Active Directory user with appropriate rights to create a Domain Computer account in the Active Directory domain.

Keep the following in mind:

- DNS must be able to resolve the domain name to an Active Directory domain controller's IP address.
• The user you specify must be able to join computers to the Active Directory domain.

• The user name must be fully qualified (for example, administrator@mydomain.com, not administrator).

If you choose Kerberos (or HTTP Negotiate, if you want Kerberos as an option) as the Authentication Type in an identity rule, the Realm you select must be configured with an AD Join Username and AD Join Password to perform Kerberos captive portal active authentication.

Directory Username and Directory Password
The distinguished username and password for a user with appropriate access to the user information you want to retrieve.

Note the following:
• For Microsoft Active Directory, the user does not need elevated privileges. You can specify any user in the domain.

• For OpenLDAP, the user's access privileges are determined by the <level> parameter discussed in section 8 of the OpenLDAP specification. The user's <level> should be auth or better.

• The user name must be fully qualified (for example, administrator@mydomain.com, not administrator).

Base DN
The directory tree on the server where the Firepower Management Center should begin searching for user data.

Typically, the base distinguished name (DN) has a basic structure indicating the company domain name and operational unit. For example, the Security organization of the Example company might have a base DN of ou=security,dc=example,dc=com.

Group DN
The directory tree on the server where the Firepower Management Center should search for users with the group attribute. A list of supported group attributes is shown in Supported Server Object Class and Attribute Names, on page 1868.

Note
Neither the group name nor the organizational unit name can contain special characters like asterisk (*), equals (=), or backslash (\) because users in those groups are not downloaded and cannot be used in identity policies.

Group Attribute
(Optional.) The group attribute for the server, Member or Unique Member.

Type
The type of realm, AD for Microsoft Active Directory or LDAP for other supported LDAP repositories. For a list of supported LDAP repositories, see Supported Servers for Realms, on page 1867.

Note
Only captive portal supports an LDAP realm.
The following fields are available when you edit an existing realm.

**User Session Timeout**

Enter the number of minutes before user sessions time out. The default is 1440 (24 hours) after the user’s login event. After the timeout is exceeded, the user’s session ends; if the user continues to access the network without logging in again, the user is seen by the Firepower Management Center as Unknown.

**Note**

The user session timeout values apply to both active authentication (captive portal) and passive authentication (TS Agent, user agent, ISE). Setting a large value might prevent user sessions from ending, resulting in those sessions being claimed by other users.

**Realm Directory Fields**

These settings apply to individual servers (such as Active Directory domain controllers) in a realm.

**Encryption**

The encryption method to use for the Firepower Management Center-server connection:

- **STARTTLS**—encrypted LDAP connection
- **LDAPS**—encrypted LDAP connection
- **None**—unencrypted LDAP connection (unsecured traffic)

**Hostname / IP Address**

The host name or IP address of an Active Directory domain controller. If you specify an encryption method, you must specify a host name in this field.

**Port**

The port to use for the Firepower Management Center-controller connection.

**SSL Certificate**

The SSL certificate to use for authentication to the server. You must configure **STARTTLS** or **LDAPS** as the encryption type in order to use an SSL certificate.

If you are using a certificate to authenticate, the name of the server in the certificate must match the server **Hostname / IP Address**. For example, if you use 10.10.10.250 as the IP address but **computer1.example.com** in the certificate, the connection fails.

**User Download Fields**

**Available Groups, Add to Include, Add to Exclude**

Identifies the groups to download and make available for user awareness and user control.

- If you leave a group in the Available Groups box, the group is not downloaded.
- If you move a group to the Add to Include box, the group is downloaded and user data is available for user awareness and user control.
- If you move a group to the Add to Exclude box, the group name only is downloaded. Users in the group are not downloaded.
To include users from groups that are not included, enter the user name in the field below **Groups to Include** and click **Add**.

To exclude users from groups that are not excluded, enter the user name in the field below **Groups to Exclude** and click **Add**.

**Note**

The users that are downloaded to the Firepower Management Center is calculated using the formula \( R = I - (E+e) + i \), where

- \( R \) is list of downloaded users
- \( I \) is included groups
- \( E \) is excluded groups
- \( e \) is excluded users
- \( i \) is included users

**Begin automatic download at**, **Repeat every**

Specifies the frequency of the automatic downloads.

**Download users and groups (required for user access control)**

Enables you to download users and groups for user awareness and user control.

## Configure a Realm Directory

This procedure enables you to create a realm directory, which corresponds to an LDAP server or a Microsoft Active Directory domain controller. An Active Directory server can have multiple domain controllers, each of which is capable of authenticating different users and groups.

Microsoft has announced that Active Directory servers will start enforcing LDAP binding and LDAP signing in 2020. Microsoft is making these a requirement because when using default settings, an elevation of privilege vulnerability exists in Microsoft Windows that could allow a man-in-the-middle attacker to successfully forward an authentication request to a Windows LDAP server. For more information, see [2020 LDAP channel binding and LDAP signing requirement for Windows](https://support.microsoft.com/en-us/help/5067862) on the Microsoft support site.

If you have not done so already, we recommend you start using TLS/SSL encryption to authenticate with an Active Directory server.

</tbody>
</table>

What to do next

- **Download Users and Groups**, on page 1877.

Download Users and Groups

<table>
<thead>
<tr>
<th>Access</th>
<th>Supported Domains</th>
<th>Supported Devices</th>
<th>Classic License</th>
<th>Smart License</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator, Access Admin, Network Admin</td>
<td>Any</td>
<td>Any</td>
<td>Control</td>
<td>Any</td>
</tr>
</tbody>
</table>

This section discusses how to download users and groups from your Active Directory server to the Firepower Management Center. If you do not specify any groups to include, the system retrieves user data for all the groups that match the parameters you provided. For performance reasons, Cisco recommends that you explicitly include only the groups that represent the users you want to use in access control.

The maximum number of users the Firepower Management Center can retrieve from the server depends on your Firepower Management Center model. If the download parameters in your realm are too broad, the Firepower Management Center obtains information on as many users as it can and reports the number of users it failed to retrieve in Task of the Message Center.

User names that include Unicode characters do not display in the Firepower Management Center. Before you download users and groups, make sure to replace Unicode characters with alphanumeric characters.

**Note**
For more information about realm configuration fields, see Realm Fields, on page 1873.

**Procedure**

**Step 1** Log in to the Firepower Management Center.

**Step 2** Click **System > Integration > Realms**.

**Step 3** To download users and groups manually, click download (📝) next to the realm to download users and user groups. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration. You can skip the remainder of this procedure.

**Step 4** To configure the realm for automatic user and group download, click edit (📝) next to the realm to configure for automatic user and group download.

**Step 5** On User Access Control page, check **Download users and groups (required for user access control).**

**Step 6** Select a time to **Begin automatic download at** from the lists.

**Step 7** Select a download interval from the **Repeat Every** list.

**Step 8** To include or exclude user groups from the download, choose user groups from the **Available Groups** column and click **Add to Include** or **Add to Exclude**.

Separate multiple users with commas. You can also use an asterisk (‘*’) as a wildcard character in this field.

**Note** You must **Add to Include** if you want to perform user control on users in that group.

Use the following guidelines:

- If you leave a group in the **Available Groups** box, the group is not downloaded.

- If you move a group to the **Add to Include** box, the group is downloaded and user data is available for user awareness and user control.

- If you move a group to the **Add to Exclude** box, the group is downloaded and user data is available for user awareness, but not for user control.

- To include users from groups that are not included, enter the user name in the field below **Groups to Include** and click **Add**.

- To exclude users from groups that are not excluded, enter the user name in the field below **Groups to Exclude** and click **Add**.

---

**Create an Identity Policy**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Administrator, Access Admin, Network Admin</td>
</tr>
</tbody>
</table>
Before you begin

An identity policy is required to use users and groups in a realm in access control policies. Create and enable one or more realms as described in Create a Realm, on page 1872.

An identity policy is not required if all of the following are true:

• You use the ISE identity source.
• You do not use users or groups in access control policies.
• You use Security Group Tags (SGT) in access control policies. For more information, see ISE SGT vs Custom SGT Rule Conditions, on page 380.

Procedure

Step 1 Log in to the Firepower Management Center.
Step 2 Click Policies > Access Control > Identity and click New Policy.
Step 3 Enter a Name and, optionally, a Description.
Step 4 Click Save.
Step 5 To add a rule to the policy, click Add Rule as described in Create an Identity Rule, on page 1879.
Step 6 To create a rule category, click Add Category.
Step 7 To configure captive portal active authentication, click Active Authentication as described in How to Configure the Captive Portal for User Control, on page 1828.
Step 8 Click Save to save the identity policy.

What to do next

• Add rules to your identity policy that specify which users to match and other options; see Create an Identity Rule, on page 1879.
• Associate the identity policy with an access control policy to allow or block selected users from accessing specified resources; see Associating Other Policies with Access Control, on page 1145.
• Deploy configuration changes to managed devices; see Deploy Configuration Changes, on page 337.

If you encounter issues, see Troubleshoot User Control, on page 379.

Create an Identity Rule

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Administrator, Access Admin, Network Admin</td>
</tr>
</tbody>
</table>

For details about configuration options for identity rules, see Identity Rule Fields, on page 1880.
**Procedure**

**Step 1** If you haven't done so already, log in to the Firepower Management Center.

**Step 2** Click Policies > Access Control > Identity.

**Step 3** Click edit (📝) next to the identity policy to which to add the identity rule.

If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4** Click Add Rule.

**Step 5** Enter a Name.

**Step 6** Specify whether the rule is Enabled.

**Step 7** To add the rule to an existing category, indicate where you want to Insert the rule. To add a new category, click Add Category.

**Step 8** Choose a rule Action from the list.

**Step 9** Click Realms & Settings.

**Step 10** Choose a realm for the identity rule from the Realms list. You must associate a realm with every identity rule.

The only exception to the realm requirement is implementing user control using only the ISE SGT attribute tag. In this case, you do not need to configure a realm for the ISE server. ISE SGT attribute conditions can be configured in policies with or without an associated identity policy.

**Step 11** If you're configuring captive portal, see How to Configure the Captive Portal for User Control, on page 1828.

**Step 12** (Optional) To add conditions to the identity rule, see Rule Condition Types, on page 354.

**Step 13** Click Add.

**Step 14** In the policy editor, set the rule position. Click and drag or use the right-click menu to cut and paste. Rules are numbered starting at 1. The system matches traffic to rules in top-down order by ascending rule number. The first rule that traffic matches is the rule that handles that traffic. Proper rule order reduces the resources required to process network traffic and prevents rule preemption.

**Step 15** Click Save.

**Related Topics**

Snort® Restart Scenarios, on page 339

**Identity Rule Fields**

Use the following fields to configure identity rules.

**Enabled**

Choosing this option enables the identity rule in the identity policy. Deselecting this option disables the identity rule.

**Action**

Specify the type of authentication you want to perform on the users in the specified realm: Passive Authentication (default), Active Authentication, or No Authentication. You must fully configure the authentication method, or identity source, before selecting it as the action in an identity rule.
Adding the first or removing the last active authentication rule when SSL decryption is disabled (that is, when the access control policy does not include an SSL policy) restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 for more information.

Note that an active authentication rule has either an Active Authentication rule action, or a Passive Authentication rule action with Use active authentication if passive authentication cannot identify user selected.

For information about which passive and active authentication methods are supported in your version of the Firepower System, see About User Identity Sources, on page 1815.

**Realm**

The realm containing the users you want to perform the specified Action on. You must fully configure a realm before selecting it as the realm in an identity rule.

**Note**

If you select Kerberos (or HTTP Negotiate, if you want Kerberos as an option) as the Authentication Type for the identity rule, the Realm you select must be configured with an AD Join Username and AD Join Password to perform Kerberos captive portal active authentication.

**Use active authentication if passive authentication cannot identify user**

Selecting this option authenticates users using captive portal active authentication if a passive or a VPN authentication fails to identify them. You must configure captive portal active authentication in your identity policy in order to select this option.

If you disable this option, users that do not have a VPN identity or that passive authentication cannot identify are identified as Unknown.

**Identify as Special Identities/Guest if authentication cannot identify user**

This field is displayed only if you configure Active Authentication (that is, captive portal authentication) as the rule Action.

**Authentication Type**

The method to use to perform captive portal active authentication. The selections vary depending on the type of realm, LDAP or AD:

- Choose HTTP Basic if you want to authenticate users using an unencrypted HTTP Basic Authentication (BA) connection. Users log in to the network using their browser's default authentication popup window.

  Most web browsers cache the credentials from HTTP Basic logins and use the credentials to seamlessly begin a new session after an old session times out.

- Choose NTLM to authenticate users using a NT LAN Manager (NTLM) connection. This selection is available only when you select an AD realm. If transparent authentication is configured in a user's browser, the user is automatically logged in. If transparent authentication is not configured, users log in to the network using their browser's default authentication popup window.
• Choose Kerberos to authenticate users using a Kerberos connection. This selection is available only when you select an AD realm for a server with secure LDAP (LDAPS) enabled. If transparent authentication is configured in a user's browser, the user is automatically logged in. If transparent authentication is not configured, users log in to the network using their browser's default authentication popup window.

The Realm you select must be configured with an AD Join Username and AD Join Password to perform Kerberos captive portal active authentication.

Note

If you are creating an identity rule to perform Kerberos captive portal and you have DNS resolution configured, you must configure your DNS server to resolve the fully qualified domain name (FQDN) of the captive portal device. The FQDN must match the host name you provided when configuring DNS.

For ASA with FirePOWER Services and Firepower Threat Defense devices, the FQDN must resolve to the IP address of the routed interface used for captive portal.

• Choose HTTP Negotiate to allow the captive portal server to choose between HTTP Basic, Kerberos, or NTLM for the authentication connection. This type is available only when you select an AD realm.

The Realm you choose must be configured with an AD Join Username and AD Join Password for HTTP Negotiate to choose Kerberos captive portal active authentication.

Note

If you are creating an identity rule to perform HTTP Negotiate captive portal and you have DNS resolution configured, you must configure your DNS server to resolve the fully qualified domain name (FQDN) of the captive portal device. The FQDN of the device you are using for captive portal must match the hostname you provided when configuring DNS.

For ASA with FirePOWER Services devices, the FQDN is the FQDN of the ASA FirePOWER module.
Manage a Realm

This section discusses how to perform various maintenance tasks for a realm using controls on the Realms page. Note the following:

- If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

- If a view icon appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

### Procedure

**Step 1** Log in to the Firepower Management Center.

**Step 2** Click **System > Integration**.

**Step 3** Click **Realms**.

**Step 4** To delete a realm, click delete ( ).

**Step 5** To edit a realm, click edit ( ) next to the realm and make changes as described in Create a Realm, on page 1872.

**Step 6** To enable a realm, slide **State** to the right; to disable a realm, slide it to the left.

**Step 7** To download users and user groups, click download ( ).

**Step 8** To copy a realm, click copy ( ).

**Step 9** To compare realms, see Compare Realms, on page 1883.

### Compare Realms

- If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

- If a view icon appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
Manage an Identity Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Administrator, Access Admin, Network Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Procedure

Step 1 If you haven't done so already, log in to the Firepower Management Center.
Step 2 Click Policies > Access Control > Identity.
Step 3 To delete a policy, click delete ( ). If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
Step 4 To edit a policy, click edit ( ) next to the policy and make changes as described in Create an Identity Policy, on page 1878. If a view icon ( ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
Step 5 To copy a policy, click copy ( ).
Step 6 To generate a report for the policy, click report ( ) as described in Generating Current Policy Reports, on page 346.
Step 7  
To compare policies, see Comparing Policies, on page 345.

---

## Manage an Identity Rule

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>

PART XXI

Correlation and Compliance

- Compliance White Lists, on page 1889
- Correlation Policies, on page 1905
- Traffic Profiling, on page 1943
- Remediations, on page 1955
CH A P T E R  9 5

Compliance White Lists

The following topics describe how to configure compliance white lists before you add them to correlation policies.

- Introduction to Compliance White Lists, on page 1889
- Creating a Compliance White List, on page 1894
- Managing Compliance White Lists, on page 1900
- Managing Shared Host Profiles, on page 1902

Introduction to Compliance White Lists

A compliance white list, sometimes abbreviated as white list, is a set of criteria that specifies which operating systems, applications (web and client), and protocols are allowed on hosts on your network. The system generates an event if a host violates the white list.

A compliance white list has two main components:

- **Targets** are the hosts you select for white list evaluation. You can evaluate all or some monitored hosts, constraining by subnet, VLAN, and host attribute. In a multidomain deployment, you can target domains and subnets within or across domains.

- **Host profiles** specify the compliance criteria for the targets. The global host profile is operating system agnostic. You can also configure operating-system specific host profiles, either unique to one white list or shared across white lists.

The Cisco Talos Intelligence Group (Talos) provides a default white list with recommended settings. You can also create custom white lists. A simple custom white list might allow only hosts running a certain operating system. A more complex white list might allow all operating systems, but specify which operating system a host must use to run a certain application protocol on a specific port.

---

**Note**

The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1742. This limitation may affect the way you build compliance white lists.
Implementing Compliance White Lists

To implement white lists, add the white list to an active correlation policy. The system evaluates the targets and assigns every host a corresponding attribute:

- Compliant — The host does not violate the white list.
- Non-Compliant — The host violates the white list.
- Not Evaluated — The host is not a target of the white list, the host is currently being evaluated, or the system has insufficient information to determine whether the host is in compliance.

To delete the host attribute, delete its corresponding white list. Deactivating, deleting, or removing a white list from a correlation policy does not delete the host attribute, nor does it change the attribute’s value for each host.

After its initial evaluation, the system generates a white list event whenever a monitored host goes out of compliance with an active white list; it also records a white list violation.

You can use workflows, dashboards, and network maps to monitor system-wide compliance activity and determine when and how an individual host violates your white lists. You can also automatically respond to white list violations with remediations and alerts.

Example: Restricting HTTP to Web Servers

Your security policy states that only web servers may run HTTP. You create a white list that evaluates your entire network, excluding your web farm, to determine which hosts are running HTTP.

Using the network map and the dashboard, you can obtain an at-a-glance summary of the compliance of your network. In just a few seconds, you can determine exactly which hosts in your organization are running HTTP in violation of your policy, and take appropriate action.

Then, using the correlation feature, you can configure the system to alert you whenever a host that is not in your web farm starts running HTTP.

Configuring Correlation Policies, on page 1906

Compliance White List Target Networks

A target network specifies the hosts you want to evaluate for white list compliance. A white list can have more than one target network, and it evaluates hosts that meet the criteria of any of its targets.

Initially, you constrain a target network by IP address or range. In multidomain deployments, the initial constraints also include a domain.

The system-provided default white list targets all monitored hosts: 0.0.0.0/0 and ::/0. In a multidomain deployment, the default white list is constrained to (and only available in) the Global domain.

If you modify a target network or a host so that the host is no longer a valid target for the white list, the host is no longer evaluated by the white list and is considered neither compliant nor non-compliant.
Surveying and Refining Target Networks

When you add a target network to a white list, the system prompts you to survey the network map to help you characterize compliant hosts. The survey adds a target to the white list that represents the hosts you surveyed.

You can survey a subnet or individual host. In a multidomain deployment, you can survey an entire domain, or you can survey across domains. Surveying an ancestor domain causes the system to survey that domain's descendants.

In addition to the added target, the survey also populates the white list with one host profile for each operating system detected in the survey. These host profiles allow all the clients, application protocols, web applications, and protocols that the system has detected on the applicable operating systems.

After you survey a target network (or skip the survey), refine the target. You can exclude hosts by IP address, or constrain target networks by host attribute or VLAN.

Targeting Domains with Compliance White Lists

In a multidomain deployment, domains and target networks are closely linked.

- Leaf-domain administrators can create white lists that evaluate hosts within their leaf domains.
- Higher-level domain administrators can create white lists that evaluate hosts across domains. You can target different subnets in different domains in the same white list.

Consider a scenario where you are a Global domain administrator, and you want to apply the same compliance criteria to web servers across the entire deployment. You can create one white list in the Global domain that defines the compliance criteria. Then, constrain the white list with target networks that specify the IP space (or individual IP addresses) of the web servers in each leaf domain.

Note

In addition to targeting IP addresses and ranges in leaf domains, you can also constrain a target network using a higher-level domain. Targeting a subnet in a higher-level domain targets the same subnet in each of the descendant leaf domains. The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

Compliance White List Host Profiles

In a compliance white list, host profiles specify which operating systems, clients, application protocols, web applications, and protocols are allowed to run on the target hosts. There are three types of host profile you can use in a compliance white list; each type appears differently in the compliance white list editor.

<table>
<thead>
<tr>
<th>Host Profile Type</th>
<th>Appearance</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>global</td>
<td>Any Operating System</td>
<td>specifies what is allowed to run on target hosts, regardless of operating system</td>
</tr>
<tr>
<td>operating-system specific</td>
<td>is listed in plain text</td>
<td>specifies what is allowed to run on target hosts of a particular operating system</td>
</tr>
</tbody>
</table>
### Host Profile Type

<table>
<thead>
<tr>
<th>Description</th>
<th>Appearance</th>
<th>Operating System-Specific Host Profiles</th>
</tr>
</thead>
<tbody>
<tr>
<td>shares</td>
<td>is listed in italics</td>
<td>specifies operating-system criteria that can be used in multiple white lists</td>
</tr>
</tbody>
</table>

### Operating System-Specific Host Profiles

In a compliance white list, *operating-system specific host profiles* indicate not only which operating systems are allowed to run on your network, but also the application protocols, clients, web applications, and protocols that are allowed to run on those operating systems.

For example, you could require that compliant hosts run a particular version of Microsoft Windows. As another example, you could allow SSH to run on Linux hosts on port 22, and further restrict the vendor and version of the SSH client.

Create one host profile for each operating system you want to allow on your network. To disallow an operating system on your network, do not create a host profile for that operating system. For example, to make sure that all the hosts on your network are running Windows, configure the white list to only contain host profiles for that operating system.

Unidentified hosts remain in compliance with all white lists until they are identified. You can, however, create a white list host profile for unknown hosts. *Unidentified hosts* are hosts about which the system has not yet gathered enough information to identify their operating systems. *Unknown hosts* are hosts whose operating systems do not match known fingerprints.

### Shared Host Profiles

In a compliance white list, *shared host profiles* are tied to specific operating systems, but you can use each shared host profile in more than one white list.

For example, you might have offices worldwide with a separate white list for each location, but you want to use the same profile for all hosts running Apple Mac OS X. You can create a shared profile for that operating system and use it in all your white lists.

The default white list uses a special category of shared host profiles, called *built-in host profiles*. These profiles use built-in application protocols, web applications, protocols, and clients. In the compliance white list editor, the system marks these profiles with the built-in host profile icon (○).

In a multidomain deployment, the system displays shared host profiles created in the current domain, which you can edit. It also displays shared host profiles from ancestor domains, which you cannot edit. To view and edit shared host profiles created in a lower domain, switch to that domain.

If you modify a shared host profile (including built-ins), or modify a built-in application protocol, protocol, or client, your change affects every white list that uses it. If you make unintended changes to or delete these built-in elements, you can reset to factory defaults.
White List Violation Triggers

The white list compliance of a host can change when the system:

- detects a change in a host’s operating system
- detects an identity conflict for a host’s operating system or an application protocol on the host
- detects a new TCP server port (for example, a port used by SMTP or web servers) active on a host, or a new UDP server running on a host
- detects a change in a discovered TCP or UDP server running on a host, for example, a version change due to an upgrade
- detects a new client or web application running on a host
- drops a client or web application from its database due to inactivity
- detects that a host is communicating with a new network or transport protocol
- detects a new jailbroken mobile device
- detects that a TCP or UDP port has closed or timed out on a host

In addition, you can trigger a compliance change for a host by using the host input feature or the host profile to:

- add a client, protocol, or server to a host
- delete a client, protocol, or server from a host
- set the operating system definition for a host
- change a host attribute for a host so that the host is no longer a valid target

To avoid overwhelming you with events, the system does not generate white list events for non-compliant hosts on its initial evaluation, nor hosts made non-compliant as a result of you modifying an active white list or shared host profile. The violations, however, are still recorded. If you want to generate white list events for all non-compliant targets, purge discovery data. Rediscovering network assets may trigger white list events.

Note

Example: Operating System Compliance

If your white list specifies that only Microsoft Windows hosts are allowed on your network, and the system detects a host running Mac OS X, the system generates a white list event. In addition, the host attribute associated with the white list changes from Compliant to Non-Compliant for that host.

For the host in this example to come back into compliance, one of the following must occur:

- you edit the white list so that the Mac OS X operating system is allowed
- you manually change the operating system definition of the host to Microsoft Windows
- the system detects that the operating system has changed back to Microsoft Windows
Example: Deleting a Non-Compliant Asset from the Network Map

If your white list disallows the use of FTP, and you then delete FTP from the application protocols network map or from an event view, hosts running FTP become compliant. However, if the system detects the application protocol again, the system generates a white list event and the hosts become non-compliant.

Example: Triggering on Complete Information Only

If your white list allows only TCP FTP traffic on port 21, and the system detects indeterminate activity on port 21/TCP, the white list does not trigger. The white list triggers only when the system identifies the traffic as something other than FTP, or you use the host input feature to designate the traffic as non-FTP traffic. The system does not record a violation with only partial information.

Creating a Compliance White List

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you create a white list, the system prompts you to survey your network to create an initial target and to help you characterize compliant hosts.

Procedure

Step 1 Choose Policies > Correlation, then click White List.
Step 2 Click New White List.
Step 3 Optionally, enter the IP Address and Netmask for an initial target network. In a multidomain deployment, choose the Domain where the target network resides.

Tip To survey the entire monitored network, use the default values of 0.0.0.0/0 and ::/0.

Note After you choose a domain for the target network, you cannot change it. Targeting a subnet in a higher-level domain targets the same subnet in each of the descendant leaf domains. The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

Step 4 Add the target network:

- Add—To add the target network without a survey, click Add.
- Add and Survey Network—To add and survey the target network, click Add and Survey Network.
- Skip—To create a white list without surveying your network, click Skip.

Step 5 Optionally, enter a new Name and Description for the white list.

Step 6 Optionally, Allow Jailbroken Mobile Devices on your network. Disabling this option causes jailbroken devices to generate white list violations.

Step 7 Add at least one Target Network to the white list, as described in Setting Target Networks for a Compliance White List, on page 1895.
Step 8  Characterize compliant hosts using Allowed Host Profiles:

- Global Host Profile—To edit the white list’s global host profile, click Any Operating System and proceed as described in Building White List Host Profiles, on page 1896.

- Edit Surveyed Profiles—To edit an existing operating system-specific host profile created by a network survey, click its name and proceed as described in Building White List Host Profiles, on page 1896.

- Create New Profiles—To create a new operating system-specific host profile for this white list, click add (add) next to Allowed Host Profiles, and proceed as described in Building White List Host Profiles, on page 1896.

- Add Shared Host Profile—To add an existing shared host profile to the white list, click Add Shared Host Profile, select the shared host profile you want to add, then click OK. Shared host profiles appear in italics.

Step 9  Click Save White List.

What to do next

- Add the white list to an active correlation policy as described in Configuring Correlation Policies, on page 1906. The system immediately starts evaluating the white list and generating violations.

Related Topics

Setting Target Networks for a Compliance White List

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you add a target network, you can survey it to characterize compliant hosts. This survey populates the white list with one host profile for each operating system detected in the survey. These host profiles allow all the clients, application protocols, web applications, and protocols that the system has detected on the applicable operating systems.

Procedure

Step 1  In the compliance white list editor, click Add Target Network.

Step 2  Enter the IP Address and Netmask for the target network.

Step 3  In a multidomain deployment, choose the Domain where the target network resides.

Note  After you choose a domain for the target network, you cannot change it. Targeting a subnet in a higher-level domain targets the same subnet in each of the descendant leaf domains. The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.
Building White List Host Profiles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

*Host profiles* specify the white list’s compliance criteria, that is, which operating systems, clients, application protocols, web applications, and protocols are allowed to run on the target hosts.

Every white list has a global host profile which is operating-system agnostic. For example, instead of editing multiple Microsoft Windows and Linux host profiles to allow Mozilla Firefox, you can configure the global host profile to allow Firefox regardless of the operating system where it was detected.

You can also configure operating-system specific host profiles, either unique to one white list or shared across white lists.

**Note**

If you modify a shared host profile (including built-ins), or modify a built-in application protocol, protocol, or client, your change affects every white list that uses it. If you make unintended changes to or delete these built-in elements, you can reset to factory defaults.

**Before you begin**

- Create or edit a host profile within a white list as described in Editing a Compliance White List, on page 1901, or create or edit a shared host profile as described in Managing Shared Host Profiles, on page 1902.
Procedure

**Step 1**
In the compliance white list host profile editor, configure a host profile:

- **Name** — Type a **Name**.

- **Operating System** — To restrict the host profile to a specific operating system, use the **OS Vendor**, **OS Name**, and **Version** drop-down lists. Because its purpose is to apply to hosts running any operating system, you cannot restrict a global host profile.

- **Application Protocol** — To allow an application protocol, click add (ﬁlled circle) and proceed as described in White Listing an Application Protocol, on page 1897.

- **Client** — To allow a client, click add (ﬁlled circle) and proceed as described in White Listing a Client, on page 1898.

- **Web Application** — To allow a web application, click add (ﬁlled circle) and proceed as described in White Listing a Web Application, on page 1899.

- **Protocol** — To allow a protocol, click add (ﬁlled circle) and proceed as described in White Listing a Protocol, on page 1899.

- **Delete** — To disallow an item you previously allowed, click delete (cross).

- **Edit Properties** — To edit the properties of an allowed application protocol, client, or protocol, click its name. The changes you make are reﬂected in every host proﬁle that uses that element.

**Tip**
Select the appropriate **Allow all...** check box to allow all application protocols, clients, or web applications for hosts matching this proﬁle.

**Step 2**
To immediately implement all changes made since the last time you saved, click **Save White List** (or **Save All Proﬁles** if you are editing a shared host proﬁle).

---

**White Listing an Application Protocol**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Using white list host proﬁles, you can white list application protocols either globally or on speciﬁc operating systems. Optionally, you can restrict the application protocol by port, vendor, or version. For example, you could allow a particular version of OpenSSH to run on Linux hosts on port 22/TCP.

**Procedure**

**Step 1**
While you are creating or modifying a white list host proﬁle, click add (ﬁlled circle) next to **Allowed Application Protocols** (or next to **Globally Allowed Application Protocols** if you are modifying the global host proﬁle).

**Step 2**
You have two options:
• If the application protocols you want to allow are listed, select them. The web interface lists application protocols that have been allowed or are currently allowed by the white list.

• To allow an application protocol not in the list, select <New Application Protocol> and click OK to display the application protocol editor. Select the application protocol Type and Protocol you want to allow. Optionally, restrict the application protocol by port, Vendor, and Version.

  Note You must type the vendor and version exactly as they would appear in a table view of applications. If you do not specify a vendor or version, the white list allows all vendors and versions as long as the type and protocol match.

Step 3 Click OK.
Step 4 To immediately implement all changes made since the last time you saved, click Save White List.

White Listing a Client

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Using white list host profiles, you can white list clients either globally or on specific operating systems. Optionally, you can require that the client be a specific version. For example, you could allow only Microsoft Internet Explorer 10 to run on Microsoft Windows hosts.

Procedure

Step 1 While you are creating or modifying a white list host profile, click add ( ) next to Allowed Clients (or next to Globally Allowed Clients if you are modifying the global host profile).
Step 2 You have two options:
  • If the clients you want to allow are listed, select them. The web interface lists clients that have been allowed or are currently allowed by the white list.
  • To allow a client not in the list, select <New Client> and click OK to display the client editor. Select the Client you want to allow from the drop-down list, and, optionally, restrict the client to an allowed Version.

    Note You must type the version exactly as it would appear in a table view of clients. If you do not specify a version, the white list allows all versions.

Step 3 Click OK.
Step 4 To immediately implement all changes made since the last time you saved, click Save White List.
White Listing a Web Application

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Using white list host profiles, you can white list web applications either globally or on specific operating systems.

**Procedure**

**Step 1** While you are creating or modifying a white list host profile, click add (_GRAPH) next to **Allowed Web Applications** (or next to **Globally Allowed Web Applications** if you are modifying the global host profile).

**Step 2** Select the web applications you want to allow.

**Step 3** Click **OK**

**Step 4** To immediately implement all changes made since the last time you saved, click **Save White List**.

White Listing a Protocol

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Using white list host profiles, you can white list protocols either globally or on specific operating systems. ARP, IP, TCP, and UDP are always allowed to run on any host; you cannot disallow them.

**Procedure**

**Step 1** While you are creating or modifying a white list host profile, click add (GRAPH) next to **Allowed Protocols** (or next to **Globally Allowed Protocols** if you are modifying the global host profile).

**Step 2** You have two options:

- If the protocols you want to allow are listed, select them. The web interface lists protocols that have been allowed or are currently allowed by the white list.

- To allow a protocol not in the list, select **<New Protocol>** and click **OK** to display the protocol editor. From the **Type** drop-down list, select the protocol type (**Network** or **Transport**), then select the **Protocol** from the drop-down list.

**Tip** Select **Other (manual entry)** to specify a protocol that is not in the list. For network protocols, type the appropriate number as listed in [http://www.iana.org/assignments/ethernet-numbers/](http://www.iana.org/assignments/ethernet-numbers/). For transport protocols, type the appropriate number as listed in [http://www.iana.org/assignments/protocol-numbers/](http://www.iana.org/assignments/protocol-numbers/).

**Step 3** Click **OK**.
Managing Compliance White Lists

You can use the White List page to manage compliance white lists and shared host profiles. The default white list represents recommended settings and uses a special category of shared host profiles, called built-in host profiles.

In a multidomain deployment, the system displays compliance white lists created in the current domain, which you can edit. It also displays selected white lists from ancestor domains, which you cannot edit. To view and edit white lists created in a lower domain, switch to that domain.

**Note**
The system does not display configurations from ancestor domains if the configurations expose information about unrelated domains, including names, managed devices, and so on. The default white list is only available in the Global domain.

**Procedure**

**Step 1** Choose **Policies > Correlation**, then click **White List**.

**Step 2** Manage your compliance white lists:

- **Create** — To create a new white list, click **New White List** and proceed as described in Creating a Compliance White List, on page 1894.

- **Delete** — To delete a white list that is not in use, click delete (🗑️), then confirm you want to delete the white list. Deleting a white list also removes its associated host attribute from all hosts on your network. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

- **Edit** — To modify an existing white list, click edit (📝) and proceed as described in Editing a Compliance White List, on page 1901. If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

- **Shared Host Profiles** — To manage your white lists’ shared host profiles, click **Edit Shared Profiles** and proceed as described in Managing Shared Host Profiles, on page 1902.
Editing a Compliance White List

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you modify and save a compliance white list that is included in an active correlation policy, the system immediately re-evaluates the compliance of the hosts in the white list’s target networks. Although this re-evaluation may bring some hosts into or out of compliance, the system does not generate any white list events.

Procedure

Step 1  Choose Policies > Correlation, then click White List.

Step 2  Next to the white list you want to modify, click edit (🔗).

If a view icon (🔗) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3  Edit your compliance white list:

- Name and Description — To change the name or description, click the white list name in the left panel to display basic white list information, then type the new information.

- Allow Jailbroken Devices — To allow jailbroken mobile devices on your network, click the white list name in the left panel to display basic white list information, then enable Allow Jailbroken Mobile Devices. Disabling this option causes jailbroken devices to generate white list violations.

- Add Allowed Host Profile — To create an operating system-specific host profile for this white list, click add (🔗) next to Allowed Host Profiles and proceed as described in Building White List Host Profiles, on page 1896.

- Add Shared Host Profile — To add an existing shared host profile to the white list, click Add Shared Host Profile, select the shared host profile you want to add, then click OK. Shared host profiles appear in italics.

- Add Target Network — To add a new target network without surveying its hosts, click add (🔗) next to Target Networks and proceed as described in Setting Target Networks for a Compliance White List, on page 1895.

- Delete Host Profile — To delete a shared or operating-system specific host profile from the white list, click delete (🗑️) next to the host profile, then confirm your choice. Deleting a shared host profile removes it from the white list, but does not delete the profile or remove it from any other white lists that use it. You cannot delete a white list’s global host profile.

- Delete Target Network — To remove a target network from the white list, click delete (🗑️) next to the network, then confirm your choice.

- Edit Global Host Profile — To edit the white list’s global host profile, click Any Operating System and proceed as described in Building White List Host Profiles, on page 1896.
Managing Shared Host Profiles

<table>

<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a compliance white list, shared host profiles are tied to specific operating systems, but you can use each shared host profile in more than one white list. If you create multiple white lists but want to use the same host profile to evaluate hosts running a particular operating system across the white lists, use a shared host profile.

In a multidomain deployment, the system displays shared host profiles created in the current domain, which you can edit. It also displays shared host profiles from ancestor domains, which you cannot edit. To view and edit shared host profiles created in a lower domain, switch to that domain.

**Note**

If you modify a shared host profile (including built-ins), or modify a built-in application protocol, protocol, or client, your change affects every white list that uses it. If you make unintended changes to or delete these built-in elements, you can reset to factory defaults.

**Procedure**

**Step 1** Choose Policies > Correlation, then click White List.

**Step 2** Click Edit Shared Profiles.

**Step 3** Manage your shared host profiles:

- Create Shared Host Profile — To create a new shared host profile without surveying hosts, click add ( ▼ ) next to Shared Host Profiles and proceed as described in Building White List Host Profiles, on page 1896.

- Create Shared Host Profile by Survey — To create multiple new shared host profiles by surveying a network, click Add Target Network and proceed as described in Setting Target Networks for a Compliance White List, on page 1895.

- Delete — To delete a shared host profile, click delete ( ▴ ), then confirm your choice.

- Edit — To modify an existing shared host profile (including a built-in shared host profile), click its name and proceed as described in Building White List Host Profiles, on page 1896.
• Reset Built-In Host Profiles — To reset all built-in host profiles to factory defaults, click **Built-in Host Profiles**, then click **Reset to Factory Defaults** and confirm your choice.

**Step 4**
To immediately implement all changes made since the last time you saved, click **Save All Profiles**.
CHAPTER 96

Correlation Policies

The following topics describe how to configure correlation policies and rules.

- Introduction to Correlation Policies and Rules, on page 1905
- Configuring Correlation Policies, on page 1906
- Configuring Correlation Rules, on page 1909
- Configuring Correlation Response Groups, on page 1940

Introduction to Correlation Policies and Rules

You can use the correlation feature to respond in real time to threats to your network, using correlation policies.

A correlation policy violation occurs when the activity on your network triggers either a correlation rule or compliance white list within an active correlation policy.

Correlation Rules

When a correlation rule in an active correlation policy triggers, the system generates a correlation event. Correlation rules can trigger when:

- The system generates a specific type of event (connection, intrusion, malware, discovery, user activity, and so on).

- Your network traffic deviates from its normal profile.

You can constrain correlation rules in the following ways:

- Add a host profile qualification to constrain the rule using information from the host profile of a host involved in the triggering event.

- Add a connection tracker to a correlation rule so that after the rule’s initial criteria are met, the system begins tracking certain connections. Then, a correlation event is generated only if the tracked connections meet additional criteria.

- Add a user qualification to a correlation rule to track certain users or groups of users. For example, you can constrain a correlation rule so that it triggers only for a particular user's traffic, or traffic from a specific department.
• Add *snooze periods*. When a correlation rule triggers, a snooze period causes that rule not to trigger again for a specified interval. After the snooze period elapses, the rule can trigger again and start a new snooze period.

• Add *inactive periods*. During inactive periods, correlation rules do not trigger.

Although you can configure correlation rules without licensing your deployment, rules that use unlicensed components do not trigger.

**Compliance White Lists**

A compliance white list specifies which operating systems, applications (web and client), and protocols are allowed on hosts on your network. When a host violates a white list used in an active correlation policy, the system generates a *white list event*.

**Correlation Responses**

*Responses* to correlation policy violations include simple alerts and various remediations (such as scanning a host). You can associate each correlation rule or white list with a single response or group of responses.

If network traffic triggers multiple rules or white lists, the system launches all the responses associated with each rule and white list.

**Correlation and Multitenancy**

In a multidomain deployment, you can create correlation policies at any domain level, using whatever rules, white lists, and responses are available at that level. Higher-level domain administrators can perform correlation within or across domains:

• Constraining a correlation rule by domain matches events reported by that domain’s descendants.

• Higher-level domain administrators can create compliance white lists that evaluate hosts across domains. You can target different subnets in different domains in the same white list.

---

**Note**

The system builds a separate network map for each leaf domain. Using literal configurations (such as IP addresses, VLAN tags, and usernames) to constrain cross-domain correlation rules can have unexpected results.

## Configuring Correlation Policies

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>
Use correlation rules, compliance white lists, alert responses, and remediations to build correlation policies. In a multidomain deployment, you can create correlation policies at any domain level, using whatever constituent configurations are available at that level.

You can assign a priority to each correlation policy, and to each rule and white list used in that policy. Rule and white list priorities override correlation policy priorities. If network traffic violates the correlation policy, the resultant correlation events display the policy priority value, unless the violated rule or white list has its own priority.

Procedure

Step 1  Choose Policies > Correlation.
Step 2  Click Create Policy.
Step 3  Enter a Policy Name and Policy Description.
Step 4  From the Default Priority drop-down list, choose a priority for the policy. Choose None to use rule priorities only.
Step 5  Click Add Rules, check the rules and white lists that you want to use in the policy, then click Add.
Step 6  From the Priority list for each rule or white list, choose a priority:
   • A priority value from 1 to 5
   • None
   • Default to use the policy’s default priority
Step 7  Add responses to rules and white lists as described in Adding Responses to Rules and White Lists, on page 1907.
Step 8  Click Save.

What to do next
   • Activate the policy by clicking the slider.

Adding Responses to Rules and White Lists

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

You can associate each correlation rule or white list with a single response or group of responses. If network traffic triggers multiple rules or white lists, the system launches all the responses associated with each rule and white list. Note that an Nmap remediation does not launch when used as a response to a traffic profile change.

In a multidomain deployment, you can use responses created in the current domain or in ancestor domains.
Procedure

**Step 1**  
In the correlation policy editor, next to a rule or white list where you want to add responses, click responses ( ).

**Step 2**  
Under Unassigned Responses, choose the responses you want to launch when the rule or white list triggers, and click the up arrow ( ).

**Step 3**  
Click Update.

Managing Correlation Policies

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

Changes made to active correlation policies take effect immediately.

When you activate a correlation policy, the system immediately begins processing events and triggering responses. Note that the system does not generate white list events for non-compliant hosts on its initial, post-activation evaluation.

In a multidomain deployment, the system displays correlation policies created in the current domain, which you can edit. It also displays selected correlation policies from ancestor domains, which you cannot edit. To view and edit correlation policies created in a lower domain, switch to that domain.

**Note**  
The system does not display configurations from ancestor domains if the configurations expose information about unrelated domains, including names, managed devices, and so on.

Procedure

**Step 1**  
Choose Policies > Correlation.

**Step 2**  
Manage your correlation policies:
- Activate or Deactivate — Click the slider. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Create — Click Create Policy; see Configuring Correlation Policies, on page 1906.
- Edit — Click edit ( ); see Configuring Correlation Policies, on page 1906. If a view icon ( ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
• Delete — Click delete (✓). If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

### Configuring Correlation Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
</tbody>
</table>

A simple correlation rule requires only that an event of a certain type occurs. You do not need to provide more specific conditions. For example, correlation rules based on traffic profile changes do not require conditions. You can also create complex correlation rules, with multiple conditions and added constraints.

When you create correlation rule trigger criteria, host profile qualifications, user qualifications, or connection trackers, the syntax varies but the mechanics remain consistent.

#### Note

In a multidomain deployment, constraining a correlation rule by an ancestor domain matches events reported by that domain's descendants.

#### Before you begin

- Confirm that your deployment is collecting the type of information you want to use to trigger correlation events. For example, the information available for any individual connection or connection summary event depends on several factors, including the detection method, the logging method, and event type. The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1742.

#### Procedure

1. Choose Policies > Correlation, then click Rule Management.
2. Click Create Rule.
3. Enter a Rule Name and Rule Description.
4. Optionally, choose a Rule Group for the rule.
5. Choose a base event type and, optionally, specify additional trigger criteria for the correlation rule. You can choose the following base event types:
   - an intrusion event occurs — See Syntax for Intrusion Event Trigger Criteria, on page 1910.
   - a malware event occurs — See Syntax for Malware Event Trigger Criteria, on page 1913.
   - a discovery event occurs — See Syntax for Discovery Event Trigger Criteria, on page 1914.
   - user activity is detected — See Syntax for User Activity Event Trigger Criteria, on page 1917.
   - a host input event occurs — See Syntax for Host Input Event Trigger Criteria, on page 1918.
   - a connection event occurs — See Syntax for Connection Event Trigger Criteria, on page 1919.
• a traffic profile changes—See Syntax for Traffic Profile Changes, on page 1922.

**Step 6**
Optionally, further constrain the correlation rule by adding any or all of the following:

- Host Profile Qualification—Click **Add Host Profile Qualification**; see Syntax for Correlation Host Profile Qualifications, on page 1924.
- Connection Tracker—Click **Add Connection Tracker**; see Connection Trackers, on page 1928.
- User Qualification—Click **Add User Qualification**; see Syntax for User Qualifications, on page 1927.
- Snooze Period—Under Rule Options, use the **Snooze** text field and drop-down list to specify the interval that the system should wait to trigger a correlation rule again, after the rule triggers.
- Inactive Period—Under Rule Options, click **Add Inactive Period**. Using the text field and drop-down lists, specify when and how often you want the system to refrain from evaluating network traffic against the correlation rule.

**Tip** To remove a snooze period, specify an interval of 0 (seconds, minutes, or hours).

**Step 7**
Click **Save Rule**.

---

**Example Simple Correlation Rule**

The following simple correlation rule triggers if a new host is detected in a specific subnet. Note that when the category represents an IP address, choosing **is in** or **is not in** as the operator allows you to specify whether the IP address is **in** or is **not in** a block of IP addresses, as expressed in special notation such as CIDR.

What to do next

- Use the rule in correlation policies as described in Configuring Correlation Policies, on page 1906.

**Syntax for Intrusion Event Trigger Criteria**

The following table describes how to build a correlation rule condition when you choose an intrusion event as the base event.
### Table 229: Syntax for Intrusion Events

<table>
<thead>
<tr>
<th>If you specify...</th>
<th>Choose an operator, then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Control Policy</td>
<td>Choose one or more access control policies that use the intrusion policy that generated the intrusion event.</td>
</tr>
<tr>
<td>Access Control Rule Name</td>
<td>Enter all or part of the name of the access control rule that uses the intrusion policy that generated the intrusion event.</td>
</tr>
<tr>
<td>Application Protocol</td>
<td>Choose one or more application protocols associated with the intrusion event.</td>
</tr>
<tr>
<td>Application Protocol Category</td>
<td>Choose one or more category of application protocol.</td>
</tr>
<tr>
<td>Classification</td>
<td>Choose one or more classifications.</td>
</tr>
<tr>
<td>Client</td>
<td>Choose one or more clients associated with the intrusion event.</td>
</tr>
<tr>
<td>Client Category</td>
<td>Choose one or more category of client.</td>
</tr>
<tr>
<td>Destination Country or Source</td>
<td>Choose one or more countries associated with the source or destination IP address in the intrusion event.</td>
</tr>
<tr>
<td>Country</td>
<td>Enter a single IP address or address block.</td>
</tr>
<tr>
<td>Destination IP, Source IP, Both</td>
<td>Enter the port number or ICMP type for source traffic or the port number or ICMP code for destination traffic.</td>
</tr>
<tr>
<td>Source IP and Destination IP, or</td>
<td>Destination Port/ICMP Code or Source Port/ICMP Type</td>
</tr>
<tr>
<td>Either Source IP or Destination IP</td>
<td></td>
</tr>
<tr>
<td>Device</td>
<td>Choose one or more devices that may have generated the event.</td>
</tr>
<tr>
<td>Domain</td>
<td>Choose one or more domains. In a multidomain deployment, constraining by an ancestor domain matches data reported by that domain's descendants. This field is only present if you have ever configured the Firepower Management Center for multitenancy.</td>
</tr>
<tr>
<td>Egress Interface or Ingress</td>
<td>Choose one or more interfaces.</td>
</tr>
<tr>
<td>Interface</td>
<td>Egress Security Zone or Ingress Security Zone</td>
</tr>
<tr>
<td>Generator ID</td>
<td>Choose one or more preprocessors.</td>
</tr>
<tr>
<td>Impact Flag</td>
<td>Choose the impact level assigned to the intrusion event.</td>
</tr>
<tr>
<td></td>
<td>Because no operating system information is available for hosts added to the network map from NetFlow data, the system cannot assign Vulnerable (impact level 1: red) impact levels for intrusion events involving those hosts. In such cases, use the host input feature to manually set the operating system identity for the hosts.</td>
</tr>
<tr>
<td>If you specify...</td>
<td>Choose an operator, then...</td>
</tr>
<tr>
<td>-------------------</td>
<td>----------------------------</td>
</tr>
</tbody>
</table>

**Inline Result**

Choose whether the system *dropped* or *would have dropped* packets as a result of the intrusion policy violation.

The system can drop packets in an inline, switched, or routed deployment. It does not drop packets in a passive deployment, including when an inline set is in tap mode, regardless of intrusion rule state or the drop behavior of the intrusion policy.

**Intrusion Policy**

Choose one or more intrusion policies that generated the intrusion event.

**IOC Tag**

Choose whether an indication of compromise tag was set as a result of the intrusion event.

**Priority**

Choose the rule priority.

For rule-based intrusion events, the priority corresponds to either the value of the `priority` keyword or the value for the `classtype` keyword. For other intrusion events, the priority is determined by the decoder or preprocessor.

**Protocol**

Enter the name or number of the transport protocol as listed in [http://www.iana.org/assignments/protocol-numbers](http://www.iana.org/assignments/protocol-numbers).

**Rule Message**

Enter all or part of the rule message.

**Rule SID**

Enter a single Snort ID (SID) or multiple SIDs separated by commas.

If you choose *is in* or *is not in* as the operator, you cannot use the multi-selection pop-up window. You must enter a comma-separated list of SIDs.

**Rule Type**

Specify whether the rule is local.

Local rules include custom standard text intrusion rules, standard text rules that you modified, and any new instances of shared object rules created when you saved the rule with modified header information.

**SSL Actual Action**

Choose the SSL rule action that indicates how the system handled an encrypted connection.

**SSL Certificate Fingerprint**

Enter the fingerprint of the certificate used to encrypt the traffic, or choose a subject common name associated with the fingerprint.

**SSL Certificate Subject Common Name (CN)**

Enter all or part of the subject common name of the certificate used to encrypt the session.

**SSL Certificate Subject Country (C)**

Choose one or more subject country codes of the certificate used to encrypt the session.

**SSL Certificate Subject Organization (O)**

Enter all or part of the subject organization name of the certificate used to encrypt the session.

**SSL Certificate Subject Organizational Unit (OU)**

Enter all or part of the subject organizational unit name of the certificate used to encrypt the session.

**SSL Flow Status**

Choose one or more statuses based on the result of the system’s attempt to decrypt the traffic.

**Username**

Enter the username of the user logged into the source host in the intrusion event.

**VLAN ID**

Enter the innermost VLAN ID associated with the packet that triggered the intrusion event.
Choose an operator, then... If you specify...

<table>
<thead>
<tr>
<th>Web Application</th>
<th>Choose one or more web applications associated with the intrusion event.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Application Category</td>
<td>Choose one or more category of web application.</td>
</tr>
</tbody>
</table>

Syntax for Malware Event Trigger Criteria

To base a correlation rule on a malware event, first specify the type of malware event you want to use. Your choice determines the set of trigger criteria you can use. You can choose:

- **by endpoint-based malware detection** (detection by AMP for Endpoints)
- **by network-based malware detection** (detection by AMP for Networks)
- **by retrospective network-based malware detection** (retroactive detection by AMP for Networks)

The following table describes how to build a correlation rule condition when you choose a malware event as the base event.

Table 230: Syntax for Malware Events

<table>
<thead>
<tr>
<th>If you specify...</th>
<th>Choose an operator, then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Protocol</td>
<td>Choose one or more application protocols associated with the malware event.</td>
</tr>
<tr>
<td>Application Protocol Category</td>
<td>Choose one or more category of application protocol.</td>
</tr>
<tr>
<td>Client</td>
<td>Choose one or more clients associated with the malware event.</td>
</tr>
<tr>
<td>Client Category</td>
<td>Choose one or more category of client.</td>
</tr>
<tr>
<td>Destination Country or Source Country</td>
<td>Choose one or more countries associated with the source or destination IP address in the malware event.</td>
</tr>
<tr>
<td>Destination IP, Host IP, or Source IP</td>
<td>Enter a single IP address or address block.</td>
</tr>
<tr>
<td>Destination Port/ICMP Code</td>
<td>Enter the port number or ICMP code for destination traffic.</td>
</tr>
<tr>
<td>Disposition</td>
<td>Choose either or both <strong>Malware</strong> or <strong>Custom Detection</strong>.</td>
</tr>
<tr>
<td>Domain</td>
<td>Choose one or more domains. In a multidomain deployment, constraining by an ancestor domain matches data reported by that domain's descendants. This field is only present if you have ever configured the Firepower Management Center for multitenancy.</td>
</tr>
<tr>
<td>Event Type</td>
<td>Choose one or more event types associated with the malware event detected by AMP for Endpoints.</td>
</tr>
</tbody>
</table>
### Syntax for Discovery Event Trigger Criteria

To base a correlation rule on a discovery event, first specify the type of discovery event you want to use. Your choice determines the set of trigger criteria you can use. The following table lists the discovery event types you can choose.

You cannot trigger a correlation rule on hops changes, or when the system drops a new host due to reaching the host limit. You can, however, choose **there is any type of event** to trigger the rule when any type of discovery event occurs.

<table>
<thead>
<tr>
<th>If you specify...</th>
<th>Choose an operator, then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Name</td>
<td>Enter the name of the file.</td>

**Syntax for Connection Event Trigger Criteria**

To base a correlation rule on a connection event, first specify the type of connection event you want to use. Note that the information available for a connection event can vary depending on how, why, and when the system logged the connection. You can choose:

- **at either the beginning or the end of the connection**
- **at the beginning of the connection**
- **at the end of the connection**

The following table describes how to build a correlation rule condition when you choose a connection event as the base event.
### Syntax for Connection Event Trigger Criteria

<table>
<thead>
<tr>
<th>If you specify...</th>
<th>Choose an operator, then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Control Policy</td>
<td>Choose one or more access control policies that logged the connection.</td>
</tr>
</tbody>
</table>
| Access Control Rule Action | Choose one or more actions associated with the access control rule that logged the connection. 
Choose **Monitor** to trigger correlation events when network traffic matches the conditions of any Monitor rule, regardless of the rule or default action that later handles the connection. |
| Access Control Rule | Enter all or part of the name of the access control rule that logged the connection. 
You can enter the name of any Monitor rule whose conditions were matched by a connection, regardless of the rule or default action that later handled the connection. |
| Application Protocol | Choose one or more application protocols associated with the connection. |
| Application Protocol Category | Choose one or more categories of application protocol. |
| Client | Choose one or more clients. |
| Client Category | Choose one or more categories of client. |
| Client Version | Enter the version number of the client. |
| Connection Duration | Enter the duration of the connection event, in seconds. |
| Connection Type | Specify whether you want to trigger the correlation rule based on how the connection information was obtained: 
- Choose **is** and **Netflow** for connection events generated from exported NetFlow data. 
- Choose **is not** and **Netflow** for connection events detected by a Firepower System managed device. |
| Destination Country or Source Country | Choose one or more countries associated with the source or destination IP address in the connection event. |
| Device | Choose one or more devices that either detected the connection, or that processed the connection (for connection data from exported NetFlow records). |
| Domain | Choose one or more domains. In a multidomain deployment, constraining by an ancestor domain matches data reported by that domain's descendants. This field is only present if you have ever configured the Firepower Management Center for multitenancy. |
| Egress Interface or Ingress Interface | Choose one or more interfaces. |
| Egress Security Zone or Ingress Security Zone | Choose one or more security zones or tunnel zones. |
### If you specify... | Choose an operator, then...
---|---
Initiator Bytes, Responder Bytes, or Total Bytes | Enter one of:
- The number of bytes sent *(Initiator Bytes)*.
- The number of bytes received *(Responder Bytes)*.
- The number of bytes both sent and received *(Total Bytes)*.

Initiator IP, Responder IP, Both Initiator and Responder IP, or Either Initiator IP or Responder IP | Specify a single IP address or address block.

Initiator Packets, Responder Packets, or Total Packets | Enter one of:
- The number of packets sent *(Initiator Packets)*.
- The number of packets received *(Responder Packets)*.
- The number of packets both sent and received *(Total Packets)*.

Initiator Port/ICMP Type or Responder Port/ICMP Code | Enter the port number or ICMP type for initiator traffic or the port number or ICMP code for responder traffic.

IOC Tag | Specify whether an indication of compromise tag is *is* or *is not* set due to the connection event.

NetBIOS Name | Enter the NetBIOS name of the monitored host in the connection.

NetFlow Device | Choose the IP address of the NetFlow exporter you want to use to trigger the correlation rule. If you did not add any NetFlow exporters to the network discovery policy, the NetFlow Device drop-down list is blank.

Prefilter Policy | Choose one or more prefilter policies that handled the connection.

Reason | Choose one or more reasons associated with the connection event.

Security Intelligence Category | Choose one or more Security Intelligence categories associated with the connection event.
To use Security Intelligence Category as a condition for end-of-connection events, set that category to *Monitor* instead of *Block* in your access control policy.

SSL Actual Action | Specify the SSL rule action that indicates how the system handled an encrypted connection.

SSL Certificate Fingerprint | Enter the fingerprint of the certificate used to encrypt the traffic, or choose a subject common name associated with the fingerprint.

SSL Certificate Status | Choose one or more statuses associated with the certificate used to encrypt the session.

SSL Certificate Subject Common Name (CN) | Enter all or part of the subject common name of the certificate used to encrypt the session.

SSL Certificate Subject Country (C) | Choose one or more subject country codes of the certificate used to encrypt the session.
### Syntax for Traffic Profile Changes

To base a correlation rule on a traffic profile change, first choose the traffic profile you want to use. The rule triggers when network traffic deviates from the pattern characterized by the profile you choose.

You can trigger the rule based on either raw data or on the statistics calculated from the data. For example, you could write a rule that triggers if the amount of data traversing your network (measured in bytes) suddenly

<table>
<thead>
<tr>
<th>If you specify...</th>
<th>Choose an operator, then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSL Certificate Subject Organization (O)</td>

spikes, which could indicate an attack or other security policy violation. You could specify that the rule trigger if either:

- the number of bytes traversing your network spikes above a certain number of bytes
- the number of bytes traversing your network spikes above a certain number of standard deviations above or below the mean amount of traffic

Note that to create a rule that triggers when the number of bytes traversing your network falls outside a certain number of standard deviations (whether above or below), you must specify upper and lower bounds, as shown in the following graphic.

To create a rule that triggers when the number of bytes traversing is greater than a certain number of standard deviations above the mean, use only the first condition shown in the graphic.

To create a rule that triggers when the number of bytes traversing is greater than a certain number of standard deviations below the mean, use only the second condition.

Check the use velocity data check box to trigger the correlation rule based on rates of change between data points. If you wanted to use velocity data in the above example, you could specify that the rule triggers if either:

- the change in the number of bytes traversing your network spikes above or below a certain number of standard deviations above the mean rate of change
- the change in the number of bytes traversing your network spikes above a certain number of bytes

The following table describes how to build a condition in a correlation rule when you choose a traffic profile change as the base event.

Total Bytes, Initiator Bytes, or Responder Bytes | one of: • the total bytes transmitted (Total Bytes) • the number of bytes transmitted (Initiator Bytes) • the number of bytes received (Responder Bytes) or the number of standard deviations either above or below the mean that one of the above criteria must be in to trigger the rule | bytes standard deviation(s)
Total Packets, Initiator Packets, or Responder Packets | one of: • the total packets transmitted (Total Packets) • the number of packets transmitted (Initiator Packets) • the number of packets received (Responder Packets) or the number of standard deviations either above or below the mean that one of the above criteria must be in to trigger the rule | packets standard deviation(s)
Unique Initiators | the number of unique hosts that initiated sessions or the number of standard deviations either above or below the mean that the number of unique initiators detected must be to trigger the rule | initiators standard deviation(s)
Unique Responders | the number of unique hosts that responded to sessions or the number of standard deviations either above or below the mean that the number of unique responders detected must be to trigger the rule | responders standard deviation(s)

**Syntax for Correlation Host Profile Qualifications**

To constrain a correlation rule based on the host profile of a host involved in the event, add a *host profile qualification*. You cannot add a host profile qualification to a correlation rule that triggers on a malware event, traffic profile change, or on the detection of a new IP host.

When you build a host profile qualification, first specify the host you want to use to constrain your correlation rule. The host you can choose depends on the rule’s base event type:

- connection event — Choose Responder Host or Initiator Host.
- intrusion event — Choose Destination Host or Source Host.
• discovery event, host input event, or user activity — Choose Host.

The following table describes how to build a host profile qualification for a correlation rule.

### Table 238: Syntax for Host Profile Qualifications

**Using Implied or Generic Clients to Build a Host Profile Qualification**

When system reports a detected client using an application protocol name followed by *client* (for example, HTTPS client), that client is an implied or generic client. In these cases, the system has not detected a particular client, but is inferring the existence of a client based on server response traffic.

To create a host profile qualification using an implied or generic client, constrain using the application protocol running on the responder host, not the client.

**Using Event Data to Build a Host Profile Qualification**

You can often use data from the correlation rule's base event when constructing a host profile qualification.

For example, assume your correlation rule triggers when the system detects the use of a particular browser on one of your monitored hosts. Further assume that when you detect this use, you want to generate an event if the browser version is not the latest.

You could add a host profile qualification to this correlation rule so that the rule triggers only if the **Client** is the *Event Client*, but the **Client Version** is not the latest version.

**Example Host Profile Qualification**

The following host profile qualification constrains a correlation rule so the rule triggers only if the host involved in the discovery event on which the rule is based is running a version of Microsoft Windows.
Syntax for User Qualifications

If you are using a connection, intrusion, discovery, or host input event to trigger your correlation rule, you can constrain the rule based on the identity of a user involved in the event. This constraint is called a **user qualification**. For example, you could constrain a correlation rule so that it triggers only when the identity of the source or destination user is one from the sales department.

You cannot add a user qualification to a correlation rule that triggers on a traffic profile change or on the detection of user activity. Also, the system obtains user details through the Firepower Management Center-server connection established in an identity realm. This information may not be available for all users in the database.

When you build a user qualification, first specify the identity you want to use to constrain your correlation rule. The identity you can choose depends on the rule's base event type:

- **connection event** — Choose **Identity on Initiator** or **Identity on Responder**.
- **intrusion event** — Choose **Identity on Destination** or **Identity on Source**.
- **discovery event** — Choose **Identity on Host**.
- **host input event** — Choose **Identity on Host**.

The following table describes how to build a user qualification for a correlation rule.

Connection Trackers

A *connection tracker* constrains a correlation rule so that after the rule’s initial criteria are met (including host profile and user qualifications), the system begins tracking certain connections. The system generates a correlation event for the rule if the tracked connections meet additional criteria gathered over a time period that you specify.

Tip

Connection trackers typically monitor very specific traffic and, when triggered, run only for a finite, specified time. Compare connection trackers with traffic profiles, which typically monitor a broad range of network traffic and run persistently.

There are two ways a connection tracker can generate an event.

**Connection Trackers That Fire Immediately When Conditions Are Met**

You can configure a connection tracker so that the correlation rule fires as soon as network traffic meets the tracker’s conditions. When this happens, the system stops tracking connections for this connection tracker instance, even if the timeout period has not expired. If the same type of policy violation that triggered the correlation rule occurs again, the system creates a new connection tracker. However, if time expires before network traffic meets the conditions in the connection tracker, the system does not generate a correlation event, and also stops tracking connections for that rule instance.

For example, a connection tracker can serve as a kind of event threshold by generating a correlation event only if a certain type of connection occurs more than a specific number of times within a specific time period. Or, you can generate a correlation event only if the system detects excessive data transfer after an initial connection.

**Connection Trackers That Fire at the End of the Timeout Period**

You can configure a connection tracker so that it relies on data collected over the entire timeout period, and therefore cannot fire until the end of the timeout period.

For example, if you configure a connection tracker to fire if you detect fewer than a certain number of bytes being transferred during a certain time period, the system waits until that time period passes and then generates an event if network traffic met that condition.
Adding a Connection Tracker

<table>
<thead>

<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
</tbody>
</table>

Before you begin

- Create a correlation rule based on a connection, intrusion, discovery, user identity, or host input event. You cannot add a connection tracker to a rule based on a malware event or traffic profile change.

Procedure

**Step 1** In the correlation rule editor, click **Add Connection Tracker**.

**Step 2** Specify the connections to track; see **Syntax for Connection Trackers**, on page 1929.

**Step 3** Based on the tracked connections, specify when you want to generate a correlation event; see **Syntax for Connection Tracker Events**, on page 1932.

**Step 4** Specify the interval (in seconds, minutes, or hours) during which the tracker’s conditions must be met.

Syntax for Connection Trackers

The following table describes how to build a connection tracker condition that specifies the kind of connections you want to track.

**Table 240: Syntax for Connection Trackers**

**Using Event Data to Build a Connection Tracker**

You can often use data from the correlation rule's base event when constructing a connection tracker. For example, assume your correlation rule triggers when the system detects a new client. When you add a connection tracker to this type of correlation rule, the system automatically populates the tracker with constraints that refer to the base event:

- The **Initiator/Responder IP** is set to the **Event IP Address**.
- The **Client** is set to the **Event Client**.
Syntax for Connection Tracker Events

The following table describes how to build a connection tracker condition that specifies when you want to generate a correlation event based on the connections you are tracking.

Sample Configuration for Excessive Connections From External Hosts

Consider a scenario where you archive sensitive files on network 10.1.0.0/16, and where hosts outside this network typically do not initiate connections to hosts inside the network. An occasional connection initiated from outside the network might occur, but you have determined that when four or more connections are initiated within two minutes, there is cause for concern.
The rule shown in the following graphic specifies that when a connection occurs from outside the 10.1.0.0/16 network to inside the network, the system begins tracking connections that meet that criterion. The system then generates a correlation event if the system detects four connections (including the original connection) within two minutes that match that signature.

The following diagram shows how network traffic can trigger the above correlation rule.

In this example, the system detected a connection that met the basic conditions of the correlation rule, that is, the system detected a connection from a host outside the 10.1.0.0/16 network to a host inside the network. This created a connection tracker.

The connection tracker is processed in the following stages:

- First, the system starts tracking connections when it detects a connection from Host A outside the network to Host 1 inside the network.
- The system detects two more connections that match the connection tracker signature: Host B to Host 2 and Host C to Host 1.
• The system detects a fourth qualifying connection when Host A connects to Host 3 within the two-minute time limit. The rule conditions are met.
• Finally, the system generates a correlation event and the system stops tracking connections.

Sample Configuration for Excessive BitTorrent Data Transfers

Consider a scenario where you want to generate a correlation event if the system detects excessive BitTorrent data transfers after an initial connection to any host on your monitored network.

The following graphic shows a correlation rule that triggers when the system detects the BitTorrent application protocol on your monitored network. The rule has a connection tracker that constrains the rule so that the rule triggers only if hosts on your monitored network (in this example, 10.1.0.0/16) collectively transfer more than 7MB of data (7340032 bytes) via BitTorrent in the five minutes following the initial policy violation.

The following diagram shows how network traffic can trigger the above correlation rule.
In this example, the system detected the BitTorrent TCP application protocol on two different hosts: Host 1 and Host 2. These two hosts transmitted data via BitTorrent to four other hosts: Host A, Host B, Host C, and Host D.

This connection tracker is processed in the following stages:

• First, the system starts tracking connections at the 0-second marker when the system detects the BitTorrent application protocol on Host 1. Note that the connection tracker will expire if the system does not detect 7MB of BitTorrent TCP data being transmitted in the next 5 minutes (by the 300-second marker).

• At 5 seconds, Host 1 has transmitted 3MB of data that matches the signature:
  • 1MB from Host 1 to Host A, at the 1-second marker (1MB total BitTorrent traffic counted towards fulfilling the connection tracker)
  • 2MB from Host 1 to Host B, at the 5-second marker (3MB total)

• At 7 seconds, the system detects the BitTorrent application protocol on Host 2 and starts tracking BitTorrent connections for that host as well.

• At 20 seconds, the system has detected additional data matching the signature being transmitted from both Host 1 and Host 2:
  • 1MB from Host 2 to Host A, at the 10-second marker (4MB total)
  • 2MB from Host 1 to Host C, at the 15-second marker (6MB total)
  • 1MB from Host 2 to Host B, at the 20-second marker (7MB total)
• Although Host 1 and Host 2 have now transmitted a combined 7MB of BitTorrent data, the rule does not trigger because the total number of bytes transmitted must be more than 7MB (Responder Bytes are greater than 7340032). At this point, if the system were to detect no additional BitTorrent transfers for the remaining 280 seconds in the tracker’s timeout period, the tracker would expire and the system would not generate a correlation event.

• However, at 30 seconds, the system detects another BitTorrent transfer, and the rule conditions are met:
  • 2MB from Host 1 to Host D at the 30-second marker (9MB total)

• Finally, the system generates a correlation event. The system also stops tracking connections for this connection tracker instance, even though the 5-minute period has not expired. If the system detects a new connection using the BitTorrent TCP application protocol at this point, it will create a new connection tracker. Note that the system generates the correlation event after Host 1 transmits the entire 2MB to Host D, because it does not tally connection data until the session terminates.

Snooze and Inactive Periods

You can configure snooze periods in correlation rules. When a correlation rule triggers, a snooze period instructs the system to stop firing that rule for a specified interval, even if the rule is violated again during the interval. When the snooze period has elapsed, the rule can trigger again (and start a new snooze period).

For example, you may have a host on your network that should never generate traffic. A simple correlation rule that triggers whenever the system detects a connection involving that host may create multiple correlation events in a short period of time, depending on the network traffic to and from the host. To limit the number of correlation events exposing your policy violation, you can add a snooze period so that the system generates a correlation event only for the first connection (within a time period that you specify) that the system detects involving that host.

You can also set up inactive periods in correlation rules. During inactive periods, the correlation rule will not trigger. You can set up inactive periods to recur daily, weekly, or monthly. For example, you might perform a nightly Nmap scan on your internal network to look for host operating system changes. In that case, you could set a daily inactive period on the affected correlation rules for the time and duration of your scan so that those rules do not trigger erroneously.

Correlation Rule Building Mechanics

You build a correlation rule by specifying the conditions under which it triggers. The syntax you can use within conditions varies depending on the element you are creating, but the mechanics are the same.

Most conditions have three parts: a category, an operator, and a value:

• The categories you can choose depend on whether you are building correlation rule triggers, a host profile qualification, a connection tracker, or a user qualification. Within correlation rule triggers, the categories further depend on the base event type for the rule. Some conditions may contain several categories, each of which may have their own operators and values.

• A condition’s available operators depend on the category.

• The syntax you can use to specify a condition’s value depends on the category and operator. Sometimes you type the value in a text field. Other times, you can choose a value (or multiple values) from a drop-down list.
For example, if you want to generate a correlation event every time a new host is detected, you can create a simple rule with no conditions.

If you want to further constrain the rule and generate an event only if that new host was detected on the 10.4.x.x network, you can add a single condition.

When your construct includes more than one condition, you must link them with an AND or an OR operator. Conditions on the same level are evaluated together:

- The AND operator requires that all conditions on the level it controls must be met.
- The OR operator requires that at least one of the conditions on the level it controls must be met.

The following rule, which detects SSH activity on a nonstandard port on the 10.4.x.x network and the 192.168.x.x network, has four conditions, with the bottom two constituting a complex condition.

Logically, the rule is evaluated as follows:

\[(A \text{ and } B \text{ and } (C \text{ or } D))\]

<table>
<thead>
<tr>
<th>Table 242: Rule Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Where...</strong></td>
</tr>
<tr>
<td>A</td>
</tr>
<tr>
<td>B</td>
</tr>
<tr>
<td>C</td>
</tr>
<tr>
<td>D</td>
</tr>
</tbody>
</table>
Evaluating complex correlation rules that trigger on frequently occurring events can degrade system performance. For example, a multicondition rule that the system must evaluate against every logged connection can cause resource overload.

### Adding and Linking Conditions in Correlation Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

**Caution**

Adding and Linking Conditions in Correlation Rules

**Procedure**

**Step 1**
In the correlation rule editor, add a simple or complex condition:

- Simple — Click **Add condition**.
- Complex — Click **Add complex condition**.

**Step 2**
Link conditions by choosing the **AND** or **OR** operator from the drop-down list to the left of the conditions.

**Example: Simple vs Complex Conditions**

The following graphic shows a correlation rule with two simple conditions joined by the **OR** operator.

The following graphic shows a correlation rule with one simple condition and one complex condition, joined by the **OR** operator. The complex condition comprises two simple conditions joined by the **AND** operator.
Using Multiple Values in Correlation Rule Conditions

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you are building a correlation condition, and the condition syntax allows you to pick a value from a drop-down list, you can often use multiple values from the list.

**Procedure**

1. In the correlation rule editor, build a condition, choosing **is in** or **is not in** as the operator.
2. Click anywhere in the text field or on the **Edit** link.
3. Under **Available**, choose multiple values. You can also click and drag to choose multiple adjacent values.
4. Click the right arrow (>) to move the selected entries to **Selected**.
5. Click **OK**.

Managing Correlation Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays correlation rules and groups created in the current domain, which you can edit. It also displays selected correlation rules and groups from ancestor domains, which you cannot edit. To view and edit correlation rules and groups created in a lower domain, switch to that domain.

**Note**

The system does not display configurations from ancestor domains if the configurations expose information about unrelated domains, including names, managed devices, and so on.

Changes made to rules in active correlation policies take effect immediately.

**Before you begin**

- If you want to delete a rule, delete it from all correlation policies, as described in Managing Correlation Policies, on page 1908.

**Procedure**

1. Choose **Policies > Correlation**, then click **Rule Management**.
2. Manage your rules:
• Create — Click **Create Rule**; see Configuring Correlation Rules, on page 1909.

• Create Group — Click **Create Group**, enter a name for the group, and click **Save**. To add a rule to a group, edit the rule.

• Edit — Click edit (-pencil); see Configuring Correlation Rules, on page 1909. If a view icon (-eye) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

• Delete Rule or Rule Group— Click delete (-trash). Deleting a rule group ungroups the rules. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

## Configuring Correlation Response Groups

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can create a *correlation response group* of alerts and remediations, then activate and assign the group to a correlation rule within an active correlation policy. The system launches all the grouped responses when network traffic matches the correlation rule.

When used in an active correlation policy, changes to an active group or any of its grouped responses take affect immediately.

### Procedure

**Step 1** Choose **Policies > Correlation**, then click **Groups**.

**Step 2** Click **Create Group**.

**Step 3** Enter a **Name**.

**Step 4** Check the **Active** check box if you want to activate the group upon creation. Deactivated groups do not launch responses.

**Step 5** Choose the **Available Responses** to group. then click the right arrow (>) to move them to the **Responses in Group**. To move responses the other way, use the left arrow (<).

**Step 6** Click **Save**.

### What to do next

• If you did not activate the group upon creation and you want to activate it now, click the slider.

Managing Correlation Response Groups

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

You can delete a response group if it is not used in a correlation policy. Deleting a response group ungroups its responses. You can also temporarily deactivate a response group without deleting it. This leaves the group on the system but does not launch it when policies are violated.

In a multidomain deployment, the system displays groups created in the current domain, which you can edit. It also displays groups created in ancestor domains, which you cannot edit. To view and edit groups created in a lower domain, switch to that domain.

Changes made to active, in-use response groups take effect immediately.

Procedure

Step 1
Choose Policies > Correlation, then click Groups.

Step 2
Manage response groups:

- Activate or Deactivate — Click the slider. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Create — Click Create Group; see Configuring Correlation Response Groups, on page 1940.
- Edit — Click edit (edit); see Configuring Correlation Response Groups, on page 1940. If a view icon (view) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Delete — Click delete (delete). If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
Traffic Profiling

The following topics describe how to configure traffic profiles:

- **Introduction to Traffic Profiles**, on page 1943
- **Managing Traffic Profiles**, on page 1947
- **Configuring Traffic Profiles**, on page 1948

**Introduction to Traffic Profiles**

A traffic profile is a graph of network traffic based on connection data collected over a profiling time window (PTW). This measurement presumably represents normal network traffic. After the learning period, you can detect abnormal network traffic by evaluating new traffic against your profile.

The default PTW is one week, but you can change it to be as short as an hour or as long as several weeks. By default, traffic profiles generate statistics on connection events generated by the system over five-minute intervals. However, you can increase this sampling rate to as long as an hour.

**Tip**

Cisco recommends that the PTW include at least 100 data points. Configure your PTW and sampling rate so that your traffic profiles contain enough data to be statistically meaningful.

The following graphic shows a traffic profile with a PTW of one day and a sampling rate of five minutes.
You can also set up inactive periods in traffic profile. Traffic profiles collect data during inactive periods, but do not use that data when calculating profile statistics. Traffic profile graphs plotted over time show inactive periods as a shaded region.

For example, consider a network infrastructure where all the workstations are backed up at midnight every night. The backup takes about 30 minutes and spikes the network traffic. You could configure recurring inactive period for your traffic profile to coincide with the scheduled backups.

![Traffic Profile: Sample Traffic Profile](image)

The system uses end-of-connection data to create connection graphs and traffic profiles. To use traffic profiles, make sure you log end-of-connection events to the Firepower Management Center database.

### Implementing Traffic Profiles

When you activate a traffic profile, the system collects and evaluates connection data for the learning period (PTW) you configured. After the learning period, the system evaluates correlation rules written against the traffic profile.

For example, you could write a rule that triggers if the amount of data traversing your network (measured in packets, KBytes, or number of connections) suddenly spikes to three standard deviations above the mean amount of traffic, which could indicate an attack or other security policy violation. Then, you could include that rule in a correlation policy to alert you of the traffic spike or to perform a remediation in response.

### Targeting Traffic Profiles

**Profile conditions** and **host profile qualifications** constrain traffic profiles.

Using profile conditions, you can profile all network traffic, or you can restrict the traffic profile to monitoring a domain, subnets within or across domains, or individual hosts. In a multidomain deployment:

- Leaf-domain administrators can profile network traffic within their leaf domains.
- Higher-level domain administrators can profile traffic within or across domains.
Profile conditions can also constrain traffic profiles using criteria based on connection data. For example, you could set the profile conditions so that the traffic profile only profiles sessions using a specific port, protocol, or application.

Finally, you can also constrain traffic profiles using information about the tracked hosts. This constraint is called a host profile qualification. For example, you could collect connection data only for hosts with high criticality.

Constraining a traffic profile to a higher-level domain aggregates and profiles the same type of traffic in each of the descendant leaf domains. The system builds a separate network map for each leaf domain. In a multidomain deployment, profiling traffic across domains can have unexpected results.

**Traffic Profile Conditions**

You can create simple traffic profile conditions and host profile qualifications, or you can create more elaborate constructs by combining and nesting conditions.

Conditions have three parts: a category, an operator, and a value:

- The categories you can use depend on whether you are building traffic profile conditions or a host profile qualification.
- The operators you can use depend on the category you choose.
- The syntax you can use to specify a condition’s value depends on the category and operator. Sometimes you must enter the value in a text field. Other times, you can pick one or more values from a drop-down list.

For a host profile qualification, you must also specify whether you are constraining the traffic profile using information data about the initiating or responding hosts.

When your construct includes more than one condition, you must link them with an AND or an OR operator. Conditions on the same level are evaluated together:

- The AND operator requires that all conditions on the level it controls must be met.
- The OR operator requires that at least one of the conditions on the level it controls must be met.

**Unconstrained Traffic Profile**

If you want to create a traffic profile that collects data for your entire monitored network segment, you can create a very simple profile with no conditions, as shown in the following graphic.
Simple Traffic Profile

If you wanted to constrain the profile and collect data only for a subnet, you can add a single condition, as shown in the following graphic.

Complex Traffic Profile

The following traffic profile contains two conditions linked by **AND**. This means that the traffic profile collects connection data only if both conditions are true. In this example, it collects HTTP connections for all hosts with IP addresses in a specific subnet.

In contrast, the following traffic profile, which collects connection data for HTTP activity in either of two subnets, has three conditions, with the last constituting a complex condition.

Logically, the above traffic profile is evaluated as follows:
(A and (B or C))

<table>
<thead>
<tr>
<th>Where...</th>
<th>Is the condition that states...</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Application Protocol Name is HTTP</td>
</tr>
<tr>
<td>B</td>
<td>IP Address is in 10.4.0.0/16</td>
</tr>
<tr>
<td>C</td>
<td>IP Address is in 192.168.0.0/16</td>
</tr>
</tbody>
</table>

## Managing Traffic Profiles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

Only rules written against active, complete traffic profiles can trigger a correlation policy violation. A slider next to each traffic profile indicates whether the profile is active and collecting data. A progress bar shows the status of the traffic profile’s learning period.

In a multidomain deployment, the system displays traffic profiles created in the current domain, which you can edit. It also displays selected traffic profiles from ancestor domains, which you cannot edit. To view and edit traffic profiles created in a lower domain, switch to that domain.

---

**Note**

The system does not display traffic profiles from ancestor domains if the profiles' conditions expose information about unrelated domains, including names, managed devices, and so on.

### Procedure

**Step 1**
Choose **Policies > Correlation**, then click **Traffic Profiles**.

**Step 2**
Manage your traffic profiles:

- **Activate/Deactivate** — To activate or deactivate a traffic profile, click the slider. Deactivating a traffic profile deletes its associated data. If you reactivate the profile, you must wait the length of its PTW before rules written against it will trigger.

- **Create** — To create a new traffic profile, click **New Profile** and proceed as described in **Configuring Traffic Profiles**, on page 1948. You can also click copy (📋) to edit a copy of an existing traffic profile.

- **Delete** — To delete a traffic profile, click delete (🗑️), then confirm your choice.

- **Edit** — To modify an existing traffic profile, click edit (✍️) and proceed as described in **Configuring Traffic Profiles**, on page 1948. If a traffic profile is active you can only change its name and description.
• Graph — To view the traffic profile as a graph, click graph ( ) In a multidomain deployment, you cannot view the graph for a traffic profile that belongs to an ancestor domain if the graph exposes information about unrelated domains.

## Configuring Traffic Profiles

<table>
<thead>
<tr>
<th>Smart License</th>

<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Constraining a traffic profile to a higher-level domain aggregates and profiles the same type of traffic in each of the descendant leaf domains. The system builds a separate network map for each leaf domain. In a multidomain deployment, profiling traffic across domains can have unexpected results.

### Procedure

**Step 1** Choose Policies > Correlation, then click Traffic Profiles.

**Step 2** Click New Profile.

**Step 3** Enter a Profile Name, and optionally, a Profile Description.

**Step 4** Optionally, constrain the traffic profile:

- Copy Settings — To copy settings from an existing traffic profile, click Copy Settings, choose the traffic profile you want to use, and click Load.
- Profile Conditions — To constrain the traffic profile using information from tracked connections, proceed as described in Adding Traffic Profile Conditions, on page 1949.
- Host Profile Qualification — To constrain the traffic profile using information from tracked hosts, proceed as described in Adding Host Profile Qualifications to a Traffic Profile, on page 1949.
- Profiling Time Window (PTW) — To change the Profiling Time Window, enter a time unit, then choose hour(s), day(s), or week(s).
- Sampling Rate — Choose a Sampling Rate, in minutes.
- Inactive Period — Click Add Inactive Period and use the drop-down lists to specify when and how often you want the traffic profile remain inactive. Inactive traffic profiles do not trigger correlation rules. Traffic profiles do not include data from inactive periods in profile statistics.

**Step 5** Save the traffic profile:

- To save the profile and start collecting data immediately, click Save & Activate.
- To save the profile without activating it, click Save.
Adding Traffic Profile Conditions

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

Procedure

**Step 1**
In the traffic profile editor, under Profile Conditions, click **Add condition** or **Add complex condition** for each condition you want to add. Conditions on the same level are evaluated together.

- To require that all conditions on the level that the operator controls are met, choose **AND**.
- To require that only one of the conditions on the level that the operator controls is met, choose **OR**.

**Step 2**
Specify a category, operator, and value for each condition as described in Syntax for Traffic Profile Conditions, on page 1950 and Traffic Profile Conditions, on page 1945.

If you choose **is in** or **is not in** as the operator, you can select multiple values in a single condition as described in Using Multiple Values in a Traffic Profile Condition, on page 1954.

When the category represents an IP address, choosing **is in** or **is not in** as the operator allows you to specify whether the IP address **is in** or **is not in** a range of IP addresses.

**Example**
The following traffic profile collects information on a specific subnet. The category of the condition is **Initiator/Responder IP**, the operator is **is in**, and the value is **10.4.0.0/16**.

- Firepower System IP Address Conventions, on page 15

Adding Host Profile Qualifications to a Traffic Profile

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>
Procedure

**Step 1**
In the traffic profile editor, click **Add Host Profile Qualification**.

**Step 2**
Under Host Profile Qualification, click **Add condition** or **Add complex condition** for each condition you want to add. Conditions on the same level are evaluated together.

- To require that all conditions on the level that the operator controls are met, choose **AND**.
- To require that only one of the conditions on the level that the operator controls is met, choose **OR**.

**Step 3**
Specify a host type, category, operator, and value for each condition as described in **Syntax for Host Profile Qualifications in a Traffic Profile**, on page 1951 and **Traffic Profile Conditions**, on page 1945.

If you choose **is in** or **is not in** as the operator, you can select multiple values in a single condition as described in **Using Multiple Values in a Traffic Profile Condition**, on page 1954.

Example

The following host profile qualification constrains a traffic profile such that it collects connection data only if the responding host in the detected connection is running a version of Microsoft Windows.

![Host Profile Qualification](image)

**Syntax for Traffic Profile Conditions**

The following table describes how to build a traffic profile condition. Keep in mind the connection data available to build a traffic profile depends on several factors, including traffic characteristics and detection method.

<table>
<thead>
<tr>
<th>If you choose...</th>
<th>Choose an operator, then...</th>
</tr>
</thead>
<tbody>

## Syntax for Host Profile Qualifications in a Traffic Profile

When you build a host profile qualification condition, you must first choose the host you want to use to constrain your traffic profile. You can choose either **Responder Host** or **Initiator Host**. After you choose the host role, continue building your host profile qualification condition.

Although you can add hosts to the network map using NetFlow records, the available information about these hosts is limited. For example, there is no operating system data available for these hosts, unless you provide it using the host input feature. In addition, if your traffic profile uses connection data from exported NetFlow records, keep in mind that NetFlow records do not contain information about which host in the connection is
the initiator and which is the responder. When the system processes NetFlow records, it uses an algorithm to determine this information based on the ports each host is using, and whether those ports are well-known.

To match against implied or generic clients, create a host profile qualification based on the application protocol used by the server responding to the client. When the client list on a host that acts as the initiator or source of a connection includes an application protocol name followed by `client`, that client may actually be an implied client. In other words, the system reports that client based on server response traffic that uses the application protocol for that client, not on detected client traffic.

For example, if the system reports `HTTPS client` as a client on a host, create a host profile qualification for `Responder Host` where `Application Protocol` is set to `HTTPS`, because HTTPS client is reported as a generic client based on the HTTPS server response traffic sent by the responder or destination host.

<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you are building a condition, and the condition syntax allows you to pick a value from a drop-down list, you can often use multiple values from the list.

For example, if you want to add a host profile qualification to a traffic profile that requires that a host be running some flavor of UNIX, instead of constructing multiple conditions linked with the OR operator, use the following procedure.

Procedure

Step 1: While building a traffic profile or host profile qualification condition, choose **is in** or **is not in** as the operator. The drop-down list changes to a text field.

Step 2: Click anywhere in the text field or on the **Edit** link.

Step 3: Under **Available**, choose multiple values.

Step 4: Click the right arrow to move the selected entries to **Selected**.

Step 5: Click **OK**.
CHAPTER 98

Remediations

The following topics contain information on configuring remediations:

- Introduction to Remediations, on page 1955
- Managing Remediation Modules, on page 1966
- Managing Remediation Instances, on page 1967
- Managing Instances for a Single Remediation Module, on page 1967

Introduction to Remediations

A remediation is a program that the Firepower System launches in response to a correlation policy violation. When a remediation runs, the system generates a remediation status event. Remediation status events include details such as the remediation name, the correlation policy and rule that triggered it, and the exit status message.

The system supports several remediation modules:

- Cisco ISE Endpoint Protection Services (EPS) — quarantines, unquarantines, or shuts down traffic sent to a host or network involved in a correlation policy violation
- Cisco IOS Null Route — blocks traffic sent to a host or network involved in a correlation policy violation (requires Cisco IOS Version 12.0 or higher)
- Nmap Scanning — scans hosts to determine running operating systems and servers
- Set Attribute Value — sets a host attribute on a host involved in a correlation policy violation

You can install custom modules that perform other tasks; see the Firepower System Remediation API Guide.

Implementing Remediations

To implement a remediation, first create at least one instance for the module you choose. You can create multiple instances per module, where each instance is configured differently. For example, to communicate with multiple routers using the Cisco IOS Null Route remediation module, configure multiples instances of that module.
You can then add multiple remediations to each instance that describe the actions you want to perform when a policy is violated.

Finally, associate remediations with rules in correlation policies, so that the system launches the remediations in response to correlation policy violations.

**Remediations and Multitenancy**

In a multidomain deployment, you can install custom remediation modules at any domain level. The system-provided modules belong to the Global domain.

Though you cannot add a remediation to an instance created in an ancestor domain, you can create a similarly configured instance in the current domain and add remediations to that instance. You can also use remediations created in ancestor domains as correlation responses.

**Related Topics**

- Firepower Management Center Alert Responses, on page 2001
- Nmap Scanning, on page 1771
- Adding Responses to Rules and White Lists, on page 1907

**Cisco ISE EPS Remediations**

If you have Endpoint Protection Service (EPS) enabled and configured in your ISE deployment, you can configure your Firepower Management Center to launch remediations using ISE. When fully configured, ISE EPS remediations run the following Mitigation Actions on the source or destination host involved in a correlation policy violation:

- **quarantine**—Limits or denies an endpoint's access the network
- **unquarantine**—Reverses an endpoint's quarantine status and allows full access to the network
- **shutdown**—Deactivates an endpoint's network attached system (NAS) port to disconnect it from the network

You can also **Whitelist** networks so that the system does not perform ISE EPS remediations on those addresses.

**Note**

Your ISE version and configuration impact how you can use ISE in the Firepower System. For more information, see The ISE Identity Source, on page 1819 for more information.

For more information about ISE EPS actions, see the Cisco Identity Services Engine User Guide.

**Configuring ISE EPS Remediations**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin Discovery Admin</td>
</tr>
</tbody>
</table>

You can respond to correlation policy violations by running ISE EPS remediations on the source or destination host.
Before you begin

- Configure EPS operations on your ISE server.
- Configure a connection to ISE as described in Configure ISE for User Control, on page 1821.

Procedure

Step 1
Choose Policies > Actions > Instances.

Step 2
Add a pxGrid mitigation instance as described in Adding an ISE EPS Instance, on page 1957.

Step 3
Add one or more ISE EPS remediations as described in Adding ISE EPS Remediations, on page 1958.

What to do next

- Assign remediations as responses to correlation policy violations as described in Adding Responses to Rules and White Lists, on page 1907.

Adding an ISE EPS Instance

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Discovery Admin</td>
</tr>
</tbody>
</table>

Create ISE EPS instances to group individual remediations by logging type.

Procedure

Step 1
Choose Policies > Actions > Instances.

Step 2
From the Add a New Instance list, choose pxGrid Mitigation(v1.0) as the module type and click Add.

Step 3
Enter an Instance Name and Description.

Step 4
Set Enable Logging option to enable or disable system logging.

Step 5
Click Create.

What to do next

- Create an ISE EPS remediation as described in Adding Set Attribute Value Remediations, on page 1965.

Related Topics

  - Firepower System IP Address Conventions, on page 15
Adding ISE EPS Remediations

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>

</tr>
</tbody>
</table>

Create one or more ISE EPS remediations within an instance to run Mitigation Actions on the source or destination host involved in a correlation policy violation.

In a multidomain deployment, you cannot add a remediation to an instance created in an ancestor domain.

**Before you begin**

- Create an ISE EPS instance as described in Adding an ISE EPS Instance, on page 1957.

**Procedure**

1. Step 1: Choose Policies > Actions > Instances.
2. Step 2: Next to the instance where you want to add the remediation, click view ( ).
3. Step 3: In the Configured Remediations section, choose the Mitigate Destination or Mitigate Source and click Add.
   
   If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

4. Step 4: Enter a Remediation Name and Description.
5. Step 5: Choose a Mitigation Action: quarantine, unquarantine, or shutdown.
6. Step 6: (Optional) Enter the IP addresses or ranges you want to Whitelist and exempt from the remediation.
7. Step 7: Click Create, then click Done.

**What to do next**

- Assign remediations as responses to correlation policy violations; see Adding Responses to Rules and White Lists, on page 1907.

**Cisco IOS Null Route Remediations**

The Cisco IOS Null Route remediation module allows you to block an IP address or range of addresses using Cisco’s “null route” command. This drops all traffic sent to a host or network by routing it to the router’s NULL interface. This does not block traffic sent from the violating host or network.

**Note**

Do not use a destination-based remediation as a response to a correlation rule that is based on a discovery or host input event. These events are associated with source hosts.
When a Cisco IOS remediation is activated, there is no timeout period. To unblock the IP address or network, you must manually clear the routing change from the router.

### Caution

When a Cisco IOS remediation is activated, there is no timeout period. To unblock the IP address or network, you must manually clear the routing change from the router.

### Configuring Remediations for Cisco IOS Routers

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Discovery Admin</td>
</tr>
</tbody>
</table>

### Note

Do not use a destination-based remediation as a response to a correlation rule that is based on a discovery or host input event. These events are associated with source hosts.

### Caution

When a Cisco IOS remediation is activated, there is no timeout period. To unblock the IP address or network, you must manually clear the routing change from the router.

### Before you begin

- Confirm that your Cisco router is running Cisco IOS 12.0 or higher.
- Confirm that you have level 15 administrative access to the router.

### Procedure

#### Step 1
Enable Telnet on the Cisco router as described in the documentation provided with your Cisco router or IOS software.

#### Step 2
On the Firepower Management Center, add a Cisco IOS Null Route instance for each Cisco IOS router you plan to use; see Adding a Cisco IOS Instance, on page 1960.

#### Step 3
Create remediations for each instance, based on the type of response you want to elicit on the router when correlation policies are violated:

- Adding Cisco IOS Block Destination Remediations, on page 1961
- Adding Cisco IOS Block Destination Network Remediations, on page 1961
- Adding Cisco IOS Block Source Remediations, on page 1962
- Adding Cisco IOS Block Source Network Remediations, on page 1963
What to do next

- Assign remediations as responses to correlation policy violations; see Adding Responses to Rules and White Lists, on page 1907.

Adding a Cisco IOS Instance

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin Discovery Admin</td>
</tr>
</tbody>
</table>

If you have multiple routers where you want to send remediations, create a separate instance for each router.

Before you begin

- Configure Telnet access on the Cisco IOS router as described in the documentation provided with the router or IOS software.

Procedure

**Step 1** Choose Policies > Actions > Instances.

**Step 2** From the Add a New Instance list, choose Cisco IOS Null Route and click Add.

**Step 3** Enter an Instance Name and Description.

**Step 4** In the Router IP field, enter the IP address of the Cisco IOS router you want to use for the remediation.

**Step 5** In the Username field, enter the Telnet user name for the router. This user must have level 15 administrative access on the router.

**Step 6** In the Connection Password fields, enter the Telnet user’s user password.

**Step 7** In the Enable Password fields, enter the Telnet user’s enable password. This is the password used to enter privileged mode on the router.

**Step 8** In the White List field, enter IP addresses or ranges that you want to exempt from the remediation, one per line.

**Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

**Step 9** Click Create.

What to do next

- Add specific remediations to be used by correlation policies as described in Adding Cisco IOS Block Destination Remediations, on page 1961, Adding Cisco IOS Block Destination Network Remediations, on page 1961, Adding Cisco IOS Block Source Remediations, on page 1962, and Adding Cisco IOS Block Source Network Remediations, on page 1963.

Adding Cisco IOS Block Destination Remediations

Adding Cisco IOS Block Destination Remediations

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin Discovery Admin</td>
</tr>
</tbody>
</table>

The Cisco IOS Block Destination remediation blocks traffic sent from the router to the destination host involved in a correlation policy violation. Do not use this remediation as a response to a correlation rule that is based on a discovery or host input event. These events are associated with source hosts.

In a multidomain deployment, you cannot add a remediation to an instance created in an ancestor domain.

Before you begin

• Add a Cisco IOS instance as described in Adding a Cisco IOS Instance, on page 1960.

Procedure

Step 1 Choose Policies > Actions > Instances.

Step 2 Next to the instance where you want to add the remediation, click view ( ).

Step 3 In the Configured Remediations section, choose Block Destination and click Add.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 4 Enter a Remediation Name and Description.

Step 5 Click Create, then click Done.

What to do next

• Assign remediations as responses to correlation policy violations; see Adding Responses to Rules and White Lists, on page 1907.

Adding Cisco IOS Block Destination Network Remediations

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin Discovery Admin</td>
</tr>
</tbody>
</table>

The Cisco IOS Block Destination Network remediation blocks traffic sent from the router to the network of the destination host involved in a correlation policy violation. Do not use this remediation as a response to a correlation rule that is based on a discovery or host input event. These events are associated with source hosts.

In a multidomain deployment, you cannot add a remediation to an instance created in an ancestor domain.

Before you begin

• Add a Cisco IOS instance as described in Adding a Cisco IOS Instance, on page 1960.
Procedure

**Step 1**  
Choose Policies > Actions > Instances.

**Step 2**  
Next to the instance where you want to add the remediation, click view ( ).

**Step 3**  
In the Configured Remediations section, choose Block Destination Network and click Add.  
If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4**  
Enter a Remediation Name and Description.

**Step 5**  
In the Netmask field, enter the subnet mask or use CIDR notation to describe the network that you want to block traffic to.

For example, to block traffic to an entire Class C network when a single host triggered a rule (this is not recommended), use 255.255.255.0 or 24 as the netmask.

As another example, to block traffic to 30 addresses that include the triggering IP address, specify 255.255.255.224 or 27 as the netmask. In this case, if the IP address 10.1.1.15 triggers the remediation, all IP addresses between 10.1.1.1 and 10.1.1.30 are blocked. To block only the triggering IP address, leave the field blank, enter 32, or enter 255.255.255.255.

**Step 6**  
Click Create, then click Done.

What to do next

- Assign remediations as responses to correlation policy violations; see Adding Responses to Rules and White Lists, on page 1907.

**What to do next**

- Assign remediations as responses to correlation policy violations; see Adding Responses to Rules and White Lists, on page 1907.

**Related Topics**

- Firepower System IP Address Conventions, on page 15

---

## Nmap Scan Remediations

The Firepower System integrates with Nmap™, an open source active scanner for network exploration and security auditing. You can respond to a correlation policy violation using an Nmap remediation, which triggers an Nmap scan remediation.

For more information about Nmap scanning, see Nmap Scanning, on page 1771.

---

## Set Attribute Value Remediations

You can respond to a correlation policy violation by setting a host attribute value on the host where the triggering event occurred. For text host attributes, you can use the description from the event as the attribute value.

---

### Configuring Set Attribute Remediations

| Access Supported Domains Supported Devices Supported Devices Classic License Smart License |  |
|---|---|---|---|---|---|
| Admin | Any | Any | Any | Access | Discovery Admin |

#### Procedure

**Step 1** Choose Policies > Actions > Instances.

**Step 2** Create a set attribute instance as described in Adding a Set Attribute Value Instance, on page 1965.

**Step 3** Add a set attribute remediation as described in Adding Set Attribute Value Remediations, on page 1965.

---

**What to do next**

- Assign remediations as responses to correlation policy violations; see Adding Responses to Rules and White Lists, on page 1907.

</tbody>
</table>

The Set Attribute Value remediation sets a host attribute on a host involved in a correlation policy violation. Create a remediation for each attribute value you want set. For text attributes, you can use the description from the triggering event as the attribute value.

In a multidomain deployment, you cannot add a remediation to an instance created in an ancestor domain.

Before you begin

- Create a set attribute instance as described in Adding a Set Attribute Value Instance, on page 1965.

Procedure

**Step 1** Choose **Policies** > **Actions** > **Instances**.

**Step 2** Next to the instance where you want to add the remediation, click view ( ).

**Step 3** In the **Configured Remediations** section, choose **Set Attribute Value** and click **Add**.
If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4** Enter a Remediation Name and Description.

**Step 5** To use this remediation in response to an event with source and destination data, choose an Update Which Host(s) From Event option.

**Step 6** For text attributes, specify whether you want to Use Description From Event For Attribute Value:

- To use the description from the event as the attribute value, click On and enter the Attribute Value you want to set.
- To use the Attribute Value setting for the remediation as the attribute value, click Off.

**Step 7** Click Create, then click Done.

---

**What to do next**

- Assign remediations as responses to correlation policy violations; see Adding Responses to Rules and White Lists, on page 1907.

---

## Managing Remediation Modules

<table>
<thead>

<td>Any</td>
<td>Admin Discovery Admin</td>
</tr>
</tbody>
</table>

The Module Detail page displays all of the instances and remediations configured for a particular remediation module.
In a multidomain deployment, you can access the Module Detail page for remediation modules installed in the current domain and in ancestor domains. However, you cannot use the Module Detail page to add, delete, or edit instances in the current domain for a module installed in an ancestor domain. Instead, use the Instances page (Policies > Actions > Instances); see Managing Remediation Instances, on page 1967.

Procedure

**Step 1** Choose Policies > Actions > Modules.

**Step 2** Next to the remediation module whose instances you want to manage, click view (اظن).  

**Step 3** Manage your remediation instances:

- Add — To add an instance, click Add. For system-provided modules, see:
  - Adding an ISE EPS Instance, on page 1957
  - Adding a Cisco IOS Instance, on page 1960
  - Adding an Nmap Scan Instance, on page 1783
  - Adding a Set Attribute Value Instance, on page 1965

  For help adding an instance for a custom module, see the documentation for that module, if available.

- Configure — To configure instance details and add remediations to the instance, click view (اظن).

- Delete — To delete an instance that is not in use, click delete (اظن).
PART XXII

Reporting and Alerting

• Working with Reports, on page 1971
• External Alerting with Alert Responses, on page 2001
• External Alerting for Intrusion Events, on page 2009
CHAPTER 99

Working with Reports

The following topics describe how to work with reports in the Firepower System:

- Introduction to Reports, on page 1971
- Risk Reports, on page 1971
- Standard Reports, on page 1972
- About Working with Generated Reports, on page 1996

Introduction to Reports

The Firepower System offers two types of reports:

- Risk Reports, on page 1971 — High-level summaries of risks found on your network.
- Standard Reports, on page 1972 — Detailed, customizable reports about all aspects of your Firepower System.

Risk Reports

Risk reports are portable, high-level, easy-to-interpret summaries of risks found in your organization. You can use these reports to share information about areas of risk, and recommendations for addressing these risks, with people who do not have access to your system and who may not be network security experts. These reports are intended to facilitate discussion about areas for investment in the security of your network.

Generating, Viewing, and Printing Risk Reports

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst/Maintenance User</td>
</tr>
</tbody>
</table>

Templates for standard reports do not apply to risk reports.

Reports pertain to the current domain.

Each risk report generates as an HTML file.
To schedule risk report generation, see Automating Report Generation, on page 190.

**Before you begin**

- Make sure your system is configured to detect the risks that you want to summarize.
- If you want to email the report and you have not yet configured a Relay Host, you can do so now. For information, see Configuring a Mail Relay Host and Notification Address, on page 830.

**Procedure**

1. Choose **Overview > Reporting**.
2. Click **Report Templates**.
3. Click **Generate Report** for the desired report.
4. Enter information.
   - Information that you enter in the Input Parameters section will appear on the title page of the report. You can leave these fields blank.
5. Click **Generate**.
6. Click **OK**.

**What to do next**

- To view, download, move, or delete a risk report, see About Working with Generated Reports, on page 1996.
- You can print to PDF any risk report from most supported browsers. For best results, enable background colors, images, and optionally headers and footers, in the print or print preview settings of your browser. Supported page sizes are A4 and US letter.

**Standard Reports**

The Firepower System provides a flexible reporting system that allows you to quickly and easily generate multi-section reports with the event views or dashboards that appear on your Firepower Management Center. You can also design your own custom reports from scratch.

A report is a document file formatted in PDF, HTML, or CSV with the content you want to communicate. A report template specifies the data searches and formats for the report and its sections. The Firepower System includes a powerful report designer that automates the design of report templates. You can replicate the content of any event view table or dashboard graphic displayed in the web interface.

You can build as many report templates as you need. Each report template defines the individual sections in the report and specifies the database search that creates the report’s content, as well as the presentation format (table, chart, detail view, and so on) and the time frame. Your template also specifies document attributes, such as the cover page and table of contents and whether the document pages have headers and footers (available only for reports in PDF format). You can export a report template in a single configuration package file and import it for reuse on another Firepower Management Center.
You can include input parameters in a template to expand its usefulness. Input parameters allow you to produce tailored variations of the same report. When you generate a report with input parameters, the generation process prompts you to enter a value for each input parameter. The values you type constrain the report contents on a one-time basis. For example, you can place an input parameter in the destination IP field of the search that produces an intrusion event report; at report generation time, you can specify a department’s network segment when prompted for the destination IP address. The generated report then contains only information concerning that particular department.

About Designing Reports

Report Templates

You use report templates to define the content and format of the data in each of the report’s sections, as well as the document attributes of the report file (cover page, table of contents, and page headers and footers). After you generate a report, the template stays available for reuse until you delete it.

Your reports contain one or more information sections. You choose the format (text, table, or chart) for each section individually. The format you select for a section may constrain the data that can be included. For example, you cannot show time-based information in certain tables using a pie chart format. You can change the data criteria or format of a section at any time to obtain optimum presentation.

You can base a report’s initial design on a predefined event view, or you can start your design by importing content from any defined dashboard, workflow, or summary. You can also start with an empty template, adding sections and defining their attributes one by one.

Note

In a multidomain deployment, you can view but not edit report templates belonging to ancestor domains. To generate reports from these templates, you must copy them to your current domain.

Report Template Fields

The following table describes the fields you can use to build a section in your report template. Not all fields are used in all types of sections; after you choose the section format, the system displays the appropriate fields.
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Section Types</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>n/a</td>
<td>Choose the format of the section data:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Bar chart: Compares quantities of the selected variables.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Line chart: Shows trends/changes over time of a selected variable. Available only for time-based tables.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Pie chart: Shows each selected variable as a percentage of the whole. Variables with quantities of zero are dropped from the chart. Very small quantities are clustered into a category labeled Other.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Table view: Shows values of attributes for each record. Not available for summary or statistical data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Detail view: Shows complex object data associated with certain events, such as packets (for intrusion events) and host profiles (for host events). This format is available only for certain event types that involve such objects. Output may degrade performance if large numbers are requested.</td>
</tr>
<tr>
<td>Table</td>
<td>All</td>
<td>Choose the table from which the section data is extracted.</td>
</tr>
<tr>
<td>Preset</td>
<td>All</td>
<td>Predefined searches. Select an appropriate preset to initialize the search criteria when you define a new search.</td>
</tr>
<tr>
<td>Search or Filter</td>
<td>All</td>
<td>For most tables, you can constrain a report using a predefined or saved Search. You can also create a new search by clicking the edit icon (📝). For the Application Statistics table, you use a user-defined application Filter to constrain a report.</td>
</tr>
<tr>
<td>X-Axis</td>
<td>Bar chart</td>
<td>Available data for the X-axis of the selected chart.</td>
</tr>
<tr>
<td></td>
<td>Line chart</td>
<td>For line charts, the X-axis value is always Time. For bar and pie charts, you cannot select Time as the X-axis value.</td>
</tr>
<tr>
<td></td>
<td>Pie chart</td>
<td></td>
</tr>
<tr>
<td>Y-Axis</td>
<td>Bar chart</td>
<td>Available data for the Y-axis of the selected chart.</td>
</tr>
<tr>
<td></td>
<td>Line chart</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Pie chart</td>
<td></td>
</tr>
<tr>
<td>Section Description</td>
<td>All</td>
<td>Descriptive text that precedes the search data in the section. Enter a combination of text and input parameters. The default for a new section is $&lt;Time Window&gt;$ and $&lt;Constraints&gt;$.</td>
</tr>
<tr>
<td>Time Window</td>
<td>All</td>
<td>The time window for the data that appears in the section. If the section searches time-based tables, you can select the check box to inherit the report’s global time window. Alternatively, you can set a specific time window for the section.</td>
</tr>
<tr>
<td>Maximum Results</td>
<td>Table view</td>
<td>The maximum number of matching records to include.</td>
</tr>
<tr>
<td></td>
<td>Detail view</td>
<td></td>
</tr>
</tbody>
</table>
### Report Template Creation

A report template is a framework of sections, each independently built from its own database query.

You can build a new report template by creating a new template, using an existing template, basing a template off an event view, or importing a dashboard or workflow.

If you do not want to copy an existing report template, you can create an entirely new template. The first step in creating a template is to generate the framework that allows you to add and format the sections. Then, in the order you prefer, you design the individual template sections and set attributes for the report document.

Each template section consists of a dataset generated by a search or filter, and has a format specification (table, pie chart, and so on) that determines the mode of presentation. You further determine section content by selecting the fields in the data records you want to include in the output, as well as the time frame and number of records to show.

Use the section preview utility to check the column selection and output characteristics such as pie chart colors. It is not a reliable indicator of the correctness of your configured search.

The report you generate from the template has several document attributes that span all sections and control features, such as the cover page, headers and footers, page numbering, and so on.

Note that if you selected CSV as your document format, you have no document attributes to set.

If you identify a good model among your existing templates, you can copy the template and edit its attributes to create a new report template. Cisco also provides a set of predefined report templates, visible on the **Reports Tab** in the list of templates.

From an event view, you can create a report template and modify it to meet your needs. You can add additional sections, modify automatically included sections, and delete sections.

You can quickly create a new report by importing dashboards, workflows, and statistics summaries. The import creates a section for each widget graphic in your dashboard and each event view in your workflow. You can delete any unnecessary sections to focus on the most important information.

### Creating a Custom Report Template

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
Creating a Report Template from an Existing Template

Procedure

Step 1 Choose Overview > Reporting.
Step 2 Click Report Templates.
Step 3 Click Create Report Template.
Step 4 Enter a name for your new template in the Report Title field.
Step 5 To add an input parameter to the report title, place your cursor in the title where the parameter value should appear, then click insert input parameter ( ).
Step 6 Use the set of add under the Report Sections title bar to insert sections as necessary.
Step 7 Configure section content as described in Report Template Configuration, on page 1979.
Tip You can click Preview at the bottom of the section window to view the column layout or graphic format you chose.
Step 8 Click Advanced to set attributes for PDF and HTML reports as described in Document Attributes in a Report Template, on page 1988.
Step 9 Click Save.

If you see an error, look for a yellow triangle beside the results value in each section. If you see any such triangles, do one of the following:

• For each field that displays a yellow triangle, mouse over the triangle and reduce the number of results to the number indicated.
• Click Generate and include an output format other than PDF.

Creating a Report Template from an Existing Template

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1 Choose Overview > Reporting.
Step 2 Click Report Templates.
Step 3 Click copy ( ) next to the report template you want to copy.
Step 4 In the Report Title field, enter a name.
Step 5 Make changes to the template as needed.
Step 6 Click Save.
Creating a Report Template from an Event View

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Populate an event view with the events you want in the report:
- Use an event search to define the events you want to view.
- Drill down through a workflow until you have the appropriate events in your event view.

**Step 2** From the event view page, click **Report Designer**.
The Report Sections page displays a section for each view in the captured workflow.

**Step 3** Optionally, enter a new name in the **Report Title** field and click **Save**.

**Step 4** You can:
- Add a cover page, table of contents, starting page number, or header and footer text — Click **Advanced** settings.
- Add page breaks — Click add page break ( ), and drag the new page break object from the template bottom to the front of the section that should start the new page.
- Add text sections — Click add text section ( ), and drag the new text section from the template bottom to the place where you want it to appear in the report template.
- Change the title of a section — Click the section title in the title bar, enter the section title, and click **OK**.
- Configure the report sections — Adjust the field settings in each section.

**Tip** To view the current column layout or chart formatting for a section, click the section’s **Preview** link.

- Exclude template sections from the report — Click delete ( ) in the section’s title bar, and confirm the deletion.

**Note** The last report section in some workflows contains detail views that show packets, host profiles, or vulnerabilities, depending on the workflow. Retrieving large numbers of events with these detail views when generating your report may affect performance of the Firepower Management Center.

**Step 5** Click **Save**.
Procedure

Step 1  Identify the dashboard, workflow, or summary you want to replicate in your report.
Step 2  Choose Overview > Reporting.
Step 3  Click Report Templates.
Step 4  Click Create Report Template.
Step 5  Enter a name for your new report template in the Report Title field.
Step 6  Click Save.
Step 7  Click import sections ( ). You can choose any of the data sources described in Data Source Options on Import Report Sections, on page 1978.
Step 8  Choose a dashboard, workflow, or summary from the drop-down menus.
Step 9  For the data sources you want to add, click Import.
        For dashboards, each widget graphic will have its own section; for workflows, each event view will have its own section.
Step 10 Make changes to the content of your sections as needed.
        Note The last report section in some workflows contains detail views that show packets, host profiles, or vulnerabilities, depending on the workflow. Retrieving large numbers of events with these detail views when generating your report may affect performance of the Firepower Management Center.
Step 11 Click Save.

Data Source Options on Import Report Sections

Table 245: Data Source Options on Import Report Sections Window

<table>
<thead>
<tr>
<th>Select this option...</th>

</tr>
<tr>
<td></td>
<td>• Discovery Short Summary</td>
</tr>
</tbody>
</table>
Report Template Configuration

You can modify and customize a report template once you create it. You can modify a variety of report section attributes to adjust the content of the section and its data presentation.

Each section in a report template queries a database table to generate content for that section. Changing the section’s data format uses the same data query, but modifies the fields that appear in the section according to the analytical purpose of the format type. For example, the table view of intrusion events populates the section with a large number of data fields per event record, while a pie chart section shows the portion of all matching records that each selected attribute represents, with no details about individual events. Bar chart sections compare the total counts of matching records that have specific attributes. Line charts summarize changes in the matching records over time with respect to a single attribute. Line charts are available only for data that is time-based, not for information about hosts, users, third-party vulnerabilities, and so on.

The search or filter in a report section specifies the database query on which the section content is based. For most tables, you can constrain a report using a predefined or saved search, or you can create a new search on the fly:

- Predefined searches serve as examples for searching certain event tables and can provide quick access to important information about your network that you may want to include in reports.

- Saved event searches include all public event searches that you or others have created, plus all your saved private event searches.

- Saved searches for the current report template are accessible only in the report template itself. The search names of saved report template searches end with the string “Custom Search.” Users create these searches while designing reports.

For the Application Statistics table, you use a user-defined application filter to constrain a report.

If you include table data in a section, you can choose which fields in the data record to show. All fields in the table are available for inclusion or exclusion. You select fields that accomplish the purpose of the report, then order and sort them accordingly.

You can add text sections to your templates to provide custom text, such as an introduction, for the whole report or for individual sections.

You can add page breaks before or after any section in the template. This feature is particularly helpful for multi-section reports with text pages that introduce the various sections.

A report template’s time window defines the template’s reporting period.

---

**Note**

Security Analysts can edit only report templates they created. In multidomain deployments, you cannot edit report templates from ancestor domains, but you can copy them to create descendant versions.

---

### Setting the Table and Data Format for a Report Template Section

<table>
<thead>
<tr>
<th></th>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
Procedure

Step 1 In the report template section, use the Table drop-down menu to choose the table to query. The Format field represents each of the output formats available for the table you chose.

Step 2 Choose the applicable output format for the section.

Step 3 To change the search constraints, click edit ( ) next to the Section description field or Filter field.

Step 4 For graphic output formats (pie chart, bar chart, and so on), adjust the X-Axis and Y-Axis parameters using the drop-down menus. When you choose a value for the X-axis, only compatible values appear in the Y-axis drop-down menu, and vice versa.

Step 5 For table output, choose the columns, order of appearance, and sort order in your output.

Step 6 Click Save.

Specifying the Search or Filter for a Report Template Section

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1 In the report template section, choose the database table to query from the Table drop-down menu:
- For most tables, the Search drop-down list appears.
- For the Application Statistics table, the Filter drop-down list appears.

Step 2 Choose the search or filter you want to use to constrain the report.

You can view the search criteria or create a new search by clicking edit ( ).

Setting the Search Fields that Appear in Table Format Sections

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
**Procedure**

**Step 1**
For table format report sections, click edit (✏️) next to the **Fields** parameter.

**Step 2**
If you want to modify the section, you must add and delete fields, and drag field into the column order you want.

**Step 3**
If you want to change the sort order of any column, you must use the drop-down lists on each field to set the sort order and priority.

**Step 4**
Click **OK**.

---

**Adding a Text Section to a Report Template**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Text sections can have rich text with multiple font sizes and styles (bold, italic, and so on) as well as input parameters and imported images.

---

**Tip**
Text sections are useful for introductions to your report or your report sections.

---

**Procedure**

**Step 1**
In the report template editor, click add text section (✍️).

**Step 2**
Drag the new text section to its intended position in the report template.

**Step 3**
If you want to position the text section first or last on a page, add page breaks before or after the text section.

**Step 4**
If you want to change the text section's generic name, click section’s name in the title bar, and enter a new name.

**Step 5**
Add formatted text and images to the body of the text section.
You can include input parameters that dynamically update when you generate the report.

**Step 6**
Click **Save**.

**Adding a Page Break to a Report Template**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
**Procedure**

**Step 1** In the report template editor, click **add page break**. A page break appears at the bottom of the template.

**Step 2** Drag the page break to its intended location, before or after a section.

**Step 3** Click **Save**.

---

**Global Time Windows and Report Template Sections**

Report templates with time-based data (such as intrusion or discovery events) have a global time window, which the time-based sections in the template inherit by default when created. Changing the global time window changes the local time window for the sections that are configured to inherit the global time window. You can disable time window inheritance for an individual section by clearing its **Inherit Time Window** check box. You can then edit the local time window.

**Note**

Global time window inheritance applies only to report sections with data from time-based tables, such as intrusion events and discovery events. For sections that report on network assets (hosts and devices) and related information (such as vulnerabilities), you must set each time window individually.

**Setting the Global Time Window for a Report Template and Its Sections**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

**Tip**

Your report can have different time ranges per section. For example, your first section could be a summary for the month, and the remaining sections could drill down into details at the week level. In such cases, you set the section-level time windows individually.

**Procedure**

**Step 1** In the report template editor, click **Generate**.

**Step 2** To modify the global time window, click time window (**`).

**Step 3** Modify time settings in **Events Time Window**.

**Step 4** Click **Apply**.

**Step 5** Click **Generate** to generate the report and **Yes** to confirm.
Setting the Local Time Window for Report Template Sections

<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**
On the Report Sections page of a template, clear the **Inherit Time Window** check box for the section if it is present.

**Step 2**
To change the section’s local time window, click time window (agination).

**Note**
Sections with data from statistics tables can have only sliding time windows.

**Step 3**
Click **Apply** on the Events Time Window.

**Step 4**
Click **Save**.

Renaming a Report Template Section

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**
In the report template editor, click the current section name in the section header.

**Step 2**
Enter a new name for the section.

**Step 3**
Click **OK**.

Previewing a Report Template Section

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

The preview function shows the field layout and sort order for table views and important legibility characteristics of graphics, such as pie chart colors.

**Procedure**

**Step 1**
At any time while editing a report template section, click **Preview** for the section.
Step 2  Close the preview by clicking OK.

Searches in Report Template Sections

The key to generating successful reports is defining the searches that populate the report’s sections. The Firepower System provides a search editor to view the searches available in your report templates and to define new custom searches.

Searching in Report Template Sections

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1  From the relevant section in the report template, click edit ( ) next to the Search field.

Step 2  If you want to base a custom search on a predefined search, you must choose a predefined search from the Saved Searches drop-down list.

This list includes all available predefined searches for this table, including system-wide and report-specific predefined searches.

Step 3  Edit the search criteria in the appropriate fields.

For certain fields, your constraints can include the same operators (<, <=, and so on) as event searches. If you enter multiple criteria, the search returns only the records that match all the criteria.

Step 4  If you want to insert an input parameter from the drop-down menu instead of entering a constraint value, you must click input parameter ( ).

Note  When you edit the constraints of a reporting search, the system saves your edited search under the following name: section custom search, where section is the name in the section title bar followed by the string custom search. To have meaningful names for your saved custom searches, be sure you change the section name before you save the edited search. You cannot rename a saved reporting search.

Step 5  Click OK.

Input Parameters

You can use input parameters in a report template that the report can dynamically update at generation time. The input parameter icon ( ) indicates the fields that can process them. There are two kinds of input parameters:

- Predefined input parameters are resolved by internal system functions or configuration information. For example, at report generation time, the system replaces the $<Time>$ parameter with the current date and time.
• **User-defined input parameters** supply constraints in section searches. Constraining a search with an input parameter instructs the system to collect a value at generation time from the person who requests the report. In this way, you can dynamically tailor a report at generation time to show a particular subset of data without changing the template. For example, you can provide an input parameter for the **Destination IP** field of a report section’s search. Then, when you generate the report, you can enter the IP network segment for a particular department to get data for that department only.

You can also define string-type input parameters to add dynamic text in certain fields of your report, such as in emails (subject or body), report file names, and text sections. You can personalize reports for different departments, with customized report file names, email addresses, and email messages, using the same template for all.

**Predefined Input Parameters**

</tr>
</tbody>
</table>
User-Defined Input Parameters

You use input parameters to expand the usefulness of your searches. The input parameter instructs the system to collect a value at generation time from the person who requests the report. In this way, you can dynamically constrain a report at generation time to show a particular subset of data without changing the search. For example, you can provide an input parameter for the Destination IP field of a report section that drills down on security events at a department level. When you generate the report, you can type the IP network segment for a particular department to get data for that department only.

An input parameter’s type determines the search fields where you can use it. You can use a given type only in appropriate fields. For example, a user parameter you define as a string type is available for insertion in text fields but not in fields that take an IP address.

Each input parameter you define has a name and a type.

Table 248: User-Defined Input Parameter Types

<table>
<thead>
<tr>
<th>Use this parameter type...</th>
<th>With fields with this data...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network/IP</td>
<td>any IP address or network segment in CIDR format</td>
</tr>
<tr>
<td>Application</td>
<td>name of an application protocol, client application, or web application</td>
</tr>
<tr>
<td>Event Message</td>
<td>any event view message</td>
</tr>
<tr>
<td>Device</td>
<td>a FMC or managed device</td>
</tr>
<tr>
<td>Username</td>
<td>user identification such as initiator user and responder user</td>
</tr>
<tr>
<td>Number (VLAN ID, Snort ID, Vuln ID)</td>
<td>any VLAN ID, Snort ID, or vulnerability ID</td>
</tr>
<tr>
<td>String</td>
<td>text fields such as application or OS version, notes, or descriptions</td>
</tr>
</tbody>
</table>

Creating User-Defined Input Parameters

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
**Procedure**

**Step 1** In the report template editor, click Advanced.

**Step 2** Click add input parameter ((Graphic)).

**Step 3** Enter the parameter Name.

**Step 4** Choose a value from the Type drop-down list.

**Step 5** Click OK to add the parameter.

**Step 6** Click OK to return to the editor.

**Editing User-Defined Input Parameters**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

The Input Parameters section of the report template lists all available user-defined parameters for the template.

**Procedure**

**Step 1** In the report template editor, click Advanced.

**Step 2** Click edit (Graphic) next to the parameter you want to modify.

**Step 3** Enter a new Name.

**Step 4** Use the Type drop-down list to change the parameter type.

**Step 5** Click OK to save your changes.

**Step 6** If you want to delete an input parameter, click delete (Graphic) next to the input parameter and confirm.

**Step 7** Click OK to return to the report template editor.

**Constraining a Search with User-Defined Input Parameters**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Input parameters you define are available only for search fields that match their parameter type. For example, a parameter of type Network/IP is available only for fields that accept IP addresses or network segments in CIDR format.
Procedure

Step 1  In the report template editor, click edit (✏) next to the Search field within the section.

Fields that can take an input parameter are marked with input parameter ( mộ).

Step 2  Click input parameter ( mộ) next to the field, then choose the input parameter from the drop-down menu.

User-defined input parameters are marked with ( mộ).

Step 3  Click OK.

Document Attributes in a Report Template

Before you generate your report, you can set document attributes that affect the report’s appearance. These attributes include the optional cover page and table of contents. Support for some attributes depends on the selected report format: PDF, HTML, or CSV.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>PDF Support?</th>
<th>HTML Support?</th>
<th>CSV Support?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cover page</td>
<td>yes, with optional logo and custom appearance</td>
<td>yes, with optional logo and custom appearance</td>
<td>no</td>
</tr>
<tr>
<td>Table of contents</td>
<td>yes</td>
<td>yes</td>
<td>no</td>
</tr>
<tr>
<td>Page headers and footers</td>
<td>yes, with optional text or logo in any field</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>Custom starting page number</td>
<td>yes</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>Option to suppress numbering of first page</td>
<td>yes</td>
<td>no</td>
<td>no</td>
</tr>
</tbody>
</table>

Editing Document Attributes in a Report Template

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1  In the report template editor, click Advanced.

Step 2  You have the following choices:

- Add cover page — To add a cover page, check the Include Cover Page check box.
• Customize cover page — To edit the cover page design, see Customizing a Cover Page, on page 1989.
• Add table of contents — To add a table of contents, check the Include Table of Contents check box.
• Manage logos — To manage the logo image associated with the template, see Managing Report Template Logos, on page 1989.
• Configure header and footer — To specify elements for the header and footer of the template, use the drop-down lists in the Header and Footer fields.
• Set first page number — To specify the page number of the report's first page, enter a Page Number Start value.
• Show first page number — To show the page number on the report's first page, check the Number First Page? check box. If you choose this option, the cover page is not numbered.

Step 3  Click OK to save your changes.

Customizing a Cover Page

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can customize a report template’s cover page. Cover pages can have rich text with multiple font sizes and styles (bold, italic, and so on) as well as input parameters and imported images.

Procedure

Step 1  In the report template editor, click Advanced.
Step 2  Click edit (-pencil) next to Cover Page Design.
Step 3  Edit the cover page design within the rich text editor.
Step 4  Click OK.

Managing Report Template Logos

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can store multiple logos on the Firepower Management Center and associate them with different report templates. You set the logo association when you design the template. If you export the template, the export package contains the logo.

When you upload a logo to the Firepower Management Center, it is available for:

• all report templates on the Firepower Management Center, or
• in a multidomain deployment, all report templates in your current domain

Logo images can be in GIF, JPG, or PNG format.
You can change the logo in a report to any JPG image uploaded to your Firepower Management Center. For example, if you reuse a template, you can associate a logo for a different organization with the report.

You can delete any uploaded logos. Deleting a logo removes it from all templates where it is used. The deletion cannot be undone. Note that you cannot delete the predefined Cisco logo.

**Procedure**

**Step 1**
In the report template editor, click **Advanced**.

The logo currently associated with the template appears under **Logo** in **General Settings**.

**Step 2**
Click edit (↵) next to the logo.

**Step 3**
You have the following choices:

- **Add** — Add a new logo as described in **Adding a New Logo**, on page 1990.
- **Change** — Change a report template’s logo as described in **Changing the Logo for a Report Template**, on page 1990.
- **Delete** — Delete a logo as described in **Deleting a Logo**, on page 1991.

---

### Adding a New Logo

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**
In the report template editor, click **Advanced**.

**Step 2**
Click edit (↵) next to the **Logo** field.

**Step 3**
Click **Upload Logo**.

**Step 4**
Click **Browse**, browse to the file’s location, and click **Open**.

**Step 5**
Click **Upload**.

**Step 6**
If you want to associate the new logo with the current template, choose it, and click **OK**.

### Changing the Logo for a Report Template

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
**Procedure**

**Step 1**  
In the report template editor, click **Advanced**.

**Step 2**  
Click edit (اظهار الصورة) next to the **Logo** field.

**Step 3**  
From the Select Logo dialog, choose the logo to associate with the report template.

**Step 4**  
Click **OK**.

---

**Deleting a Logo**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**  
In the report template editor, click **Advanced**.

**Step 2**  
Click edit (اظهار الصورة) next to the **Logo** field.

**Step 3**  
From the Select Logo dialog, choose the logo you want to delete.

**Step 4**  
Click **Delete Logo**.

**Step 5**  
Click **OK**.

---

**Managing Report Templates**

<table>
<thead>
<tr>
<th>Smart License</th>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays report templates created in the current domain, which you can edit. It also displays report templates created in ancestor domains, which you cannot edit. To view and edit report templates in a lower domain, switch to that domain. The system displays reports created in the current domain only.

**Procedure**

**Step 1**  
Choose **Overview** > **Reporting**.

**Step 2**  
Click **Report Templates**.

**Step 3**  
You have the following choices:

- **Delete** — Next to the template you want to delete, click delete (اظهار الصورة) and confirm.
You cannot delete system-provided report templates. Security Analysts can delete only report templates they created. In a multidomain deployment, you can delete report templates belonging to the current domain only.

- **Edit** — To edit report templates; see Editing Report Templates, on page 1992.
- **Export** — To export report templates, see Exporting Report Templates, on page 1993.

**Tip** You can also export report templates using the standard configuration export process; see Exporting Configurations, on page 179.

- **Import** — To import report templates, see Importing Configurations, on page 180.

---

### Editing Report Templates

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays report templates created in the current domain, which you can edit. It also displays report templates created in ancestor domains, which you cannot edit. To view and edit report templates in a lower domain, switch to that domain.

**Procedure**

- **Step 1** Choose **Overview > Reporting**.
- **Step 2** Click **Report Templates**.
- **Step 3** Click edit (✏️) for the template you want to edit.

If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

- **Step 4** You have the following choices:
  - Add a page break; see Adding a Page Break to a Report Template, on page 1981.
  - Add a text section; see Adding a Text Section to a Report Template, on page 1981.
  - Configure section content as described in Report Template Configuration, on page 1979.
  - Create input parameters; see Creating User-Defined Input Parameters, on page 1986.
  - Edit input parameters; see Editing User-Defined Input Parameters, on page 1987.
  - Search template sections; see Searching in Report Template Sections, on page 1984.
  - Set document attributes described in Document Attributes in a Report Template, on page 1988 by clicking Advanced.
  - Set the global time window; see Setting the Global Time Window for a Report Template and Its Sections, on page 1982.
  - Set the local time window; see Setting the Local Time Window for Report Template Sections, on page 1983.
  - Set the search fields; see Setting the Search Fields that Appear in Table Format Sections, on page 1980.
• Set the table and data format; see Setting the Table and Data Format for a Report Template Section, on page 1979.
• Specify searches and filters; see Specifying the Search or Filter for a Report Template Section, on page 1980.

---

Exporting Report Templates

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose Overview > Reporting.

**Step 2** Choose Report Templates.

**Step 3** For the template you want to export, click export ( ).

**Step 4** Click Save file and OK to save the file to your local computer.

---

**About Generating Reports**

**Generating Reports**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

After you create and customize your report template, you are ready to generate the report. The generation process lets you select the report’s format (HTML, PDF, or CSV). You can also adjust the report’s global time window, which applies a consistent time frame to all sections except those you exempt.

For PDF reports:

• File names using Unicode (UTF-8) characters are not supported.

• Any report sections that include special Unicode file names (such as those appearing in file or malware events) display these file names in transliterated form.

If the report template includes user input parameters in its search specification, the generation process prompts you to enter values, which tailor this run of the report to a subset of the data.

If you have a DNS server configured and IP address resolution enabled, reports contain host names if resolution was successful.

In a multidomain deployment, when you generate a report in an ancestor domain, it can include results from all descendant domains. To generate a report for a specific leaf domain, switch to that domain.
Procedure

**Step 1** Choose **Overview > Reporting**.

**Step 2** Click **Report Templates**.

**Step 3** Click report ( ) next to the template you want to use to generate a report. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Tip** To generate a report from an ancestor's template, copy the template into the current domain.

**Step 4** Optionally, configure the report name:

- Enter a new **File Name**. If you do not enter a new name, the system uses the name specified in the report template.
- Use input parameter ( ) to add one or more input parameters to the file name.

**Step 5** Choose the output format for the report by clicking: HTML, PDF, or CSV.

**Step 6** If you want to change the global time window, click time window ( ).

**Note** Setting the global time window affects the content of individual report sections only if they are configured to inherit the global setting.

**Step 7** Enter values for any fields that appear in the **Input Parameters** section.

**Tip** You can ignore user parameters by typing the * wildcard character in the field. This eliminates the user parameter’s constraint on the search.

**Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses or VLAN tags to constrain report results can have unexpected results.

**Step 8** If you enabled an email relay host in the Firepower Management Center configuration, click **Email** to automate email delivery of the report when it generates.

**Step 9** Click **Generate** and confirm when prompted.

Clicking **Generate** saves Generate settings with the report template.

If you click **Cancel**, your selections are saved only for the duration of your session.

**Step 10** You have the following choices:

- Click the report link to display the report in a new window.
- Click **OK** to return to the report template editor.

---

**Report Generation Options**

You can configure report generation options to:

- Schedule generation of future reports, either once or recurring. See **Automating Report Generation**, on page 190. You can customize the schedule on a full range of time frames such as daily, weekly, monthly, and so on.
Distributing Reports by Email at Generation Time

- Distribute email reports using the scheduler. You must configure your report template and a mail relay host before scheduling the task.

- Automatically send the report as an email attachment to a list of recipients when you generate a report. You must have a properly configured mail relay host to deliver a report by email.

- Save newly generated report files to your configured remote storage location. To use remote storage, you must first configure a remote storage location.

> **Note**

If you store remotely and then switch back to local storage, the reports in remote storage do not appear on the Reports tab list. Similarly, if you switch from one remote storage location to another, the reports in the previous location do not appear in the list.

### Distributing Reports by Email at Generation Time

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose Overview > Reporting.

**Step 2** Click Report Templates.

**Step 3** Click report ( ) next to the template you want to use to generate a report.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

> **Tip**

To generate a report from an ancestor's template, copy the template into the current domain.

**Step 4** Expand the Email section of the window.

**Step 5** In the Email Options field, choose Send Email.

**Step 6** In the Recipient List, CC, and BCC fields, enter recipients’ email addresses in comma-separated lists.

**Step 7** In the Subject field, enter an email subject.

> **Tip**

You can provide input parameters in the Subject field and the message body to dynamically generate information in the email, such as a timestamp or the name of the Firepower Management Center.

**Step 8** Enter a cover letter in the email body as necessary.

**Step 9** Click OK and confirm.

About Working with Generated Reports

Access and work with previously-generated reports on the Reports tab page.

Viewing Reports

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

The Reports lists all previously generated reports, with report name, date and time of generation, generating user, and whether the report is stored locally or remotely. A status column indicates whether the report is already generated, is in the generation queue (for example, for scheduled tasks), or failed to generate (for example, due to lack of disk space).

Note that users with Administrator access can view all reports; other users can view only the reports they generated.

In a multidomain deployment, you can view reports generated in the current domain only.

The Reports page shows all locally stored reports. It shows remotely stored reports as well, if remote storage is currently configured. The Location column data for remotely-stored reports is Remote.

Note

If you store remotely and then switch back to local storage, the reports in remote storage do not appear on the Reports tab list. Similarly, if you switch from one remote storage location to another, the reports in the previous location do not appear in the list.

Procedure

Step 1 Choose Overview > Reporting.
Step 2 Click Reports.
Step 3 Click the report you want to view.

Downloading Reports

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
You can download any report file to your local computer. From there, you can email it or distribute it electronically by other available means.

In a multidomain deployment, you can download reports generated in the current domain only.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose <strong>Overview</strong> &gt; <strong>Reporting</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Click <strong>Reports</strong>.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Check the check boxes next to the reports you want to download, then click <strong>Download</strong>.</td>
</tr>
<tr>
<td><strong>Tip</strong></td>
<td>Click the check box at the top left of the page to download all reports on the page. If you have multiple pages of reports, a second check box appears that you can click to download all reports on all pages.</td>
</tr>
</tbody>
</table>

| Step 4 | Follow your browser’s prompts to download the reports. If you chose multiple reports, they are downloaded in a single .zip file. |

## Storing Reports Remotely

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

The location of your currently configured report storage appears at the bottom of the Overview > Reporting > Reports page, with disk usage for local, NFS, and SMB storage. If you access remote storage using SSH, disk usage data is not available.

---

**Note**

If you store remotely and then switch back to local storage, the reports in remote storage do not appear on the Reports tab list. Similarly, if you switch from one remote storage location to another, the reports in the previous location do not appear in the list.

---

**Before you begin**

- Configure a remote storage location as described in Remote Storage Management, on page 813.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose <strong>Overview</strong> &gt; <strong>Reporting</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Choose <strong>Reports</strong>.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Check the <strong>Enable Remote Storage of Reports</strong> check box at the bottom of the page.</td>
</tr>
</tbody>
</table>
What to do next

- Move reports from local storage to remote storage; see Moving Reports to Remote Storage, on page 1998.

Related Topics
Remote Storage Management, on page 813
Moving Reports to Remote Storage, on page 1998

Moving Reports to Remote Storage

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can move your reports in local storage to a remote storage location in batch mode or singly.

**Note**
If you store remotely and then switch back to local storage, the reports in remote storage do not appear on the Reports tab list. Similarly, if you switch from one remote storage location to another, the reports in the previous location do not appear in the list.

Before you begin

- Configure a remote storage location as described in Remote Storage Management, on page 813.

Procedure

**Step 1**
Choose Overview > Reporting.

**Step 2**
Choose Reports.

**Step 3**
Choose the check boxes next to the reports you want to move, then click Move.

**Tip**
Check the check box at the top left of the page to move all reports on the page. If you have multiple pages of reports, a second check box appears that you can check to move all reports on all pages.

**Step 4**
Confirm that you want to move the reports.

Deleting Reports

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
You can delete your report files at any time. The procedure completely removes the files, and no recovery is possible. Although you still have the report template that generated the report, it may be difficult to regenerate a particular report file if the time window was expanding or sliding. Regeneration may also be difficult if your template uses input parameters.

In a multidomain deployment, you can delete reports generated in the current domain only.

**Procedure**

**Step 1** Choose Overview > Reporting.

**Step 2** Click Reports.

**Step 3** You have the following choices:

- Delete selected — Check the check boxes next to the reports you want to delete, then click **Delete**.
- Delete all — Check the check box at the top left of the page to delete all reports on the page. If you have multiple pages of reports, a second check box appears that you can check to delete all reports on all pages.

**Step 4** Confirm the deletion.
Deleting Reports
CHAPTER 100

External Alerting with Alert Responses

The following topics describe how to send external event alerts from the Firepower Management Center using alert responses:

- Firepower Management Center Alert Responses, on page 2001
- Creating an SNMP Alert Response, on page 2002
- Creating a Syslog Alert Response, on page 2003
- Creating an Email Alert Response, on page 2006
- Configuring Impact Flag Alerting, on page 2007
- Configuring Discovery Event Alerting, on page 2007
- Configuring AMP for Networks Alerting, on page 2008

Firepower Management Center Alert Responses

External event notification via SNMP, syslog, or email can help with critical-system monitoring. The Firepower Management Center uses configurable alert responses to interact with external servers. An alert response is a configuration that represents a connection to an email, SNMP, or syslog server. They are called responses because you can use them to send alerts in response to events detected by Firepower. You can configure multiple alert responses to send different types of alerts to different monitoring servers and/or people.

Alerts that use alert responses are sent by the Firepower Management Center. Intrusion email alerts, which do not use alert responses, are also sent by the Firepower Management Center. By contrast, SNMP and syslog alerts that are based on individual intrusion rules triggering are sent directly by managed devices. For more information, see External Alerting for Intrusion Events, on page 2009.

In most cases, the information in an external alert is the same as the information in any associated event you logged to the database. However, for correlation event alerts where the correlation rule contains a connection tracker, the information you receive is the same as for an alert on a traffic profile change, regardless of the base event type.

You create and manage alert responses on the Alerts page (Policies > Actions > Alerts). New alert responses are automatically enabled. To temporarily stop alert generation, you can disable alert responses rather than deleting them.

Changes to alert responses take effect immediately, except when sending connection logs to an SNMP trap or syslog server.
In a multidomain deployment, when you create an alert response it belongs to the current domain. This alert response can also be used by descendant domains.

## Configurations Supporting Alert Responses

After you create an alert response, you can use it to send the following external alerts from the Firepower Management Center.

<table>
<thead>
<tr>
<th>Alert/Event Type</th>
<th>For More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intrusion events, by impact flag</td>
<td>Configuring Impact Flag Alerting, on page 2007</td>
</tr>
<tr>
<td>Discovery events, by type</td>
<td>Configuring Discovery Event Alerting, on page 2007</td>
</tr>
<tr>
<td>Malware and retrospective malware events detected by AMP for Networks (&quot;network-based&quot;)</td>
<td>Configuring AMP for Networks Alerting, on page 2008</td>
</tr>
<tr>
<td>Correlation events, by correlation policy violation</td>
<td>Adding Responses to Rules and White Lists, on page 1907</td>
</tr>
<tr>
<td>Connection events, by the logging rule or default action (email alerts not supported)</td>
<td>Other Connections You Can Log, on page 2134</td>
</tr>
<tr>
<td>Health events, by health module and severity level</td>
<td>Creating Health Monitor Alerts, on page 287</td>
</tr>
</tbody>
</table>

### Creating an SNMP Alert Response

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except FTD</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can create SNMP alert responses using SNMPv1, SNMPv2, or SNMPv3.

**Note**

When selecting SNMP versions for the SNMP protocol, note that SNMPv2 only supports read-only communities and SNMPv3 only supports read-only users. SNMPv3 also supports encryption with AES128.

If you want to monitor 64-bit values with SNMP, you must use SNMPv2 or SNMPv3. SNMPv1 does not support 64-bit monitoring.

**Before you begin**

- If your network management system requires the Firepower Management Center’s management information base (MIB) file, obtain it at `/etc/sf/DCEALERT.MIB`.

**Procedure**

**Step 1** Choose **Policies** > **Actions** > **Alerts**.
Step 2  From the **Create Alert** drop-down menu, choose **Create SNMP Alert**.

Step 3  Enter a **Name** to identify the SNMP response.

Step 4  In the **Trap Server** field, enter the hostname or IP address of the SNMP trap server.

**Note**  The system does **not** warn you if you enter an invalid IPv4 address (such as 192.169.1.456) in this field. Instead, the invalid address is treated as a hostname.

Step 5  From the **Version** drop-down list, choose the SNMP version you want to use. SNMP v3 is the default.

Step 6  Depending on the version on SNMP you use, do one of the following:

- **Version 1** or **Version 2**: Enter a read-only SNMP community name in the **Community String** field, then skip to the end of the procedure.
  
  **Note**  Do not include special characters (< > / % # & ?, etc.) in the SNMP community string name.

- For SNMP v3, enter the name of the user that you want to authenticate with the SNMP server in the **User Name** field and continue to the next step.

Step 7  From the **Authentication Protocol** drop-down list, choose the protocol you want to use for authentication.

Step 8  In the **Authentication Password** field, enter the password required for authentication with the SNMP server.

Step 9  From the **Privacy Protocol** list, choose **None** to use no privacy protocol or **DES** to use Data Encryption Standard as the privacy protocol.

Step 10  In the **Privacy Password** field, enter the privacy password required by the SNMP server.

Step 11  In the **Engine ID** field, enter an identifier for the SNMP engine, in hexadecimal notation, using an even number of digits.

When you use SNMPv3, the system uses an Engine ID value to encode the message. Your SNMP server requires this value to decode the message.

Cisco recommends that you use the hexadecimal version of the Firepower Management Center’s IP address. For example, if the Firepower Management Center has an IP address of 10.1.1.77, use 0a01014D0.

Step 12  Click **Save**.

---

**What to do next**

Changes take effect immediately, EXCEPT:

If you are using alert responses to send connection logs, you must deploy configuration changes after you edit those alert responses.

---

**Creating a Syslog Alert Response**

<table>
<thead>

<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When configuring a syslog alert response, you can specify the severity and facility associated with the syslog messages to ensure that they are processed properly by the syslog server. The facility indicates the subsystem that creates the message and the severity defines the severity of the message. Facilities and severities are not
displayed in the actual message that appears in the syslog, but are instead used to tell the system that receives
the syslog message how to categorize it.

Tip
For more detailed information about how syslog works and how to configure it, refer to the documentation
for your system. On UNIX systems, the man pages for syslog and syslog.conf provide conceptual information
and configuration instructions.

Although you can choose any type of facility when creating a syslog alert response, you should choose one
that makes sense based on your syslog server; not all syslog servers support all facilities. For UNIX syslog
servers, the syslog.conf file should indicate which facilities are saved to which log files on the server.

Before you begin
- Confirm that the syslog server can accept remote messages.

Procedure

Step 1  Choose Policies > Actions > Alerts.
Step 2  From the Create Alert drop-down menu, choose Create Syslog Alert.
Step 3  Enter a Name for the alert.
Step 4  In the Host field, enter the hostname or IP address of your syslog server.

Note  The system does not warn you if you enter an invalid IPv4 address (such as 192.168.1.456) in this
field. Instead, the invalid address is treated as a hostname.

Step 5  In the Port field, enter the port the server uses for syslog messages. By default, this value is 514.
Step 6  From the Facility list, choose a facility described in Syslog Alert Facilities, on page 2004.
Step 7  From the Severity list, choose a severity described in Syslog Severity Levels, on page 2005.
Step 8  In the Tag field, enter the tag name that you want to appear with the syslog message.

For example, if you wanted all messages sent to the syslog to be preceded with FromMC, enter FromMC in the
field.

Step 9  Click Save.

What to do next
Changes take effect immediately, EXCEPT:

If you are using alert responses to send connection logs to a syslog server, you must deploy configuration
changes after you edit those alert responses.

Syslog Alert Facilities

The following table lists the syslog facilities you can select.
Table 250: Available Syslog Facilities

<table>
<thead>
<tr>
<th>Facility</th>
<th>Description</th>
</tr>

Creating an Email Alert Response

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Before you begin

- Confirm that the Firepower Management Center can reverse-resolve its own IP address.
- Configure your mail relay host as described in Configuring a Mail Relay Host and Notification Address, on page 830.

Note: You cannot use email alerting to log connections.

Procedure

Step 1  Choose Policies > Actions > Alerts.
Step 2  From the Create Alert drop-down menu, choose Create Email Alert.
Step 3  Enter a Name for the alert response.
Step 4  In the To field, enter the email addresses where you want to send alerts, separated by commas.
Step 5  In the From field, enter the email address that you want to appear as the sender of the alert.
Step 6  Next to Relay Host, verify the listed mail server is the one that you want to use to send the alert.

Tip: To change the email server, click edit (-pencil).
Step 7  Click Save.

---

## Configuring Impact Flag Alerting

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can configure the system to alert you whenever an intrusion event with a specific impact flag occurs. Impact flags help you evaluate the impact an intrusion has on your network by correlating intrusion data, network discovery data, and vulnerability information.

### Procedure

**Step 1** Choose Policies > Actions > Alerts.

**Step 2** Click Impact Flag Alerts.

**Step 3** In the Alerts section, choose the alert response you want to use for each alert type.

**Tip** To create a new alert response, choose New from any drop-down list.

**Step 4** In the Impact Configuration section, check the appropriate check boxes to specify the alerts you want to receive for each impact flag.

For definitions of the impact flags, see Intrusion Event Impact Levels, on page 2189.

**Step 5** Click Save.

---

## Configuring Discovery Event Alerting

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can configure the system to alert you whenever a specific type of discovery event occurs.

### Before you begin

- Configure your network discovery policy to log the discovery event types you want to configure alerting for as described in Configuring Network Discovery Event Logging, on page 1861.

### Procedure

**Step 1** Choose Policies > Actions > Alerts.
Configuring AMP for Networks Alerting

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Malware</td>
<td>Malware</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can configure the system to alert you whenever any malware event, including a retrospective event, is generated by AMP for Networks (that is, a “network-based malware event” is generated.) You cannot alert on malware events generated by AMP for Endpoints (“endpoint-based malware events.”)

Before you begin

• Configure a file policy to perform malware cloud lookups and associate that policy with an access control rule as described in Understanding Access Control, on page 1115.

Procedure

Step 1 Choose Policies > Actions > Alerts.
Step 2 Click Advanced Malware Protections Alerts.
Step 3 In the Alerts section, choose the alert response you want to use for each alert type.
Tip To create a new alert response, choose New from any drop-down list.
Step 4 In the Event Configuration section, check the check boxes that correspond to the alerts you want to receive for each malware event type.
Keep in mind that All network-based malware events includes Retrospective Events.
(By definition, network-based malware events do not include events generated by AMP for Endpoints.)
Step 5 Click Save.
CHAPTER 101

External Alerting for Intrusion Events

The following topics describe how to configure external alerting for intrusion events:

- About External Alerting for Intrusion Events, on page 2009
- Configuring SNMP Alerting for Intrusion Events, on page 2010
- Configuring Syslog Alerting for Intrusion Events, on page 2011
- Configuring Email Alerting for Intrusion Events, on page 2013

About External Alerting for Intrusion Events

External intrusion event notification can help with critical-system monitoring:

- SNMP—Configured per intrusion policy and sent from managed devices. You can enable SNMP alerting per intrusion rule.
- Syslog—Configured per intrusion policy and sent from managed devices. When you enable syslog alerting in an intrusion policy, you turn it on for every rule in the policy.
- Email—Configured across all intrusion policies and sent from the Firepower Management Center. You can enable email alerts per intrusion rule, as well as limit their length and frequency.

Keep in mind that if you configured intrusion event suppression or thresholding, the system may not generate intrusion events (and thus may not send alerts) every time a rule triggers.

In a multidomain deployment, you can configure external alerting in any domain. In ancestor domains, the system generates notifications for intrusion events in descendant domains.

The Firepower Management Center also uses SNMP, syslog, and email alert responses to send different types of external alerts; see Firepower Management Center Alert Responses, on page 2001. The system does not use alert responses to send alerts based on individual intrusion events.

Related Topics

Intrusion Event Notification Filters in an Intrusion Policy, on page 1428
Configuring SNM Alerting for Intrusion Events

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

After you enable external SNMP alerting in an intrusion policy, you can configure individual rules to send SNMP alerts when they trigger. These alerts are sent from the managed device.

**Procedure**

**Step 1** In the intrusion policy editor's navigation pane, click **Advanced Settings**.

**Step 2** Make sure **SNMP Alerting** is **Enabled**, then click **Edit**. A message at the bottom of the page identifies the intrusion policy layer that contains the configuration.

**Step 3** Choose an **SNMP Version**, then specify configuration options as described in Intrusion SNMP Alert Options, on page 2010.

**Step 4** In the navigation pane, click **Rules**.

**Step 5** In the rules pane, choose the rules where you want to set SNMP alerts, then choose **Alerting > Add SNMP Alert**.

**Step 6** To save changes you made in this policy since the last policy commit, choose **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

**What to do next**
- Deploy configuration changes; see Deploy Configuration Changes, on page 337.

**Intrusion SNMP Alert Options**

If your network management system requires a management information base file (MIB), you can obtain it from the Firepower Management Center at `/etc/sf/DCEALERT.MIB`.

**SNMP v2 Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trap Type</td>
<td>The trap type to use for IP addresses that appear in the alerts. If your network management system correctly renders the INET_IPV4 address type, choose as <strong>Binary</strong>. Otherwise, choose as <strong>String</strong>. For example, HP OpenView requires as <strong>String</strong>.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Trap Server</td>
<td>The server that will receive SNMP traps notification. You can specify a single IP address or hostname.</td>
</tr>
<tr>
<td>Community String</td>
<td>The community name.</td>
</tr>
</tbody>
</table>

### SNMP v3 Options

Managed devices encode SNMPv3 alerts with an Engine ID value. To decode the alerts, your SNMP server requires this value, which is the hexadecimal version of the sending device's management interface IP address, appended with "01."

For example, if the device sending the SNMP alert has a management interface IP address of 172.16.1.50, the Engine ID value is 0xAC10013201.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trap Type</td>
<td>The trap type to use for IP addresses that appear in the alerts.</td>
</tr>
<tr>
<td></td>
<td>If your network management system correctly renders the INET_IPV4 address type, choose <strong>as Binary</strong>. Otherwise, choose <strong>as String</strong>. For example, HP OpenView requires <strong>as String</strong>.</td>
</tr>
<tr>
<td>Trap Server</td>
<td>The server that will receive SNMP traps notification. You can specify a single IP address or hostname.</td>
</tr>
<tr>
<td>Authentication Password</td>
<td>The password required for authentication. SNMP v3 uses either the Message Digest 5 (MD5) hash function or the Secure Hash Algorithm (SHA) hash function to encrypt this password, depending on configuration. If you specify an authentication password, authentication is enabled.</td>
</tr>
<tr>
<td>Private Password</td>
<td>The SNMP key for privacy. SNMP v3 uses the Data Encryption Standard (DES) block cipher to encrypt this password. When you enter an SNMP v3 password, the password displays in plain text during initial configuration but is saved in encrypted format. If you specify a private password, privacy is enabled, and you must also specify an authentication password.</td>
</tr>
<tr>
<td>User Name</td>
<td>Your SNMP user name.</td>
</tr>
</tbody>
</table>

### Configuring Syslog Alerting for Intrusion Events

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>
After you enable syslog alerting in an intrusion policy, the system sends all intrusion events to the syslog, either on the managed device itself or to an external host or hosts. If you specify an external host, syslog alerts are sent from the managed device.

**Procedure**

**Step 1**
In the intrusion policy editor's navigation pane, click *Advanced Settings*.

**Step 2**
Make sure *Syslog Alerting* is *Enabled*, then click *Edit*.
A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. The *Syslog Alerting* page is added under *Advanced Settings*.

**Step 3**
Enter the IP addresses of the *Logging Hosts* where you want to send syslog alerts.
If you leave this field blank, the managed device logs intrusion events using its own syslog facility.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

**Step 4**
Choose *Facility* and *Priority* levels as described in *Facilities and Priorities for Intrusion Syslog Alerts*, on page 2012.

**Step 5**
To save changes you made in this policy since the last policy commit, choose *Policy Information*, then click *Commit Changes*.
If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

**What to do next**

- Deploy configuration changes; see *Deploy Configuration Changes*, on page 337.

**Facilities and Priorities for Intrusion Syslog Alerts**

Managed devices can send intrusion events as syslog alerts using a particular facility and *Priority*, so that the logging host can categorize the alerts. The *facility* specifies the subsystem that generated it. The *priority* specifies its severity. These facility and *Priority* values do not appear in the actual syslog messages.

Choose values that make sense based on your environment. Local configuration files (such as syslog.conf on UNIX-based logging hosts) may indicate which facilities are saved to which log files.

**Syslog Alert Facilities**

<table>
<thead>
<tr>
<th>Facility</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTH</td>
<td>A message associated with security and authorization.</td>
</tr>
<tr>
<td>AUTHPRIV</td>
<td>A restricted access message associated with security and authorization. On many systems, these messages are forwarded to a secure file.</td>

### Configuring Email Alerting for Intrusion Events

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>
If you enable intrusion email alerting, the system can send email when it generates an intrusion event, regardless of which managed device or intrusion policy detected the intrusion. These alerts are sent from the Firepower Management Center.

**Before you begin**

- Configure your mail host to receive email alerts; see Configuring a Mail Relay Host and Notification Address, on page 830.

- Ensure that the Firepower Management Center can reverse resolve its own IP address.

**Procedure**

1. Choose **Policies** > **Actions** > **Alerts**.
2. Click **Intrusion Email**.
3. Choose alerting options, including the intrusion rules or rule groups for which you want to alert, as described in Intrusion Email Alert Options, on page 2014.
4. Click **Save**.

### Intrusion Email Alert Options

**On/Off**

Enables or disables intrusion email alerts.

**Note**

Enabling it will enable alerting for all rules unless individual rules are selected.

**From/To Addresses**

The email sender and recipients. You can specify a comma-separated list of recipients.

**Max Alerts and Frequency**

The maximum number of email alerts (Max Alerts) that the Firepower Management Center will send per time interval (Frequency).

**Coalesce Alerts**

Reduces the number of alerts sent by grouping alerts that have the same source IP and rule ID.

**Summary Output**

Enables brief alerts, suitable for text-limited devices. Brief alerts contain:

- Timestamp
- Protocol
• Source and destination IPs and ports
• Message
• The number of intrusion events generated against the same source IP

For example: 2011-05-18 10:35:10 10.1.1.100 icmp 10.10.10.1:8 -> 10.2.1.3:0
snort_decoder: Unknown Datagram decoding problem! (116:108)

If you enable Summary Output, also consider enabling Coalesce Alerts. You may also want to lower Max Alerts to avoid exceeding text-message limits.

**Time Zone**

The time zone for alert timestamps.

**Email Alerting on Specific Rules Configuration**

Allows you to choose the rules where you want to set email alerts.

Event and Asset Analysis Tools

• Using the Context Explorer, on page 2019
• Using the Network Map, on page 2041
• Incidents, on page 2051
• Using Lookups, on page 2059
CHAPTER 102

Using the Context Explorer

The following topics describe how to use the Context Explorer in the Firepower System:

- About the Context Explorer, on page 2019
- Refreshing the Context Explorer, on page 2032
- Setting the Context Explorer Time Range, on page 2033
- Minimizing and Maximizing Context Explorer Sections, on page 2033
- Drilling Down on Context Explorer Data, on page 2034
- Filters in the Context Explorer, on page 2035

About the Context Explorer

The Firepower System Context Explorer displays detailed, interactive graphical information in context about the status of your monitored network, including data on applications, application statistics, connections, geolocation, indications of compromise, intrusion events, hosts, servers, Security Intelligence, users, files (including malware files), and relevant URLs. Distinct sections present this data in the form of vivid line, bar, pie, and donut graphs, accompanied by detailed lists. The first section, a line chart of traffic and event counts over time, provides an at-a-glance picture of recent trends in your network’s activity.

You can easily create and apply custom filters to fine-tune your analysis, and you can examine data sections in more detail by simply clicking or hovering your cursor over graph areas. You can also configure the explorer’s time range to reflect a period as short as the last hour or as long as the last year. Only users with the Administrator, Security Analyst, or Security Analyst (Read Only) user roles have access to the Context Explorer.

The Firepower System dashboard is highly customizable and compartmentalized and updates in real time. In contrast, the Context Explorer is manually updated, designed to provide broader context for its data, and has a single, consistent layout designed for active user exploration.

You use the dashboard to monitor real-time activity on your network and appliances according to your own specific needs. Conversely, you use the Context Explorer to investigate a predefined set of recent data in granular detail and clear context: for example, if you notice that only 15% of hosts on your network use Linux, but account for almost all YouTube traffic, you can quickly apply filters to view data only for Linux hosts, only for YouTube-associated application data, or both. Unlike the compact, narrowly focused dashboard widgets, the Context Explorer sections are designed to provide striking visual representations of system activity in a format useful to both expert and casual users of the Firepower System.
The data displayed depends on such factors as how you license and deploy your managed devices, and whether you configure features that provide the data. You can also apply filters to constrain the data that appears in all Context Explorer sections.

In a multidomain deployment, the Context Explorer displays aggregated data from all subdomains when you view it in an ancestor domain. In a leaf domain, you can view data specific to that domain only.

**Differences Between the Dashboard and the Context Explorer**

The following table summarizes some of the key differences between the dashboard and the Context Explorer.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Dashboard</th>
<th>Context Explorer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displayable data</td>
<td>Anything monitored by the Firepower System</td>
<td>Applications, application statistics, geolocation, indications of compromise, intrusion events, files (including malware files), hosts, Security Intelligence events, servers, users, and URLs</td>
</tr>
<tr>
<td>Customizability</td>
<td>• Selection of widgets for a dashboard is customizable</td>
<td>• Cannot change base layout</td>
</tr>
<tr>
<td></td>
<td>• Individual widgets can be customized to varying degrees</td>
<td>• Applied filters appear in explorer URL and can be bookmarked for later use</td>
</tr>
<tr>
<td>Data update frequency</td>
<td>Automatic (default); user-configured</td>
<td>Manual</td>
</tr>
<tr>
<td>Data filtering</td>
<td>Possible for some widgets (must edit widget preferences)</td>
<td>Possible for all parts of the explorer, with support for multiple filters</td>
</tr>
<tr>
<td>Graphical context</td>
<td>Some widgets (particularly Custom Analysis) can display data in graph form</td>
<td>Extensive graphical context for all data, including uniquely detailed donut graphs</td>
</tr>
<tr>
<td>Links to relevant web interface pages</td>
<td>In some widgets</td>
<td>In every section</td>
</tr>
<tr>
<td>Time range of displayed data</td>
<td>User-configured</td>
<td>User-configured</td>
</tr>
</tbody>
</table>

**Related Topics**

*About Dashboards*, on page 251

**The Traffic and Intrusion Event Counts Time Graph**

At the top of the Context Explorer is a line chart of traffic and intrusion events over time. The X-axis plots time intervals (which range from five minutes to one month, depending on the selected time window). The Y-axis plots traffic in kilobytes (blue line) and intrusion event count (red line).

Note that the smallest X-axis interval is five minutes. To accommodate this, the system will round the beginning and ending points in your selected time range down to the nearest five-minute interval.

By default, this section shows all network traffic and all generated intrusion events for the selected time range. If you apply filters, the chart changes to display only traffic and intrusion events associated with the criteria.
specified in the filters. For example, filtering on the OS Name of Windows causes the time graph to display only traffic and events associated with hosts using Windows operating systems.

If you filter the Context Explorer on intrusion event data (such as a Priority of High), the blue Traffic line is hidden to allow greater focus on intrusion events alone.

You can hover your pointer over any point on the graph lines to view exact information about traffic and event counts. Hovering your pointer over one of the colored lines also brings that line to the forefront of the graph, providing clearer context.

This section draws data primarily from the Intrusion Events and Connection Events tables.

The Indications of Compromise Section

The Indications of Compromise (IOC) section of the Context Explorer contains two interactive sections that provide an overall picture of potentially compromised hosts on your monitored network: a proportional view of the most prevalent IOC types triggered, as well as a view of hosts by number of triggered indications.

For more information about IOCs, see Indications of Compromise Data, on page 2306.

The Hosts by Indication Graph

The Hosts by Indication graph, in donut form, displays a proportional view of the Indications of Compromise (IOC) triggered by hosts on your monitored network. The inner ring divides by IOC category (such as CnC Connected or Malware Detected), while the outer ring further divides that data by specific event type (such as Impact 2 Intrusion Event — attempted-admin or Threat Detected in File Transfer).

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Hosts and Indications of Compromise tables.

The Indications by Host Graph

The Indications by Host graph, in bar form, displays counts of unique Indications of Compromise (IOC) triggered by the 15 most IOC-active hosts on your monitored network.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Hosts and Indications of Compromise tables.

The Network Information Section

The Network Information section of the Context Explorer contains six interactive graphs that display an overall picture of connection traffic on your monitored network: sources, destinations, users, and security zones associated with traffic, a breakdown of operating systems used by hosts on the network, as well as a proportional view of access control actions your Firepower System has performed on network traffic.

The Operating Systems Graph

The Operating Systems graph, in donut form, displays a proportional representation of operating systems detected on hosts on your monitored network. The inner ring divides by OS name (such as Windows or Linux), while the outer ring further divides that data by specific operating system version (such as Windows Server 2008 or Linux 11.x). Some closely related operating systems (such as Windows 2000, Windows XP, and
Windows Server 2003) are grouped together. Very scarce or unrecognized operating systems are grouped under Other.

Note that this graph reflects all available data regardless of date and time constraints. If you change the explorer time range, the graph does not change.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Hosts table.

The Traffic by Source IP Graph

The Traffic by Source IP graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top 15 most active source IP addresses on your monitored network. For each source IP address listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note: If you filter on intrusion event information, the Traffic by Source IP graph is hidden.

This graph draws data primarily from the Connection Events table.

The Traffic by Source User Graph

The Traffic by Source User graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top 15 most active source users on your monitored network. For each source IP address listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note: If you filter on intrusion event information, the Traffic by Source User graph is hidden.

This graph draws data primarily from the Connection Events table. It displays authoritative user data.

The Connections by Access Control Action Graph

The Connections by Access Control Action graph, in pie form, displays a proportional view of access control actions (such as Block or Allow) that your Firepower System deployment has taken on monitored traffic.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note: If you filter on intrusion event information, the Traffic by Source User graph is hidden.

This graph draws data primarily from the Connection Events table.
The Traffic by Destination IP Graph

The Traffic by Destination IP graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top 15 most active destination IP addresses on your monitored network. For each destination IP address listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note
If you filter on intrusion event information, the Traffic by Destination IP graph is hidden.

This graph draws data primarily from the Connection Events table.

The Traffic by Ingress/Egress Security Zone Graph

The Traffic by Ingress/Egress Security Zone graph, in bar form, displays counts of incoming or outgoing network traffic (in kilobytes per second) and unique connections for each security zone configured on your monitored network. You can configure this graph to display either ingress (the default) or egress security zone information, according to your needs.

For each security zone listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Tip
To constrain the graph so it displays only traffic by egress security zone, hover your pointer over the graph, then click Egress on the toggle button that appears. Click Ingress to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Ingress view.

Note
If you filter on intrusion event information, the Traffic by Ingress/Egress Security Zone graph is hidden.

This graph draws data primarily from the Connection Events table.

The Application Information Section

The Application Information section of the Context Explorer contains three interactive graphs and one table-format list that display an overall picture of application activity on your monitored network: traffic, intrusion events, and hosts associated with applications, further organized by the estimated risk or business relevance assigned to each application. The Application Details list provides an interactive list of each application and its risk, business relevance, category, and host count.

For all instances of “application” in this section, the Application Information graph set, by default, specifically examines application protocols (such as DNS or SSH). You can also configure the Application Information section to specifically examine client applications (such as PuTTY or Firefox) or web applications (such as Facebook or Pandora).
Focusing the Application Information Section

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

**Step 1** Choose Analysis > Context Explorer.

**Step 2** Hover your pointer over the Application Protocol Information section.

**Note** If you previously changed this setting in the same Context Explorer session, the section title may appear as Client Application Information or Web Application Information instead.

**Step 3** Click Application Protocol, Client Application, or Web Application.

The Traffic by Risk/Business Relevance and Application Graph

The Traffic by Risk/Business Relevance and Application graph, in donut form, displays a proportional representation of application traffic detected on your monitored network, arranged by the applications’ estimated risk (the default) or estimated business relevance. The inner ring divides by estimated risk/business relevance level (such as Medium or High), while the outer ring further divides that data by specific application (such as SSH or NetBIOS). Scarcely detected applications are grouped under Other.

Note that this graph reflects all available data regardless of date and time constraints. If you change the explorer time range, the graph does not change.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Tip

To constrain the graph so it displays traffic by business relevance and application, hover your pointer over the graph, then click Business Relevance on the toggle button that appears. Click Risk to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Risk view.

Note

If you filter on intrusion event information, the Traffic by Risk/Business and Application graph is hidden.

This graph draws data primarily from the Connection Events and Application Statistics tables.

The Intrusion Events by Risk/Business Relevance and Application Graph

The Intrusion Events by Risk/Business Relevance and Application graph, in donut form, displays a proportional representation of intrusion events detected on your monitored network and the applications associated with
those events, arranged by the applications’ estimated risk (the default) or estimated business relevance. The inner ring divides by estimated risk/business relevance level (such as Medium or High), while the outer ring further divides that data by specific application (such as SSH or NetBIOS). Scarcely detected applications are grouped under Other.

Hover your pointer over any part of the donut graph to view more detailed information. Click any part of the graph to filter or drill down on that information, or (where applicable) to view application information.

Tip
To constrain the graph so it displays intrusion events by business relevance and application, hover your pointer over the graph, then click Business Relevance on the toggle button that appears. Click Risk to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Risk view.

This graph draws data primarily from the Intrusion Events and Application Statistics tables.

The Hosts by Risk/Business Relevance and Application Graph

The Hosts by Risk/Business Relevance and Application graph, in donut form, displays a proportional representation of hosts detected on your monitored network and the applications associated with those hosts, arranged by the applications’ estimated risk (the default) or estimated business relevance. The inner ring divides by estimated risk/business relevance level (such as Medium or High), while the outer ring further divides that data by specific application (such as SSH or NetBIOS). Very scarce applications are grouped under Other.

Hover your pointer over any part of the donut graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Tip
To constrain the graph so it displays hosts by business relevance and application, hover your pointer over the graph, then click Business Relevance on the toggle button that appears. Click Risk to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Risk view.

This graph draws data primarily from the Applications table.

The Application Details List

At the bottom of the Application Information section is the Application Details List, a table that provides estimated risk, estimated business relevance, category, and hosts count information for each application detected on your monitored network. The applications are listed in descending order of associated host count.

The Application Details List table is not sortable, but you can click on any table entry to filter or drill down on that information, or (where applicable) to view application information. This table draws data primarily from the Applications table.

Note that this list reflects all available data regardless of date and time constraints. If you change the explorer time range, the list does not change.

The Security Intelligence Section

The Security Intelligence section of the Context Explorer contains three interactive bar graphs that display an overall picture of traffic on your monitored network that is blacklisted or monitored by Security Intelligence.
The graphs sort such traffic by category, source IP address, and destination IP address, respectively; both the amount of traffic (in kilobytes per second) and the number of applicable connections appear.

**The Security Intelligence Traffic by Category Graph**

The Security Intelligence Traffic by Category graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top Security Intelligence categories of traffic on your monitored network. For each category listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to drill down on that information.

---

**Note**

If you filter on intrusion event information, the Security Intelligence Traffic by Category graph is hidden.

This graph draws data primarily from the Security Intelligence Events table.

---

**The Security Intelligence Traffic by Source IP Graph**

The Security Intelligence Traffic by Source IP graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top source IP addresses of Security Intelligence-monitored traffic on your monitored network. For each category listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to drill down on that information.

---

**Note**

If you filter on intrusion event information, the Security Intelligence Traffic by Source IP graph is hidden.

This graph draws data primarily from the Security Intelligence Events table.

---

**The Security Intelligence Traffic by Destination IP Graph**

The Security Intelligence Traffic by Destination IP graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top destination IP addresses of Security Intelligence-monitored traffic on your monitored network. For each category listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to drill down on that information.

---

**Note**

If you filter on intrusion event information, the Security Intelligence Traffic by Destination IP graph is hidden.

This graph draws data primarily from the Security Intelligence Events table.
The Intrusion Information Section

The Intrusion Information section of the Context Explorer contains six interactive graphs and one table-format list that display an overall picture of intrusion events on your monitored network: impact levels, attack sources, target destinations, users, priority levels, and security zones associated with intrusion events, as well as a detailed list of intrusion event classifications, priorities, and counts.

The Intrusion Events by Impact Graph

The Intrusion Events by Impact graph, in pie form, displays a proportional view of intrusion events on your monitored network, grouped by estimated impact level (from 0 to 4).

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the intrusion detection (IDS Statistics) and Intrusion Events tables.

The Top Attackers Graph

The Top Attackers graph, in bar form, displays counts of intrusion events for the top attacking host IP addresses (causing those events) on your monitored network.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Intrusion Events table.

The Top Users Graph

The Top Users graph, in bar form, displays users on your monitored network that are associated with the highest intrusion event counts, by event count.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the intrusion detection (IDS User Statistics and Intrusion Events tables. It displays authoritative user data.

The Intrusion Events by Priority Graph

The Intrusion Events by Priority graph, in pie form, displays a proportional view of intrusion events on your monitored network, grouped by estimated priority level (such as High, Medium, or Low).

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Intrusion Events table.

The Top Targets Graph

The Top Targets graph, in bar form, displays counts of intrusion events for the top target host IP addresses (targeted in the connections causing those events) on your monitored network.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Intrusion Events table.
The Top Ingress/Egress Security Zones Graph

The Top Ingress/Egress Security Zones graph, in bar form, displays counts of intrusion events associated with each security zone (ingress or egress, depending on graph settings) configured on your monitored network.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Tip
To constrain the graph so it displays only traffic by egress security zone, hover your pointer over the graph, then click Egress on the toggle button that appears. Click Ingress to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Ingress view.

This graph draws data primarily from the Intrusion Events table.

You can configure this graph to display either ingress (the default) or egress security zone information, according to your needs.

The Intrusion Event Details List

At the bottom of the Intrusion Information section is the Intrusion Event Details List, a table that provides classification, estimated priority, and event count information for each intrusion event detected on your monitored network. The events are listed in descending order of event count.

The Intrusion Event Details List table is not sortable, but you can click on any table entry to filter or drill down on that information. This table draws data primarily from the Intrusion Events table.

The Files Information Section

The Files Information section of the Context Explorer contains six interactive graphs that display an overall picture of file and malware events on your monitored network.

Five of the graphs display data related to AMP for Networks (formerly called AMP for Firepower): the file types, file names, and malware dispositions of the files detected in network traffic, as well as the hosts sending (uploading) and receiving (downloading) those files. The final graph displays all malware threats detected in your organization, whether by AMP for Networks or AMP for Endpoints.

Note
If you filter on intrusion information, the entire Files Information Section is hidden.

The Top File Types Graph

The Top File Types graph, in donut form, displays a proportional view of the file types detected in network traffic (outer ring), grouped by file category (inner ring).

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note that you must have a Malware license to for this graph to display AMP for Networks data.

This graph draws data primarily from the File Events table.
The Top File Names Graph

The Top File Names graph, in bar form, displays counts of the top unique file names detected in network traffic.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note that you must have a Malware license to for this graph to display AMP for Networks data.

This graph draws data primarily from the File Events table.

The Files by Disposition Graph

The Files by Disposition Graph in pie form, displays a proportional view of the malware dispositions for files detected by the AMP for Networks feature (formerly called AMP for Firepower). Note that only files for which the Firepower Management Center performed a malware cloud lookup have dispositions. Files that did not trigger a cloud lookup have a disposition of N/A. The disposition Unavailable indicates that the Firepower Management Center could not perform a malware cloud lookup.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note that you must have a Malware license to for this graph to display AMP for Networks data.

This graph draws data primarily from the File Events table.

The Top Hosts Sending Files Graph

The Top Hosts Sending Files graph, in bar form, displays counts of the number of files detected in network traffic for the top file-sending host IP addresses.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Tip

To constrain the graph so it displays only hosts sending malware, hover your pointer over the graph, then click Malware on the toggle button that appears. Click Files to return to the default files view. Note that navigating away from the Context Explorer also returns the graph to the default files view.

Note that you must have a Malware license to for this graph to display AMP for Networks data.

This graph draws data primarily from the File Events table.

The Top Hosts Receiving Files Graph

The Top Hosts Receiving Files graph, in bar form, displays counts of the number of files detected in network traffic for the top file-receiving host IP addresses.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.
To constrain the graph so it displays only hosts receiving malware, hover your pointer over the graph, then click **Malware** on the toggle button that appears. Click **Files** to return to the default files view. Note that navigating away from the Context Explorer also returns the graph to the default files view.

Note that you must have a Malware license to for this graph to display AMP for Networks data.

This graph draws data primarily from the File Events table.

### The Top Malware Detections Graph

The Top Malware Detections graph, in bar form, displays counts of the top malware threats detected in your organization, whether by AMP for Networks or AMP for Endpoints.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note that you must have a Malware license to for this graph to display AMP for Networks data.

This graph draws data primarily from the File Events and Malware Events tables.

### The Geolocation Information Section

The Geolocation Information section of the Context Explorer contains three interactive donut graphs that display an overall picture of countries with which hosts on your monitored network are exchanging data: unique connections by initiator or responder country, intrusion events by source or destination country, and file events by sending or receiving country.

#### The Connections by Initiator/Responder Country Graph

The Connections by Initiator/Responder Country graph, in donut form, displays a proportional view of the countries involved in connections on your network as either the initiator (the default) or the responder. The inner ring groups these countries together by continent.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

To constrain the graph so it displays only countries acting as the responder in connections, hover your pointer over the graph, then click **Responder** on the toggle button that appears. Click **Initiator** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Initiator view.

This graph draws data primarily from the Connection Summary Data table.

#### The Intrusion Events by Source/Destination Country Graph

The Intrusion Events by Source/Destination Country graph, in donut form, displays a proportional view of the countries involved in intrusion events on your network as either the source of the event (the default) or the destination. The inner ring groups these countries together by continent.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.
To constrain the graph so it displays only countries acting as the destinations of intrusion events, hover your pointer over the graph, then click **Destination** on the toggle button that appears. Click **Source** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Source view.

This graph draws data primarily from the Intrusion Events table.

### The File Events by Sending/Receiving Country Graph

The File Events by Sending/Receiving Country graph, in donut form, displays a proportional view of the countries detected in file events on your network as either sending (the default) or receiving files. The inner ring groups these countries together by continent.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

To constrain the graph so it displays only countries receiving files, hover your pointer over the graph, then click **Receiver** on the toggle button that appears. Click **Sender** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Sender view.

This graph draws data primarily from the File Events table.

### The URL Information Section

The URL Information section of the Context Explorer contains three interactive bar graphs that display an overall picture of URLs with which hosts on your monitored network are exchanging data: traffic and unique connections associated with URLs, sorted by individual URL, URL category, and URL reputation. You cannot filter on URL information.

If you filter on intrusion event information, the entire URL Information Section is hidden.

Note that you must have a URL Filtering license for this graph to include URL category and reputation data.

### The Traffic by URL Graph

The Traffic by URL graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top 15 most requested URLs on your monitored network. For each URL listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to drill down on that information.

If you filter on intrusion event information, the Traffic by URL graph is hidden.

Note that you must have a URL Filtering license for this graph to include URL category and reputation data.
The Traffic by URL Category Graph

This graph draws data primarily from the Connection Events table.

The Traffic by URL Category Graph

The Traffic by URL Category graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the most requested URL categories (such as Search Engines or Streaming Media) on your monitored network. For each URL category listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to drill down on that information.

Note

If you filter on intrusion event information, the Traffic by URL Category graph is hidden.

Note that you must have a URL Filtering license for this graph to include URL category and reputation data.

This graph draws data primarily from the URL Statistics and Connection Events tables.

The Traffic by URL Reputation Graph

The Traffic by URL Reputation graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the most requested URL reputation groups (such as Well Known or Benign sites with security risks) on your monitored network. For each URL reputation listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to drill down on that information.

Note

If you filter on intrusion event information, the Traffic by URL Reputation graph is hidden.

Note that you must have a URL Filtering license for this graph to include URL category and reputation data.

This graph draws data primarily from the URL Statistics and Connection Events tables.

Refreshing the Context Explorer

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

The Context Explorer does not automatically update the information it displays. To incorporate new data, you must manually refresh the explorer.

Note that, although reloading the Context Explorer itself (by refreshing the browser program or navigating away from, then back to, the Context Explorer) refreshes all displayed information, this does not preserve any changes you made to section configuration (such as the Ingress/Egress graphs and the Application Information section) and may cause delays in loading.
In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose *Analysis > Context Explorer*.

**Step 2** Click *Reload* at the upper right.

*Reload* is dimmed until your refresh is finished.

---

### Setting the Context Explorer Time Range

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can configure the Context Explorer time range to reflect a period as short as the last hour (the default) or as long as the last year. Note that when you change the time range, the Context Explorer does not automatically update to reflect the change. To apply the new time range, you must manually refresh the explorer.

Changes to the time range persist even if you navigate away from the Context Explorer or end your login session.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose *Analysis > Context Explorer*.

**Step 2** From the *Show the last* drop-down list, choose a time range.

**Step 3** Optionally, to view data from the new time range, click *Reload*.

**Tip** Clicking *Apply Filters* also applies any time range updates.

---

### Minimizing and Maximizing Context Explorer Sections

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
You can minimize and hide one or more sections of the Context Explorer. This is useful if you want to focus on only certain sections, or if you want a simpler view. You cannot minimize the Traffic and Intrusion Event Counts Time Graph.

Context Explorer sections retain the minimized or maximized states that you configure even if you refresh the page or log out of the appliance.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose Analysis > Context Explorer.

**Step 2** To minimize a section, click minimize (-) in a section’s title bar.

**Step 3** To maximize a section, click maximize (□) in a minimized section’s title bar.

### Drilling Down on Context Explorer Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

If you want to examine graph or list data in more detail than the Context Explorer allows, you can drill down to the table views of the relevant data. (Note that you cannot drill down on the Traffic and Intrusion Events over Time graph.) For example, drilling down on an IP address in the Traffic by Source IP graph displays the Connections with Application Details view of the Connection Events table, including only data associated with the source IP address you selected.

Depending on the type of data you examine, additional options can appear in the context menu. Data points that are associated with specific IP addresses offer the option to view host or whois information on the IP address you select. Data points associated with specific applications offer the option to view application information on the application you select. Data points associated with a specific user offer the option to view that user’s user profile page. Data points associated with an intrusion event message offer the option to view the rule documentation for that event’s associated intrusion rule, and data points associated with a specific IP address offer the option to blacklist or whitelist that address.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose Analysis > Context Explorer.

**Step 2** In any section but Traffic and Intrusion Events over Time, click a data point that you want to investigate.

**Step 3** Depending on the data point you selected, you have several options:
• To view more details of this data in a table view, choose Drill into Analysis.
• If you chose a data point associated with a specific IP address and want more information about the associated host, choose View Host Information.
• If you chose a data point with a specific IP address and want to make a whois search on that address, choose Whois.
• If you chose a data point associated with a specific application and want more information about that application, choose View Application Information.
• If you chose a data point associated with a specific user and want more information about that user, choose View User Information.
• If you chose a data point associated with a specific intrusion event message and want more information about the associated intrusion rule, choose View Rule Documentation.
• If you chose a data point associated with a specific IP address and want to add that IP address to the Security Intelligence global blacklist or whitelist, choose the appropriate option: Blacklist Now or Whitelist Now.

Filters in the Context Explorer

Beyond the basic, wide-ranging data that the Context Explorer initially displays, you have the option to filter that data for a more granular contextual picture of activity on your network. Filters encompass all types of Firepower System data except URL information, support exclusion as well as inclusion, can be applied quickly by clicking on Context Explorer graph data points, and affect the entire explorer. You can apply up to 20 filters at a time.

You can add filters to Context Explorer data in several ways:

• from the Add Filter dialog
• from the context menu, when you select a data point in the explorer
• from the text links that appear in certain detail view pages (Application Detail, Host Profile, Rule Detail, and User Profile). Clicking these links automatically opens and filters the Context Explorer according to the relevant data on the detail view page. For example, clicking the Context Explorer link on a user detail page for the user jenkins constrains the explorer to show only data associated with that user.

Some filter types are incompatible with others: for example, filters that relate to intrusion events (such as Device and Inline Result) cannot be applied at the same time as connection event-related filters (such as Access Control Action) because the system cannot sort connection event data by intrusion event data. The system automatically prevents incompatible filters from simultaneously applying; when one filter type is more recently activated, filters of the incompatible type are hidden as long as the incompatibility exists.

When multiple filters are active, values for the same data type are treated as OR search criteria: all data that matches at least one of the values appears. Values for different data types are treated as AND search criteria: to appear, data must match at least one value for each filtered data type. For example, data that appears for the filter set of Application: 2channel, Application: Reddit, and User: edickinson must be associated with the user edickinson AND either the application 2channel OR the application Reddit.

In a multidomain deployment, you can filter by multiple descendant domains when viewing the Context Explorer in an ancestor domain. In such cases, use caution when also adding IP Address filters. The system builds a separate network map for each leaf domain. Using literal IP addresses to constrain this configuration can have unexpected results.
Note that the data displayed depends on such factors as how you license and deploy your managed devices and whether you configure features that provide the data.

Filters function as a simple, agile tool to get the precise Firepower data context you need at any given time. They are not intended as permanent configuration settings, and disappear when you navigate away from the Context Explorer or end your session. To preserve filter settings for later use, see Saving Filtered Context Explorer Views, on page 2039.

### Data Type Field Options

The following table lists the data types available as filters, with examples and brief definitions of each.

<table>
<thead>
<tr>
<th>Type</th>
<th>Example Values</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Control Action</td>
<td>Allow, Block</td>
<td>Action taken by your access control policy to allow or block traffic.</td>
</tr>
<tr>
<td>Application Category</td>
<td>web browser, email</td>
<td>General classification of an application’s most essential function.</td>
</tr>
<tr>
<td>Application Name</td>
<td>Facebook, HTTP</td>
<td>Name of an application.</td>
</tr>
<tr>
<td>Application Risk</td>
<td>Very High, Medium</td>
<td>Estimated security risk of an application.</td>
</tr>
<tr>
<td>Application Tag</td>
<td>encrypts communications, sends mail</td>
<td>Additional information about an application; applications can have any number of tags, including none.</td>
</tr>
<tr>
<td>Application Type</td>
<td>Client, Web Application</td>
<td>Type of an application: application protocol, client, or web application.</td>
</tr>
<tr>
<td>Business Relevance</td>
<td>Very Low, High</td>
<td>Estimated relevance of an application to business activity (as opposed to recreation).</td>
</tr>
<tr>
<td>Continent</td>
<td>North America, Asia</td>
<td>Continent associated with a routable IP address detected on your monitored network.</td>
</tr>
<tr>
<td>Country</td>
<td>Canada, Japan</td>
<td>Country associated with a routable IP address detected on your monitored network.</td>
</tr>
<tr>
<td>Device</td>
<td>device1.example.com, 192.168.1.3</td>
<td>Name or IP address of a device on your monitored network.</td>
</tr>
<tr>
<td>Domain</td>
<td>Asia Division, Europe Division</td>
<td>The domain of the device whose network activity you want to graph. This data type is only present in a multidomain deployment.</td>
</tr>
<tr>
<td>Type</td>
<td>Example Values</td>
<td>Definition</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Event Classification</td>
<td>Potential Corporate Policy Violation, Attempted Denial of Service</td>
<td>Capsule description of an intrusion event, determined by the classification of the rule, decoder, or preprocessor that triggered it.</td>
</tr>
<tr>
<td>Event Message</td>
<td>dns response, P2P</td>
<td>Message generated by an event, determined by the rule, decoder, or preprocessor that triggered it.</td>
</tr>
<tr>
<td>File Disposition</td>
<td>Malware, Clean</td>
<td>Disposition of a file for which the Firepower Management Center performed a malware cloud lookup.</td>
</tr>
<tr>
<td>File Name</td>
<td>Packages.bz2</td>
<td>Name of a file detected in network traffic.</td>
</tr>
<tr>
<td>File SHA256</td>
<td>any 32-bit string</td>
<td>SHA-256 hash value of a file for which the Firepower Management Center performed a malware cloud lookup.</td>
</tr>
<tr>
<td>File Type</td>
<td>GZ, SWF, MOV</td>
<td>File type detected in network traffic.</td>
</tr>
<tr>
<td>File Type Category</td>
<td>Archive, Multimedia, Executables</td>
<td>General category of file type detected in network traffic.</td>
</tr>
<tr>
<td>IP Address</td>
<td>192.168.1.3, 2001:0db8:85a3::0000/24</td>
<td>IPv4 or IPv6 addresses, address ranges, or address blocks. Note that searching for an IP address returns events where that address was either the source or the destination for the event.</td>
</tr>
<tr>
<td>Impact Level</td>
<td>Impact Level 1, Impact Level 2</td>
<td>Estimated impact of an event on your monitored network.</td>
</tr>
<tr>
<td>Inline Result</td>
<td>dropped, would have dropped</td>
<td>Whether traffic was dropped, would have been dropped, or was not acted upon by the system.</td>
</tr>
<tr>
<td>IOC Category</td>
<td>High Impact Attack, Malware Detected</td>
<td>Category for a triggered Indication of Compromise (IOC) event.</td>
</tr>
<tr>
<td>IOC Event Type</td>
<td>exploit-kit, malware-backdoor</td>
<td>Identifier associated with a specific Indication of Compromise (IOC), referring to the event that triggers it.</td>
</tr>
<tr>
<td>Malware Threat Name</td>
<td>W32.Trojan.a6b1</td>
<td>The name of a malware threat.</td>
</tr>
<tr>
<td>OS Name</td>
<td>Windows, Linux</td>
<td>Name of an operating system.</td>
</tr>
<tr>
<td>OS Version</td>
<td>XP, 2.6</td>
<td>Specific version of an operating system.</td>
</tr>
<tr>
<td>Priority</td>
<td>high, low</td>
<td>Estimated urgency of an event.</td>
</tr>
</tbody>
</table>
Creating a Filter from the Add Filter Window

<table>
<thead>
<tr>
<th>Type</th>
<th>Example Values</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Intelligence Category</td>
<td>Malware, Spam</td>
<td>Category of risky traffic, as determined by Security Intelligence.</td>
</tr>
<tr>
<td>Security Zone</td>
<td>My Security Zone, Security Zone X</td>
<td>A set of interfaces through which traffic is analyzed and, in an inline deployment, passes.</td>
</tr>
<tr>
<td>SSL</td>
<td>yes, no</td>
<td>SSL- or TLS-encrypted traffic.</td>
</tr>
<tr>
<td>User</td>
<td>wsmith, mtwain</td>
<td>Identity of a user logged in to a host on your monitored network.</td>
</tr>
</tbody>
</table>

Use this procedure to create filters from scratch with the Add Filter window. (You can also use the context menu to create quick filters.)

The Add Filter window, which you access by clicking plus (+) under Filters at the top left of the Context Explorer, contains only two fields:

- The Data Type drop-down list contains many different types of Firepower System data you can use to constrain the Context Explorer. After you select a data type, you then enter a specific value for that type in the Filter field (for example, a value of Asia for the type Continent). To assist you, the Filter field presents several grayed-out example values for the data type you select. (These are erased when you enter data in the field.)

- In the Filter field, you can input special search parameters such as * and ! essentially as you can in event searches. You can create exclusionary filters by prefixing filter parameters with the ! symbol.

**Note**

Filters that you add are not automatically applied; you must click Apply Filters to see the filtering in the Context Explorer.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose Analysis > Context Explorer.

**Step 2** Under Filters at the top left, click plus (+).

**Step 3** From the Data Type drop-down list, choose the data type you want to filter on.
Step 4: In the Filter field, enter the data type value you want to filter on.

Step 5: Click OK.

Step 6: Optionally, repeat the previous steps to add more filters until you have the filter set you need.

Step 7: Click Apply Filters.

Creating a Quick Filter from the Context Menu

<table>
<thead>
<tr>
<th>Access</th>
<th>Supported Domains</th>
<th>Supported Devices</th>
<th>Classic License</th>
<th>Smart License</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin/Any Security Analyst</td>
<td>Any</td>
<td>Any</td>
<td>feature dependent</td>
<td>feature dependent</td>
</tr>
</tbody>
</table>

While exploring Context Explorer graph and list data, you can click on data points, then use the context menu to quickly create a filter based on that data, either inclusive or exclusive. If you use the context menu to filter on information of data type Application, User, or Intrusion Event Message, or any individual host, the filter widget includes a widget information that links to the relevant detail page for that data type (such as Application Detail for application data). Note that you cannot filter on URL data.

You can also use the context menu to investigate specific graph or list data in more detail.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

Step 1: Choose Analysis > Context Explorer.

Step 2: In any explorer section except Traffic and Intrusion Events over Time or sections that contain URL data, click a data point you want to filter on.

Step 3: You have two options:
  - To add a filter for this data, click Add Filter.
  - To add an exclusion filter for this data, click Add Exclude Filter. The filter, when applied, displays all data not associated with the excluded value. Exclude filters display an exclamation point (!) before the filter value.

Saving Filtered Context Explorer Views

To preserve filter settings in the Context Explorer after you navigate away from the Context Explorer or end your session, create a browser bookmark of the Context Explorer with your preferred filters applied. Because applied filters are incorporated in the Context Explorer page URL, loading a bookmark of that page also loads the corresponding filters.
Viewing Filter Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

Step 1 Choose Analysis > Context Explorer.

Step 2 Click information (𝑖) on any eligible filter widget.

Deleting a Filter

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1 Choose Analysis > Context Explorer.

Step 2 Under Filters at the top left, click clear (𝑥) on any filter widget.

Tip If you want to delete all filters at once, you can click Clear.
Using the Network Map

The following topics describe how to use the network map:

- The Network Map, on page 2041
- Custom Network Topologies, on page 2047

The Network Map

The Firepower System monitors traffic traveling over your network, decodes the traffic data, and then compares the data to established operating systems and fingerprints. The system then uses this data to build a detailed representation of your network, called a network map. In multidomain deployments, the system creates an individual network map for each leaf domain.

The system gathers data from the managed devices identified for monitoring in the network discovery policy. The managed devices detect network assets directly from monitored traffic and indirectly from processed NetFlow records. If multiple devices detect the same network asset, the system combines the information into a composite representation of the asset.

To augment data from passive detection, you can:

- Actively scan hosts using the open-source scanner, Nmap™, and add the scan results to your network map.

- Manually add host data from a third-party application using the host input feature.

The network map displays your network topology in terms of detected hosts and network devices.

You can use the network map to:

- Obtain a quick, overall view of your network.

- Select different views to suit the analysis you want to perform. Each view of the network map has the same format: a hierarchical tree with expandable categories and sub-categories. When you click a category, it expands to show you the sub-categories beneath it.

- Organize and identify subnets via the custom topology feature. For example, if each department in your organization uses a different subnet, you can assign familiar labels to those subnets using the custom topology feature.

- View detailed information by drilling down to any monitored host's host profile.

- Delete an asset if you are no longer interested in investigating it.
If the system detects activity associated with a host you deleted from a network map, it re-adds the host to the network map. Similarly, deleted applications are re-added to the network map if the system detects a change in the application (for example, if an Apache web server is upgraded to a new version). Vulnerabilities are reactivated on specific hosts if the system detects a change that makes the host vulnerable.

Note

If you want to permanently exclude a host or subnet from the network map, modify the network discovery policy. You may wish to exclude load balancers and NAT devices from monitoring if you find that they are generating excessive or irrelevant events.

Tip

Related Topics

Configuring the Network Discovery Policy, on page 1842

The Hosts Network Map

The network map on the Hosts tab displays a host count and a list of host IP addresses and primary MAC addresses. Each address or partial address is a link to the next level. This network map view provides a count of all unique hosts detected by the system, regardless of whether the hosts have one IP address or multiple IP addresses.

Use the hosts network map to view the hosts on your network, organized by subnet in a hierarchical tree, as well as to drill down to the host profiles for specific hosts.

The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1742.

By creating a custom topology for your network, you can assign meaningful labels to your subnets, such as department names, that appear in the hosts network map. You can also view the hosts network map according to the organization you specified in the custom topology.

You can delete entire networks, subnets, or individual hosts from the hosts network map. For example, if you know that a host is no longer attached to your network, you can delete it to simplify your analysis. If the system afterwards detects activity associated with the deleted host, it re-adds the host to the network map. If you want to permanently exclude a host or subnet from the network map, modify the network discovery policy.

Caution

Do not delete network devices from the network map. The system uses them to determine network topology.

On the hosts network map page, you can search only for primary MAC addresses, and the Hosts [MAC] counter includes only primary MAC addresses. For descriptions of primary and secondary MAC addresses, see Basic Host Information in the Host Profile, on page 2257.

The Network Devices Network Map

The network map on the Network Devices tab displays the network devices (bridges, routers, NAT devices, and load balancers) that connect one segment of your network to another. The map contains two sections listing devices identified by an IP address and devices identified by a MAC address.
The map also provides a count of all unique network devices detected by the system, regardless of whether the devices have one IP address or multiple IP addresses.

If you create a custom topology for your network, the labels you assign to your subnets appear in the network devices network map.

The methods the system uses to distinguish network devices include:

- the analysis of Cisco Discovery Protocol (CDP) messages, which can identify network devices and their types (Cisco devices only)
- the detection of the Spanning Tree Protocol (STP), which identifies a device as a switch or bridge
- the detection of multiple hosts using the same MAC address, which identifies the MAC address as belonging to a router
- the detection of TTL value changes from the client side, or TTL values that change more frequently than a typical boot time, which identify NAT devices and load balancers

If a network device communicates using CDP, it may have one or more IP addresses. If it communicates using STP, it may only have a MAC address.

You cannot delete network devices from the network map, because the system uses their locations to determine network topology.

The host profile for a network device has a Systems section rather than an Operating Systems section, which includes a Hardware column that reflects the hardware platform for any mobile devices detected behind the network device. If a value for a hardware platform is listed under Systems, that system represents a mobile device or devices detected behind the network device. Note that mobile devices may or may not have hardware platform information, but hardware platform information is never detected for systems that are not mobile devices.

---

The Mobile Devices Network Map

The network map on the Mobile Devices tab displays mobile devices attached to your network. This network map also provides a count of all unique mobile devices detected by the system, regardless of whether the devices have one IP address or multiple IP addresses.

Each address or partial address is a link to the next level. You can also delete a subnet or IP address; if the system rediscovers the device, it re-adds the device to the network map.

You can also drill down to view the host profiles for the mobile devices.

To identify mobile devices, the system:

- analyzes User-Agent strings in HTTP traffic from the mobile device’s mobile browser
- monitors the HTTP traffic of specific mobile applications

If you create a custom topology for your network, the labels you assign to your subnets appear in the mobile devices network map.
The Indications of Compromise Network Map

The network map on the Indications of Compromise tab displays the compromised hosts on your network, organized by IOC category. Affected hosts are listed beneath each category. Each address or partial address is a link to the next level.

From the indications of compromise network map, you can view the host profile of each host determined to have been compromised in a specific way. You can also delete (mark as resolved) any IOC category or any specific host, which removes the IOC tag from the relevant hosts. For example, you can delete an IOC category from the network map if you have determined that the issue is addressed and unlikely to recur.

Marking a host or IOC category resolved from the network map does not remove it from your network. A resolved host or IOC category reappears in the network map if your system newly detects information that triggers that IOC.

For more information about how the system determines indications of compromise, see Indications of Compromise Data, on page 2306 and subtopics.

The Application Protocols Network Map

The network map on the Application Protocols tab displays the applications running on your network, organized in a hierarchical tree by application name, vendor, version, and finally by the hosts running each application.

The applications that the system detects may change with system software and VDB updates, and if you import any add-on detectors. The release notes or advisory text for each system or VDB update contains information on any new and updated detectors. For a comprehensive up-to-date list of detectors, see the Cisco Support Site (http://www.cisco.com/cisco/web/support/index.html).

From this network map, you can view the host profile of each host that runs a specific application.

You can also delete any application category, any application running on all hosts, or any application running on a specific host. For example, you can delete an application from the network map if you know it is disabled on the host and you want to make sure the system does not use it for impact level qualification.

Deleting an application from the network map does not remove it from your network. A deleted application reappears in the network map if your system detects a change in the application (for example, if an Apache web server is upgraded to a new version) or if you restart your system’s discovery function.

Depending on what you delete, the behavior differs:

- Application Category — Deleting removes the application category from the network map. All applications that reside beneath the category are removed from any host profile that contains the applications.
  
  For example, if you delete http, all applications identified as http are removed from all host profiles and http no longer appears in the applications view of the network map.

- Specific Application, Vendor, or Version — Deleting removes the affected application from the network map and from any host profiles that contain it.
  
  For example, if you expand the http category and delete Apache, all applications listed as Apache with any version listed beneath Apache are removed from any host profiles that contain them. Similarly, if instead of deleting Apache, you delete a specific version (1.3.17, for example), only the version you selected will be deleted from affected host profiles.

- Specific IP Address — Deleting the IP address removes it from the application list and removes the application itself from the host profile of the IP address you selected.
For example, if you expand http, Apache, 1.3.17 (Win32), and then delete 172.16.1.50:80/tcp, the Apache 1.3.17 (Win32) application is deleted from the host profile of IP address 172.16.1.50.

## The Vulnerabilities Network Map

The network map on the Vulnerabilities tab displays vulnerabilities that the system has detected on your network, organized by legacy vulnerability ID (SVID), Bugtraq ID, CVE ID, or Snort ID. By default, vulnerabilities are displayed by SVID. The vulnerabilities are arranged by identification number, with affected hosts listed beneath each vulnerability.

From this network map, you can view the details of specific vulnerabilities, as well as the host profile of any host subject to a specific vulnerability. This information can help you evaluate the threat posed by that vulnerability to specific affected hosts.

If you determine that a specific vulnerability is not applicable to the hosts on your network (for example, you have applied a patch), you can deactivate the vulnerability. Deactivated vulnerabilities still appear on the network map, but the IP addresses of their previously affected hosts appear in gray italics. The host profiles for those hosts show deactivated vulnerabilities as invalid, though you can manually mark them as valid for individual hosts.

If there is an identity conflict for an application or operating system on a host, the system lists the vulnerabilities for both potential identities. When the identity conflict is resolved, the vulnerabilities remain associated with the current identity.

By default, the network map displays the vulnerabilities of a detected application only if the packet contains the application’s vendor and version. However, you can configure the system to list the vulnerabilities for applications lacking vendor and version data by enabling the vulnerability mapping setting for the application in the Firepower Management Center configuration.

The numbers next to a vulnerability ID (or range of vulnerability IDs) represent two counts:

### Affected Hosts

The first number is a count of non-unique hosts that are affected by a vulnerability or vulnerabilities. If a host is affected by more than one vulnerability, it is counted multiple times. Therefore, it is possible for the count to be higher than the number of hosts on your network. Deactivating a vulnerability decrements this count by the number of hosts that are potentially affected by the vulnerability. If you have not deactivated any vulnerabilities for any of the potentially affected hosts for a vulnerability or range of vulnerabilities, this count is not displayed.

### Potentially Affected Hosts

The second number is a count of the total number of non-unique hosts that the system has determined are potentially affected by a vulnerability or vulnerabilities.

Deactivating a vulnerability renders it inactive only for the hosts you designate. You can deactivate a vulnerability for all hosts that have been judged vulnerable or for a specified individual vulnerable host. After a vulnerability is deactivated, the applicable hosts’ IP addresses appear in gray italics in the network map. In addition, host profiles for those hosts show deactivated vulnerabilities as invalid.

If the system subsequently detects the vulnerability on a host where it has not been deactivated (for example, on a new host in the network map), the system activates the vulnerability for that host. You have to explicitly deactivate the newly discovered vulnerability. Also, if the system detects an operating system or application change for a host, it may reactivate associated deactivated vulnerabilities.
The Host Attributes Network Map

The network map on the Host Attributes tab displays the hosts on your network organized by either user-defined
or compliance white list host attributes. You cannot organize hosts using predefined host attributes in this
display.

When you choose the host attribute you want to use to organize your hosts, the Firepower Management Center
lists the possible values for that attribute in the network map and groups hosts based on their assigned values.
For example, if you choose to organize your hosts by white list host attributes, the system displays them in
categories of Compliant, Non-Compliant, and Not Evaluated.

You can also view the host profile of any host assigned a specific host attribute value.

Related Topics

Host Attributes in the Host Profile, on page 2272

Viewing Network Maps

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1  Choose Analysis > Hosts > Network Map.
Step 2  Click the network map you want to view.
Step 3  Continue as appropriate:

• Choose Domain — In multidomain environments, choose a leaf domain from the Domain drop-down list.
• Filter Hosts — If you want to filter by IP or MAC addresses, enter an address into the search field. To clear the search, click clear ( X ).
• Drill Down — If you want to investigate a category or host profile, drill down through the categories or subnets in the map. If you have defined a custom topology, click (topology) from Hosts to view it, then click on (hosts) if you want to toggle back to the default view.
• Delete — Click delete ( ) next to the appropriate element to:

  • Remove an element from the map on Hosts, Network Devices, Mobile Devices, or Application Protocols.
  • Mark an IOC category, compromised host, or group of compromised hosts resolved on Indications of Compromise.
  • Deactivate a vulnerability for all hosts or a single host on Vulnerabilities.

  • Specify Vulnerabilities Class — On Vulnerabilities, choose the class of vulnerabilities you want to view from the Type drop-down list.
• Specify Organizing Attribute — On Host Attributes, choose an attribute from the Attribute drop-down list.

- Host Profiles, on page 2255

Custom Network Topologies

Use the custom topology feature to help you organize and identify subnets in your hosts and network devices network maps.

For example, if each department within your organization uses a different subnet, you can label those subnets using the custom topology feature.

You can also view the hosts network map according to the organization you specified in the custom topology.

You can specify a custom topology’s networks using any or all of the following strategies:

• You can import networks from the network discovery policy to add the networks that you configured the system to monitor.

• You can add networks to your topology manually.

The Custom Topology page lists your custom topologies and their status. If the light bulb icon next to the policy name is lit, the topology is active and affects your network map. If it is dimmed, the topology is inactive.

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1 Choose Policies > Network Discovery.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2**  
Click **Custom Topology** in the toolbar.

**Step 3**  
Click **Create Topology**.

**Step 4**  
Enter a **Name**.

**Step 5**  
Optionally, enter a **Description**.

**Step 6**  
Add networks to your topology. You can use any or all of the following strategies:

- Import networks from a network discovery policy as described in Importing Networks from the Network Discovery Policy, on page 2048.
- Manually add networks as described in Manually Adding Networks to Your Custom Topology, on page 2049.

**Step 7**  
Click **Save**.

---

**What to do next**

- Activate the topology as described in Activating and Deactivating Custom Topologies, on page 2049.

---

### Importing Networks from the Network Discovery Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**  
Access the custom topology to which you want to import the network:

- Create a custom topology; see Creating Custom Topologies, on page 2047.
- Edit an existing custom topology; see Editing Custom Topologies, on page 2050.

**Step 2**  
Click **Import Policy Networks**.

**Step 3**  
Click **Load**. The system displays the topology information for the network discovery policy.

**Step 4**  
Refine your topology:

- Rename a network in the topology by clicking edit (edit) next to the network, typing a name, and clicking **Rename**.
- Remove a network from the topology by clicking delete (delete) and then clicking **OK** to confirm.

**Step 5**  
Click **Save**.

---

**What to do next**

- Activate the topology as described in Activating and Deactivating Custom Topologies, on page 2049.
Manually Adding Networks to Your Custom Topology

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery</td>
</tr>
</tbody>
</table>

Procedure

Step 1
Access the custom topology where you want to add the network:
- Create a custom topology; see Creating Custom Topologies, on page 2047.
- Edit an existing custom topology; see Editing Custom Topologies, on page 2050.

Step 2
Click Add Network.

Step 3
If you want to add a custom label for the network in the hosts and network devices network maps, type a Name.

Step 4
Enter the IP Address and Netmask (IPv4) that represent the network you want to add.

Step 5
Click Add.

Step 6
Click Save.

What to do next
- Activate the topology as described in Activating and Deactivating Custom Topologies, on page 2049.

Changes you make to an active topology take effect immediately.

### Procedure

Step 1  Choose **Policies > Network Discovery**.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 2  Click **Custom Topology**.

Step 3  Click edit (_toolbar) next to the topology you want to edit.

Step 4  Edit the topology as described in *Creating Custom Topologies, on page 2047*.

Step 5  Click **Save**.
Incidents

The following topics describe how to configure incident handling:

- About Incident Handling, on page 2051
- Creating Custom Incident Types, on page 2054
- Creating an Incident, on page 2055
- Editing an Incident, on page 2056
- Generating Incident Reports, on page 2056

About Incident Handling

Incident handling refers to the response an organization takes when a violation of its security policies is suspected. The Firepower System includes features to support you as you collect and process information that is relevant to your investigation of an incident. You can use these features to gather intrusion events and packet data that may be related to the incident. You can also use the incident as a repository for notes about any activity that you take outside of the Firepower System to mitigate the effects of the attack. For example, if your security policies require that you quarantine compromised hosts from your network, you can note that in the incident.

The Firepower System also supports an incident life cycle, allowing you to change an incident’s status as you progress through your response to an attack. When you close an incident, you can note any changes you have made to your security policies as a result of any lessons learned.

Definition of an Incident

Generally, an incident is defined as one or more intrusion events that you suspect are involved in a possible violation of your security policies. In the Firepower System, the term also describes the feature you can use to track your response to an incident.

Some intrusion events are more important than others to the availability, confidentiality, and integrity of your network assets. For example, the port scan detection can keep you informed of port scanning activity on your network. Your security policy, however, may not specifically prohibit port scanning or see it as a high priority threat, so rather than take any direct action, you may instead want to keep logs of any port scanning for later forensic study.

On the other hand, if the system generates events that indicate hosts within your network have been compromised and are participating in distributed denial-of-service (DDoS) attacks, this activity is likely a
clear violation of your security policy, and you should create an incident in the Firepower System to help you track your investigation of these events.

Common Incident Handling Processes

Preparation
You can prepare for incidents in two ways:

• by having clear and comprehensive security policies in place, as well as the hardware and software resources to enforce them
• by having a clearly defined plan to respond to incidents and a properly trained team that can implement the plan

A key part of incident handling is understanding which parts of your network are at the greatest risk. By deploying Firepower System components on those network segments, you can increase your awareness of when and how incidents occur. Also, by taking the time to carefully tune the intrusion policy for each managed device, you can ensure that the events that are generated are of the highest quality.

Detection and Notification
You cannot respond to an incident unless you can detect it. Your incident handling process should note the kinds of security-related events that you can detect and the mechanisms, both software and hardware, that you use to detect them. You should also note where you can detect violations of your security policies. If your network includes segments that are not actively or passively monitored, you need to note that as well.

The managed devices that you deploy on your network are responsible for analyzing the traffic on the segments where they are installed, for detecting intrusions, and for generating events that describe them. Keep in mind that the access control policy you deploy to each of the managed devices governs what kinds of activity they detect and how it is prioritized. You can also set notification options for certain types of intrusion events so that the incident team does not need to sift through hundreds of events. You can specify that you are notified automatically when certain high priority, high severity events are detected.

Investigation and Qualification
Your incident handling process should specify how, after a security incident is detected, an investigation is conducted. In some organizations, junior members of the team triage all the incidents and handle the less severe or lower priority cases themselves, while more senior members of the team handle high severity and high priority incidents. You should carefully outline the escalation process so that each team member understands the criteria for raising an incident’s importance.

Part of the escalation process is tied to understanding how a detected event can affect the security of your network assets. For example, an attack against hosts running Microsoft SQL Server is not a high priority for organizations that use a different database server. Similarly, the attack is less important to you if you use SQL Server on your network, but you are confident that all the servers are patched and are not vulnerable to the attack. However, if someone has recently installed a copy of the vulnerable version of the software (perhaps for testing purposes), you may have a greater problem than a cursory investigation would suggest.

The Firepower System is particularly well suited to supporting the investigation and qualification process. You can create your own event classifications, and then apply them in a way that best describes the vulnerabilities on your network. When traffic on your network triggers an event, that event is automatically
prioritized and qualified for you with special indicators showing which attacks are directed against hosts that are known to be vulnerable.

The incident tracking feature in the Firepower System also includes a status indicator that you can change to show which incidents have been escalated.

**Communication**

All incident handling processes should specify how an incident is communicated between the incident handling team and both internal and external audiences. For example, you should consider what kinds of incidents require management intervention and at what level. Also, your process should outline how and when you communicate with outside organizations. Consider the following:

- Will some incidents require that you notify law enforcement agencies?
- If your hosts are participating in a distributed denial of service (DDoS) against a remote site, will you inform them?
- Do you want to share information with organizations such as the CERT Coordination Center (CERT/CC) or FIRST?

The Firepower System has features that you can use to gather intrusion data in standard formats such as HTML, PDF, and CSV (comma-separated values) so that you can easily share intrusion data with others. For example, CERT/CC collects standard information about security incidents on its web site. CERT/CC looks for the kinds of information that you can easily extract from the Firepower System, such as:

- information about the affected machines, including:
  - the host name and IP
  - the time zone
  - the purpose or function of the host

- information about the sources of the attack, including:
  - the host name and IP
  - the time zone
  - whether you had any contact with an attacker
  - the estimated cost of handling the incident

- a description of the incident, including:
  - dates
  - methods of intrusion
  - the intruder tools involved
  - the software versions and patch levels
  - any intruder tool output
  - the details of vulnerabilities exploited
  - the source of the attack
• any other relevant information

You can also use the comment section of an incident to record when you communicate issues and with whom.

**Containment and Recovery**

Your incident handling process should clearly indicate what steps are taken when a host or other network component is compromised. The range of containment and recovery options stretches from applying patches to vulnerable hosts to shutting down the target and removing it from the network. You should also consider the importance, depending upon the nature and severity of the attack, of preserving evidence in case you pursue criminal charges.

You can use the incident feature of Firepower System to maintain a record of the actions you take during the containment and recovery phase of the incident.

**Lessons Learned**

Each security incident, whether or not it is a successful attack, is an opportunity to review your security policies. Do you need to update your firewall rules? Do you need a more structured approach to patch management? Are unauthorized wireless access points a new security issue? Each lesson learned should feed back into your security policies and help you prepare better for the next incident.

### Incident Types in the Firepower System

You can assign an incident type to each incident you create. The following types are supported by default in the Firepower System:

- Intrusion
- Denial of Service
- Unauthorized Admin Access
- Web Site Defacement
- Compromise of System Integrity
- Hoax
- Theft
- Damage
- Unknown

You can also create your own incident types.

### Creating Custom Incident Types

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>
Creating an Incident

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can view and modify incidents created in the current domain only. In an ancestor domain, you can add events to incidents from any descendant domains.

Procedure

Step 1 Choose Analysis > Intrusions > Incidents.
Step 2 Click Create Incident.
Step 3 From the Type drop-down menu, choose the option that best describes the incident.
Step 4 In the Time Spent field, enter the amount of time you spent on the incident in the #d #h #m #s format, where 
# represents the number of days, hours, minutes, or seconds.
Step 5 In the Summary text box, enter a short description of the incident (up to 255 alphanumeric characters, spaces, and symbols).
Step 6 In the Add Comment text box, enter a more complete description for the incident (up to 8191 alphanumeric characters, spaces, and symbols).
Step 7 Add events to the incident:
  • To add a selection of events, choose the events on the clipboard, and click Add to Incident.
  • To add all events from the clipboard, click Add All to Incident.

Note If you want to add individual events from more than one page on the clipboard, you must add the events from one page, then add the events from the other pages separately.

Step 8 Click Save.
Editing an Incident

In a multidomain deployment, you can view and modify incidents created in the current domain only. In an ancestor domain, you can add events to an incident from any descendant domains.

Procedure

**Step 1** Choose **Analysis > Intrusions > Incidents**.

**Step 2** Click edit (✍️) next to the incident you want to edit.

**Step 3** You can edit any of the following aspects of the incident:
- change the status
- change the type
- add events from the clipboard
- delete events

**Step 4** In the **Time Spent** field, enter the amount of additional time you spent on the incident.

**Step 5** In the **Add Comment** text box, indicate your changes to the incident (up to 8191 alphanumeric characters, spaces and symbols) for the incident.

**Step 6** Optionally, you can add or delete events from the incident:
- To add events from the clipboard, choose the events on the clipboard and click **Add to Incident**.
- To add all the events from the clipboard, click **Add All to Incident**.
- To delete specific events from the incident, choose the events and click **Delete**.
- To delete all events from the incident, click **Delete All**.
- To update the incident without adding or deleting events, click **Save**.

Generating Incident Reports

You can use the Firepower System to generate incident reports. These reports can include the incident summary, incident status, and any comments along with information from the events you add to the incident. You can also specify whether you want to include event summary information in the report.
### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Analysis &gt; Intrusions &gt; Incidents.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Click edit (📝) next to the incident you want to include in your report.</td>
</tr>
<tr>
<td>Step 3</td>
<td>You have two options:</td>
</tr>
<tr>
<td></td>
<td>• To include all the events from the incident in the report, click <strong>Generate Report All</strong>.</td>
</tr>
<tr>
<td></td>
<td>• To include specific events from the incident in the report, check the check boxes next to the events you want, and click <strong>Generate Report</strong>.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Enter a name for the report.</td>
</tr>
<tr>
<td>Step 5</td>
<td>In <strong>Incident Report Sections</strong>, check the check boxes for the portions of the incident that you want to include in the report: <strong>status</strong>, <strong>summary</strong>, and <strong>comments</strong>.</td>
</tr>
<tr>
<td>Step 6</td>
<td>If you want to include event information in the report, choose the workflow you want to use and then, in <strong>Report Sections</strong>, specify whether you want to include event summary information.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Check the check boxes next to the workflow pages you want to include in the report.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Check the check boxes next to the output formats you want to use for the report: <strong>PDF</strong>, <strong>HTML</strong>, and <strong>CSV</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> CSV-based incident reports include only event information. They do <strong>not</strong> include the status, summary, or comments from the incident.</td>
</tr>
<tr>
<td>Step 9</td>
<td>Click <strong>Generate Report</strong> and confirm that you want to update the report profile.</td>
</tr>
</tbody>
</table>
CHAPTER 105

Using Lookups

The following topics explain how to look up information about entities that may or may not be known to the Firepower System:

- Introduction to Lookups, on page 2059
- Performing Whois Lookups, on page 2059
- Finding Geolocation Information for an IP Address, on page 2060

Introduction to Lookups

If your Firepower Management Center is connected to the Internet, you can use manual lookup features to find the following information:

- Regional Information Registries (RIR) information (whois) for any IP address.
- Geolocation information for any IP address: country name, country code, and continent name. (To ensure that you are using up-to-date geolocation information, Cisco strongly recommends that you regularly update the Geolocation Database (GeoDB) on your Firepower Management Center.)

Related Topics

Update the Geolocation Database (GeoDB), on page 146

Performing Whois Lookups

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
</tr>
</tbody>
</table>

Before you begin

- Ensure that the Firepower Management Center has Internet access; see Security, Internet Access, and Communication Ports, on page 2357.
**Procedure**

**Step 1** Choose *Analysis > Lookup > Whois*.

**Step 2** Enter an IP address and click *Search*.

**Related Topics**
- *The Context Menu*, on page 10

## Finding Geolocation Information for an IP Address

You can use the geolocation lookup feature to find the country name, ISO 3166-1 three-digit country code, and continent name associated with any IP address.

### Procedure

**Step 1** Choose *Analysis > Lookup > Geolocation*.

**Step 2** To view the geolocation information for one or more IP addresses, enter the address or addresses and click *Search*. You may specify IPv4 addresses, IPv6 addresses, or both. Use a comma, semicolon, return, or any white space character to separate multiple addresses.

**Tip** Click *Clear* to clear the text box.

**Step 3** Optionally, click the column titles to sort the data. You can sort by any field except IP Address.

Workflows

- Workflows, on page 2063
- Searching for Events, on page 2103
- Custom Workflows, on page 2113
- Custom Tables, on page 2121
Workflows

The following topics describe how to use workflows:

- **Overview: Workflows, on page 2063**
- **Predefined Workflows, on page 2063**
- **Custom Table Workflows, on page 2073**
- **Using Workflows, on page 2073**
- **Bookmarks, on page 2101**

**Overview: Workflows**

A workflow is a tailored series of data pages on the Firepower Management Center web interface that analysts can use to evaluate events generated by the system.

The following types of workflows are available on the Firepower Management Center:

**Predefined Workflows**

Preset workflows delivered with the system. You cannot edit or delete a predefined workflow. You can, however, copy a predefined workflow and use it as the basis for a custom workflow.

**Saved Custom Workflows**

Custom workflows based on saved custom tables delivered with the Firepower Management Center. You can edit, delete, and copy these workflows.

**Custom Workflows**

Workflows that you create and customize for your specific needs, or that the system generates automatically when you create custom tables. You can edit, delete, and copy these workflows.

The data displayed in a workflow often depends on such factors as how you license and deploy your managed devices, and whether you configure features that provide the data.

**Predefined Workflows**

The predefined workflows described in the following sections are delivered with the system. You cannot edit or delete a predefined workflow, but you can copy a predefined workflow and use it as the basis for a custom workflow.
Predefined Intrusion Event Workflows

The following table describes the predefined intrusion event workflows included with the Firepower System.

Table 254: Predefined Intrusion Event Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination Port</td>
<td>Because destination ports are usually tied to an application, this workflow can help you detect applications that are experiencing an uncommonly high volume of alerts. The Destination Port column can also help you identify applications that should not be present on your network.</td>
</tr>
<tr>
<td>Event-Specific</td>
<td>This workflow provides two useful features. Events that occur frequently may indicate:</td>
</tr>
<tr>
<td></td>
<td>• false positives</td>
</tr>
<tr>
<td></td>
<td>• a worm</td>
</tr>
<tr>
<td></td>
<td>• a badly misconfigured network</td>
</tr>
<tr>
<td></td>
<td>Events that occur infrequently are most likely evidence of a targeted attack and warrant special attention.</td>
</tr>
<tr>
<td>Events by Priority and Classification</td>
<td>This workflow lists events and their type in order of event priority, along with a count showing how many times each event has occurred.</td>
</tr>
<tr>
<td>Events to Destinations</td>
<td>This workflow provides a high-level view of which host IP addresses are being attacked and the nature of the attack; where available, you can also see information about the countries involved in attacks.</td>
</tr>
<tr>
<td>IP-Specific</td>
<td>This workflow shows which host IP addresses are generating the most alerts. Hosts with the greatest number of events are either public-facing and receiving worm-type traffic (indicating a good place to look for tuning) or require further investigation to determine the cause of the alerts. Hosts with the lowest counts also warrant investigation as they could be the subject of a targeted attack. Low counts may also indicate that a host may not belong on the network.</td>
</tr>
<tr>
<td>Impact and Priority</td>
<td>This workflow lets you find high-impact recurring events quickly. The reported impact level is shown with the number of times the event has occurred. Using this information, you can identify the high-impact events that recur most often, which might be an indicator of a widespread attack on your network.</td>
</tr>
</tbody>
</table>
Workflow Name | Description
---|---
Impact and Source | This workflow can help you identify the source of an attack in progress. The reported impact level is shown with the associated source IP address for the event. If, for example, events with a level 1 impact are coming from the same source IP address repeatedly, they may indicate an attacker who has identified vulnerable systems and is targeting them.
Impact to Destination | You can use this workflow to identify events repeatedly occurring on vulnerable computers, so you can address the vulnerabilities on those systems and stop any attacks in progress.
Source Port | This workflow indicates which servers are generating the most alerts. You can use this information to identify areas that require tuning, and to decide which servers require attention.
Source and Destination | This workflow identifies host IP addresses sharing high levels of alerts. Pairs at the top of the list could be false positives, and may identify areas that require tuning. You can check pairs at the bottom of the list for targeted attacks, for users accessing resources they should not be accessing, or for hosts that do not belong on the network.

Predefined Malware Workflows

The following table describes the predefined malware workflows included on the Firepower Management Center. All predefined malware workflows use the table view of malware events.

**Table 255: Predefined Malware Workflows**

Workflow Name | Description
---|---
Malware Summary | This workflow provides a list of the malware detected in network traffic or by AMP for Endpoints Connectors, grouped by individual threat.
Malware Event Summary | This workflow provides a quick breakdown of the different malware event types and subtypes.
Hosts Receiving Malware | This workflow provides a list of host IP addresses that have received malware, grouped by the malware files’ associated dispositions.
Hosts Sending Malware | This workflow provides a list of host IP addresses that have sent malware, grouped by the malware files’ associated dispositions.
Applications Introducing Malware | This workflow provides a list of host IP addresses that have received files, grouped by the associated malware dispositions for those files.
Predefined File Workflows

The following table describes the predefined file event workflows included on the Firepower Management Center. All the predefined file event workflows use the table view of file events.

**Table 256: Predefined File Workflows**

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Summary</td>
<td>This workflow provides a quick breakdown of the different file event categories and types, along with any associated malware dispositions.</td>
</tr>
<tr>
<td>Hosts Receiving Files</td>
<td>This workflow provides a list of host IP addresses that have received files, grouped by the associated malware dispositions for those files.</td>
</tr>
<tr>
<td>Hosts Sending Files</td>
<td>This workflow provides a list of host IP addresses that have sent files, grouped by the associated malware dispositions for those files.</td>
</tr>
</tbody>
</table>

Predefined Captured File Workflows

The following table describes the predefined captured file workflows included on the Firepower Management Center. All predefined captured file workflows use the table view of captured files.

**Table 257: Predefined Captured File Workflows**

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Captured File Summary</td>
<td>This workflow provides a breakdown of captured files based on type, category, and threat score.</td>
</tr>
<tr>
<td>Dynamic Analysis Status</td>
<td>This workflow provides a count of captured files based on whether they have been submitted for dynamic analysis.</td>
</tr>
</tbody>
</table>

Predefined Connection Data Workflows

The following table describes the predefined connection data workflows included on the Firepower Management Center. All the predefined connection data workflows use the table view of connection data.

**Table 258: Predefined Connection Data Workflows**

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Events</td>
<td>This workflow provides a summary view of basic connection and detected application information, which you can then use to drill down to the table view of events.</td>
</tr>
<tr>
<td><strong>Workflow Name</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>Connections by Application</td>
<td>This workflow contains a graph of the 10 most active applications on the monitored network segment, based on the number of detected connections.</td>
</tr>
<tr>
<td>Connections by Initiator</td>
<td>This workflow contains a graph of the 10 most active host IP addresses on the monitored network segment, based on the number of connections where the host initiated the connection transaction.</td>
</tr>
<tr>
<td>Connections by Port</td>
<td>This workflow contains a graph of the 10 most active ports on the monitored network segment, based on the number of detected connections.</td>
</tr>
<tr>
<td>Connections by Responder</td>
<td>This workflow contains a graph of the 10 most active host IP addresses on the monitored network segment, based on the number of connections where the host IP was the responder in the connection transaction.</td>
</tr>
<tr>
<td>Connections over Time</td>
<td>This workflow contains a graph of the total number of connections on the monitored network segment over time.</td>
</tr>
<tr>
<td>Traffic by Application</td>
<td>This workflow contains a graph of the 10 most active applications on the monitored network segment, based on the number of kilobytes transmitted. Application counts reflect each detector that matched against an application connection. The same application session may be represented more than once in the list depending on whether an application protocol, web application, client detector, or internal detector matched the traffic, as well as whether the traffic originated from a mobile device or was part of an encrypted session. If the application was seen in a client flow and no specific client detector exists, a generic client may be reported. For example, you may see the same session of YouTube traffic reported as <strong>YouTube</strong> (because it matched a YouTube web application detector) and as <strong>YouTube client</strong> (because an internal YouTube detector matched against characteristics typically seen in a client session). Use the information in the connection events and network map for your network to determine more context for specific application connections.</td>
</tr>
<tr>
<td>Traffic by Initiator</td>
<td>This workflow contains a graph of the 10 most active host IP addresses on the monitored network segment, based on the total number of kilobytes transmitted from each address.</td>
</tr>
<tr>
<td>Traffic by Port</td>
<td>This workflow contains a graph of the 10 most active ports on the monitored network segment, based on the number of kilobytes transmitted.</td>
</tr>
</tbody>
</table>
**Predefined Security Intelligence Workflows**

The following table describes the predefined Security Intelligence workflows included on the Firepower Management Center. All the predefined Security Intelligence workflows use the table view of Security Intelligence events.

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Predefined Security Intelligence Workflows</strong></td>
<td></td>
</tr>
<tr>
<td>Security Intelligence Events</td>
<td>This workflow provides a summary view of basic Security Intelligence and detected application information, which you can then use to drill down to the table view of events.</td>
</tr>
<tr>
<td>Security Intelligence Summary</td>
<td>This workflow is identical to the Security Intelligence Events workflow, but begins with the Security Intelligence Summary page, which lists security intelligence events by category and count only.</td>
</tr>
<tr>
<td>Security Intelligence with DNS Details</td>
<td>This workflow is identical to the Security Intelligence Events workflow, but begins with the Security Intelligence with DNS Details page, which lists Security Intelligence events by category and DNS-related characteristics.</td>
</tr>
</tbody>
</table>

**Predefined Host Workflows**

The following table describes the predefined workflows that you can use with host data.
### Predefined Host Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hosts</td>
<td>This workflow contains a table view of hosts followed by the host view. Workflow views based on the Hosts table allow you to easily view data on all IP addresses associated with a host.</td>
</tr>
<tr>
<td>Operating System</td>
<td>You can use this workflow to analyze the operating systems in use on your network.</td>
</tr>
</tbody>
</table>

### Predefined Indications of Compromise Workflows

The following table describes the predefined workflows that you can use with IOC (Indications of Compromise) data.

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indications of Compromise</td>
<td>This workflow begins with a summary view of IOC data grouped by count and category, and provides a detail view that further subdivides the summary data by event type. Access this workflow via the <strong>Analysis &gt; Hosts</strong> menu.</td>
</tr>
<tr>
<td>Indications of Compromise by Host</td>
<td>You can use this workflow to gauge which hosts on your network are most likely to be compromised (based on IOC data). Access this workflow via the <strong>Analysis &gt; Hosts</strong> menu.</td>
</tr>
</tbody>
</table>

### Predefined Applications Workflows

The following table describes the predefined workflows that you can use with application data.

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Business Relevance</td>
<td>You can use this workflow to analyze running applications of each estimated business relevance level on your network, so you can monitor appropriate use of your network resources.</td>
</tr>
<tr>
<td>Application Category</td>
<td>You can use this workflow to analyze running applications of each category (such as email, search engine, or social networking) on your network, so you can monitor appropriate use of your network resources.</td>
</tr>
</tbody>
</table>
Predefined Application Details Workflows

The following table describes the predefined workflows that you can use with application detail and client data.

Table 263: Predefined Application Details Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Details</td>
<td>You can use this workflow to analyze the client applications on your network in more detail. The workflow then provides a table view of client applications, followed by the host view.</td>
</tr>
<tr>
<td>Clients</td>
<td>This workflow contains a table view of client applications, followed by the host view.</td>
</tr>
</tbody>
</table>

Predefined Servers Workflows

The following table describes the predefined workflows that you can use with server data.

Table 264: Predefined Servers Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network Applications by Count</td>
<td>You can use this workflow to analyze the most frequently used applications on your network.</td>
</tr>
<tr>
<td>Network Applications by Hit</td>
<td>You can use this workflow to analyze the most active applications on your network.</td>
</tr>
<tr>
<td>Server Details</td>
<td>You can use this workflow to analyze the vendors and versions of detected server application protocols in detail.</td>
</tr>
<tr>
<td>Servers</td>
<td>This workflow contains a table view of applications followed by the host view.</td>
</tr>
</tbody>
</table>
Predefined Host Attributes Workflows

The following table describes the predefined workflow that you can use with host attribute data.

Table 265: Predefined Host Attributes Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attributes</td>
<td>You can use this workflow to monitor IP addresses of hosts on your network and the hosts’ status.</td>
</tr>
</tbody>
</table>

The Predefined Discovery Events Workflow

The following table describes the predefined workflow that you can use to view discovery and identity data.

Table 266: Predefined Discovery Event Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery Events</td>
<td>This workflow provides a detailed list, in table view form, of discovery events, followed by the host view.</td>
</tr>
</tbody>
</table>

Predefined User Workflows

The following table describes the predefined workflow that you can use to view user discovery and user identity data.

Table 267: Predefined User Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td>This workflow provides a list of user information collected by user identity sources.</td>
</tr>
</tbody>
</table>

Predefined Vulnerabilities Workflows

The following table describes the predefined vulnerabilities workflow included on the Firepower Management Center.

Table 268: Predefined Vulnerabilities Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vulnerabilities</td>
<td>You can use this workflow to review vulnerabilities in the database, including a table view of only those active vulnerabilities that apply to the detected hosts on your network. The workflow provides a vulnerability detail view, which contains a detailed description for every vulnerability that meets your constraints.</td>
</tr>
</tbody>
</table>
Predefined Third-Party Vulnerabilities Workflows

The following table describes the predefined third-party vulnerabilities workflows included on the Firepower Management Center.

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vulnerabilities by IP Address</td>
<td>You can use this workflow to quickly see how many third-party vulnerabilities you have detected per host IP address on your monitored network.</td>
</tr>
<tr>
<td>Vulnerabilities by Source</td>
<td>You can use this workflow to quickly see how many third-party vulnerabilities you have detected per third-party vulnerability source, such as the QualysGuard Scanner.</td>
</tr>
</tbody>
</table>

Predefined Correlation and White List Workflows

There is a predefined workflow for each type of correlation data, white list events, white list violations, and remediation status events.

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Correlation Events</td>
<td>This workflow contains a table view of correlation events.</td>
</tr>
<tr>
<td>White List Events</td>
<td>This workflow contains a table view of white list events.</td>
</tr>
<tr>
<td>Host Violation Count</td>
<td>This workflow provides a series of pages that list all the host IP addresses that violate at least one white list.</td>
</tr>
<tr>
<td>White List Violations</td>
<td>This workflow includes a table view of white list violations that lists all violations with the most recently detected violation at the top of the list. Each row in the table contains a single detected violation.</td>
</tr>
<tr>
<td>Status</td>
<td>This workflow contains a table view of remediation status, which includes the name of the policy that was violated and the name and status of the remediation that was applied.</td>
</tr>
</tbody>
</table>

Predefined System Workflows

The Firepower System is delivered with some additional workflows, including system events such as audit events and health events, as well as workflows that list results from rule update imports and active scans.
### Custom Table Workflows

You can use the custom tables feature to create tables that use the data from two or more types of events. This is useful because you can, for example, create tables and workflows that correlate intrusion event data with discovery data to allow simple searches for events that affect critical systems.

When you create a custom table, the system automatically creates a workflow that you can use to view the events associated with the table. The features in the workflow differ depending on which type of table you use. For example, custom table workflows based on the intrusion event table always end with the packet view. However, custom table workflows based on discovery events end with the host view.

Unlike workflows based on the predefined event tables, workflows based on custom tables do not have links to other types of workflows.

### Using Workflows

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

### Procedure

**Step 1** Choose the appropriate menu path and option as described in Workflow Selection, on page 2075.

**Step 2** Navigate within the current workflow:

- To view all of the columns available in your chosen event data type, use table view pages; see Using Table View Pages, on page 2082.
• To view a subset of the columns available in your chosen event data type, use drill-down pages; see Using Drill-Down Pages, on page 2081.

• To display the corresponding row in the next page of the workflow, click blue down-arrow (▼).

• To move among the pages of a multipage workflow, use the tools at the bottom of each page; see Workflow Page Traversal Tools, on page 2078.

• To view the same constraints applied within a workflow for a different type of event, click Jump to and choose the event view from the drop-down list.

Step 3 Modify the display of the current workflow:

• Check the check boxes by one or more rows on a page to indicate which row(s) you want to affect, then click one of the buttons at the bottom of the page (for example, View) to perform that action for all selected rows.

• Check the check box at the top of the row to select all the rows on the page, then click one of the buttons at the bottom of the page (for example, View) to perform that action for all rows on the page.

• Constrain the columns in the display by clicking close (×) in the column heading that you want to hide. In the pop-up window that appears, click Apply.

Tip To hide or show other columns, check or clear the appropriate check boxes before you click Apply. To add a disabled column back to the view, click the expand arrow to expand the search constraints, then click the column name under Disabled Columns.

• Constrain the data view by selected values for selected fields. For information, see Event View Constraints, on page 2097 and Compound Event View Constraints, on page 2099.

• Change the time constraints on the event view. The date range located in the upper right corner of the page sets a time range for events to include in the workflow; for information, see Event Time Constraints, on page 2090.

Note Events that were generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.

• To sort data by columns, click the name of a column. To reverse the sort order, click the column name again. The direction indicates which column the data is sorted by, and whether the sort is ascending (▼) or descending (▼). Cannes workflow page link to display that page using any active constraints. Workflow page links appear in the upper left corner of predefined workflow table views and drill-down pages, above events and below the workflow name.

Step 4 View additional data within the current workflow:

• To view the file's trajectory map in a new window, click network file trajectory in file name and SHA-256 hash value columns. The icon is different depending on the file status; see File Trajectory Icons, on page 2079.

• To display a pop-up window of the host profile associated with an IP address, click host profile in any IP address column. The icon is different depending on the file status; see Host Profile Icons, on page 2079.
• To view the Dynamic Analysis Summary report for the highest threat score associated with a file, click threat score in any threat score column. The icon is different depending on the file’s highest threat score; see Threat Score Icons, on page 2080.

• To view user profile information, click user ( ) or, for users associated with an indication of compromise, ( ) in any user identity column. The user icon is dimmed if that user cannot be in the database (that is, is an AMP for Endpoints Connector user).

• To view vulnerability details for third-party vulnerabilities, click vulnerability ( ) in any third-party vulnerability ID column.

• When viewing aggregated data points, hover your pointer over the flag to view the country name.

• When viewing individual data points, click flag to view further geolocation details described in Geolocation, on page 2082.

Step 5 Navigate to a different workflow:

To view the same event type using a different workflow, click (switch workflow) next to the workflow title, then choose the workflow you want to use. Note that you cannot use a different workflow for scan results.

Workflow Access by User Role

Access to a workflow is determined by the user's role. See the table below for more information.

<table>
<thead>
<tr>
<th>User Role</th>
<th>Accessible Workflows</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator</td>
<td>Can access any workflow, and are the only users who can access the audit log, scan results, and the rule update import log.</td>
</tr>
<tr>
<td>Maintenance User</td>
<td>Can access health events.</td>
</tr>
<tr>
<td>Security Analyst and Security Analyst (Read Only)</td>
<td>Can access intrusion, malware, file, connection, discovery, vulnerability, correlation, and health workflows.</td>
</tr>
</tbody>
</table>

Workflow Selection

The Firepower System provides predefined workflows for the types of data listed in the following table.
<table>
<thead>
<tr>
<th>Feature</th>
<th>Menu Path</th>
<th>Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intrusion events</td>
<td>Analysis &gt; Intrusions</td>
<td>Events</td>
</tr>

<tr>
<td></td>
<td></td>
<td>Third-Party Vulnerabilities</td>
</tr>
<tr>
<td>Correlation events</td>
<td>Analysis &gt; Correlation</td>
<td>Correlation Events</td>
</tr>
<tr>
<td></td>
<td></td>
<td>White List Events</td>
</tr>
<tr>
<td></td>
<td></td>
<td>White List Violations</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Status</td>
</tr>
<tr>
<td>Audit events</td>
<td>System &gt; Monitoring</td>
<td>Audit</td>
</tr>
<tr>
<td>Health events</td>
<td>System &gt; Health &gt; Events</td>
<td>n/a</td>
</tr>
<tr>
<td>Rule Update Import Log</td>
<td>System &gt; Updates</td>
<td>n/a</td>
</tr>
<tr>
<td>Scan Results</td>
<td>Policies &gt; Actions &gt; Scanners</td>
<td>n/a</td>
</tr>
</tbody>
</table>
When you view any of the kinds of data described in the above table, events appear on the first page of the default workflow for that data. You can specify a different default workflow by configuring your event view settings. Note that workflow access depends on your user role.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Configuring Event View Settings, on page 33

Workflow Pages

Although the data in each type of workflow is different, all workflows share a common set of features. Workflows can include several types of pages. The actions you can perform on a workflow page depend on the type of page.

Drill-down and table view pages in workflows allow you to quickly narrow your view of the data so you can zero in on events that are significant to your analysis. Table view pages and drill-down pages both support many features you can use to constrain the set of events you want to view or to navigate the workflow. When viewing data on drill-down pages or in the table view in a workflow, you can sort the data in ascending or descending order based on any available column. If the database contains more events than can be displayed on a single workflow page, you can click the links at the bottom of the page to display more events. When you click one of these links, the time window automatically pauses so that you do not see the same events twice; you can unpause the time window when you are ready.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Table Views

Table views include a column for each of the fields in the database on which your workflow is based if the page is enabled by default.

Note that when you disable a column on a table view, the Firepower System adds the Count column to the event view if disabling the column could create two or more identical rows.

Removing any of the following columns is not recommended, for performance reasons: First Packet, Last Packet, Device, Initiator IP,Responder IP, Source Port/ICMP Type, Destination Port/ICMP Code. These fields uniquely identify each event, and removing any of them from the view automatically adds the count field to the table, which is a resource-intensive operation, particularly when there are a large number of fields in the view.

When you click on a value in a table view page, you constrain by that value.

When you create a custom workflow, you add a table view to it by clicking Add Table View.

Drill-Down Pages

Generally, drill-down pages are intermediate pages that you use to narrow your investigation to a few events before moving to a table view page. Drill-down pages contain a subset of columns that are available in the database.

For example, a drill-down page for discovery events might include only the IP Address, MAC Address, and Time columns. A drill-down page for intrusion events, on the other hand, might include the Priority, Impact Flag, Inline Result, and Message columns.
Drill-down pages allow you to narrow the scope of events you are viewing and to move forward in the workflow. If you click on a value in a drill-down page, for example, you constrain by that value and move to the next page in the workflow, focusing more closely on events that match your selected values. Clicking a value in a drill-down page does not disable the column where the value is, even if the page you advance to is a table view. Note that drill-down pages for predefined workflows always have a Count column. When you create a custom workflow, you add a drill-down page to it by clicking Add Page.

**Graphs**

Workflows based on connection data can include graph pages, also called *connection graphs*.

For example, a connection graph might display a line graph that shows the number of connections detected by the system over time. Generally, connection graphs are, like drill-down pages, intermediate pages that you use to narrow your investigation.

**Final Pages**

The final page of a workflow depends on the type of event on which the workflow is based:

- The host view is the final page for workflows based on applications, application details, discovery events, hosts, indications of compromise (IOC), servers, white list violations, host attributes, or third-party vulnerabilities. Viewing host profiles from this page allows you to easily view data on all IP addresses associated with hosts that have multiple addresses.

- The user detail view is the final page for workflows based on users and user activity.

- The vulnerability detail view is the final page for workflows based on Cisco vulnerabilities.

- The packet view is the final page for workflows based on intrusion events.

Workflows based on other kinds of events (for example, audit log events or malware events) do not have final pages.

On the final page of a workflow, you can expand detail sections to view specific information about each object in the set you focused on over the course of the workflow. Although the web interface does not list the constraints on the final page of a workflow, previously set constraints are retained and applied to the set of data.

**Workflow Page Navigation Tools**

Workflow pages provide visual cues to facilitate navigating among them and choosing what information to display during event analysis.

**Workflow Page Traversal Tools**

If a workflow contains multiple pages of data, the bottom of each page displays the number of pages in the workflow, as well as the tools listed in the table below which you may use to navigate among the pages:
### Table 273: Workflow Page Traversal Tools

<table>
<thead>
<tr>
<th>Page Traversal Tool</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>page number</td>
<td>view a different page</td>
</tr>
<tr>
<td>(To view a different page, enter the number you wish to view, then press Enter.)</td>
<td></td>
</tr>
<tr>
<td>&gt;</td>
<td>view the next page</td>
</tr>
<tr>
<td>&lt;</td>
<td>view the previous page</td>
</tr>
<tr>
<td>&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&lt;</td>
</tr>
</tbody>
</table>

### File Trajectory Icons

When a workflow page provides the opportunity to view the trajectory map for a file in a new window, a network trajectory icon appears. This icon differs depending upon the file status.

<table>
<thead>
<tr>
<th>File Trajectory Icon</th>
<th>File Status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Clean</td>
</tr>
<tr>
<td></td>
<td>Malware</td>
</tr>
<tr>
<td></td>
<td>Custom detection</td>
</tr>
<tr>
<td></td>
<td>Unknown</td>
</tr>
<tr>
<td></td>
<td>Unavailable</td>
</tr>
</tbody>
</table>

### Host Profile Icons

When a workflow page provides the opportunity to view the host profile associated with an IP address in a pop-up window, a host profile icon appears. If the host profile icon is dimmed, you cannot view the host profile because that host cannot be in the network map (for example, 0.0.0.0). This icon appears different depending on the status of the host.

<table>
<thead>
<tr>
<th>Host Profile Icon</th>
<th>Host Status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Host is not tagged as potentially compromised.</td>
</tr>
</tbody>
</table>
## Threat Score Icons

When a workflow page provides the opportunity to view a Dynamic Analysis Summary report for the highest threat score associated with a file, a threat score icon appears. The icon differs depending on the file’s highest threat score.

### Table 276: Threat Score Icons

<table>
<thead>
<tr>
<th>Threat Score Icon</th>
<th>Threat Score Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>📚</td>
<td>Low</td>
</tr>
<tr>
<td>📚📚</td>
<td>Medium</td>
</tr>
<tr>
<td>📚📚📚</td>
<td>High</td>
</tr>
<tr>
<td>📚📚📚📚</td>
<td>Very high</td>
</tr>
</tbody>
</table>

## The Workflow Toolbar

Each page in a workflow includes a toolbar that offers quick access to related features. The following table describes each of the links on the toolbar.

### Table 277: Workflow Toolbar Links

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bookmark This Page</td>
<td>Bookmarks the current page so you can return to it later.</td>
</tr>
<tr>
<td></td>
<td>Bookmarked captures the constraints in effect on the page you are viewing so</td>
</tr>
<tr>
<td></td>
<td>you can return to the same data (assuming the data still exists) at a later</td>
</tr>
<tr>
<td></td>
<td>time.</td>
</tr>
<tr>
<td>Report Designer</td>
<td>Opens the report designer with the currently constrained workflow as the</td>
</tr>
<tr>
<td></td>
<td>selection criteria.</td>
</tr>
<tr>
<td>Dashboard</td>
<td>Opens a dashboard relevant to your current workflow. For example, Connection</td>
</tr>
<tr>
<td></td>
<td>Events workflows link to the Connection Summary dashboard.</td>
</tr>
</tbody>
</table>
### Using Drill-Down Pages

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Bookmarks</td>
<td>Displays a list of saved bookmarks from which you can select.</td>
</tr>
<tr>
<td>Search</td>
<td>Displays a Search page where you can perform advanced searches on data in the workflow. You can also click the down arrow icon to select and use a saved search.</td>
</tr>
</tbody>
</table>

### Using Drill-Down Pages

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Security Analyst</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>(depending on workflow)</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**  Access a workflow by choosing the appropriate menu path and option as described in Features Using Workflows.

**Step 2**  In any workflow, you have the following options:

- To drill down to the next workflow page constraining on a specific value, click a value within a row. Note that this works only on drill-down pages. Clicking a value within a row in a table view only constrains the table view and does not drill down to the next page.

- To drill down to the next workflow page constraining on some events, check the check boxes next to the events you want to view on the next workflow page, then click **View**.

- To drill down to the next workflow page keeping the current constraints, click **View All**.

**Tip**  Table views always include “Table View” in the page name.
Using Table View Pages

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

Table view pages provide some features not available on drill-down, host view, packet view, or vulnerability detail pages. Use these features as described below:

**Procedure**

**Step 1**
Access a workflow by choosing the appropriate menu path and option as described in Workflow Selection, on page 2075.

**Step 2**
Choose a table view from the workflow path displayed beneath the workflow name.

**Step 3**
Use the features listed below to arrange and navigate within the table view as needed:

- To display the list of disabled columns, click the Search Constraints expand arrow (►).
- To hide the list of disabled columns, click the Search Constraints collapse arrow (▼).
- To add a disabled column back to the event view, click the Search Constraints expand arrow (►) to expand the search constraints, then click the column name under Disabled Columns.
- To show or hide (disable) a column, click clear (✗) next to any column name. In the pop-up window that appears, check or clear the appropriate check boxes to indicate which column(s) you want to display, then click Apply.

**Geolocation**

The geolocation feature provides data about the geographical sources of routable IP addresses (country, continent, and so on). This information is available in events, asset profiles, the Context Explorer, dashboard, and other analysis tools.

**Note**
For mobile devices and other hosts detected moving from country to country, the system may report a continent instead of a specific country.

You can use geolocation data to filter network traffic. For example, you can determine if connections are originating from or terminating in countries unconnected with your organization. In an inline deployment, you can block or rate limit those connections.

The system stores geolocation data in its geolocation database (GeoDB). Cisco issues periodic updates to the GeoDB. The About page (Help > About) shows the current GeoDB update version.
If you accept GeoDB updates, you can click the small country flag icons and ISO country codes in the Firepower Management Center web interface to obtain geolocation details about specific IP addresses; see Geolocation Detail Information, on page 2083. You can also pinpoint the detected location with third-party map tools. If you do not update the GeoDB, these details are unavailable.

You cannot view geolocation details for aggregate geolocation information, such as on the Connection Summary dashboard.

Geolocation Detail Information

Depending on availability, a number of fields may appear on the Geolocation Details page. The following table contains information on these fields. (Fields with no information are not displayed.)

Table 278: Geolocation Detail Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Country</td>
<td>Country associated with the host’s IP address, accompanied by the country’s flag. The continent is listed in parentheses. Examples: United States (North America), Equatorial Guinea (Africa)</td>
</tr>
<tr>
<td>Region</td>
<td>State, province, or other subregion of the country where the host is located. Examples: VA, 35</td>
</tr>
<tr>
<td>City</td>
<td>City where the host is located. Examples: Seattle, Fukuoka</td>
</tr>
<tr>
<td>Postal Code</td>
<td>Postal code of the region where the host is located. Examples: 361000, 90210</td>
</tr>
<tr>
<td>Latitude/Longitude</td>
<td>Exact coordinates of the host’s location. Examples: 40.0375, -76.1053; 53.4050, -0.5484</td>
</tr>
<tr>
<td>Maps</td>
<td>Links to external mapping sites (Google Maps, Yahoo Maps, Bing Maps, and OpenStreetMap). Click any link to view a contextual map of the host’s approximate location.</td>
</tr>
<tr>
<td>Timezone</td>
<td>Time zone of the host’s location, with Daylight Savings Time noted where applicable. Examples: GMT+8:00, GMT-4:00 (In DST)</td>
</tr>
<tr>
<td>ASN</td>
<td>Autonomous System Number (ASN) associated with the host’s IP address, and any additional information about that ASN. Examples: 14618 (Amazon.com Inc.); 4837 (Cncgroup China169 Backbone)</td>
</tr>
</tbody>
</table>
### Connection Event Graphs

In addition to workflows that use tabular drill-down pages and a final table view of events, the system can present certain connection data graphically, using data aggregated over five-minute intervals. Note that you can graph only the information used to aggregate data: source and destination IP addresses (and those hosts’ associated users), destination port, transport protocol, and application protocol.

**Tip**
You cannot graph Security Intelligence events separately from their associated connection events. For a graphical overview of Security Intelligence filtering activity, use dashboards and the Context Explorer.

There are three different types of connection graphs:

- *Pie charts* display data from one dataset grouped into discrete categories.
- *Bar graphs* display data from one or more datasets grouped into discrete categories.
- *Line graphs* plot data from one or more datasets over time, using either a standard or a velocity (rate of change) view.

**Note**
The system displays traffic profiles as line graphs, which you can manipulate in the same way as you would any other connection graph, with some restrictions. To view traffic profiles, you must have Administrator access.

Like workflow tables, you can drill down and constrain workflow graphs to focus your analysis.

Both bar graphs and line graphs can display multiple datasets; that is, they can display several values on the y-axis for each x-axis data point. For example, you could display the total number of unique initiators and responders. Pie charts can only display one dataset.
You can display different data and datasets on a connection graph by changing either the x-axis, the y-axis, or both. On a pie chart, changing the x-axis changes the independent variable and changing the y-axis changes the dependent variable.

**Related Topics**
- Connection Summaries (Aggregated Data for Graphs), on page 2150

## Using Connection Event Graphs

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

On the Firepower Management Center, you can view connection event graphs and manipulate them depending on the information you are looking for.

The page you see when you access connection graphs differs depending on the workflow you use. You can use a predefined workflow, which terminates in a table view of connection events. You can also create a custom workflow that displays only the information that matches your specific needs.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

### Procedure

**Step 1** Choose **Analysis > Connections > Events**.

**Note** If a connection event table appears instead of a graph, or to view a different graph, click **(switch workflow)** by the workflow title and choose a predefined workflow that includes graphs, or a custom workflow. Note that all predefined connection event workflows—including connection graphs—terminate in a table view of connections.

**Step 2** You have the following options:

- **Time Range** — To adjust the time range, which is useful if the graph is blank, see Changing the Time Window, on page 2094.

- **Field Names** — To learn more about the data you can graph, see Connection and Security Intelligence Event Fields, on page 2151.

- **Host Profile** — To view the host profile for an IP address, on a graph displaying connection data by initiator or responder, click either a bar on a bar graph or a wedge on a pie chart and choose **View Host Profile**.

- **User Profile** — To view user profile information, on a graph displaying connection data by initiator user, click either a bar on a bar graph or a wedge on a pie chart and choose **View User Profile**.

- **Other Information** — To learn more information about the graphed data, position your cursor over a point on a line graph, a bar in a bar graph, or a wedge in a pie chart.
• Constrain — To constrain a connection graph by any x-axis (independent variable) criterion without advancing the workflow to the next page, click a point on a line graph, a bar on a bar graph, or a wedge on a pie chart, and choose a View by... option.

• Data Selection — To change the data displayed on the graph, click X-Axis or Y-Axis and choose the new data to graph. Note that changing the x-axis to or from Time also changes the graph type; changing the y-axis affects the displayed datasets.

• Datasets — To change the graph’s dataset, click Datasets and choose a new dataset.

• Detach — To detach a connection graph so you can perform further analysis without affecting the default time range, click Detach.

  Tip Click New Window in a detached graph to create a copy. You can then perform different analyses on each of the detached graphs. Note that traffic profiles are detached graphs.

• Drill Down — To drill down to the next page in the workflow, click a point on a line graph, a bar on a bar graph, or a wedge on a pie chart, then choose Drill-down. Clicking a point on a line graph changes the time range on the next page to a 10-minute span, centered on the point you clicked. Clicking a bar on a bar graph or a wedge on a pie chart constrains the next page based on the criterion represented by the bar or wedge.

• Export — To export the connection data for a graph as a CSV (comma-separated values) file, Export Data. Then, click Download CSV File and save the file.

• Graph Type: Line — To switch between a standard and velocity (rate of change) line graph, click Velocity, then choose Standard or Velocity.

• Graph Type: Bar and Pie — To switch between a bar graph and pie chart, click Switch to Bar or Switch to Pie. Because you cannot display multiple datasets on a pie chart, if you switch to a pie chart from a bar graph that has multiple datasets, the pie chart shows only one dataset, which is selected automatically. When choosing which dataset to display, the Firepower Management Center favors total statistics over initiator and responder statistics, and favors initiator statistics over responder statistics.

• Navigate Between Pages — To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page.

• Navigate Between Event Views — To navigate to other event views to view associated events, click Jump to and choose the event view from the drop-down list.

• Recenter — To recenter a line graph around a point in time without changing the length of the time range, click that point, then choose Recenter.

• Zoom — To recenter a line graph around a point in time while zooming in or out, click that point, choose Zoom, then choose a new time span.

Note Unless you are working with a detached graph, constraining, recentering, and zooming changes the default time range for the Firepower Management Center.
Example: Constraining a Connection Graph

Example: Changing X-Axis and Y-Axis on a Pie Chart

Consider a graph of connections over time. If you constrain a point on the graph by port, a bar graph appears, showing the 10 most active ports based on the number of detected connection events, but constrained by the ten-minute time span that is centered on the point you clicked.

If you further constrain the graph by clicking on one of the bars and choosing View by Initiator IP, a new bar graph appears, constrained by not only the same ten-minute time span as before, but also by the port represented by the bar you clicked.

Consider a pie chart that graphs kilobytes per port. In this case, the x-axis is Responder Port and the y-axis is KBytes. This pie chart represents the total kilobytes of data transmitted over a monitored network during a certain interval. The wedges of the pie represent the percent of the data that was detected on each port.

- If you change the x-axis of the chart to Application Protocol, the pie chart still represents the total kilobytes of data transmitted, but the wedges of the pie represent the percentage of the data transmitted for each detected application protocol.

- If you change the y-axis of the chart to Packets, the pie chart represents the total number of packets transmitted over the monitored network during a certain interval, and the wedges of the pie represent the percentage of the total number of packets that was detected on each port.

Connection Graph Data Options

You can display different data on a connection graph by changing either the x-axis, the y-axis, or both. On a pie chart, changing the x-axis changes the independent variable and changing the y-axis changes the dependent variable.

Table 279: X-Axis Options

<table>
<thead>
<tr>
<th>X-Axis Option</th>
<th>Graph Type</th>
<th>Graphs This Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Protocol</td>
<td>bar or pie</td>
<td>by the 10 most active application protocols</td>

<tr>
<td>Initiator User</td>
<td>bar or pie</td>
<td>by the 10 most active initiator users</td>
</tr>
<tr>
<td>Responder IP</td>
<td>bar or pie</td>
<td>by the 10 most active responder host IP addresses</td>
</tr>
</tbody>
</table>
Connection Graphs with Multiple Datasets

Both bar graphs and line graphs can display multiple datasets; that is, they can display several values on the y-axis for each x-axis data point. For example, you could display the total number of unique initiators and responders.

### Note

You **cannot** display multiple datasets on a pie chart. If you switch to a pie chart from a bar graph that has multiple datasets, the pie chart shows only one dataset, which is selected automatically. When selecting which dataset to display, the Firepower Management Center favors total statistics over initiator and responder statistics, and favors initiator statistics over responder statistics.

On line graphs, multiple datasets appear as multiple lines, each with a different color. For example, the following graphic displays the total number of unique initiators and the total number of unique responders detected on a monitored network over a one hour interval.
On bar graphs, multiple datasets appear as a set of colored bars for each x-axis data point. For example, the following bar graph displays the total packets transmitted on a monitored network, packets transmitted by initiators, and packets transmitted by responders.

### Connection Graph Dataset Options

The following table describes the datasets you can display on the x-axis of a connection graph.

**Table 281: Dataset Options**

<table>
<thead>
<tr>
<th>If the y-axis displays...</th>
<th>You can select as datasets...</th>
</tr>
</thead>
<tbody>
<tr>

<td>the default only, which is the number of unique users logged into session initiators on the monitored network (Unique Initiator Users)</td>
</tr>
</tbody>
</table>

**Event Time Constraints**

Each event has a time stamp that indicates when the event occurred. You can constrain the information that appears in some workflows by setting the time window, sometimes called the time range.

Workflows based on events that can be constrained by time include a time range line at the top of the page.
By default, workflows use an expanding time window set to the past hour. For example, if you log in at 11:30 AM, you will see events that occurred between 10:30 AM and 11:30 AM. As time moves forward, the time window expands. At 12:30 PM, you will see events that occurred between 10:30 AM and 12:30 PM.

You can change this behavior by setting your own default time window in the event view settings. This governs three properties:

- time window type (static, expanding, or sliding)
- time window length
- the number of time windows (either multiple time windows or a single global time window)

Regardless of the default time window setting, you can manually change the time window during your event analysis by clicking the time range at the top of the page, which displays the Date/Time pop-up window. Depending on the number of time windows you configured and the type of appliance you are using, you can also use the Date/Time window to change the default time window for the type of event you are viewing.

Finally, you can pause the time window while looking at a sliding or expanding workflow. See Pause the Time Window to Temporarily Freeze the Data Set, on page 2094.

Related Topics

- Configuring Event View Settings, on page 33
- Using Connection and Security Intelligence Event Tables, on page 2170

Per-Session Time Window Customization for Events

Regardless of the default time window, you can manually change the time window during your event analysis.

Note

Manual time window settings are valid for only the current session. When you log out and then log back in, time windows are reset to the default.

Depending on the number of time windows you configured, changing the time window for one workflow may affect other workflows on the appliance. For example, if you have a single, global time window, changing the time window for one workflow changes it for all other workflows on the appliance. On the other hand, if you are using multiple time windows, changing the audit log or health event workflow time windows has no effect on any other time window, while changing the time window for other kinds of events affects all events that can be constrained by time (with the exception of audit events and health events).

Note that because not all workflows can be constrained by time, time window settings have no effect on workflows based on hosts, host attributes, applications, application details, vulnerabilities, users, or white list violations.

Use the Time Window tab on the Date/Time window to manually configure a time window. Depending on the number of time windows you configured in your default time window settings, the tab’s title is one of the following:

- **Events Time Window**, if you configured multiple time windows and are setting the time window for a workflow other than the audit log or health events workflow

- **Health Monitoring Time Window**, if you configured multiple time windows and are setting the time window for the health events workflow
• **Audit Log Time Window**, if you configured multiple time windows and are setting the time window for the audit log

• **Global Time Window**, if you configured a single time window

The first decision you must make when configuring a time window is the type of time window you want to use:

• A *static* time window displays all the events generated from a specific start time to a specific end time.

• An *expanding* time window displays all the events generated from a specific start time to the present; as time moves forward, the time window expands and new events are added to the event view.

• A *sliding* time window displays all the events generated from a specific start time (for example, one week ago) to the present; when you refresh the page, the time window “slides” so that you see only the events in the time range you configured (in this example, for the last week). To temporarily prevent the data set from updating while you are examining it, see Pause the Time Window to Temporarily Freeze the Data Set, on page 2094.

Depending on what type you select, the Date/Time window changes to give you different configuration options.

**Note**
The Firepower System uses a 24-hour clock based on the time you specified in your time zone preferences.

### Time Window Settings

The following table explains the various settings you can configure on the Time Window tab.

**Table 282: Time Window Settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Time Window Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time window type drop-down list</td>
<td>n/a</td>
<td>Select the type of time window you want to use: static, expanding, or sliding. Note that events that were generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.</td>
</tr>
<tr>
<td>Start Time calendar</td>
<td>static and expanding</td>
<td>Specify a start date and time for your time window. The maximum time range for all time windows is from midnight on January 1, 1970 (UTC) to 3:14:07 AM on January 19, 2038 (UTC). Instead of using the calendar, you can use the Presets options, described below.</td>
</tr>
<tr>
<td>Setting</td>
<td>Time Window Type</td>

<tr>
<td>End Time calendar</td>
<td>static</td>
<td>Specify an end date and time for your time window. The maximum time range for all time windows is from midnight on January 1, 1970 (UTC) to 3:14:07 AM on January 19, 2038 (UTC). Note that if you are using an expanding time window, the End Time calendar is grayed out and specifies that the end time is “Now.” Instead of using the calendar, you can use the Presets options, described below.</td>
</tr>
<tr>
<td>Show the Last field and drop-down list</td>
<td>sliding</td>
<td>Configure the length of the sliding time window.</td>
</tr>
<tr>
<td>Presets: Last</td>
<td>all</td>
<td>Click one of the time ranges in the list to change the time window, based on the local time of the appliance. For example, clicking <strong>1 week</strong> changes the time window to reflect the last week. Clicking a preset changes the calendars to reflect the preset you choose.</td>
</tr>
</tbody>
</table>
| Presets: Current                | static and expanding | Click one of the time ranges in the list to change the time window, based on the local time and date of the appliance. Clicking a preset changes the calendars to reflect the preset you choose. Note that:  
  • the current day begins at midnight  
  • the current week begins at midnight Sunday  
  • the current month begins at midnight on the first of the month |
| Presets: Synchronize with       | all (not available if you are using a global time window) | Click one of:  
  • **Events Time Window** to synchronize the current time window with the events time window  
  • **Health Monitoring Time Window** to synchronize the current time window with the health monitoring time window  
  • **Audit Log Time Window** to synchronize the current time window with the audit log time window |
Changing the Time Window

### Procedure

**Step 1** On a workflow constrained by time, click time range (📅) to go to the Date/Time window.

**Step 2** On **Events Time Window**, set the time window as described in **Time Window Settings, on page 2092**.

**Tip** Click **Reset** to change the time window back to the default settings.

**Step 3** Click **Apply**.

---

**Pause the Time Window to Temporarily Freeze the Data Set**

<table>
<thead>
<tr>
<th>Smart License</th>

<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

If you are using a sliding or expanding time window, you can pause the time window to examine a snapshot of the data provided by the workflow. This is useful because when an unpaused workflow updates, it may remove events that you want to examine or add events that you are not interested in.

The time window automatically pauses when you click a link at the bottom of the page to display another page of events; you can unpause the time window when you are ready.

When you are finished with your analysis, you can unpause the time window. Unpausing the time window updates it according to your preferences, and also updates the event view to reflect the unpaused time window.

Pausing an event time window has no effect on dashboards, nor does pausing a dashboard have any effect on pausing an event time window.

**Procedure**

On a workflow constrained by time, choose the desired time range control:

- To pause the time window, click time range control pause (/wait).
- To unpause the time window, click time range control play (play).
The Default Time Window for Events

During your event analysis, you can use the Preferences tab on the Date/Time window to change the default time window for the type of event you are viewing without having to use the event view settings.

Keep in mind that changing the default time window in this way changes the default time window for only the type of event you are viewing. For example, if you configured multiple time windows, changing the default time window on the Preferences tab changes the settings for either the events, health monitoring, or audit log window, in other words, whichever time window is indicated by the first tab. If you configured a single time window, changing the default time window on the Preferences tab changes the default time window for all types of events.

Default Time Windows, on page 35

Default Time Window Options for Event Types

The following table explains the various settings you can configure on the Preferences tab.

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refresh Interval</td>
<td>Sets the refresh interval for event views, in minutes. Entering zero disables the refresh option.</td>
</tr>
<tr>
<td>Number of Time Windows</td>
<td>Specify how many time windows you want to use:</td>
</tr>
<tr>
<td></td>
<td>• Select Multiple to configure separate default time windows for the audit log, for health events, and for workflows based on events that can be constrained by time.</td>
</tr>
<tr>
<td></td>
<td>• Select Single to use a global time window that applies to all events.</td>
</tr>
<tr>
<td>Default Time Window: Show the Last - Sliding</td>
<td>This setting allows you to configure a sliding default time window of the length you specify.</td>
</tr>
<tr>
<td></td>
<td>The appliance displays all the events generated from a specific start time (for example, 1 hour ago) to the present. As you change event views, the time window “slides” so that you always see events from the last hour.</td>
</tr>
</tbody>
</table>
### Preference

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
</table>
| Default Time Window: Show the Last - Static/Expanding | This setting allows you to configure either a static or expanding default time window of the length you specify.  
For **static** time windows (enable the Use End Time check box), the appliance displays all the events generated from a specific start time (for example, 1 hour ago), to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window.  
For **expanding** time windows (disable the Use End Time check box), the appliance displays all the events generated from a specific start time (for example, 1 hour ago), to the present. As you change event views, the time window expands to the present time. |
| Default Time Window: Current Day - Static/Expanding | This setting allows you to configure either a static or expanding default time window for the current day. The current day begins at midnight, based on the time zone setting for your current session.  
For **static** time windows (enable the Use End Time check box), the appliance displays all the events generated from midnight to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window.  
For **expanding** time windows (disable the Use End Time check box), the appliance displays all the events generated from midnight to the present. As you change event views, the time window expands to the present time. Note that if your analysis continues for over 24 hours before you log out, this time window can be more than 24 hours. |
| Default Time Window: Current Week - Static/Expanding | This setting allows you to configure either a static or expanding default time window for the current week. The current week begins at midnight on the previous Sunday, based on the time zone setting for your current session.  
For **static** time windows (enable the Use End Time check box), the appliance displays all the events generated from midnight to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window.  
For **expanding** time windows (disable the Use End Time check box), the appliance displays all the events generated from midnight Sunday to the present. As you change event views, the time window expands to the present time. Note that if your analysis continues for over 1 week before you log out, this time window can be more than 1 week. |
## Changing the Default Time Window for Your Event Type

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Security Analyst</td>
</tr>
</tbody>
</table>

### Procedure

**Step 1**
On a workflow constrained by time, click time range (🕒) to go to the Date/Time window.

**Step 2**
Click Preferences and change your preferences, as described in Default Time Window Options for Event Types, on page 2095.

**Step 3**
Click Save Preferences.

**Step 4**
You have two options:

- To apply your new default time window settings to the event view you are using, click Apply to close the Date/Time window and refresh the event view.
- To continue with your analysis without applying the default time window settings, close the Date/Time window without clicking Apply.

### Event View Constraints

The information that you see on a workflow page is determined by the constraints that you impose. For example, when you initially open an event workflow, the information is constrained to events that were generated in the previous hour.

To advance to the next page in the workflow and constrain the data you are viewing by specific values, select the rows with those values on the page and click View. To advance to the next page in the workflow retaining the current constraints and carrying forward all events, select View All.

#### Note
If you select a row with multiple non-count values and click View, you create a compound constraint.

There is a third method for constraining data in a workflow. To constrain the page to the rows with values that you selected and also add the selected value to the list of constraints at the top of the page, click a value within a row on the page. For example, if you are viewing a list of logged connections and want to constrain the list to only those you allowed using access control, click Allow in the Action column. As another example, if you are viewing intrusion events and want to constrain the list to only events where the destination port is 80, click 80 (http)/tcp in the Destination Port/ICMP Code column.

#### Tip
The procedure for constraining connection events based on Monitor rule criteria is slightly different and you may need to take some extra steps. Additionally, you cannot constrain connection events by associated file or intrusion information.
You can also use searches to constrain the information in a workflow. Use this feature when you want to constrain against multiple values in a single column. For example, if you want to view the events related to two IP addresses, click **Edit Search**, then modify the appropriate IP address field on the Search page to include both addresses, and then click **Search**.

The search criteria you enter on the search page are listed as the constraints at the top of the page, with the resulting events constrained accordingly. On the Firepower Management Center, the current constraints are also applied when navigating to other workflows, unless they are compound constraints.

When searching, you must pay careful attention to whether your search constraints apply to the table you are searching. For example, client data is not available in connection summaries. If you search for connection events based on the detected client in the connection and then view the results in a connection summary event view, the Firepower Management Center displays connection data as if you had not constrained it at all. Invalid constraints are labeled as not applicable (N/A) and are marked with a strikethrough.

### Constraining Events

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

### Procedure

**Step 1** Access a workflow by choosing the appropriate menu path and option as described in Workflow Selection, on page 2075.

**Step 2** In any workflow, you have the following options:

- To constrain the view to events that match a single value, click the desired value within a row on the page.
- To constrain the view to events that match multiple values, check the check boxes for events with those values, and click **View**.
  
  **Note** A compound constraint is added if the row contains multiple non-count values.

- To remove a constraint, click the Search Constraints expand arrow (►) and click the name of the constraint in the expanded Search Constraints list.
- To edit constraints using the Search page, click **Edit Search**.
- To save constraints as a saved search, click **Save Search** and give the query a name.
  
  **Note** You cannot save queries containing compound constraints.

- To use the same constraints with another event view, click **Jump to** and choose the event view.
  
  **Note** You do not retain compound constraints when you switch to another workflow.
• To toggle the display of constraints click the Search Constraints expand arrow (▲) or the Search Constraints collapse arrow (▼). This is useful when the list of constraints is large and takes up most of the screen.

## Compound Event View Constraints

Compound constraints are based on all non-count values for a specific event. When you select a row with multiple non-count values, you set a compound constraint that retrieves only events matching all the non-count values in that row on that page. For example, if you select a row that has a source IP address of 10.10.31.17 and a destination IP address of 10.10.31.15 and a row that has a source IP address of 172.10.31.17 and a destination IP address of 172.10.31.15, you retrieve all of the following:

- Events that have a source IP address of 10.10.31.17 AND a destination IP address of 10.10.31.15

OR

- Events that have a source IP address of 172.10.31.17 AND a destination IP address of 172.10.31.15

When you combine compound constraints with simple constraints, the simple constraints are distributed across each set of compound constraints. If, for example, you added a simple constraint for a protocol value of tcp to the compound constraints listed above, you retrieve all of the following:

- Events that have a source IP address of 10.10.31.17 AND a destination IP address of 10.10.31.15 AND a protocol of tcp

OR

- Events that have a source IP address of 172.10.31.17 AND a destination IP address of 172.10.31.15 AND a protocol of tcp

You cannot perform a search or save a search on a compound constraint. You also cannot retain compound constraints when you use the event view links or click (switch workflow) to switch to another workflow. If you bookmark an event view with compound constraints applied, the constraints are not saved with the bookmark.

## Using Compound Event View Constraints

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

### Procedure

**Step 1**  
Access a workflow by choosing the appropriate menu path and option as described in Workflow Selection, on page 2075.
Step 2

To manage compound constraints, you have the following options:

- To create a compound constraint, choose one or more rows with multiple non-count values and click View.

- To clear compound constraints, click the Search Constraints expand arrow (►) and click Compound Constraints.

### Inter-Workflow Navigation

You can navigate to other workflows using the links in the Jump to... drop-down list on a workflow page. Select the drop-down list to view and select additional workflows.

When you select a new workflow, properties shared by the rows you select and the constraints you set are used in the new workflow, if they are applicable. If configured constraints or event properties do not map to fields in the new workflow, they are dropped. In addition, compound constraints are not retained when you switch from one workflow to another. In addition, constraints from the captured files workflow only transfer to file and malware event workflows.

**Note**

When you view event counts over a time range, the total number of events may not reflect the number of events for which more detailed data is available. This occurs because the system sometimes prunes older event details to manage disk space usage. To minimize the occurrence of event detail pruning, you can fine-tune event logging to log only those events most important to your deployment.

Note that unless you have either paused the time window or have configured a static time window, the time window changes when you change workflows.

This feature enhances your ability to investigate suspicious activity. For example, if you are viewing connection data and notice that an internal host is transmitting an abnormally large amount of data to an external site, you can select the responder IP address and the port as constraints and then jump to the Applications workflow. The applications workflow will use the responder IP address and port as IP Address and Port constraints and display additional information about the application, such as what kind of application it is. You can also click Hosts at the top of the page to view the host profile for the remote host.

After finding more information about the application, you can select Correlation Events to return to the connection data workflow, remove the Responder IP from the constraints, add the Initiator IP to constraints, and select Application Details to see what client the user on the initiating host used when transferring data to the remote host. Note that the Port constraint is not transferred to the Application Details page. While keeping the local host as a constraint, you can also use other navigation buttons to find additional information:

- To discover if any policies have been violated by the local host, keep the IP address as a constraint and select Correlation Events from the Jump to drop-down list.

- To find out if an intrusion rule triggered against the host, indicating a compromise, select Intrusion Events from the Jump to drop-down list.

- To view the host profile for the local host and determine if the host is susceptible to any vulnerabilities that may have been exploited, select Hosts from the Jump to drop-down list.
Bookmarks

Create a bookmark if you want to return quickly to a specific location and time in an event analysis. Bookmarks retain information about:

- the workflow you are using
- the part of the workflow you are viewing
- the page number within the workflow
- any search constraints
- any disabled columns
- the time range you are using

The bookmarks you create are available to all user accounts with bookmark access. This means that if you uncover a set of events that require more in-depth analysis, you can easily create a bookmark and turn over the investigation to another user with the appropriate privileges.

Note

If the events that appear in a bookmark are deleted (either directly by a user or by automatic database cleanup), the bookmark no longer displays the original set of events.

Creating Bookmarks

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can only view bookmarks created in the current domain.

Procedure

Step 1
During an event analysis, with the events of interest displayed, click **Bookmark This Page**.

Step 2
In the **Bookmark Name** field, enter a name.

Step 3
Click **Save Bookmark**.
Viewing Bookmarks

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can only view bookmarks created in the current domain.

Procedure

From any event view, you have two options:

- Hover your pointer over **View Bookmarks**, and click on the desired bookmark in the drop-down menu.
- Click on click **View Bookmarks** and on the View Bookmarks page, click on the desired bookmark name or view ( ) next to it.

**Note** If the events that originally appeared in a bookmark are deleted (either directly by a user or by automatic database cleanup), the bookmark no longer displays the original set of events.
Searching for Events

The following topics describe how to search for events within a workflow:

- Event Searches, on page 2103
- Query Overrides Via the Shell, on page 2111

Event Searches

The Firepower System generates information that is stored as events in database tables. Events contain multiple fields that describe the activity that caused the appliance to generate the event. You can create and save searches customized for your environment for any of the different event types and save them to reuse later.

When you save a search you give it a name and specify whether the search will be available to you alone or to all users of the appliance. If you want to use the search as a data restriction for a custom user role, you must save it as a private search. If you previously saved a search, you can load it, make any necessary modifications, and then start the search. Custom analysis dashboard widgets, report templates, and custom roles can also use saved searches. If you have saved searches, you can delete them from the Search page.

For some event types, the Firepower System provides predefined searches that serve as examples and can provide quick access to important information about your network. You can modify fields within the predefined searches for your network environment, then save the searches to reuse later.

The search criteria you can use depends on the type of search, but the mechanics are the same. Searches return only records that match the search criteria specified for all fields.

Note

Searching a custom table requires a slightly different procedure.

Related Topics

- Searching Custom Tables, on page 2129

Search Constraints

Each database table has its own search page where you can enter search constraint values to apply to fields defined for the table. Depending on the type of field, special syntax may be used to specify criteria such as wildcard characters or a range of numeric values.
Search results appear on workflow pages displaying each table field in columnar layout. Some database tables can additionally be searched using fields that are not displayed as columns on workflow pages. To determine whether such a constraint applies to your search results when viewing the results on a workflow page, click on the expand icon () to view the active search constraints.

**General Search Constraints**

When searching for events, observe the following general guidelines:

- All fields accept negation (!).
- All fields accept comma-separated lists of search values. Records that contain any of the listed values in the specified field match that search criteria.
- All fields accept comma-separated lists enclosed in quotation marks as search values.
  - For fields that may contain only a single value, records with the specified field containing the exact string specified within the quotation marks match the search criteria. For instance, a search for "A, B, "C, D, E" will match records where the specified field contains "A" or "B" or "C, D, E". This permits matching on fields that include the comma in possible values.
  - For fields that may contain multiple values at the same time, records with the specified fields containing all of the values in the quote-enclosed comma-separated list match that search criteria.
  - For fields that may contain multiple values at the same time, search criteria may include single values as well as quote-enclosed comma-separated lists. For instance, a search for "A, B, "C, D, E" on a field that may contain one of more of these letters matches records where the specified field contains A or B, or all of C, D, and E.
- Specify n/a in any field to identify events where information is not available for that field; use !n/a to identify the events where that field is populated.
- You can precede many numeric fields with greater than (>), greater than or equal to (≥), less than (<), less than or equal to (≤), equal to (=), or not equal to (<> operators.

**Tip**

When searching a field with long complicated values (such as SHA-256 hash values), you can copy the search criteria value from source material and paste it into the appropriate field on the search page.

**Wildcards and Symbols in Searches**

Many text fields on search pages allow you to use an asterisk (*) to match characters in a string. For example, specifying net* matches network, netware, netscape, and so on.

Note that in text fields that allow a wildcard, you must use the wildcard if you want to match a partial string. For example, if you are searching the audit log for all audit records that involve page views (that is, the message is Page View), searching for Page returns no results. Instead, specify Page*.

In some fields you can search for all or part of the field contents without using asterisks. In these cases, you must use quotation marks around a search string to make exact matches—otherwise, the system performs a partial match. For example, if you were to search such a field for the string Scan Completed with Detection without using quotation marks, the system would return records where the field contains the following strings as well as those where the field exactly matches the search string:
If you want to search for non-alphanumeric characters (including the asterisk character), enclose the search string in quotation marks. For example, to search for the string:

Find an asterisk (*)

enter:

"Find an asterisk (*)"

**Objects and Application Filters in Searches**

The Firepower System allows you to create named objects, object groups, and application filters that can be used as part of your network configuration. You can use these objects, groups, and filters as search criteria when performing or saving searches.

When you perform a search, objects, object groups, and application filters appear in the format, `${object_name}`. For example, a network object with the object name `ten_ten_network` appears as `${ten_ten_network}` in a search.

You can click the add object icon (➕) that appears next to a search field where you can use an object as a search criterion.

**Related Topics**

The Object Manager, on page 388

**Time Constraints in Searches**

The formats accepted by search criteria fields that take a time value are shown in the following table.

**Table 284: Time Specification in Search Fields**

<table>
<thead>
<tr>
<th>Time Formats</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>today [at HH:MMam</td>
<td>pm]</td>
</tr>
<tr>
<td></td>
<td>today at 12:45pm</td>
</tr>
</tbody>
</table>

You can precede a time value with one of the following operators:

**Table 285: Time Specification Operators**

<table>
<thead>
<tr>
<th>Operator</th>
<th>Example</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;</td>
<td>&gt; today at 2:45pm</td>
<td>Returns events with a timestamp later than today at 2:45 PM.</td>
</tr>
</tbody>
</table>
IP Addresses in Searches

When specifying IP addresses in searches, you can enter an individual IP address, a comma-separated list of addresses, an address block, or a range of IP addresses separated with a hyphen (-). You can also use negation.

For searches that support IPv6 (such as intrusion event, connection data, and correlation event searches) you can enter IPv4 and IPv6 addresses and CIDR/prefix length address blocks in any combination. When you search for hosts by IP address, the results include all hosts for which at least one IP address matches your search conditions, that is, a search for an IPv6 address may return hosts whose primary address in IPv4.

When you use CIDR or prefix length notation to specify a block of IP addresses, the Firepower System uses only the portion of the network IP address specified by the mask or prefix length. For example, if you type 10.1.2.3/8, the Firepower System uses 10.0.0.0/8.

Because IP addresses can be represented by network objects, you can also click the add network object icon (+) that appears next to an IP address search field to use a network object as an IP address search criterion.

**Table 286: Acceptable IP Address Syntax**

<table>
<thead>
<tr>
<th>To specify...</th>
<th>Type...</th>
<th>For example...</th>
</tr>
</thead>
<tbody>
<tr>
<td>a single IP address</td>
<td>the IP address.</td>
<td>192.168.1.1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2001:db8::abcd</td>
</tr>
<tr>
<td>multiple IP addresses using a list</td>

<tr>
<td></td>
<td>!192.168.1.10,!2001:db8::/32</td>
<td></td>
</tr>
</tbody>
</table>

**Related Topics**

[Firepower System IP Address Conventions](#), on page 15

**Managed Devices in Searches**

If you group devices—whether just on the FMC, or as actual high availability or scalability configurations—searching for the name for the group correctly returns results for all devices in the group.

If the system finds a match for a group, device high-availability pair, or stack, it replaces the group, device high-availability pair, or stack name with the appropriate member device names for the purpose of performing the search. When you save a search that uses a device group, device high-availability pair, or stack in the
device field the system saves the name specified in the device field and performs the device name replacement again each time the search is executed.

**Ports in Searches**

The Firepower System accepts specific syntax for port numbers in searches. You can enter:

- a single port number
- a comma-separated list of port numbers
- two port numbers separated by a dash to represent a range of port numbers
- a port number followed by a protocol abbreviation, separated by a forward slash (only when searching for intrusion events)
- a port number or range of port numbers preceded by an exclamation mark to indicate a negation of the specified ports

Do **not** use spaces when specifying port numbers or ranges.

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>21</td>
<td>Returns all events on port 21, including TCP and UDP events.</td>
</tr>
<tr>
<td>123</td>
<td>Returns all events except those on port 23.</td>
</tr>
<tr>
<td>25/tcp</td>
<td>Returns all TCP-related intrusion events on port 25.</td>
</tr>
<tr>
<td>21/tcp,25/tcp</td>
<td>Returns all TCP-related intrusion events on ports 21 and 25.</td>
</tr>
<tr>
<td>21–25</td>
<td>Returns all events on ports 21 through 25.</td>
</tr>
</tbody>
</table>

**Event Fields in Searches**

When searching for events, you can use the following fields as search criteria:

- Audit Log Workflow Fields, on page 2350
- Application Data Fields, on page 2314
- Application Detail Data Fields, on page 2316
- Captured File Fields, on page 2244
- White List Event Fields, on page 2340
- Connection and Security Intelligence Event Fields, on page 2151
- Correlation Event Fields, on page 2336
Performing a Search

<table>
<thead>
<tr>
<th>License</th>
<th>Any</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported Devices</td>
<td></td>
</tr>
<tr>
<td>Access</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

**Step 1**  Select Analysis > Search.

*Tip*  You may also click Search from any page on a workflow.

**Step 2**  From the table drop-down list, select the type of event or data to search.

**Step 3**  Enter your search criteria in the appropriate fields. See the following sections for detailed information on the search criteria you can use:

- Search Constraints, on page 2103
- Audit Log Workflow Fields, on page 2350
- Application Data Fields, on page 2314
- Application Detail Data Fields, on page 2316
- Captured File Fields, on page 2244
Step 4
If you want to use the search again in the future, save the search as described in Saving a Search, on page 2109.

Step 5
Click Search to start the search. Your search results appear in the default workflow for the table you are searching, constrained by time (if applicable).

What to do next
• To analyze the search results using workflows, see Using Workflows, on page 2073.

Firepower Management Center Configuration Guide, Version 6.1
In a multidomain deployment, the system displays saved searches created in the current domain, which you can edit. It also displays searches saved in ancestor domains, which you cannot edit. To view and edit searches created in a lower domain, switch to that domain.

**Before you begin**

- Establish search criteria as described in *Performing a Search, on page 2108*, or load a saved search as described in *Loading a Saved Search, on page 2110*.

**Procedure**

**Step 1**  
From the Search page, if you want to save the search as private so only you can access it, check the **Private** checkbox.  

**Tip**  
If you want to use the search as a data restriction for a custom user role, you must save it as a private search.

**Step 2**  
You have two options:  
- If you want to save a new version of a loaded search, click **Save As New**.  
- If you want to save a new search, or overwrite a custom search using the same name, click **Save**. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

---

**Loading a Saved Search**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays saved searches created in the current domain, which you can edit. It also displays searches saved in ancestor domains, which you cannot edit. To view and edit searches created in a lower domain, switch to that domain.

**Procedure**

**Step 1**  
Choose **Analysis > Search**.  

**Tip**  
You may also click **Search** from any page on a workflow.

**Step 2**  
From the table drop-down list, choose the type of event or data to search.

**Step 3**  
Choose the search you want to load from the **Custom Searches** list or the **Predefined Searches** list.

**Step 4**  
If you want to use different search criteria, change the search constraints.

**Step 5**  
If you want to use a changed search again in the future, save the search as described in *Saving a Search, on page 2109*.
Step 6  
Click Search.

Query Overrides Via the Shell

System administrators can use a Linux shell-based query management tool to locate and stop long-running queries.

The query management tool allows you to locate queries running longer than a specified number of minutes and stop those queries. The tool logs an event to the audit log and to syslog when you stop a query.

Note that the admin internal user can access the FMC CLI. If you use an external authentication object which grants CLI access, users matching the shell access filter can also log into the CLI.

Note
Leaving the search page in the web interface does not stop a query. Queries that take a long time to return results impact overall system performance while the query is running.

Shell-Based Query Management Syntax

Use the following syntax to manage long-running queries:

```
query_manager [-v] [-l [minutes]] [-k query_id [...] [--kill-all minutes]
```

**Table 288: query_manager Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-h, --help</code></td>
<td>Prints a brief help message.</td>
</tr>
<tr>
<td><code>-l, --list [minutes]</code></td>
<td>Lists all queries taking longer than passed-in minutes. By default it will show all queries taking longer than 1 minute.</td>
</tr>
<tr>
<td><code>-k, --kill query_id [...]</code></td>
<td>Kills the query with the passed-in id. The option can take multiple ids.</td>
</tr>
<tr>
<td><code>--kill-all minutes</code></td>
<td>Kills all queries taking longer than passed-in minutes.</td>
</tr>
<tr>
<td><code>-v, --verbose</code></td>
<td>Verbose output including full SQL queries.</td>
</tr>
</tbody>
</table>

Caution
For system security reasons, Cisco strongly recommends that you not establish additional Linux shell users on any appliance.
Stopping Long-Running Queries

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>admin or externally authenticated user with shell access</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** Connect to the Firepower Management Center via `ssh`.

**Step 2** Run `query_manager` under `sudo` using the syntax described in Shell-Based Query Management Syntax, on page 2111.
Custom Workflows

The following topics describe how to use custom workflows:

- Introduction to Custom Workflows, on page 2113
- Saved Custom Workflows, on page 2113
- Custom Workflow Creation, on page 2114
- Custom Workflow Use and Management, on page 2118

Introduction to Custom Workflows

If the predefined and Cisco-provided custom workflows do not meet your needs, you can create and manage custom workflows.

Custom workflows are workflows that you create to meet the unique needs of your organization. When you create a custom workflow, you choose the kind of event (or database table) on which the workflow is based. On the Firepower Management Center, you can base a custom workflow on a custom table. You can also choose the pages a custom workflow contains; custom workflows can contain drill-down, table view, and host or packet view pages.

If your event evaluation process changes, you can edit custom workflows to meet your new needs. Note that you cannot edit any of the predefined workflows.

Tip

You can set a custom workflow as the default workflow for any event type.

Saved Custom Workflows

In addition to predefined workflows, which cannot be modified, the Firepower Management Center includes several saved custom workflows. Each of these workflows is based on a custom table and can be modified.

In a multidomain deployment, these saved workflows belong to the Global domain and cannot be modified in lower domains.
### Table 289: Saved Custom Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Events by Impact, Priority, and Host Criticality</td>
<td>You can use this workflow to quickly pick out and focus in on hosts that are important to your network, currently vulnerable, and possibly currently under attack. This workflow is based on the Intrusion Events with Destination Criticality custom table.</td>
</tr>
<tr>
<td>Events by Priority and Classification</td>
<td>This workflow lists events and their type in order of event priority, along with a count showing how many times each event has occurred. This workflow is based on the Intrusion Events custom table.</td>
</tr>
<tr>
<td>Events with Destination, Impact, and Host Criticality</td>
<td>You can use this workflow to find the most recent attacks on hosts that are important to your network and currently vulnerable. This workflow is based on the Intrusion Events with Destination Criticality custom table.</td>
</tr>
<tr>
<td>Hosts with Servers Default Workflow</td>
<td>You can use this workflow to quickly view the basic information in the Hosts with Servers custom table. This workflow is based on the Hosts with Servers custom table.</td>
</tr>
<tr>
<td>Intrusion Events with Destination Criticality Default Workflow</td>
<td>You can use this workflow to quickly view the basic information in the Intrusion Events with Destination Criticality custom table. This workflow is based on the Intrusion Events with Destination Criticality custom table.</td>
</tr>
<tr>
<td>Intrusion Events with Source Criticality Default Workflow</td>
<td>You can use this workflow to quickly view the basic information in the Intrusion Events with Source Criticality custom table. This workflow is based on the Intrusion Events with Source Criticality custom table.</td>
</tr>
<tr>
<td>Server and Host Details</td>
<td>You can use this workflow to determine what servers are most frequently used on your network and which hosts are running those servers. This workflow is based on the Hosts with Servers custom table.</td>
</tr>
</tbody>
</table>

### Custom Workflow Creation

If the predefined and Cisco-provided custom workflows do not meet your needs, you can create custom workflows.
Instead of creating a new custom workflow, you can export a custom workflow from another appliance and then import it onto your appliance. You can then edit the imported workflow to suit your needs.

When you create a custom workflow, you:

- Select a table to be the source of the workflow
- Provide a workflow name
- Add drill-down pages and table view pages to the workflow

For each drill-down page in the workflow, you can:

- Provide a name that appears at the top of the page in the web interface
- Include up to five columns per page
- Specify a default sort order, ascending or descending

You can add table view pages in any position in the sequence of workflow pages. They do not have any editable properties, such as a page name, sort order, or user-definable column positions.

You must add at least one drill-down page or a table view of events to a custom workflow.

If you selected Vulnerabilities as the table type, then add IP Address as a table column, the IP Address column does not appear when you are viewing vulnerabilities using your custom workflow, unless you use the search feature to constrain the workflow to view a specific IP address or block of addresses.

The final page of a custom workflow depends on the table on which you base the workflow, as described in the following table. These final pages are added by default when you create the workflow.

<table>
<thead>
<tr>
<th>Event/Asset Type</th>
<th>Final Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery events</td>
<td>Hosts</td>
</tr>
<tr>
<td>Vulnerabilities</td>
<td>Vulnerability detail</td>
</tr>
<tr>
<td>Third-party vulnerabilities</td>
<td>Hosts</td>
</tr>
<tr>
<td>Users</td>
<td>Users</td>
</tr>
<tr>
<td>Indications of compromise</td>
<td>Hosts</td>
</tr>
<tr>
<td>Intrusion events</td>
<td>Packets</td>
</tr>
</tbody>
</table>

The system does not add a final page to custom workflows based on other kinds of events (for example, audit log or malware events).
Custom workflows based on connection data are like other custom workflows, except you can include drill-down pages containing connection summary data, and connection data graph pages as well as drill-down pages containing data for individual connections and table view pages.

### Creating Custom Workflows Based on Non-Connection Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose Analysis > Custom > Custom Workflows.

**Step 2** Click Create Custom Workflow.

**Step 3** Enter a name for the workflow in the Name field.

**Step 4** Optionally, enter a Description.

**Step 5** Choose the table you want to include from the Table drop-down list.

**Step 6** If you want to add one or more drill-down pages to the workflow, click Add Page.

**Step 7** Enter a name for the page in the Page Name field.

**Step 8** Under Column 1, choose a sort priority and a table column. This column will appear in the leftmost column of the page.

**Example:**

For example, to create a page showing the destination ports that are targeted, and to sort the page by count, choose 2 from the Sort Priority drop-down list and Destination Port/ICMP Code from the Field drop-down list.

**Step 9** Continue choosing fields to include and setting their sort priority until you have specified all the fields you want to appear on the page.

**Step 10** If you want to add a table view page to the workflow, click Add Table View.

**Step 11** Click Save.

### Creating Custom Connection Data Workflows

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Custom workflows based on connection data are like other custom workflows, except you can include connection data graph pages as well as drill-down pages and table view pages. You can include as many of each type of page in the workflow as you want, in any order. Each connection data graph page contains a single graph, which can be a line graph, bar graph, or pie chart. On line and bar graphs, you may include more than one dataset.
Procedure

**Step 1** Choose Analysis > Custom > Custom Workflows.

**Step 2** Click Create Custom Workflow.

**Step 3** Enter a name for the workflow in the Name field.

**Step 4** Optionally, enter a Description.

**Step 5** From the Table drop-down list, choose Connection Events.

**Step 6** If you want to add one or more drill-down pages to the workflow, you have two options:
- Click Add Page to add a drill-down page that contains data on individual connections,
- Click Add Summary Page to add a drill-down page that contains connection summary data.

**Step 7** Enter a name for the page in the Page Name field.

**Step 8** Under Column 1, choose a sort priority and a table column. This column will appear in the leftmost column of the page.

**Step 9** Continue choosing fields to include and setting their sort priority until you have specified all the fields you want to appear on the page.

**Example:**
For example, to create a page showing the amount of traffic transmitted over your monitored network and to sort the page by the responders that transmitted the most traffic, choose 1 from the Sort Priority drop-down list and Responder Bytes from the Field drop-down list.

**Step 10** If you want to add one or more graph pages to the workflow, click Add Graph.

**Step 11** Enter a name for the page in the Graph Name field.

**Step 12** Choose the type of graph you want to include on the page:
- line graph
- bar graph
- pie chart

**Step 13** Specify what kind of data you want to graph by choosing the x- and y-axes of the graph.

On a pie chart, the x-axis represents the independent variable and the y-axis represents the dependent variable.

**Step 14** Choose the datasets you want to include on the graph.

Note that pie charts can include only one data set.

**Step 15** If you want to add a table view of connection data, click Add Table View.

Table views are not configurable.

**Step 16** Click Save.
Custom Workflow Use and Management

The method you use to view a workflow depends on whether the workflow is based on one of the predefined event tables or on a custom table.

If your custom workflow is based on a predefined event table, access it in the same way that you would access a workflow that ships with the appliance. For example, to access a custom workflow based on the Hosts table, choose Analysis > Hosts > Hosts. If, on the other hand, your custom workflow is based on a custom table, you must access it from the Custom Tables page.

If your event evaluation process changes, you can edit custom workflows to meet your new needs. Note that you cannot edit any of the predefined workflows.

![Tip](image)

You can set a custom workflow as the default workflow for any event type.

Viewing Custom Workflows Based on Predefined Tables

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose the appropriate menu path and option for the table on which you based your custom workflow, as described in the Workflow Selection, on page 2075.

**Step 2** To use a different workflow, including a custom workflow, click (switch workflow) next to the current workflow title.

**Step 3** If no events appear and the workflow can be constrained by time, you may need to adjust the time range; see Event Time Constraints, on page 2090.

Viewing Custom Workflows Based on Custom Tables

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays custom workflows created in the current domain, which you can edit. It also displays custom workflows created in ancestor domains, which you cannot edit. To view and edit custom workflows in a lower domain, switch to that domain.
Procedure

Step 1  Choose Analysis > Custom > Custom Tables.

Step 2  Click view ( ) next to the custom table you want to view, or click the name of the custom table.

Step 3  To use a different workflow, including a custom workflow, click (switch workflow) beside the current workflow title.

Step 4  If no events appear and the workflow can be constrained by time, you may need to adjust the time range; see Event Time Constraints, on page 2090.

Editing Custom Workflows

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays custom workflows created in the current domain, which you can edit. It also displays custom workflows created in ancestor domains, which you cannot edit. To view and edit custom workflows in a lower domain, switch to that domain.

Procedure

Step 1  Choose Analysis > Custom > Custom Workflows.

Step 2  Click edit ( ) next to the name of the workflow that you want to edit.

If a view icon ( ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3  Make any changes that you want to the workflow.

Step 4  Click Save.
Custom Tables

The following topics describe how to use custom tables:

- Introduction to Custom Tables, on page 2121
- Predefined Custom Tables, on page 2121
- User-Defined Custom Tables, on page 2126
- Searching Custom Tables, on page 2129

Introduction to Custom Tables

As the Firepower System collects information about your network, the Firepower Management Center stores it in a series of database tables. When you use a workflow to view the resulting information, the Firepower Management Center pulls the data from one of these tables. For example, the columns on each page of the Network Applications by Count workflow are taken from the fields in the Applications table.

If you determine that your analysis of the activity on your network would be enhanced by combining fields from different tables, you can create a custom table. For example, you could combine the host criticality information from the predefined Host Attributes table with the fields from the predefined Connection Data table and then examine connection data in a new context.

Note that you can create custom workflows for either predefined or custom tables.

Predefined Custom Tables

Custom tables contain fields from two or more predefined tables. The Firepower System is delivered with a number of system-defined custom tables, but you can create additional custom tables that contain only information that matches your specific needs.

For example, the Firepower System is delivered with system-defined custom tables that correlate intrusion event data with host data, so you can search for events that impact critical systems and view the results of that search in one workflow.

In a multidomain deployment, the predefined custom tables belong to the Global domain and cannot be modified in lower domains.

The following table describes the custom tables provided with the system.
Possible Table Combinations

When you create a custom table, you can combine fields from predefined tables that have related data. The following table lists the predefined tables you can combine to create a new custom table. Keep in mind that you can create a custom table that combines fields from more than two predefined custom tables.

Table 292: Custom Table Combinations

<table>
<thead>
<tr>
<th>You can combine fields from...</th>

Sometimes a field in one table maps to more than one field in another table. For example, the predefined Intrusion Events with Destination Criticality custom table combines fields from the Intrusion Events table and the Hosts table. Each event in the Intrusion Events table has two IP addresses associated with it—a source IP address and a destination IP address. However, the “events” in the Hosts table each represent a single host IP address (hosts may have multiple IP addresses). Therefore, when you create a custom table based on the Intrusion Events table and the Hosts table, you must choose whether the data you display from the Hosts table applies to the host source IP address or the host destination IP address in the Intrusion Events table.

When you create a new custom table, a default workflow that displays all the columns in the table is automatically created. Also, just as with predefined tables, you can search custom tables for data that you want to use in your network analysis. You can also generate reports based on custom tables, as you can with predefined tables.
User-Defined Custom Tables

Instead of creating a new custom table, you can export a custom table from another Firepower Management Center, then import it onto your Firepower Management Center.

To create a custom table, decide which predefined tables delivered with the Firepower System contain the fields you want to include in your custom table. You can then choose which fields you want to include and, if necessary, configure field mappings for any common fields.

Data involving the Hosts table allows you to view data associated with all IP addresses from one host, rather than one specific IP address.

For example, consider a custom table that combines fields from the Correlation Events table and the Hosts table. You can use this custom table to get detailed information about the hosts involved in violations of any of your correlation policies. Note that you must decide whether to display data from the Hosts table that matches the source IP address or the destination IP address in the Correlation Events table.

If you view the table view of events for this custom table, it displays correlation events, one per row. You can configure the custom table to include the following information:

• the date and time the event was generated
• the name of the correlation policy that was violated
• the name of the rule that triggered the violation
• the IP address associated with the source, or initiating, host involved in the correlation event
• the source host’s NetBIOS name
• the operating system and version the source host is running
• the source host criticality

You could create a similar custom table that displays the same information for destination, or responding, hosts.

Creating a Custom Table

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any/Admin</td>
</tr>
</tbody>
</table>
Procedure

Step 1: Choose Analysis > Custom > Custom Tables.
Step 2: Click Create Custom Table.
Step 3: In the Name field, enter a name for the custom table.

Example:
For example, you might enter Correlation Events with Host Information (Src IP).

Step 4: From the Tables drop-down list, choose Correlation Events.
Step 5: Under Fields, choose Time and click Add to add the date and time when a correlation event was generated.
Step 6: Repeat step 5 to add the Policy and Rule fields.

Tip: You can use Ctrl or Shift while clicking to choose multiple fields. You can also click and drag to choose multiple adjacent values. However, if you want to specify the order the fields appear in the table view of events associated with the table, add the fields one at a time.

Step 7: From the Tables drop-down list, choose Hosts.
Step 8: Add the IP Address, NetBIOS Name, OS Name, OS Version, and Host Criticality fields to the custom table.
Step 9: Under Common Fields, next to Correlation Events, choose Source IP.

Your custom table is configured to display the host information you chose in step 8 for the source, or initiating, hosts involved in correlation events.

Tip: You can create a custom table that displays detailed host information for the destination, or responding, hosts involved in a correlation event by following this procedure but choosing Destination IP instead of Source IP.

Step 10: Click Save.

Modifying a Custom Table

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any/Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays custom tables created in the current domain, which you can edit. It also displays custom tables created in ancestor domains, which you cannot edit. To view and edit custom tables in a lower domain, switch to that domain.

Procedure

Step 1: Choose Analysis > Custom > Custom Tables.
Step 2: Click edit (📝) next to the table you want to edit.
Deleting a Custom Table

If a view icon (Eye) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Optionally, remove fields from the table by clicking delete (Trash) next to the fields you want to remove.

**Note** If you delete fields currently in use in reports, the system will prompt you to confirm that you want to remove the sections using those fields from those reports.

**Step 4** Make other changes as needed.

**Step 5** Click Save.

---

**Deleting a Custom Table**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any/行政部门</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays custom tables created in the current domain, which you can delete. It also displays custom tables created in ancestor domains, which you cannot delete. To delete custom tables in a lower domain, switch to that domain.

**Procedure**

**Step 1** Choose Analysis > Custom > Custom Tables.

**Step 2** Click delete (Trash) next to the custom table you want to delete.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

---

**Viewing a Workflow Based on a Custom Table**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any/行政部门</td>
</tr>
</tbody>
</table>

When you create a custom table, the system automatically creates a default workflow for it. The first page of this workflow displays a table view of events. If you include intrusion events in your custom table, the second page of the workflow is the packet view. Otherwise, the second page of the workflow is a hosts page. You can also create your own custom workflows based on your custom table.

**Tip** If you create a custom workflow based on a custom table, you can specify it as the default workflow for that table.
You can use the same techniques to view events in your custom table that you use for event views based on predefined tables.

In a multidomain deployment, the system displays custom tables created in the current domain, which you can edit. It also displays custom tables created in ancestor domains, which you cannot edit. To view and edit custom tables in a lower domain, switch to that domain.

**Procedure**

1. **Step 1** Choose Analysis > Custom > Custom Tables.
2. **Step 2** Click view (🔍) next to the custom table related to the workflow you want to see.

---

### Searching Custom Tables

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any/Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays custom tables created in the current domain, which you can edit. It also displays custom tables created in ancestor domains, which you cannot edit. To view and edit custom tables in a lower domain, switch to that domain.

**Procedure**

1. **Step 1** Choose Analysis > Custom > Custom Tables.
2. **Step 2** Click view (🔍) next to the custom table you want to search.
   - **Tip** To use a different workflow, including a custom workflow, click (switch workflow) next the workflow title.
3. **Step 3** Click Search.
   - **Tip** To search the database for a different kind of event or data, choose it from the table drop-down list.
4. **Step 4** Enter your search criteria in the appropriate fields.
   - If you enter criteria for multiple fields, the search returns only the records that match search criteria specified for all fields.
   - **Tip** Click object (➕) next to a search field to use an object as a search criterion.
5. **Step 5** Optionally, if you plan to save the search, you can check the Private check box to save the search as private so only you can access it. Otherwise, leave the check box clear to save the search for all users.
   - **Tip** If you want to use the search as a data restriction for a custom user role, you must save it as a private search.
Step 6  Optionally, you can save the search to be used again in the future. You have the following options:

- Click Save to save the search criteria. The search is visible only to your account if you checked the Private check box.
- Click Save As New to save a new search or assign a name to a search you created by altering a previously-saved search. The search is saved and visible only to your account if you checked the Private check box.

Step 7  Click Search to start the search.
Your search results appear in the default workflow for the custom table, constrained by the current time range (if applicable).
PART XXV

Events and Assets

Connection Logging

The following topics describe how to configure the Firepower System to log connections made by hosts on your monitored network:

- About Connection Logging, on page 2133
- Limitations of Connection Logging, on page 2141
- Best Practices for Connection Logging, on page 2142
- Configure Connection Logging, on page 2144

About Connection Logging

The system can generate logs of the connections its managed devices detect. These logs are called connection events. Settings in rules and policies give you granular control over which connections you log, when you log them, and where you store the data. Special connection events, called Security Intelligence events, represent connections blacklisted (blocked) by the reputation-based Security Intelligence feature.

Connection events contain data about the detected sessions. The information available for any individual connection event depends on several factors, but in general includes:

- Basic connection properties: timestamp, source and destination IP address, ingress and egress zones, the device that handled the connection, and so on
- Additional connection properties discovered or inferred by the system: applications, requested URLs, or users associated with the connection, and so on
- Metadata about why the connection was logged: which configuration handled the traffic, whether the connection was allowed or blocked, details about encrypted and decrypted connections, and so on

Log connections according to the security and compliance needs of your organization. When setting up connection logging, keep in mind that the system can log a connection for multiple reasons, and that disabling logging in one place does not mean that matching connections will not be logged.

The information in a connection event depends on several factors, including traffic characteristics, the configuration that ultimately handled the connection, and so on.

You can supplement the connection logs gathered by your managed devices with connection data generated from exported NetFlow records. This is especially useful if you have NetFlow-enabled routers or other devices deployed on networks that your Firepower System managed devices cannot monitor.
Connections That Are Always Logged

Unless you disable connection event storage, the system automatically saves the following end-of-connection events to the Firepower Management Center database, regardless of any other logging configurations.

Connections Associated with Intrusions

The system automatically logs connections associated with intrusion events, unless the connection is handled by the access control policy's default action.

When an intrusion policy associated with the access control default action generates an intrusion event, the system does not automatically log the end of the associated connection. Instead, you must explicitly enable default action connection logging. This is useful for intrusion prevention-only deployments where you do not want to log any connection data.

However, if you enable beginning-of-connection logging for the default action, the system does log the end of the connection when an associated intrusion policy triggers, in addition to logging the beginning of the connection.

Connections Associated with File and Malware Events

The system automatically logs connections associated with file and malware events.

Note

File events generated by inspecting NetBIOS-SSN (SMB) traffic do not immediately generate connection events because the client and server establish a persistent connection. The system generates connection events after the client or server ends the session.

Connections Associated with Intelligent Application Bypass

The system automatically logs bypassed and would-have-bypassed connections associated with IAB.

Monitored Connections

The system always logs the ends of connections for monitored traffic, even if the traffic matches no other rules and you do not enable default action logging. For more information, see Logging for Monitored Connections, on page 2136.

Other Connections You Can Log

So that you log only critical connections, enable connection logging on a per-rule basis. If you enable connection logging for a rule, the system logs all connections handled by that rule.

You can also log connections handled by policy default actions. Depending on the rule or default action (and for access control, a rule's inspection configuration), your logging options differ.
Prefilter Policy: Rules and Default Action

You can log connections (including entire plaintext, passthrough tunnels) that you fastpath or block with a prefilter policy.

Prefiltering uses outer-header criteria to handle traffic. For tunnels that you log, the resulting connection events contain information from the outer, encapsulation headers.

For traffic subject to further analysis, logging in the prefilter policy is disabled, although matching connections may still be logged by other configurations. The system performs all further analysis using inner headers, that is, the system independently handles and logs each connection within an allowed tunnel.

SSL Policy: Rules and Default Action

You can log connections that match an SSL rule or SSL policy default action.

For blocked connections, the system immediately ends the session and generates an event. For monitored connections and connections that you pass to access control rules, the system generates an event when the session ends.

Access Control Policy: Security Intelligence Decisions

You can log a connection whenever it is blacklisted (blocked) by the reputation-based Security Intelligence feature.

Optionally, and recommended in passive deployments, you can use a monitor-only setting for Security Intelligence filtering. This allows the system to further analyze connections that would have been blacklisted, but still log the match to the blacklist. Security Intelligence monitoring also allows you to create traffic profiles using Security Intelligence information.

When the system logs a connection event as the result of Security Intelligence filtering, it also logs a matching SecurityIntelligence event, which is a special kind of connection event that you can view and analyze separately, and that is also stored and pruned separately. So that you can identify the blacklisted IP address in the connection, host icons next to blacklisted and monitored IP addresses look slightly different in the tables on the pages under the Analysis > Connections menus.

Access Control Policy: Rules and Default Action

You can log connections that match an access control rule or access control policy default action.

Related Topics

How Rules and Policy Actions Affect Logging, on page 2135

How Rules and Policy Actions Affect Logging

Connection events contain metadata about why the connection was logged, including which configurations handled the traffic. Where you can configure connection logging, rule actions, and policy default actions determine not only how the system inspects and handles matching traffic, but also when and how you can log details about matching traffic.

Related Topics

Tunnel and Prefilter Rule Components, on page 1205
TLS/SSL Rule Actions, on page 1279
Access Control Rule Actions, on page 1155
Connection and Security Intelligence Event Fields, on page 2151
Logging for Fastpathed Connections

You can log fastpathed connections and non-encrypted tunnels, which includes traffic matching the following rules and actions in the prefilter policy:

- Tunnel rules—Fastpath action (logs the outer session)
- Prefilter rules—Fastpath action

Fastpathed traffic bypasses the rest of access control and QoS, so connection events for fastpathed connections contain limited information. You cannot log connections fastpathed with 8000 Series fastpath rules.

Logging for Monitored Connections

The system always logs the ends of connections for traffic matching the following configurations, even if the traffic matches no other rules and you do not enable default action logging:

- Security Intelligence—Blacklists set to monitor (also generates a Security Intelligence event)
- SSL rules—Monitor action
- Access control rules—Monitor action

The system does not generate a separate event each time a single connection matches a Monitor rule. Because a single connection can match multiple Monitor rules, each connection event can include and display information on the first eight Monitor access control rules that the connection matches, as well as the first matching SSL Monitor rule.

Similarly, if you send connection events to an external syslog or SNMP trap server, the system does not send a separate alert each time a single connection matches a Monitor rule. Rather, the alert that the system sends at the end of the connection contains information on the Monitor rules the connection matched.

Logging for Trusted Connections

You can log the beginnings and ends of trusted connections, which includes traffic matching the following rules and actions:

- Access control rules—Trust action
- Access control default action—Trust All Traffic

Although you can log trusted connections, we recommend you do not do so because trusted connections are not subject to deep inspection or discovery, so connection events for trusted connections contain limited information.

The system logs TCP connections handled by a Trust access control rule differently depending on the device that detected the connection:

- For 7000 and 8000 Series devices, TCP connections detected by a Trust rule on the first packet generate different events depending on the presence of a preceding enabled Monitor rule. If the Monitor rule is active, the system evaluates the packet and generates both a beginning and end-of-connection event. If no Monitor rule is active, the system generates only an end-of-connection event.
For all other models, TCP connections detected by a Trust rule on the first packet generate only an end-of-connection event. The system generates the event one hour after the final session packet.

Logging for Blocked Connections

You can log blocked connections, which includes traffic matching the following rules and actions:

- Tunnel rules—Block
- Prefilter rules—Block
- Prefilter default action—Block all tunnel traffic
- Security Intelligence—Blacklists set to block (also generates a Security Intelligence event)
- SSL rules—Block and Block with reset
- SSL default action—Block and Block with reset
- Access control rules—Block, Block with reset, and Interactive Block
- Access control default action—Block All Traffic

Only devices deployed inline (that is, using routed, switched, or transparent interfaces, or inline interface pairs) can block traffic. Because blocked connections are not actually blocked in passive deployments, the system may report multiple beginning-of-connection events for each blocked connection.

Caution

Logging blocked TCP connections during a Denial of Service (DoS) attack can affect system performance and overwhelm the database with multiple similar events. Before you enable logging for an Block rule, consider whether the rule monitors traffic on an Internet-facing interface or other interface vulnerable to DoS attack.

Beginning vs End-of-Connection Logging for Blocked Connections

When you log a blocked connection, how the system logs it depends on why the connection was blocked; this is important to keep in mind when configuring correlation rules based on connection logs:

- For SSL rules and SSL policy default actions that block encrypted traffic, the system logs end-of-connection events. This is because the system cannot determine if a connection is encrypted using the first packet in the session.
- For other blocking actions, the system logs beginning-of-connection events. Matching traffic is denied without further inspection.

Logging Bypassed Interactive Blocks

Interactive blocking access control rules, which cause the system to display a warning page when a user browses to a prohibited website, allow you to configure end-of-connection logging. This is because if the user clicks through the warning page, the connection is considered a new, allowed connection which the system can monitor and log.

Therefore, for packets that match an Interactive Block or Interactive Block with Reset rule, the system can generate the following connection events:
• A beginning-of-connection event when a user’s request is initially blocked and the warning page is displayed; this event has an associated action of Interactive Block or Interactive Block with Reset.

• Multiple beginning- or end-of-connection events if the user clicks through the warning page and loads the originally requested page; these events have an associated action of Allow and a reason of User Bypass.

The following figure shows an example of an interactive block followed by allow.

**Connection Events** (switch workflow)

*Connections with Application Details* > *Table View of Connection Events*

<table>
<thead>
<tr>

</tbody>
</table>

Logging for Allowed Connections

You can log allowed connections, which includes traffic matching the following rules and actions:

- SSL rules—Decrypt action
- SSL rules—Do not decrypt action
- SSL default action—Do not decrypt
- Access control rules—Allow action
- Access control default action—Network Discovery Only and any intrusion prevention option

Enabling logging for these configurations ensures the connection is logged, while also permitting (or specifying) the next phase of inspection and traffic handling. SSL logging is always end-of-connection; access control configurations also allow beginning-of-connection logging.

Although the Analyze action in tunnel and prefilter rules also allows connections to continue with access control, logging is disabled for rules with this action. Matching connections may still be logged by other configurations. Allowed tunnels might have their encapsulated sessions evaluated and logged individually.

When you allow traffic with an access control rule or default action, you can use an associated intrusion policy to further inspect traffic and block intrusions. For access control rules, you can also use a file policy to detect and block prohibited files, including malware. Unless you disable connection event storage, the system automatically logs most allowed connections associated with intrusion, file, and malware events. For detailed information, see *Connections That Are Always Logged*, on page 2134.

Connections with encrypted payloads are not subject to deep inspection, so connection events for encrypted connections contain limited information.

**File and Malware Event Logging for Allowed Connections**

When a file policy detects or blocks a file, it logs one of the following events to the Firepower Management Center database:
• *File events*, which represent detected or blocked files, including malware files

• *Malware events*, which represent detected or blocked malware files only

• *Retrospective malware events*, which are generated when the malware disposition for a previously detected file changes

You can disable this logging on a per-access-control-rule basis. You can also disable file and malware event storage entirely.

---

**Note**

We recommend you leave file and malware event logging enabled.

## Beginning vs End-of-Connection Logging

You can log a connection at its beginning or its end, with the following exceptions for blocked traffic:

• **Blocked traffic**—Because blocked traffic is immediately denied without further inspection, usually you can log only beginning-of-connection events for blocked or blacklisted traffic. There is no unique end of connection to log.

• **Blocked encrypted traffic**—When you enable connection logging in an SSL policy, the system logs end-of-connection rather than beginning-of-connection events. This is because the system cannot determine if a connection is encrypted using the first packet in the session, and thus cannot immediately block encrypted sessions.

To optimize performance, log either the beginning or the end of any connection, but not both. Monitoring a connection for any reason forces end-of-connection logging. For a single non-blocked connection, the end-of-connection event contains all of the information in the beginning-of-connection event, as well as information gathered over the duration of the session.

The following table details the differences between beginning and end-of-connection events, including the advantages to logging each.

**Table 293: Comparing Beginning and End-of-Connection Events**

<table>
<thead>
<tr>
<th>Can be generated...</th>
<th>Beginning-of-Connection Events</th>
<th>End-of-Connection Events</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>Can be logged for...</td>
<td>All connections except those blocked by the SSL policy</td>
<td>Most connections</td>
</tr>
</tbody>
</table>
### Firepower Management Center vs External Logging

If you store connection and Security Intelligence event logs on the Firepower Management Center, you can use the Firepower System's reporting, analysis, and data correlation features. For example:

- Dashboards and the Context Explorer provide you with graphical, at-a-glance views of the connections logged by the system.
- Event views (most of the options available under the Analysis menu) present detailed information on the connections logged by the system, which you can display in a graphical or tabular format or summarize in a report.
- Traffic profiling uses connection data to create a profile of your normal network traffic that you can then use as a baseline against which to detect and track anomalous behavior.
- Correlation policies allow you to generate events and trigger responses (such as alerts or external remediations) to specific types of connections or traffic profile changes.

The number of events the Firepower Management Center can store depends on its model.
To use these features, you must log connections (and in most cases, the end of those connections rather than the beginning). This is why the system automatically logs critical connections—those associated with logged intrusions, prohibited files, and malware.

You can also log events to an external syslog or SNMP trap server using the following:

- For external logging on any device:
  A connection you configure called an alert response.

- For external logging on FTD devices:
  See About Configuring Syslog, on page 888 and Configure SNMP Traps, on page 887.

Firepower Management Center Alert Responses, on page 2001

Limitations of Connection Logging

You cannot log:

- Connections fastpathed with 8000 Series fastpath rules
- The outer session of a plaintext, passthrough tunnel whose encapsulated connections are inspected by access control
- TCP connections if the three-way handshake is not completed.

These connections are not logged as doing so would provide an opportunity for a denial-of-service attack against your Firepower deployment.

However, you can use the following workaround to monitor or debug failed connections:

- Use the use show asp drops command in the command-line interface.

If a connection event does not contain the information you think it should, see Requirements for Populating Connection Event Fields, on page 2165 and Information Available in Connection Event Fields, on page 2167.

When Events Appear in the Event Viewer

The following points are applicable to all types of events:

- If you are looking at a page under the Analysis menu, you must refresh the page to display new events.

- Events generally are available for viewing within a few seconds of the time the traffic was detected. However, there can be an arbitrary delay under situations such as: Exceptionally heavy traffic conditions; the FMC is managing a lot of devices on a low-bandwidth network; or during operations such as event backup which pause event processing.
Best Practices for Connection Logging

Use the following best practices to ensure that you log only the connections you want to log. So that you log only critical connections, enable connection logging on a per-access-control-rule basis.

Connections that are always logged

The system automatically logs the following:

- Some connections associated with detected files, malware, intrusions, and Intelligent Application Bypass (IAB).
  
  For more information, see Connections That Are Always Logged, on page 2134.

- Monitored connections.
  
  For more information, see Logging for Monitored Connections, on page 2136.

Connections to never log

Do not enable logging for the following:

- Access control rules with a Trust action.
  
  Trusted connections are not subject to deep inspection or discovery, so connection events for trusted connections contain limited information.

- Do not enable logging for Block rules in passive deployments. To log connections that the system would have blocked if your devices were deployed inline, use a Monitor rule instead of a Block rule.
  
  Only devices deployed inline (that is, using routed, switched, or transparent interfaces, or inline interface pairs) can block traffic. Because blocked connections are not actually blocked in passive deployments, the system may report multiple beginning-of-connection events for each blocked connection.

- Traffic you're not interested in. Examples follow:
  
  - Specific allowed traffic, such as DNS requests to a trusted DNS host.
  - Infrastructure traffic that is not related to your service offering.

    (As previously mentioned, you can still monitor this traffic for threats.)

As discussed in Connections That Are Always Logged, on page 2134, even if you disable logging for the preceding, intrusion events, malware, and IAB are still logged.

Avoid logging what's being logged elsewhere

If another device or service is logging connection data for a network segment, disable logging for that segment's data in the Firepower Management Center. Examples follow:

- If a router logs connection events on the same network segment as the Firepower Management Center, avoid logging the same connections on the Firepower Management Center unless you need those connection events for something else, such as correlation policies or traffic profiles.
For more information about correlation policies, see Introduction to Correlation Policies and Rules, on page 1905. For more information about traffic profiles, see Introduction to Traffic Profiles, on page 1943.

• If you use Stealthwatch to leverage NetFlow records reported from switches and routers to identify potential behavioral anomalies and suspicious traffic patterns, you can disable connection logging for rules monitoring those segments and instead rely on Stealthwatch for behavioral analytics for those parts of your network.

For more information, consult the Stealthwatch documentation.

Log either the beginning or end of the connection (not both)

If you have a choice between beginning and end-of-connection logging, enable end-of-connection logging. This is because end-of-connection logs information from beginning-of-connection events, as well as information gathered over the duration of the session.

Log the beginning of connections only if you want to log blocked connections, or if end-of-connection information does not matter to you.

For more information, see Beginning vs End-of-Connection Logging, on page 2139.

Logging for blocked traffic

Because blocked traffic is immediately denied without further inspection, usually you can log only beginning-of-connection events.

For more information, see Logging for Blocked Connections, on page 2137.

Log events to an external location

If your company's security policy permits it, you can save disk space on your Firepower Management Center by streaming logs to an external source using any of the following:

• eStreamer, which enables you to stream logs from a Firepower Management Center or 7000 or 8000 Series device to a custom-developed client application. For more information, see the Firepower eStreamer Integration Guide.

• Syslog or SNMP trap, which are referred to as alert responses. For more information, see Firepower Management Center Alert Responses, on page 2001.

Specify the maximum number of event records

Consider the minimum and maximum number of records that can be stored in the database. For example, a virtual Firepower Management Center by default stores 10 million events but the maximum number of events is 50 million. Go to System > Configuration > Database to adjust the size to meet your needs.

For a list of all Firepower Management Center models and their event database sizes, see Database Event Limits, on page 797.

Control what is displayed in connection events

To specify the number of rows displayed in connection events, click your username in the upper right of the Firepower Management Center and click User Preferences > Event View Settings. The maximum you can set is 1000 events per page.
Set up connection event reports

To make sure you do not miss connection events, you can set up automated reports in .csv format and optionally schedule them to occur at a regular interval. For more information, see the following:

- Schedule tasks (System > Tools > Scheduling): About Task Scheduling, on page 183.

Configure Connection Logging

The following sections describe how to set up connection logging to match various rules and conditions.

Logging Connections with Tunnel and Prefilter Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Defense</td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Before you begin

- Set the rule action to Block or Fastpath. Logging is disabled for the Analyze action, which allows connections to continue with access control, where other configurations determine their handling and logging.

Procedure

Step 1 In the prefilter policy editor, click edit ( ) next to the rule where you want to configure logging.

If a view icon ( ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 2 Click Logging.

Step 3 Specify whether you want to Log at Beginning of Connection or Log at End of Connection.

To optimize performance, log either the beginning or the end of any connection, but not both. Because blocked traffic is immediately denied without further inspection, you cannot log end-of-connection events for Block rules.

Step 4 Specify where to send connection events:

Send events to the event viewer if you want to perform Firepower Management Center-based analysis on these connection events.

Step 5 Click Save to save the rule.
Step 6  Click **Save** to save the policy.

---

**What to do next**
- Deploy configuration changes; see [Deploy Configuration Changes, on page 337](#).

## Logging Decryptable Connections with SSL Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

### Procedure

**Step 1**  In the SSL policy editor, click edit (📝) next to the rule where you want to configure logging.

If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 2**  Click **Logging**.

**Step 3**  Check **Log at End of Connection**.

For monitored traffic, end-of-connection logging is required.

**Step 4**  Specify where to send connection events.

Send events to the event viewer if you want to perform Firepower Management Center-based analysis on these connection events. For monitored traffic, this is required.

**Step 5**  Click **Save** to save the rule.

**Step 6**  Click **Save** to save the policy.

---

**What to do next**
- Deploy configuration changes; see [Deploy Configuration Changes, on page 337](#).

---

## Logging Connections with Security Intelligence

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>
Procedure

Step 1  In the access control policy editor, click Security Intelligence.
Step 2  Click logging ( ) to enable Security Intelligence logging using the following criteria:
   • By IP address—Click logging next to Networks.
   • By URL—Click logging next to URLs.
   • By Domain Name—Click logging next to the DNS Policy drop-down list.
If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck Inherit from base policy to enable editing.
Step 3  Check the Log Connections check box.
Step 4  Specify where to send connection and Security Intelligence events.
Send events to the event viewer if you want to perform Firepower Management Center-based analysis, or if you want to set blacklisted objects to monitor-only.
Step 5  Click OK to set logging options.
Step 6  Click Save to save the policy.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Logging Connections with Access Control Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

Depending on your choices for the rule action and deep inspection options, your logging options differ; see How Rules and Policy Actions Affect Logging, on page 2135.

Procedure

Step 1  In the access control policy editor, click the edit icon ( ) next to the rule where you want to configure logging.
If a view icon ( ) appears instead, the configuration is inherited from an ancestor policy, belongs to an ancestor domain, or you do not have permission to modify the configuration.
Step 2  Click the Logging tab.
Step 3  Specify whether you want to Log at Beginning of Connection or Log at End of Connection.
To optimize performance, log either the beginning or the end of any connection, but not both.
Step 4 (Optional) Check the Log Files check box to log file and malware events associated with the connection. Cisco recommends you leave this option enabled.

Step 5 Specify where to send the connection events:

- **Event Viewer**: Send connection events to Firepower Management Center web interface if you want to perform Firepower Management Center-based analysis on these connection events, or if the rule action is Monitor.

- **Syslog Server**: Send connection events to the syslog server configured in the Logging tab in Access Control Policy, unless overridden.

- **SNMP Trap**: Connection events are sent to the selected SNMP trap.

Step 6 Click Save to save the rule.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 337.

### Logging Connections with a Policy Default Action

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

A policy's default action determines how the system handles traffic that matches none of the rules in the policy (except Monitor rules in access control and SSL policies, which match and log—but do not handle or inspect—traffic).

Logging settings for the SSL policy default action also govern how the system logs undecryptable sessions.

**Before you begin**

- For prefilter default action logging, set the default action to Block all tunnel traffic. Logging is disabled for the Allow all tunnel traffic action, which allows connections to continue with access control, where other configurations determine their handling and logging.

**Procedure**

Step 1 In the policy editor, click logging ( ) next to the Default Action drop-down list.

Step 2 Specify when you want to log matching connections:

- Log at Beginning of Connection—Not supported for SSL default actions.
- Log at End of Connection—Not supported if you choose the access control Block All Traffic default action or the prefilter Block all tunnel traffic default action.
To optimize performance, log either the beginning or the end of any connection, but not both.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration. In an access control policy, the configuration may also be inherited from an ancestor policy.

**Step 3**
Specify where to send connection events.

Send events to the event viewer if you want to perform Firepower Management Center-based analysis on these connection events.

**Step 4**
Click OK.

**Step 5**
Click Save to save the policy.

---

**Limiting Logging of Long URLs**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Any</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Access</td>
</tr>
</tbody>
</table>

End-of-connection events for HTTP traffic record the URL requested by monitored hosts. Disabling or limiting the number of stored URL characters may improve system performance. Disabling URL logging (storing zero characters) does not affect URL filtering. The system filters traffic based on requested URLs even though the system does not record them.

**Procedure**

**Step 1**
In the access control policy editor, click Advanced, then click edit (📝) next to General Settings.

If a view icon (👀) appears instead, the configuration is inherited from an ancestor policy, belongs to an ancestor domain, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck Inherit from base policy to enable editing.

**Step 2**
Enter the Maximum URL characters to store in connection events.

**Step 3**
Click OK.

**Step 4**
Click Save to save the policy.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 337.
CHAPTER 11

Connection and Security Intelligence Events

The following topics describe how to use connection and security events tables.

• About Connection Events, on page 2149
• Connection and Security Intelligence Event Fields, on page 2151
• Using Connection and Security Intelligence Event Tables, on page 2170
• Viewing the Connection Summary Page, on page 2174

About Connection Events

The system can generate logs of the connections its managed devices detect. These logs are called connection events. Connection events include Security Intelligence events (connections blacklisted (blocked) by the reputation-based Security Intelligence feature.)

Connection events generally include transactions detected by:

• Access Control policies
• SSL policies
• Prefilter policies (captured by prefilter or tunnel rules)
• DNS blacklists
• URL blacklists
• Network (IP address) blacklists

Settings in rules and policies give you granular control over which connections you log, when you log them, and where you store the data.

For detailed information, see Connection Logging, on page 2133.

Related Topics

About Security Intelligence, on page 1177

Connection vs. Security Intelligence Events

A Security Intelligence event is a connection event that is generated whenever a session is blacklisted (blocked) or monitored by the reputation-based Security Intelligence feature.
However, for every Security Intelligence event, there is an identical connection event. You can view and analyze Security Intelligence events independently. The system also stores and prunes Security Intelligence events separately.

Note that the system enforces Security Intelligence before more resource-intensive evaluations. When a connection is blocked by Security Intelligence, the resulting event does not contain the information that the system would have gathered from subsequent evaluation, for example, user identity.

In this guide, information about connection events also pertains to Security Intelligence events, unless otherwise noted.

### NetFlow Connections

To supplement the connection data gathered by your managed devices, you can use records broadcast by NetFlow exporters to generate connection events. This is especially useful if the NetFlow exporters are monitoring different networks than those monitored by your managed devices.

The system logs NetFlow records as unidirectional end-of-connection events in the Firepower Management Center database. The available information for these connections differs somewhat from connections detected by your access control policy; see Differences between NetFlow and Managed Device Data, on page 1742.

**Related Topics**

- [Netflow Data in the Firepower System](#), on page 1741

### Connection Summaries (Aggregated Data for Graphs)

The Firepower System aggregates connection data collected over five-minute intervals into connection summaries, which the system uses to generate connection graphs and traffic profiles. Optionally, you can create custom workflows based on connection summary data, which you use in the same way as you use workflows based on individual connection events.

Note that there are no connection summaries specifically for Security Intelligence events, although corresponding end-of-connection events can be aggregated into connection summary data.

To be aggregated, multiple connections must:
- represent the end of connections
- have the same source and destination IP addresses, and use the same port on the responder (destination) host
- use the same protocol (TCP or UDP)
- use the same application protocol
- either be detected by the same Firepower System managed device or by the same NetFlow exporter

Each connection summary includes total traffic statistics, as well as the number of connections in the summary. Because NetFlow exporters generate unidirectional connections, a summary’s connection count is incremented by two for every connection based on NetFlow data.
Note that connection summaries do not contain all of the information associated with the summaries’ aggregated connections. For example, because client information is not used to aggregate connections into connection summaries, summaries do not contain client information.

Long-Running Connections

If a monitored session spans two or more five-minute intervals over which connection data is aggregated, the connection is considered a long-running connection. When calculating the number of connections in a connection summary, the system increments the count only for the five-minute interval in which a long-running connection was initiated.

Also, when calculating the number of packets and bytes transmitted by the initiator and responder in a long-running connection, the system does not report the number of packets and bytes that were actually transmitted during each five-minute interval. Instead, the system assumes a constant rate of transmission and calculates estimated figures based on the total number of packets and bytes transmitted, the length of the connection, and what portion of the connection occurred during each five-minute interval.

Combined Connection Summaries from External Responders

To reduce the space required to store connection data and speed up the rendering of connection graphs, the system combines connection summaries when:

• one of the hosts involved in the connection is not on your monitored network
• other than the IP address of the external host, the connections in the summaries meet the summary aggregation criteria

When viewing connection summaries in the Analysis > Connections submenu pages, and when working with connection graphs, the system displays external instead of an IP address for the non-monitored hosts.

As a consequence of this aggregation, if you attempt to drill down to the table view of connection data (that is, access data on individual connections) from a connection summary or graph that involves an external responder, the table view contains no information.

Connection and Security Intelligence Event Fields

Note

You cannot use the connection/Security Intelligence events Search page to search for events associated with a connection.

Access Control Policy (Syslog: ACPolicy)

The access control policy that monitored the connection.

Access Control Rule (Syslog: AccessControlRuleName)

The access control rule or default action that handled the connection, as well as up to eight Monitor rules matched by that connection.

If the connection matched one Monitor rule, the Firepower Management Center displays the name of the rule that handled the connection, followed by the Monitor rule name. If the connection matched more than one Monitor rule, the number of matching Monitor rules is displayed, for example, Default Action + 2 Monitor Rules.
To display a pop-up window with a list of the first eight Monitor rules matched by the connection, click *Monitor Rules*.

**Action (Syslog: AccessControlRuleAction)**

The action associated with the configuration that logged the connection.

For Security Intelligence-monitored connections, the action is that of the first non-Monitor access control rule triggered by the connection, or the default action. Similarly, because traffic matching a Monitor rule is always handled by a subsequent rule or by the default action, the action associated with a connection logged due to a Monitor rule is never Monitor. However, you can still trigger correlation policy violations on connections that match Monitor rules.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow</td>
<td>Connections either allowed by access control explicitly, or allowed because a user bypassed an interactive block.</td>
</tr>
</tbody>
</table>
| Block, Block with reset | Blocked connections, including:  
  • tunnels and other connections blocked by the prefilter policy  
  • connections blacklisted by Security Intelligence  
  • encrypted connections blocked by an SSL policy  
  • connections where an exploit was blocked by an intrusion policy  
  • connections where a file (including malware) was blocked by a file policy  
  For connections where the system blocks an intrusion or file, system displays Block, even though you use access control Allow rules to invoke deep inspection. |
| Fastpath | Non-encrypted tunnels and other connections fastpathed by the prefilter policy. |
| Interactive Block, Interactive Block with reset | Connections logged when the system initially blocks a user’s HTTP request using an Interactive Block rule. If the user clicks through the warning page that the system displays, additional connections logged for the session have an action of Allow. |
| Trust | Connections trusted by access control. The system logs trusted TCP connections differently depending on the device model. |
| Default Action | Connections handled by the access control policy's default action. |

**Application Protocol (Syslog: ApplicationProtocol)**

In the Firepower Management Center web interface, this value constrains summaries and graphs.

The application protocol, which represents communications between hosts, detected in the connection.

**Application Protocol Category and Tag**

Criteria that characterize the application to help you understand the application's function.
Application Risk

The risk associated with the application traffic detected in the connection: Very High, High, Medium, Low, or Very Low. Each type of application detected in the connection has an associated risk; this field displays the highest of those.

Business Relevance

The business relevance associated with the application traffic detected in the connection: Very High, High, Medium, Low, or Very Low. Each type of application detected in the connection has an associated business relevance; this field displays the lowest (least relevant) of those.

Client and Client Version (Syslog: Client, ClientVersion)

The client application and version of that client detected in the connection.

If the system cannot identify the specific client used in the connection, the field displays the word "client" appended to the application protocol name to provide a generic name, for example, FTP client.

Client Category and Tag

Criteria that characterize the application to help you understand the application's function.

Connections

The number of connections in a connection summary. For long-running connections, that is, connections that span multiple connection summary intervals, only the first connection summary interval is incremented. To view meaningful results for searches using the Connections criterion, use a custom workflow that has a connection summary page.

Count

The number of connections that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. If you create a custom workflow and do not add the Count column to a drill-down page, each connection is listed individually and packets and bytes are not summed.

Destination Port/ICMP Code (Syslog: Separate fields - DstPort, ICMPCode)

In the Firepower Management Center web interface, these values constrain summaries and graphs.

The port or ICMP code used by the session responder.

Device

In the Firepower Management Center web interface, this value constrains summaries and graphs.

The managed device that detected the connection or, for connections generated from NetFlow data, the managed device that processed the data.

DNS Query (Syslog: DNSQuery)

The DNS query submitted in a connection to the name server to look up a domain name.

DNS Record Type (Syslog: DNSRecordType)

The type of the DNS resource record used to resolve a DNS query submitted in a connection.

DNS Response (Syslog: DNSResponseType)

The DNS response returned in a connection to the name server when queried.
DNS Sinkhole Name (Syslog: DNS_Sinkhole)
The name of the sinkhole server where the system redirected a connection.

DNS TTL (Syslog: DNS_TTL)
The number of seconds a DNS server caches the DNS resource record.

Domain
The domain of the managed device that detected the connection or, for connections generated from
NetFlow data, the domain of the managed device that processed the data. This field is only present if
you have ever configured the Firepower Management Center for multitenancy.

Endpoint Location
The IP address of the network device that used ISE to authenticate the user, as identified by ISE.

Endpoint Profile (Syslog: Endpoint Profile)
The user's endpoint device type, as identified by ISE.

Files (Syslog: FileCount)
The number of files (including malware files) detected or blocked in a connection associated with one
or more file events.

In the Firepower Management Center web interface, the view files icon links to a list of files. The
number on the icon indicates the number of files (including malware files) detected or blocked in that
connection.

First Packet or Last Packet (Syslog: See the ConnectionDuration field)
The date and time the first or last packet of the session was seen.

HTTP Referrer (Syslog: HTTPReferer)
The HTTP referrer, which represents the referrer of a requested URL for HTTP traffic detected in the
connection (such as a website that provided a link to, or imported a link from, another URL).

HTTP Response Code (Syslog: HTTPResponse)
The HTTP status code sent in response to a client's HTTP request over a connection.

Ingress/Egress Interface (Syslog: IngressInterface, EgressInterface)
The ingress or egress interface associated with the connection. If your deployment includes an asymmetric
routing configuration, the ingress and egress interface may not belong to the same inline pair.

Ingress/Egress Security Zone (Syslog: IngressZone, EgressZone)
The ingress or egress security zone associated with the connection.
For rezoned encapsulated connections, the ingress field displays the tunnel zone you assigned, instead
of the original ingress security zone. The egress field is blank.

Initiator/Responder Bytes (Syslog: InitiatorBytes, ResponderBytes)
The total number of bytes transmitted by the session initiator or received by the session responder.

Initiator/Responder Continent
When a routable IP is detected, the continent associated with the IP address for the session initiator or
responder.
Initiator/Responder Country

When a routable IP is detected, the country associated with the IP address of the session initiator or responder. The system displays an icon of the country’s flag, and the country’s ISO 3166-1 alpha-3 country code. Hover your pointer over the flag icon to view the country’s full name.

Initiator/Responder IP (Syslog: SrcIP, DstIP)

In the Firepower Management Center web interface, these values constrain summaries and graphs.

The IP address (and host name, if DNS resolution is enabled) of the session initiator (source IP address) or responder (destination IP address).

In the Firepower Management Center web interface, host icons next to blacklisted IP addresses look slightly different so that you can identify the blacklisted IP address in a blacklisted connection.

For plaintext, passthrough tunnels either blocked or fastpathed by the prefilter policy, source and destination IP addresses represent the tunnel endpoints—the routed interfaces of the network devices on either side of the tunnel.

Initiator/Responder Packets (Syslog: InitiatorPackets, ResponderPackets)

The total number of packets transmitted by the session initiator or received by the session responder.

Initiator User (Syslog: User)

In the Firepower Management Center web interface, this value constrains summaries and graphs.

The user logged into the session initiator. If this field is populated with No Authentication, the user traffic:

• matched an access control policy without an associated identity policy
• did not match any rules in the identity policy

Intrusion Events (Syslog: IPSCount)

The number of intrusion events, if any, associated with the connection.

In the Firepower Management Center web interface, the view intrusion events icon links to a list of events.

IOC

Whether the event triggered an indication of compromise (IOC) against a host involved in the connection.

NetBIOS Domain (Syslog: NetBIOSDomain)

The NetBIOS domain used in the session.

NetFlow SNMP Input/Output

For connections generated from NetFlow data, the interface index for the interface where connection traffic entered or exited the NetFlow exporter.

NetFlow Source/Destination Autonomous System

For connections generated from NetFlow data, the border gateway protocol autonomous system number for the source or destination of traffic in the connection.
NetFlow Source/Destination Prefix

For connections generated from NetFlow data, the source or destination IP address ANDed with the source or destination prefix mask.

NetFlow Source/Destination TOS

For connections generated from NetFlow data, the setting for the type-of-service (TOS) byte when connection traffic entered or exited the NetFlow exporter.

Network Analysis Policy (Syslog: NAPPolicy)

The network analysis policy (NAP), if any, associated with the generation of the event.

Original Client Country

The country where the original client IP address belongs. To obtain this value, the system extracts the original client IP address from an X-Forwarded-For (XFF), True-Client-IP, or custom-defined HTTP header, then maps it to the country using the geolocation database (GeoDB). To populate this field, you must enable an access control rule that handles proxied traffic based on its original client.

Original Client IP (Syslog: originalClientSrcIP)

The original client IP address from an X-Forwarded-For (XFF), True-Client-IP, or custom-defined HTTP header. To populate this field, you must enable an access control rule that handles proxied traffic based on its original client.

Prefilter Policy (Syslog: Prefilter Policy)

The prefilter policy that handled the connection.

Protocol (Syslog: Protocol)

In the Firepower Management Center web interface:

- This value constrains summaries and graphs.
- This field is available only as a search field.

The transport protocol used in the connection. To search for a specific protocol, use the name or number protocol as listed in [http://www.iana.org/assignments/protocol-numbers](http://www.iana.org/assignments/protocol-numbers).

QoS-Applied Interface

For rate-limited connections, the name of the interface where you applied rate limiting.

QoS-Dropped Initiator/Responder Bytes

The number of bytes dropped from the session initiator or session responder due to rate limiting.

QoS-Dropped Initiator/Responder Packets

The number of packets dropped from the session initiator or session responder due to rate limiting.

QoS Policy

The QoS policy that rate limited the connection.

QoS Rule

The QoS rule that rate limited the connection.

Reason (Syslog: AccessControlRuleReason)

The reason or reasons the connection was logged, in many situations. For a full list, see Connection Event Reasons, on page 2164.

Connections with a Reason of IP Block, DNS Block, and URL Block have a threshold of 15 seconds per unique initiator-respondent pair. After the system blocks one of those connections, it does not generate
connection events for additional blocked connections between those two hosts for the next 15 seconds, regardless of port or protocol.

**Referenced Host (Syslog: ReferencedHost)**

If the protocol in the connection is HTTP or HTTPS, this field displays the host name that the respective protocol was using.

**SecIntMatchingIP (Syslog Only)**

Which IP address matched.

Possible values: **None**, **Destination**, or **Source**.

**Security Context (Syslog: Context)**

For connections handled by ASA FirePOWER in multiple context mode, the metadata identifying the virtual firewall group through which the traffic passed.

**Security Group Tag (Syslog: Security Group)**

The Security Group Tag (SGT) attribute of the packet involved in the connection. The SGT specifies the privileges of a traffic source within a trusted network. Security Group Access (a feature of both Cisco TrustSec and Cisco ISE) applies the attribute as packets enter the network.

**Security Intelligence Category (Syslog: URLSICategory, DNSSICategory, IPReputationSICategory,**

The name of the blacklisted object that represents or contains the blacklisted IP address in the connection. The Security Intelligence category can be the name of a network object or group, a blacklist, a custom Security Intelligence list or feed, or one of the categories in the Intelligence Feed.

In the Firepower Management Center web interface, DNS, Network (IP address), and URL Security Intelligence connection events are combined into a single category field. In syslog messages, those events are specific by type.

For more information about the categories in the Intelligence Feed, see **Security Intelligence Options**, on page 1182.

**Source Device**

In the Firepower Management Center web interface, this value constrains summaries and graphs.

The IP address of the NetFlow exporter that broadcast the data used to generate for the connection. If the connection was detected by a managed device, this field displays Firepower.

**Source Port/ICMP Type (Syslog: SrcPort, ICMPType)**

In the Firepower Management Center web interface, these values constrain summaries and graphs.

The port or ICMP type used by the session initiator.

**SSL Actual Action (Syslog: SSLActualAction)**

In the Firepower Management Center web interface, this field is a search field only.

The system displays field values in the **SSL Status** field on search workflow pages.

The action the system applied to encrypted traffic in the SSL policy.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block/Block with reset</td>
<td>Represents blocked encrypted connections.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Decrypt (Resign)</td>
<td>Represents an outgoing connection decrypted using a re-signed server certificate.</td>
</tr>
<tr>
<td>Decrypt (Replace Key)</td>
<td>Represents an outgoing connection decrypted using a self-signed server certificate with a substituted public key.</td>
</tr>
<tr>
<td>Decrypt (Known Key)</td>
<td>Represents an incoming connection decrypted using a known private key.</td>
</tr>
<tr>
<td>Default Action</td>
<td>Indicates the connection was handled by the default action.</td>
</tr>
<tr>
<td>Do not Decrypt</td>
<td>Represents a connection the system did not decrypt.</td>
</tr>
</tbody>
</table>

**SSL Certificate Information (Syslog: SSLCertificate)**

In the Firepower Management Center web interface, this field is a search field only.

The information stored on the public key certificate used to encrypt traffic, including:

- Subject/Issuer Common Name
- Subject/Issuer Organization
- Subject/Issuer Organization Unit
- Not Valid Before/After
- Serial Number
- Certificate Fingerprint
- Public Key Fingerprint

**SSL Certificate Status (Syslog: SSLServerCertStatus)**

This applies only if you configured a Certificate Status SSL rule condition. If encrypted traffic matches an SSL rule, this field displays one or more of the following server certificate status values:

- Self Signed
- Valid
- Invalid Signature
- Invalid Issuer
- Expired
- Unknown
- Not Valid Yet
- Revoked
If undecryptable traffic matches an SSL rule, this field displays **Not Checked**.

**SSL Cipher Suite (Syslog: SSSLCipherSuite)**

A macro value representing a cipher suite used to encrypt the connection. See [www.iana.org/assignments/tls-parameters/tls-parameters.xhtml](http://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml) for cipher suite value designations.

**SSL Encryption applied to the connection**

This field is available only as a search field in the Firepower Management Center web interface.

Enter **yes** or **no** in the **SSL** search field to view TLS/SSL-encrypted or non-encrypted connections.

**SSL Expected Action (Syslog: SSLExpectedAction)**

In the Firepower Management Center web interface, this field is a search field only.

The action the system expected to apply to encrypted traffic, given the SSL rules in effect.

Enter any of the values listed for **SSL Actual Action**.

**SSL Failure Reason (Syslog: SSLFlowStatus)**

The reason the system failed to decrypt encrypted traffic:

- Unknown
- No Match
- Success
- Uncached Session
- Unknown Cipher Suite
- Unsupported Cipher Suite
- Unsupported SSL Version
- SSL Compression Used
- Session Undecryptable in Passive Mode
- Handshake Error
- Decryption Error
- Pending Server Name Category Lookup
- Pending Common Name Category Lookup
- Internal Error
- Network Parameters Unavailable
- Invalid Server Certificate Handle
- Server Certificate Fingerprint Unavailable
- Cannot Cache Subject DN
- Cannot Cache Issuer DN
- Unknown SSL Version
• External Certificate List Unavailable
• External Certificate Fingerprint Unavailable
• Internal Certificate List Invalid
• Internal Certificate List Unavailable
• Internal Certificate Unavailable
• Internal Certificate Fingerprint Unavailable
• Server Certificate Validation Unavailable
• Server Certificate Validation Failure
• Invalid Action

Field values are displayed in the SSL Status field on the search workflow pages.

SSL Flow Error

The error name and hexadecimal code if an error occurred during the TLS/SSL session; Success if no error occurred.

SSL Flow Flags

The first ten debugging level flags for an encrypted connection. On a workflow page, to view all flags, click the ellipsis (...).

SSL Flow Messages

The keywords below indicate encrypted traffic is associated with the specified message type exchanged between client and server during the TLS/SSL handshake. See http://tools.ietf.org/html/rfc5246 for more information.

• HELLO_REQUEST
• CLIENT_ALERT
• SERVER_ALERT
• CLIENT_HELLO
• SERVER_HELLO
• SERVER_CERTIFICATE
• SERVER_KEY_EXCHANGE
• CERTIFICATE_REQUEST
• SERVER_HELLO_DONE
• CLIENT_CERTIFICATE
• CLIENT_KEY_EXCHANGE
• CERTIFICATE_VERIFY
• CLIENT_CHANGE_CIPHER_SPEC
• CLIENT_FINISHED
• SERVER_CHANGE_CIPHER_SPEC
• SERVER_FINISHED
• NEW_SESSION_TICKET
• HANDSHAKE_OTHER
• APP_DATA_FROM_CLIENT
• APP_DATA_FROM_SERVER

**SSL Policy (Syslog: SSLPolicy)**

The SSL policy that handled the connection.

**SSL Rule (Syslog: SSLRuleName)**

The SSL rule or default action that handled the connection, as well as the first Monitor rule matched by that connection. If the connection matched a Monitor rule, the field displays the name of the rule that handled the connection, followed by the Monitor rule name.

**SSLServerName (Syslog Only)**

This field exists ONLY as a syslog field; it does not exist in the Firepower Management Center web interface.

Hostname of the server with which the client established an encrypted connection.

**SSL Session ID (Syslog: SSLSessionID)**

The hexadecimal Session ID negotiated between the client and server during the TLS/SSL handshake.

**SSL Status**

The action associated with the **SSL Actual Action** (SSL rule, default action, or undecryptable traffic action) that logged the encrypted connection. The lock icon links to SSL certificate details. If the certificate is unavailable (for example, for connections blocked due to TLS/SSL handshake error), the lock icon is dimmed.

If the system fails to decrypt an encrypted connection, it displays the **SSL Actual Action** (undecryptable traffic action) taken, as well as the **SSL Failure Reason**. For example, if the system detects traffic encrypted with an unknown cipher suite and allows it without further inspection, this field displays **Do Not Decrypt (Unknown Cipher Suite)**.

When searching this field, enter one or more of the **SSL Actual Action** and **SSL Failure Reason** values to view encrypted traffic the system handled or failed to decrypt.

**SSL Subject/Issuer Country**

This field is available only in the Firepower Management Center web interface, and only as a search field.

A two-character ISO 3166-1 alpha-2 country code for the subject or issuer country associated with the encryption certificate.

**SSL Ticket ID (Syslog: SSLTicketID)**

A hexadecimal hash value of the session ticket information sent during the TLS/SSL handshake.
SSLURLCategory (Syslog Only)
URL categories for the URL visited in the encrypted connection.

This field exists ONLY as a syslog field; in the Firepower Management Center web interface, values in
this field are included in the URL Category column.

See also URL.

SSL Version (Syslog: SSLVersion)
The TLS/SSL protocol version used to encrypt the connection:
• Unknown
• SSLv2.0
• SSLv3.0
• TLSv1.0
• TLSv1.1
• TLSv1.2

TCP Flags (Syslog: TCPFlags)
For connections generated from NetFlow data, the TCP flags detected in the connection.

When searching this field, enter a list of comma-separated TCP flags to view all connections that have
at least one of those flags.

Time
The ending time of the five-minute interval that the system used to aggregate connections in a connection
summary. This field is not searchable.

Total Packets
This field is available only as a search field.

The total number of packets transmitted in the connection.

Traffic (KB)
This field is available only as a search field.

The total amount of data transmitted in the connection, in kilobytes.

Tunnel/Prefilter Rule (Syslog: Tunnel or Prefilter Rule)
The tunnel rule, prefilter rule, or prefilter policy default action that handled the connection.

URL, URL Category, and URL Reputation (Syslog: URL, URLCategory and SSLURLCategory,
URLReputation)
The URL requested by the monitored host during the session and its associated category and reputation,
if available.

If the system identifies or blocks a TLS/SSL application, the requested URL is in encrypted traffic, so
the system identifies the traffic based on an SSL certificate. For TLS/SSL applications, therefore, this
field indicates the common name contained in the certificate.

See also SSLURLCategory, above.
User Agent (Syslog: UserAgent)
The user-agent string application information extracted from HTTP traffic detected in the connection.

VLAN ID
The innermost VLAN ID associated with the packet that triggered the connection.

Web Application (Syslog: WebApplication)
The web application, which represents the content or requested URL for HTTP traffic detected in the connection.

If the web application does not match the URL for the event, the traffic is probably referred traffic, such as advertisement traffic. If the system detects referred traffic, it stores the referring application (if available) and lists that application as the web application.

If the system cannot identify the specific web application in HTTP traffic, this field displays Web Browsing.

Web Application Category and Tag
Criteria that characterize the application to help you understand the application's function.

About Connection and Security Intelligence Event Fields
In the Firepower Management Center web interface, you can view and search connection and security intelligence events using tabular and graphical workflows under the Analysis > Connections submenus.

For each Security Intelligence event, there is an identical, separately stored connection event. All Security Intelligence events have a populated Security Intelligence Category field.

The information available for any individual event can vary depending on how, why, and when the system logged the connection.

Search Constraints
Fields marked with an asterisk (*) on search pages constrain connection graphs and connection summaries. Because connection graphs are based on connection summaries, the same criteria that constrain connection summaries also constrain connection graphs. If you search connection summaries using invalid search constraints and view your results using a connection summary page in a custom workflow, the invalid constraints are labeled as not applicable (N/A) and are marked with a strikethrough.

Syslog Fields
Most fields appear both in the Firepower Management Center web interface and as syslog messages. Fields without a listed syslog equivalent are not available in syslog messages. A few fields are syslog-only, as noted, and few others are separate fields in syslog messages but are consolidated fields in the web interface or vice-versa.
## Connection Event Reasons

The Reason field in a connection event displays the reason or reasons the connection was logged, in the following situations:

<table>
<thead>
<tr>
<th>Reason</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content Restriction</td>
<td>The system modified the packet to enforce content restrictions related to either the Safe Search or YouTube EDU feature.</td>
</tr>
<tr>
<td>DNS Block</td>
<td>The system denied the connection without inspection, based on the domain name and Security Intelligence data. A reason of DNS Block is paired with an action of Block, Domain not found, or Sinkhole, depending on the DNS rule action.</td>
</tr>
<tr>
<td>DNS Monitor</td>
<td>The system would have denied the connection based on the domain name and Security Intelligence data, but you configured the system to monitor, rather than deny, the connection.</td>
</tr>
<tr>
<td>File Block</td>
<td>The connection contained a file or malware file that the system prevented from being transmitted. A reason of File Block is always paired with an action of Block.</td>
</tr>
<tr>
<td>File Custom Detection</td>
<td>The connection contained a file on the custom detection list that the system prevented from being transmitted.</td>
</tr>
<tr>
<td>File Monitor</td>
<td>The system detected a particular type of file in the connection.</td>
</tr>
<tr>
<td>File Resume Allow</td>
<td>File transmission was originally blocked by a Block Files or Block Malware file rule. After a new access control policy allowing the file was deployed, the HTTP session automatically resumed. This reason only appears in inline deployments.</td>
</tr>
<tr>
<td>File Resume Block</td>
<td>File transmission was originally allowed by a Detect Files or Malware Cloud Lookup file rule. After a new access control policy blocking the file was deployed, the HTTP session automatically stopped. This reason only appears in inline deployments.</td>
</tr>
</tbody>
</table>
| Intelligent App Bypass      | The Intelligent Application Bypass (IAB) mode:  
  • If the action is Trust, IAB was in bypass mode. Matching traffic passed without further inspection.  
  • If the action is Allow, IAB was in test mode. Matching traffic was available for further inspection. |
<p>| Intrusion Block             | The system blocked or would have blocked an exploit (intrusion policy violation) detected in the connection. A reason of Intrusion Block is paired with an action of Block for blocked exploits and Allow for would-have-blocked exploits. |
| Intrusion Monitor           | The system detected, but did not block, an exploit detected in the connection. This occurs when the state of the triggered intrusion rule is set to Generate Events.                                               |
| IP Block                    | The system denied the connection without inspection, based on the IP address and Security Intelligence data. A reason of IP Block is always paired with an action of Block.                                         |</p>
<table>
<thead>
<tr>
<th>Reason</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Monitor</td>
<td>The system would have denied the connection based on the IP address and Security Intelligence data, but you configured the system to monitor, rather than deny, the connection.</td>
</tr>
<tr>
<td>SSL Block</td>
<td>The system blocked an encrypted connection based on the TLS/SSL inspection configuration. A reason of SSL Block is always paired with an action of Block.</td>
</tr>
<tr>
<td>URL Block</td>
<td>The system denied the connection without inspection, based on the URL and Security Intelligence data. A reason of URL Block is always paired with an action of Block.</td>
</tr>
<tr>
<td>URL Monitor</td>
<td>The system would have denied the connection based on the URL and Security Intelligence data, but you configured the system to monitor, rather than deny, the connection.</td>
</tr>
<tr>
<td>User Bypass</td>
<td>The system initially blocked a user’s HTTP request, but the user clicked through a warning page to view the site. A reason of User Bypass is always paired with an action of Allow.</td>
</tr>
</tbody>
</table>

Requirements for Populating Connection Event Fields

The information available for a connection event, Security Intelligence event, or connection summary depends on several factors.

Appliance Model and License
Many features require that you enable specific licensed capabilities on target devices, and many features are only available on some models.

For example, NGIPSv devices do not support TLS/SSL inspection. They cannot inspect encrypted traffic; logged connection events do not contain information about encrypted connections.

Traffic Characteristics
The system only reports information present (and detectable) in network traffic. For example, there could be no user associated with an initiator host, or no referenced host detected in a connection where the protocol is not DNS, HTTP, or HTTPS.

Origin/Detection Method: Traffic-Based Detection vs NetFlow
With the exception of NetFlow-only fields, the information available in NetFlow records is more limited than the information generated by traffic-based detection; see Differences between NetFlow and Managed Device Data, on page 1742.

Evaluation Stage
Each type of traffic inspection and control occurs where it makes the most sense for maximum flexibility and performance.

For example, the system enforces Security Intelligence before more resource-intensive evaluations. When a connection is blocked by Security Intelligence, the resulting event does not contain the information that the system would have gathered from subsequent evaluation, for example, user identity.
Logging Method: Beginning or End of Connection

When the system detects a connection, whether you can log it at its beginning or its end (or both) depends on how you configure the system to detect and handle it.

Beginning-of-connection events do not have information that must be determined by examining traffic over the duration of the session (for example, the total amount of data transmitted or the timestamp of the last packet in the connection). Beginning-of-connection events are also not guaranteed to have information about application or URL traffic in the session, and do not contain any details about the session's encryption. Beginning-of-connection logging is usually the only option for blocked connections.

Connection Event Type: Individual vs Summary

Connection summaries do not contain all of the information associated with their aggregated connections. For example, because client information is not used to aggregate connections into connection summaries, summaries do not contain client information.

Keep in mind that connection graphs are based on connection summary data, which use only end-of-connection logs. If your system is configured to log only beginning-of-connection data, connection graphs and connection summary event views contain no data.

Other Configurations

Other configurations that affect connection logging include, but are not limited to:

- ISE-related fields are populated only if you configure ISE, in connections associated with users who authenticate via an Active Directory domain controller. Connection events do not contain ISE data for users who authenticate via LDAP, RADIUS, or RSA domain controllers.

- The Security Group Tag field is populated only if you configure ISE as an identity source or add custom SGT rule conditions.

- Prefilter-related fields (including tunnel zone information in security zone fields) are populated only in connections handled by a prefilter policy.

- TLS/SSL-related fields are populated only in encrypted connections handled by an SSL policy. You can view the values of the fields using a Do Not Decrypt rule action if you do not need to decrypt the traffic.

- File information fields are populated only in connections logged by access control rules associated with file policies.

- Intrusion information fields are populated only in connections logged by access control rules either associated with intrusion policies or using the default action.

- QoS-related fields are populated only in connections subject to rate limiting.

- The Reason field is populated only in specific situations, such as when a user bypasses an Interactive Block configuration.

- The Domain field is only present if you have ever configured the Firepower Management Center for multitenancy.

- An advanced setting in the access control policy controls the number of characters the system stores in the connection log for each URL requested by monitored hosts in HTTP sessions. If you use this setting to disable URL logging, the system does not display individual URLs in the connection log, although you can still view category and reputation data, if it exists.
Related Topics

Differences between NetFlow and Managed Device Data, on page 1742

Information Available in Connection Event Fields

The table in this topic indicates when the system can populate connection and Security Intelligence fields. The columns in the table represent the following event types:

- **Origin: Direct**—Events that represent connections detected and handled by a Firepower System managed device.
- **Origin: NetFlow**—Events that represent connections exported by a NetFlow exporter.
- **Logging: Start**—Events that represent connections logged at their beginning.
- **Logging: End**—Events that represent connections logged at their end.

A "yes" in the table does not mean that the system must populate a connection event field, rather, that it can. The system only reports information present (and detectable) in network traffic. For example, TLS/SSL-related fields are populated only for records of encrypted connections handled by an SSL policy.

#### Using Connection and Security Intelligence Event Tables

You can use the Firepower Management Center to view a table of connection or Security Intelligence events. Then, you can manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access connection graphs differs depending on the workflow you use. You can use a predefined workflow, which terminates in a table view of events. You can also create a custom workflow that displays only the information that matches your specific needs.

When you are using a connection or Security Intelligence workflow table, you can perform many common actions.
Note that when you constrain connection events on a drill-down page, the packets and bytes from identical events are summed. However, if you are using a custom workflow and did not add a Count column to a drill-down page, the events are listed individually and packets and bytes are not summed.

Note that Connection Events table view displays 1 of Many instead of how many pages of events are available if your system generates more than 25 connection events.

Procedure

Step 1
Choose either of the following:
• Analysis > Connections > Events (for connection events)
• Analysis > Connections > Security Intelligence Events

Note If a connection graph appears instead of a table, click (switch workflow) by the workflow title, and choose the predefined Connection Events workflow, or a custom workflow. Note that all predefined connection event workflows—including connection graphs—terminate in a table view of connections.

Step 2
You have the following choices:
• Time Range — To adjust the time range, which is useful if no events appear, see Changing the Time Window, on page 2094.
• Field Names — To learn more about the contents of the columns in the table, see Connection and Security Intelligence Event Fields, on page 2151.

Tip In the table view of events, several fields are hidden by default, including the Category and Tag fields for each type of application, NetFlow-related fields, TLS/SSL-related fields, and others. To show a hidden field in an event view, expand the search constraints, then click the field name under Disabled Columns.

• Host Profile — To view the host profile for an IP address, click host profile ( ) or, for hosts with active indications of compromise (IOC) tags, compromised host ( ) that appears next to the IP address.
• User Profile — To view user identity information, click the user icon that appears next to the user identity ( ).
• Files and Malware —To view the files, including malware, detected or blocked in a connection, click view files ( ) and proceed as described in Viewing Files and Malware Detected in a Connection, on page 2172.
• Intrusion Events — To view the intrusion events associated with a connection, as well as their priority and impact, click intrusion events ( ) in the Intrusion Events column and proceed as described in Viewing Intrusion Events Associated with a Connection, on page 2173.

Tip To quickly view intrusion, file, or malware events associated with one or more connections, check the connections using the check boxes in the table, then choose the appropriate option from the Jump to drop-down list. Note that because they are blocked before access control rule evaluation, there can be no files or intrusions associated with connections blacklisted by Security Intelligence. You can only see this information for a Security Intelligence event if you configured Security Intelligence to monitor, rather than blacklist, connections.
• Certificate — To view details about an available certificate used to encrypt a connection, click enabled lock () in the SSL Status column.

• Constrain — To constrain the columns that appear, click close (×) in the column heading that you want to hide. In the pop-up window that appears, click Apply.

  Tip To hide or show other columns, check or clear the appropriate check boxes before you click Apply. To add a disabled column back to the view, expand the search constraints, then click the column name under Disabled Columns.

• Delete Events — To delete some or all items in the current constrained view, check the check boxes next to items you want to delete and click Delete or click Delete All.

• Drill Down — See Using Drill-Down Pages, on page 2081.

  Tip To drill down using one of several Monitor rules that matched a logged connection, click an N Monitor Rules value. In the pop-up window that appears, click the Monitor rule you want to use to constrain connection events.

• Navigate This Page — See Workflow Page Traversal Tools, on page 2078.

• Navigate Between Pages — To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page.

• Navigate Between Event Views — To navigate to other event views to view associated events, click Jump to and choose the event view from the drop-down list.

• Sort — To sort data in a workflow, click the column title. Click the column title again to reverse the sort order.

Viewing Files and Malware Detected in a Connection

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat or Malware</td>
<td>Protection or Malware</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

If you associate a file policy with one or more access control rules, the system can detect files (including malware) in matching traffic. Use the Analysis > Connections menu options to see the file events, if any, associated with the connections logged by those rules. Instead of a list of files, the Firepower Management Center displays view files () in the Files column. The number on the view files indicates the number of files (including malware files) detected or blocked in that connection.

Not all file and malware events are associated with connections. Specifically:

• Malware events detected by AMP for Endpoints ("endpoint-based malware events") are not associated with connections. Those events are imported from your AMP for Endpoints deployment.
• Many IMAP-capable email clients use a single IMAP session, which ends only when the user exits the application. Although long-running connections are logged by the system, files downloaded in the session are not associated with the connection until the session ends.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1**
Go to **Analysis > Connections** and choose the relevant option.

**Step 2**
While using a connection event table, click view files (⁹). A pop-up window appears with a list of the files detected in the connection as well as their types, and if applicable, their malware dispositions.

**Step 3**
You have the following choices:

- **View** — To view a table view of file events, click a file's view (⁹).
- **View** — To view details in a table view of malware events, click a malware file’s view (⁹).
- **Track** — To track the file’s transmission through your network, click a file’s trajectory (⁹).
- **View** — To view details on all of the connection’s detected file or malware events detected by AMP for Networks (“network-based malware events”), click View File Events or View Malware Events.

### Viewing Intrusion Events Associated with a Connection

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

If you associate an intrusion policy with an access control rule or default action, the system can detect exploits in matching traffic. Use the Analysis > Connections menu options to see the intrusion events, if any, associated with logged connections, as well as their priority and impact.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1**
Go to **Analysis > Connections** and choose the relevant option.

**Step 2**
While using a connection event table, click intrusion events (⁹) in the **Intrusion Events** column.

**Step 3**
In the pop-up window that appears, you have the following options:
Encrypted Connection Certificate Details

You can use options under the Analysis > Connections menu to display the public key certificate (if available) used to encrypt a connection handled by the system. The certificate contains the following information.

**Table 294: Encrypted Connection Certificate Details**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject/Issuer Common Name</td>
<td>The host and domain name of the certificate subject or certificate issuer.</td>
</tr>
<tr>
<td>Subject/Issuer Organization</td>
<td>The organization of the certificate subject or certificate issuer.</td>
</tr>
<tr>
<td>Subject/Issuer Organization Unit</td>
<td>The organizational unit of the certificate subject or certificate issuer.</td>
</tr>
<tr>
<td>Not Valid Before/After</td>
<td>The dates when the certificate is valid.</td>
</tr>
<tr>
<td>Serial Number</td>
<td>The serial number assigned by the issuing CA.</td>
</tr>
<tr>
<td>Certificate Fingerprint</td>
<td>The SHA hash value used to authenticate the certificate.</td>
</tr>
<tr>
<td>Public Key Fingerprint</td>
<td>The SHA hash value used to authenticate the public key contained within the certificate.</td>
</tr>
</tbody>
</table>

**Viewing the Connection Summary Page**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Custom</td>
</tr>
</tbody>
</table>

The Connection Summary page is visible only to users who have custom roles that are restricted by searches on connection events and who have been granted explicit menu-based access to the Connection Summary page. This page provides graphs of the activity on your monitored network organized by different criteria. For example, the Connections over Time graph displays the total number of connections on your monitored network over the interval that you choose.

You can perform almost all the same actions on connection summary graphs that you can perform on connection graphs. However, because the graphs on the Connection Summary page are based on aggregated data, you cannot examine the individual connection events on which the graphs are based. In other words, you cannot drill down to a connection data table view from a connection summary graph.
In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose **Overview > Summary > Connection Summary**.

**Step 2** From the **Select Device** list, choose the device whose summary you want to view, or choose All to view a summary of all devices.

**Step 3** To manipulate and analyze the connection graphs, proceed as described in **Using Connection Event Graphs**, on page 2085.

**Tip** To detach a connection graph so you can perform further analysis without affecting the default time range, click **View**.

- Viewing Intrusion Event Graphs, on page 2222

About Intrusion Events

The Firepower System can help you monitor your network for traffic that could affect the availability, integrity, and confidentiality of a host and its data. By placing managed devices on key network segments, you can examine the packets that traverse your network for malicious activity. The system has several mechanisms it uses to look for the broad range of exploits that attackers have developed.

When the system identifies a possible intrusion, it generates an intrusion event (sometimes called by a legacy term, "IPS event"), which is a record of the date, time, the type of exploit, and contextual information about the source of the attack and its target. For packet-based events, a copy of the packet or packets that triggered the event is also recorded. Managed devices transmit their events to the Firepower Management Center where you can view the aggregated data and gain a greater understanding of the attacks against your network assets.

You can also deploy a managed device as an inline, switched, or routed intrusion system, which allows you to configure the device to drop or replace packets that you know to be harmful.

Tools for Reviewing and Evaluating Intrusion Events

You can use the following tools to review intrusion events and evaluate whether they are important in the context of your network environment and your security policies.

- An event summary page that gives you an overview of the current activity on your managed devices
- Text-based and graphical reports that you can generate for any time period you choose; you can also design your own reports and configure them to run at scheduled intervals
An incident-handling tool that you can use to gather event data related to an attack; you can also add notes to help you track your investigation and response

Automated alerting that you can configure for SNMP, email, and syslog

Automated correlation policies that you can use to respond to and remediate specific intrusion events

Predefined and custom workflows that you can use to drill down through the data to identify the events that you want to investigate further

External tools for managing and analyzing data. You can send data to those tools using syslog or eStreamer.

To search for a particular message string and retrieve documentation for the rule that generated an event, see https://www.snort.org/rule_docs/.

Viewing Intrusion Events

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You view an intrusion event to determine whether there is a threat to your network security.

The initial intrusion events view differs depending on the workflow you use to access the page. You can use one of the predefined workflows, which includes one or more drill-down pages, a table view of intrusion events, and a terminating packet view, or you can create your own workflow. You can also view workflows based on custom tables, which may include intrusion events.

An event view may be slow to display if it contains a large number of IP addresses and you have enabled the Resolve IP Addresses event view setting.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

Step 1 Choose Analysis > Intrusions > Events.

Step 2 You have the following choices:

- Adjust time range — Adjust the time range for the event view as described in Changing the Time Window, on page 2094.
- Change workflows — If you are using a custom workflow that does not include the table view of intrusion events, choose any of the system-provided workflows by clicking (switch workflow) next to the workflow title.
- Constrain — To narrow your view to the intrusion events that are important to your analysis, see Using Intrusion Event Workflows, on page 2196.
- Delete event — To delete an event from the database, click Delete to delete the event whose packet you are viewing or click Delete All to delete all the events whose packets you previously selected.
- Mark reviewed — To mark intrusion events reviewed, see Marking Intrusion Events Reviewed, on page 2191.
• View connection data — To view connection data associated with intrusion events, see Viewing Connection Data Associated with Intrusion Events, on page 2190.
• View contents — To view the contents of the columns in the table as described in Intrusion Event Fields, on page 2179.

Using the Intrusion Event Packet View, on page 2199

---

**About Intrusion Event Fields**

When the system identifies a possible intrusion, it generates an *intrusion event*, which is a record of the date, time, the type of exploit, and contextual information about the source of the attack and its target. For packet-based events, a copy of the packet or packets that triggered the event is also recorded.

You can view intrusion event data in the Firepower Management Center web interface at **Analysis > Intrusions > Events** or emit data from certain fields as syslog messages for consumption by an external tool. Syslog fields are indicated in the list below; fields without a listed syslog equivalent are not available in syslog messages.

When searching intrusion events, keep in mind that the information available for any individual event can vary depending on how, why, and when system logged the event. For example, only intrusion events triggered on decrypted traffic contain TLS/SSL information.

---

**Intrusion Event Fields**

**Access Control Policy (Syslog: ACPolicy)**

The access control policy associated with the intrusion policy where the intrusion, preprocessor, or decoder rule that generated the event is enabled.

**Access Control Rule**

The access control rule that invoked the intrusion policy that generated the event. **Default Action** indicates that the intrusion policy where the rule is enabled is not associated with a specific access control rule but, instead, is configured as the default action of the access control policy.

This field is empty if there is:

• No associated rule/default action: Intrusion inspection was associated with neither an access control rule nor the default action, for example, if the packet was examined by the intrusion policy specified to handle packets that must pass before the system can determine which rule to apply. (This policy is specified in the Advanced tab of the access control policy.)

• No associated connection event: The connection event logged for the session has been purged from the database, for example, if connection events have higher turnover than intrusion events.
**Application Protocol (Syslog: ApplicationProtocol)**

The application protocol, if available, which represents communications between hosts detected in the traffic that triggered the intrusion event.

**Application Protocol Category and Tag**

Criteria that characterize the application to help you understand the application's function.

**Application Risk**

The risk associated with detected applications in the traffic that triggered the intrusion event: Very High, High, Medium, Low, and Very Low. Each type of application detected in a connection has an associated risk; this field displays the highest risk of those.

**Business Relevance**

The business relevance associated with detected applications in the traffic that triggered the intrusion event: Very High, High, Medium, Low, and Very Low. Each type of application detected in a connection has an associated business relevance; this field displays the lowest (least relevant) of those.

**Classification (Syslog: Classification)**

The classification where the rule that generated the event belongs.

See a list of possible classification values in Intrusion Event Details, on page 1472.

When searching this field, enter the classification number, or all or part of the classification name or description for the rule that generated the events you want to view. You can also enter a comma-separated list of numbers, names, or descriptions. Finally, if you add a custom classification, you can also search using all or part of its name or description.

**Client (Syslog: Client)**

The client application, if available, which represents software running on the monitored host detected in the traffic that triggered the intrusion event.

**Client Category and Tag**

Criteria that characterize the application to help you understand the application's function.

**Count**

The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable.

**Destination Continent**

The continent of the receiving host involved in the intrusion event.

**Destination Country**

The country of the receiving host involved in the intrusion event.
**Destination IP (Syslog: DstIP)**
The IP address used by the receiving host involved in the intrusion event.

**Destination Port / ICMP Code (Syslog: DstPort, ICMPCode)**
The port number for the host receiving the traffic. For ICMP traffic, where there is no port number, this field displays the ICMP code.

**Destination User**
The User ID for any known user logged in to the destination host.

**Device**
The managed device where the access control policy was deployed.
Note that the primary and secondary devices in a stacked configuration report intrusion events as if they were separate devices.

**Domain**
The domain of the device that detected the intrusion. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

**Egress Interface (Syslog: EgressInterface)**
The egress interface of the packet that triggered the event. This interface column is not populated for a passive interface.

**Egress Security Zone (Syslog: EgressZone)**
The egress security zone of the packet that triggered the event. This security zone field is not populated in a passive deployment.

**Email Attachments**
The MIME attachment file name that was extracted from the MIME Content-Disposition header. To display attachment file names, you must enable the SMTP preprocessor Log MIME Attachment Names option. Multiple attachment file names are supported.

**Email Headers**
This field is a search field only.
The data that was extracted from the email header.
To associate email headers with intrusion events for SMTP traffic, you must enable the SMTP preprocessor Log Headers option.

**Email Recipient**
The address of the email recipient that was extracted from the SMTP RCPT TO command. To display a value for this field, you must enable the SMTP preprocessor Log To Addresses option. Multiple recipient addresses are supported.
Email Sender
The address of the email sender that was extracted from the SMTP MAIL FROM command. To display a value for this field, you must enable the SMTP preprocessor Log From Address option. Multiple sender addresses are supported.

Generator
The component that generated the event.
See also information about the following intrusion event fields: GID, Message, and Snort ID.

GID (Syslog Only)
Generator ID; the ID of the component that generated the event.
See also information about the following intrusion event fields: Generator, Message, and Snort ID.

HTTP Hostname
The host name, if present, that was extracted from the HTTP request Host header. Note that request packets do not always include the host name.
To associate host names with intrusion events for HTTP client traffic, you must enable the HTTP Inspect preprocessor Log Hostname option.
In table views, this column displays the first fifty characters of the extracted host name. You can hover your pointer over the displayed portion of an abbreviated host name to display the complete name, up to 256 bytes. You can also display the complete host name, up to 256 bytes, in the packet view.

HTTP Response Code (Syslog: HTTPResponse)
The HTTP status code sent in response to a client's HTTP request over the connection that triggered the event.

HTTP URI
The raw URI, if present, associated with the HTTP request packet that triggered the intrusion event. Note that request packets do not always include a URI.
To associate URIs with intrusion events for HTTP traffic, you must enable the HTTP Inspect preprocessor Log URI option.
To see the associated HTTP URI in intrusion events triggered by HTTP responses, you should configure HTTP server ports in the Perform Stream Reassembly on Both Ports option; note, however, that this increases resource demands for traffic reassembly.
This column displays the first fifty characters of the extracted URI. You can hover your pointer over the displayed portion of an abbreviated URI to display the complete URI, up to 2048 bytes. You can also display the complete URI, up to 2048 bytes, in the packet view.

Impact
The impact level in this field indicates the correlation between intrusion data, network discovery data, and vulnerability information.
When searching this field, do not specify impact icon colors or partial strings. For example, do not use blue, level 1, or 0. Valid case-insensitive values are:
Because no operating system information is available for hosts added to the network map from NetFlow data, the system cannot assign Vulnerable (impact level 1: red) impact levels for intrusion events involving those hosts. In such cases, use the host input feature to manually set the operating system identity for the hosts.

**Ingress Interface (Syslog: IngressInterface)**

The ingress interface of the packet that triggered the event. Only this interface column is populated for a passive interface.

**Ingress Security Zone (Syslog: IngressZone)**

The ingress security zone or tunnel zone of the packet that triggered the event. Only this security zone field is populated in a passive deployment.

**Inline Result**

In workflow and table views, this field displays one of the following:

<table>
<thead>
<tr>
<th>This Icon</th>
<th>Indicates</th>
</tr>
</thead>
<tbody>
<tr>
<td>A black down arrow</td>
<td>The system dropped the packet that triggered the rule</td>
</tr>
<tr>
<td>A gray down arrow</td>
<td>IPS would have dropped the packet if you enabled the <strong>Drop when Inline</strong> intrusion policy option (in an inline deployment), or if a Drop and Generate rule generated the event while the system was pruning</td>
</tr>
<tr>
<td>No icon (blank)</td>
<td>The triggered rule was not set to Drop and Generate Events</td>
</tr>
</tbody>
</table>

In a passive deployment, the system does not drop packets, including when an inline interface is in tap mode, regardless of the rule state or the inline drop behavior of the intrusion policy.

When searching this field, enter either of the following:

- **dropped** to specify whether the packet is dropped in an inline deployment
- **would have dropped** to specify whether the packet would have dropped if the intrusion policy had been set to drop packets in an inline deployment

**Intrusion Policy**

The intrusion policy where the intrusion, preprocessor, or decoder rule that generated the event was enabled. You can choose an intrusion policy as the default action for an access control policy, or you can associate an intrusion policy with an access control rule.
IOC (Syslog: NumIOC)

Whether the traffic that triggered the intrusion event also triggered an indication of compromise (IOC) for a host involved in the connection.

When searching this field, specify triggered or n/a.

Message (Syslog: Message)

The explanatory text for the event. For rule-based intrusion events, the event message is pulled from the rule. For decoder- and preprocessor-based events, the event message is hard coded.

The Generator and Snort IDs (GID and SID) and the SID version (Revision) are appended in parentheses to the end of each message in the format of numbers separated by colons (GID:SID:version). For example (1:36330:2).

MPLS Label

The Multiprotocol Label Switching label associated with the packet that triggered the intrusion event.

Network Analysis Policy (Syslog: NAPPolicy)

The network analysis policy, if any, associated with the generation of the event.

This field displays the first fifty characters of the extracted URI. You can hover your pointer over the displayed portion of an abbreviated URI to display the complete URI, up to 2048 bytes. You can also display the complete URI, up to 2048 bytes, in the packet view.

Original Client IP

The original client IP address that was extracted from an X-Forwarded-For (XFF), True-Client-IP, or custom-defined HTTP header.

To display a value for this field, you must enable the HTTP preprocessor Extract Original Client IP Address option in the network analysis policy. Optionally, in the same area of the network analysis policy, you can also specify up to six custom client IP headers, as well as set the priority order in which the system selects the value for the Original Client IP event field.

Priority (Syslog: Priority)

The event priority as determined by the Cisco Talos Intelligence Group (Talos). The priority corresponds to either the value of the priority keyword or the value for the classtype keyword. For other intrusion events, the priority is determined by the decoder or preprocessor. Valid values are high, medium, and low.

Protocol (Syslog: Protocol)

In the Firepower Management Center web interface, this field is a search field only.

The name or number of the transport protocol used in the connection as listed in http://www.iana.org/assignments/protocol-numbers. This is the protocol associated with the source and destination port/ICMP column.

Reviewed By

The name of the user who reviewed the event. When searching this field, you can enter unreviewed to search for events that have not been reviewed.
Revision (Syslog Only)
The version of the signature that was used to generate the event.
See also information about the following intrusion event fields: Generator, GID, Message, SID, and Snort ID.

Security Context (Syslog: Context)
The metadata identifying the virtual firewall group through which the traffic passed. The system only populates this field for ASA FirePOWER in multiple context mode.

SID (Syslog Only)
The signature ID (also known as the Snort ID) of the rule that generated the event.
See also information about the following intrusion event fields: Generator, GID, Message, Revision, and Snort ID.

Snort ID
This field is a search field only.
(For the syslog field, see SID.)
When performing your search: Specify the Snort ID (SID) of the rule that generated the event or, optionally, specify the combination Generator ID (GID) and SID of the rule, where the GID and SID are separated with a colon (:) in the format GID:SID. You can specify any of the values in the following table:

<table>
<thead>
<tr>
<th>Value</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>a single SID</td>
<td>10000</td>
</tr>
<tr>
<td>a SID range</td>
<td>10000-11000</td>
</tr>
<tr>
<td>greater than a SID</td>
<td>&gt;10000</td>
</tr>
<tr>
<td>greater than or equal to a SID</td>
<td>&gt;=10000</td>
</tr>
<tr>
<td>less than a SID</td>
<td>&lt;10000</td>
</tr>
<tr>
<td>less than or equal to a SID</td>
<td>&lt;=10000</td>
</tr>
<tr>
<td>a comma-separated list of SIDs</td>
<td>10000,11000,12000</td>
</tr>
<tr>
<td>a single GID:SID combination</td>
<td>1:10000</td>
</tr>
<tr>
<td>a comma-separated list of GID:SID combinations</td>
<td>1:10000,1:11000,1:12000</td>
</tr>
<tr>
<td>a comma-separated list of SIDs and GID:SID combinations</td>
<td>10000,1:11000,12000</td>
</tr>
</tbody>
</table>

The SIDs of the events you are viewing is listed in the Message column. For more information, see the description in this section for the Message field.
Source Continent
The continent of the sending host involved in the intrusion event.

Source Country
The country of the sending host involved in the intrusion event.

Source IP (Syslog: SrcIP)
The IP address used by the sending host involved in the intrusion event.

Source Port / ICMP Type (Syslog: SrcPort, ICMPType)
The port number on the sending host. For ICMP traffic, where there is no port number, this field displays the ICMP type.

Source User (Syslog: User)
The User ID for any known user logged in to the source host.

SSL Actual Action (Syslog: SSLActualAction)
In the Firepower Management Center web interface, this field is a search field only.
The action the system applied to encrypted traffic:
Block/Block with reset
Represents blocked encrypted connections.
Decrypt (Resign)
Represents an outgoing connection decrypted using a re-signed server certificate.
Decrypt (Replace Key)
Represents an outgoing connection decrypted using a self-signed server certificate with a substituted public key.
Decrypt (Known Key)
Represents an incoming connection decrypted using a known private key.
Default Action
Indicates the connection was handled by the default action.
Do not Decrypt
Represents a connection the system did not decrypt.

Field values are displayed in the SSL Status field on the search workflow pages.

SSL Certificate Information
This field is a search field only.
The information stored on the public key certificate used to encrypt traffic, including:
• Subject/Issuer Common Name
SSL Failure Reason
This field is a search field only.
The reason the system failed to decrypt encrypted traffic:
- Unknown
- No Match
- Success
- Uncached Session
- Unknown Cipher Suite
- Unsupported Cipher Suite
- Unsupported SSL Version
- SSL Compression Used
- Session Undecryptable in Passive Mode
- Handshake Error
- Decryption Error
- Pending Server Name Category Lookup
- Pending Common Name Category Lookup
- Internal Error
- Network Parameters Unavailable
- Invalid Server Certificate Handle
- Server Certificate Fingerprint Unavailable
- Cannot Cache Subject DN
- Cannot Cache Issuer DN
- Unknown SSL Version
- External Certificate List Unavailable
- External Certificate Fingerprint Unavailable
• Internal Certificate List Invalid
• Internal Certificate List Unavailable
• Internal Certificate Unavailable
• Internal Certificate Fingerprint Unavailable
• Server Certificate Validation Unavailable
• Server Certificate Validation Failure
• Invalid Action

Field values are displayed in the **SSL Status** field on the search workflow pages.

**SSL Status**
The action associated with the **SSL Actual Action** (SSL rule, default action, or undecryptable traffic action) that logged the encrypted connection.

If the system fails to decrypt an encrypted connection, it displays the **SSL Actual Action** (undecryptable traffic action) taken, as well as the **SSL Failure Reason**. For example, if the system detects traffic encrypted with an unknown cipher suite and allows it without further inspection, this field displays Do Not Decrypt (Unknown Cipher Suite).

Click the lock icon (🔒) to view certificate details.

When searching this field, enter one or more of the **SSL Actual Action** and **SSL Failure Reason** values to view encrypted traffic the system handled or failed to decrypt.

**SSL Subject/Issuer Country**
This field is a search field only.

A two-character ISO 3166-1 alpha-2 country code for the subject or issuer country associated with the encryption certificate.

**Time**
The date and time of the event. This field is not searchable.

**VLAN ID**
The innermost VLAN ID associated with the packet that triggered the intrusion event.

**Web Application (Syslog: WebApplication)**
The web application, which represents the content or requested URL for HTTP traffic detected in the traffic that triggered the intrusion event.

If the system detects an application protocol of HTTP but cannot detect a specific web application, the system supplies a generic web browsing designation instead.

**Web Application Category and Tag**
Criteria that characterize the application to help you understand the application's function.
Intrusion Event Impact Levels

To help you evaluate the impact an event has on your network, the Firepower Management Center displays an impact level in the table view of intrusion events. For each event, the system adds an impact level icon whose color indicates the correlation between intrusion data, network discovery data, and vulnerability information.

Note
Because no operating system information is available for hosts added to the network map from NetFlow data, the system cannot assign Vulnerable (impact level 1: red) impact levels for intrusion events involving those hosts. In such cases, use the host input feature to manually set the operating system identity for the hosts.

The following table describes the possible values for the impact levels.

<table>
<thead>
<tr>
<th>Impact Level</th>
<th>Vulnerability</th>
<th>Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Unknown</td>
<td>gray</td>
<td>Neither the source nor the destination host is on a network that is monitored by network discovery.</td>
</tr>
<tr>
<td>1</td>
<td>Vulnerable</td>
<td>red</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• the source or the destination host is in the network map, and a vulnerability is mapped to the host</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• the source or destination host is potentially compromised by a virus, trojan, or other piece of malicious software</td>
</tr>
<tr>
<td>2</td>
<td>Potentially Vulnerable</td>
<td>orange</td>
<td>Either the source or the destination host is in the network map and one of the following is true:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• for port-oriented traffic, the port is running a server application protocol</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• for non-port-oriented traffic, the host uses the protocol</td>
</tr>
</tbody>
</table>
Viewing Connection Data Associated with Intrusion Events

<table>
<thead>
<tr>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

The system can log the connections where intrusion events are detected. Although this logging is automatic for intrusion policies associated with access control rules, you must manually enable connection logging to see associated connection data for the default action.

Viewing associated data is most useful when navigating between table views of events.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose **Analysis > Intrusions > Events**.

**Step 2** Choose the intrusion events using the check boxes in the table, then choose **Connections** from the **Jump to** drop-down list.

**Tip** You can view the intrusion events associated with particular connections in a similar way. For more information, see **Inter-Workflow Navigation**, on page 2100.

**Related Topics**

- **Logging for Allowed Connections**, on page 2138
Marking Intrusion Events Reviewed

If you are confident that an intrusion event is not malicious, you can mark the event reviewed.

If you have examined an intrusion event and are confident that the event does not represent a threat to your network security (for example, because you know that none of the hosts on your network are vulnerable to the detected exploit), you can mark the event reviewed. Reviewed events are stored in the event database and are included in the event summary statistics, but no longer appear in the default intrusion event pages. Your name appears as the reviewer.

In a multidomain deployment, if you mark an event reviewed, the system marks it reviewed in all domains that can view that event.

If you perform a backup and then delete reviewed intrusion events, restoring your backup restores the deleted intrusion events but does not restore their reviewed status. You view those restored intrusion events under *Intrusion Events*, not under *Reviewed Events*.

**Procedure**

On a page that displays intrusion events, you have two options:

- To mark one or more intrusion events from the list of events, check the check boxes next to the events and click **Review**.
- To mark all intrusion events from the list of events, click **Review All**.

**Related Topics**

*Using Intrusion Event Workflows*, on page 2196

Viewing Previously Reviewed Intrusion Events

In a multidomain deployment, if you mark an event reviewed, the system marks it reviewed in all domains that can view that event.
Procedure

**Step 1**  Choose Analysis > Intrusions > Reviewed Events.

**Step 2**  You have the following choices:

- Adjust the time range as described in Changing the Time Window, on page 2094.
- If you are using a custom workflow that does not include the table view of intrusion events, choose any of the system-provided workflows by clicking (switch workflow) next to the workflow title.
- To learn more about the events that appear, see Intrusion Event Fields, on page 2179.

Related Topics

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You can return a reviewed event to the default intrusion events view by marking the event unreviewed.

In a multidomain deployment, if you mark an event reviewed, the system marks it reviewed in all domains that can view that event.

Procedure

On a page that displays reviewed events, you have two choices:

- To remove individual intrusion events from the list of reviewed events, check the check boxes next to specific events and click Unreview.
- To remove all intrusion events from the list of reviewed events, click Unreview All.

Preprocessor Events

Preprocessors provide two functions: performing the specified action on the packet (for example, decoding and normalizing HTTP traffic) and reporting the execution of specified preprocessor options by generating an event whenever a packet triggers that preprocessor option and the associated preprocessor rule is enabled. For example, you can enable the Double Encoding HTTP Inspect option and the associated preprocessor rule with the HTTP Inspect Generator (GID) 119 and the Snort ID (SID) 2 to generate an event when the preprocessor encounters IIS double-encoded traffic.

Generating events to report the execution of preprocessors helps you detect anomalous protocol exploits. For example, attackers can craft overlapping IP fragments to cause a DoS attack on a host. The IP defragmentation preprocessor can detect this type of attack and generate an intrusion event for it.
Preprocessor events differ from rule events in that the packet display does not include a detailed rule description for the event. Instead, the packet display shows the event message, the GID, SID, the packet header data, and the packet payload. This allows you to analyze the packet’s header information, determine if its header options are being used and if they can exploit your system, and inspect the packet payload. After the preprocessors analyze each packet, the rules engine executes appropriate rules against it (if the preprocessor was able to defragment it and establish it as part of a valid session) to further analyze potential content-level threats and report on them.

### Preprocessor Generator IDs

Each preprocessor has its own Generator ID number, or GID, that indicates which preprocessor was triggered by the packet. Some of the preprocessors also have related SIDs, which are ID numbers that classify potential attacks. This helps you analyze events more effectively by categorizing the type of event much the way a rule’s Snort ID (SID) can offer context for packets triggering rules. You can list preprocessor rules by preprocessor in the Preprocessors filter group on the intrusion policy Rules page; you can also list preprocessor rules in the preprocessor and packet decoder sub-groupings in the Category filter group.

Events generated by standard text rules have a generator ID of 1. For shared object rules, the events have a generator ID of 3. For both, the event’s SID indicates which specific rule triggered.

The following table describes the types of events that generate each GID.

<table>
<thead>
<tr>
<th>ID</th>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Standard Text Rule</td>

**Intrusion Event Workflow Pages**

The preprocessor, decoder, and intrusion rules that are enabled in the current intrusion policy generate intrusion events whenever the traffic that you monitor violates the policy.

The Firepower System provides a set of predefined workflows, populated with event data, that you can use to view and analyze intrusion events. Each of these workflows steps you through a series of pages to help you pinpoint the intrusion events that you want to evaluate.

The predefined intrusion event workflows contain three different types of pages, or event views:

- one or more drill-down pages
- the table view of intrusion events
- a packet view

*Drill-down pages* generally include two or more columns in a table (and, for some drill-down views, more than one table) that allow you to view one specific type of information.

When you “drill down” to find more information for one or more destination ports, you automatically select those events and the next page in the workflow appears. In this way, drill-down tables help you reduce the number of events you are analyzing at one time.

The initial *table view* of intrusion events lists each intrusion event in its own row. The columns in the table list information such as the time, the source IP address and port, the destination IP address and port, the event priority, the event message, and more.

When you select events on a table view, instead of selecting events and displaying the next page in the workflow, you add to what are called *constraints*. Constraints are limits that you impose on the types of events that you want to analyze.

For example, if you click the close column icon (✗) in any column and clear *Time* from the drop-down list, you can remove Time as one of the columns. To narrow the list of events in your analysis, you can click the link for a value in one of the rows in the table view. For example, to limit your analysis to the events generated...
from one of the source IP addresses (presumably, a potential attacker), click the IP address in the **Source IP Address** column.

If you select one or more rows in a table view and then click **View**, the packet view appears. A *packet view* provides information about the packet that triggered the rule or the preprocessor that generated the event. Each section of the packet view contains information about a specific layer in the packet. You can expand collapsed sections to see more information.

---

**Note**

Because each portscan event is triggered by multiple packets, portscan events use a special version of the packet view.

If the predefined workflows do not meet your specific needs, you can create custom workflows that display only the information you are interested in. Custom intrusion event workflows can include drill-down pages, a table view of events, or both; the system automatically includes a packet view as the last page. You can easily switch between the predefined workflows and your own custom workflows depending on how you want to investigate events.

---

### Using Intrusion Event Workflows

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

The drill-down views and table view of events share some common features that you can use to narrow a list of events and then concentrate your analysis on a group of related events.

To avoid displaying the same intrusion events on different workflow pages, the time range pauses when you click a link at the bottom of the page to display another page of events, and resumes when you click to take any other action on the subsequent page.

---

**Tip**

At any point in the process, you can save the constraints as a set of search criteria. For example, if you find that over the course of a few days your network is being probed by an attacker from a single IP address, you can save your constraints during your investigation and then use them again later. You cannot, however, save compound constraints as a set of search criteria.

---

**Procedure**

**Step 1**

Access an intrusion event workflow using **Analysis > Intrusions > Events**.

**Step 2**

Optionally, constrain the number of intrusion events that appear on the event views as described in Intrusion Event Drill-Down Page Constraints, on page 2197 or Intrusion Event Table View Constraints, on page 2198.

**Step 3**

You have the following choices:

- To learn more about the columns that appear, see Intrusion Event Fields, on page 2179.

- To view a host’s profile, click host profile ( ) that appears next to the host IP address.
• To view geolocation details, click flag that appears in the Source Country or Destination Country columns.

• To modify the time and date range for displayed events, see Changing the Time Window, on page 2094.

Tip  If no intrusion events appear on the event views, adjusting the specified time range might return results. If you specified an older time range, events in that time range might have been deleted. Adjusting the rule thresholding configuration might generate events.

Note  Events generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.

• To sort events on the current workflow page or navigate within the current workflow page, see Using Workflows, on page 2073.

• To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page.

• To add events to the clipboard so you can transfer them to an incident at a later time, click Copy or Copy All.

• To delete events from the event database, check the check boxes next to events you want to delete, then click Delete, or click Delete All.

• To mark events reviewed to remove them from intrusion event pages, but not the event database, see Marking Intrusion Events Reviewed, on page 2191.

• To download a local copy of the packet (a packet capture file in libpcap format) that triggered each selected event, check the check boxes next to events triggered by the packets you want to download, then click Download Packets, or click Download All Packets. Captured packets are saved in libpcap format. This format is used by several popular protocol analyzers.

• To navigate to other event views to view associated events, see Inter-Workflow Navigation, on page 2100.

• To temporarily use a different workflow, click (switch workflow).

• To bookmark the current page so that you can quickly return to it, click Bookmark This Page.

• To view the Intrusion Events section of the Summary Dashboard, click Dashboards.

• To navigate to the bookmark management page, click View Bookmarks.

• To generate a report based on the data in the current view, see Creating a Report Template from an Event View, on page 1977.

Intrusion Event Drill-Down Page Constraints

The following table describes how to use the drill-down pages.
Table 299: Constraining Events on Drill-Down Pages

<table>
<thead>
<tr>
<th>To...</th>
<th>You can...</th>
</tr>
</thead>
<tbody>
<tr>
<td>drill down to the next workflow page constraining on a specific value</td>
<td>click the value. For example, on the Destination Port workflow, to constrain the events to those with a destination of port 80, click 80/tcp in the DST Port/ICMP Code column. The next page of the workflow, Events, appears and contains only port 80/tcp events.</td>
</tr>
<tr>
<td>drill down to the next workflow page constraining on selected events</td>
<td>select the check boxes next to the events you want to view on the next workflow page, then click View. For example, on the Destination Port workflow, to constrain the events to those with destination ports 20/tcp and 21/tcp, select the check boxes next to the rows for those ports and click View. The next page of the workflow, Events, appears and contains only port 20/tcp and 21/tcp events. Note that if you constrain on multiple rows and the table has more than one column (not including a Count column), you build what is called a compound constraint. Compound constraints ensure that you do not include more events in your constraint than you mean to. For example, if you use the Event and Destination workflow, each row that you select on the first drill-down page creates a compound constraint. If you pick event 1:100 with a destination IP address of 10.10.10.100 and you also pick event 1:200 with a destination IP address of 192.168.10.100, the compound constraint ensures that you do not also select events with 1:100 as the event type and 192.168.10.100 as the destination IP address or events with 1:200 as the event type and 10.10.10.100 as the destination IP address.</td>
</tr>
<tr>
<td>drill down to the next workflow page keeping the current constraints</td>
<td>click View All.</td>
</tr>
</tbody>
</table>

Intrusion Event Table View Constraints

The following table describes how to use the table view.

Table 300: Constraining Events on the Table View of Events

<table>
<thead>
<tr>
<th>To...</th>
<th>You can...</th>
</tr>
</thead>
<tbody>
<tr>
<td>constrain the view to events with a single attribute</td>
<td>click the attribute. For example, to constrain the view to events with a destination of port 80, click 80/tcp in the DST Port/ICMP Code column.</td>
</tr>
</tbody>
</table>
To... | You can...
---|---
remove a column from the table | click the close icon (×) in the column heading that you want to hide. In the pop-up window that appears, click Apply. If you want to hide or show other columns, select or clear the appropriate check boxes before you click Apply. To add a disabled column back to the view, click the expand arrow (▼) to expand the search constraints, then click the column name under Disabled Columns.

view the packets associated with one or more events | either:
- click the down arrow icon (▼) next to the event whose packets you want to view.
- select one or more events whose packets you want to view, and, at the bottom of the page, click View.
- at the bottom of the page, click View All to view the packets for all events that match the current constraints.

---

### Using the Intrusion Event Packet View

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

A packet view provides information about the packet that triggered the rule that generated an intrusion event.

**Tip**
The packet view on a Firepower Management Center does not contain packet information when the Transfer Packet option is disabled for the device detecting the event.

The packet view indicates why a specific packet was captured by providing information about the intrusion event that the packet triggered, including the event’s time stamp, message, classification, priority, and, if the event was generated by a standard text rule, the rule that generated the event. The packet view also provides general information about the packet, such as its size.

In addition, the packet view has a section that describes each layer in the packet: data link, network, and transport, as well as a section that describes the bytes that comprise the packet. If the system decrypted the packet, you can view the decrypted bytes. You can expand collapsed sections to display detailed information.

**Note**
Because each portscan event is triggered by multiple packets, portscan events use a special version of the packet view.
In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** On the table view of intrusion events, choose packets to view as described in Intrusion Event Table View Constraints, on page 2198.

**Step 2** Optionally, if you chose more than one event, you can page through the packets in the packet view by using the page numbers at the bottom of the page.

**Step 3** You also have the following options:

- Adjust — To modify the date and time range in the packet views, see Changing the Time Window, on page 2094.
- Clipboard — To add an event to the clipboard so you can transfer it to the incidents at a later time, click Copy to copy the event whose packet you are viewing or click Copy All to copy all the events whose packets you previously selected.
- Configure — To configure the intrusion rule that triggered the event, click the arrow next to Actions and continue as described in Configuring Intrusion Rules within the Packet View, on page 2203.
- Delete — To delete an event from the database, click Delete to delete the event whose packet you are viewing or click Delete All to delete all the events whose packets you previously selected.
- Download — To download a local copy of the packet (a packet capture file in libpcap format) that triggered the event, click Download Packet to save a copy of the captured packet for the event you are viewing or click Download All Packets to save copies of the captured packets for all the events whose packets you previously selected. The captured packet is saved in libpcap format. This format is used by several popular protocol analyzers.
  
  **Note** You cannot download a portscan packet because single portscan events are based on multiple packets; however, the portscan view provides all usable packet information. You must have at least 15% available disk space in order to download.

  - Mark reviewed — To mark an event reviewed to remove it from event views, but not the event database, click Review to mark the event whose packet you are viewing or click Review All to mark all the events whose packets you previously selected. For more information, see Marking Intrusion Events Reviewed, on page 2191.
  - View additional information — To expand or collapse a page section, click the arrow next to the section. For details, see Event Information Fields, on page 2200, Frame Information Fields, on page 2206, and Data Link Layer Information Fields, on page 2207.
  - View network layer information — See Viewing Network Layer Information, on page 2208.
  - View packet byte information — See Viewing Packet Byte Information, on page 2213.
  - View transport layer information — See Viewing Transport Layer Information, on page 2211

**Related Topics**

- Portscan Detection, on page 1715
- The Intrusion Events Clipboard, on page 2214

**Event Information Fields**

On the packet view, you can view information about the packet in the Event Information section.
Event
The event message. For rule-based events, this corresponds to the rule message. For other events, this is determined by the decoder or preprocessor.

The ID for the event is appended to the message in the format (GID:SID:Rev). GID is the generator ID of the rules engine, the decoder, or the preprocessor that generated the event. SID is the identifier for the rule, decoder message, or preprocessor message. Rev is the revision number of the rule.

Timestamp
The time that the packet was captured, in UTC time zone.

Classification
The event classification. For rule-based events, this corresponds to the rule classification. For other events, this is determined by the decoder or preprocessor.

Priority
The event priority. For rule-based events, this corresponds to either the value of the priority keyword or the value for the classtype keyword. For other events, this is determined by the decoder or preprocessor.

Ingress Security Zone
The ingress security zone of the packet that triggered the event. Only this security zone field is populated in a passive deployment.

Egress Security Zone
The egress security zone of the packet that triggered the event. This field is not populated in a passive deployments

Domain
The domain where the managed device belongs. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Device
The managed device where the access control policy was deployed.

Note that the primary and secondary devices in a stacked configuration report intrusion events as if they were separate devices.

Security Context
The metadata identifying the virtual firewall group through which the traffic passed. Note that the system only populates this field for ASA FirePOWER in multiple context mode.

Ingress Interface
The ingress interface of the packet that triggered the event. Only this interface column is populated for a passive interface.
**Egress Interface**
For an inline set, the egress interface of the packet that triggered the event.

**Source/Destination IP**
The host IP address or domain name where the packet that triggered the event (source) originated, or the target (destination) host of the traffic that triggered the event.

**Source Port/ICMP Type**
Source port of the packet that triggered the event. For ICMP traffic, where there is no port number, the system displays the ICMP type.

**Destination Port/ICMP Code**
The port number for the host receiving the traffic. For ICMP traffic, where there is no port number, the system displays the ICMP code.

**Email Headers**
The data that was extracted from the email header. Note that email headers do not appear in the table view of intrusion events, but you can use email header data as a search criterion.

To associate email headers with intrusion events for SMTP traffic, you must enable the SMTP preprocessor Log Headers option. For rule-based events, this row appears when email data is extracted.

**HTTP Hostname**
The host name, if present, extracted from the HTTP request Host header. This row displays the complete host name, up to 256 bytes. You can expand the complete host name if it is longer than a single row.

To display host names, you must enable the HTTP Inspect preprocessor Log Hostname option.

Note that HTTP request packets do not always include a host name. For rule-based events, this row appears when the packet contains the HTTP host name or the HTTP URI.

**HTTP URI**
The raw URI, if present, associated with the HTTP request packet that triggered the intrusion event. This row displays the complete URI, up to 2048 bytes. You can expand the complete URI if it is longer than a single row.

To display the URI, you must enable the HTTP Inspect preprocessor Log URI option.

Note that HTTP request packets do not always include a URI. For rule-based events, this row appears when the packet contains the HTTP host name or the HTTP URI.

To see the associated HTTP URI in intrusion events triggered by HTTP responses, you should configure HTTP server ports in the **Perform Stream Reassembly on Both Ports** option; note, however, that this increases resource demands for traffic reassembly.

**Intrusion Policy**
The intrusion policy, if present, where the intrusion, preprocessor, or decoder rule that generated the intrusion event was enabled. You can choose an intrusion policy as the default action for an access control policy or associate an intrusion policy with an access control rule.
Access Control Policy

The access control policy that includes the intrusion policy where the intrusion, preprocessor, or decoder rule that generated the event is enabled.

Access Control Rule

The access control rule associated with an intrusion rule that generated the event. Default Action indicates that the intrusion policy where the rule is enabled is not associated with an access control rule but, instead, is configured as the default action of the access control policy.

Rule

For standard text rule events, the rule that generated the event.

Note that if the event is based on a shared object rule, a decoder, or a preprocessor, the rule is not available.

Because rule data may contain sensitive information about your network, administrators may toggle users’ ability to view rule information in the packet view with the View Local Rules permission in the user role editor.

Actions

For standard text and custom rule events, expand Actions to take any of the following actions on the rule that triggered the event:

• edit the rule
• view documentation for the revision of the rule
• add a comment to the rule
• change the state of the rule
• set a threshold for the rule
• suppress the rule

Note that if the event is based on a shared object rule, a decoder, or a preprocessor, the rule is not available.

Configuring Intrusion Rules within the Packet View

Within the packet view of an intrusion event, you can take several actions on the rule that triggered the event. Note that if the event is based on a shared object rule, a decoder, or a preprocessor, the rule is not available.

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1
Within the packet view of an intrusion event that was generated by an intrusion rule, expand Actions in the Event Information section.

Step 2
You have the following choices:
• Comment — For standard text rule events, click **Rule Comment** to add a text comment to the rule that generated the event. This allows you to provide additional context and information about the rule and the exploit or policy violation it identifies. You can also add and view rule comments in the intrusion rules editor.

• Disable — Click **Disable this rule...** to disable the rule.

If this event is generated by a standard text rule, you can disable the rule, if necessary. You can set the rule in all policies that you can edit locally. Alternately, you can set the rule only in the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by the system.

**Note** You **cannot** disable shared object rules from the packet view, nor can you disable rules in the default policies.

• Drop packets — Click **Set this rule to drop the triggering packet...** to set the rule to drop packets that trigger it.

If your managed device is deployed inline on your network, you can set the rule that triggered the event to drop packets that trigger the rule in all policies that you can edit locally. Alternately, you can set the rule only in the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by the system. Note also that this option appears only when **Drop when Inline** is enabled in the current policy.

• Edit — For standard text rule events, click **Edit** to modify the rule that generated the event. If the event is based on a shared object rule, a decoder, or a preprocessor, the rule is not available.

**Note** If you edit a system-provided rule (as opposed to a custom standard text rule), you actually create a new local rule. Make sure you set the local rule to generate events and also disable the original rule in the current intrusion policy. Note, however, that you **cannot** enable local rules in the default policies.

• Generate events — Click **Set this rule to generate events...** to set the rule to generate events.

If this event is generated by a standard text rule, you can set the rule to generate events in all policies that you can edit locally. Alternately, you can set the rule only in the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by the system.

**Note** You **cannot** set shared object rules to generate events from the packet view, nor can you disable rules in the default policies.

• Set suppression options — Expand **Set Suppression Options** and continue as described in **Setting Suppression Options within the Packet View**, on page 2206.

You can use this option to suppress the rule that triggered this event in all policies that you can edit locally. Alternately, you can suppress the rule only in the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by the system.
Set threshold options — Expand **Set Thresholding Options** and continue as described in Setting Threshold Options within the Packet View, on page 2205.

You can use this option to create a threshold for the rule that triggered this event in all policies that you can edit locally. Alternately, you create a threshold only for the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default intrusion policy provided by the system.

• View documentation — Click **View Documentation** to learn more about the rule that generated the event.

---

**Setting Threshold Options within the Packet View**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can control the number of events that are generated per rule over time by setting the threshold options in the packet view of an intrusion event. You can set threshold options in all policies that you can edit locally or, when it can be edited locally, only in the in the current policy (that is, the policy that caused the event to be generated).

**Procedure**

**Step 1** Within the packet view of an intrusion event that was generated by an intrusion rule, expand **Actions** in the Event Information section.

**Step 2** Expand **Set Thresholding Options** and choose one of the two possible options:

- in the current policy
- in all locally created policies

*Note* The current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by the system.

**Step 3** Choose the type of threshold you want to set:

- Click **limit** to limit notification to the specified number of event instances per time period.
- Click **threshold** to provide notification for each specified number of event instances per time period.
- Click **both** to provide notification once per time period after a specified number of event instances.

**Step 4** Click the appropriate threshold to indicate whether you want the event instances tracked by **Source** or **Destination** IP address.

**Step 5** In the **Count** field, enter the number of event instances you want to use as your threshold.

**Step 6** In the **Seconds** field, enter a number between 1 and 86400 that specifies the time period for which event instances are tracked.
Step 7 If you want to override any current thresholds for this rule in existing intrusion policies, check the Override any existing settings for this rule check box.

Step 8 Click Save Thresholding.

Setting Suppression Options within the Packet View

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can use the suppression options to suppress intrusion events altogether, or based on the source or destination IP address. You can set suppression options in all policies that you can edit locally. Alternately, you can set suppression options only in the current policy (that is, the policy that generated the event) when the current policy can be edited locally.

Procedure

Step 1 Within the packet view of an intrusion event that was generated by an intrusion rule, expand Actions in the Event Information section.

Step 2 Expand Set Suppression Options and click one of the two possible options:

• in the current policy
• in all locally created policies

Note The current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by Cisco.

Step 3 Choose one of the following Track By options:

• Click Source to suppress events generated by packets originating from a specified source IP address.
• Click Destination to suppress events generated by packets going to a specified destination IP address.
• Click Rule to completely suppress events for the rule that triggered this event.

Step 4 In the IP address or CIDR block field, enter the IP address or CIDR block/prefix length you want to specify as the source or destination IP address.

Step 5 Click Save Suppression.

Firepower System IP Address Conventions, on page 15

Frame Information Fields

On the packet view, click the arrow next to Frame to view information about the captured frame. The packet view may display a single frame or multiple frames. Each frame provides information about an individual network packet. You would see multiple frames, for example, in the case of tagged packets or packets in reassembled TCP streams.
Frame n
The captured frame, where n is 1 for single-frame packets and the incremental frame number for multi-frame packets. The number of captured bytes in the frame is appended to the frame number.

Arrival Time
The date and time the frame was captured.

Time delta from previous captured frame
For multi-frame packets, the elapsed time since the previous frame was captured.

Time delta from previous displayed frame
For multi-frame packets, the elapsed time since the previous frame was displayed.

Time since reference or first frame
For multi-frame packets, the elapsed time since the first frame was captured.

Frame Number
The incremental frame number.

Frame Length
The length of the frame in bytes.

Capture Length
The length of the captured frame in bytes.

Frame is marked
Whether the frame is marked (true or false).

Protocols in frame
The protocols included in the frame.

TCP Stream Reassembly, on page 1701

Data Link Layer Information Fields
On the packet view, click the arrow next to the data link layer protocol (for example, Ethernet II) to view the data link layer information about the packet, which contains the 48-bit media access control (MAC) addresses for the source and destination hosts. It may also display other information about the packet, depending on the hardware protocol.
Viewing Network Layer Information

**Note**

Note that this example discusses Ethernet link layer information; other protocols may also appear.

The packet view reflects the protocol used at the data link layer. The following listing describes the information you might see for an Ethernet II or IEEE 802.3 Ethernet packet in the packet view.

**Destination**

The MAC address for the destination host.

**Note**

Ethernet can also use multicast and broadcast addresses as the destination address.

**Source**

The MAC address for the source host.

**Type**

For Ethernet II packets, the type of packet that is encapsulated in the Ethernet frame; for example, IPv6 or ARP datagrams. Note that this item only appears for Ethernet II packets.

**Length**

For IEEE 802.3 Ethernet packets, the total length of the packet, in bytes, not including the checksum. Note that this item only appears for IEEE 802.3 Ethernet packets.

<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

**Procedure**

On the packet view, click the arrow next to the network layer protocol (for example, Internet Protocol) to view more detailed information about network layer information related to the packet.

**Note**

Note that this example discusses IP packets; other protocols may also appear.

### IPv4 Network Layer Information Fields

The following listing describes protocol-specific information that might appear in an IPv4 packet.
**Version**
The Internet Protocol version number.

**Header Length**
The number of bytes in the header, including any IP options. An IP header with no options is 20 bytes long.

**Differentiated Services Field**
The values for differentiated services that indicate how the sending host supports Explicit Congestion Notification (ECN):
- 0x0 — does not support ECN-Capable Transport (ECT)
- 0x1 and 0x2 — supports ECT
- 0x3 — Congestion Experienced (CE)

**Total Length**
The length of the IP packet, in bytes, minus the IP header.

**Identification**
The value that uniquely identifies an IP datagram sent by the source host. This value is used to trace fragments of the same datagram.

**Flags**
The values that control IP fragmentation, where:
- values for the Last Fragment flag indicate whether there are more fragments associated with the datagram:
  - 0 — there are no more fragments associated with the datagram
  - 1 — there are more fragments associated with the datagram
- values for the Don’t Fragment flag control whether the datagram can be fragmented:
  - 0 — the datagram can be fragmented
  - 1 — the datagram must not be fragmented

**Fragment Offset**
The value for the fragment offset from the beginning of the datagram.

**Time to Live (ttl)**
The remaining number of hops that the datagram can make between routers before the datagram expires.

**Protocol**
The transport protocol that is encapsulated in the IP datagram; for example, ICMP, IGMP, TCP, or UDP.
Header Checksum

The indicator for whether the IP checksum is valid. If the checksum is invalid, the datagram may have been corrupted during transit or may be being used in an intrusion evasion attempt.

Source/Destination

The IP address or domain name for the source (or destination) host.

Note that to display the domain name, you must enable IP address resolution.

Click the address or domain name to view the context menu, then select Whois to do a whois search on the host, View Host Profile to view host information, or Blacklist Now or Whitelist Now to add the address to a global blacklist or whitelist.

IPv6 Network Layer Information Fields

The following listing describes protocol-specific information that might appear in an IPv6 packet.

Traffic Class

An experimental 8-bit field in the IPv6 header for identifying IPv6 packet classes or priorities similar to the differentiated services functionality provided for IPv4. When unused, this field is set to zero.

Flow Label

A optional 20-bit IPv6 hexadecimal value 1 to FFFFFFFF that identifies a special flow such as non-default quality of service or real-time service. When unused, this field is set to zero.

Payload Length

A 16-bit field identifying the number of octets in the IPv6 payload, which is comprised of all of the packet following the IPv6 header, including any extension headers.

Next Header

An 8-bit field identifying the type of header immediately following the IPv6 header, using the same values as the IPv4 Protocol field.

Hop Limit

An 8-bit decimal integer that each node that forwards the packet decrements by one. The packet is discarded if the decremented value reaches zero.

Source

The 128-bit IPv6 address for the source host.

Destination

The 128-bit IPv6 address for the destination host.
Viewing Transport Layer Information

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**
On the packet view, click the arrow next to the transport layer protocol (for example, TCP, UDP, or ICMP).

**Step 2**
Optionally, click **Data** when present to view the first twenty-four bytes of the payload for the protocol immediately above it in the Packet Information section of the packet view.

**Step 3**
View the contents of the transport layer for TCP, UDP, and ICMP protocols as described in TCP Packet View Fields, on page 2211, UDP Packet View Fields, on page 2212, or ICMP Packet View Fields, on page 2212.

**Note**
Note that these examples discuss TCP, UDP, and ICMP packets; other protocols may also appear.

**TCP Packet View Fields**

This section describes the protocol-specific information for a TCP packet.

**Source port**
The number that identifies the originating application protocol.

**Destination port**
The number that identifies the receiving application protocol.

**Sequence number**
The value for the first byte in the current TCP segment, keyed to initial sequence number in the TCP stream.

**Next sequence number**
In a response packet, the sequence number of the next packet to send.

**Acknowledgement number**
The TCP acknowledgement, which is keyed to the sequence number of the previously accepted data.

**Header Length**
The number of bytes in the header.

**Flags**
The six bits that indicate the TCP segment’s transmission state:

- u — the urgent pointer is valid
A — the acknowledgement number is valid
P — the receiver should push data
R — reset the connection
S — synchronize sequence numbers to start a new connection
F — the sender has finished sending data

Window size
The amount of unacknowledged data, in bytes, that the receiving host will accept.

Checksum
The indicator for whether the TCP checksum is valid. If the checksum is invalid, the datagram may have been corrupted during transit or may be being used in an evasion attempt.

Urgent Pointer
The position, if present, in the TCP segment where the urgent data ends. Used in conjunction with the U flag.

Options
The values, if present, for TCP options.

UDP Packet View Fields
This section describes the protocol-specific information for a UDP packet.

Source port
The number that identifies the originating application protocol.

Destination port
The number that identifies the receiving application protocol.

Length
The combined length of the UDP header and data.

Checksum
The indicator for whether the UDP checksum is valid. If the checksum is invalid, the datagram may have been corrupted during transit.

ICMP Packet View Fields
This section describes the protocol-specific information for an ICMP packet.

Type
The type of ICMP message:
- 0 — echo reply
- 3 — destination unreachable
- 4 — source quench
- 5 — redirect
- 8 — echo request
- 9 — router advertisement
- 10 — router solicitation
- 11 — time exceeded
- 12 — parameter problem
- 13 — timestamp request
- 14 — timestamp reply
- 15 — information request (obsolete)
- 16 — information reply (obsolete)
- 17 — address mask request
- 18 — address mask reply

**Code**

The accompanying code for the ICMP message type. ICMP message types 3, 5, 11, and 12 have corresponding codes as described in RFC 792.

**Checksum**

The indicator for whether the ICMP checksum is valid. If the checksum is invalid, the datagram may have been corrupted during transit.

**Viewing Packet Byte Information**

<table>
<thead>
<tr>
<th>Smart License</th>

<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

**Procedure**

On the packet view, click the arrow next to **Packet Bytes** to view hexadecimal and ASCII versions of the bytes that comprise the packet. If the system decrypted traffic, you can view the decrypted packet bytes.
The Intrusion Events Clipboard

The clipboard is a holding area where you can copy intrusion events from any of the intrusion event views. The contents of the clipboard are sorted by the date and time that the events were generated. After you add intrusion events to the clipboard, you can delete them from the clipboard as well as generate reports on the contents of the clipboard.

You can also add intrusion events from the clipboard to incidents, which are compilations of events that you suspect are involved in a possible violation of your security policies.

Related Topics
- Using Intrusion Event Workflows, on page 2196
- Using the Intrusion Event Packet View, on page 2199
- Creating an Incident, on page 2055

Generating Clipboard Reports

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You can generate a report for the events on the clipboard just as you would from any of the event views.

Before you begin
- Add one or more events to the clipboard as described in Using Intrusion Event Workflows, on page 2196 or Using the Intrusion Event Packet View, on page 2199.

Procedure

Step 1 Choose Analysis > Intrusions > Clipboard.
Step 2 You have the following options:
  - To include specific events from a page on the clipboard, navigate to that page, check the check box next to the events, and click Generate Report.
  - To include all the events from the clipboard, click Generate Report All.
Step 3 Specify how you want your report to look, then click Generate.
Step 4 Choose one or more output formats and, optionally, modify any of the other settings.
Step 5 Click Generate, then click Yes.
Step 6 You have the following choices:
  - Click a report link to display the report in a new window.
  - Click OK to return to the Report Templates page where you can modify your report design.
Deleting Events from the Clipboard

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Admin/Intrusion</td>
</tr>
</tbody>
</table>

If you have intrusion events on the clipboard that you do not want to add to an incident, you can delete the events.

Note

Deleting an event from the clipboard does not delete the event from the event database. However, deleting an event from the event database does delete the event from the clipboard.

Procedure

**Step 1**
Choose *Analysis > Intrusions > Clipboard.*

**Step 2**
You have the following options:

- **Delete specific events** — To delete specific intrusion events from a page on the clipboard, navigate to the page, check the check box next to the events, and click **Delete**.
- **Delete all events** — To delete all the intrusion events from the clipboard, click **Delete All**. Note that if you choose the **Confirm 'All' Actions** option in the Event Preferences, you are first prompted to confirm that you want to delete all the events.

Viewing Intrusion Event Statistics

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Admin/Intrusion</td>
</tr>
</tbody>
</table>

The Intrusion Event Statistics page provides you with a quick summary of the current state of your appliance and any intrusion events generated for your network.

Each of the IP addresses, ports, protocols, event messages, and so on shown on the page is a link. Click any link to view the associated event information. For example, if one of the top 10 destination ports is 80 (http/tcp), clicking that link displays the first page in the default intrusion events workflow, and lists the events targeting that port. Note that only the events (and the managed devices that generate events) in the current time range appear. Also, intrusion events that you have marked reviewed continue to appear in the statistics. For example, if the current time range is the past hour but the first event was generated five hours ago...
ago, when you click the First Event link, the resulting event pages will not show the event until you change the time range.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose <strong>Overview &gt; Summary &gt; Intrusion Event Statistics</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>From the two selection boxes at the top of the page, choose the zones and devices whose statistics you want to view, or choose <strong>All Security Zones</strong> and <strong>All Devices</strong> to view statistics for all the devices that are collecting intrusion events.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click <strong>Get Statistics</strong>.</td>
</tr>
</tbody>
</table>

**Tip** To view data from a custom time range, click the link in the upper right page area and follow the directions in Changing the Time Window, on page 2094.

**Host Statistics**

The Host Statistics section of the Intrusion Event Statistics page provides information about the appliance itself. On the Firepower Management Center, this section also provides information about any managed devices.

This information includes the following:

**Time**

The current time on the appliance.

**Uptime**

The number of days, hours, and minutes since the appliance itself was restarted. On the Firepower Management Center, the uptime also shows the last time each managed device was rebooted, the number of users logged in, and the load average.

**Disk Usage**

The percentage of the disk that is being used.

**Memory Usage**

The percentage of system memory that is being used.

**Load Average**

The average number of processes in the CPU queue for the past 1 minute, 5 minutes, and 15 minutes.

**Event Overview**

The Event Overview section of the Intrusion Event Statistics page provides an overview of the information in the intrusion event database.

These statistics include the following:
Events

The number of events in the intrusion event database.

Events in Time Range

The currently selected time range as well as the number and percentage of events from the database that fall within the time range.

First Event

The event message for the first event in the event database.

Last Event

The event message for the last event in the event database.

Note

If you select a managed device while viewing intrusion event data on the Firepower Management Center, the Event Overview section for that device appears instead.

Event Statistics

The Event Statistics section of the Intrusion Event Statistics page provides more specific information about the information in the intrusion event database.

This information includes details on:

- the top 10 event types
- the top 10 source IP addressees
- the top 10 destination IP addresses
- the top 10 destination ports
- the protocols, ingress and egress security zones, and devices with the greatest number of events

Note

In a multidomain deployment, the system builds a separate network map for each leaf domain. As a result, a leaf domain can contain an IP address that is unique within its network, but identical to an IP address in another leaf domain. When you view event statistics in an ancestor domain, the system may display multiple instances of that repeated IP address. At first glance, they might appear to be duplicate entries. However, if you drill down to the host profile information for each IP address, the system shows that they belong to different leaf domains.

Viewing Intrusion Event Performance Graphs

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>
The intrusion event performance page allows you to generate graphs that depict performance statistics for intrusion events over a specific period of time for a Firepower Management Center or a managed device. Graphs can be generated to reflect number of intrusion events per second, number of megabits per second, average number of bytes per packet, the percent of packets uninspected by Snort, and the number of packets blocked as the result of TCP normalization. These graphs can show statistics for the last hour, last day, last week, or last month of operation.

New data is accumulated for statistics graphs every five minutes. Therefore, if you reload a graph quickly, the data may not change until the next five-minute increment occurs. Each graph displays average values in the intervals shown (day, hour, or five minutes) for the selected time period (last month, week, day, or hour). Decimal values are displayed when the average is less than one.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

1. Choose `Overview > Summary > Intrusion Event Performance`.
2. From the `Select Device` list, choose the devices whose data you want to view.
3. From the `Select Graph(s)` list, choose the type of graph you want to create as described in `Intrusion Event Performance Statistics Graph Types`, on page 2218.
4. From the `Select Time Range` list, choose the time range you would like to use for the graph.
5. Click `Graph`.
6. To save the graph, right-click it and follow the instructions for your browser to save the image.

### Intrusion Event Performance Statistics Graph Types

The following table lists the available graph types. Note that graph types display differently if they are populated with data affected by the network analysis policy Inline Mode setting. If Inline Mode is disabled, the graph types marked with an asterisk (*) in the web interface (a yes in the column below) populate with data about the traffic the system would have modified or dropped if Inline Mode was enabled.

<table>
<thead>
<tr>
<th>To generate data for...</th>
<th>You must...</th>

The Firepower System provides graphs that show you intrusion event trends over time. You can generate intrusion event graphs over time ranging from the last hour to the last month, for one or all managed devices.
In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose **Overview > Summary > Intrusion Event Graphs**.

**Step 2** Under **Select Device**, choose **all** to include all devices, or choose the specific device you want to include in the graph.

**Step 3** Under **Select Graph(s)**, choose the type of graph you want to generate:
- Top 10 Destination Ports
- Top 10 Source IP Addresses
- Top 10 Event Messages

**Step 4** Under **Select Time Range**, choose the time range for the graph:
- Last Hour
- Last Day
- Last Week
- Last Month

**Step 5** Click **Graph**.
Viewing Intrusion Event Graphs
The following topics provide an overview of file and malware events, local malware analysis, dynamic analysis, captured files, and network file trajectories.

- About File/Malware Events and Network File Trajectory, on page 2225
- File and Malware Events, on page 2226
- View Details About Analyzed Files, on page 2241
- Using Captured File Workflows, on page 2243
- Manually Submit Files for Analysis, on page 2248
- Network File Trajectory, on page 2249

About File/Malware Events and Network File Trajectory

File policies automatically generate file and malware events for matched traffic, and log captured file information. When a file policy generates a file or malware event, or captures a file, the system also automatically logs the end of the associated connection to the Firepower Management Center database. You can analyze this data to address any negative impacts and block future attacks.

Based on the file analysis results, you can review captured files and generated malware and file events using tables on pages available under the Analysis > Files menu. When available, you can examine a file's composition, disposition, threat score, and dynamic analysis summary report for further insight into the malware analysis.

To further target your analysis, you can use a malware file’s network file trajectory (a map of how the file traversed your network, passing among hosts, as well as various file properties) to track the spread of an individual threat across hosts over time, allowing you to concentrate outbreak control and prevention efforts where most useful.

If you configure local malware analysis or dynamic analysis in a file rule, the system preclassifies files matching the rule and generates a file composition report.

If your organization has deployed AMP for Endpoints and integrated that deployment with your Firepower Management Center, you can also import records of scans, malware detections, and quarantines, as well as indications of compromise (IOC) identified by that product. This data is displayed alongside event data gathered by Firepower for a more complete picture of malware on your network.

The Context Explorer, dashboards, and reporting features can also aid a deeper understanding of the files and malware detected, captured, and blocked. You can also use events to trigger correlation policy violations, or alert you via email, SMTP, or syslog.
To configure your system to detect malware and generate file and malware events, see File Policies and Advanced Malware Protection, on page 1323.

File and Malware Events

The Firepower Management Center can log various types of file and malware events. The information available for any individual event can vary depending on how and why it was generated:

- **File events** represent files, including malware, detected by the Firepower system (AMP for Networks.) File events do not contain AMP for Endpoints-related fields.

- **Malware events** represent malware detected by either AMP for Networks or AMP for Endpoints; malware events can also record data other than threats from your AMP for Endpoints deployment, such as scans and quarantines.

- **Retrospective malware events** represent files detected by AMP for Networks whose dispositions (whether the files are malware) have changed.

File Events generated by inspecting NetBIOS-ssn (SMB) traffic do not immediately generate connection events because the client and server establish a persistent connection. The system generates connection events after the client or server ends the session.

The Firepower System supports the display and input of file names that use Unicode (UTF-8) characters. However, Unicode file names appear in PDF reports in transliterated form. Additionally, the SMB protocol replaces unprintable characters in file names with periods.

File and Malware Event Types

File Events

The system logs the file events generated when a managed device detects or blocks a file in network traffic, according to the rules in currently deployed file policies.

When the system generates a file event, the system also logs the end of the associated connection to the Firepower Management Center database, regardless of the logging configuration of the invoking access control rule.

Malware Events

The Firepower system (specifically the AMP for Networks feature) generates malware events when it detects malware in network traffic as part of your overall access control configuration. Malware events contain the disposition of the resulting event and contextual data about how, where, and when the malware was detected.
Table 302: Malware Event Generation Scenarios

<td>Custom Detection</td>
</tr>
<tr>
<td>it is on the clean list (manually marked as clean),</td>
<td>Clean</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Retrospective Malware Events

For malware detected in network traffic, dispositions can change. For example, the AMP cloud can determine that a file that was previously thought to be clean is now identified as malware, or the reverse—that a malware-identified file is actually clean. When the disposition changes for a file you queried in the last week, the AMP cloud notifies the system. Then, two things happen:

• The Firepower Management Center generates a new retrospective malware event.

  This new retrospective malware event represents a disposition change for all files detected in the last week that have the same SHA-256 hash value. For that reason, these events contain limited information: the date and time the Firepower Management Center was notified of the disposition change, the new disposition, the SHA-256 hash value of the file, and the threat name. They do not contain IP addresses or other contextual information.

• The Firepower Management Center changes the file disposition for previously detected files with the retrospective event’s associated SHA-256 hash value.

  If a file’s disposition changes to Malware, the Firepower Management Center logs a new malware event to its database. Except for the new disposition, the information in this new malware event is identical to that in the file event generated when the file was initially detected.

  If a file’s disposition changes to Clean, the Firepower Management Center does not delete the malware event. Instead, the event reflects the change in disposition. This means that files with clean dispositions can appear in the malware table, but only if they were originally thought to be malware. Files that were never identified as malware appear only in the files table.

Malware Events Generated by AMP for Endpoints

If your organization uses AMP for Endpoints, individual users install lightweight connectors on endpoints: computers and mobile devices. Connectors can inspect files upon upload, download, execution, open, copy, move, and so on. These connectors communicate with the AMP cloud to determine if inspected files contain malware.
When a file is positively identified as malware, the AMP cloud sends the threat identification to the Firepower Management Center. The AMP cloud can also send other kinds of information to the Firepower Management Center, including data on scans, quarantines, blocked executions, and cloud recalls. The Firepower Management Center logs this information as malware events.

**Note**
The IP addresses reported in malware events generated by AMP for Endpoints may not be in your network map—and may not even be in your monitored network at all. Depending on your deployment, level of compliance, and other factors, endpoints in your organization monitored by AMP for Endpoints may not be the same hosts as those monitored by AMP for Networks.

**Malware Event Analysis with AMP for Endpoints**
If your organization has deployed Cisco AMP for Endpoints:

- You can configure the system to display malware events detected by AMP for Endpoints on Firepower Management Center event pages, alongside events detected by AMP for Networks.

To configure the above functionality, see [Integrate Firepower and AMP for Endpoints, on page 1358](#).

**Event Data from AMP for Endpoints**
If your organization has deployed AMP for Endpoints for malware protection, you can configure the system to let you work in FMC with file and malware data from AMP for Endpoints.

However, you should be aware of the differences between file and malware data from AMP for Endpoints and file and malware data from AMP for Networks (malware protection using the Firepower system.)

Because AMP for Endpoints malware detection is performed at the endpoint at download or execution time, while managed devices detect malware in network traffic, the information in the two types of malware events is different. For example, malware events detected by AMP for Endpoints ("endpoint-based malware") contain information on file path, invoking client application, and so on, while malware detections in network traffic contain port, application protocol, and originating IP address information about the connection used to transmit the file.

As another example, for malware events detected by AMP for Networks ("network-based malware events"), user information represents the user most recently logged into the host where the malware was destined, as determined by network discovery. But AMP for Endpoints-reported users represent the user currently logged into the endpoint where the malware was detected.

**Note**
Depending on your deployment, endpoints monitored by AMP for Endpoints may not be the same hosts as those monitored by AMP for Networks. For this reason, malware events generated by AMP for Endpoints do not add hosts to the network map. However, the system uses IP and MAC address data to tag monitored hosts with indications of compromise obtained from your AMP for Endpoints deployment. If two different hosts monitored by different AMP solutions have the same IP and MAC address, the system can incorrectly tag monitored hosts with AMP for Endpoints IOCs.

The following table summarizes the differences between the event data generated by Firepower when using a Malware license, and event data generated by AMP for Endpoints.
Table 303: Summary of Data Differences Between AMP Products

<table>
<thead>
<tr>
<th>Feature</th>

### Using File and Malware Event Workflows

Use this procedure to view file and malware events in a table and to manipulate the event view depending on the information relevant to your analysis. The page you see when you access events differs depending on the workflow, which is simply a series of pages you can use to evaluate events by moving from a broad to a more focused view. You can also create a custom workflow that displays only the information that matches your specific needs.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

Choose one of the following:

- **Analysis > Files > File Events**
- **Analysis > Files > Malware Events**

**Tip**  
In the table view of events, several fields are hidden by default. To show a hidden field in an event view, expand the search constraints, then click the field name under **Disabled Columns**.

**Tip**  
To quickly view the connections where specific files were detected, choose the files using the check boxes in the table, then choose **Connections Events** from the **Jump to** drop-down list.
File and Malware Event Fields

File and malware events, which you can view and search using workflows, contain the fields listed in this section. Keep in mind that the information available for any individual event can vary depending on how and why it was generated.

**Tip**
Right-click an item in the table to see options. (Not every column offers options.)

**Related Topics**
- File and Malware Event Fields, on page 2230
- Predefined File Workflows, on page 2066
- Predefined Malware Workflows, on page 2065
- Configuring Event View Settings, on page 33

---

**Note**
Files identified as malware by AMP for Networks generate both a file event and a malware event. Malware events generated by AMP for Endpoints do not have corresponding file events, and file events do not have AMP for Endpoints-related fields.

---

**Action**
The action associated with file policy rule that detected the file, and any associated file rule action options.

**AMP Cloud**
The name of the AMP cloud where the AMP for Endpoints event originated.

**Application File Name**
The client application accessing the malware file when AMP for Endpoints detection occurred. These applications are not tied to network discovery or application control.

**Application File SHA256**
The SHA-256 hash value of the parent file accessing the AMP for Endpoints-detected or quarantined file when detection occurred.

**Application Protocol**
The application protocol used by the traffic in which a managed device detected the file.

**Application Protocol Category or Tag**
The criteria that characterize the application to help you understand the application's function.
Application Risk
The risk associated with the application traffic detected in the connection: Very High, High, Medium, Low, or Very Low. Each type of application detected in the connection has an associated risk; this field displays the highest of those.

Archive Depth
The level (if any) at which the file was nested in an archive file.

Archive Name
The name of the archive file (if any) which contained the malware file.

To view the contents of an archive file, go to any table under Analysis > Files that lists the archive file, right-click on the archive file’s table row to open the context menu, then click View Archive Contents.

Archive SHA256
The SHA-256 hash value of the archive file (if any) which contains the malware file.

To view the contents of an archive file, go to any table under Analysis > Files that lists the archive file, right-click on that archive file’s table row to open the context menu, then click View Archive Contents.

Business Relevance
The business relevance associated with the application traffic detected in the connection: Very High, High, Medium, Low, or Very Low. Each type of application detected in the connection has an associated business relevance; this field displays the lowest (least relevant) of those.

Category / File Type Category
The general categories of file type, for example: Office Documents, Archive, Multimedia, Executables, PDF files, Encoded, Graphics, or System Files.

Client
The client application that runs on one host and relies on a server to send a file.

Client Category or Tag
The criteria that characterize the application to help you understand the application's function.

Count
After you apply a constraint that creates two or more identical rows, the number of events that match the information in each row.

Detection Name
The name of the detected malware.

Detector
The AMP for Endpoints detector that identified the malware, such as ClamAV, Spero, or SHA.
**Device**

For file events and for malware events generated by AMP for Networks, the name of the device that detected the file.

For malware events generated by AMP for Endpoints and for retrospective malware events generated by the AMP cloud, the name of the Firepower Management Center.

**Disposition / File Disposition**

The file’s disposition:

**Malware**

Indicates that the AMP cloud categorized the file as malware, local malware analysis identified malware, or the file’s threat score exceeded the malware threshold defined in the file policy.

**Clean**

Indicates that the AMP cloud categorized the file as clean, or that a user added the file to the clean list. Clean files appear in the malware table only if they were changed to clean.

**Unknown**

Indicates that the system queried the AMP cloud, but the file has not been assigned a disposition; in other words, the AMP cloud has not categorized the file.

**Custom Detection**

Indicates that a user added the file to the custom detection list.

**Unavailable**

Indicates that the system could not query the AMP cloud. You may see a small percentage of events with this disposition; this is expected behavior.

**N/A**

Indicates a Detect Files or Block Files rule handled the file and the Firepower Management Center did not query the AMP cloud.

File dispositions appear only for files for which the system queried the AMP cloud.

**Domain**

For file events and for malware events generated by AMP for Networks, the domain of the device that detected the file. For malware events generated by AMP for Endpoints and for retrospective malware events generated by the AMP cloud, the domain associated with the AMP cloud connection that reported the event.

This field is only present if you have ever configured the Firepower Management Center for multitenancy.

**Event Subtype**

The AMP for Endpoints action that led to malware detection, for example, Create, Execute, Move, or Scan.

**Event Type**

The sub-type of malware event.
**File Name**
The name of the file.

**File Path**
The file path of the malware file detected by AMP for Endpoints, not including the file name.

**File Policy**
The file policy that detected the file.

**File Storage / Stored (Search Only)**
The storage status of the file associated with the event:

- **Stored**
  Returns all events where the associated file is currently stored.

- **Stored in connection**
  Returns all events where the system captured and stored the associated file, regardless of whether the associated file is currently stored.

- **Failed**
  Returns all events where the system failed to store the associated file.

**File Timestamp**
The time and date that AMP for Endpoints detected the malware file was created.

**HTTP Response Code**
The HTTP status code sent in response to a client's HTTP request when a file is transferred.

**IOC**
Whether the malware event triggered an indication of compromise (IOC) against a host involved in the connection. When AMP for Endpoints data triggers an IOC rule, a full malware event is generated, with the type AMP IOC.

**Message**
Additional information associated with a malware event. For file events and for malware events generated by AMP for Networks, this field is populated only for files whose disposition has changed, that is, that have an associated retrospective event.

**Receiving Continent**
The continent of the host receiving the file.

**Receiving Country**
The country of the host receiving the file.
Receiving IP
For file events and for malware events generated by AMP for Networks, the IP address of the host receiving the file.
For malware events generated by AMP for Endpoints, the IP address of the endpoint whose connector reported the event.

Receiving Port
The destination port used by the traffic where the file was detected.

Security Context
The metadata identifying the virtual firewall group through which the traffic passed. Note that the system only displays this field when managing at least one ASA FirePOWER device that is running in multiple context mode.

Sending Continent
The continent of the host sending the file.

Sending Country
The country of the host sending the file.

Sending IP
The IP address of the host sending the file.

Sending Port
The source port used by the traffic where the file was detected.

SHA256 / File SHA256
The SHA-256 hash value of the file.
To have a SHA256 value, the file must have been handled by one of:
  • a Detect Files file rule with Store files enabled
  • a Block Files file rule with Store files enabled
  • a Malware Cloud Lookup file rule
  • a Block Malware file rule
  • AMP for Endpoints
This column also displays a network file trajectory icon that represents the most recently detected file event and file disposition, and that links to the network file trajectory.

Size (KB) / File Size (KB)
The size of the file, in kilobytes.
Note that if the system determines the file type of a file before the file is fully received, the file size may not be calculated. In this case, this field is blank.

**SSL Actual Action (Search Only)**

The action the system applied to encrypted traffic:

**Block or Block with reset**

Represents blocked encrypted connections.

**Decrypt (Resign)**

Represents an outgoing connection decrypted using a re-signed server certificate.

**Decrypt (Replace Key)**

Represents an outgoing connection decrypted using a self-signed server certificate with a substituted public key.

**Decrypt (Known Key)**

Represents an incoming connection decrypted using a known private key.

**Default Action**

Indicates the connection was handled by the default action.

**Do not Decrypt**

Represents a connection the system did not decrypt.

Field values are displayed in the **SSL Status** field on the search workflow pages.

**SSL Certificate Information (Search Only)**

The information stored on the public key certificate used to encrypt traffic, including:

- Subject/Issuer Common Name
- Subject/Issuer Organization
- Subject/Issuer Organization Unit
- Not Valid Before/After
- Serial Number, Certificate Fingerprint
- Public Key Fingerprint

**SSL Failure Reason (Search Only)**

The reason the system failed to decrypt encrypted traffic:

- Unknown
- No Match
- Success
- Uncached Session
Field values are displayed in the SSL Status field on the search workflow pages.

**SSL Status**

The action associated with the SSL Actual Action (SSL rule, default action, or undecryptable traffic action) that logged the encrypted connection. The lock icon links to TLS/SSL certificate details. If the certificate is unavailable (for example, for connections blocked due to TLS/SSL handshake error), the lock icon is grayed out.

If the system fails to decrypt an encrypted connection, it displays the SSL Actual Action (undecryptable traffic action) taken, as well as the SSL Failure Reason. For example, if the system detects traffic encrypted...
with an unknown cipher suite and allows it without further inspection, this field displays *Do Not Decrypt (Unknown Cipher Suite)*.

When searching this field, type one or more of the **SSL Actual Action** and **SSL Failure Reason** values to view encrypted traffic the system handled or failed to decrypt.

**SSL Subject/I ssuer Country (Search Only)**
The two-character ISO 3166-1 alpha-2 country code for the subject or issuer country associated with the encryption certificate.

**Threat Name**
The name of the detected malware.

**Threat Score**
The threat score most recently associated with this file. This is a value from 0 to 100 based on the potentially malicious behaviors observed during dynamic analysis.

The threat score icon links to the Dynamic Analysis Summary report.

**Time**
The date and time the event was generated. This field is not searchable.

**Type / File Type**
The type of file, for example, HTML or MSEXE.

**URI / File URI**
The URI of the connection associated with the file transaction, for example, the URL from which a user downloaded the file.

**User**
The username associated with the host (*Receiving IP*) where the event occurred.

For file events and for malware events generated by AMP for Networks, this user is determined by network discovery. Because the user is associated with the destination host, users are not associated with malware events in which the internal host uploaded a malware file.

For malware events generated by AMP for Endpoints, AMP for Endpoints determines user names. These users **cannot** be tied to user discovery or control. They do not appear in the Users table, nor can you view details for these users.

**Web Application**
The application that represents the content or requested URL for HTTP traffic detected in the connection.

**Web Application Category or Tag**
Criteria that characterize the application to help you understand the application's function.
Malware Event Sub-Types

The following table lists the malware event subtypes, whether a malware event generated by AMP for Networks (a "network-based malware event") or AMP for Endpoints (an "endpoint-based malware event") can have that subtype, and whether the system uses that subtype to build network file trajectories.

<table>

Information Available in File and Malware Event Fields

The following table lists whether the system displays information for each file and malware event field.

If your organization has deployed AMP for Endpoints and integrated that product with your Firepower deployment:

- Malware events and indications of compromise (IOCs) imported from your AMP for Endpoints deployment do not contain contextual connection information, but they do include information obtained at download or execution time, such as file path, invoking client application, and so on.
- File event table views do not display AMP for Endpoints-related fields.

### View Details About Analyzed Files

#### File Composition Report

If you configure local malware analysis or dynamic analysis, the system generates a file composition report after analyzing a file. This report allows you to further analyze files and determine whether they may carry embedded malware.

Firepower Management Center Configuration Guide, Version 6.1
The file composition report lists file properties, any objects embedded in the file, and any detected viruses. The file composition report may also list additional information specific to that file type. When the system prunes stored files, it also prunes the associated file composition report.

To view file composition information, see Using a Network File Trajectory, on page 2252.

View File Details in AMP Private Cloud

If you have deployed an AMP private cloud, you can view additional details about analyzed files in your private cloud.

For more information, see the documentation for your private cloud.

Procedure

Sign in directly to your AMP private cloud console.

Threat Scores and Dynamic Analysis Summary Reports

Threat Scores

Table 306: Threat Score Ratings

<td>High</td>
<td>70-94</td>
<td>⦿⦿⦿</td>
</tr>
<tr>
<td>Very High</td>
<td>95-100</td>
<td>⦿⦿⦿⦿</td>
</tr>
</tbody>
</table>

The Firepower Management Center caches a file’s threat score for the same amount of time as the file’s disposition. If the system later detects these files, it displays the cached threat scores instead of re-querying the Cisco Threat Grid cloud or an Cisco Threat Grid on-premises appliance. You can automatically assign a malware file disposition to any file with a threat score that exceeds the defined malware threshold threat score.

Dynamic Analysis Summary

If a dynamic analysis summary is available, you can click the threat score icon to view it. If multiple reports exist, this summary is based on the most recent report matching the exact threat score. If none match the exact threat score, the report with the highest threat score is displayed. If more than one report exists, you can select a threat score to view each separate report.

The summary lists each component threat comprising the threat score. Each component threat is expandable to list the AMP cloud findings, as well as any processes related to this component threat.
The process tree shows the processes that started when the Cisco Threat Grid cloud attempted to run the file. This can help identify whether a file that contains malware is attempting to access processes and system resources beyond what is expected (for example, running a Word document opens Microsoft Word, then starts Internet Explorer, then runs the Java Runtime Environment).

Each listed process contains a process identifier you can use to verify the actual process. Child nodes in the process tree represent processes started as a result of parent processes.

From the dynamic analysis summary, you can click View Full Report to view the full Analysis Report, detailing the AMP cloud’s full analysis, including general file information, a more in-depth review of all detected processes, a breakdown of the file analysis, and other relevant information.

### Using Captured File Workflows

<table>
<thead>
<tr>

<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

When a managed device captures a file detected in network traffic, it logs an event.

**Note**

If a device captures a file containing malware, the device generates two events: a file event when it detects the file, and a malware event when it identifies malware.

Use this procedure to view a list of captured files in a table and manipulate the event view depending on the information relevant to your analysis. The page you see when you access captured files differs depending on the workflow, which is simply a series of pages you can use to evaluate events by moving from a broad to a more focused view. You can also create a custom workflow that displays only the information that matches your specific needs.

If the system recaptures a file after a configuration change, such as an updated file policy, it updates existing information for that file.

For example, if you configure a file policy to capture files with a Malware Cloud Lookup action, the system stores the file disposition and threat score along with the file. Then, if you update your file policy, and the system recaptures the same file due to a new Detect Files action, the system updates the file's Last Changed value. However, the system does not remove the existing disposition and threat score, even though you did not perform another malware cloud lookup.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

Choose Analysis > Files > Captured Files.
In the table view of events, several fields are hidden by default. To show a hidden field in an event view, expand the search constraints, then click the field name under **Disabled Columns**.

---

**Tip**

In the table view of events, several fields are hidden by default. To show a hidden field in an event view, expand the search constraints, then click the field name under **Disabled Columns**.

---

### Captured File Fields

The table view of captured files, which is the final page in predefined captured file workflows, and which you can add to custom workflows, includes a column for each field in the captured files table.

When searching this table keep in mind that your search results depend on the available data in the events you are searching; depending on the available data, your search constraints may not apply. For example, if a file has never been submitted for dynamic analysis, it may not have an associated threat score.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Archive Inspection Status</strong></td>
<td>For archive files, the status of archive inspection:</td>
</tr>
<tr>
<td></td>
<td>• Pending indicates that the system is still inspecting the archive file and its contents. If the file passes through your system again, complete information becomes available.</td>
</tr>
<tr>
<td></td>
<td>• Extracted indicates that the system was able to extract and inspect the archive’s contents.</td>
</tr>
<tr>
<td></td>
<td>• Failed may, in rare cases, occur if the system is unable to process an extraction.</td>
</tr>
<tr>
<td></td>
<td>• Depth Exceeded indicates that the archive contains further nested archive files beyond the maximum allowed depth.</td>
</tr>
<tr>
<td></td>
<td>• Encrypted indicates that the archive file’s contents are encrypted and could not be inspected.</td>
</tr>
<tr>
<td></td>
<td>• Not Inspectable indicates that the system did not extract and inspect the archive’s contents. Policy rule actions, policy configuration, and corrupted files are three major reasons for this status.</td>
</tr>
<tr>
<td></td>
<td>To view the contents of an archive file, right-click on its row in the table to bring up the context menu, then choose <strong>View Archive Contents</strong>.</td>

</thead>
<tbody>
<tr>
<td>Dynamic Analysis Status</td>
<td>One or more of the following values indicating whether the file was submitted for dynamic analysis:</td>
</tr>
<tr>
<td>• Analysis Complete</td>
<td>file submitted for dynamic analysis that received a threat score and dynamic analysis summary report</td>
</tr>
<tr>
<td>• Capacity Handled</td>
<td>file stored because it could not be submitted currently</td>
</tr>
<tr>
<td>• Capacity Handled (Network Issue)</td>
<td>file stored because it could not be submitted due to a network connectivity issue</td>
</tr>
<tr>
<td>• Capacity Handled (Rate Limit)</td>
<td>file stored because it could not be submitted due to the maximum number of submissions reached</td>
</tr>
<tr>
<td>• Device Not Activated</td>
<td>file not submitted because the device is not activated on the on-premises Cisco Threat Grid appliance. If you see this status, contact Support.</td>
</tr>
<tr>
<td>• Failure (Analysis Timeout)</td>
<td>file submitted for which the AMP cloud has yet to return a result</td>
</tr>
<tr>
<td>• Failure (Cannot Run File)</td>
<td>file submitted that the AMP cloud could not run in the test environment</td>
</tr>
<tr>
<td>• Failure (Network Issue)</td>
<td>file that did not get submitted due to a network connectivity failure</td>
</tr>
<tr>
<td>• Not Sent for Analysis</td>
<td>file not submitted</td>
</tr>
<tr>
<td>• Not Suspicious (Not Sent For Analysis)</td>
<td>file pre-classified as non-malware</td>
</tr>
<tr>
<td>• Previously Analyzed</td>
<td>file with a cached threat score that a user tried to submit again</td>
</tr>
<tr>
<td>• Sent for Analysis</td>
<td>file pre-classified as malware and queued for dynamic analysis</td>
</tr>
<tr>
<td>Dynamic Analysis Status Changed</td>
<td>The last time the file's dynamic analysis status changed.</td>
</tr>
<tr>
<td>File Name</td>
<td>The most recently detected file name associated with the file’s SHA-256 hash value.</td>
</tr>
<tr>
<td>Last Changed</td>
<td>The last time the information associated with this file was updated.</td>
</tr>
<tr>
<td>Last Sent</td>
<td>The time the file was most recently submitted to the AMP cloud for dynamic analysis.</td>
</tr>
</tbody>
</table>
### Local Malware Analysis Status

One of the following values indicating whether the system performed local malware analysis on a file:

- **Analysis Complete** — the system inspected the file using local malware analysis and pre-classified the file
- **Analysis Failed** — the system attempted to inspect the file using local malware analysis and failed
- **Manual Request Submitted** — a user submitted a file for local malware analysis
- **Not Analyzed** — the system did not inspect the file with local malware analysis

### SHA256

The SHA-256 hash value of the file, as well as a network file trajectory icon representing the most recently detected file event and file disposition. To view the network file trajectory, click the trajectory icon.

### Storage Status

Indicates whether the file is stored on a managed device:

- **File Stored**
- **Not Stored (Disposition Was Pending)**

### Threat Score

The threat score most recently associated with this file. To view the Dynamic Analysis Summary report, click the threat score icon.

### Type

The type of file; for example, HTML or MSEXE.

---

## Stored Files Download

Once a device stores a file, as long as the Firepower Management Center can communicate with that device and it has not deleted the file, you can download the file to a local host for long-term storage and analysis, and manually analyze the file. You can download a file from any associated file event, malware event, captured file view, or the file’s trajectory.

Because malware is harmful, by default, you must confirm every file download. However, you can disable the confirmation in your User Preferences.

Because files with a disposition of Unknown may contain malware, when you download a file, the system first archives the file in a `.zip` package. The `.zip` file name contains the file disposition and file type, if available, and SHA-256 hash value. You can password-protect the `.zip` file to prevent accidental unpacking. You can edit or remove the default `.zip` file password in your User Preferences.
Cisco strongly recommends you do not download malware, as it can cause adverse consequences. Exercise caution when downloading any file, as it may contain malware. Ensure you have taken any necessary precautions to secure the download destination before downloading files.

Manually Submit Files for Analysis

When you manually submit files for analysis, the system runs local analysis, then submits these files to the cloud for dynamic analysis. However, if local analysis is not enabled in a file policy, and you manually submit a file for analysis, the file will only be sent for dynamic analysis.

In addition to executable files, you can also submit file types not eligible for automatic submission, such as .swf, .jar, and others. This allows you to more quickly analyze a broad range of files, regardless of disposition, and pinpoint the exact causes of an incident.

Note

The system checks the AMP cloud for updates (no more than once a day) to the list of file types eligible for dynamic analysis and the minimum and maximum file sizes you can submit.

Depending on the situation, there are two ways to submit files for analysis:

Before you begin

In order to manually submit captured files for analysis, one or more file rules must be configured to store files. For information, see File Policies and Advanced Malware Protection, on page 1323.

Procedure

Step 1
To submit a single file for analysis:

a) Select one of the following:
   - Analysis > Files > File Events
   - Analysis > Files > Malware Events
   - Analysis > Files > Captured Files

b) Click Table View of <Event type or files>.

c) Right-click a file in the table and select Analyze File.

Step 2
To submit multiple captured files for analysis (up to 25 at a time):

a) Select Analysis > Files > Captured Files

b) Select the checkbox beside each file to analyze.

c) Click Analyze.
Network File Trajectory

The network file trajectory feature maps how hosts transferred files, including malware files, across your network. A trajectory charts file transfer data, the disposition of the file, and if a file transfer was blocked or the file was quarantined. You can determine which hosts may have transferred malware, which hosts are at risk, and observe file transfer trends.

You can track the transmission of any file with a AMP cloud-assigned disposition. The system can use information related to detecting and blocking malware from both AMP for Networks and AMP for Endpoints to build the a trajectory.

Recently Detected Malware and Analyzed Trajectories

The Network File Trajectory List page displays the malware most recently detected on your network, as well as the files whose trajectory maps you have most recently viewed. From these lists, you can view when each file was most recently seen on the network, the file’s SHA-256 hash value, name, type, current file disposition, contents (for archive files), and the number of events associated with the file.

The page also contains a search box that lets you locate files, either based on SHA-256 hash value or file name, or by the IP address of the host that transferred or received a file. After you locate a file, you can click the File SHA256 value to view the detailed trajectory map.

Network File Trajectory Detailed View

You can trace a file through the network by viewing the detailed network file trajectory. Search for a file's SHA 256 value or click a File SHA 256 link in the Network File Trajectory list to view details about that file.

The network file trajectory details page has three parts:

• Summary Information — A file’s trajectory page displays summary information about the file, including file identification information; when the file was first seen and most recently seen on the network; the number of related events and hosts associated with the file; and the file’s current disposition. From this section, if the managed device stored the file, you can download it locally, submit the file for dynamic analysis, or add the file to a file list.

• Trajectory Map — A file’s trajectory map visually tracks a file from the first detection on your network to the most recent. The map shows when hosts transferred or received the file, how often they transferred the file, and when the file was blocked or quarantined. Vertical lines between data points represent file transfers between hosts. Horizontal lines connecting the data points show a host’s file activity over time.

The map also shows how often file events occurred for the file and when the system assigned the file a disposition or retrospective disposition. You can select a data point in the map and highlight a path that traces back to the first instance the host transferred that file; this path also intersects with every occurrence involving the host as either sender or receiver of the file.

• Related Events — The Events table lists event information for each data point in the map. Using the table and the map, you can pinpoint specific file events, hosts on the network that transferred or received this file, related events in the map, and other related events in a table constrained on selected values.
Network File Trajectory Summary Information

The following summary information appears at the top of the details page for a file that appears in the Network File Trajectory list.

Tip
To view related file events, click a field value link. The first page in the File Events default workflow opens in a new window, displaying all file events that also contain the selected value.

Table 308: Network File Trajectory Summary Information Fields

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Archive Contents</td>
<td>For inspected archive files, the number of files the archive contains.</td>
</tr>
<tr>
<td>Current Disposition</td>
<td>One of the following AMP for Networks file dispositions:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Malware</strong> indicates that the AMP cloud categorized the file as malware, local malware analysis identified malware, or the file’s threat score exceeded the malware threshold defined in the file policy.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Clean</strong> indicates that the AMP cloud categorized the file as clean, or that a user added the file to the clean list.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Unknown</strong> indicates that the system queried the AMP cloud, but the file has not been assigned a disposition; in other words, the AMP cloud has not categorized the file.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Custom Detection</strong> indicates that a user added the file to the custom detection list.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Unavailable</strong> indicates that the system could not query the AMP cloud. You may see a small percentage of events with this disposition; this is expected behavior.</td>
</tr>
<tr>
<td></td>
<td>- <strong>N/A</strong> indicates a Detect Files or Block Files rule handled the file and the Firepower Management Center did not query the AMP cloud.</td>
</tr>
<tr>
<td>Detection Name</td>
<td>Name of the malware detected by local malware analysis.</td>
</tr>
<tr>
<td>Event Count</td>
<td>The number of events seen on the network associated with the file, and the number of events displayed in the map if there are more than 250 detected events.</td>
</tr>
<tr>
<td>File Category</td>
<td>The general categories of file type, for example, <strong>Office Documents</strong> or <strong>System Files</strong>.</td>
</tr>
</tbody>
</table>
The names of the file associated with the event, as seen on the network.

If multiple file names are associated with a SHA-256 hash value, the most recent detected file name is listed. You can expand this to view the remaining file names by clicking more.

The SHA-256 hash value of the file.

The hash is displayed by default in a condensed format. To view the full hash value, hover your pointer over it. If multiple SHA-256 hash values are associated with a file name, hover your pointer over the link to view all of the hash values.

The size of the file, in kilobytes.

The file type of the file, for example, HTML or MSEXE.

The first time AMP for Networks or AMP for Endpoints detected the file, as well as the IP address of the host that first uploaded the file.

The most recent time AMP for Networks or AMP for Endpoints detected the file, as well as the IP address of the host that last downloaded the file.

The client application accessing the malware file when detection occurred by AMP for Endpoints. These applications are not tied to network discovery or application control.

The number of hosts that either sent or received the file. Because one host can upload and download a file at different times, the total number of hosts may not match the total number of senders plus the total number of receivers in the Seen On Breakdown field.

The number of hosts that sent the file, followed by the number of hosts that received the file.

Name of the threat associated with the detected malware by AMP for Endpoints.

The file’s threat score.

Network File Trajectory Map and Related Events List

The file trajectory map’s y-axis contains a list of all host IP addresses that have interacted with the file. The IP addresses are listed in descending order based on when the system first detected the file on that host. Each row contains all events associated with that IP address, whether a single file event, file transfer, or retrospective event. The x-axis contains the date and time the system detected each event. The timestamps are listed in chronological order. If multiple events occurred within a minute, all are listed within the same column. You can scroll the map horizontally and vertically to view additional events and IP addresses.
The map displays up to 250 events associated with the file SHA-256 hash. If there are more than 250 events, the map displays the first 10, then truncates extra events with an arrow icon (↓). The map then displays the remaining 240 events.

The first page of the File Events default workflow appears in a new window with all the extra events constrained based on the file type. If malware events generated by AMP for Endpoints are not displayed, you must switch to the Malware Events table to view these.

Each data point represents an event plus the file disposition, as described in the legend below the map. For example, a Malware Block event icon combines the Malicious Disposition icon and the Block Event icon.

Malware events generated by AMP for Endpoints ("endpoint-based malware events") include one icon. A retrospective event displays an icon in the column for each host on which the file is detected. File transfer events always include two icons, one file send icon and one file receive icon, connected by a vertical line. Arrows indicate the file transfer direction from sender to receiver.

To track a file’s progress through the network, you can click any data point to highlight a path that includes all data points related to the selected data point. This includes data points associated with the following types of events:

- any file transfers in which the associated IP address was either sender or receiver
- any malware events generated by AMP for Endpoints ("endpoint-based malware events") involving the associated IP address
- if another IP address was involved, all file transfers in which that associated IP address was either sender or receiver
- if another IP address was involved, any malware events generated by AMP for Endpoints ("endpoint-based malware events") involving the other IP address

All IP addresses and timestamps associated with any highlighted data point are also highlighted. The corresponding event in the Events table is also highlighted. If a path includes truncated events, the path itself is highlighted with a dotted line. Truncated events might intersect the path, but are not displayed in the map.

### Using a Network File Trajectory

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Malware (AMP for Networks)</td>
<td>Malware (AMP for Networks)</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
<tr>
<td>Any (AMP for Endpoints)</td>
<td>Any (AMP for Endpoints)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose **Analysis > Files > Network File Trajectory**.

**Tip** You can also access a file’s trajectory from the Context Explorer, dashboard, or event views with file information.
Step 2  Click a **File SHA 256** link in the list.

Step 3  Optionally, enter a complete SHA-256 hash value, the host IP address, or the name of a file you want to track into the search field, and press Enter.

**Tip**  If only one result matches, the Network File Trajectory page for that file appears.

Step 4  In the Summary Information section, you can:

- **Add a file to a file list** — To add a file or remove a file from the clean list or custom detection list, click **edit**.

- **Download a file** — To download a file, click **download file**, and if prompted, confirm you want to download the file. If the file is unavailable for download, this download file is dimmed.

- **Report** — Click threat score to view the Dynamic Analysis Summary report.

- **Submit for dynamic analysis** — Click **AMP cloud** to submit the file for dynamic analysis. If the file is unavailable for submission or you cannot connect to the AMP cloud, this AMP cloud is dimmed.

- **View archive contents** — To view information about an archive file’s contents, click **view**.

- **View file composition** — To view a file's composition, click **file list**. If the system has not generated a file composition report, this file list is dimmed.

- **View captured files with same threat score** — Click the threat score link to view all captured files with that threat score.

**Note**  Cisco strongly recommends you do **not** download malware, as it can cause adverse consequences. Exercise caution when downloading any file, as it may contain malware. Ensure you have taken any necessary precautions to secure the download destination before downloading files.

Step 5  On the trajectory map, you can:

- **Locate the first instance** — Click an IP address to locate the first time a file event occurred involving an IP address. This highlights a path to that data point, as well as any intervening file events and IP addresses related to the first file event. The corresponding event in the Events table is also highlighted. The map scrolls to that data point if not currently visible.

- **Track** — Click any data point to highlight a path that includes all data points related to the selected data point, tracking a file’s progress through the network.

- **View hidden events** — Click **arrow** to view all events not displayed in the File Summary event view.

- **View matching file events** — Hover your pointer over the event to view summary information for the event. If you click any event summary information link, the first page of the File Events default workflow appears in a new window with all the extra events constrained based on the file type. The File Summary event view opens in a new window, displaying all file events that match on the criteria value you clicked.

Step 6  In the Events table, you can:

- **Highlight** — Choose a table row to highlight a data point in the map. The map scrolls to display the selected file event if not currently visible.
Work with Event Data in the AMP for Endpoints Console

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If your organization has deployed AMP for Endpoints, you can view AMP for Endpoints malware event data in the AMP for Endpoints console, and use that application's global network file trajectory tool.

Tip

For information about using AMP for Endpoints and its console, see the online help in the console or other documentation available from https://www.cisco.com/c/en/us/support/security/fireamp-endpoints/tsd-products-support-series-home.html

To access the AMP for Endpoints console from the Firepower Management Center:

Before you begin

- The connection to AMP for Endpoints must be configured (see Integrate Firepower and AMP for Endpoints, on page 1358) and Firepower Management Center must be able to connect to the AMP cloud.
- You will need your AMP for Endpoints credentials.

Procedure

Step 1 Choose AMP > AMP Management.

Step 2 Click the cloud name in the table.
Using Host Profiles

The following topics describe how to use host profiles:

- Host Profiles, on page 2255
- Basic Host Information in the Host Profile, on page 2257
- Operating Systems in the Host Profile, on page 2259
- Servers in the Host Profile, on page 2264
- Web Applications in the Host Profile, on page 2268
- Host Protocols in the Host Profile, on page 2270
- Indications of Compromise in the Host Profile, on page 2271
- VLAN Tags in the Host Profile, on page 2271
- User History in the Host Profile, on page 2271
- Host Attributes in the Host Profile, on page 2272
- White List Violations in the Host Profile, on page 2276
- Malware Detections in the Host Profile, on page 2277
- Vulnerabilities in the Host Profile, on page 2278
- Scan Results in the Host Profile, on page 2281

Host Profiles

A host profile provides a complete view of all the information the system has gathered about a single host. To access a host profile:

- navigate from any network map view.
- navigate from any event view that includes the IP addresses of hosts on monitored networks.

Host profiles provide basic information about detected hosts or devices, such as the host name or MAC addresses. Depending on your licenses and system configuration, host profiles can also provide you with the following information:

- the operating system running on a host
- the servers running on a host
- the clients and web applications running on a host
- the protocols running on a host
Host Profile Limitations

Unavailable Hosts

A host profile may not be available for every host on your network. Possible reasons include:

- The host was deleted from the network map because it timed out.
- You have reached your host limit.
- The host resides in a network segment that is not monitored by the network discovery policy.

Unavailable Information

The information displayed in a host profile may vary according to the type of host and the information available about the host.

For example:

- If your system detects a host using a non-IP-based protocol like STP, SNAP, or IPX, the host is added to the network map as a MAC host and much less information is available than for an IP host.
The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1742.

### Viewing Host Profiles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

### Procedure

You have two choices:

- On any network map, drill down to the IP address of the host whose profile you want to view.
- On any event view, click host profile ( ) or compromised host ( ) next to the IP address of the host whose profile you want to view.

### Basic Host Information in the Host Profile

Each host profile provides basic information about a detected host or other device.

Descriptions of each of the basic host profile fields follow.

**Domain**

The domain associated with the host.

**IP Addresses**

All IP addresses (both IPv4 and IPv6) associated with the host. The system detects IP addresses associated with hosts and, where supported, groups multiple IP addresses used by the same host. IPv6 hosts often have at least two IPv6 addresses (local-only and globally routable), and may also have IPv4 addresses. IPv4-only hosts may have multiple IPv4 addresses.

The host profile lists all detected IP addresses associated with that host. Where available, routable host IP addresses also include a flag icon and country code indicating the geolocation data associated with that address.

Note that only the first three addresses are shown by default. Click **show all** to show all addresses for a host.

**Hostname**

The fully qualified domain name of the host, if known.

**NetBIOS Name**

The NetBIOS name of the host, if available. Microsoft Windows hosts, as well as Macintosh, Linux, or other platforms configured to use NetBIOS, can have a NetBIOS name. For example, Linux hosts configured as Samba servers have NetBIOS names.

**Device (Hops)**

Either:

- the reporting device for the network where the host resides, as defined in the network discovery policy, or
- the device that processed the NetFlow data that added the host to the network map

The number of network hops between the device that detected the host and the host itself follows the device name, in parentheses. If multiple devices can see the host, the reporting device is displayed in bold.

If this field is blank, either:

- the host was added to the network map by a device that is not explicitly monitoring the network where the host resides, as defined in the network discovery policy, or
- the host was added using the host input feature and has not also been detected by the Firepower System.

**MAC Addresses (TTL)**

The host’s detected MAC address or addresses and associated NIC vendors, with the NIC’s hardware vendor and current time-to-live (TTL) value in parentheses.

If multiple devices detected the host, the Firepower Management Center displays all MAC addresses and TTL values associated with the host, regardless of which device reported them.

If the MAC address is displayed in bold font, the MAC address is the actual/true/primary MAC address of the host, definitively tied to the IP address by detection through ARP and DHCP traffic.

MAC addresses that are not displayed in bold font are secondary addresses, which cannot be definitively associated with the IP address of the host. For example, since the Firepower device can obtain MAC addresses only for hosts on its own network segments, if traffic originates from a network segment to which the Firepower device is not directly connected, the observed MAC address (i.e. the router MAC address) will be displayed as a secondary MAC address for the host.

**Host Type**

The type of device that the system detected: host, mobile device, jailbroken mobile device, router, bridge, NAT device, or load balancer.

The methods the system uses to distinguish network devices include:

- the analysis of Cisco Discovery Protocol (CDP) messages, which can identify network devices and their type (Cisco devices only)
- the detection of the Spanning Tree Protocol (STP), which identifies a device as a switch or bridge
- the detection of multiple hosts using the same MAC address, which identifies the MAC address as belonging to a router
• the detection of TTL value changes from the client side, or TTL values that change more frequently than a typical boot time, which identify NAT devices and load balancers

• The methods the system uses to distinguish mobile devices include:
  • analysis of User-Agent strings in HTTP traffic from the mobile device’s mobile browser
  • monitoring of HTTP traffic of specific mobile applications

If a device is not identified as a network device or a mobile device, it is categorized as a host.

**Last Seen**

The date and time that any of a host’s IP addresses was last detected.

**Current User**

The user most recently logged into this host.

Note that a non-authoritative user logging into a host only registers as the current user on the host if the existing current user is not an authoritative user.

**View**

Links to views of connection, discovery, malware, and intrusion event data, using the default workflow for that event type and constrained to show events related to the host; where possible, these events include all IP addresses associated with the host.

### Operating Systems in the Host Profile

The system passively detects the identity of the operating system running on a host by analyzing the network and application stack in traffic generated by the host or by analyzing host data reported by the User Agent. The system also collates operating system information from other sources, such as the Nmap scanner or application data imported through the host input feature. The system considers the priority assigned to each identity source when determining which identity to use. By default, user input has the highest priority, followed by application or scanner sources, followed by the discovered identity.

Sometimes the system supplies a general operating system definition rather than a specific one because the traffic and other identity sources do not provide sufficient information for a more focused identity. The system collates information from the sources to use the most detailed definition possible.

Because the operating system affects the vulnerabilities list for the host and the event impact correlation for events targeting the host, you may want to manually supply more specific operating system information. In addition, you can indicate that fixes have been applied to the operating system, such as service packs and updates, and invalidate any vulnerabilities addressed by the fixes.

For example, if the system identifies a host’s operating system as Microsoft Windows 2003, but you know that the host is actually running Microsoft Windows XP Professional with Service Pack 2, you can set the operating system identity accordingly. Setting a more specific operating system identity refines the list of vulnerabilities for the host, so your impact correlation for that host is more focused and accurate.

If the system detects operating system information for a host and that information conflicts with a current operating system identity that was supplied by an active source, an identity conflict occurs. When an identity conflict is in effect, the system uses both identities for vulnerabilities and impact correlation.
You can configure the network discovery policy to add discovery data to the network map for hosts monitored by NetFlow exporters. However, there is no operating system data available for these hosts, unless you set the use the host input feature to set the operating system identity.

If a host is running an operating system that violates a compliance white list in an activated network discovery policy, the Firepower Management Center marks the operating system information with the white list violation icon (1). In addition, if a jailbroken mobile device violates an active white list, the icon appears next to the operating system for the device.

You can set a custom display string for the host’s operating system identity. That display string is then used in the host profile.

---

**Note**

Changing the operating system information for a host may change its compliance with a compliance white list.

In the host profile for a network device, the label for the Operating Systems section changes to Systems and an additional Hardware column appears. If a value for a hardware platform is listed under Systems, that system represents a mobile device or devices detected behind the network device. Note that mobile devices may or may not have hardware platform information, but hardware platform information is never detected for systems that are not mobile devices.

Descriptions of the operating system information fields displayed in the host profile follow.

**Hardware**

The hardware platform for a mobile device.

**OS Vendor/Vendor**

The operating system vendor.

**OS Product/Product**

One of the following values:

- the operating system determined most likely to be running on the host, based on the identity data collected from all sources
- Pending if the system has not yet identified an operating system and no other identity data is available
- unknown if the system cannot identify the operating system and no other identity data is available for the operating system

---

**Note**

If the host’s operating system is not one the system is capable of detecting, see Identifying Host Operating Systems, on page 1752:

**OS Version/Version**

The operating system version. If a host is a jailbroken mobile device, Jailbroken is indicated in parentheses after the version.
Source

One of the following values:
- User: user_name
- Application: app_name
- Scanner: scanner_type (Nmap or other scanner)
- Firepower

The system may reconcile data from multiple sources to determine the identity of an operating system.

Viewing Operating System Identities

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can view the specific operating system identities discovered or added for a host. The system uses source prioritization to determine the current identity for the host. In the list of identities, the current identity is highlighted by boldface text.

Note that the View is only available if multiple operating system identities exist for the host.

Procedure

Step 1  Click View in the Operating System or Operating System Conflicts section of a host profile.

Step 2  View the information described in Operating Systems in the Host Profile, on page 2259.

Step 3  Optionally, click delete ( ) next to any operating system identity.

Note  You cannot delete Cisco-detected operating system identities.

This system removes the identity from the Operating System Identity Information pop-up window and, if applicable, updates the current identity for the operating system in the host profile.

Setting the Current Operating System Identity

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can set the current operating system identity for a host using the Firepower System web interface. Setting the identity through the web interface overrides all other identity sources so that identity is used for vulnerability assessment and impact correlation. However, if the system detects a conflicting operating system identity for
the host after you edit the operating system, an operating system conflict occurs. Both operating systems are then considered current until you resolve the conflict.

**Procedure**

**Step 1**
Click **Edit** in the **Operating System** section of a host profile.

**Step 2**
You have several options:

- Choose **Current Definition** from the **OS Definition** drop-down list to confirm the current operating system identity through host input, then skip to step 6.
- Choose a variation on the current operating system identity from the **OS Definition** drop-down list, then skip to step 6.
- Choose **User-Defined** from the **OS Definition** drop-down list, then continue with step 3.

**Step 3**
Optionally, choose **Use Custom Display String** and modify the custom strings you want to display in the **Vendor String**, **Product String**, and **Version String** fields.

**Step 4**
Optionally, to change to an operating system from a different vendor, choose from the **Vendor** and **Product** drop-down lists.

**Step 5**
Optionally, to configure the operating system product release level, choose from the **Major**, **Minor**, **Revision**, **Build**, **Patch**, and **Extension** drop-down lists.

**Step 6**
Optionally, if you want to indicate that fixes for the operating system have been applied, click **Configure Fixes**.

**Step 7**
Choose the applicable fixes in the drop-down list, and click **Add**.

**Step 8**
Optionally, add the relevant patches and extensions using the **Patch** and **Extension** drop-down lists.

**Step 9**
Click **Finish**.

**Related Topics**
- **Operating System Identity Conflicts**, on page 2262

**Operating System Identity Conflicts**

An operating system identity conflict occurs when a new identity detected by the system conflicts with the current identity, if that identity was provided by an active source, such as a scanner, application, or user.

The list of operating system identities in conflict displays in bold in the host profile.

You can resolve an identity conflict and set the current operating system identity for a host through the system web interface. Setting the identity through the web interface overrides all other identity sources so that identity is used for vulnerability assessment and impact correlation.

Servers in the Host Profile

The Servers Section of the host profile lists servers either detected on hosts on your monitored network, added from exported NetFlow records, or added through an active source like a scanner or the host input feature.

The list can include up to 100 servers per host. After that limit is reached, new server information from any source, whether active or passive, is discarded until you delete a server from the host or a server times out.

If you scan a host using Nmap, Nmap adds the results of previously undetected servers running on open TCP ports to the Servers list. If you perform an Nmap scan or import Nmap results, an expandable Scan Results section also appears in the host profile, listing the server information detected on the host by the Nmap scan. In addition, if the host is deleted from the network map, the Nmap scan results for that server for the host are discarded.

Note

The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1742.

The process for working with servers in the host profile differs depending on how you access the profile:

- If you access the host profile by drilling down through the network map, the details for that server appear with the server name highlighted in bold. If you want to view the details for any other server on the host, click the view icon ( ), next to that server name.

- If you access the host profile in any other way, expand the Servers section and click the view icon ( ) next to the server whose details you want to see.

Note

If the host is running a server that violates a compliance white list in an activated correlation policy, the Firepower Management Center marks the non-compliant server with the white list violation icon ( ).

Descriptions of the columns in the Servers list follow.

**Protocol**

The name of the protocol the server uses.

**Port**

The port where the server runs.

**Application Protocol**

One of:

- the name of the application protocol

- pending if the system cannot positively or negatively identify the application protocol for one of several reasons
unknown if the system cannot identify the application protocol based on known application protocol fingerprints, or if the server was added through host input by adding a vulnerability with port information without adding a corresponding server

When you hover the mouse on an application protocol name, the tags display.

**Vendor and Version**

The vendor and version identified by the Firepower System, Nmap, or another active source, or acquired via the host input feature. The field is blank if none of the available sources provides an identification.

**Related Topics**

- Host Limits and Discovery Event Logging, on page 1799

- Application Detector Fundamentals, on page 1796

## Server Details in the Host Profile

The Firepower Management Center lists up to 16 passively detected identities per server. Passive detection sources include network discovery data and NetFlow records. A server can have multiple passive identities if the system detects multiple vendors or versions of that server. For example, a load balancer between your managed device and your web server farm may cause your system to identify multiple passive identities for HTTP if your web servers are not running the same version of the server software. Note that the Firepower Management Center does not limit the number of server identities from active sources such as user input, scanners, or other applications.

The Firepower Management Center displays the current identity in bold. The system uses the current identity of a server for multiple purposes, including assigning vulnerabilities to a host, impact assessment, evaluating correlation rules written against host profile qualifications and compliance white lists, and so on.

The server detail may also display updated sub-server information known about the selected server.

The server detail may also display the server banner, which appears below the server details when you view a server from the host profile. Server banners provide additional information about a server that may help you identify the server. The system cannot identify or detect a misidentified server when an attacker purposely alters the server banner string. The server banner displays the first 256 bytes of the first packet detected for the server. It is collected only once, the first time the server is detected by the system. Banner content is listed in two columns, with a hexadecimal representation on the left and a corresponding ASCII representation on the right.

---

**Note**

To view server banners, you must enable the **Capture Banners** check box in the network discovery policy. This option is disabled by default.

The server details section of the host profile includes the following information:

**Protocol**

The name of the protocol the server uses.

**Port**

The port where the server runs.
Hits
The number of times the server was detected by a Firepower System managed device or an Nmap scanner. The number of hits is 0 for servers imported through host input, unless the system detects traffic for that server.

Last Used
The time and date the server was last detected. The last used time for host input data reflects the initial data import time unless the system detects new traffic for that server. Scanner and application data imported through the host input feature times out according to settings in the Firepower Management Center configuration, but user input through the FMC web interface does not time out.

Application Protocol
The name of the application protocol used by the server, if known.

Vendor
The server vendor. This field does not appear if the vendor is unknown.

Version
The server version. This field does not appear if the version is unknown.

Source
One of the following values:
- User: user_name
- Application: app_name
- Scanner: scanner_type (Nmap or other scanner)
- Firepower, Firepower Port Match, or Firepower Pattern Match for applications detected by the Firepower System
- NetFlow for servers added to the network map from NetFlow records

The system may reconcile data from multiple sources to determine the identity of a server.

You can manually update the identity settings for a server on a host and configure any fixes that you have applied to the host to remove the vulnerabilities addressed by the fixes. You can also delete server identities.

Deleting an identity does not delete the server, even if you delete the only identity. Deleting an identity does remove the identity from the Server Detail pop-up window and, if applicable, updates the current identity for the server in the host profile.

You cannot edit or delete server identities added by a Cisco-managed device.

**Procedure**

**Step 1** Navigate to the **Servers** section of a host profile.

**Step 2** Click **View** to open the Server Detail pop-up window.

**Step 3** To delete a server identity, click delete (🗑️) next to the server identity you want to remove.

**Step 4** To modify a server identity, click edit (🛠️) next to the server in the servers list.

**Step 5** You have two choices:
- Choose the current definition from the **Select Server Type** drop-down list.
- Choose the type of server from the **Select Server Type** drop-down list.

**Step 6** Optionally, to only list vendors and products for that server type, choose the **Restrict by Server Type** check box.

**Step 7** Optionally, to customize the name and version of the server, choose the **Use Custom Display String**, and enter a **Vendor String** and **Version String**.

**Step 8** In the **Product Mappings** section, choose the operating system, product, and versions you want to use.

**Example:**
For example, if you want the server to map to Red Hat Linux 9, choose **Redhat, Inc.** as the vendor, **Redhat Linux** as the product, and **9** as the version.

**Step 9** If you want to indicate that fixes for the server have been applied, click **Configure Fixes**, and add the patches you want to apply for that server to the fixes list.

**Step 10** Click **Finish**.
Resolving Server Identity Conflicts

A server identity conflict occurs when an active source, such as an application or scanner, adds identity data for a server to a host, after which the system detects traffic for that port that indicates a conflicting server identity.

**Procedure**

**Step 1**
In a host profile, navigate to the Servers section.

**Step 2**
Click resolve next to a server.

**Step 3**
Choose the type of server from the Select Server Type drop-down list.

**Step 4**
Optionally, to only list vendors and products for that server type, choose the Restrict by Server Type check box.

**Step 5**
Optionally, to customize the name and version of the server, choose Use Custom Display String, and enter a Vendor String and Version String.

**Step 6**
In the Product Mappings section, choose the operating system, product, and versions you want to use.

**Example:**
For example, if you want the server to map to Red Hat Linux 9, choose Redhat, Inc. as the vendor, Redhat Linux as the product, and 9 as the version.

**Step 7**
If you want to indicate that fixes for the server have been applied, click Configure Fixes, and add the patches you want to apply for that server to the fixes list.

**Step 8**
Click Finish.

Configuring Network Discovery Identity Conflict Resolution, on page 1856

Web Applications in the Host Profile

The Web Application section of the host profile displays the clients and web applications that the system identifies as running on the hosts on your network. The system can identify client and web application information from both passive and active detection sources, although the information for hosts added from NetFlow records is limited.

Details in this section include the product and version of the detected applications on a host, any available client or web application information, and the time that the application was last detected in use.

The section lists up to 16 clients running on the host. After that limit is reached, new client information from any source, whether active or passive, is discarded until you delete a client application from the host or the system deletes the client from the host profile due to inactivity (the client times out).
Additionally, for each detected web browser, the system displays the first 100 web applications accessed. After that limit is reached, new web applications associated with that browser from any source, whether active or passive, are discarded until either:

- the web browser client application times out, or
- you delete application information associated with a web application from the host profile

If the host is running an application that violates a compliance white list in an activated correlation policy, the Firepower Management Center marks the non-compliant application with the white list violation icon (⏺).

To analyze the connection events associated with a particular application on the host, click the events icon (⏺) next to the application. The first page of your preferred workflow for connection events appears, showing connection events constrained by the type, product, and version of the application, as well as the IP address(es) of the host. If you do not have a preferred workflow for connection events, you must select one.

Descriptions of the application information that appears in a host profile follow.

**Application Protocol**

Displays the application protocol used by the application (HTTP browser, DNS client, and so on).

**Client**

Client information derived from payload if identified by the Firepower System, captured by Nmap, or acquired via the host input feature. The field is blank if none of the available sources provides an identification.

**Version**

Displays the version of the client.

**Web Application**

For web browsers, the content detected by the system in the http traffic. Web application information indicates the specific type of content (for example, WMV or QuickTime) identified by the Firepower System, captured by Nmap, or acquired via the host input feature. The field is blank if none of the available sources provides an identification.

### Deleting Web Applications from the Host Profile

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can delete an application from a host profile to remove applications that you know are not running on the host. Note that deleting an application from a host may bring the host into compliance with a white list.
If the system detects the application again, it re-adds it to the network map and the host profile.

Procedure

Step 1  In a host profile, navigate to the Applications section.
Step 2  Click delete ( ) next to the application you want to delete.

Host Protocols in the Host Profile

Each host profile contains information about the protocols detected in the network traffic associated with the host. This information includes:

**Protocol**

The name of a protocol used by the host.

**Layer**

The network layer where the protocol runs (Network or Transport).

If a protocol displaying in the host profile violates a compliance white list in an activated correlation policy, the Firepower Management Center marks the non-compliant protocol with the white list violation icon ( ).

If the host profile lists protocols that you know are not running on the host, you can delete those protocols. Deleting a protocol from a host may bring the host into compliance with a compliance white list.

Note

If the system detects the protocol again, it re-adds it to the network map and the host profile.

Deleting a Protocol From the Host Profile

<table>
<thead>
<tr>
<th>Smart License</th>

<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1  Navigate to the Protocols section of a host profile.
Step 2  Click delete ( ) next to the protocol you want to delete.
Indications of Compromise in the Host Profile

The Firepower System correlates various types of data (intrusion events, Security Intelligence, connection events, and file or malware events) to determine whether a host on your monitored network is likely to be compromised by malicious means. Certain combinations and frequencies of event data trigger indications of compromise (IOC) tags on affected hosts.

The Indications of Compromise section of the host profile displays all indication of compromise tags for a host.

To configure the system to tag indications of compromise, see Enabling Indications of Compromise Rules, on page 1858.

For more information about working with indications of compromise, see Indications of Compromise Data, on page 2306 and the subtopics under that topic.

Related Topics
- Indications of Compromise, on page 1857

VLAN Tags in the Host Profile

The VLAN Tag section of the host profile appears if the host is a member of a Virtual LAN (VLAN).

Physical network equipment often uses VLANs to create logical network segments from different network blocks. The system detects 802.1q VLAN tags and displays the following information for each:

- **VLAN ID** identifies the VLAN where the host is a member. This can be any integer between zero and 4095 for 802.1q VLANs.
- **Type** identifies the encapsulated packet containing the VLAN tag, which can be either Ethernet or Token Ring.
- **Priority** identifies the priority in the VLAN tag, which can be any integer from zero to 7, where 7 is the highest priority.

If VLAN tags are nested within the packet, the system processes and the Firepower Management Center displays the innermost VLAN tag. The system collects and displays VLAN tag information only for MAC addresses that it identifies through ARP and DHCP traffic.

VLAN tag information can be useful, for example, if you have a VLAN composed entirely of printers and the system detects a Microsoft Windows 2000 operating system in that VLAN. VLAN information also helps the system generate more accurate network maps.

User History in the Host Profile

The user history portion of the host profile provides a graphic representation of the last twenty-four hours of user activity. A typical user logs off in the evening and may share the host resource with another user. Periodic login requests, such as those made to check email, are indicated by short regular bars. A list of user identities is provided with bar graphs to indicate when the user login was detected. Note that for non-authoritative logins, the bar graph is gray.
Note that the system does associate a non-authoritative user login to a host with an IP address of that host, so the user does appear in the host’s user history. However, if an authoritative user login is detected for the same host, the user associated with the authoritative user login takes over the association with the host IP address, and new non-authoritative user logins do not disrupt that user association with the host IP address. If you configure capture of failed logins in the network discovery policy, the list includes users that failed to log into the host.

Host Attributes in the Host Profile

You can use *host attributes* to classify hosts in ways that are important to your network environment. Three types of attributes are present in the Firepower System:

- *predefined host attributes*
- *white list host attributes*
- *user-defined host attributes*

After you set a predefined host attribute or create a user-defined host attribute, you must assign a host attribute value.

**Note**

Host attributes can be defined at any domain level. You can assign host attributes created in current and ancestor domains.

Predefined Host Attributes

The Firepower Management Center provides two predefined host attributes:

**Host Criticality**

Use this attribute to designate the business criticality of a given host and to tailor correlation responses to host criticality. For example, if you consider your organization’s mail servers more critical to your business than a typical user workstation, you can assign a value of High to your mail servers and other business-critical devices and Medium or Low to other hosts. You can then create a correlation policy that launches different alerts based on the criticality of an affected host.

**Notes**

Use this host-specific attribute to record information about the host that you want other analysts to view. For example, if you have a computer on the network that has an older, unpatched version of an operating system that you use for testing, you can use the Notes feature to indicate that the system is intentionally unpatched.

White List Host Attributes

Each compliance white list that you create automatically creates a host attribute with the same name as the white list. Possible values for white list host attributes are:

- Compliant — Identifies hosts that are compliant with the white list.
- Non-Compliant — Identifies hosts that violate the white list.
- Not Evaluated — Identifies hosts that are not valid targets of the white list or have not been evaluated for any reason.

You cannot edit the value of a white list host attribute or delete a white list host attribute.

**User-Defined Host Attributes**

If you want to identify hosts using criteria that differs from those used in the predefined host attributes or white list host attributes, you can create user-defined host attributes. For example, you can:

- Assign physical location identifiers to hosts, such as a facility code, city, or room number.
- Assign a Responsible Party Identifier that indicates which system administrator is responsible for a given host. You can then craft correlation rules and policies to send alerts to the correct system administrator when problems related to a host are detected.
- Automatically assign values to hosts from a predefined list based on the hosts’ IP addresses. This feature can be useful to assign values to new hosts when they appear on your network for the first time.

User-defined host attributes appear in the host profile page, where you can assign values on a per-host basis. You can also:

- Use the attributes in correlation policies and searches.
- View the attributes on the host attribute table view of events and generate reports based on them.

User-defined host attributes can be one of the following types:

**Text**

Allows you to manually assign a text string to a host.

**Integer**

Allows you to specify the first and last number of a range of positive integers, then manually assign one of these numbers to a host.

**List**

Allows you to create a list of string values, then manually assign one of the values to a host. You can also automatically assign values to hosts based on the host’s IP addresses.

If you auto-assign values based on one IP address of a host with multiple IP addresses, those values will apply across all addresses associated with that host. Keep this in mind when you view the Host Attributes table.

When automatically assigning list values, consider using network objects rather than literal IP addresses. This approach can improve maintainability, particularly in a multidomain deployment where using override-enabled objects allows descendant domain administrators to tailor ancestor configurations to their local environments. In a multidomain deployment, be careful when defining auto-assigned lists at ancestor domain levels to avoid matching unintended hosts when the descendant domains use overlapping IP addresses.

**URL**

Allows you to manually assign a URL value to a host.

Deleting a user-defined host attribute removes it from every host profile where it is used.
Creating Text- or URL-Based Host Attributes

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

### Procedure

**Step 1** Choose Analysis > Hosts > Host Attributes.

**Step 2** Click Host Attribute Management.

**Step 3** Click Create Attribute.

**Step 4** Enter a Name.

**Step 5** Choose the Type of attribute that you want to create as described in User-Defined Host Attributes, on page 2273.

**Step 6** Click Save.

---

Creating Integer-Based Host Attributes

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

When you define an integer-based host attribute, you must specify the range of numbers that the attribute accepts.

### Procedure

**Step 1** Choose Analysis > Hosts > Host Attributes.

**Step 2** Click Host Attribute Management.

**Step 3** Click Create Attribute.

**Step 4** Enter a Name.

**Step 5** Choose the Type of attribute that you want to create as described in User-Defined Host Attributes, on page 2273.

**Step 6** In the Min field, enter the minimum integer value that can be assigned to a host.

**Step 7** In the Max field, enter the maximum integer value that can be assigned to a host.

**Step 8** Click Save.
Creating List-Based Host Attributes

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

When you define a list-based host attribute, you must supply each of the values for the list. These values can contain alphanumeric characters, spaces, and symbols.

**Procedure**

**Step 1** Choose Analysis > Hosts > Host Attributes.

**Step 2** Click Host Attribute Management.

**Step 3** Click Create Attribute.

**Step 4** Enter a Name.

**Step 5** Choose the Type of attribute that you want to create as described in User-Defined Host Attributes, on page 2273.

**Step 6** To add a value to the list, click Add Value.

**Step 7** In the Name field, enter the first value you want to add.

**Step 8** Optionally, to auto-assign the attribute value you just added to your hosts, click Add Networks.

**Step 9** Choose the value you added from the Value drop-down list.

**Step 10** In the IP Address and Netmask fields, enter the IP address and network mask (IPv4) that represent the IP address block where you want to auto-assign this value.

**Step 11** Repeat steps 6 through 10 to add additional values to the list and assign them automatically to new hosts that fall within an IP address block.

**Step 12** Click Save.

Setting Host Attribute Values

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can set values for predefined and user-defined host attributes. You cannot set values for white list host attributes generated by the system.

**Procedure**

**Step 1** Open the host profile you want to modify.

**Step 2** In the Attributes section, click Edit Attributes.

**Step 3** Update attribute as desired.
Step 4 Click Save.

White List Violations in the Host Profile

A compliance white list (or white list) is a set of criteria that allows you to specify the operating systems, application protocols, clients, web applications, and protocols that are allowed to run on a specific subnet.

If you add a white list to an active correlation policy, when the system detects that a host is violating the white list, the Firepower Management Center logs a white list event—which is a special kind of correlation event—to the database. Each of these white list events is associated with a white list violation, which indicates how and why a particular host is violating a white list. If a host violates one or more white lists, you can view these violations in its host profile in two ways.

First, the host profile lists all of the individual white list violations associated with the host. Descriptions of the white list violation information in the host profile follow.

**Type**

The type of the violation, that is, whether the violation occurred as a result of a non-compliant operating system, application, server, or protocol.

**Reason**

The specific reason for the violation. For example, if you have a white list that allows only Microsoft Windows hosts, the host profile displays the current operating system running on the host (such as Linux 2.4, 2.6)

**White List**

The name of the white list associated with the violation.

Second, in the sections associated with operating systems, applications, protocols, and servers, the Firepower Management Center marks non-compliant elements with the white list violation icon (1). For example, for a white list that allows only Microsoft Windows hosts, the host profile displays the white list violation icon next to the operating system information for that host.

**Note** You can use a host’s profile to create a shared host profile for compliance white lists.

Creating Shared White List Host Profiles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Shared host profiles for compliance white lists specify which operating systems, application protocols, clients, web applications, and protocols are allowed to run on target hosts across multiple white lists. That is, if you create multiple white lists but want to use the same host profile to evaluate hosts running a particular operating system across the white lists, use a shared host profile.
You can use a host profile of any host with a known IP address to create a shared host profile that your compliance white lists can use. However, note that you cannot create a shared host profile based on an individual host’s host profile if the system has not yet identified the operating system of the host.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>In a host profile, click <strong>Generate White List Profile</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Modify and save the shared host profile according to your specific needs.</td>
</tr>
</tbody>
</table>

### Malware Detections in the Host Profile

The Most Recent Malware Detections section lists the most recent malware events where the host sent or received a malware file, up to 100 events. The host profile lists both network-based malware events (those generated by AMP for Networks) and endpoint-based malware events (those generated by AMP for Endpoints).

If the host is involved in a file event where the file is then retrospectively identified as malware, the original events where the file was transmitted appear in the malware detections list after the malware identification occurs. When a file identified as malware is retrospectively determined not to be malware, the malware events related to that file no longer appear in the list. For example, if a file has a disposition of **Malware** and that disposition changes to **Clean**, the event for that file is removed from the malware detections list on the host profile.

When viewing malware detections in the host profile, you can view malware events for that host by clicking the malware icon (قضاء).

Description of the columns in the Most Recent Malware Detections sections of the host profile follow.

**Time**
The date and time the event was generated.

For an event where the file was retrospectively identified as malware, note that this is the time of the original event, not the time when the malware was identified.

**Host Role**
The host’s role in the transmission of detected malware, either sender or receiver. Note that for malware events generated by AMP for Endpoints ("endpoint-based malware events"), the host is always the receiver.

**Threat Name**
The name of the detected malware.

**File Name**
The name of the malware file.
Vulnerabilities in the Host Profile

The Vulnerabilities sections of the host profile list the vulnerabilities that affect that host. These vulnerabilities are based on the operating system, servers, and applications that the system detected on the host.

If there is an identity conflict for either the identity of the host’s operating system or one of the application protocols on the host, the system lists vulnerabilities for both identities until the conflict is resolved.

Because no operating system information is available for hosts added to the network map from NetFlow data, the system cannot assign Vulnerable (impact level 1: red) impact levels for intrusion events involving those hosts. In such cases, use the host input feature to manually set the operating system identity for the hosts.

Server vendor and version information is often not included in traffic. By default, the system does not map the associated vulnerabilities for the sending and receiving hosts of such traffic. However, you can configure the system to map vulnerabilities for specific application protocols that do not have vendor or version information.

If you use the host input feature to add third-party vulnerability information for the hosts on your network, additional Vulnerabilities sections appear. For example, if you import vulnerabilities from a QualysGuard Scanner, host profiles on your include a QualysGuard Vulnerabilities section. For third-party vulnerabilities, the information in the corresponding Vulnerabilities section in the host profile is limited to the information that you provided when you imported the vulnerability data using the host input feature.

You can associate third-party vulnerabilities with operating systems and application protocols, but not clients. For information on importing third-party vulnerabilities, see the Firepower System Host Input API Guide.

Descriptions of the columns in the Vulnerabilities sections of the host profile follow.

Name
The name of the vulnerability.

Remote
Indicates whether the vulnerability can be remotely exploited. If this column is blank, the vulnerability definition does not include this information.

Component
The name of the operating system, application protocol, or client associated with the vulnerability.

Port
A port number, if the vulnerability is associated with an application protocol running on a specific port.

Downloading Patches for Vulnerabilities

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can download patches to mitigate the vulnerabilities discovered on the hosts on your network.

**Procedure**

**Step 1** Access the host profile of a host for which you want to download a patch.

**Step 2** Expand the **Vulnerabilities** section.

**Step 3** Click the name of the vulnerability you want to patch.

**Step 4** Expand the **Fixes** section to display the list of patches for the vulnerability.

**Step 5** Click **Download** next to the patch you want to download.

**Step 6** Download the patch and apply it to your affected systems.

Deactivating Vulnerabilities for Individual Hosts

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can use the host vulnerability editor to deactivate vulnerabilities on a host-by-host basis. When you deactivate a vulnerability for a host, it is still used for impact correlations for that host, but the impact level is automatically reduced one level.

**Procedure**

**Step 1** Navigate to the **Vulnerabilities** section of a host profile.

**Step 2** Click **Edit Vulnerabilities**.

**Step 3** Choose the vulnerability from the **Valid Vulnerabilities** list, and click the down arrow to move it to the **Invalid Vulnerabilities** list.

**Tip** You can click and drag to choose multiple adjacent vulnerabilities; you can also double-click any vulnerability to move it from list to list.

**Step 4** Click **Save**.
What to do next

- Optionally, activate the vulnerability for the host by moving it from the Invalid Vulnerabilities list to the Valid Vulnerabilities list.

Related Topics

Deactivating Individual Vulnerabilities, on page 2280
Deactivating Multiple Vulnerabilities, on page 2322

Deactivating Individual Vulnerabilities

<table>
<thead>
<tr>
<th>Smart License</th>

<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

If you deactivate a vulnerability in a host profile, it deactivates it for all hosts in your network map. However, you can reactivate it at any time.

In a multidomain deployment, deactivating a vulnerability in an ancestor domain deactivates it in all descendant domains. Leaf domains can activate or deactivate a vulnerability for their devices if the vulnerability is activated in the ancestor domain.

Procedure

Step 1 Access the vulnerability detail:

- In an affected host profile, expand the Vulnerabilities section, and click the name of the vulnerability you want to enable or disable.
- In the predefined workflow, choose Analysis > Vulnerabilities > Vulnerabilities, and click view (🔍) next to the vulnerability you want to enable or disable.

Step 2 Choose Disabled from the Impact Qualification drop-down list.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3 Confirm that you want to change the Impact Qualification value for all hosts on the network map.

Step 4 Click Done.

What to do next

- Optionally, activate the vulnerability by choosing Enabled from the Impact Qualification drop-down list while performing the steps above.

Scan Results in the Host Profile

When you scan a host using Nmap, or when you import results from an Nmap scan, those results appear in the host profile for any hosts included in the scan.

The information that Nmap collects about the host operating system and any servers running on open unfiltered ports is added directly into the Operating System and Servers sections of the host profile, respectively. In addition, Nmap adds a list of the scan results for that host in the Scan Results section. Note that the scan must find open ports on the host for Scan Results section to appear in the profile.

Each result indicates the source of the information, the number and type of the scanned port, the name of the server running on the port, and any additional information detected by Nmap, such as the state of the port or the vendor name for the server. If you scan for UDP ports, servers detected on those ports only appear in the Scan Results section.

Note that you can run an Nmap scan from the host profile.

Scanning a Host from the Host Profile

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can perform a Nmap scan against a host from the host profile. After the scan completes, server and operating system information for that host are updated in the host profile. Any additional scan results are added to the Scan Results section of the host profile.

Caution

Nmap-supplied server and operating system data remains static until you run another Nmap scan or override it with higher priority host input. If you plan to scan a host using Nmap, regularly schedule scans.

Before you begin

- Add an Nmap scan instance; see Adding an Nmap Scan Instance, on page 1783.

Procedure

**Step 1**
In the host profile, click **Scan Host**.

**Step 2**
Click **Scan** next to the scan remediation you want to use to scan the host. The system scans the host and adds the results to the host profile.

Working with Discovery Events

The following topics describe how to work with discovery events:

- Discovery and Identity Data in Discovery Events, on page 2283
- Viewing Discovery Event Statistics, on page 2284
- Viewing Discovery Performance Graphs, on page 2287
- Using Discovery and Identity Workflows, on page 2288

Discovery and Identity Data in Discovery Events

The system generates tables of events that represent the changes detected in your monitored network. You can use these tables to review the user activity on your network and determine how to respond. The network discovery and identity policies specify the kinds of data you want to collect, the network segments you want to monitor, and the specific hardware interfaces you want to use to do it.

You can use discovery and identity event tables to identify threats associated with hosts, applications, and users on your network. The system provides a set of predefined workflows that you can use to analyze the events that your system generates. You can also create custom workflows that display only the information that matches your specific needs.

To collect and store network discovery and identity data for analysis, you must configure network discovery and identity policies. After you configure an identity policy, you must invoke it in your access control policy and deploy it to the devices you want to use to monitor traffic.

Your network discovery policy provides host, application, and non-authoritative user data. Your identity policy provides authoritative user data.

The following discovery event tables are located under the Analysis > Hosts, Analysis > Users, and Analysis > Vulnerabilities menus.

The Discovery Statistics page displays a summary of the hosts, events, protocols, application protocols, and operating systems detected by the system.

The page lists statistics for the last hour and the total accumulated statistics. You can choose to view statistics for a particular device, or all devices. You can also view events that match the entries on the page by clicking the event, server, operating system, or operating system vendor listed within the summary.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

#### Procedure

**Step 1** Choose **Overview > Summary > Discovery Statistics**.

**Step 2** From the **Select Device** list, choose the device whose statistics you want to view. Optionally, choose **All** to view statistics for all devices managed by the Firepower Management Center.

**Step 3** You have the following options:

- In the Statistics Summary, view general statistics as described in **The Statistics Summary Section, on page 2285**.

- In the Event Breakdown, click the type of event you want to view. If no events appear, you may need to adjust the time range as described in **Changing the Time Window, on page 2094**.

- In the Protocol Breakdown, view the protocols currently in use by detected hosts.

- In the Application Protocol Breakdown, click the name of the application protocol you want to view.
• In the OS Breakdown, click the **OS Name** or **OS Vendor**.

---

**Related Topics**

- The Application Protocol Breakdown Section, on page 2286
- The OS Breakdown Section, on page 2286

---

### The Statistics Summary Section

Descriptions of the rows of the Statistics Summary section follow.

**Total Events**

Total number of discovery events stored on the Firepower Management Center.

**Total Events Last Hour**

Total number of discovery events generated in the last hour.

**Total Events Last Day**

Total number of discovery events generated in the last day.

**Total Application Protocols**

Total number of application protocols from servers running on detected hosts.

**Total IP Hosts**

Total number of detected hosts identified by unique IP address.

**Total MAC Hosts**

Total number of detected hosts not identified by IP address.

Note that the Total MAC Hosts statistic remains the same whether you are viewing discovery statistics for all devices or for a specific device. This is so because managed devices discover hosts based on their IP addresses. This statistic gives the total of all hosts that are identified by other means and is independent of a given managed device.

**Total Routers**

Total number of detected nodes identified as routers.

**Total Bridges**

Total number of detected nodes identified as bridges.
Host Limit Usage

Total percentage of the host limit currently in use. The host limit is defined by the model of your Firepower Management Center. Note that the host limit usage only appears if you are viewing statistics for all managed devices.

Note

If the host limit is reached and a host is deleted, the host will not reappear on the network map you purge discovery data.

Last Event Received

The date and time that the most recent discovery event occurred.

Last Connection Received

The date and time that the most recent connection was completed.

The Event Breakdown Section

The Event Breakdown section lists a count of each type of discovery event and host input event that occurred within the last hour, as well as a count of the total number of each event type stored in the database.

You can also use the Event Breakdown section to view details on discovery and host input events.

Related Topics

Discovery and Host Input Events, on page 2290

The Protocol Breakdown Section

The Protocol Breakdown section lists the protocols currently in use by detected hosts. It displays each detected protocol name, its “layer” in the protocol stack, and the total number of hosts that communicate using the protocol.

The Application Protocol Breakdown Section

The Application Protocol Breakdown section lists the application protocols that are currently in use by detected hosts. It lists the protocol name, the total number of hosts running the application protocol in the past hour, and the total number of hosts that have been detected running the protocol at any point.

You can also use the Application Protocol Breakdown section to view details on servers using the detected protocols.

Related Topics

Server Data, on page 2310

The OS Breakdown Section

The OS Breakdown section lists the operating systems currently running on the monitored network, along with their vendors and the total number of hosts running each operating system.
A value of *unknown* for the operating system name or version means that the operating system or its version does not match any of the system’s fingerprints. A value of *pending* means that the system has not yet gathered enough information to identify the operating system or its version.

You can use the OS Breakdown section to view details on the detected operating systems.

---

### Viewing Discovery Performance Graphs

You can generate graphs that display performance statistics for managed devices with discovery events.

New data is accumulated for statistics graphs every five minutes. Therefore, if you reload a graph quickly, the data may not change until the next five-minute increment occurs.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Before you begin**

Edit the applicable network discovery policy to include applications, hosts, and users. (This may impact system performance.) See Configuring Network Discovery Rules, on page 1844 and Actions and Discovered Assets, on page 1845.

**Procedure**

1. Choose **Overview > Summary > Discovery Performance**.
2. From the **Select Device** list, choose the Firepower Management Center or managed devices you want to include.
3. From the **Select Graph(s)** list, choose the type of graph you want to create as described in Discovery Performance Graph Types, on page 2287.
4. From the **Select Time Range** list, choose the time range you would like to use for the graph.
5. Click **Graph** to graph the selected statistics.

---

### Discovery Performance Graph Types

Descriptions of the available graph types follow.

**Processed Events/Sec**

Displays a graph that represents the number of events that the Data Correlator processes per second.
Using Discovery and Identity Workflows

**Processed Connections/Sec**
Displays a graph that represents the number of connections that the Data Correlator processes per second

**Generated Events/Sec**
Displays a graph that represents the number of events that the system generates per second

**Mbits/Sec**
Displays a graph that represents the number of megabits of traffic that are analyzed by the discovery process per second

**Avg Bytes/Packet**
Displays a graph that represents the average number of bytes included in each packet analyzed by the discovery process

**K Packets/Sec**
Displays a graph that represents the number of packets analyzed by the discovery process per second, in thousands

**Using Discovery and Identity Workflows**

The Firepower Management Center provides a set of event workflows that you can use to analyze the discovery and identity data that is generated for your network. The workflows are, along with the network map, a key source of information about your network assets.

The Firepower Management Center provides predefined workflows for discovery and identity data, detected hosts and their host attributes, servers, applications, application details, vulnerabilities, user activities, and users. You can also create custom workflows.

**Procedure**

**Step 1**
To access a predefined workflow:

- Discovery and Host Input Data — See Viewing Discovery and Host Input Events, on page 2296.
- Host Data — See Viewing Host Data, on page 2298.
- Host Attributes Data — See Viewing Host Attributes, on page 2304.
- Indications of Compromise Data — See View and Work with Indications of Compromise Data, on page 2306.
- Server Data — See Viewing Server Data, on page 2310.
- Application Data — See Viewing Application Data, on page 2313.
To access a custom workflow, choose **Analysis** > **Custom** > **Custom Workflows**.

To access a workflow based on a custom table, choose **Analysis** > **Custom** > **Custom Tables**.

Perform any of the following actions, which are common to all of the pages accessed in the network discovery workflows:

- **Constrain Columns** — To constrain the columns that display, click close (\(\times\)) in the column heading that you want to hide. In the pop-up window that appears, click **Apply**.

  **Tip** To hide or show other columns, check or clear the appropriate check boxes before you click **Apply**. To add a disabled column back to the view, click the column name under Disabled Columns.

- **Delete** — To delete some or all items in the current constrained view, check the check boxes next to items you want to delete and click **Delete**, or click **Delete All**. These items remain deleted until the system’s discovery function is restarted, when they may be detected again.

  **Caution** Before you delete a session on the Analysis > Users > Users page, verify that the session is actually closed. After you delete the active session, an applicable policy will not be able to detect the session on the device, and therefore the session will not be monitored or blocked even if the policy was configured to perform those actions.

  **Note** You **cannot** delete Cisco (as opposed to third-party) vulnerabilities; you can, however, mark them reviewed.

- **Drill Down** — To drill down to the next page in the workflow, see Using Drill-Down Pages, on page 2081.

- **Navigate Current Page** — To navigate within the current workflow page, see Workflow Page Navigation Tools, on page 2078.

- **Navigate within a Workflow** — To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page.

- **Navigate to Other Workflows** — To navigate to other event views to examine associated events, see Inter-Workflow Navigation, on page 2100.

- **Sort Data** — To sort data in a workflow, click the column title. Click the column title again to reverse the sort order.

- **View Host Profile** — To view the host profile for an IP address, click host profile (\(\text{host profile}\)) or, for hosts with active indications of compromise (IOC) tags, the compromised host (\(\text{compromised host}\)) that appears next to the IP address.
• View User Profile — To view user identity information, click the user icon that appears next to the user identity ( ).

Discovery and Host Input Events

The system generates discovery events that communicate the details of changes in your monitored network segments. New events are generated for newly discovered network features, and change events are generated for any change in previously identified network assets.

During its initial network discovery phase, the system generates new events for each host and any TCP or UDP servers discovered running on each host. Optionally, you can configure the system to use exported NetFlow records to generate these new host and server events.

In addition, the system generates new events for each network, transport, and application protocol running on each discovered host. You can disable detection of application protocols in discovery rules configured to monitor NetFlow exporters, but not in discovery rules configured to monitor Firepower System managed devices. If you enable host or user discovery in non-NetFlow discovery rules, applications are automatically discovered.

After the initial network mapping is complete, the system continuously records network changes by generating change events. Change events are generated whenever the configuration of a previously discovered asset changes.

When a discovery event is generated, it is logged to the database. You can use the Firepower Management Center web interface to view, search, and delete discovery events. You can also use discovery events in correlation rules. Based on the type of discovery event generated as well as other criteria that you specify, you can build correlation rules that, when used in a correlation policy, launch remediations and syslog, SNMP, and email alert responses when network traffic meets your criteria.

You can add data to the network map using the host input feature. You can add, modify, or delete operating system information, which causes the system to stop updating that information for that host. You can also manually add, modify, or delete application protocols, clients, servers, and host attributes or modify vulnerability information. When you do this, the system generates host input events.

Discovery Event Types

You can configure the types of discovery events the system logs in your network discovery policy. When you view the discovery events table, the event type is listed in the Event column. Descriptions of the discovery event types follow.

Additional MAC Detected for Host

This event is generated when the system detects a new MAC address for a previously discovered host.

This event is often generated when the system detects hosts passing traffic through a router. While each host has a different IP address, they all appear to have the MAC address associated with the router. When the system detects the actual MAC address associated with the IP address, it displays the MAC address in bold.
text within the host profile and displays an “ARP/DHCP detected” message within the event description in the event view.

**Client Timeout**

This event is generated when the system drops a client from the database due to inactivity.

**Client Update**

This event is generated when the system detects a payload (that is, a specific type of content, such as audio, video, or webmail) in HTTP traffic.

**DHCP: IP Address Changed**

This event is generated when the system detects that a host IP address has changed due to DHCP address assignment.

**DHCP: IP Address Reassigned**

This event is generated when a host is reusing an IP address; that is, when a host obtains an IP address formerly used by another physical host due to DHCP IP address assignment.

**Hops Change**

This event is generated when the system detects a change in the number of network hops between a host and the device that detects the host. This may happen if:

- The device sees host traffic through different routers and is able to make a better determination of the host’s location.
- The device detects an ARP transmission from the host, indicating that the host is on a local segment.

**Host Deleted: Host Limit Reached**

This event is generated when the host limit on the Firepower Management Center is exceeded and a monitored host is deleted from the network map.

**Host Dropped: Host Limit Reached**

This event is generated when the host limit on the Firepower Management Center is reached and a new host is dropped. Compare this with the previous event where old hosts are deleted from the network map when the host limit is reached.

To drop new hosts when the host limit is reached, go to **Policies > Network Discovery > Advanced** and set **When Host Limit Reached** to **Drop hosts**.

**Host IOC Set**

This event is generated when an IOC (Indications of Compromise) is set for a host and generates an alert.

**Host Timeout**

This event is generated when a host is dropped from the network map because the host has not produced traffic within the interval defined in the network discovery policy. Note that individual host IP addresses and
MAC addresses time out individually; a host does not disappear from the network map unless all of its associated addresses have timed out.

If you change the networks you want to monitor in your network discovery policy, you may want to manually delete old hosts from the network map so that they do not count against your host limit.

**Host Type Changed to Network Device**
This event is generated when the system detects that a detected host is actually a network device.

**Identity Conflict**
This event is generated when the system detects a new server or operating system identity that conflicts with a current active identity for that server or operating system.

If you want to resolve identity conflicts by rescanning the host to obtain newer active identity data, you can use Identity Conflict events to trigger an Nmap remediation.

**Identity Timeout**
This event is generated when server or operating system identity data from an active source times out.

If you want to refresh identity data by rescanning the host to obtain newer active identity data, you can use Identity Conflict events to trigger an Nmap remediation.

**MAC Information Change**
This event is generated when the system detects a change in the information associated with a specific MAC address or TTL value.

This event often occurs when the system detects hosts passing traffic through a router. While each host has a different IP address, they will all appear to have the MAC address associated with the router. When the system detects the actual MAC address associated with the IP address, it displays the MAC address in bold text within the host profile and displays an “ARP/DHCP detected” message within the event description in the event view. The TTL may change because the traffic may pass through different routers or if the system detects the actual MAC address of the host.

**NETBIOS Name Change**
This event is generated when the system detects a change to a host’s NetBIOS name. This event will only be generated for hosts using the NetBIOS protocol.

**New Client**
This event is generated when the system detects a new client.

---

**Note**
To collect and store client data for analysis, make sure that you enable application detection in your discovery rules in the network discovery policy.

**New Host**
This event is generated when the system detects a new host running on the network.
This event can also be generated when a device processes NetFlow data that involves a new host. To generate an event in this case, configure the network discovery rule that manages NetFlow data to discover hosts.

**New Network Protocol**

This event is generated when the system detects that a host is communicating with a new network protocol (IP, ARP, and so on).

**New OS**

This event is generated when the system either detects a new operating system for a host, or a change in a host’s operating system.

**New TCP Port**

This event is generated when the system detects a new TCP server port (for example, a port used by SMTP or web services) active on a host. This event is not used to identify the application protocol or the server associated with it; that information is transmitted in the TCP Server Information Update event.

This event can also be generated when a device processes NetFlow data involving a server on your monitored networks that does not already exist in the network map. To generate an event in this case, configure the network discovery rule that manages NetFlow data to discover applications.

**New Transport Protocol**

This event is generated when the system detects that a host is communicating with a new transport protocol, such as TCP or UDP.

**New UDP Port**

This event is generated when the system detects a new UDP server port running on a host.

This event can also be generated when a device processes NetFlow data involving a server on your monitored networks that does not already exist in the network map. To generate an event in this case, configure the network discovery rule that manages NetFlow data to discover applications.

**TCP Port Closed**

This event is generated when the system detects that a TCP port has closed on a host.

**TCP Port Timeout**

This event is generated when the system has not detected activity from a TCP port within the interval defined in the system’s network discovery policy.

**TCP Server Information Update**

This event is generated when the system detects a change in a discovered TCP server running on a host.

This event may be generated if a TCP server is upgraded.

**UDP Port Closed**

This event is generated when the system detects that a UDP port has closed on a host.
UDP Port Timeout
This event is generated when the system has not detected activity from a UDP port within the interval defined in the network discovery policy.

UDP Server Information Update
This event is generated when the system detects a change in a discovered UDP server running on a host.
This event may be generated if a UDP server is upgraded.

VLAN Tag Information Update
This event is generated when the system detects a change in the VLAN tag attributed to a host.

Related Topics
- Host Input Event Types, on page 2294
- Network Discovery Data Storage Settings, on page 1859
- Application and Operating System Identity Conflicts, on page 1740
- Network Discovery Identity Conflict Settings, on page 1855

Host Input Event Types
When you view a table of discovery events, the event type is listed in the Event column.
Contrast host input events, which are generated when a user takes a specific action (such as manually adding a host), with discovery events, which are generated when the system itself detects a change in your monitored network (such as detecting traffic from a previously undetected host).
You can configure the types of host input events that the system logs by modifying your network discovery policy.
If you understand the information the different types of host input events provide, you can more effectively determine which events you want to log and alert on, and how to use these alerts in correlation policies. In addition, knowing the names of the event types can help you craft more effective event searches. Descriptions of the different types of host input events follow.

Add Client
This event is generated when a user adds a client.

Add Host
This event is generated when a user adds a host.

Add Protocol
This event is generated when a user adds a protocol.

Add Scan Result
This event is generated when the system adds the results of an Nmap scan to a host.

Add Port
This event is generated when a user adds a server port.
Delete Client
This event is generated when a user deletes a client from the system.

Delete Host/Network
This event is generated when a user deletes an IP address or subnet from the system.

Delete Protocol
This event is generated when a user deletes a protocol from the system.

Delete Port
This event is generated when a user deletes a server port or group of server ports from the system.

Host Attribute Add
This event is generated when a user creates a new host attribute.

Host Attribute Delete
This event is generated when a user deletes a user-defined host attribute.

Host Attribute Delete Value
This event is generated when a user deletes a value assigned to a host attribute.

Host Attribute Set Value
This event is generated when a user sets a host attribute value for a host.

Host Attribute Update
This event is generated when a user changes the definition of a user-defined host attribute.

Set Host Criticality
This event is generated when a user sets or modifies the host criticality value for a host.

Set Operating System Definition
This event is generated when a user sets the operating system for a host.

Set Server Definition
This event is generated when a user sets the vendor and version definitions for a server.

Set Vulnerability Impact Qualification
This event is generated when a vulnerability impact qualification is set.
When a vulnerability is disabled at a global level from being used for impact qualifications, or when a vulnerability is enabled at a global level, this event is generated.
Vulnerability Set Invalid
This event is generated when a user invalidates (or reviews) a vulnerability or vulnerabilities.

Vulnerability Set Valid
This event is generated when a user validates a vulnerability that was previously marked as invalid.

Discovery events workflows allow you to view data from both discovery events and host input events. You can manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access events differs depending on the workflow you use. You can use the predefined workflow, which includes the table view of discovery events and a terminating host view page. You can also create a custom workflow that displays only the information that matches your specific needs.

Procedure

**Step 1** Choose **Analysis > Hosts > Discovery Events**.

**Step 2** You have the following options:

- Adjust the time range as described in Changing the Time Window, on page 2094.

  **Note**  
  Events that were generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.

- Use a different workflow, including a custom workflow, by clicking (switch workflow).
- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2288.
- Learn more about the contents of the columns in the table; see Discovery Event Fields, on page 2296.

**Related Topics**
- Using Discovery and Identity Workflows, on page 2288

**Discovery Event Fields**

Descriptions of the fields that can be viewed and searched in the discovery events table follow.
**Time**
The time that the system generated the event.

**Event**
The discovery event type or host input event type.

**IP Address**
The IP address associated with the host involved in the event.

**User**
The last user to log into the host involved in the event before the event was generated. If only non-authoritative users log in after an authoritative user, the authoritative user remains the current user for the host unless another authoritative user logs in.

**MAC Address**
The MAC address of the NIC used by the network traffic that triggered the discovery event. This MAC address can be either the actual MAC address of the host involved in the event, or the MAC address of a network device that the traffic passed through.

**MAC Vendor**
The MAC hardware vendor of the NIC used by the network traffic that triggered the discovery event. When searching this field, enter `virtual_mac_vendor` to match events that involve virtual hosts.

**Port**
The port used by the traffic that triggered the event, if applicable.

**Description**
The text description of the event.

**Domain**
The domain of the device that discovered the host. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

**Device**
The name of the managed device that generated the event. For new host and new server events based on NetFlow data, this is the managed device that processed the data.

**Related Topics**
- Event Searches, on page 2103
Host Data

The system generates an event when it detects a host and collects information about it to build the host profile. You can use the Firepower Management Center web interface to view, search, and delete hosts.

While viewing hosts, you can create traffic profiles and compliance white lists based on selected hosts. You can also assign host attributes, including host criticality values (which designate business criticality) to groups of hosts. You can then use these criticality values, white lists, and traffic profiles within correlation rules and policies.

The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1742.

You can use the Firepower Management Center to view a table of hosts that the system has detected. Then, you can manipulate the view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access hosts differs depending on the workflow you use. Both predefined workflows terminate in a host view, which contains a host profile for every host that meets your constraints. You can also create a custom workflow that displays only the information that matches your specific needs.

Procedure

Step 1

Access the host data:

- If you are using the predefined workflow, choose Analysis > Hosts > Hosts.
- If you are using a custom workflow that does not include the table view of hosts, click (switch workflow), then choose Hosts.

Step 2

You have the following options:

- Use a different workflow, including a custom workflow, by clicking (switch workflow).
- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2288.
- Learn more about the contents of the columns in the table; see Host Data Fields, on page 2299.
- Right-click an item in the table to see options. (Not every column offers options.)
- Assign a host attribute to specific hosts; see Setting Host Attributes for Selected Hosts, on page 2305.
- Create traffic profiles for specific hosts, see Creating a Traffic Profile for Selected Hosts, on page 2302.
- Create a compliance white list based on specific hosts, see Creating a Compliance White List Based on Selected Hosts, on page 2303.
Host Data Fields

When the system discovers a host, it collects data about that host. That data can include the host’s IP addresses, the operating system it is running, and more. You can view some of that information in the table view of hosts. Descriptions of the fields that can be viewed and searched in the hosts table follow below.

Last Seen
The date and time any of the host’s IP addresses was last detected by the system. The Last Seen value is updated at least as often as the update interval you configured in the network discovery policy, as well as when the system generates a new host event for any of the host’s IP addresses.

For hosts with operating system data updated using the host input feature, the Last Seen value indicates the date and time when the data was originally added.

IP Address
The IP addresses associated with the host.

MAC Address
The host’s detected MAC address of the NIC.

The MAC Address field appears in the Table View of Hosts, which you can find in the Hosts workflow. You can also add the MAC Address field to:

• custom tables that include fields from the Hosts table
• drill-down pages in custom workflows based on the Hosts table

MAC Vendor
The host’s detected MAC hardware vendor of the NIC.

The MAC Vendor field appears in the Table View of Hosts, which you can find in the Hosts workflow. You can also add the MAC Vendor field to:

• custom tables that include fields from the Hosts table
• drill-down pages in custom workflows based on the Hosts table

When searching this field, enter `virtual_mac_vendor` to match events that involve virtual hosts.

Current User
The user identity (username) of the currently logged in user on the host.

Note that when a non-authoritative user logs into a host, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user logs into the host, only a login by another authoritative user changes the current user. In addition, when a non-authoritative user is the current user on a host, that user still cannot be used for user control.

Host Criticality
The user-specified criticality value assigned to the host.
**NetBIOS Name**

The NetBIOS name of the host. Only hosts running the NetBIOS protocol will have a NetBIOS name.

**VLAN ID**

VLAN ID used by the host.

**Hops**

The number of network hops from the device that detected the host to the host.

**Host Type**

The type of host. Can be any of the following: host, mobile device, jailbroken mobile device, router, bridge, NAT device, and load balancer.

The methods the system uses to distinguish network devices include:

- the analysis of Cisco Discovery Protocol (CDP) messages, which can identify network devices and their type (Cisco devices only)
- the detection of the Spanning Tree Protocol (STP), which identifies a device as a switch or bridge
- the detection of multiple hosts using the same MAC address, which identifies the MAC address as belonging to a router
- the detection of TTL value changes from the client side, or TTL values that change more frequently than a typical boot time, which identify NAT devices and load balancers

If a device is not identified as a network device, it is categorized as a host.

When searching this field, enter !host to search for all network devices.

**Hardware**

The hardware platform for a mobile device.

**OS**

One of the following:

- The operating system (name, vendor, and version) either detected on the host or updated using Nmap or the host input feature
- unknown if the operating system does not match any known fingerprint
- pending if the system has not yet gathered enough information to identify the operating system

If the system detects multiple identities, it displays those identities in a comma-separated list.

This field appears when you invoke the hosts event view from the Custom Analysis widget on the dashboard. It is also a field option in custom tables based on the Hosts table.

When searching this field, enter n/a to include hosts where the operating system has not yet been identified.
OS Conflict
This field is search only.

OS Vendor
One of the following:
• The vendor of the operating system detected on the host or updated using Nmap or the host input feature
• unknown if the operating system does not match any known fingerprint
• pending if the system has not yet gathered enough information to identify the operating system

If the system detects multiple vendors, it displays those vendors in a comma-separated list.
When searching this field, enter n/a to include hosts where the operating system has not yet been identified.

OS Name
One of the following:
• The operating system detected on the host or updated using Nmap or the host input feature
• unknown if the operating system does not match any known fingerprint
• pending if the system has not yet gathered enough information to identify the operating system

If the system detects multiple names, it displays those names in a comma-separated list.
When searching this field, enter n/a to include hosts where the operating system has not yet been identified.

OS Version
One of the following:
• The version of the operating system detected on the host or updated using Nmap or the host input feature
• unknown if the operating system does not match any known fingerprint
• pending if the system has not yet gathered enough information to identify the operating system

If the system detects multiple versions, it displays those versions in a comma-separated list.
When searching this field, enter n/a to include hosts where the operating system has not yet been identified.

Source Type
The type of source used to establish the host’s operating system identity:
• User: user_name
• Application: app_name
• Scanner: scanner_type (Nmap or scanner added through network discovery configuration)
• Firepower for operating systems detected by the system

The system may reconcile data from multiple sources to determine the identity of an operating system.
Confidence

One of the following:

- the percentage of confidence that the system has in the identity of the operating system running on the host, for hosts detected by the system
- 100%, for operating systems identified by an active source, such as the host input feature or Nmap scanner
- unknown, for hosts for which the system cannot determine an operating system identity, and for hosts added to the network map based on NetFlow data

When searching this field, enter n/a to include hosts added to the network map based on NetFlow data.

Notes

The user-defined content of the Notes host attribute.

Domain

The domain associated with the host. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Device

Either the managed device that detected the traffic or the device that processed NetFlow or host input data.

If this field is blank, either of the following conditions is true:

- The host was added to the network map by a device that is not explicitly monitoring the network where the host resides, as defined in the network discovery policy.
- The host was added using the host input feature and has not also been detected by the system.

Count

The number of events that match the information that appears in each row. This field appears only after you apply a constraint that creates two or more identical rows.

Creating a Traffic Profile for Selected Hosts

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

A traffic profile is a profile of the traffic on your network, based on connection data collected over a timespan that you specify. After you create a traffic profile, you can detect abnormal network traffic by evaluating new traffic against your profile, which presumably represents normal network traffic.

You can use the Hosts page to create a traffic profile for a group of hosts that you specify. The traffic profile will be based on connections detected where one of the hosts you specify is the initiating host. Use the sort and search features to isolate the hosts for which you want to create a profile.
Creating a Compliance White List Based on Selected Hosts

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Compliance white lists allow you to specify which operating systems, clients, and network, transport, or application protocols are allowed on your network.

You can use the Hosts page to create a compliance white list based on the host profiles of a group of hosts that you specify. Use the sort and search features to isolate the hosts that you want to use to create a white list.

Procedure

**Step 1**
On a table view in the hosts workflow, check the check boxes next to the hosts for which you want to create a white list.

**Step 2**
At the bottom of the page, click **Create White List**.

**Step 3**
Modify and save the white list according to your specific needs.

Related Topics

Introduction to Compliance White Lists, on page 1889

Host Attribute Data

The Firepower System collects information about the hosts it detects and uses that information to build host profiles. However, there may be additional information about the hosts on your network that you want to provide to your analysts. You can add notes to a host profile, set the business criticality of a host, or provide any other information that you choose. Each piece of information is called a host attribute.

You can use host attributes in host profile qualifications, which constrain the data you collect while building a traffic profile, and also can limit the conditions under which you want to trigger a correlation rule. You can also set attribute values in response to a correlation rule.

Related Topics

Viewing Host Attributes, on page 2304
Configuring Set Attribute Remediations, on page 1964
Viewing Host Attributes

You can use the Firepower Management Center to view a table of hosts detected by the system, along with their host attributes. Then, you can manipulate the view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access host attributes differs depending on the workflow you use. You can use the predefined workflow, which includes a table view of host attributes that lists all detected hosts and their attributes, and terminates in a host view page, which contains a host profile for every host that meets your constraints.

You can also create a custom workflow that displays only the information that matches your specific needs.

### Procedure

#### Step 1
Access the host attributes data:
- If you are using the predefined workflow, choose Analysis > Hosts > Host Attributes.
- If you are using a custom workflow that does not include the table view of host attributes, click (switch workflow), then choose Attributes.

#### Step 2
You have the following options:
- Use a different workflow, including a custom workflow, by clicking (switch workflow).
- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2288.
- Learn more about the contents of the columns in the table; see Host Attribute Data Fields, on page 2304.
- Assign a host attribute to specific hosts; see Setting Host Attributes for Selected Hosts, on page 2305.

### Host Attribute Data Fields

Note that the host attributes table does not display hosts identified only by MAC addresses.

Descriptions of the fields that can be viewed and searched in the host attributes table follow.

**IP Address**

The IP addresses associated with a host.

**Current User**

The user identity (username) of the currently logged in user on the host.

Note that when a non-authoritative user logs into a host, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user logs into the host, only a login by another authoritative user changes the
current user. In addition, when a non-authoritative user is the current user on a host, that user still cannot be used for user control.

**Host Criticality**

The user-assigned importance of a host to your enterprise. You can use the host criticality in correlation rules and policies to tailor policy violations and their responses to the importance of a host involved in an event. You can assign a host criticality of low, medium, high, or none.

**Notes**

Information about the host that you want other analysts to view.

**Any user-defined host attribute, including those for compliance white lists**

The value of the user-defined host attribute. The host attributes table contains a field for each user-defined host attribute.

**Domain**

The domain associated with the host. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

**Count**

The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows.

**Related Topics**

- [Event Searches](#), on page 2103

### Setting Host Attributes for Selected Hosts

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can configure predefined and user-defined host attributes from a host workflow.

**Procedure**

1. **Step 1**
   - In a host workflow, check the check boxes next to the hosts to which you want to add a host attribute.

   **Tip** Use the sort and search features to isolate the hosts to which you want to assign particular attributes.

2. **Step 2**
   - At the bottom of the page, click Set Attributes.

3. **Step 3**
   - Optionally, set the host criticality for the hosts you selected. You can choose None, Low, Medium, or High.

4. **Step 4**
   - Optionally, add notes to the host profiles of the hosts you selected in the text box.

5. **Step 5**
   - Optionally, set any user-defined host attributes you have configured.
### Indications of Compromise Data

The Firepower System correlates various types of data (intrusion events, Security Intelligence, connection events, and file or malware events) to determine whether a host on your monitored network is likely to be compromised by malicious means. Certain combinations and frequencies of event data trigger indications of compromise (IOC) tags on affected hosts. The IP addresses of these hosts appear in event views with a red compromised host icon ( ).

If a file containing malware is seen again within 300 seconds of being tagged as an IOC, another IOC is not generated. If the same file is seen more than 300 seconds later, a new IOC will be generated.

To configure the system to tag events as indications of compromise, see [Enabling Indications of Compromise Rules](#), on page 1858.

### Related Topics
- [Enabling Indications of Compromise Rules](#), on page 1858

### View and Work with Indications of Compromise Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can use the Firepower Management Center to view tables showing Indications of Compromise (IOC). Manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see depends on the workflow you use. The predefined IOC workflows terminate in a profile view, which contains a host profile for every host that meets your constraints. You can also create a custom workflow that displays only the information that matches your specific needs.

### Before you begin
- For your system to detect and tag indications of compromise (IOC), you must activate the IOC feature in the network discovery policy and enable at least one IOC rule. See [Enabling Indications of Compromise Rules](#), on page 1858.

### Procedure

#### Step 1
Determine which location in the web interface presents information that meets your needs.

You can use the following locations to view or work with Indication of Compromise data:

- **Event Viewer (under the Analysis menu)** — Connection, Security Intelligence, intrusion, malware, and IOC discovery event views indicate whether an event triggered an IOC. Note that malware events
generated by AMP for Endpoints that trigger IOC rules have the event type AMP IOC and appear with an event subtype that specifies the compromise.

- Dashboard — In the dashboard, Threats of the Summary Dashboard displays, by default, IOC tags by host and new IOC rules triggered over time. The Custom Analysis widget offers presets based on IOC data.

- Context Explorer — The Indications of Compromise section of the Context Explorer displays graphs of hosts by IOC category and IOC categories by host.

- Network Map page — The Indications of Compromise under Analysis > Hosts > Network Map groups potentially compromised hosts on your network by type of compromise and IP address.

- Network File Trajectory details page — The details pages for files listed under Analysis > Files > Network File Trajectory let you track indications of compromise on your network.

- Indications of Compromise page — The Indications of Compromise page under the Analysis > Hosts menu lists monitored hosts, grouped by IOC tag. Use the workflows on this page to drill down into your data.

- Host Profile page — The host profile for a potentially compromised host displays all IOC tags associated with that host, and lets you resolve IOC tags and configure IOC rule states.

**Step 2**

If you are using the predefined workflow, choose **Analysis > Hosts > Indications of Compromise**.

If you are using a custom workflow that does not include the Host IOC table view, click (switch workflow), then choose **Indications of Compromise**.

**Step 3**

You have the following options:

- Use a different workflow, including a custom workflow, by clicking (switch workflow).
- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2288.
- Learn more about the contents of the columns in the table; see Indications of Compromise Data Fields, on page 2307.

- View the host profile for a compromised host by clicking compromised host ( ) in the IP Address column.
- Mark IOC events resolved so they no longer appear in the list. To do so, check the check boxes next to the IOC events you want to modify, then click **Mark Resolved**.
- View details of events that triggered the IOC by clicking view ( ) in the First Seen or Last Seen columns.
- See more options: Right-click a value in the table.

**Indications of Compromise Data Fields**

The following are the fields in IOC (indication of compromise) tables. Not every IOC-related table includes all fields.

**IP Address**

The IP address associated with the host that triggered the IOC.
Category
Brief description of the type of compromise indicated, such as Malware Executed or Impact 1 Attack.

Event Type
Identifier associated with a specific IOC, referring to the event that triggered it.

Description
Description of the impact on the potentially compromised host, such as This host may be under remote control or Malware has been executed on this host.

First Seen/Last Seen
The first/most recent date and time that events triggering the IOC occurred.

Domain
The domain of the host that triggered the IOC. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Related Topics
Event Searches, on page 2103

Editing Indication of Compromise Rule States for a Single Host

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst except Read Only</td>
</tr>
</tbody>
</table>

When enabled in a network discovery policy, indication of compromise rules apply to all hosts in the monitored network. You can disable a rule for an individual host to avoid unhelpful IOC tags (for example, you may not want to see IOC tags for a DNS server.) If a rule is disabled in the applicable network discovery policy, it cannot be enabled for a specific host.

Procedure

Step 1 Navigate to the Indications of Compromise section of a host profile.
Step 2 Click Edit Rule States.
Step 3 In the Enabled column for a rule, click the slider to enable or disable it.
Step 4 Click Save.
Viewing Source Events for Indication of Compromise Tags

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can use the Indications of Compromise section of the host profile to navigate quickly to the events that triggered the IOC tags. Analyzing these events can give you the information you need to determine what, and whether, action is required to address threats of compromise.

Clicking view ( ) next to the timestamp of an IOC tag navigates to the table view of events for the relevant event type, constrained to show only the event that triggered the IOC tag.

Procedure

Step 1
In a host profile, navigate to the Indications of Compromise section.

Step 2
Click view ( ) in the First Seen or Last Seen column for the IOC tag you want to investigate.

Resolving Indication of Compromise Tags

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

After you have analyzed and addressed the threats indicated by an indication of compromise (IOC) tag, or if you determine that an IOC tag represents a false positive, you can mark an event resolved. Marking an event resolved removes it from the host profile; when all active IOC tags on a profile are resolved, the compromised host ( ) no longer appears. You can still view the IOC-triggering events for the resolved IOC.

If the events that triggered the IOC tag recur, the tag is set again unless you have disabled the IOC rule for the host.

Procedure

Step 1
In a host profile, navigate to the Indications of Compromise section.

Step 2
You have two choices:

- To mark an individual IOC tag resolved, click delete ( ) to the right of the tag you want to resolve.
- To mark all IOC tags on the profile resolved, click Mark All Resolved.
Server Data

The Firepower System collects information about all servers running on hosts on monitored network segments. This information includes:

- the name of the server
- the application and network protocols used by the server
- the vendor and version of the server
- the IP address associated with the host running a server
- the port on which the server communicates

When the system detects a server, it generates a discovery event unless the associated host has already reached its maximum number of servers. You can use the Firepower Management Center web interface to view, search, and delete server events.

You can also base correlation rules on server events. For example, you could trigger a correlation rule when the system detects a chat server, such as ircd, running on one of your hosts.

The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1742.

Related Topics

- Host Limits and Discovery Event Logging, on page 1799
- Differences between NetFlow and Managed Device Data, on page 1742

Viewing Server Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can use the Firepower Management Center to view a table of detected servers. Then, you can manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access servers differs depending on the workflow you use. All the predefined workflows terminate in a host view, which contains a host profile for every host that meets your constraints. You can also create a custom workflow that displays only the information that matches your specific needs.

Procedure

Step 1

Access the server data:

- If you are using the predefined workflow, choose **Analysis > Hosts > Servers**.
- If you are using a custom workflow that does not include the table view of servers, click (switch workflow), then choose **Servers**.

Step 2

You have the following options:
• Use a different workflow, including a custom workflow, by clicking (switch workflow).
• Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2288.
• Learn more about the contents of the columns in the table; see Server Data Fields, on page 2311.
• Edit server identities by checking the check boxes next to the events for servers you want to edit, then clicking Set Server Identity.
• Right-click an item in the table to see options. (Not every column offers options.)

Related Topics

Editing Server Identities, on page 2267

Server Data Fields

Descriptions of the fields that can be viewed and searched in the servers table follow below.

Last Used
The date and time the server was last used on the network or the date and time that the server was originally updated using the host input feature. The Last Used value is updated at least as often as the update interval you configured in the network discovery policy, as well as when the system detects a server information update.

IP Address
The IP address associated with the host running the server.

Port
The port where the server is running.

Protocol
The network or transport protocol used by the server.

Application Protocol
One of the following:
• the name of the application protocol for the server
• pending if the system cannot positively or negatively identify the server for one of several reasons
• unknown if the system cannot identify the server based on known server fingerprints or if the server was added through host input and did not include the application protocol

Category, Tags, Risk, or Business Relevance for Application Protocols
The categories, tags, risk level, and business relevance assigned to the application protocol. These filters can be used to focus on a specific set of data.

Vendor
One of the following:
• the server vendor as identified by the system, Nmap or another active source, or that you specified using the host input feature

• blank, if the system cannot identify its vendor based on known server fingerprints, or if the server was added to the network map using NetFlow data

**Version**

One of the following:

• the server version as identified by the system, Nmap or another active source, or that you specified using the host input feature

• blank, if the system cannot identify its version based on known server fingerprints, or if the server was added to the network map using NetFlow data

**Web Application**

The web application based on the payload content detected by the system in the HTTP traffic. Note that if the system detects an application protocol of **HTTP** but cannot detect a specific web application, the system supplies a generic web browsing designation.

**Category, Tags, Risk, or Business Relevance for Web Applications**

The categories, tags, risk level, and business relevance assigned to the web application. These filters can be used to focus on a specific set of data.

**Hits**

The number of times the server was accessed. For servers added using the host input feature, this value is always 0.

**Source Type**

One of the following values:

  • User: user_name

  • Application: app_name

  • Scanner: scanner_type (Nmap or scanner added through network discovery configuration)

  • Firepower, Firepower Port Match, or Firepower Pattern Match for servers detected by the Firepower System

  • NetFlow for servers added using NetFlow data

**Domain**

The domain of the host running the server. This field is only present if you have ever configured the Firepower Management Center for multitenancy.
Device
Either the managed device that detected the traffic or the device that processed NetFlow or host input data.

Current User
The user identity (username) of the currently logged in user on the host.
When a non-authoritative user logs into a host, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user logs into the host, only a login by another authoritative user changes the current user. In addition, when a non-authoritative user is the current user on a host, that user still cannot be used for user control.

Count
The number of events that match the information that appears in each row. This field appears only after you apply a constraint that creates two or more identical rows.

Related Topics
Event Searches, on page 2103
Network Discovery Data Storage Settings, on page 1859

Application and Application Details Data
When a monitored host connects to another host, the system can, in many cases, determine what application was used. The Firepower System detects the use of many email, instant messaging, peer-to-peer, web applications, as well as other types of applications.

For each detected application, the system logs the IP address that used the application, the product, the version, and the number of times its use was detected. You can use the web interface to view, search, and delete application events. You can also update application data on a host or hosts using the host input feature.

If you know which applications are running on which hosts, you can use that knowledge to create host profile qualifications, which constrain the data you collect while building a traffic profile, and also can limit the conditions under which you want to trigger a correlation rule. You can also base correlation rules on the detection of application. For example, if you want your employees to use a specific mail client, you could trigger a correlation rule when the system detects a different mail client running on one of your hosts.

You can obtain the latest information about Firepower's application detectors by carefully reading both the release notes for each Firepower System update and advisories for each VDB update.

To collect and store application data for analysis, make sure that you enable application detection in your network discovery policy.

Viewing Application Data

<table>
<thead>

</table>

You can use the Firepower Management Center to view a table of detected applications. Then, you can manipulate the event view depending on the information you are looking for.
In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access applications differs depending on the workflow you use. You can also create a custom workflow that displays only the information that matches your specific needs.

**Procedure**

### Step 1
Access the application data:

- If you are using the predefined workflow, choose **Analysis > Hosts > Application Details**.
- If you are using a custom workflow that does not include the table view of application details, click **(switch workflow)**, then choose **Clients**.

### Step 2
You have the following options:

- Use a different workflow, including a custom workflow, by clicking **(switch workflow)**.
- Perform basic workflow actions; see [Using Discovery and Identity Workflows, on page 2288](#).
- Learn more about the contents of the columns in the table; see [Application Data Fields, on page 2314](#).
- Open the Application Detail View for a specific application by clicking application detail view (□) next to a client, application protocol, or web application.

---

### Application Data Fields

When the system detects traffic for a known client, application protocol, or web application, it logs information about the application and the host running it.

Descriptions of the fields that can be viewed and searched in the applications table follow.

**Application**

The name of the detected application.

**IP Address**

The IP address associated with the host using the application.

**Type**

The type of application:

- **Application Protocols**
  
  Represents communications between hosts.

- **Client Applications**
  
  Represents software running on a host.

- **Web Applications**
  
  Represents the content or requested URL for HTTP traffic.
Category
A general classification for the application that describes its most essential function. Each application belongs to at least one category.

Tag
Additional information about the application. Applications can have any number of tags, including none.

Risk
How likely the application is to be used for purposes that might be against your organization’s security policy. An application’s risk can range from Very Low to Very High.
Of Application Protocol Risk, Client Risk, and Web Application Risk, the highest of the three detected, when available, in the traffic that triggered the intrusion event.

Business Relevance
The likelihood that the application is used within the context of your organization’s business operations, as opposed to recreationally. An application’s business relevance can range from Very Low to Very High.
Of Application Protocol Business Relevance, Client Business Relevance, and Web Application Business Relevance, the lowest of the three detected, when available, in the traffic that triggered the intrusion event.

Current User
The user identity (username) of the currently logged in user on the host.
Note that when a non-authoritative user logs into a host, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user logs into the host, only a login by another authoritative user changes the current user. In addition, when a non-authoritative user is the current user on a host, that user still cannot be used for user control.

Domain
The domain of the host using the application. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Count
The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows.

- Open the Application Detail View for a specific application by clicking application detail view (□) next to a client.

---

**Application Detail Data Fields**

When the system detects traffic for a known client, application protocol, or web application, it logs information about the application and the host running it.

Descriptions of the fields that can be viewed and searched in the application details table follow.

**Last Used**
The time that the application was last used or the time that the application data was updated using the host input feature. The Last Used value is updated at least as often as the update interval you configured in the network discovery policy, as well as when the system detects an application information update.

**IP Address**
The IP address associated with the host using the application.

**Client**
The name of the application. Note that if the system detected an application protocol but could not detect a specific client, `client` is appended to the application protocol name to provide a generic name.
**Version**
The version of the application.

**Category, Tags, Risk, or Business Relevance for Clients, Application Protocols, and Web Applications**
The categories, tags, risk level, and business relevance assigned to the application. These filters can be used to focus on a specific set of data.

**Application Protocol**
The application protocol used by the application. Note that if the system detected an application protocol but could not detect a specific client, `client` is appended to the application protocol name to provide a generic name.

**Web Application**
The web application based on the payload content or URL detected by the system in the HTTP traffic. Note that if the system detects an application protocol of HTTP but cannot detect a specific web application, the system supplies a generic web browsing designation here.

**Hits**
The number of times the system detected the application in use. For applications added using the host input feature, this value is always 0.

**Domain**
The domain of the host using the application. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

**Device**
The device that generated the discovery event containing the application detail.

**Current User**
The user identity (username) of the currently logged in user on the host.
Note that when a non-authoritative user logs into a host, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user logs into the host, only a login by another authoritative user changes the current user. In addition, when a non-authoritative user is the current user on a host, that user still cannot be used for user control.

**Count**
The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows.

**Vulnerability Data**

The Firepower System includes its own vulnerability tracking database which is used, in conjunction with the system’s fingerprinting capability, to identify the vulnerabilities associated with the hosts on your network. The operating systems, servers, and clients running on your hosts have different sets of associated vulnerabilities.

You can use the Firepower Management Center to:

- Track and review the vulnerabilities for each host.
- Deactivate vulnerabilities for a host after you patch the host or otherwise judge it immune to a vulnerability.

Vulnerabilities for vendorless and versionless servers are not mapped unless the applications protocols used by the servers are mapped in the Firepower Management Center configuration. Vulnerabilities for vendorless and versionless clients cannot be mapped.

**Related Topics**

</tbody>
</table>

#### Additional Information

Click the arrow to view additional information (if available) about the vulnerability, such as known exploits and their availability, exploit scenarios, and mitigation strategies.

#### Available Exploits

Indicates whether there are known exploits for the vulnerability (TRUE/FALSE).

#### Bugtraq ID

#### Count

The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows.

#### CVE ID

The identification number associated with the vulnerability in MITRE’s Common Vulnerabilities and Exposures (CVE) database ([https://cve.mitre.org/](https://cve.mitre.org/)).

#### Date Published

The date the vulnerability was published.

#### Description

A brief description of the vulnerability.

#### Fixes

Provides links to downloadable patches for the selected vulnerability.

---

**Tip**

If direct links to fix or patch downloads appear, right-click the link and save it to your local computer.

#### Impact Qualification

Use the drop-down list to enable or disable a vulnerability. The Firepower Management Center ignores disabled vulnerabilities in its impact correlations.

The setting you specify here determines how the vulnerability is treated on a system-wide basis and is not limited to the host profile where you select the value.
Remote
Indicates whether the vulnerability is remotely exploitable (TRUE/FALSE).

Snort ID
The identification number associated with the vulnerability in the Snort ID (SID) database. That is, if an intrusion rule can detect network traffic that exploits a particular vulnerability, that vulnerability is associated with the intrusion rule’s SID.

Note that a vulnerability can be associated with more than one SID (or no SIDs at all). If a vulnerability is associated with more than one SID, the vulnerabilities table includes a row for each SID.

Solution
Information about repairing the vulnerability.

SVID
The Cisco vulnerability identification number that the system uses to track vulnerabilities.

Click the view icon ( ) to access the vulnerability details for the SVID.

Technical Description
A detailed technical description of the vulnerability.

Title
The title of the vulnerability.

Vulnerability Impact
Displays the severity assigned to the vulnerability in the Bugtraq database on a scale of 0 to 10, with 10 being the most severe. The vulnerability impact is determined by the writer of the Bugtraq entry based on his or her best judgment and guided by SANS Critical Vulnerability Analysis (CVA) criteria.

Vulnerability Deactivation
Deactivating a vulnerability prevents the system from using that vulnerability to evaluate intrusion impact correlations. You can deactivate a vulnerability after you patch the hosts on your network or otherwise judge them immune. Note that if the system discovers a new host that is affected by that vulnerability, the vulnerability is considered valid (and is not automatically deactivated) for that host.

Deactivating a vulnerability within a vulnerabilities workflow that is not constrained by IP addresses deactivates the vulnerability for all detected hosts on your network. You can deactivate vulnerabilities within the vulnerabilities workflow only on:

• the second page of the default vulnerabilities workflow, Vulnerabilities on the Network, which shows only the vulnerabilities that apply to the hosts on your network
• a page in a vulnerabilities workflow, custom or predefined, that you constrained based on IP address using a search.
You can deactivate a vulnerability for a single host using the network map, using the host’s host profile, or by constraining the vulnerabilities workflow based on the IP addresses of the host or hosts for which you want to deactivate vulnerabilities. For hosts with multiple associated IP addresses, this function applies only to the single, selected IP address of that host.

In a multidomain deployment, deactivating a vulnerability in an ancestor domain deactivates it in all descendant domains. Leaf domains can activate or deactivate a vulnerability for their devices if the vulnerability is activated in the ancestor domain.

### Viewing Vulnerability Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can use the Firepower Management Center to view a table of vulnerabilities. Then, you can manipulate the event view depending on the information you are looking for.

The page you see when you access vulnerabilities differs depending on the workflow you use. You can use the predefined workflow, which includes a table view of vulnerabilities. The table view contains a row for each vulnerability in the database, regardless of whether any of your detected hosts exhibit the vulnerabilities. The second page of the predefined workflow contains a row for each vulnerability (that you have not deactivated) that applies to detected hosts on your network. The predefined workflow terminates in a vulnerability detail view, which contains a detailed description for every vulnerability that meets your constraints.

**Tip**

If you want to see the vulnerabilities that apply to a single host or set of hosts, perform a search for vulnerabilities, specifying an IP address or range of IP addresses for the hosts.

You can also create a custom workflow that displays only the information that matches your specific needs. The table of vulnerabilities is not restricted by domain in a multidomain deployment.

**Procedure**

**Step 1**
Access the table of vulnerabilities:
- If you are using the predefined vulnerabilities workflow, choose Analysis > Vulnerabilities > Vulnerabilities.
- If you are using a custom workflow that does not include the table view of vulnerabilities, click (switch workflow), then choose Vulnerabilities.

**Step 2**
You have the following options:
- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2288.
• Deactivate vulnerabilities so they are no longer used for intrusion impact correlation for currently vulnerable hosts; see Deactivating Multiple Vulnerabilities, on page 2322.

• View the details for a vulnerability by clicking view ( ) in the SVID column. Alternatively, constrain on the vulnerability ID and drill down to the vulnerability details page.

• View the full text of a vulnerability title by right-clicking the title and choosing Show Full Text.

### Viewing Vulnerability Details

**Procedure**

You can view vulnerability details in any of the following ways:

- Choose **Analysis > Vulnerabilities > Vulnerabilities**, and click view ( ) next to the SVID.
- Choose **Analysis > Vulnerabilities > Third-Party Vulnerabilities** and click view ( ) next to the SVID.
- Choose **Analysis > Hosts > Network Map**, and click **Vulnerabilities**.
- View the profile of a host affected by the vulnerability, and expand the **Vulnerabilities** section of the profile.

### Deactivating Multiple Vulnerabilities

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Deactivating a vulnerability within a vulnerabilities workflow that is not constrained by IP addresses deactivates the vulnerability for all detected hosts on your network.

In a multidomain deployment, deactivating a vulnerability in an ancestor domain deactivates it in all descendant domains. Leaf domains can activate or deactivate a vulnerability for their devices so long as the vulnerability is activated in the ancestor domain.

**Procedure**

**Step 1**
Access the table of vulnerabilities:
- If you are using the predefined vulnerabilities workflow, choose **Analysis > Vulnerabilities > Vulnerabilities**.
- If you are using a custom workflow that does not include the table view of vulnerabilities, click (switch workflow), then choose **Vulnerabilities**.

**Step 2**
Click **Vulnerabilities on the Network**.

**Step 3**
Check the check boxes next to vulnerabilities you want to deactivate.
Step 4  Click **Review** at the bottom of the page.

## Third-Party Vulnerability Data

The Firepower System includes its own vulnerability tracking database which is used, in conjunction with the system's fingerprinting capability, to identify the vulnerabilities associated with the hosts on your network.

You can augment the system's vulnerability data with imported network map data from third-party applications. To do so, your organization must be able to write scripts or create command line import files to import the data. For more information, see the **Firepower System Host Input API Guide**.

To include imported data in impact correlations, you must map third-party vulnerability information to the operating system and application definitions in the database. You cannot map third-party vulnerability information to client definitions.

### Viewing Third-Party Vulnerability Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

After you use the host input feature to import third-party vulnerability data, you can use the Firepower Management Center to view a table of third-party vulnerabilities. Then, you can manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access third-party vulnerabilities differs depending on the workflow you use. There are two predefined workflows. You can also create a custom workflow that displays only the information that matches your specific needs.

### Procedure

**Step 1**  Access the third-party vulnerabilities data:

- If you are using the predefined workflow, choose **Analysis > Vulnerabilities > Third-Party Vulnerabilities**.
- If you are using a custom workflow that does not include the table view of third-party vulnerabilities, click **(switch workflow)**, then choose **Vulnerabilities by Source** or **Vulnerabilities by IP Address**.

**Step 2**  You have the following options:

- Use a different workflow, including a custom workflow, by clicking **(switch workflow)**.
- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2288.
- Learn more about the contents of the columns in the table; see Third-Party Vulnerability Data Fields, on page 2324.
Third-Party Vulnerability Data Fields

Descriptions of the fields that can be viewed and searched in the third-party vulnerabilities table follow.

**Vulnerability Source**
The source of the third-party vulnerabilities, for example, QualysGuard or NeXpose.

**Vulnerability ID**
The ID number associated with the vulnerability for its source.

**IP Address**
The IP address associated with the host affected by the vulnerability.

**Port**
A port number, if the vulnerability is associated with a server running on a specific port.

**Bugtraq ID**

**CVE ID**
The identification number associated with the vulnerability in MITRE’s Common Vulnerabilities and Exposures (CVE) database ([https://cve.mitre.org/](https://cve.mitre.org/)).

**SVID**
The legacy vulnerability identification number that the system uses to track vulnerabilities

Click the view icon (🔍) to access the vulnerability details for the SVID.

**Snort ID**
The identification number associated with the vulnerability in the Snort ID (SID) database. That is, if an intrusion rule can detect network traffic that exploits a particular vulnerability, that vulnerability is associated with the intrusion rule’s SID.

Note that a vulnerability can be associated with more than one SID (or no SIDs at all). If a vulnerability is associated with more than one SID, the vulnerabilities table includes a row for each SID.

**Title**
The title of the vulnerability.
**Description**

A brief description of the vulnerability.

**Domain**

The domain of the host with the vulnerability. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

**Count**

The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows.

**Related Topics**

Event Searches, on page 2103

---

**Users and User Activity Data**

User and user activity data are displayed in individual user-related workflows:

- Users — this workflow displays all users seen on your network. A single user occupies a single row in this table. For more information, see User Data, on page 2328.

- User Activity — this workflow displays all user activity seen on your network. A single user with more than one instance of user activity would occupy several rows in this table. For more information, see User Activity Data, on page 2331.

For more information about the identity sources that populate these workflows, see About User Identity Sources, on page 1815.

**User-Related Fields**

User-related data is displayed in the users and user activity tables.

**Table 310: Users and User Activity Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Users Table</th>
<th>User Activity Table</th>
</tr>

<tbody>
<tr>
<td>Authentication Type</td>
<td>The type of authentication: No Authentication, Passive Authentication, Active Authentication, Guest Authentication, or Failed Authentication.</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Count</td>
<td><strong>Note</strong> The Count field appears only after you apply a constraint that creates two or more identical rows. The number of users or events that match the information that appears in a particular row.</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### User-Related Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Users Table</th>
<th>User Activity Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current IP</td>
<td>The IP address associated with the host that the user is logged into. This field is blank if another authoritative user logs into the host with the same IP address after the user’s login, unless the user is an authoritative user and the new user is a non-authoritative user. (The system associates the IP address with the last authoritative user that logged in with the host.)</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
| Department     | The user’s department, as obtained by a realm. If there is no department explicitly associated with the user on your servers, the department is listed as whatever default group the server assigns. For example, on Active Directory, this is `Users (ad)`. This field is blank if:  
  - You have not configured a realm.  
  - The Firepower Management Center cannot correlate the user in the FMC database with an LDAP record (for example, for users added to the database via an AIM, Oracle, or SIP login). | Yes         | No                  |
| Description    | More information, if available, about the user or user activity.                                                                                                                                                                                                                                                                           | No          | Yes                 |
| Device         | For user activity detected by traffic-based detection, the name of the device that detected the user. For other types of user activity, the managing Firepower Management Center.                                                                                                                                                   | No          | Yes                 |
| Domain         | In the Users table, the domain associated with the user’s realm. In the User Activity table, the domain where the user activity was detected. This field is only present if you have ever configured the Firepower Management Center for multitenancy.                                                                     | Yes         | Yes                 |
| E-Mail         | The user’s email address. This field is blank if:  
  - The user was added to the database via an AIM login.  
  - The user was added to the database via an LDAP login and there is no email address associated with the user on your LDAP servers.                                                                                                                                   | Yes         | No                  |
<p>| Endpoint Location | The IP address of the network device that used ISE to authenticate the user, as identified by ISE. If you do not configure ISE, this field is blank.                                                                                                                                                  | No          | Yes                 |
| Endpoint Profile | The user's endpoint device type, as identified by Cisco ISE. If you do not configure ISE, this field is blank.                                                                                                                                                                                                                       | No          | Yes                 |
| Event          | The user activity event type.                                                                                                                                                                                                                                                                                                             | No          | Yes                 |</p>

</tbody>
</table>

**User Data**

When an identity source reports a user login for a user who is not already in the database, the user is added to the database, unless you have specifically restricted that login type.

The system updates the users database when one of the following occurs:

- A user on the Firepower Management Center manually deletes a non-authoritative user from the Users table.
- An identity source reports a logoff by that user.
- A realm ends the user session as specified by the realm's User Session Timeout: Authenticated Users, User Session Timeout: Failed Authentication Users, or User Session Timeout: Guest Users setting.

**Note**

If you have ISE configured, you may see host data in the users table. Because host detection by ISE is not fully supported, you cannot perform user control using ISE-reported host data.

The type of user login that the system detected determines what information is stored about the new user.

|                  | Oracle     | • type (AD)  
|                  | SIP        |                  
|                  | HTTP       |                  
|                  | FTP        |                  
|                  | MDNS       |                  
|                  | POP3       | • username  
|                  | IMAP       | • current IP address  
|                  |            | • email address  
|                  |            | • type (pop3 or imap)  

If you configure a realm to automatically download users, the Firepower Management Center queries the servers based on the interval you specified. It may take five to ten minutes for the Firepower Management Center database to update with user metadata after the system detects a new user login. The Firepower Management Center obtains the following information and metadata about each user:

- username
- first and last names
- email address
- department
- telephone number
- current IP address
- Security Group Tag (SGT), if available
- endpoint profile, if available
- endpoint location, if available
- start port, if available
- end port, if available

The number of users the Firepower Management Center can store in its database depends on your Firepower Management Center model. When a non-authoritative user login to a host is detected, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user login is detected for that host, only another authoritative user login changes the current user.

Note that traffic-based detection of AIM, Oracle, and SIP logins create duplicate user records because they are not associated with any of the user metadata that the system obtains from LDAP servers. To prevent overuse of user count because of duplicate user records from these protocols, configure traffic-based detection to ignore those protocols.

You can search, view, and delete users from the database; you can also purge all users from the database.

For information about general user-related event troubleshooting, see Troubleshoot Realms and User Downloads, on page 1869.

### Viewing User Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can view a table of users, and then manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.
The page you see when you access users differs depending on the workflow you use. You can use the predefined workflow, which includes a table view of users that lists all detected users, and terminates in a user details page. The user details page provides information on every user that meets your constraints.

**Procedure**

**Step 1**
Access the users data:

- If you are using the predefined workflow, choose **Analysis > Users > Users**.
- If you are using a custom workflow that does not include the table view of users, click **(switch workflow)**, then choose **Users**.

**Step 2**
You have the following options:

- Use a different workflow, including a custom workflow, by clicking **(switch workflow)**.
- Perform basic workflow actions; see **Using Discovery and Identity Workflows, on page 2288**.
- Learn more about the contents of the columns in the table; see **User-Related Fields, on page 2325**.

---

**User Activity Data**

The Firepower System generates events that communicate the details of user activity on your network. When the system detects user activity, the user activity data is logged to the database. You can view, search, and delete user activity; you can also purge all user activity from the database.

The system logs a user activity event when a user is seen on your network for the first time. Subsequent appearances by that user do not log new user activity events. However, if the user's IP address changes, the system logs a new user activity event.

The Firepower System also correlates user activity with other types of events. For example, intrusion events can tell you the users who were logged into the source and destination hosts at the time of the event. This correlation can tell you who was logged into the host that was targeted by an attack, or who initiated an internal attack or portscan.

You can also use user activity in correlation rules. Based on the type of user activity as well as other criteria that you specify, you can build correlation rules that, when used in a correlation policy, launch remediations and alert responses when network traffic meets your criteria.

---

**Note**

If you have ISE configured, you may see host data in the users table. Because host detection by ISE is not fully supported, you cannot perform user control using ISE-reported host data.

Descriptions of the four types of user activity data follow.

**New User Identity**

This type of event is generated when the system detects a login by an unknown user that is not in the database.

The system logs a user activity event when a user is seen on your network for the first time. Subsequent appearances by that user do not log new user activity events. However, if the user's IP address changes, the system logs a new user activity event.
**User Login**

This type of event is generated when any of the following occur:

- A User Agent, ISE, or TS Agent reports a successful user login.
- Captive portal performs a successful or failed user authentication.
- Traffic-based detection detects a successful or failed user login.

---

**Note**

SMTP logins detected by traffic-based detection are not recorded unless there is already a user with a matching email address in the database.

When a non-authoritative user logs into a host, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user logs into the host, only a login by another authoritative user changes the current user.

If you are using captive portal or traffic-based detection, note the following about failed user login and failed user authentication data:

- Failed logins reported by traffic-based detection (LDAP, IMAP, FTP, and POP3 traffic) are displayed in the table view of user activity, but not in the table view of users. If a known user failed to log in, the system identifies them by their username. If an unknown user failed to log in, the system uses **Failed Authentication** as their username.
- Failed authentications reported by captive portal are displayed in both the table view of user activity and the table view of users. If a known user failed to authenticate, the system identifies them by their username. If an unknown user failed to authenticate, the system identifies them by the username they entered.

**Delete User Identity**

This type of event is generated when you manually delete a user from the database.

**User Identity Dropped: User Limit Reached**

This type of event is generated when the system detects a user that is not in the database, but cannot add the user because you have reached the maximum number of users in the database as determined by your Firepower Management Center model.

After you reach the user limit, in most cases the system stops adding new users to the database. To add new users, you must either manually delete old or inactive users from the database, or purge all users from the database.

However, the system favors authoritative users. If you have reached the limit and the system detects a login for a previously undetected authoritative user, the system deletes the non-authoritative user who has remained inactive for the longest time, and replaces it with the new authoritative user.

For information about general user-related event troubleshooting, see Troubleshoot Realms and User Downloads, on page 1869.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

You can view a table of user activity, and then manipulate the event view depending on the information you are looking for. The page you see when you access user activity differs depending on the workflow you use. You can use the predefined workflow, which includes the table view of user activity and terminates in a user details page, which contains user details for every user that meets your constraints. You can also create a custom workflow that displays only the information that matches your specific needs.

**Procedure**

**Step 1**

Access the user activity data:

- If you are using the predefined workflow, choose Analysis > Users > User Activity.
- If you are using a custom workflow that does not include the table view of user activity, click (switch workflow), then choose User Activity.

**Tip** If no events appear, you may need to adjust the time range; see Changing the Time Window, on page 2094.

**Step 2**

You have the following options:

- Use a different workflow, including a custom workflow, by clicking (switch workflow).
- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2288.
- Learn more about the contents of the columns in the table; see User-Related Fields, on page 2325.

**User Profile and Host History**

You can learn more about a specific user by viewing the User pop-up window. The page that appears, called the "User Profile" in this document, is titled "User Identity" in the web interface.

You can display the window from:

- any event view that associates user data with other kinds of events
- the table view of users

User information also appears in the terminating page for users workflows.

The user data you see is the same as you would see in the table view of users.

**Indications of Compromise Section**

For information about this section, see:

- Indications of Compromise, on page 1857
Host History Section

The host history provides a graphic representation of the last twenty-four hours of the user’s activity. A list of IP addresses of the hosts that the user logged into and logged off of approximates login and logout times with bar graphs. A typical user might log on to and off of multiple hosts in the course of a day. For example, periodic automated logins to a mail server would display as multiple short sessions, while longer logins (such as during working hours) display longer sessions.

If you use traffic-based detection or captive portal to capture failed logins, the host history also includes hosts where the user failed to log in.

The data used to generate the host history is stored in the user history database, which by default stores 10 million user login events. If you do not see any data in the host history for a particular user, either that user is inactive, or you may need to increase the database limit.

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

You have two options:

- In any event view that lists users, click user that appears next to a user identity ( ).
- In any users workflow, click the Users terminating page.
Correlation and Compliance Events

The following topics describe how to view correlation and compliance events.

- Viewing Correlation Events, on page 2335
- Using Compliance White List Workflows, on page 2339
- Remediation Status Events, on page 2343

Viewing Correlation Events

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

When a correlation rule within an active correlation policy triggers, the system generates a correlation event and logs it to the database.

**Note**

When a compliance white list within an active correlation policy triggers, the system generates a white list event.

You can view a table of correlation events, then manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access correlation events differs depending on the workflow you use. You can use the predefined workflow, which includes the table view of correlation events. You can also create a custom workflow that displays only the information that matches your specific needs.

**Procedure**

**Step 1** Choose Analysis > Correlation > Correlation Events.

Optionally, to use a different workflow, including a custom workflow, click (switch workflow) by the workflow title.
If you are using a custom workflow that does not include the table view of correlation events, click (switch workflow), then choose Correlation Events.

**Tip**
If you are using a custom workflow that does not include the table view of correlation events, click (switch workflow), then choose Correlation Events.

**Step 2**
 Optionally, adjust the time range as described in Changing the Time Window, on page 2094.

**Step 3**
Perform any of the following actions:

- To learn more about the columns that appear, see Correlation Event Fields, on page 2336.
- To view the host profile for an IP address, click host profile that appears next to the IP address.
- To view user identity information, click the user icon that appears next to the user identity ( ).
- To sort and constrain events or to navigate within the current workflow page, see Using Workflows, on page 2073.
- To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page.
- To drill down to the next page in the Workflows, constraining on a specific value, see Using Drill-Down Pages, on page 2081.
- To delete some or all correlation events, check the check boxes next to the events you want to delete and click Delete, or click Delete All and confirm you want to delete all the events in the current constrained view.
- To navigate to other event views to view associated events, see Inter-Workflow Navigation, on page 2100.

## Correlation Event Fields

When a correlation rule triggers, the system generates a correlation event. The fields in the correlation events table that can be viewed and searched are described in the following table.

**Table 311: Correlation Event Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>The description of the correlation event. The information in the description depends on how the rule was triggered. For example, if the rule was triggered by an operating system information update event, the new operating system name and confidence level appears.</td>
</tr>
<tr>
<td>Device</td>
<td>The name of the device that generated the event that triggered the policy violation.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Domain</td>
<td>The domain of the device whose monitored traffic triggered the policy violation. This field is only present if you have ever configured the Firepower Management Center for multitenancy.</td>
</tr>
</tbody>
</table>
| Impact                       | The impact level assigned to the correlation event based on the correlation between intrusion data, discovery data, and vulnerability information.  

When searching this field, valid case-insensitive values are Impact 0, Impact Level 0, Impact 1, Impact Level 1, Impact 2, Impact Level 2, Impact 3, Impact Level 3, Impact 4, and Impact Level 4. Do not use impact icon colors or partial strings (for example, do not use blue, level 1, or 0). |
| Ingress Interface or Egress Interface | The ingress or egress interface in the intrusion or connection event that triggered the policy violation.                                               |
| Ingress Security Zone or Egress Security Zone | The ingress or egress security zone in the intrusion or connection event that triggered the policy violation.                                      |
| Inline Result                | One of:  

- a black down arrow, indicating that the system dropped the packet that triggered the intrusion rule  
- a gray down arrow, indicating that the system would have dropped the packet in an inline, switched, or routed deployment if you enabled the **Drop when Inline** intrusion policy option  
- blank, indicating that the triggered intrusion rule was not set to Drop and Generate Events  

When using this field to search for policy violations triggered by intrusion events, type either:  

- dropped, to specify whether the packet was dropped in an inline, switched, or routed deployment  
- would have dropped, to specify whether the packet would have dropped if the intrusion policy had been set to drop packets in an inline, switched, or routed deployment  

Note that the system does not drop packets in a passive deployment, including when an inline set is in tap mode, regardless of the rule state or the drop behavior of the intrusion policy. |
<p>| Policy                       | The name of the policy that was violated.                                                                                                         |
| Priority                     | The priority of the correlation event, which is determined by the priority of either the triggered rule or the violated correlation policy. When searching this field, enter none for no priority. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule</td>
<td>The name of the rule that triggered the policy violation.</td>
</tr>
</tbody>
</table>
| Security Intelligence Category            | The name of the blacklisted object that represents or contains the blacklisted IP address in the event that triggered the policy violation.  
When searching this field, specify the Security Intelligence category associated with the correlation event that triggered the policy violation. The Security Intelligence category can be the name of a Security Intelligence object, the global blacklist, a custom Security Intelligence list or feed, or one of the categories in the Intelligence Feed.                                                                                                                                                                                                 |
| Source Continent or Destination Continent | The continent associated with the source or destination host IP addresses in the event that triggered the policy violation.                                                                                                                                                                                                                                                                                                                                                     |
| Source Country or Destination Country     | The country associated with the source or destination IP address in the event that triggered the policy violation.                                                                                                                                                                                                                                                                                                                                                                           |
| Source Host Criticality or Destination Host Criticality | The user-assigned host criticality of the source or destination host involved in the correlation event: None, Low, Medium, or High.  
Note that only correlation events generated by rules based on discovery events, host input events, or connection events contain a source host criticality.                                                                                                                                                                                                                                                                                          |
| Source IP or Destination IP               | The IP address of the source or destination host in the event that triggered the policy violation.                                                                                                                                                                                                                                                                                                                                                                               |
| Source Port/ICMP Type or Destination Port/ICMP Code | The source port or ICMP type for the source traffic or the destination port or ICMP code for destination traffic associated with the event that triggered the policy violation.                                                                                                                                                                                                                                                                                                             |
| Source User or Destination User           | The name of the user logged in to the source or destination host in the event that triggered the policy violation.                                                                                                                                                                                                                                                                                                                                                                   |
| Time                                      | The date and time that the correlation event was generated. This field is not searchable.                                                                                                                                                                                                                                                                                                                                                                                           |
| Count                                     | The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable.                                                                                                                                                                                                                                            |

Using Compliance White List Workflows

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst/Discovery Admin</td>
</tr>
</tbody>
</table>

The Firepower Management Center provides a set of workflows that you can use to analyze the white list events and violations that are generated for your network. The workflows are, along with the network map and dashboard, a key source of information about the compliance of your network assets.

The system provides predefined workflows for white list events and violations. You can also create custom workflows. When you are using a compliance white list workflow, you can perform many common actions.

**Procedure**

**Step 1** Access a white list workflow using the **Analysis > Correlation** menu.

**Step 2** You have the following options:

- **Switch Workflow** — To use a different workflow, including a custom workflow, click (switch workflow).
- **Time Range** — To adjust the time range, which is useful if no events appear, see Changing the Time Window, on page 2094.
- **Host Profile** — To view the host profile for an IP address, click host profile (균) or, for hosts with active indications of compromise (IOC) tags, the compromised host (균) that appears next to the IP address.
- **User Profile (events only)** — To view user identity information, click the user icon that appears next to the user identity (균).
- **Constrain** — To constrain the columns that appear, click close (균) in the column heading that you want to hide. In the pop-up window that appears, click **Apply**.

**Tip** To hide or show other columns, select or clear the appropriate check boxes before you click **Apply**. To add a disabled column back to the view, expand the search constraints, then click the column name under Disabled Columns.

- **Drill Down** — See Using Drill-Down Pages, on page 2081.
- **Sort** — To sort data in a workflow, click the column title. Click the column title again to reverse the sort order.
- **Navigate This Page** — See Workflow Page Traversal Tools, on page 2078.
- **Navigate Between Pages** — To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page.
- **Navigate Between Event Views** — To navigate to other event views to view associated events, click **Jump to** and select the event view from the drop-down list.
• Delete Events (events only) — To delete some or all items in the current constrained view, select the check boxes next to items you want to delete and click **Delete** or click **Delete All**.

**Viewing White List Events**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst/Discovery Admin</td>
</tr>
</tbody>
</table>

After its initial evaluation, the system generates a *white list event* whenever a monitored host goes out of compliance with an active white list. White list events are a special kind of correlation event, and are logged to the FMC correlation event database.

You can use the Firepower Management Center to view a table of compliance white list events. Then, you can manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access white list events differs depending on the workflow you use. You can use a predefined workflow, which terminates in a table view of events. You can also create a custom workflow that displays only the information that matches your specific needs.

**Procedure**

**Step 1**
Choose **Analysis > Correlation > White List Events**.

**Step 2**
You have the following options:

- To perform basic workflow actions, see *Using Compliance White List Workflows*, on page 2339.
- To learn more about the contents of the columns in the table, see *White List Event Fields*, on page 2340.
- To see more options, right-click values in the table.

**White List Event Fields**

White list events, which you can view and search using workflows, contain the following fields.

**Device**

The name of the managed device that detected the white list violation.
**Description**
A description of how the white list was violated. For example:

Client “AOL Instant Messenger” is not allowed.

Violations that involve an application protocol indicate the application protocol name and version, as well as the port and protocol (TCP or UDP) it is using. If you restrict prohibitions to a particular operating system, the description includes the operating system name. For example:

Server "ssh / 22 TCP (OpenSSH 3.6.1p2)" is not allowed on Operating System “Linux Linux 2.4 or 2.6”.

**Domain**
The domain of the host that has become non-compliant with the white list. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

**Host Criticality**
The user-assigned host criticality of the source host that is out of compliance with the white list: None, Low, Medium, or High.

**IP Address**
The IP address of the host that has become non-compliant with the white list.

**Policy**
The name of the correlation policy that was violated, that is, the correlation policy that includes the white list.

**Port**
The port, if any, associated with the discovery event that triggered an application protocol white list violation (a violation that occurred as a result of a non-compliant application protocol). For other types of white list violations, this field is blank.

**Priority**
The priority specified by the policy or white list that triggered the policy violation. This is determined either by the priority of the white list in a correlation policy or by the priority of the correlation policy itself. Note that the white list priority overrides the priority of its policy. When searching this field, enter none for no priority.

**Time**
The date and time that the white list event was generated. This field is not searchable.

**User**
The identity of any known user logged in to the host that has become non-compliant with the white list.

**White List**
The name of the white list.
Count

The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable.

Viewing White List Violations

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Analyst/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

The system keeps a record of the current white list violations on your network. Each violation represents something disallowed running on one of your hosts. If a host becomes compliant, the system removes the now-corrected violation from the database.

You can use the Firepower Management Center to view a table of white list violations for all active white lists. Then, you can manipulate the event view depending on the information you are looking for.

The page you see when you access white list violations differs depending on the workflow you use. The predefined workflows terminate in a host view, which contains a host profile for every host that meets your constraints. You can also create a custom workflow that displays only the information that matches your specific needs.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

Step 1
Choose Analysis > Correlation > White List Violations.

Step 2
You have the following options:

- To perform basic workflow actions, see Using Compliance White List Workflows, on page 2339.
- To learn more about the contents of the columns in the table, see White List Violation Fields, on page 2342.
- To see more options, right-click values in the table.

White List Violation Fields

White list violations, which you can view and search using workflows, contain the following fields.

Domain

The domain where the non-compliant host resides. This field is only present if you have ever configured the Firepower Management Center for multitenancy.
Information
Any available vendor, product, or version information associated with the white list violation. For protocols that violate a white list, this field also indicates whether the violation is due to a network or transport protocol.

IP Address
The IP address of the non-compliant host.

Port
The port, if any, associated with the event that triggered an application protocol white list violation (a violation that occurred as a result of a non-compliant application protocol). For other types of white list violations, this field is blank.

Protocol
The protocol, if any, associated with the event that triggered an application protocol white list violation (a violation that occurred as a result of a non-compliant application protocol). For other types of white list violations, this field is blank.

Time
The date and time that the white list violation was detected.

Type
The type of white list violation, that is, whether the violation occurred as a result of a non-compliant:
- operating system (os) (When searching this field, enter os or operating system.)
- application protocol (server)
- client
- protocol
- web application (web) (When searching this field, enter web application.)

White List
The name of the white list that was violated.

Count
The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable.

Remediation Status Events
When a remediation triggers, the system logs a remediation status event to the database. These events can be viewed on the Remediation Status page. You can search, view, and delete remediation status events.
Viewing Remediation Status Events

The page you see when you access remediation status events differs depending on the workflow you use. You can use the predefined workflow, which includes a table view of remediations. The table view contains a row for each remediation status event. You can also create a custom workflow that displays only the information that matches your specific needs.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

**Step 1**  Choose **Analysis > Correlation > Status**.

**Step 2**  Optionally, adjust the time range as described in **Changing the Time Window, on page 2094**.

**Step 3**  Optionally, to use a different workflow, including a custom workflow, click **(switch workflow)** by the workflow title.

**Tip**  If you are using a custom workflow that does not include the table view of remediations, click **(switch workflow)** menu by the workflow title, then choose **Remediation Status**.

**Step 4**  You have the following options:

- To learn more about the columns that appear, see **Remediation Status Table Fields, on page 2345**.
- To sort and constrain the events, see **Using Workflows, on page 2073**.
- To navigate to the correlation events view to see associated events, click **Correlation Events**.
- To bookmark the current page so that you can quickly return to it, click **Bookmark This Page**. To navigate to the bookmark management page, click **View Bookmarks**.
- To generate a report based on the data in the table view, click **Report Designer** as described in **Creating a Report Template from an Event View, on page 1977**.
- To drill down to the next page in the workflow, see **Using Drill-Down Pages, on page 2081**.
- To delete remediation status events from the system, check the check boxes next to events you want to delete and click **Delete** or click **Delete All** and confirm you want to delete all the events in the current constrained view.
- To search for remediation status events, click **Search**.

# Remediation Status Table Fields

The following table describes the fields in the remediation status table that can be viewed and searched.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>The domain of the device whose monitored traffic triggered the policy violation, that in turn triggered the remediation. This field is only present if you have ever configured the Firepower Management Center for multitenancy.</td>
</tr>
<tr>
<td>Policy</td>
<td>The name of the correlation policy that was violated and triggered the remediation.</td>
</tr>
<tr>
<td>Remediation Name</td>
<td>The name of the remediation that was launched.</td>
</tr>
<tr>
<td>Result Message</td>
<td>A message that describes what happened when the remediation was launched. Status messages include:</td>
</tr>
<tr>
<td></td>
<td>• Successful completion of remediation</td>
</tr>
<tr>
<td></td>
<td>• Error in the input provided to the remediation module</td>
</tr>
<tr>
<td></td>
<td>• Error in the remediation module configuration</td>
</tr>
<tr>
<td></td>
<td>• Error logging into the remote device or server</td>
</tr>
<tr>
<td></td>
<td>• Unable to gain required privileges on remote device or server</td>
</tr>
<tr>
<td></td>
<td>• Timeout logging into remote device or server</td>
</tr>
<tr>
<td></td>
<td>• Timeout executing remote commands or servers</td>
</tr>
<tr>
<td></td>
<td>• The remote device or server was unreachable</td>
</tr>
<tr>
<td></td>
<td>• The remediation was attempted but failed</td>
</tr>
<tr>
<td></td>
<td>• Failed to execute remediation program</td>
</tr>
<tr>
<td></td>
<td>• Unknown/unexpected error</td>
</tr>
<tr>
<td>Rule</td>
<td>The name of the correlation rule that triggered the remediation.</td>
</tr>
<tr>
<td>Time</td>
<td>The date and time that the Firepower Management Center launched the remediation.</td>
</tr>
</tbody>
</table>
Using the Remediation Status Events Table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable.</td>
</tr>
</tbody>
</table>

**Related Topics**

Event Searches, on page 2103

### Using the Remediation Status Events Table

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can change the layout of the event view or constrain the events in the view by a field value.

When you disable a column, it is disabled for the duration of your session unless you add it back later. If you disable the first column, the Count column is added.

Clicking a value within a row in a table view constrains the table view and does not drill down to the next page.

**Tip**

Table views always include “Table View” in the page name.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose Analysis > Correlation > Status.

**Tip** If you are using a custom workflow that does not include the table view of remediations, click (switch workflow) menu by the workflow title, then choose Remediation Status.

**Step 2** You have the following options:

- To learn more about the columns that appear, see Remediation Status Table Fields, on page 2345.
- To sort and constrain the events, see Using Workflows, on page 2073.
Auditing the System

The following topics describe how to audit activity on your system:

- The System Log, on page 2347
- About System Auditing, on page 2349

The System Log

The System Log (syslog) page provides you with system log information for the appliance.

You can audit activity on your system in two ways. The appliances that are part of the Firepower System generate an audit record for each user interaction with the web interface, and also record system status messages in the system log.

The system log displays each message generated by the system. The following items are listed in order:

- the date that the message was generated
- the time that the message was generated
- the host that generated the message
- the message itself

Viewing the System Log

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Global only</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

System log information is local. For example, you cannot use the Firepower Management Center to view system status messages in the system logs on your managed devices.

You can filter messages using most syntax accepted by the UNIX file search utility Grep. This includes using Grep-compatible regular expressions for pattern matching.
Procedure

Step 1  Choose **System > Monitoring > Syslog**.

Step 2  To search for specific message content in the system log:

a)  Enter a word or query in the filter field as described in **Syntax for System Log Filters**, on page 2348.

Only Grep-compatible search syntax is supported.

Examples:

To search for all log entries that contain the user name “Admin,” use `Admin`.

To search for all log entries that are generated on November 27, use `Nov[:space:]*27` or `Nov.*27` (but not `Nov 27` or `Nov*27`).

To search for all log entries that contain authorization debugging information on November 5, use `Nov[:space:]*5.*AUTH.*DEBUG`.

b)  To make your search case-sensitive, select **Case-sensitive**. (By default, filters are not case-sensitive.)

c)  To search for all system log messages that do **not** meet the criteria you entered, select **Exclusion**.

d)  Click **Go**.

Syntax for System Log Filters

The following table shows the regular expression syntax you can use in System Log filters:

**Table 313: System Log Filter Syntax**

<table>
<thead>
<tr>
<th>Syntax Component</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>.</td>
<td>Matches any character or white space</td>
<td><code>Admi.</code> matches <code>Admin</code>, <code>AdmiN</code>, <code>Admi1</code>, and <code>Admi6</code></td>
</tr>
<tr>
<td>[:alpha:]</td>
<td>Matches any alphabetic character</td>
<td><code>[:alpha:]dmin</code> matches <code>Admin</code>, <code>badmin</code>, and <code>cadmin</code></td>
</tr>
<tr>
<td>[:upper:]</td>
<td>Matches any uppercase alphabetic character</td>
<td><code>[:upper:]dmin</code> matches <code>Admin</code>, <code>badmin</code>, and <code>cadmin</code></td>
</tr>
<tr>
<td>[:lower:]</td>
<td>Matches any lowercase alphabetic character</td>
<td><code>[:lower:]dmin</code> matches <code>admin</code>, <code>badmin</code>, and <code>cadmin</code></td>
</tr>
<tr>
<td>[:digit:]</td>
<td>Matches any numeric character</td>
<td><code>[:digit:]dmin</code> matches <code>0dmin</code>, <code>1dmin</code>, and <code>2dmin</code></td>
</tr>
<tr>
<td>[:alnum:]</td>
<td>Matches any alphanumeric character</td>
<td><code>[:alnum:]dmin</code> matches <code>1dmin</code>, <code>admin</code>, <code>2dmin</code>, and <code>badmin</code></td>
</tr>
<tr>
<td>[:space:]</td>
<td>Matches any white space, including tabs</td>
<td><code>Feb[:space:]29</code> matches logs from February 29th</td>
</tr>
</tbody>
</table>
### About System Auditing

The appliances that are part of the Firepower System generate an audit record for each user interaction with the web interface.

**Related Topics**

[Standard Reports](#), on page 1972

### Audit Records

Firepower Management Centers and 7000 and 8000 Series devices log read-only auditing information for user activity. Audit logs are presented in a standard event view that allows you to view, sort, and filter audit log messages based on any item in the audit view. You can easily delete and report on audit information and can view detailed reports of the changes that users make.

The audit log stores a maximum of 100,000 entries. When the number of audit log entries exceeds 100,000, the appliance prunes the oldest records from the database to reduce the number to 100,000.

**Note**

If you reboot a 7000 or 8000 Series device, then log into the auxiliary CLI as soon as you are able, any commands you execute are not recorded in the audit log until the local web interface is available.

### Viewing Audit Records

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

On a Firepower Management Center or 7000 and 8000 Series devices, you can view a table of audit records. The predefined audit workflow includes a single table view of events. You can manipulate the table view depending on the information you are looking for. You can also create a custom workflow that displays only the information that matches your specific needs.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

---

<table>
<thead>
<tr>
<th>Syntax Component</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Matches zero or more instances of the character or expression it follows</td>
<td>ab* matches a, ab, abb, ca, cab, and cabb</td>
</tr>
<tr>
<td>?</td>
<td>Matches zero or one instances</td>
<td>ab? matches a or ab</td>
</tr>
<tr>
<td>\</td>
<td>Allows you to search for a character typically interpreted as regular expression syntax</td>
<td>alert? matches alert?</td>
</tr>
</tbody>
</table>
Procedure

Step 1
Access the audit log workflow using **System > Monitoring > Audit.**

Step 2
If no events appear, you may need to adjust the time range. For more information, see **Event Time Constraints, on page 2090.**

**Note**
Events that were generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.

Step 3
You have the following choices:

- To learn more about the contents of the columns in the table, see **The System Log, on page 2347.**
- To sort and constrain events on the current workflow page, see **Using Table View Pages, on page 2082.**
- To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page. For more information, see **Using Workflows, on page 2073.**
- To drill down to the next page in the workflow, see **Using Drill-Down Pages, on page 2081.**
- To constrain on a specific value, click a value within a row. If you click a value on a drill-down page, you move to the next page and constrain on the value. Note that clicking a value within a row in a table view constrains the table view and does **not** drill down to the next page. See **Event View Constraints, on page 2097** for more information.

**Tip**
Table views always include “Table View” in the page name.

- To delete audit records, check the check boxes next to events you want to delete, then click **Delete**, or click **Delete All** to delete all events in the current constrained view.
- To bookmark the current page so you can quickly return to it, click **Bookmark This Page**. For more information, see **Bookmarks, on page 2101.**
- To navigate to the bookmark management page, click **View Bookmarks**. For more information, see **Bookmarks, on page 2101.**
- To generate a report based on the data in the current view, click **Report Designer**. For more information, see **Creating a Report Template from an Event View, on page 1977.**
- To view a summary of a change recorded in the audit log, click compare (≡) next to applicable events in the **Message** column. For more information, see **Using the Audit Log to Examine Changes, on page 2352.**

**Related Topics**
**Event View Constraints, on page 2097**

**Audit Log Workflow Fields**

The following table describes the audit log fields that can be viewed and searched.

**Table 314: Audit Log Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time</td>
<td>Time and date that the appliance generated the audit record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User</td>
<td>User name of the user that triggered the audit event.</td>
</tr>
<tr>
<td>Subsystem</td>
<td>The full menu path the user followed to generate the audit record. For example, <strong>System &gt; Monitoring &gt; Audit</strong> is the menu path to view the audit log. In a few cases where a menu path is not relevant, the Subsystem field displays only the event type. For example, <strong>Login</strong> classifies user login attempts.</td>
</tr>
<tr>
<td>Message</td>
<td>The action the user performed or the button the user clicked on the page. For example, <strong>Page View</strong> signifies that the user simply viewed the page indicated in the Subsystem, while <strong>Save</strong> means that the user clicked the <strong>Save</strong> button on the page. Changes made to the Firepower System appear with a compare icon (olars) that you can click to see a summary of the changes.</td>
</tr>
<tr>
<td>Source IP</td>
<td>IP address associated with the host used by the user. Note: When searching this field you must type a specific IP address; you cannot use IP ranges when searching audit logs.</td>
</tr>
<tr>
<td>Domain</td>
<td>The current domain of the user when the audit event was triggered. This field is only present if you have ever configured the Firepower Management Center for multitenancy.</td>
</tr>
<tr>
<td>Configuration Change (search only)</td>
<td>Specifies whether to view audit records of configuration changes in the search results. (yes or no)</td>
</tr>
<tr>
<td>Count</td>
<td>The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable.</td>
</tr>
</tbody>
</table>

**Related Topics**

- Event Searches, on page 2103

**The Audit Events Table View**

You can change the layout of the event view or constrain the events in the view by a field value. When disabling columns, after you click the close icon (olars) in the column heading that you want to hide, in the pop-up window that appears, click **Apply**. When you disable a column, it is disabled for the duration of your session (unless you add it back later). Note that when you disable the first column, the Count column is added.
To hide or show other columns, or to add a disabled column back to the view, select or clear the appropriate check boxes before you click **Apply**.

Clicking a value within a row in a table view constrains the table view and does not drill down to the next page in the workflow.

---

**Tip**

Table views always include “Table View” in the page name.

---

**Related Topics**

[Using Workflows](#), on page 2073

---

**Using the Audit Log to Examine Changes**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can use the audit log to view detailed reports of changes to your system. These reports compare the current configuration of your system to its most recent configuration before a particular change.

The Compare Configurations page displays the differences between the system configuration before changes and the running configuration in a side-by-side format. The audit event type, time of last modification, and name of the user who made the change are displayed in the title bar above each configuration.

Differences between the two configurations are highlighted:

- Blue indicates that the highlighted setting is different in the two configurations, and the difference is noted in red text.
- Green indicates that the highlighted setting appears in one configuration but not the other.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1**  
Choose **System > Monitoring > Audit**.

**Step 2**  
Click compare () next to an applicable audit log event in the **Message** column.

**Tip**  
You can navigate through changes individually by clicking **Previous** or **Next** above the title bar. If the change summary is more than one page long, you can also use the scroll bar on the right to view additional changes.

---

**Suppressing Audit Records**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>
If your auditing policy does not require that you audit specific types of user interactions with the Firepower System, you can prevent those interactions from generating audit records on a Firepower Management Center or 7000 and 8000 Series devices. For example, by default, each time a user views the online help, the Firepower System generates an audit record. If you do not need to keep a record of these interactions, you can automatically suppress them.

To configure audit event suppression, you must have access to an appliance’s admin user account, and you must be able to either access the appliance’s console or open a secure shell.

⚠️ Caution

Make sure that only authorized personnel have access to the appliance and to its admin account.

Procedure

In the /etc/sf directory, create one or more AuditBlock files in the following form, where type is one of the types described in Audit Block Types, on page 2353:

AuditBlock.type

Note If you create an AuditBlock.type file for a specific type of audit message, but later decide that you no longer want to suppress them, you must delete the contents of the AuditBlock.type file but leave the file itself on the Firepower System.

Audit Block Types

The contents for each audit block type must be in a specific format, as described in the following table. Make sure you use the correct capitalization for the file names. Note also that the contents of the files are case sensitive.

Note that when you add an AuditBlock file, an audit record with a subsystem of Audit and a message of Audit Filter type Changed is added to the audit events. For security reasons, this audit record cannot be suppressed.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>Create a file named AuditBlock.address and include, one per line, each IP address that you want to suppress from the audit log. You can use partial IP addresses provided that they map from the beginning of the address. For example, the partial address 10.1.1 matches addresses from 10.1.1.0 through 10.1.1.255.</td>
</tr>
</tbody>
</table>
**Type** | **Description**
---|---
Message | Create a file named `AuditBlock.message` and include, one per line, the message substrings that you want to suppress. Note that substrings are matched so that if you include `backup` in your file, all messages that include the word `backup` are suppressed.

Subsystem | Create a file named `AuditBlock.subsystem` and include, one per line, each subsystem that you want to suppress. Note that substrings are not matched. You must use exact strings. See Audited Subsystems, on page 2354 for a list of subsystems that are audited.

User | Create a file named `AuditBlock.user` and include, one per line, each user account that you want to suppress. You can use partial string matching provided that they map from the beginning of the username. For example, the partial username `IPSAnalyst` matches the user names `IPSAnalyst1` and `IPSAnalyst2`.

---

**Audited Subsystems**

The following table lists audited subsystems.

About Sending Audit Logs to an External Location

To send audit logs to an external location from the FMC, see:

- Audit Logs, on page 821
- Audit Log Certificate, on page 823

For Classic devices, see:

- Stream Audit Logs from Classic Devices, on page 860
- Require Valid Audit Log Server Certificates for Classic Devices, on page 861
- Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device, on page 868
Security, Internet Access, and Communication Ports

The following topics provide information on system security, internet access, and communication ports:

- Security Requirements, on page 2357
- Cisco Clouds, on page 2357
- Internet Access Requirements, on page 2358
- Communication Port Requirements, on page 2360

Security Requirements

To safeguard the Firepower Management Center, you should install it on a protected internal network. Although the FMC is configured to have only the necessary services and ports available, you must make sure that attacks cannot reach it (or any managed devices) from outside the firewall.

If the FMC and its managed devices reside on the same network, you can connect the management interfaces on the devices to the same protected internal network as the FMC. This allows you to securely control the devices from the FMC. You can also configure multiple management interfaces to allow the FMC to manage and isolate traffic from devices on other networks.

Regardless of how you deploy your appliances, inter-appliance communication is encrypted. However, you must still take steps to ensure that communications between appliances cannot be interrupted, blocked, or tampered with; for example, with a distributed denial of service (DDoS) or man-in-the-middle attack.

Cisco Clouds

The Firepower System uses Cisco’s Collective Security Intelligence (CSI) cloud to obtain the threat intelligence data it uses to assess risk for files and to obtain URL category and reputation. With the correct licenses, you can specify communications options for the AMP for Networks and URL Filtering features.

Additional information:

- Advanced Malware Protection
  The public cloud is configured by default; to make changes, see Change AMP Options, on page 1335.
- URL filtering
Internet Access Requirements

By default, Firepower appliances are configured to connect to the internet on ports 443/tcp (HTTPS) and 80/tcp (HTTP). If you do not want your appliances to have direct access to the internet, you can configure a proxy server.

In most cases, it is the Firepower Management Center that accesses the internet. However, sometimes managed devices also access the internet. For example, if your malware protection configuration uses dynamic analysis, managed devices submit files directly to the Cisco Threat Grid cloud. Or, you may synchronize a device to an external NTP server.

Tip
If you are using AMP for Networks or AMP for Endpoints, your location can determine which AMP cloud resources the FMC accesses. The Required Server Addresses for Proper AMP Operations Troubleshooting TechNote lists the internet resources (including static IP addresses) required not only by Firepower appliances, but also by Cisco AMP components like connectors and private cloud appliances.

Both FMCs in a high availability pair should have internet access. Depending on the feature, sometimes both peers access the internet, and sometimes only the active peer does.

</tr>
</tbody>
</table>
Communication Port Requirements

Firepower appliances communicate using a two-way, SSL-encrypted communication channel on port 8305/tcp. This port must remain open for basic intra-platform communication.

Other ports allow secure management, as well as access to external resources required by specific features. In general, feature-related ports remain closed until you enable or configure the associated feature. Do not change or close an open port until you understand how this action will affect your deployment.

Table 318: Firepower Communication Port Requirements

The Classic device CLI reference applies to:

- 7000 and 8000 Series
- ASA FirePOWER
- NGIPSv

For other Firepower appliances:

- Firepower Threat Defense: See the Cisco Firepower Threat Defense Command Reference.
- Firepower Management Center: Not available. Instead, the FMC supports Linux shell access under Cisco Technical Assistance Center (TAC) supervision.

- About the Classic Device CLI, on page 2363
- Classic Device CLI Management Commands, on page 2364
- Classic Device CLI Show Commands, on page 2367
- Classic Device CLI Configuration Commands, on page 2396
- Classic Device CLI System Commands, on page 2415

### About the Classic Device CLI

After you log into a Classic device (7000 and 8000 Series, ASA FirePOWER, NGIPSv) via the CLI (see Logging Into the CLI on 7000/8000 Series, ASA FirePOWER, and NGIPSv Devices, on page 27), you can use the commands described in this appendix to view, configure, and troubleshoot your device.

**Note**

If you reboot a 7000 or 8000 Series device and then log in to the CLI as soon as you are able, any commands you execute are not recorded in the audit log until the web interface is available.

Note that CLI commands are case-insensitive with the exception of parameters whose text is not part of the CLI framework, such as user names and search filters.

**Related Topics**

Firepower System User Interfaces, on page 21
Classic Device CLI Modes

The CLI encompasses four modes. The default mode, CLI Management, includes commands for navigating within the CLI itself. The remaining modes contain commands addressing three different areas of classic device functionality; the commands within these modes begin with the mode name: system, show, or configure.

When you enter a mode, the CLI prompt changes to reflect the current mode. For example, to display version information about system components, you can enter the full command at the standard CLI prompt:

> show version

If you have previously entered show mode, you can enter the command without the show keyword at the show mode CLI prompt:

show> version

Classic Device CLI Access Levels

Within each mode, the commands available to a user depend on the user’s CLI access. When you create a user account, you can assign it one of the following CLI access levels:

- Basic — The user has read-only access and cannot run commands that impact system performance.
- Configuration — The user has read-write access and can run commands that impact system performance.
- None — The user is unable to log into the CLI.

On 7000 and 8000 Series devices, you can assign command line permissions on the User Management page in the local web interface. On NGIPSv and ASA FirePOWER, you assign command line permissions using the CLI.

Classic Device CLI Management Commands

The CLI management commands provide the ability to interact with the CLI. These commands do not affect the operation of the device.

configure password

Allows the current user to change their password. After issuing the command, the CLI prompts the user for their current (or old) password, then prompts the user to enter the new password twice.

Access
Basic

Syntax
configure password
Example

> configure password
Enter current password:
Enter new password:
Confirm new password:

exit

Moves the CLI context up to the next highest CLI context level. Issuing this command from the default mode logs the user out of the current CLI session, and is equivalent to issuing the `logout` CLI command.

Access
Basic

Syntax

exit

Example

configure network ipv4> exit
configure network>

expert

Invokes the Linux shell.

Caution

We strongly recommend that you do not use the Linux shell unless directed by Cisco TAC or explicit instructions in the user documentation. For more information, see Firepower System User Accounts, on page 19.

Access
Configuration

Syntax

expert

Example

> expert
**history**

Displays the command line history for the current session.

**Access**
Basic

**Syntax**

```
history limit
```

where `limit` sets the size of the history list. To set the size to unlimited, enter zero.

**Example**

```
history 25
```

**logout**

Logs the current user out of the current CLI console session.

**Access**
Basic

**Syntax**

```
logout
```

**Example**

```
> logout
```

**? (question mark)**

Displays context-sensitive help for CLI commands and parameters. Use the question mark (```?``` command as follows:

- To display help for the commands that are available within the current CLI context, enter a question mark (```?``` at the command prompt.
- To display a list of the available commands that start with a particular character set, enter the abbreviated command immediately followed by a question mark (```?```).
- To display help for a command’s legal arguments, enter a question mark (```?``` in place of an argument at the command prompt.

Note that the question mark (```?``` is not echoed back to the console.
Classic Device CLI Show Commands

Show commands provide information about the state of the device. These commands do not change the operational mode of the device and running them has minimal impact on system operation. Most show commands are available to all CLI users; however, only users with configuration CLI access can issue the show user command.

**access-control-config**

Displays the currently deployed access control configurations, including:

- Security Intelligence settings
- Names of any subpolicies the access control policy invokes
- Intrusion variable set data
- Logging settings
- Other advanced settings, including policy-level performance, preprocessing, and general settings

Also displays policy-related connection information, such as source and destination port data (including type and code for ICMP entries) and the number of connections that matched each access control rule (hit counts).
alarms

Displays currently active (failed/down) hardware alarms on the device. This command is not available on NGIPSv and ASA FirePOWER devices.

**Access**
Basic

**Syntax**

```
show alarms
```

**Example**

```
> show alarms
```

arp-tables

Displays the Address Resolution Protocol tables applicable to your network. This command is not available on NGIPSv and ASA FirePOWER.

**Access**
Basic

**Syntax**

```
show arp-tables
```

**Example**

```
> show arp-tables
```

audit-log

Displays the audit log in reverse chronological order; the most recent audit log events are listed first.

**Access**
Basic

**Syntax**

```
show audit-log
```
Example

> show audit-log

**audit_cert**

Displays the current audit log client certificate.

**Access**
Basic

**Syntax**

show audit_cert

Example

> show audit_cert

**bypass**

On 7000 or 8000 Series devices, lists the inline sets in use and shows the bypass mode status of those sets as one of the following:

- **armed**—the interface pair is configured to go into hardware bypass if it fails (**Bypass Mode: Bypass**), or has been forced into fail-close with the `configure bypass close` command
- **engaged**—the interface pair has failed open or has been forced into hardware bypass with the `configure bypass open` command
- **off**—the interface pair is set to fail-close (**Bypass Mode: Non-Bypass**); packets are blocked if the interface pair fails

**Access**
Basic

**Syntax**

show bypass

Example

> show bypass
s1p1 ↔ s1p2: status 'armed'
s1p1 ↔ s1p2: status 'engaged'
high-availability Commands

Displays information about high-availability configuration, status, and member devices or stacks. This command is not available on NGIPSv and ASA FirePOWER devices.

Access
Basic

config

Displays the high-availability configuration on the device.

Syntax

show high-availability config

Example

> show high-availability config

high-availability ha-statistics

Displays state sharing statistics for a device in a high-availability pair.

Syntax

show high-availability ha-statistics

Example

> show high-availability ha-statistics

cpu

Displays the current CPU usage statistics appropriate for the platform for all CPUs on the device.

For 7000 and 8000 Series devices, the following values are displayed:

• CPU — Processor number.
• Load — The CPU utilization, represented as a number from 0 to 100. 0 is not loaded and 100 is completely loaded.

For NGIPSv and ASA FirePOWER, the following values are displayed:

• CPU — Processor number.
• %user — Percentage of CPU utilization that occurred while executing at the user level (application).
• %nice — Percentage of CPU utilization that occurred while executing at the user level with nice priority.

• %sys — Percentage of CPU utilization that occurred while executing at the system level (kernel). This does not include time spent servicing interrupts or softirqs. A softirq (software interrupt) is one of up to 32 enumerated software interrupts that can run on multiple CPUs at once.

• %iowait — Percentage of time that the CPUs were idle when the system had an outstanding disk I/O request.

• %irq — Percentage of time spent by the CPUs to service interrupts.

• %soft — Percentage of time spent by the CPUs to service softirqs.

• %steal — Percentage of time spent in involuntary wait by the virtual CPUs while the hypervisor was servicing another virtual processor.

• %guest — Percentage of time spent by the CPUs to run a virtual processor.

• %idle — Percentage of time that the CPUs were idle and the system did not have an outstanding disk I/O request.

**Access**
Basic

**Syntax**

`show cpu [procnum]`

where `procnum` is the number of the processor for which you want the utilization information displayed. Valid values are 0 to one less than the total number of processors on the system. If `procnum` is used for a 7000 or 8000 Series device, it is ignored because for that platform, utilization information can only be displayed for all processors.

```
> show cpu
```

**database Commands**

The `show database` commands configure the device’s management interface.

**Access**
Basic

**processes**

Displays a list of running database queries.

**Access**
Basic
Syntax

show database processes

Example

> show database processes

database

Displays the slow query log of the database.

Access

Basic

Syntax

show database slow-query-log

Example

> show database slow-query-log

device-settings

Displays information about application bypass settings specific to the current device.

Access

Basic

Syntax

show device-settings

Example

> show device-settings

disk

Displays the current disk usage.
Access
Basic

Syntax

show disk

Example

> show disk

disk-manager

Displays detailed disk usage information for each part of the system, including silos, low watermarks, and high watermarks.

Access
Basic

Syntax

show disk-manager

Example

> show disk-manager

dns

Displays the current DNS server addresses and search domains.

Access
Basic

Syntax

show dns

Example

> show dns
**fan-status**

Displays the current status of hardware fans. This command is not available on NGIPSv and ASA FirePOWER devices.

**Access**
Basic

**Syntax**

```plaintext
show fan-status
```

**Example**

```
> show fan-status
```

**fastpath-rules**

Displays the currently configured 8000 Series fastpath rules. This command is only available on 8000 Series devices.

**Access**
Basic

**Syntax**

```plaintext
show fastpath-rules
```

**Example**

```
> show fastpath-rules
```

**gui**

Displays the current state of the web interface. This command is not available on NGIPSv and ASA FirePOWER.

**Access**
Basic

**Syntax**

```plaintext
show gui
```
Example

> show gui

hostname

Displays the device’s host name and appliance UUID. If you edit the host name of a device using the CLI, confirm that the changes are reflected on the managing Firepower Management Center. In some cases, you may need to edit the device management settings manually.

Access
Basic

Syntax

show hostname

Example

> show hostname

hosts

Displays the contents of an ASA FirePOWER module’s /etc/hosts file.

Access
Basic

Syntax

show hosts

Example

> show hosts

hyperthreading

Displays whether hyperthreading is enabled or disabled. This command is not available on ASA FirePOWER.

Access
Basic
inline-sets

Displays configuration data for all inline security zones and associated interfaces. This command is not available on ASA FirePOWER.

Access
Basic

Syntax
show inline-sets

Example
> show inline-sets

interfaces

If no parameters are specified, displays a list of all configured interfaces. If a parameter is specified, displays detailed information about the specified interface.

Access
Basic

Syntax
show interfaces interface
where interface is the specific interface for which you want the detailed information.

Example
> show interfaces
ifconfig

Displays the interface configuration for an ASA FirePOWER module.

Access
Basic

Syntax

show ifconfig

Example

> show ifconfig

lcd

Displays whether the LCD hardware display is enabled or disabled. This command is not available on NGIPSv and ASA FirePOWER.

Access
Basic

Syntax

show lcd

Example

> show lcd

link-aggregation Commands

The show link-aggregation commands display configuration and statistics information for link aggregation groups (LAGs). This command is not available on NGIPSv and ASA FirePOWER devices.

Access
Basic

configuration

Displays configuration details for each configured LAG, including LAG ID, number of interfaces, configuration mode, load-balancing mode, LACP information, and physical interface type.
show link-aggregation configuration

Example
> show link-aggregation configuration

statistics

Displays statistics, per interface, for each configured LAG, including status, link state and speed, configuration mode, counters for received and transmitted packets, and counters for received and transmitted bytes.

Access
Basic

Syntax

show link-aggregation statistics

Example
> show link-aggregation statistics

link-state

Displays type, link, and speed, duplex state, and bypass mode of the ports on the device. This command is not available on ASA FirePOWER devices.

Access
Basic

Syntax

show link-state

Example
> show link-state
**log-ips-connection**

Displays whether the logging of connection events that are associated with logged intrusion events is enabled or disabled.

**Access**
Basic

**Syntax**

`show log-ips-connection`

**Example**

```
> show log-ips-connection
```

**managers**

Displays the configuration and communication status of the Firepower Management Center. Registration key and NAT ID are only displayed if registration is pending.

If a device is configured as a secondary device in a stacked configuration, information about both the managing FMC and the primary device is displayed.

**Access**
Basic

**Syntax**

`show managers`

**Example**

```
> show managers
```

**memory**

Displays the total memory, the memory in use, and the available memory for the device.

**Access**
Basic
Syntax

show memory

Example

> show memory

model

Displays model information for the device.

Access

Basic

Syntax

show model

Example

> show model

mpls-depth

Displays the number of MPLS layers configured on the management interface, from 0 to 6. This command is not available on NGIPSv and ASA FirePOWER.

Access

Basic

Syntax

show mpls-depth

Example

> show mpls-depth

NAT Commands

The show nat commands display NAT data and configuration information for the management interface. This command is not available on NGIPSv and ASA FirePOWER devices.
Access
Basic

active-dynamic
Displays NAT flows translated according to dynamic rules. These entries are displayed when a flow matches a rule, and persist until the rule has timed out. Therefore, the list can be inaccurate. Timeouts are protocol dependent: ICMP is 5 seconds, UDP is 120 seconds, TCP is 3600 seconds, and all other protocols are 60 seconds.

Syntax

show nat active-dynamic

Example

> show nat active-dynamic

active-static
Displays NAT flows translated according to static rules. These entries are displayed as soon as you deploy the rule to the device, and the list does not indicate active flows that match a static NAT rule.

Syntax

show nat active-static

Example

> show nat active-static

allocators
Displays information for all NAT allocators, the pool of translated addresses used by dynamic rules.

Syntax

show nat allocators

Example

> show nat allocators

config
Displays the current NAT policy configuration for the management interface.
**Syntax**

show nat config

**Example**

> show nat config

dynamic-rules

Displays dynamic NAT rules that use the specified allocator ID.

**Syntax**

show nat dynamic-rules allocator_id

where *allocator_id* is a valid allocator ID number.

**Example**

> show nat dynamic-rules 9

flows

Displays the number of flows for rules that use the specified allocator ID.

**Syntax**

show nat flows allocator-id

where *allocator_id* is a valid allocator ID number.

**Example**

> show nat flows 81

static-rules

Displays all static NAT rules.

**Syntax**

show nat static-rules
Example

> show nat static-rules

**netstat**

Displays the active network connections for an ASA FirePOWER module.

**Access**
Basic

**Syntax**

```
show netstat
```

**Example**

> show netstat

**network**

Displays the IPv4 and IPv6 configuration of the management interface, its MAC address, and HTTP proxy address, port, and username if configured.

**Access**
Basic

**Syntax**

```
show network
```

**Example**

> show network

**network-modules**

Displays all installed modules and information about them, including serial numbers. This command is not available on NGIPSv and ASA FirePOWER.

**Access**
Basic
Syntax

show network-modules

Example

> show network-modules

network-static-routes

Displays all configured network static routes and information about them, including interface, destination address, network mask, and gateway address.

Access
Basic

Syntax

show network-static-routes

Example

> show network-static-routes

ntp

Displays the ntp configuration.

Access
Basic

Syntax

show ntp

Example

> show ntp

perfstats

Displays performance statistics for the device.
portstats

Displays port statistics for all installed ports on the device. This command is not available on NGIPSv and ASA FirePOWER.

Access
Basic

Syntax

show perfstats

Example

> show perfstats

power-supply-status

Displays the current state of hardware power supplies. This command is not available on NGIPSv and ASA FirePOWER.

Note
If an 8000 Series managed device experiences a power failure, it may take up to 15 minutes for the show power-supply-status CLI command to reflect the correct status.

Access
Basic
Syntax

show power-supply-status

Example

> show power-supply-status

process-tree

Displays processes currently running on the device, sorted in tree format by type.

Access

Basic

Syntax

show process-tree

Example

> show process-tree

processes

Displays processes currently running on the device, sorted by descending CPU usage.

Access

Basic

Syntax

show processes sort-flag filter

where sort-flag can be -m to sort by memory (descending order), -u to sort by username rather than the process name, or verbose to display the full name and path of the command. The filter parameter specifies the search term in the command or username by which results are filtered. The header row is still displayed.

Example

> show processes -u user1
route

Displays the routing information for an ASA FirePOWER module.

Access
Basic

Syntax
show route

Example
> show route

routing-table

If no parameters are specified, displays routing information for all virtual routers. If parameters are specified, displays routing information for the specified router and, as applicable, its specified routing protocol type. All parameters are optional. This command is not available on NGIPSv and ASA FirePOWER.

Access
Basic

Syntax
show routing-table name [ ospf | rip | static ]

where name is the name of the specific router for which you want information, and ospf, rip, and static specify the routing protocol type.

Example
> show routing-table Vrouter1 static

serial-number

Displays the chassis serial number. This command is not available on NGIPSv.

Access
Basic
Syntax

show serial-number

Example

> show serial-number

ssl-policy-config

Displays the currently deployed SSL policy configuration, including policy description, default logging settings, all enabled SSL rules and rule configurations, trusted CA certificates, and undecryptable traffic actions.

Access
Basic

Syntax

show ssl-policy-config

Example

> show ssl-policy-config

stacking

Shows the stacking configuration and position on managed devices; on devices configured as primary, also lists data for all secondary devices. For stacks in a high-availability pair, this command also indicates that the stack is a member of a high-availability pair. The user must use the web interface to enable or (in most cases) disable stacking; if stacking is not enabled, the command will return Stacking not currently configured. This command is not available on NGIPSv and ASA FirePOWER.

Access
Basic

Syntax

show stacking

Example

> show stacking
**summary**

Displays a summary of the most commonly used information (version, type, UUID, and so on) about the device. For more detailed information, see the following `show` commands: `version`, `interfaces`, `device-settings`, and `access-control-config`.

**Access**

Basic

**Syntax**

`show summary`

**Example**

`> show summary`

---

**syslog**

Displays the system log in reverse chronological order. You can optionally specify a filter to display specific records based on content and the number of records to display per page view (the default is 25).

**Access**

Basic

**Syntax**

`show syslog ["filter" records_per_page]`

where `filter` specifies a Grep-compatible search filter and `records_per_page` specifies the number of records to display with each page view. See Syntax for System Log Filters, on page 2348 for more information on search filters.

**Example**

`> show syslog "ssh" 20`

The system displays the 20 most recent syslog records containing the string "ssh". To display the next 20 records, press Enter; to stop the display enter q.

---

**time**

Displays the current date and time in UTC and in the local time zone configured for the current user.
**Access Basic Syntax**

```
show time
```

**Example**

```
> show time
```

### traffic-statistics

If no parameters are specified, displays details about bytes transmitted and received from all ports. If a port is specified, displays that information only for the specified port. You cannot specify a port for ASA FirePOWER modules; the system displays only the data plane interfaces.

**Note**

In some situations the output of this command may show packet drops when, in point of fact, the device is not dropping traffic. Drop counters increase when malformed packets are received. A malformed packet may be missing certain information in the header or it may have failed a cyclical-redundancy check (CRC). Typically, common root causes of malformed packets are data link layer issues such as bad cables or a bad interface. The dropped packets are not logged. However, if the source is a reliable transport protocol such as TCP, the packets will be retransmitted.

**Access Basic Syntax**

```
show traffic-statistics port
```

where `port` is the specific port for which you want information.

**Example**

```
> show traffic-statistics s1p1
```

### user

Applicable to NGIPSv only. Displays detailed configuration information for the specified user(s). The following values are displayed:

- Login — the login name
• UID — the numeric user ID
• Auth (Local or Remote) — how the user is authenticated
• Access (Basic or Config) — the user's privilege level
• Enabled (Enabled or Disabled) — whether the user is active
• Reset (Yes or No) — whether the user must change password at next login
• Exp (Never or a number) — the number of days until the user's password must be changed
• Warn (N/A or a number) — the number of days a user is given to change their password before it expires
• Str (Yes or No) — whether the user's password must meet strength checking criteria
• Lock (Yes or No) — whether the user's account has been locked due to too many login failures
• Max (N/A or a number) — the maximum number of failed logins before the user's account is locked

**Access**

Configuration

**Syntax**

```
show user username username username ...
```

where `username` specifies the name of the user and the usernames are space-separated.

**Example**

```
> show user jdoe
```

**users**

Applicable to NGIPSv and ASA FirePOWER only. Displays detailed configuration information for all local users. The following values are displayed:

• Login — the login name
• UID — the numeric user ID
• Auth (Local or Remote) — how the user is authenticated
• Access (Basic or Config) — the user's privilege level
• Enabled (Enabled or Disabled) — whether the user is active
• Reset (Yes or No) — whether the user must change password at next login
• Exp (Never or a number) — the number of days until the user's password must be changed
• Warn (N/A or a number) — the number of days a user is given to change their password before it expires
• Str (Yes or No) — whether the user's password must meet strength checking criteria
• Lock (Yes or No) — whether the user's account is locked due to too many login failures
• Max (N/A or a number) — the maximum number of failed logins before the user's account is locked

Access
Configuration

Syntax

show users

Example

> show users

version

Displays the product version and build. If the detail parameter is specified, displays the versions of additional components.

Note

The detail parameter is not available on ASA with FirePOWER Services.

Access
Basic

Syntax

show version [detail]

Example

> show version

virtual-routers

If no parameters are specified, displays a list of all currently configured virtual routers with DHCP relay, OSPF, and RIP information. If parameters are specified, displays information for the specified router, limited by the specified route type. All parameters are optional. This command is not available on NGIPSv and ASA FirePOWER.

Access
Basic
Syntax

show virtual-routers [ dhcprelay | ospf | rip ] name

where dhcprelay, ospf, and rip specify for route types, and name is the name of the specific router for which you want information. If you specify ospf, you can then further specify neighbors, topology, or lsadb between the route type and (if present) the router name.

Example

> show virtual-routers ospf VRouter2

virtual-switches

If no parameters are specified, displays a list of all currently configured virtual switches. If parameters are specified, displays information for the specified switch. This command is not available on NGIPSv and ASA FirePOWER.

Access

Basic

Syntax

show virtual-switches name

Example

> show virtual-switches Vswitch1

vmware-tools

Indicates whether VMware Tools are currently enabled on a virtual device. This command is available only on NGIPSv.

VMware Tools is a suite of utilities intended to enhance the performance of the virtual machine. These utilities allow you to make full use of the convenient features of VMware products. The system supports the following plugins on all virtual appliances:

- guestInfo
- powerOps
- timeSync
- vmbackup

For more information about VMware Tools and the supported plugins, see the VMware website (http://www.vmware.com).
**Access Basic**

**Syntax**

```
show vmware-tools
```

**Example**

```
> show vmware-tools
```

---

**VPN Commands**

The `show VPN` commands display VPN status and configuration information for VPN connections. This command is not available on NGIPSv and ASA FirePOWER devices.

**Access Basic**

**config**

Displays the configuration of all VPN connections.

**Syntax**

```
show vpn config
```

**Example**

```
> show vpn config
```

**config by virtual router**

Displays the configuration of all VPN connections for a virtual router.

**Syntax**

```
show vpn config virtual router
```

**Example**

```
> show vpn config VRouter1
```
status

Displays the status of all VPN connections.

Syntax

show vpn status

Example

> show vpn status

status by virtual router

Displays the status of all VPN connections for a virtual router.

Syntax

show vpn status virtual router

Example

> show vpn status VRouter1

counters

Displays the counters for all VPN connections.

Syntax

show vpn counters

Example

> show vpn counters

counters by virtual router

Displays the counters of all VPN connections for a virtual router.

Syntax

show vpn counters virtual router
Example

> show vpn counters VRouter1

Classic Device CLI Configuration Commands

The configuration commands enable the user to configure and manage the system. These commands affect system operation; therefore, with the exception of Basic-level `configure password`, only users with configuration CLI access can issue these commands.

audit_cert Commands

The `configure audit_cert` commands configure the device’s audit log client certificate for secure audit log streaming.

Access
Configuration

delete

Deletes the current client certificate for secure audit log streaming.

Syntax

`configure audit_cert delete`

Example

> configure audit_cert delete

import

Imports a client certificate for secure audit log streaming. After the user enters the command, the CLI prompts the user to provide either a client certificate and private key, or a certificate chain.

Syntax

`configure audit_cert import`

Example

> configure audit_cert import

***************Import Audit Client Certificate***************
bypass

On 7000 or 8000 Series devices, places an inline pair in fail-open (hardware bypass) or fail-close mode. You can use this command only when the inline set Bypass Mode option is set to Bypass.

Note that rebooting a device takes an inline set out of fail-open mode.

Access
Configuration

Syntax

configure bypass {open | close} {interface}

where interface is the name of either hardware port in the inline pair.

Example

> configure bypass open s1p1

high-availability

Disables or configures bypass for high availability on the device. This command is not available on NGIPSv, ASA FirePOWER, or on devices configured as secondary stack members.

Access
Configuration
Syntax

configure high-availability {disable | bypass}

Example

> configure high-availability disable

gui

Enables or disables the device web interface, including the streamlined upgrade web interface that appears during major updates to the system. This command is not available on NGIPSv and ASA FirePOWER.

Access
Configuration

Syntax

configure gui [enable | disable]

Example

> configure gui disable

lcd

Enables or disables the LCD display on the front of the device. This command is not available on NGIPSv and ASA FirePOWER.

Access
Configuration

Syntax

configure lcd {enable | disable}

Example

> configure lcd disable

log-ips-connections

Enables or disables logging of connection events that are associated with logged intrusion events.
Access
Configuration

Syntax

configure log-ips-connections {enable | disable}

Example

> configure log-ips-connections disable

manager Commands

The configure manager commands configure the device’s connection to its managing Firepower Management Center.

Access
Configuration

add

Configures the device to accept a connection from a managing Firepower Management Center. This command works only if the device is not actively managed.

A unique alphanumeric registration key is always required to register a device to a Firepower Management Center. In most cases, you must provide the hostname or the IP address along with the registration key. However, if the device and the Firepower Management Center are separated by a NAT device, you must enter a unique NAT ID, along with the registration key, and specify DONTRESOLVE instead of the hostname.

Syntax

configure manager add {hostname | IPv4_address | IPv6_address | DONTRESOLVE} regkey [nat_id]

where (hostname | IPv4_address | IPv6_address | DONTRESOLVE} specifies the DNS host name or IP address (IPv4 or IPv6) of the Firepower Management Center that manages this device. If the Firepower Management Center is not directly addressable, use DONTRESOLVE. If you use DONTRESOLVE, nat_id is required. regkey is the unique alphanumeric registration key required to register a device to the Firepower Management Center. nat_id is an optional alphanumeric string used during the registration process between the Firepower Management Center and the device. It is required if the hostname is set to DONTRESOLVE.

Example

> configure manager add DONTRESOLVE abc123 efg456
delete

Removes the Firepower Management Center’s connection information from the device. This command only works if the device is not actively managed.

**Syntax**

`configure manager delete`

**Example**

```
> configure manager delete
```

mpls-depth

Configures the number of MPLS layers on the management interface. This command is not available on NGIPSv and ASA FirePOWER.

**Access**

Configuration

**Syntax**

```
configure mpls-depth depth
```

where `depth` is a number between 0 and 6.

**Example**

```
> configure mpls-depth 3
```

network Commands

The `configure network` commands configure the device’s management interface.

**Access**

Configuration

**dns searchdomains**

Replaces the current list of DNS search domains with the list specified in the command.

**Syntax**

```
configure network dns searchdomains (searchlist)
```
where searchlist is a comma-separated list of domains.

Example

> configure network dns searchdomains foo.bar.com,bar.com

dns servers

Replaces the current list of DNS servers with the list specified in the command.

Syntax

configure network dns servers {dnslist}

where dnslist is a comma-separated list of DNS servers.

Example

> configure network dns servers 10.123.1.10,10.124.1.10

hostname

Sets the hostname for the device.

Syntax

configure network hostname {name}

where name is the new hostname.

Example

> configure network hostname sfrocks

http-proxy

On 7000 & 8000 Series and NGIPSv devices, configures an HTTP proxy. After issuing the command, the
CLI prompts the user for the HTTP proxy address and port, whether proxy authentication is required, and if
it is required, the proxy username, proxy password, and confirmation of the proxy password.

Use this command on NGIPSv to configure an HTTP proxy server so the virtual device can submit files to
the AMP cloud for dynamic analysis.

Syntax

The proxy password can use only alphanumeric characters.

configure network http-proxy
Example

> configure network http-proxy
Manual proxy configuration
Enter HTTP Proxy address:
Enter HTTP Proxy Port:
Use Proxy Authentication? (y/n) [n]:
Enter Proxy Username:
Enter Proxy Password:
Confirm Proxy Password:

http-proxy-disable

On 7000 Series, 8000 Series, or NGIPSv devices, deletes any HTTP proxy configuration.

Syntax

configure network http-proxy-disable

Example

> configure network http-proxy-disable
Are you sure that you wish to delete the current
http-proxy configuration? (y/n):

ipv4 delete

Disables the IPv4 configuration of the device’s management interface.

Syntax

configure network ipv4 delete [management_interface]

where management_interface is the management interface ID. If you do not specify an interface, this command configures the default management interface. This parameter is needed only if you use the configure management-interface commands to enable more than one management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only. Do not specify this parameter for other platforms. The management interface IDs are eth0 for the default management interface and eth1 for the optional event interface.

Example

> configure network ipv4 delete eth1

ipv4 dhcp

Sets the IPv4 configuration of the device’s management interface to DHCP. The management interface communicates with the DHCP server to obtain its configuration information.
Syntax

configure network ipv4 dhcp [management_interface]

where management_interface is the management interface ID. DHCP is supported only on the default management interface, so you do not need to use this argument.

Example

> configure network ipv4 dhcp

**ipv4 manual**

Manually configures the IPv4 configuration of the device’s management interface.

Syntax

configure network ipv4 manual ipaddr netmask [gw] [management_interface]

where ipaddr is the IP address, netmask is the subnet mask, and gw is the IPv4 address of the default gateway. The management_interface is the management interface ID. If you do not specify an interface, this command configures the default management interface. This parameter is needed only if you use the configure management-interface commands to enable more than one management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only. Do not specify this parameter for other platforms. The management interface IDs are eth0 for the default management interface and eth1 for the optional event interface.

Example

> configure network ipv4 manual 10.123.1.10 255.255.0.0 10.123.1.1

**ipv6 delete**

Disables the IPv6 configuration of the device’s management interface.

Syntax

configure network ipv6 delete [management_interface]

where management_interface is the management interface ID. If you do not specify an interface, this command configures the default management interface. This parameter is needed only if you use the configure management-interface commands to enable more than one management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only. Do not specify this parameter for other platforms. The management interface IDs are eth0 for the default management interface and eth1 for the optional event interface.
Example

> configure network ipv6 delete

**ipv6 dhcp**

Sets the IPv6 configuration of the device’s management interface to DHCP. The management interface communicates with the DHCP server to obtain its configuration information.

**Syntax**

```
configure network ipv6 dhcp [management_interface]
```

where *management_interface* is the management interface ID. DHCP is supported only on the default management interface, so you do not need to use this argument.

**Example**

> configure network ipv6 dhcp

**ipv6 manual**

Manually configures the IPv6 configuration of the device’s management interface.

**Syntax**

```
configure network ipv6 manual ip6addr/ip6prefix [ip6gw] [management_interface]
```

where *ip6addr/ip6prefix* is the IP address and prefix length and *ip6gw* is the IPv6 address of the default gateway. The *management_interface* is the management interface ID. If you do not specify an interface, this command configures the default management interface. This parameter is needed only if you use the `configure management-interface` commands to enable more than one management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only. Do not specify this parameter for other platforms. The management interface IDs are **eth0** for the default management interface and **eth1** for the optional event interface.

**Example**

**ipv6 router**

Sets the IPv6 configuration of the device’s management interface to Router. The management interface communicates with the IPv6 router to obtain its configuration information.
Syntax

```plaintext
configure network ipv6 router [management_interface]
```

where `management_interface` is the management interface ID. If you do not specify an interface, this command configures the default management interface. This parameter is needed only if you use the `configure management-interface` commands to enable more than one management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only. Do not specify this parameter for other platforms. The management interface IDs are `eth0` for the default management interface and `eth1` for the optional event interface.

Example

```plaintext
> configure network ipv6 router
```

**management-interface disable**

Disables a management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only.

Syntax

```plaintext
configure network management-interface disable ethn
```

where `n` is the number of the management interface you want to configure. `eth0` is the default management interface and `eth1` is the optional event interface. Cisco recommends that you leave the eth0 default management interface enabled, with both management and event channels enabled. See Management Interfaces, on page 799 for detailed information about using a separate event interface on the Firepower Management Center and on the managed device.

Example

```plaintext
> configure network management-interface disable eth1
```

**management-interface disable-event-channel**

Disables the event traffic channel on the specified management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only.

Syntax

```plaintext
configure network management-interface disable-event-channel ethn
```

where `n` is the number of the management interface you want to configure. `eth0` is the default management interface and `eth1` is the optional event interface. Cisco recommends that you leave the eth0 default management interface enabled, with both management and event channels enabled. See Management Interfaces, on page 799 for detailed information about using a separate event interface on the Firepower Management Center and on the managed device.
Example

> configure network management-interface disable-event-channel eth1

management-interface disable-management-channel

Disables the management traffic channel on the specified management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only.

Syntax

configure network management-interface disable-management-channel eth

where \( n \) is the number of the management interface you want to configure. \texttt{eth0} is the default management interface and \texttt{eth1} is the optional event interface. Cisco recommends that you leave the eth0 default management interface enabled, with both management and event channels enabled. See Management Interfaces, on page 799 for detailed information about using a separate event interface on the Firepower Management Center and on the managed device.

Example

> configure network management-interface disable-management-channel eth1

management-interface enable

Enables the specified management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only.

Syntax

configure network management-interface enable eth

where \( n \) is the number of the management interface you want to enable. \texttt{eth0} is the default management interface and \texttt{eth1} is the optional event interface.

For device management, the Firepower Management Center management interface carries two separate traffic channels: the management traffic channel carries all internal traffic (such as inter-device traffic specific to the management of the device), and the event traffic channel carries all event traffic (such as web events). You can optionally configure a separate event-only interface on the Management Center to handle event traffic (see the Firepower Management Center web interface do perform this configuration). You can only configure one event-only interface. Event traffic can use a large amount of bandwidth, so separating event traffic from management traffic can improve the performance of the Management Center.

The default eth0 interface includes both management and event channels by default. You can optionally enable the eth0 interface as an event-only interface. Event traffic is sent between the device event interface and the Firepower Management Center event interface if possible. If the event network goes down, then event traffic reverts to the default management interface. Separate event interfaces are used when possible, but the management interface is always the backup.
When you enable a management interface, both management and event channels are enabled by default. We recommend that you use the default management interface for both management and eventing channels; and then enable a separate event-only interface. The Firepower Management Center event-only interface cannot accept management channel traffic, so you should simply disable the management channel on the device event interface.

Use the `configure network {ipv4 | ipv6} manual` commands to configure the address(es) for management interfaces.

**Example**

```plaintext
> configure network management-interface enable eth1
> configure network management-interface disable-management-channel eth1
```

### management-interface enable-event-channel

Enables the event traffic channel on the specified management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only.

**Syntax**

```plaintext
configure network management-interface enable-event-channel ethn
```

where `n` is the number of the management interface you want to configure. `eth0` is the default management interface and `eth1` is the optional event interface. Cisco recommends that you leave the eth0 default management interface enabled, with both management and event channels enabled. See Management Interfaces, on page 799 for detailed information about using a separate event interface on the Firepower Management Center and on the managed device.

**Example**

```plaintext
> configure network management-interface enable-event-channel eth1
```

### management-interface enable-management-channel

Enables the management traffic channel on the specified management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only.

**Syntax**

```plaintext
configure network management-interface enable-management-channel ethn
```

where `n` is the number of the management interface you want to configure. `eth0` is the default management interface and `eth1` is the optional event interface. Cisco recommends that you leave the eth0 default management interface enabled, with both management and event channels enabled. See Management Interfaces, on page 799 for detailed information about using a separate event interface on the Firepower Management Center and on the managed device.
Example

> configure network management-interface enable-management-channel eth1

management-interface tcpport

Changes the value of the TCP port for management.

**Syntax**

```
configure network management-interface tcpport port
```

where `port` is the management port value you want to configure.

**Example**

> configure network management-interface tcpport 8500

management-port

Sets the value of the device’s TCP management port.

**Syntax**

```
configure network management-port number
```

where `number` is the management port value you want to configure.

**Example**

> configure network management-port 8500

static-routes ipv4 add

Adds an IPv4 static route for the specified management interface.

**Syntax**

```
configure network static-routes ipv4 add interface destination netmask gateway
```

where `interface` is the management interface, `destination` is the destination IP address, `netmask` is the network mask address, and `gateway` is the gateway address you want to add.
Example

> configure network static-routes ipv4
add eth1 10.115.24.0 255.255.255.0 10.115.9.2

**static-routes ipv4 delete**

Deletes an IPv4 static route for the specified management interface.

**Syntax**

```
configure network static-routes ipv4
delete interface destination netmask gateway
```

where interface is the management interface, destination is the destination IP address, netmask is the network mask address, and gateway is the gateway address you want to delete.

**Example**

> configure network static-routes ipv4
delete eth1 10.115.24.0 255.255.255.0 10.115.9.2

**static-routes ipv6 add**

Adds an IPv6 static route for the specified management interface.

**Syntax**

```
configure network static-routes ipv6
add interface destination prefix gateway
```

where interface is the management interface, destination is the destination IP address, prefix is the IPv6 prefix length, and gateway is the gateway address you want to add.

**Example**

> configure network static-routes ipv6

**static-routes ipv6 delete**

Deletes an IPv6 static route for the specified management interface.

**Syntax**

```
configure network static-routes ipv6
delete interface destination prefix gateway
```
where interface is the management interface, destination is the destination IP address, prefix is the IPv6 prefix length, and gateway is the gateway address you want to delete.

Example

> configure network static-routes ipv6
delete eth1 2001:DB8:3ffe:1900:4545:3:200:ff: fe21:67cf 64

password

Allows the current user to change their password. After issuing the command, the CLI prompts the user for their current (or old) password, then prompts the user to enter the new password twice.

Access
Basic

Syntax

configure password

Example

> configure password
Enter current password:
Enter new password:
Confirm new password:

stacking disable

On 7000 and 8000 Series devices, removes any stacking configuration present on that device:

• On devices configured as primary, the stack is removed entirely.
• On devices configured as secondary, that device is removed from the stack.

This command is not available on NGIPSv or ASA FirePOWER modules, and you cannot use it to break a device high-availability pair.

Use this command when you cannot establish communication with appliances higher in the stacking hierarchy. If the Firepower Management Center is available for communication, a message appears instructing you to use the Firepower Management Center web interface instead; likewise, if you enter stacking disable on a device configured as secondary when the primary device is available, a message appears instructing you to enter the command from the primary device.

Access
Configuration
Syntax

configure stacking disable

Example

> configure stacking disable

user Commands

Applicable only to NGIPSv, the configure user commands manage the device’s local user database.

Access

Configuration

access

Modifies the access level of the specified user. This command takes effect the next time the specified user logs in.

Syntax

configure user access username [basic | config]

where username specifies the name of the user for which you want to modify access, basic indicates basic access, and config indicates configuration access.

Example

> configure user access jdoe basic

add

Creates a new user with the specified name and access level. This command prompts for the user’s password.

Syntax

configure user add username [basic | config]

where username specifies the name of the new user, basic indicates basic access, and config indicates configuration access.

Example

> configure user add jdoe basic

Enter new password for user jdoe:
Confirm new password for user jdoe:
aging

Forces the expiration of the user’s password.

**Syntax**

```plaintext
configure user aging username max_days warn_days
```

where `username` specifies the name of the user, `max_days` indicates the maximum number of days that the password is valid, and `warn_days` indicates the number of days that the user is given to change the password before it expires.

**Example**

```plaintext
> configure user aging jdoe 100 3
```

delete

Deletes the user and the user’s home directory.

**Syntax**

```plaintext
configure user delete username
```

where `username` specifies the name of the user.

**Example**

```plaintext
> configure user delete jdoe
```

disable

Disables the user. Disabled users cannot login.

**Syntax**

```plaintext
configure user disable username
```

where `username` specifies the name of the user.

**Example**

```plaintext
> configure user disable jdoe
```

enable

Enables the user.
Syntax

`configure user enable username`

where `username` specifies the name of the user.

**Example**

`> configure user enable jdoe`

**forcereset**

Forces the user to change their password the next time they login. When the user logs in and changes the password, strength checking is automatically enabled.

**Syntax**

`configure user forcereset username`

where `username` specifies the name of the user.

**Example**

`> configure user forcereset jdoe`

**maxfailedlogins**

Sets the maximum number of failed logins for the specified user.

**Syntax**

`configure user maxfailedlogins username number`

where `username` specifies the name of the user, and `number` specifies the maximum number of failed logins.

**Example**

`> configure user maxfailedlogins jdoe 3`

**minpasswdlen**

Sets the minimum number of characters a user password must contain.

**Syntax**

`configure user minpasswdlen username number`
Where *username* specifies the name of the user account, and *number* specifies the minimum number of characters the password for that account must contain (ranging from 1 to 127).

**Example**

```
> configure user minpasswdlen jdoe 13
```

### password

Sets the user’s password. This command prompts for the user’s password.

**Syntax**

```
configure user password username
```

where *username* specifies the name of the user.

**Example**

```
> configure user password jdoe
Enter new password for user jdoe:
Confirm new password for user jdoe:
```

### strengthcheck

Enables or disables the strength requirement for a user’s password. When a user’s password expires or if the configure user forcereset command is used, this requirement is automatically enabled the next time the user logs in.

**Syntax**

```
configure user strengthcheck username {enable | disable}
```

where *username* specifies the name of the user, `enable` sets the requirement for the specified users password, and `disable` removes the requirement for the specified user’s password.

**Example**

```
> configure user strengthcheck jdoe enable
```

### unlock

Unlocks a user that has exceeded the maximum number of failed logins.

**Syntax**

```
configure user unlock username
```
where *username* specifies the name of the user.

**Example**

```
> configure user unlock jdoe
```

### vmware-tools

Enables or disables VMware Tools functionality on NGIPSv. This command is available only on NGIPSv. VMware Tools is a suite of utilities intended to enhance the performance of the virtual machine. These utilities allow you to make full use of the convenient features of VMware products. The system supports the following plugins on all virtual appliances:

- guestInfo
- powerOps
- timeSync
- vmbbackup

For more information about VMware Tools and the supported plugins, see the VMware website ([http://www.vmware.com](http://www.vmware.com)).

**Access**

Basic

**Syntax**

```
configure vmware-tools [enable | disable]
```

**Example**

```
> configure vmware-tools enable
```

### Classic Device CLI System Commands

The system commands enable the user to manage system-wide files and access control settings. Only users with configuration CLI access can issue commands in system mode.

**access-control Commands**

The *system access-control commands* enable the user to manage the access control configuration on the device.
Access Configuration

archive

Saves the currently deployed access control policy as a text file on /var/common.

Syntax

system access-control archive

Example

> system access-control archive

clear-rule-counts

Resets the access control rule hit count to 0.

Syntax

system access-control clear-rule-counts

Example

> system access-control clear-rule-counts

rollback

Reverts the system to the previously deployed access control configuration. You cannot use this command with devices in stacks or high-availability pairs.

Syntax

system access-control rollback

Example

> system access-control rollback

compliance Commands

The compliance commands display and configure the device’s security certifications compliance mode.
enable cc

Configures the device’s security certifications compliance to Common Criteria (CC) mode.

Caution
After you enable this setting, you cannot disable it. If you need to do so, contact Support for assistance.

Syntax

system compliance enable cc

Example

> system compliance enable cc

enable ucapl

Configures the device’s security certifications compliance to Unified Capabilities Approved Products List (UCAPL) mode.

Caution
After you enable this setting, you cannot disable it. If you need to do so, contact Support for assistance.

Syntax

system compliance enable ucapl

Example

> system compliance enable ucapl

show

Displays the device's current security certifications compliance mode.
disable-http-user-cert

Disables the requirement that the browser present a valid client certificate.

Access
Configuration

Syntax
system disable-http-user-cert

Example
> system disable-http-user-cert

file Commands

The `system file` commands enable the user to manage the files in the common directory on the device.

Access
Configuration

copy

Uses FTP to transfer files to a remote location on the host using the login username. The local files must be located in the common directory.

Syntax

```
system file copy hostname username path filenames filenames ...
```

where `hostname` specifies the name or IP address of the target remote host, `username` specifies the name of the user on the remote host, `path` specifies the destination path on the remote host, and `filenames` specifies the local files to transfer; the file names are space-separated.
Example

> system file copy sfrocks jdoe /pub *

delete

Removes the specified files from the common directory.

Syntax

system file delete filenames filenames ...

where filenames specifies the files to delete; the file names are space-separated.

Example

> system file delete *

list

If no file names are specified, displays the modification time, size, and file name for all the files in the common directory. If file names are specified, displays the modification time, size, and file name for files that match the specified file names.

Syntax

system file list filenames

where filenames specifies the files to display; the file names are space-separated.

Example

> system file list

secure-copy

Uses SCP to transfer files to a remote location on the host using the login username. The local files must be located in the /var/common directory.

Syntax

system file secure-copy hostname username path filenames filenames ...

where hostname specifies the name or ip address of the target remote host, username specifies the name of the user on the remote host, path specifies the destination path on the remote host, and filenames specifies the local files to transfer; the file names are space-separated.
Example

> system file secure-copy 10.123.31.1 jdoe /tmp *

generate-troubleshoot

Generates troubleshooting data for analysis by Cisco.

⚠️ Caution

Generating troubleshooting files for lower-memory devices can trigger Automatic Application Bypass (AAB) when AAB is enabled. At a minimum, triggering AAB restarts the Snort process, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 for more information. In some such cases, triggering AAB can render the device temporarily inoperable. If inoperability persists, contact Cisco Technical Assistance Center (TAC), who can propose a solution appropriate to your deployment. Susceptible devices include Firepower 7010, 7020, and 7030; ASA 5506-X, 5508-X, 5512-X, 5515-X, 5516-X, and 5525-X; NGIPSv.

Access

Configuration

Syntax

```
 system generate-troubleshoot option1 optionN
```

Where options are one or more of the following, space-separated:

- **ALL**: Run all of the following options.
- **SNT**: Snort Performance and Configuration
- **PER**: Hardware Performance and Logs
- **SYS**: System Configuration, Policy, and Logs
- **DES**: Detection Configuration, Policy, and Logs
- **NET**: Interface and Network Related Data
- **VDB**: Discover, Awareness, VDB Data, and Logs
- **UPG**: Upgrade Data and Logs
- **DBO**: All Database Data
- **LOG**: All Log Data
- **NMP**: Network Map Information
Example

> system generate-troubleshoot VDB NMP
starting /usr/local/sf/bin/sf_troubleshoot.pl...
Please, be patient. This may take several minutes.
The troubleshoot options codes specified are VDB,NMP.
Getting filenames from [usr/local/sf/etc/db_updates/index]
Getting filenames from [usr/local/sf/etc/db_updates/base-6.2.3]
Troubleshooting information successfully created at
/var/common/results-06-14-2018—222027.tar.gz

Idapsearch

Enables the user to perform a query of the specified LDAP server. Note that all parameters are required.

Access
Configuration

Syntax

system ldapsearch host port baseDN userDN basefilter

where host specifies the LDAP server domain, port specifies the LDAP server port, baseDN specifies the DN (distinguished name) that you want to search under, userDN specifies the DN of the user who binds to the LDAP directory, and basefilter specifies the record or records you want to search for.

Example

> system ldapsearch ldap.example.com 389 cn=users,
dc-example,dc=com cn=user1,cn=users,dc-example,dc=com, cn=user2

lockdown-sensor

Removes the expert command and access to the Linux shell on the device.

Caution

This command is irreversible without a hotfix from Support. Use with care.

Access
Configuration

Syntax

system lockdown-sensor
**nat rollback**

Reverts the system to the previously applied NAT configuration. This command is not available on NGIPSv or ASA FirePOWER. You cannot use this command with devices in stacks or high-availability pairs.

**Access**
Configuration

**Syntax**

```bash
system nat rollback
```

**Example**

```bash
> system nat rollback
```

**reboot**

Reboots the device.

**Access**
Configuration

**Syntax**

```bash
system reboot
```

**Example**

```bash
> system reboot
```

**restart**

Restarts the device application.

**Access**
Configuration
Syntax

system restart

Example

> system restart

support Commands

The system support commands enable the user to manage special SSL ClientHello processing on the device.

Access
Configuration

ssl-client-hello-display

Displays the current settings for processing the ClientHello message during an SSL handshake. For a description of these settings, see the ssl-client-hello-enabled and ssl-client-hello-tuning commands.

Access
Basic

Syntax
system support ssl-client-hello-display

Example

> system support ssl-client-hello-display

ssl-client-hello-enabled

Controls special processing of the ClientHello message during the SSL handshake.

Caution

Use these commands only if advised to do so by Cisco TAC.

Access
Configuration

Syntax
system support ssl-client-hello-enabled setting {true | false}

Possible setting values are:
feature
Controls all special handling of ClientHello messages.

curves
Controls stripping of elliptic curves that the Firepower System does not support:
- true (enabled)—The system strips any unsupported elliptic curves from the ClientHello message, increasing the likelihood of traffic decryption. You must also enable the extensions setting.
- false (disabled)—The system retains unsupported elliptic curves in the ClientHello message, decreasing the likelihood of traffic decryption.

ciphers
Controls stripping of cipher suites that the Firepower System does not support:
- true (enabled)—The system strips unsupported cipher suites from ClientHello messages, increasing the likelihood of traffic decryption.
- false (disabled)—The system retains unsupported cipher suites in ClientHello messages. This decreases the likelihood of traffic decryption and can result in a number of Unsupported or Unknown Cipher errors in the SSL Flow Error field of associated connection events.

extensions
Controls stripping of TLS extensions that prevent decryption:
- true (enabled)—The system identifies TLS extensions that prevent decryption and strips them from the ClientHello message. This value is required if you want to enable curves, session_ticket, and alpn.
- false (disabled)—The system retains all TLS extensions in the ClientHello message. This decreases the likelihood of traffic decryption and can result in Unknown Session errors in the SSL Flow Error field of associated connection events.

session_ticket
Controls processing of the SessionTicket extension in ClientHello messages. If the system can match a SessionTicket value in an incoming ClientHello message to cached session data, it can resume the session without the client and server performing the full SSL handshake.
- true (enabled)—The system strips unrecognized SessionTicket values from the ClientHello message. This increases the likelihood of traffic decryption for the resumed session. You must also enable the extensions setting.
- false (disabled)—The system retains all SessionTicket values in the ClientHello message. This decreases the likelihood of traffic decryption and can result in Uncached Session errors in the SSL Flow Error field of associated connection events.

session_id
Controls processing of the Session Identifier element in ClientHello messages. If the system can match the Session Identifier in an incoming ClientHello message to cached session data, it can resume the session without the client and server performing the full SSL handshake.
- true (enabled)—The system strips unrecognized Session Identifier values from the ClientHello message. This increases the likelihood of traffic decryption for the resumed session.
- false (disabled)—The system retains all Session Identifier values in the ClientHello message. This decreases the likelihood of traffic decryption and can result in Uncached Session errors in the SSL Flow Error field of associated connection events.
**alpn**
Controls stripping of ALPN protocol values that cannot be decrypted, specifically, the SPDY and HTTP2 protocols:

- **true (enabled)**—The system prevents the client from establishing SPDY or HTTP2 sessions, increasing the likelihood of traffic decryption and inspection. You must also enable the `extensions` setting.
- **false (disabled)**—The system allows the client to establish SPDY or HTTP2 sessions with the server, decreasing the likelihood of traffic decryption and inspection.

**compression**
Controls stripping of TLS compression requests from ClientHello messages:

- **true (enabled)**—The system prevents the client from establishing a TLS compressed session with the server.
- **false (disabled)**—The system allows the client to establish a TLS compressed session with the server. This prevents traffic decryption for the session and can result in Compression Used errors in the SSL Flow Error field of associated connection events.

**Example**

```bash
> system support ssl-client-hello-enabled feature false
```

**ssl-client-hello-force-reset**

Resets the configurable settings for ClientHello message processing to default values. The system does not require user confirmation before proceeding.

⚠️ **Caution**

Do not use this command unless you are directed to do so by Support.

**Access**

Configuration

**Syntax**

```bash
system support ssl-client-hello-force-reset
```

**Example**

```bash
> system support ssl-client-hello-force-reset
```

**ssl-client-hello-reset**

Resets the configurable settings for ClientHello message processing to default values. The system requires user confirmation before proceeding.
ssl-client-hello-tuning

Allows you to refine how the managed device modifies ClientHello messages during SSL handshakes. This command tunes the default lists of cipher suites, elliptic curves, and extensions that the system allows in ClientHello messages. This command only adds entries to or removes entries from the default lists of allowed values. It does not overwrite the default lists.

Access
Configuration

Syntax
system support ssl-client-hello-tuning

Example
> system support ssl-client-hello-tuning

ssl-client-hello-tuning

Caution
Do not use this command unless you are directed to do so by Support.

Access
Configuration

Syntax
system support ssl-client-hello-tuning setting value

The value element supports a comma-delimited list of values. Possible values for the setting and value elements include:

<table>
<thead>
<tr>
<th>Setting</th>
<th>System Action</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ciphers_allow</td>
<td>Allows the specified cipher suites in ClientHello messages. If you use this command, the system retains the specified cipher suites in any ClientHello messages it modifies.</td>
<td>Obtain individual cipher suite numbers from the IANA website: <a href="https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-4">https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-4</a></td>
</tr>
<tr>
<td>ciphers_remove</td>
<td>Disallows the specified cipher suites in ClientHello messages. If you use this command, the system strips the specified cipher suites from any ClientHello message it modifies.</td>
<td>IANA provides values in hexadecimal. Convert them to decimal for use in this command.</td>
</tr>
</tbody>
</table>
### Setting

<table>
<thead>
<tr>
<th>Setting</th>
<th>System Action</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>curves_allow</td>
<td>Allows the specified elliptic curves in ClientHello messages. If you use this command, the system retains the specified elliptic curves in any ClientHello message it modifies.</td>
<td>Obtain curve numbers from the IANA website: <a href="https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-8">https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-8</a></td>
</tr>
<tr>
<td>curves_remove</td>
<td>Disallows the specified elliptic curves in ClientHello messages. If you use this command, the system strips the specified elliptic curves from any ClientHello message it modifies.</td>
<td></td>
</tr>
<tr>
<td>extensions_allow</td>
<td>Allows the specified extensions in ClientHello messages. If you use this command, the system retains the specified extensions in any ClientHello message it modifies.</td>
<td>Obtain extension numbers from the IANA website: <a href="https://www.iana.org/assignments/tls-extensiontype-values/tls-extensiontype-values.xhtml">https://www.iana.org/assignments/tls-extensiontype-values/tls-extensiontype-values.xhtml</a></td>
</tr>
<tr>
<td>extensions_remove</td>
<td>Disallows the specified elliptic curves in ClientHello messages. The system strips the specified extensions from any ClientHello message it modifies. By default, the system disallows extensions 22, 23, and 30032.</td>
<td></td>
</tr>
</tbody>
</table>

### Example

```bash
> system support ssl-client-hello-tuning ciphers_allow 4,7,16,22
```

### shutdown

Shuts down the device. This command is not available on ASA FirePOWER modules.

#### Access

Configuration

#### Syntax

```bash
system shutdown
```

#### Example

```bash
> system shutdown
```
shutdown
