<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

Network address translation can be very complex. We recommend that you keep your rules as simple as possible to avoid translation problems and difficult troubleshooting situations. Careful planning before you implement NAT is critical. The following procedure provides the basic approach.

The NAT policy is a shared policy. You assign the policy to devices that should have similar NAT rules. Whether a given rule in the policy applies to an assigned device is determined by the interface objects (security zones or interface groups) used in the rule. If the interface objects include one or more interface for the device, the rule is deployed to the device. Thus, you can configure rules that apply to subsets of devices within a single shared policy by carefully designing your interface objects. Rules that apply to “any” interface object are deployed to all devices.

You can configure multiple NAT policies if groups of your devices require significantly different rules.

Procedure

Step 1  Select Devices > NAT.

• Click New Policy > Threat Defense NAT to create a new policy. Give the policy a name, optionally assign devices to it, and click Save.

You can change device assignments later by editing the policy and clicking the Policy Assignments link.

• Click the the edit icon (📝) to edit an existing Threat Defense NAT policy. Note that the page also shows Firepower NAT policies, which are not used by Firepower Threat Defense devices.

Step 2  Decide what kinds of rules you need.

You can create dynamic NAT, dynamic PAT, static NAT, and identity NAT rules. For an overview, see NAT Types, on page 894.

Step 3  Decide which rules should be implemented as manual or auto NAT.
For a comparison of these two implementation options, see Auto NAT and Manual NAT, on page 897.

**Step 4**
Decide which rules should be custom per device.

Because you can assign a NAT policy to multiple devices, you can configure a single rule on many devices. However, you might have rules that should be interpreted differently by each device, or some rules that should apply to a subset of devices only.

Use interface objects to control on which devices a rule is configured. Then, use object overrides on network objects to customize the addresses used per device.

For detailed information, see Customizing NAT Rules for Multiple Devices, on page 907.

**Step 5**
Create the rules as explained in the following sections.

- Dynamic NAT, on page 909
- Dynamic PAT, on page 915
- Static NAT, on page 922
- Identity NAT, on page 931

**Step 6**
Manage the NAT policy and rules.

You can do the following to manage the policy and its rules.

- To edit the policy name or description, click in those fields, type in your changes, and click outside the fields.
- To view only those rules that apply to a specific device, click **Filter by Device** and select the desired device. A rule applies to a device if it uses an interface object that includes an interface on the device.
- To change the devices to which the policy is assigned, click the **Policy Assignments** link and modify the selected devices list as desired.
- To change whether a rule is enabled or disabled, right click the rule and select the desired option from the **State** command. You can temporarily disable a rule without deleting it using these controls.
- To edit a rule, click the edit icon (عظ) for the rule.
- To delete a rule, click the delete icon (حذف) for the rule.

**Step 7**
Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

**Customizing NAT Rules for Multiple Devices**

Because the NAT policy is shared, you can assign a given policy to more than one device. However, you can configure at most one auto NAT rule for a given object. Thus, if you want to configure different translations for an object based on the specific device doing the translation, you need to carefully configure the interface objects (security zones or interface groups) and define network object overrides for the translated address.
The interface objects determine on which devices a rule gets configured. The network object overrides determine what IP addresses are used by a given device for that object.

Consider the following scenario:

- FTD-A and FTD-B have inside networks 192.168.1.0/24 attached to the interface named “inside.”
- On FTD-A, you want to translate all 192.168.1.0/24 addresses to a NAT pool in the 10.100.10.10 - 10.100.10.200 range when going to the “outside” interface.
- On FTD-B, you want to translate all 192.168.1.0/24 addresses to a NAT pool in the 10.200.10.10 - 10.200.10.200 range when going to the “outside” interface.

To accomplish the above, you would do the following. Although this example rule is for dynamic auto NAT, you can generalize the technique for any type of NAT rule.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| Step 1 | Create the security zones for the inside and outside interfaces.  
  a) Choose **Objects > Object Management**.  
  b) Select **Interface Objects** from the table of contents and click **Add > Security Zone**. (You can use interface groups instead of zones.)  
  c) Configure the inside zone properties.  
    • **Name**—Enter a name, for example, **inside-zone**.  
    • **Type**—Select **Routed** for routed-mode devices, **Switched** for transparent mode.  
    • **Selected Interfaces**—Add the FTD-A/inside and FTD-B/inside interfaces to the selected list.  
  d) Click **Save**.  
  e) Click **Add > Security Zone** and define the outside zone properties.  
    • **Name**—Enter a name, for example, **outside-zone**.  
    • **Type**—Select **Routed** for routed-mode devices, **Switched** for transparent mode.  
    • **Selected Interfaces**—Add the FTD-A/outside and FTD-B/outside interfaces to the selected list.  
  f) Click **Save**. |
| Step 2 | Create the network object for the original inside network on the Object Management page.  
  a) Select **Network** from the table of contents and click **Add Network > Add Object**.  
  b) Configure the inside network properties.  
    • **Name**—Enter a name, for example, **inside-network**.  
    • **Network**—Enter the network address, for example, **192.168.1.0/24**.  
  c) Click **Save**. |
| Step 3 | Create the network object for the translated NAT pool and define overrides.  
  a) Click **Add Network > Add Object**.  
  b) Configure the NAT pool properties for FTD-A. |
• Name—Enter a name, for example, NAT-pool.

• Network—Enter the range of addresses to include in the pool for FTD-A, for example, 10.100.10.10-10.100.10.200.

c) Select Allow Overrides.
d) Click the Overrides heading to open the list of object overrides.
e) Click Add to open the Add Object Override dialog box.
f) Select FTD-B and Add it to the Selected Devices list.
g) Click the Override tab and change Network to 10.200.10.10-10.200.10.200
h) Click Add to add the override to the device.

By defining an override for FTD-B, whenever the system configures this object on FTD-B, it will use the override value instead of the value defined in the original object.

i) Click Save.

Step 4 Configure the NAT rule.
a) Select Devices > NAT and create or edit a Firepower Threat Defense NAT policy.
b) Click Add Rule.
c) Configure the following properties:
   • NAT Rule = Auto NAT Rule.
   • Type = Dynamic.

d) On the Interface Objects tab, configure the following:
   • Source Interface Objects = inside-zone.
   • Destination Interface Objects = outside-zone.

Note The interface objects control on which devices the rule is configured. Because in this example the zones contain interfaces for FTD-A and FTD-B only, even if the NAT policy were assigned to additional devices, the rule would be deployed to those 2 devices only.

e) On the Translation tab, configure the following:
   • Original Source = inside-network object.
   • Translated Source > Address = NAT-pool object.

f) Click Save.

You now have a single rule that will be interpreted differently for FTD-A and FTD-B, providing unique translations for the inside networks protected by each firewall.

Dynamic NAT

The following topics explain dynamic NAT and how to configure it.
About Dynamic NAT

Dynamic NAT translates a group of real addresses to a pool of mapped addresses that are routable on the destination network. The mapped pool typically includes fewer addresses than the real group. When a host you want to translate accesses the destination network, NAT assigns the host an IP address from the mapped pool. The translation is created only when the real host initiates the connection. The translation is in place only for the duration of the connection, and a given user does not keep the same IP address after the translation times out. Users on the destination network, therefore, cannot initiate a reliable connection to a host that uses dynamic NAT, even if the connection is allowed by an access rule.

Note

For the duration of the translation, a remote host can initiate a connection to the translated host if an access rule allows it. Because the address is unpredictable, a connection to the host is unlikely. Nevertheless, in this case you can rely on the security of the access rule.

The following figure shows a typical dynamic NAT scenario. Only real hosts can create a NAT session, and responding traffic is allowed back.

*Figure 23: Dynamic NAT*

The following figure shows a remote host attempting to initiate a connection to a mapped address. This address is not currently in the translation table; therefore, the packet is dropped.
Dynamic NAT Disadvantages and Advantages

Dynamic NAT has these disadvantages:

- If the mapped pool has fewer addresses than the real group, you could run out of addresses if the amount of traffic is more than expected.

  Use PAT or a PAT fall-back method if this event occurs often because PAT provides over 64,000 translations using ports of a single address.

- You have to use a large number of routable addresses in the mapped pool, and routable addresses may not be available in large quantities.

The advantage of dynamic NAT is that some protocols cannot use PAT. PAT does not work with the following:

- IP protocols that do not have a port to overload, such as GRE version 0.

- Some multimedia applications that have a data stream on one port, the control path on another port, and are not open standard.

Configure Dynamic Auto NAT

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

</tr>
</tbody>
</table>

Use dynamic auto NAT rules to translate addresses to different IP addresses that are routable on the destination network.

Figure 24: Remote Host Attempts to Initiate a Connection to a Mapped Address
Before you begin

Select Objects > Object Management and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host, range, or subnet.
- **Translated Source**—This can be a network object or group, but it cannot include a subnet. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only. If a group contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.

Procedure

**Step 1**
Select Devices > NAT and create or edit a Firepower Threat Defense NAT policy.

**Step 2**
Do one of the following:

- Click the Add Rule button to create a new rule.
- Click the edit icon (📝) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3**
Configure the basic rule options:

- **NAT Rule**—Select Auto NAT Rule.
- **Type**—Select Dynamic.

**Step 4**
On the Interface Objects tab, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (Any) except for bridge group member interfaces.

**Step 5**
On the Translation tab, configure the following options:

- **Original Source**—The network object that contains the addresses you are translating.
- **Translated Source**—The network object or group that contains the mapped addresses.

**Step 6**
(Optional.) On the Advanced tab, select the desired options:

- **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see Rewriting DNS Queries and Responses Using NAT, on page 976.
- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT
fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option.

- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

**Step 7**
Click **Save** to add the rule.

**Step 8**
Click **Save** on the NAT page to save your changes.

## Configure Dynamic Manual NAT

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat</td>
<td>Any</td>
<td>Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Defense</td>
<td></td>
<td>Administrator</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

Use dynamic manual NAT rules when auto NAT does not meet your needs. For example, if you want to do different translations based on the destination. Dynamic NAT translates addresses to different IP addresses that are routable on the destination network.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.

- **Translated Source**—This can be a network object or group, but it cannot include a subnet.

You can also create network objects for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule.

For dynamic NAT, you can also perform port translation on the destination. In the Object Manager, ensure that there are port objects you can use for the **Original Destination Port** and **Translated Destination Port**. If you specify the source port, it will be ignored.

### Procedure

**Step 1**
Select **Devices > NAT** and create or edit a Firepower Threat Defense NAT policy.

**Step 2**
Do one of the following:

- Click the **Add Rule** button to create a new rule.

- Click the edit icon ( carta ) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3**
Configure the basic rule options:

- **NAT Rule**—Select **Manual NAT Rule**.
Configure Dynamic Manual NAT

- **Type**—Select **Dynamic**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

**Step 4**

On the **Interface Objects** tab, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (Any) except for bridge group member interfaces.

**Step 5**

(On the **Translation** tab.) Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Source Interface IP** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

**Step 6**

Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—The network object or group that contains the mapped addresses.
- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

**Step 7**

(Optional.) Identify the destination service ports for service translation: **Original Destination Port, Translated Destination Port**.
Dynamic NAT does not support port translation, so leave the **Original Source Port** and **Translated Source Port** fields empty. However, because the destination translation is always static, you can perform port translation for the destination port.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

**Step 8** (Optional.) On the **Advanced** tab, select the desired options:

- (For source translation only.) **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see [Rewriting DNS Queries and Responses Using NAT](https://www.forcepoint.com/products/forcepoint-firepower-managed-security-systems/technical-guides/network-address-translation-nat.html), on page 976.
- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

**Step 9** Click **Save** to add the rule.

**Step 10** Click **Save** on the NAT page to save your changes.

---

### Dynamic PAT

The following topics describe dynamic PAT.

### About Dynamic PAT

Dynamic PAT translates multiple real addresses to a single mapped IP address by translating the real address and source port to the mapped address and a unique port. If available, the real source port number is used for the mapped port. However, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 0 to 511, 512 to 1023, and 1024 to 65535. Therefore, ports below 1024 have only a small PAT pool that can be used. If you have a lot of traffic that uses the lower port ranges, you can specify a flat range of ports to be used instead of the three unequal-sized tiers.

Each connection requires a separate translation session because the source port differs for each connection. For example, 10.1.1.1:1025 requires a separate translation from 10.1.1.1:1026.

The following figure shows a typical dynamic PAT scenario. Only real hosts can create a NAT session, and responding traffic is allowed back. The mapped address is the same for each translation, but the port is dynamically assigned.
For the duration of the translation, a remote host on the destination network can initiate a connection to the translated host if an access rule allows it. Because the port address (both real and mapped) is unpredictable, a connection to the host is unlikely. Nevertheless, in this case you can rely on the security of the access rule. After the connection expires, the port translation also expires.

**Dynamic PAT Disadvantages and Advantages**

Dynamic PAT lets you use a single mapped address, thus conserving routable addresses. You can even use the Firepower Threat Defense device interface IP address as the PAT address.

You cannot use dynamic PAT for IPv6 (NAT66) when translating between interfaces in the same bridge group.

Dynamic PAT does not work with some multimedia applications that have a data stream that is different from the control path. For more information, see NAT Support for Inspected Protocols, on page 903.

Dynamic PAT might also create a large number of connections appearing to come from a single IP address, and servers might interpret the traffic as a DoS attack. You can configure a PAT pool of addresses and use a round-robin assignment of PAT addresses to mitigate this situation.

**PAT Pool Object Guidelines**

When creating network objects for a PAT pool, follow these guidelines.

**For a PAT pool**

- If available, the real source port number is used for the mapped port. However, if the real port is not available, by default the mapped ports are chosen from the same range of ports as the real port number: 0 to 511, 512 to 1023, and 1024 to 65535. Therefore, ports below 1024 have only a small PAT pool that can be used. If you have a lot of traffic that uses the lower port ranges, you can specify a flat range of ports to be used instead of the three unequal-sized tiers: either 1024 to 65535, or 1 to 65535.

- If you use the same PAT pool object in two separate rules, then be sure to specify the same options for each rule. For example, if one rule specifies extended PAT and a flat range, then the other rule must also specify extended PAT and a flat range.

**For extended PAT for a PAT pool**

- Many application inspections do not support extended PAT.

- If you enable extended PAT for a dynamic PAT rule, then you cannot also use an address in the PAT pool as the PAT address in a separate static NAT with port translation rule. For example, if the PAT pool
includes 10.1.1.1, then you cannot create a static NAT-with-port-translation rule using 10.1.1.1 as the
PAT address.

• If you use a PAT pool and specify an interface for fallback, you cannot specify extended PAT.
• For VoIP deployments that use ICE or TURN, do not use extended PAT. ICE and TURN rely on the
  PAT binding to be the same for all destinations.

For round robin for a PAT pool

• If a host has an existing connection, then subsequent connections from that host will use the same PAT
  IP address if ports are available. However, this “stickiness” does not survive a failover. If the device fails
  over, then subsequent connections from a host might not use the initial IP address.

• Round robin, especially when combined with extended PAT, can consume a large amount of memory.
  Because NAT pools are created for every mapped protocol/IP address/port range, round robin results in
  a large number of concurrent NAT pools, which use memory. Extended PAT results in an even larger
  number of concurrent NAT pools.

Configure Dynamic Auto PAT

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat</td>
<td>Any</td>
<td>Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Defense</td>
<td></td>
<td>Administrator</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

Use dynamic auto PAT rules to translate addresses to unique IP address/port combinations, rather than to
multiple IP addresses only. You can translate to a single address (either the destination interface's address or
another address), or use a PAT pool of addresses to provide a larger number of possible translations.

Before you begin

Select Objects > Object Management and create the network objects or groups needed in the rule.
Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following
requirements:

• Original Source—This must be a network object (not a group), and it can be a host, range, or subnet.

• Translated Source—You have the following options to specify the PAT address:
  • Destination Interface—To use the destination interface address, you do not need a network object.
  • Single PAT address—Create a network object containing a single host.
  • PAT pool—Create a network object that includes a range, or create a network object group that
    contains hosts, ranges, or both. You cannot include subnets. The group cannot contain both IPv4
    and IPv6 addresses; it must contain one type only.

Procedure

Step 1 Select Devices > NAT and create or edit a Firepower Threat Defense NAT policy.
Step 2  Do one of the following:

• Click the Add Rule button to create a new rule.
• Click the edit icon (📝) to edit an existing rule.

The right-click menu also has options to cut, copy, paste, insert, and delete rules.

Step 3  Configure the basic rule options:

• NAT Rule—Select Auto NAT Rule.
• Type—Select Dynamic.

Step 4  On the Interface Objects tab, configure the following options:

• Source Interface Objects, Destination Interface Objects—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. Source is the object containing the real interface, the one through which the traffic enters the device. Destination is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (Any) except for bridge group member interfaces.

Step 5  On the Translation tab, configure the following options:

• Original Source—The network object that contains the addresses you are translating.
• Translated Source—One of the following:
  • (Interface PAT.) To use the address of the destination interface, select Destination Interface IP. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the IPv6 option on the Advanced tab. Skip the step for configuring a PAT pool.
  • To use a single address other than the destination interface address, select the host network object you created for this purpose. Skip the step for configuring a PAT pool.
  • To use a PAT pool, leave Translated Source empty.

Step 6  If you are using a PAT pool, select the PAT Pool tab and do the following:

a) Select Enable PAT pool.
b) Select the network object group that contains the addresses for the pool in the PAT > Address field.

You can alternatively select Destination Interface IP, which is another way to implement interface PAT.

c) (Optional) Select the following options as needed:

  • Use Round Robin Allocation—To assign addresses/ports in a round-robin fashion. By default without round robin, all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns one address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.

  • Extended PAT Table—To use extended PAT. Extended PAT uses 65535 ports per service, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. You cannot use this option with interface PAT or interface PAT fallback.
• **Flat Port Range, Include Reserved Ports**—To use the 1024 to 65535 port range as a single flat range when allocating TCP/UDP ports. When choosing the mapped port number for a translation, PAT uses the real source port number if it is available. However, without this option, if the real port is not available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also check the **Include Reserved Ports** option.

**Step 7** (Optional.) On the **Advanced** tab, select the desired options:

- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option. You cannot select this option if you already configured interface PAT as the translated address or PAT pool.

- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

**Step 8** Click **Save** to add the rule.

**Step 9** Click **Save** on the NAT page to save your changes.

---

### Configure Dynamic Manual PAT

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>

<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

Use dynamic manual PAT rules when auto PAT does not meet your needs. For example, if you want to do different translations based on the destination. Dynamic PAT translates addresses to unique IP address/port combinations, rather than to multiple IP addresses only. You can translate to a single address (either the destination interface's address or another address), or use a PAT pool of addresses to provide a larger number of possible translations.

**Before you begin**

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.

- **Translated Source**—You have the following options to specify the PAT address:
  - **Destination Interface**—To use the destination interface address, you do not need a network object.
  - **Single PAT address**—Create a network object containing a single host.
  - **PAT pool**—Create a network object that includes a range, or create a network object group that contains hosts, ranges, or both. You cannot include subnets.
You can also create network objects for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule.

For dynamic NAT, you can also perform port translation on the destination. In the Object Manager, ensure that there are port objects you can use for the **Original Destination Port** and **Translated Destination Port**. If you specify the source port, it will be ignored.

**Procedure**

**Step 1**
Select **Devices > NAT** and create or edit a Firepower Threat Defense NAT policy.

**Step 2**
Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click the edit icon (✏️) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3**
Configure the basic rule options:

- **NAT Rule**—Select **Manual NAT Rule**.
- **Type**—Select **Dynamic**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

**Step 4**
On the **Interface Objects** tab, configure the following options:

- **Source Interface Objects**, **Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (Any) except for bridge group member interfaces.

**Step 5**
(On the **Translation** tab.) Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet.

- **Original Source**—The network object or group that contains the addresses you are translating.
• **Original Destination**—(Optional.) The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Source Interface IP** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

**Step 6** Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—One of the following:
  - (Interface PAT.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on the **Advanced** tab. Skip the step for configuring a PAT pool.
  - To use a single address other than the destination interface address, select the host network object you created for this purpose. Skip the step for configuring a PAT pool.
  - To use a PAT pool, leave **Translated Source** empty.

- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

**Step 7** (Optional.) Identify the destination service ports for service translation: **Original Destination Port**, **Translated Destination Port**.

Dynamic NAT does not support port translation, so leave the **Original Source Port** and **Translated Source Port** fields empty. However, because the destination translation is always static, you can perform port translation for the destination port.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

**Step 8** If you are using a PAT pool, select the **PAT Pool** tab and do the following:

a) Select **Enable PAT pool**.

b) Select the network object group that contains the addresses for the pool in the **PAT > Address** field.

You can alternatively select **Destination Interface IP**, which is another way to implement interface PAT.

c) (Optional) Select the following options as needed:

- **Use Round Robin Allocation**—To assign addresses/ports in a round-robin fashion. By default without round robin, all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns one address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.

- **Extended PAT Table**—To use extended PAT. Extended PAT uses 65535 ports per service, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so
you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. You cannot use this option with interface PAT or interface PAT fallback.

- **Flat Port Range, Include Reserved Ports**—To use the 1024 to 65535 port range as a single flat range when allocating TCP/UDP ports. When choosing the mapped port number for a translation, PAT uses the real source port number if it is available. However, without this option, if the real port is not available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also check the **Include Reserved Ports** option.

**Step 9**  
(Optional.) On the **Advanced** tab, select the desired options:
- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

**Step 10**  
Click **Save** to add the rule.

**Step 11**  
Click **Save** on the NAT page to save your changes.

### Static NAT

The following topics explain static NAT and how to implement it.

#### About Static NAT

Static NAT creates a fixed translation of a real address to a mapped address. Because the mapped address is the same for each consecutive connection, static NAT allows bidirectional connection initiation, both to and from the host (if an access rule exists that allows it). With dynamic NAT and PAT, on the other hand, each host uses a different address or port for each subsequent translation, so bidirectional initiation is not supported.

The following figure shows a typical static NAT scenario. The translation is always active so both real and remote hosts can initiate connections.

*Figure 26: Static NAT*
You can disable bidirectionality if desired.

**Static NAT with Port Translation**

Static NAT with port translation lets you specify a real and mapped protocol and port.

When you specify the port with static NAT, you can choose to map the port and/or the IP address to the same value or to a different value.

The following figure shows a typical static NAT with port translation scenario showing both a port that is mapped to itself and a port that is mapped to a different value; the IP address is mapped to a different value in both cases. The translation is always active so both translated and remote hosts can initiate connections.

*Figure 27: Typical Static NAT with Port Translation Scenario*

Static NAT-with-port-translation rules limit access to the destination IP address for the specified port only. If you try to access the destination IP address on a different port not covered by a NAT rule, then the connection is blocked. In addition, for manual NAT, traffic that does not match the source IP address of the NAT rule will be dropped if it matches the destination IP address, regardless of the destination port. Therefore, you must add additional rules for all other traffic allowed to the destination IP address. For example, you can configure a static NAT rule for the IP address, without port specification, and place it after the port translation rule.

*Note*

For applications that require application inspection for secondary channels (for example, FTP and VoIP), NAT automatically translates the secondary ports.

Following are some other uses of static NAT with port translation.

**Static NAT with Identity Port Translation**

You can simplify external access to internal resources. For example, if you have three separate servers that provide services on different ports (such as FTP, HTTP, and SMTP), you can give external users a single IP address to access those services. You can then configure static NAT with identity port translation to map the single external IP address to the correct IP addresses of the real servers based on the port they are trying to access. You do not need to change the port, because the servers are using the standard ones (21, 80, and 25 respectively).

**Static NAT with Port Translation for Non-Standard Ports**

You can also use static NAT with port translation to translate a well-known port to a non-standard port or vice versa. For example, if inside web servers use port 8080, you can allow outside users to connect
to port 80, and then undo translation to the original port 8080. Similarly, to provide extra security, you can tell web users to connect to non-standard port 6785, and then undo translation to port 80.

**Static Interface NAT with Port Translation**

You can configure static NAT to map a real address to an interface address/port combination. For example, if you want to redirect Telnet access for the device's outside interface to an inside host, then you can map the inside host IP address/port 23 to the outside interface address/port 23.

**One-to-Many Static NAT**

Typically, you configure static NAT with a one-to-one mapping. However, in some cases, you might want to configure a single real address to several mapped addresses (one-to-many). When you configure one-to-many static NAT, when the real host initiates traffic, it always uses the first mapped address. However, for traffic initiated to the host, you can initiate traffic to any of the mapped addresses, and they will be untranslated to the single real address.

The following figure shows a typical one-to-many static NAT scenario. Because initiation by the real host always uses the first mapped address, the translation of real host IP/first mapped IP is technically the only bidirectional translation.

*Figure 28: One-to-Many Static NAT*

For example, you have a load balancer at 10.1.2.27. Depending on the URL requested, it redirects traffic to the correct web server.
NAT has the flexibility to allow any kind of static mapping scenario: one-to-one, one-to-many, but also few-to-many, many-to-few, and many-to-one mappings. We recommend using only one-to-one or one-to-many mappings. These other mapping options might result in unintended consequences.

Functionally, few-to-many is the same as one-to-many; but because the configuration is more complicated and the actual mappings may not be obvious at a glance, we recommend creating a one-to-many configuration for each real address that requires it. For example, for a few-to-many scenario, the few real addresses are mapped to the many mapped addresses in order (A to 1, B to 2, C to 3). When all real addresses are mapped, the next mapped address is mapped to the first real address, and so on until all mapped addresses are mapped (A to 4, B to 5, C to 6). This results in multiple mapped addresses for each real address. Just like a one-to-many configuration, only the first mappings are bidirectional; subsequent mappings allow traffic to be initiated to the real host, but all traffic from the real host uses only the first mapped address for the source.

The following figure shows a typical few-to-many static NAT scenario.
For a many-to-few or many-to-one configuration, where you have more real addresses than mapped addresses, you run out of mapped addresses before you run out of real addresses. Only the mappings between the lowest real IP addresses and the mapped pool result in bidirectional initiation. The remaining higher real addresses can initiate traffic, but traffic cannot be initiated to them (returning traffic for a connection is directed to the correct real address because of the unique 5-tuple (source IP, destination IP, source port, destination port, protocol) for the connection).

**Note**

Many-to-few or many-to-one NAT is not PAT. If two real hosts use the same source port number and go to the same outside server and the same TCP destination port, and both hosts are translated to the same IP address, then both connections will be reset because of an address conflict (the 5-tuple is not unique).

The following figure shows a typical many-to-few static NAT scenario.

**Configure Static Auto NAT**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

Use static auto NAT rules to translate addresses to different IP addresses that are routable on the destination network. You can also do port translation with the static NAT rule.
Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host, range, or subnet.
- **Translated Source**—You have the following options to specify the translated address:
  - **Destination Interface**—To use the destination interface address, you do not need a network object. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
  - **Address**—Create a network object or group containing hosts, ranges, or subnets. A group cannot contain both IPv4 and IPv6 addresses; it must contain one type only. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Select Devices &gt; NAT and create or edit a Firepower Threat Defense NAT policy.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Do one of the following:</td>
</tr>
<tr>
<td></td>
<td>- Click the <strong>Add Rule</strong> button to create a new rule.</td>
</tr>
<tr>
<td></td>
<td>- Click the edit icon (✏️) to edit an existing rule.</td>
</tr>
<tr>
<td></td>
<td>The right click menu also has options to cut, copy, paste, insert, and delete rules.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Configure the basic rule options:</td>
</tr>
<tr>
<td></td>
<td>- <strong>NAT Rule</strong>—Select <strong>Auto NAT Rule</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>—Select <strong>Static</strong>.</td>
</tr>
<tr>
<td>Step 4</td>
<td>On the <strong>Interface Objects</strong> tab, configure the following options:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Source Interface Objects, Destination Interface Objects</strong>—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. <strong>Source</strong> is the object containing the real interface, the one through which the traffic enters the device. <strong>Destination</strong> is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (Any) except for bridge group member interfaces.</td>
</tr>
<tr>
<td>Step 5</td>
<td>On the <strong>Translation</strong> tab, configure the following options:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Original Source</strong>—The network object that contains the addresses you are translating.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Translated Source</strong>—One of the following:</td>
</tr>
<tr>
<td></td>
<td>- To use a set group of addresses, select <strong>Address</strong> and the network object or group that contains the mapped addresses. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.</td>
</tr>
</tbody>
</table>
|        |     - (Static interface NAT with port translation.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the
IPv6 address of the interface, you must also select the IPv6 option on the Advanced tab. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.

- (Optional.) **Original Port, Translated Port**—If you need to translate a TCP or UDP port, select the protocol in Original Port, and type the original and translated port numbers. For example, you can translate TCP/80 to 8080 if necessary.

**Step 6** (Optional.) On the Advanced tab, select the desired options:

- **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see Rewriting DNS Queries and Responses Using NAT, on page 976. This option is not available if you are doing port translation.

- **IPv6**—Whether to use the IPv6 address of the destination interface for interface NAT.

- **Net to Net Mapping**—For NAT 46, select this option to translate the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used. For a one-to-one translation, you must use this option.

- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.

**Step 7** Click Save to add the rule.

**Step 8** Click Save on the NAT page to save your changes.

### Configure Static Manual NAT

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

Use static manual NAT rules when auto NAT does not meet your needs. For example, if you want to do different translations based on the destination. Static NAT translates addresses to different IP addresses that are routable on the destination network. You can also do port translation with the static NAT rule.

**Before you begin**

Select Objects > Object Management and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:
- **Original Source**—This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can skip this step and specify Any in the rule.

- **Translated Source**—You have the following options to specify the translated address:
  - **Destination Interface**—To use the destination interface address, you do not need a network object. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
  - **Address**—Create a network object or group containing hosts, range, or subnets. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.

You can also create network objects for the Original Destination and Translated Destination if you are configuring a static translation for those addresses in the rule. If you want to configure destination static interface NAT with port translation only, you can skip adding an object for the destination mapped addresses and specify the interface in the rule.

You can also perform port translation on the source, destination, or both. In the Object Manager, ensure that there are port objects you can use for the original and translated ports.

**Procedure**

**Step 1**
Select Devices > NAT and create or edit a Firepower Threat Defense NAT policy.

**Step 2**
Do one of the following:
- Click the Add Rule button to create a new rule.
- Click the edit icon (📝) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3**
Configure the basic rule options:
- **NAT Rule**—Select Manual NAT Rule.
- **Type**—Select Static. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

**Step 4**
On the Interface Objects tab, configure the following options:
- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. Source is the object containing the real interface, the one through which the traffic enters the device. Destination is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (Any) except for bridge group member interfaces.

**Step 5**
(On the Translation tab.) Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.
See the following figure for an example of the original packet vs. the translated packet.

**Source**

- **Real:** 10.1.2.2
- **Mapped:** 192.168.2.2

**Translated Packet**

- **Real:** 192.168.1.1
- **Mapped:** 192.168.2.2

**Step 6**

Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—One of the following:
  - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
  - (Static interface NAT with port translation.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on the **Advanced** tab. This configures static interface NAT with port translation: the source address/port is translated to the interface’s address and the same port number.

- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

**Step 7**

(Optional.) Identify the source or destination service ports for service translation.

If you are configuring static NAT with port translation, you can translate ports for the source, destination, or both. For example, you can translate between TCP/80 and TCP/8080.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

- **Original Source Port, Translated Source Port**—Defines a port translation for the source address.
- **Original Destination Port, Translated Destination Port**—Defines a port translation for the destination address.
Step 8  (Optional.) On the Advanced tab, select the desired options:

- **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see Rewriting DNS Queries and Responses Using NAT, on page 976. This option is not available if you are doing port translation.

- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

- **Net to Net Mapping**—For NAT 46, select this option to translate the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used. For a one-to-one translation, you must use this option.

- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.

- **Unidirectional**—Select this option to prevent the destination addresses from initiating traffic to the source addresses.

Step 9  Click **Save** to add the rule.

Step 10  Click **Save** on the NAT page to save your changes.

---

### Identity NAT

You might have a NAT configuration in which you need to translate an IP address to itself. For example, if you create a broad rule that applies NAT to every network, but want to exclude one network from NAT, you can create a static NAT rule to translate an address to itself.

The following figure shows a typical identity NAT scenario.

*Figure 32: Identity NAT*

![Identity NAT Diagram](image)

The following topics explain how to configure identity NAT.
Configure Identity Auto NAT

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

Use static identity auto NAT rules to prevent the translation of an address. That is, to translate the address to itself.

Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host, range, or subnet.
- **Translated Source**—A network object or group with the exact same contents as the original source object. You can use the same object.

Procedure

**Step 1** Select **Devices > NAT** and create or edit a Firepower Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click the edit icon (✏️) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Auto NAT Rule**.
- **Type**—Select **Static**.

**Step 4** On the **Interface Objects** tab, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (Any) except for bridge group member interfaces.

**Step 5** On the **Translation** tab, configure the following options:

- **Original Source**—The network object that contains the addresses you are translating.
- **Translated Source**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.

Do not configure the **Original Port** and **Translated Port** options for identity NAT.
Step 6  (Optional.) On the Advanced tab, select the desired options:

- **Translate DNS replies that match this rule**—Do not configure this option for identity NAT.
- **IPv6**—Do not configure this option for identity NAT.
- **Net to Net Mapping**—Do not configure this option for identity NAT.
- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.
- **Perform Route Lookup for Destination Interface**—If you select source and destination interfaces when selecting the same object for original and translated source address, you can select this option to have the system determine the destination interface based on the routing table rather than using the destination interface configured in the NAT rule.

Step 7  Click **Save** to add the rule.

Step 8  Click **Save** on the NAT page to save your changes.

### Configure Identity Manual NAT

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

Use static identity manual NAT rules when auto NAT does not meet your needs. For example, if you want to do different translations based on the destination. Use static identity NAT rules to prevent the translation of an address. That is, to translate the address to itself.

**Before you begin**

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can skip this step and specify Any in the rule.

- **Translated Source**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.

You can also create network objects for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule. If you want to configure destination static interface NAT with port translation only, you can skip adding an object for the destination mapped addresses and specify the interface in the rule.
You can also perform port translation on the source, destination, or both. In the Object Manager, ensure that there are port objects you can use for the original and translated ports. You can use the same object for identity NAT.

Procedure

**Step 1**
Select Devices > NAT and create or edit a Firepower Threat Defense NAT policy.

**Step 2**
Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click the edit icon (✏️) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3**
Configure the basic rule options:

- **NAT Rule**—Select Manual NAT Rule.
- **Type**—Select Static. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

**Step 4**
On the Interface Objects tab, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (Any) except for bridge group member interfaces.

**Step 5**
Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet where you perform identity NAT on the inside host but translate the outside host.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify
the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select Interface Object to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

Step 6  Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- Translated Source—The same object as the original source. Optionally, you can select a different object that has the exact same contents.
- Translated Destination—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for Original Destination, you can set up identity NAT (that is, no translation) by selecting the same object.

Step 7  (Optional.) Identify the source or destination service ports for service translation.

If you are configuring static NAT with port translation, you can translate ports for the source, destination, or both. For example, you can translate between TCP/80 and TCP/8080.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

- Original Source Port, Translated Source Port—Defines a port translation for the source address.
- Original Destination Port, Translated Destination Port—Defines a port translation for the destination address.

Step 8  (Optional.) On the Advanced tab, select the desired options:

- Translate DNS replies that match this rule—Do not configure this option for identity NAT.
- IPv6—Whether to use the IPv6 address of the destination interface for interface PAT.
- Do not proxy ARP on Destination Interface—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.
- Perform Route Lookup for Destination Interface—If you select source and destination interfaces when selecting the same object for original and translated source address, you can select this option to have the system determine the destination interface based on the routing table rather than using the destination interface configured in the NAT rule.
- Unidirectional—Select this option to prevent the destination addresses from initiating traffic to the source addresses.

Step 9  Click Save to add the rule.

Step 10  Click Save on the NAT page to save your changes.
NAT Rule Properties for Firepower Threat Defense

Use Network Address Translation (NAT) rules to translate IP addresses to other IP addresses. You would typically use NAT rules to convert private addresses to publically routable addresses. The translation can be from one address to another, or you can use Port Address Translation (PAT) to translate many addresses to one or a few addresses, using port numbers to distinguish among the source addresses.

NAT rules include the following basic properties. The properties are the same for auto NAT and manual NAT rules except where indicated.

**NAT Type**

Whether you want to configure a [Manual NAT Rule](#) or an [Auto NAT Rule](#). Auto NAT translates the source address only, and you cannot make different translations based on the destination address. Because auto NAT is more simple to configure, use it unless you need the added features of manual NAT. For more information on the differences, see [Auto NAT and Manual NAT](#), on page 897.

**Type**

Whether the translation rule is [Dynamic](#) or [Static](#). Dynamic translation automatically chooses the mapped address from a pool of addresses, or an address/port combination when implementing PAT. Use static translation if you want to precisely define the mapped address/port.

**Enable (Manual NAT only.)**

Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page. You cannot disable auto NAT rules.

**Insert (Manual NAT only.)**

Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

**Description (Optional. Manual NAT only.)**

A description of the purpose of the rule.

The following topics describe the tabs for the NAT rules properties.

### Interface Objects NAT Properties

Interface objects (security zones or interface groups) define the interfaces to which a NAT rule applies. In routed mode, you can use the default "any" for both source and destination to apply to all interfaces of all assigned devices. However, you typically want to select specific source and destination interfaces.

---

**Note**

The concept of “any” interface does not apply to bridge group member interfaces. When you specify “any” interface, all bridge group member interfaces are excluded. Thus, to apply NAT to bridge group members, you must specify the member interface. You cannot configure NAT for the Bridge Virtual Interface (BVI) itself, you can configure NAT for member interfaces only.

If you select interface objects, a NAT rule will be configured on an assigned device only if the device has interfaces included in all selected objects. For example, if you select both source and destination security zones, both zones must contain one or more interface for a given device.
**Source Interface Objects, Destination Interface Objects**

(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Translation Properties for Auto NAT**

Use the options on the **Translation** tab to define the source addresses and the mapped translated addresses. The following properties apply to auto NAT only.

**Original Source (Always required.)**

The network object that contains the addresses you are translating. This must be a network object (not a group), and it can be a host, range, or subnet.

**Translated Source (Usually required.)**

The mapped addresses, the ones to which you are translating. What you select here depends on the type of translation rule you are defining.

- **Dynamic NAT**—The network object or group that contains the mapped addresses. This can be a network object or group, but it cannot include a subnet. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only. If a group contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.

- **Dynamic PAT**—One of the following:
  - (Interface PAT.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on the **Advanced** tab. Do not configure a PAT pool.
  - To use a single address other than the destination interface address, select the host network object you created for this purpose. Do not configure a PAT pool.
  - To use a PAT pool, leave **Translated Source** empty. Select the PAT pool object on the **PAT Pool** tab.

- **Static NAT**—One of the following:
  - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. The object or group can contain hosts, ranges, or subnets. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
  - (Static interface NAT with port translation.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on the **Advanced** tab. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.

- **Identity NAT**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.
Original Port, Translated Port (Static NAT only.)

If you need to translate a TCP or UDP port, select the protocol in Original Port, and type the original and translated port numbers. For example, you can translate TCP/80 to 8080 if necessary. Do not configure these options for identity NAT.

Translation Properties for Manual NAT

Use the options on the Translation tab to define the source addresses and the mapped translated addresses. The following properties apply to manual NAT only. All are optional except as indicated.

Original Source (Always required.)

The network object or group that contains the addresses you are translating. This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can specify Any in the rule.

Translated Source (Usually required.)

The mapped addresses, the ones to which you are translating. What you select here depends on the type of translation rule you are defining.

- Dynamic NAT—The network object or group that contains the mapped addresses. This can be a network object or group, but it cannot include a subnet. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only. If a group contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.

- Dynamic PAT—One of the following:
  - (Interface PAT.) To use the address of the destination interface, select Destination Interface IP. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the IPv6 option on the Advanced tab. Do not configure a PAT pool.
  - To use a single address other than the destination interface address, select the host network object you created for this purpose. Do not configure a PAT pool.
  - To use a PAT pool, leave Translated Source empty. Select the PAT pool object on the PAT Pool tab.

- Static NAT—One of the following:
  - To use a set group of addresses, select Address and the network object or group that contains the mapped addresses. The object or group can contain hosts, ranges, or subnets. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
  - (Static interface NAT with port translation.) To use the address of the destination interface, select Destination Interface IP. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the IPv6 option on the Advanced tab. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.

- Identity NAT—The same object as the original source. Optionally, you can select a different object that has the exact same contents.
Original Destination

The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Source Interface IP** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

Translated Destination

The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

Original Source Port, Translated Source Port, Original Destination Port, Translated Destination Port

The port objects that define the source and destination services for the original and translated packets. You can translate the ports, or select the same object to make the rule sensitive to the service without translating the ports. Keep the following rules in mind when configuring services:

- (Dynamic NAT or PAT.) You cannot do translation on the **Original Source Port** and **Translated Source Port**. You can do translation on the destination port only.

- NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

**PAT Pool NAT Properties**

When you configure dynamic NAT, you can define a pool of addresses to use for Port Address Translation using the properties on the **PAT Pool** tab.

**Enable PAT Pool**

Select this option to configure a pool of addresses for PAT.

**PAT**

The addresses to use for the PAT pool, one of the following:

- **Address**—The object that defines the PAT pool addresses, either a network object that includes a range, or a network object group that contains hosts, ranges, or both. You cannot include subnets. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only.

- **Destination Interface IP**—Indicates that you want to use the destination interface as the PAT address. For this option, you must select a specific **Destination Interface Object**; you cannot use Any as the destination interface. This is another way to implement interface PAT.

**Round Robin**

To assign addresses/ports in a round-robin fashion. By default without round robin, all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns one address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.
Extended PAT Table

To use extended PAT, Extended PAT uses 65535 ports per service, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. You cannot use this option with interface PAT or interface PAT fallback.

Flat Port Range; Include Reserved Ports

To use the 1024 to 65535 port range as a single flat range when allocating TCP/UDP ports. When choosing the mapped port number for a translation, PAT uses the real source port number if it is available. However, without this option, if the real port is not available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also check the Include Reserved Ports option.

Advanced NAT Properties

When you configure NAT, you can configure properties that provide specialized services in the Advanced options. All of these properties are optional: configure them only if you need the service.

Translate DNS replies that match this rule

Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see Rewriting DNS Queries and Responses Using NAT, on page 976. This option is not available if you are doing port translation in a static NAT rule.

Fallthrough to Interface PAT (Destination Interface) (Dynamic NAT only.)

Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the IPv6 option. You cannot select this option if you already configured interface PAT as the translated address. You also cannot select the option if you configure a PAT pool.

IPv6

Whether to use the IPv6 address of the destination interface for interface PAT.

Net to Net Mapping (Static NAT only.)

For NAT 46, select this option to translate the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used. For a one-to-one translation, you must use this option.

Do not proxy ARP on Destination Interface (Static NAT only.)

Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if
desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.

**Perform Route Lookup for Destination Interface (Static Identity NAT only. Routed mode only.)**

If you select source and destination interfaces when selecting the same object for original and translated source address, you can select this option to have the system determine the destination interface based on the routing table rather than using the destination interface configured in the NAT rule.

**Unidirectional (Manual NAT only, static NAT only.)**

Select this option to prevent the destination addresses from initiating traffic to the source addresses.

---

# Translating IPv6 Networks

In cases where you need to pass traffic between IPv6-only and IPv4-only networks, you need to use NAT to convert between the address types. Even with two IPv6 networks, you might want to hide internal addresses from the outside network.

You can use the following translation types with IPv6 networks:

- **NAT64, NAT46**—Translates IPv6 packets into IPv4 and vice versa. You need to define two policies, one for the IPv6 to IPv4 translation, and one for the IPv4 to IPv6 translation. Although you can accomplish this with a single manual NAT rule, if the DNS server is on the external network, you probably need to rewrite the DNS response. Because you cannot enable DNS rewrite on a manual NAT rule when you specify a destination, creating two auto NAT rules is the better solution.

  **Note**
  
  NAT46 supports static mappings only.

- **NAT66**—Translates IPv6 packets to a different IPv6 address. We recommend using static NAT. Although you can use dynamic NAT or PAT, IPv6 addresses are in such large supply, you do not have to use dynamic NAT.

  **Note**
  
  NAT64 and NAT 46 are possible on standard routed interfaces only. NAT66 is possible on both routed and bridge group member interfaces.

---

**NAT64/46: Translating IPv6 Addresses to IPv4**

When traffic goes from an IPv6 network to an IPv4-only network, you need to convert the IPv6 address to IPv4, and return traffic from IPv4 to IPv6. You need to define two address pools, an IPv4 address pool to bind IPv6 addresses in the IPv4 network, and an IPv6 address pool to bind IPv4 addresses in the IPv6 network.

- The IPv4 address pool for the NAT64 rule is normally small and typically might not have enough addresses to map one-to-one with the IPv6 client addresses. Dynamic PAT might more easily meet the possible large number of IPv6 client addresses compared to dynamic or static NAT.
• The IPv6 address pool for the NAT46 rule can be equal to or larger than the number of IPv4 addresses to be mapped. This allows each IPv4 address to be mapped to a different IPv6 address. NAT46 supports static mappings only, so you cannot use dynamic PAT.

You need to define two policies, one for the source IPv6 network, and one for the destination IPv4 network. Although you can accomplish this with a single manual NAT rule, if the DNS server is on the external network, you probably need to rewrite the DNS response. Because you cannot enable DNS rewrite on a manual NAT rule when you specify a destination, creating two auto NAT rules is the better solution.

**NAT46 Example: Inside IPv6 Network with Outside IPv4 Internet**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

Following is a typical example where you have an inside IPv6-only network, but there are some IPv4-only services on the outside Internet that internal users need.

In this example, you translate the inside IPv6 network to IPv4 using dynamic interface PAT with the IP address of the outside interface. Outside IPv4 traffic is statically translated to addresses on the 2001:db8::/96 network, allowing transmission on the inside network. You enable DNS rewrite on the NAT46 rule, so that replies from the external DNS server can be converted from A (IPv4) to AAAA (IPv6) records, and the addresses converted from IPv4 to IPv6.

Following is a typical sequence for a web request where a client at 2001:DB8::100 on the internal IPv6 network tries to open www.example.com.

1. The client’s computer sends a DNS request to the DNS server at 2001:DB8::D1A5:CA81. The NAT rules make the following translations to the source and destination in the DNS request:
• 2001:DB8::100 to a unique port on 209.165.201.1 (The NAT64 interface PAT rule.)

• 2001:DB8::D1A5:CA81 to 209.165.202.129 (The NAT46 rule. D1A5:CA81 is the IPv6 equivalent of 209.165.202.129.)

2. The DNS server responds with an A record indicating that www.example.com is at 209.165.200.225. The NAT46 rule, with DNS rewrite enabled, converts the A record to the IPv6-equivalent AAAA record, and translates 209.165.200.225 to 2001:db8:D1A5:C8E1 in the AAAA record. In addition, the source and destination addresses in the DNS response are untranslated:
   • 209.165.202.129 to 2001:DB8::D1A5:CA81
   • 209.165.201.1 to 2001:db8::100

3. The IPv6 client now has the IP address of the web server, and makes an HTTP request to www.example.com at 2001:db8:D1A5:C8E1. (D1A5:C8E1 is the IPv6 equivalent of 209.165.200.225.) The source and destination of the HTTP request are translated:
   • 2001:DB8::100 to a unique port on 209.156.101.54 (The NAT64 interface PAT rule.)
   • 2001:db8:D1A5:C8E1 to 209.165.200.225 (The NAT46 rule.)

The following procedure explains how to configure this example.

Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

Procedure

**Step 1** Create the network objects that define the inside IPv6 and outside IPv4 networks.

a) Choose **Objects > Object Management**.

b) Select **Network** from the table of contents and click **Add Network > Add Object**.

c) Define the inside IPv6 network.

   Name the network object (example, inside_v6) and enter the network address, 2001:db8::/96.

   ![New Network Objects](image)

   d) Click **Save**.

   e) Click **Add Network > Add Object** and define the outside IPv4 network.
Name the network object (for example, outside_v4_any) and enter the network address 0.0.0.0/0.

f) Click Save.

**Step 2**
Configure the NAT64 dynamic PAT rule for the inside IPv6 network.

a) Select Devices > NAT and create or edit a Firepower Threat Defense NAT policy.
b) Click Add Rule.
c) Configure the following properties:
   • NAT Rule = Auto NAT Rule.
   • Type = Dynamic.
d) On the Interface Objects tab, configure the following:
   • Source Interface Objects = inside.
   • Destination Interface Objects = outside.
e) On the Translation tab, configure the following:
   • Original Source = inside_v6 network object.
   • Translated Source = Destination Interface IP.

f) Click OK.

With this rule, any traffic from the 2001:db8::/96 subnet on the inside interface going to the outside interface gets a NAT64 PAT translation using the IPv4 address of the outside interface.

**Step 3**
Configure the static NAT46 rule for the outside IPv4 network.
a) Click **Add Rule**.
b) Configure the following properties:
   • **NAT Rule** = Auto NAT Rule.
   • **Type** = Static.
c) On the **Interface Objects** tab, configure the following:
   • **Source Interface Objects** = outside.
   • **Destination Interface Objects** = inside.
d) On the **Translation** tab, configure the following:
   • **Original Source** = outside_v4_any network object.
   • **Translated Source > Address** = inside_v6 network object.
e) On the **Advanced** tab, select **Translate DNS replies that match this rule**.
f) Click **OK**.

With this rule, any IPv4 address on the outside network coming to the inside interface is translated to an address on the 2001:db8::/96 network using the embedded IPv4 address method. In addition, DNS responses are converted from A (IPv4) to AAAA (IPv6) records, and the addresses converted from IPv4 to IPv6.

---

**NAT66: Translating IPv6 Addresses to Different IPv6 Addresses**

When going from an IPv6 network to another IPv6 network, you can translate the addresses to different IPv6 addresses on the outside network. We recommend using static NAT. Although you can use dynamic NAT or PAT, IPv6 addresses are in such large supply, you do not have to use dynamic NAT.

Because you are not translating between different address types, you need a single rule for NAT66 translations. You can easily model these rules using auto NAT. However, if you do not want to allow returning traffic, you can make the static NAT rule unidirectional using manual NAT only.
NAT66 Example, Static Translation between Networks

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

You can configure a static translation between IPv6 address pools using auto NAT. The following example explains how to convert inside addresses on the 2001:db8:122:2091::/96 network to outside addresses on the 2001:db8:122:2999::/96 network.

Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named inside and outside. To configure interface objects, select Objects > Object Management, then select Interface.

Procedure

Step 1

Create the network objects that define the inside IPv6 and outside IPv6 NAT networks.

a) Choose Objects > Object Management.
b) Select Network from the table of contents and click Add Network > Add Object.
c) Define the inside IPv6 network.

   Name the network object (for example, inside_v6) and enter the network address, 2001:db8:122:2091::/96.
d) Click Save.
e) Click Add Network > Add Object and define the outside IPv6 NAT network.
   Name the network object (for example, outside_nat_v6) and enter the network address

   ![New Network Objects](image)

   Name: inside_v6
   Description: 
   Network: 2001:db8:122:2999::/96
   Allow Overrides: 

   ![New Network Objects](image)

   Name: outside_nat_v6
   Description: 
   Network: 2001:db8:122:2999::/96
   Allow Overrides: 

f) Click Save.

**Step 2**
Configure the static NAT rule for the inside IPv6 network.

a) Select Devices > NAT and create or edit a Firepower Threat Defense NAT policy.
b) Click Add Rule.
c) Configure the following properties:
   - **NAT Rule** = Auto NAT Rule.
   - **Type** = Static.

d) On the Interface Objects tab, configure the following:
   - **Source Interface Objects** = inside.
   - **Destination Interface Objects** = outside.
e) On the Translation tab, configure the following:
   - **Original Source** = inside_v6 network object.
   - **Translated Source > Address** = outside_nat_v6 network object.
f) Click **OK**.

With this rule, any traffic from the 2001:db8:122:2091::/96 subnet on the inside interface going to the outside interface gets a static NAT66 translation to an address on the 2001:db8:122:2999::/96 network.

---

### NAT66 Example, Simple IPv6 Interface PAT

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

A simple approach for implementing NAT66 is to dynamically assign internal addresses to different ports on the outside interface IPv6 address.

When you configure an interface PAT rule for NAT66, all the global addresses that are configured on that interface are used for PAT mapping. Link-local or site-local addresses for the interface are not used for PAT.
Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named inside and outside. To configure interface objects, select Objects > Object Management, then select Interface.

Procedure

Step 1  Create the network object that defines the inside IPv6 network.
   a) Choose Objects > Object Management.
   b) Select Network from the table of contents and click Add Network > Add Object.
   c) Define the inside IPv6 network.
      Name the network object (for example, inside_v6) and enter the network address, 2001:db8:122:2091::/96.
      ![New Network Objects](image)
      d) Click Save.

Step 2  Configure the dynamic PAT rule for the inside IPv6 network.
   a) Select Devices > NAT and create or edit a Firepower Threat Defense NAT policy.
   b) Click Add Rule.
   c) Configure the following properties:
      • NAT Rule = Auto NAT Rule.
      • Type = Dynamic.
   d) On the Interface Objects tab, configure the following:
      • Source Interface Objects = inside.
      • Destination Interface Objects = outside.
   e) On the Translation tab, configure the following:
      • Original Source = inside_v6 network object.
      • Translated Source = Destination Interface IP.
   f) On the Advanced tab, select IPv6, which indicates that the IPv6 address of the destination interface should be used.
g) Click OK.

With this rule, any traffic from the 2001:db8:122:2091::/96 subnet on the inside interface going to the outside interface gets a NAT66 PAT translation to one of the IPv6 global addresses configured for the outside interface.

---

### Monitoring NAT

To monitor and troubleshoot NAT connections, log into the device CLI and use the following commands.

- **show nat** displays the NAT rules and per-rule hit counts. There are additional keywords to show other aspects of NAT.
- **show xlate** displays the actual NAT translations that are currently active.
- **clear xlate** lets you remove an active NAT translation. You might need to remove active translations if you alter NAT rules, because existing connections continue to use the old translation slot until the connection ends. Clearing a translation allows the system to build a new translation for a client on the client's next connection attempt based on your new rules.

---

### Examples for NAT

The following topics provide examples for configuring NAT on Threat Defense devices.

#### Providing Access to an Inside Web Server (Static Auto NAT)

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

The following example performs static NAT for an inside web server. The real address is on a private network, so a public address is required. Static NAT is necessary so hosts can initiate traffic to the web server at a fixed address.
Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the web server. In this example, we will assume the interface objects are security zones named inside and outside. To configure interface objects, select Objects > Object Management, then select Interface.

Procedure

**Step 1**
Create the network objects that define the server’s private and public host addresses.

a) Choose Objects > Object Management.
b) Select Network from the table of contents and click Add Network > Add Object.
c) Define the web server’s private address.

Name the network object (for example, WebServerPrivate) and enter the real host IP address, 10.1.2.27.
d) Click Save.

e) Click **Add Network > Add Object** and define the public address.

Name the network object (for example, WebServerPublic) and enter the host address 209.165.201.10.

![New Network Objects](image)

f) Click Save.

**Step 2** Configure static NAT for the object.

a) Select **Devices > NAT** and create or edit a Firepower Threat Defense NAT policy.

b) Click **Add Rule**.

c) Configure the following properties:

- **NAT Rule** = Auto NAT Rule.
- **Type** = Static.

d) On the **Interface Objects** tab, configure the following:

- **Source Interface Objects** = inside.
- **Destination Interface Objects** = outside.

e) On the **Translation** tab, configure the following:

- **Original Source** = WebServerPrivate network object.
- **Translated Source > Address** = WebServerPublic network object.

![Add NAT Rule](image)

f) Click Save.
Step 3  Click Save on the NAT rule page.

Dynamic Auto NAT for Inside Hosts and Static NAT for an Outside Web Server

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

The following example configures dynamic NAT for inside users on a private network when they access the outside. Also, when inside users connect to an outside web server, that web server address is translated to an address that appears to be on the inside network.

*Figure 34: Dynamic NAT for Inside, Static NAT for Outside Web Server*

Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the web server. In this example, we will assume the interface objects are security zones named inside and outside. To configure interface objects, select Objects > Object Management, then select Interface.
Procedure

**Step 1** Create a network object for the dynamic NAT pool to which you want to translate the inside addresses.

a) Choose *Objects > Object Management*.
b) Select *Network* from the table of contents and click *Add Network > Add Object*.
c) Define the dynamic NAT pool.
   Name the network object (for example, myNATpool) and enter the network range 209.165.201.20-209.165.201.30.
d) Click *Save*.

**Step 2** Create a network object for the inside network.

a) Click *Add Network > Add Object*.
b) Name the network object (for example, MyInsNet) and enter the network address 10.1.2.0/24.
c) Click *Save*.

**Step 3** Create a network object for the outside web server.

a) Click *Add Network > Add Object*.
b) Name the network object (for example, MyWebServer) and enter the host address 209.165.201.12.
c) Click Save.

**Step 4**
Create a network object for the translated web server address.

a) Click **Add Network > Add Object**.

b) Name the network object (for example, TransWebServer) and enter the host address 10.1.2.20.

```
New Network Objects
Name: TransWebServer
Description:
Network: 10.1.2.20
Allow Overides: [ ]
```

c) Click Save.

**Step 5**
Configure dynamic NAT for the inside network using the dynamic NAT pool object.

a) Select **Devices > NAT** and create or edit a Firepower Threat Defense NAT policy.

b) Click **Add Rule**.

c) Configure the following properties:

- **NAT Rule** = Auto NAT Rule.
- **Type** = Dynamic.

d) On the **Interface Objects** tab, configure the following:

- **Source Interface Objects** = inside.
- **Destination Interface Objects** = outside.

e) On the **Translation** tab, configure the following:

- **Original Source** = myInsNet network object.
- **Translated Source > Address** = myNATpool network group.

```
Add NAT Rule
NAT Rule: Auto NAT Rule
Type: Dynamic

Interface Objects Translation PAT Pool Advanced
```

f) Click Save.

**Step 6**
Configure static NAT for the web server.
a) Click Add Rule.
b) Configure the following properties:
   - NAT Rule = Auto NAT Rule.
   - Type = Static.

c) On the Interface Objects tab, configure the following:
   - Source Interface Objects = outside.
   - Destination Interface Objects = inside.

d) On the Translation tab, configure the following:
   - Original Source = myWebServer network object.
   - Translated Source > Address = TransWebServer network object.

e) Click Save.

Step 7  
Click Save on the NAT rule page.

---

Inside Load Balancer with Multiple Mapped Addresses (Static Auto NAT, One-to-Many)

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

The following example shows an inside load balancer that is translated to multiple IP addresses. When an outside host accesses one of the mapped IP addresses, it is untranslated to the single load balancer address. Depending on the URL requested, it redirects traffic to the correct web server.
Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the web server. In this example, we will assume the interface objects are security zones named inside and outside. To configure interface objects, select Objects > Object Management, then select Interface.

Procedure

Step 1

Create a network object for the addresses to which you want to map the load balancer.

a) Choose Objects > Object Management.
b) Select Network from the table of contents and click Add Network > Add Object.
c) Define the addresses.

Name the network object (for example, myPublicIPs) and enter the network range 209.165.201.3-209.165.201.5.
Step 2
Create a network object for the load balancer.

a) Click **Add Network > Add Object**.

b) Name the network object (for example, myLBHost), enter the host address 10.1.2.27.

d) Click **Save**.

Step 3
Configure static NAT for the load balancer.

a) Select **Devices > NAT** and create or edit a Firepower Threat Defense NAT policy.

b) Click **Add Rule**.

c) Configure the following properties:

   • **NAT Rule** = Auto NAT Rule.
   
   • **Type** = Static.

   d) On the **Interface Objects** tab, configure the following:

   • **Source Interface Objects** = inside.
   
   • **Destination Interface Objects** = outside.

   e) On the **Translation** tab, configure the following:

   • **Original Source** = myLBHost network object.
   
   • **Translated Source > Address** = myPublicIPs network group.
f) Click Save.

**Step 4**  Click Save on the NAT rule page.

---

**Single Address for FTP, HTTP, and SMTP (Static Auto NAT-with-Port-Translation)**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

The following static NAT-with-port-translation example provides a single address for remote users to access FTP, HTTP, and SMTP. These servers are actually different devices on the real network, but for each server, you can specify static NAT-with-port-translation rules that use the same mapped IP address, but different ports.
Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the servers. In this example, we will assume the interface objects are security zones named inside and outside. To configure interface objects, select Objects > Object Management, then select Interface.

Procedure

Step 1 Create a network object for the FTP server.
   a) Choose Objects > Object Management.
   b) Select Network from the table of contents and click Add Network > Add Object.
   c) Name the network object (for example, FTPserver), and enter the real IP address for the FTP server, 10.1.2.27.
d) Click \textit{Save}.

\textbf{Step 2} Create a network object for the HTTP server.
\begin{itemize}
  \item \textit{a)} Click \textit{Add Network} \textgreater{} \textit{Add Object}.
  \item \textit{b)} Name the network object (for example, HTTPserver), enter the host address 10.1.2.28.
\end{itemize}

\begin{center}
\textbf{New Network Objects}
\end{center}
\begin{itemize}
  \item Name: HTTPserver
  \item Description:
  \item Network: 10.1.2.28
  \item Allow Overides: \checkmark
\end{itemize}
\hfill

\begin{itemize}
  \item \textit{c)} Click \textit{Save}.
\end{itemize}

\textbf{Step 3} Create a network object for the SMTP server.
\begin{itemize}
  \item \textit{a)} Click \textit{Add Network} \textgreater{} \textit{Add Object}.
  \item \textit{b)} Name the network object (for example, SMTPserver), enter the host address 10.1.2.29.
\end{itemize}

\begin{center}
\textbf{Edit Network Objects}
\end{center}
\begin{itemize}
  \item Name: SMTPserver
  \item Description:
  \item Network: 10.1.2.29
  \item Allow Overides: \checkmark
\end{itemize}

\begin{itemize}
  \item \textit{c)} Click \textit{Save}.
\end{itemize}

\textbf{Step 4} Create a network object for the public IP address used for the three servers.
\begin{itemize}
  \item \textit{a)} Click \textit{Add Network} \textgreater{} \textit{Add Object}.
  \item \textit{b)} Name the network object (for example, ServerPublicIP) and enter the host address 209.165.201.3.
\end{itemize}

\begin{center}
\textbf{New Network Objects}
\end{center}
\begin{itemize}
  \item Name: ServerPublicIP
  \item Description:
  \item Network: 209.165.201.3
  \item Allow Overides: \checkmark
\end{itemize}

\begin{itemize}
  \item \textit{c)} Click \textit{Save}.
\end{itemize}

\textbf{Step 5} Configure static NAT with port translation for the FTP server, mapping the FTP port to itself.
\begin{itemize}
  \item \textit{a)} Select Devices \textgreater{} NAT and create or edit a Firepower Threat Defense NAT policy.
  \item \textit{b)} Click \textit{Add Rule}.
  \item \textit{c)} Configure the following properties:
    \begin{itemize}
      \item NAT Rule = Auto NAT Rule.
    \end{itemize}
\end{itemize}
Step 6
Configure static NAT with port translation for the HTTP server, mapping the HTTP port to itself.

a) Click Add Rule.

b) Configure the following properties:

- **NAT Rule** = Auto NAT Rule.
- **Type** = Static.

c) On the Interface Objects tab, configure the following:

- **Source Interface Objects** = inside.
- **Destination Interface Objects** = outside.

d) On the Translation tab, configure the following:

- **Original Source** = HTTPserver network object.
- **Translated Source > Address** = ServerPublicIP network object.
- **Original Port > TCP** = 80.
- **Translated Port** = 80.
e) Click Save.

**Step 7** Configure static NAT with port translation for the SMTP server, mapping the SMTP port to itself.

a) Click **Add Rule**.

b) Configure the following properties:
   - **NAT Rule** = Auto NAT Rule.
   - **Type** = Static.

c) On the **Interface Objects** tab, configure the following:
   - **Source Interface Objects** = inside.
   - **Destination Interface Objects** = outside.

d) On the **Translation** tab, configure the following:
   - **Original Source** = SMTP server network object.
   - **Translated Source** > **Address** = ServerPublicIP network object.
   - **Original Port** > **TCP** = 25.
   - **Translated Port** = 25.

e) Click Save.
Step 8  Click Save on the NAT rule page.

Different Translation Depending on the Destination (Dynamic Manual PAT)

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Any</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

The following figure shows a host on the 10.1.2.0/24 network accessing two different servers. When the host accesses the server at 209.165.201.11, the real address is translated to 209.165.202.129:port. When the host accesses the server at 209.165.200.225, the real address is translated to 209.165.202.130:port.

Figure 37: Manual NAT with Different Destination Addresses

Before you begin
Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the servers. In this example, we will assume the interface objects are security zones named inside and dmz. To configure interface objects, select Objects > Object Management, then select Interface.

Procedure

Step 1  Create a network object for the inside network.
   a) Choose Objects > Object Management.
b) Select **Network** from the table of contents and click **Add Network > Add Object**.

c) Name the network object (for example, myInsideNetwork), and enter the real network address, 10.1.2.0/24.

```
New Network Objects
Name: myInsideNetwork
Description:
Network: 10.1.2.0/24
Allow Overrides: 
```

d) Click **Save**.

**Step 2**
Create a network object for the DMZ network 1.

a) Click **Add Network > Add Object**.

b) Name the network object (for example, DMZnetwork1) and enter the network address 209.165.201.0/27 (subnet mask of 255.255.255.224).

```
New Network Objects
Name: DMZnetwork1
Description:
Network: 209.165.201.0/27
Allow Overrides: 
```

c) Click **Save**.

**Step 3**
Create a network object for the PAT address for DMZ network 1.

a) Click **Add Network > Add Object**.

b) Name the network object (for example, PATaddress1) and enter the host address 209.165.202.129.

```
New Network Objects
Name: PATaddress1
Description:
Allow Overrides: 
```

c) Click **Save**.

**Step 4**
Create a network object for the DMZ network 2.

a) Click **Add Network > Add Object**.

b) Name the network object (for example, DMZnetwork2) and enter the network address 209.165.200.224/27 (subnet mask of 255.255.255.224).
c) Click Save.

**Step 5** Create a network object for the PAT address for DMZ network 2.

a) Click Add Network > Add Object.
b) Name the network object (for example, PATaddress2) and enter the host address 209.165.202.130.

c) Click Save.

**Step 6** Configure dynamic manual PAT for DMZ network 1.

a) Select Devices > NAT and create or edit a Firepower Threat Defense NAT policy.
b) Click Add Rule.
c) Configure the following properties:
   - **NAT Rule** = Manual NAT Rule.
   - **Type** = Dynamic.

d) On the Interface Objects tab, configure the following:
   - **Source Interface Objects** = inside.
   - **Destination Interface Objects** = dmz.

e) On the Translation tab, configure the following:
   - **Original Source** = myInsideNetwork network object.
   - **Translated Source > Address** = PATaddress1 network object.
   - **Original Destination > Address** = DMZnetwork1 network object.
   - **Translated Destination** = DMZnetwork1 network object.

**Note** Because you do not want to translate the destination address, you need to configure identity NAT for it by specifying the same address for the original and translated destination addresses. Leave all of the port fields blank.
Add NAT Rule

<table>
<thead>
<tr>
<th>NAT Rule:</th>
<th>Manual NAT Rule</th>
<th>Insert:</th>
<th>In Category</th>
<th>NAT Rules Before</th>
</tr>
</thead>
<tbody>
<tr>

</table>

Description:

Interface Objects | Translation | PAT Pool | Advanced

Original Packet | Translated Packet

Original Source: myInsideNetwork
Original Destination: Address

Translated Source: Address
Translated Destination: DMZNetwork2

Firepower Management Center Configuration Guide, Version 6.1

Step 7

Configure dynamic manual PAT for DMZ network 2.

a) Click Add Rule.

b) Configure the following properties:

- **NAT Rule** = Manual NAT Rule.
- **Type** = Dynamic.

c) On the **Interface Objects** tab, configure the following:

- **Source Interface Objects** = inside.
- **Destination Interface Objects** = dmz.

d) On the **Translation** tab, configure the following:

- **Original Source** = myInsideNetwork network object.
- **Translated Source > Address** = PATaddress2 network object.
- **Original Destination > Address** = DMZnetwork2 network object.
- **Translated Destination** = DMZnetwork2 network object.
e) Click Save.

**Step 8**  Click Save on the NAT rule page.

## Different Translation Depending on the Destination Address and Port (Dynamic Manual PAT)

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

The following figure shows the use of source and destination ports. The host on the 10.1.2.0/24 network accesses a single host for both web services and Telnet services. When the host accesses the server for Telnet services, the real address is translated to 209.165.202.129:port. When the host accesses the same server for web services, the real address is translated to 209.165.202.130:port.

*Figure 38: Manual NAT with Different Destination Ports*

**Before you begin**

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the servers. In this example, we will assume the interface objects are security zones named *inside* and *dmz*. To configure interface objects, select Objects > Object Management, then select Interface.
Procedure

Step 1  Create a network object for the inside network.
   a) Choose **Objects > Object Management**.
   b) Select **Network** from the table of contents and click **Add Network > Add Object**.
   c) Name the network object (for example, myInsideNetwork) and enter the real network address, 10.1.2.0/24.
      
      ![New Network Objects](image1)
      
      d) Click **Save**.

Step 2  Create a network object for the Telnet/Web server.
   a) Click **Add Network > Add Object**.
   b) Name the network object (for example, TelnetWebServer) and enter the host address 209.165.201.11.
      
      ![New Network Objects](image2)
      
      c) Click **Save**.

Step 3  Create a network object for the PAT address when using Telnet.
   a) Click **Add Network > Add Object**.
   b) Name the network object (for example, PATaddress1) and enter the host address 209.165.202.129.
      
      ![New Network Objects](image3)
      
      c) Click **Save**.

Step 4  Create a network object for the PAT address when using HTTP.
   a) Click **Add Network > Add Object**.
   b) Name the network object (for example, PATaddress2) and enter the host address 209.165.202.130.
c) Click Save.

**Step 5** Configure dynamic manual PAT for Telnet access.

a) Select Devices > NAT and create or edit a Firepower Threat Defense NAT policy.
b) Click Add Rule.
c) Configure the following properties:
   - **NAT Rule** = Manual NAT Rule.
   - **Type** = Dynamic.
d) On the **Interface Objects** tab, configure the following:
   - **Source Interface Objects** = inside.
   - **Destination Interface Objects** = dmz.
e) On the **Translation** tab, configure the following:
   - **Original Source** = myInsideNetwork network object.
   - **Translated Source > Address** = PATaddress1 network object.
   - **Original Destination > Address** = TelnetWebServer network object.
   - **Translated Destination** = TelnetWebServer network object.
   - **Original Destination Port** = TELNET port object (system-defined).
   - **Translated Destination Port** = TELNET port object (system-defined).

**Note** Because you do not want to translate the destination address or port, you need to configure identity NAT for them by specifying the same address for the original and translated destination addresses, and the same port for the original and translated port.
f) Click **Save**.

**Step 6**  Configure dynamic manual PAT for web access.

a) Click **Add Rule**.

b) Configure the following properties:

   • **NAT Rule** = Manual NAT Rule.
   
   • **Type** = Dynamic.

c) On the **Interface Objects** tab, configure the following:

   • **Source Interface Objects** = inside.
   
   • **Destination Interface Objects** = dmz.

d) On the **Translation** tab, configure the following:

   • **Original Source** = myInsideNetwork network object.
   
   • **Translated Source Address** = PATaddress2 network object.
   
   • **Original Destination Address** = TelnetWebServer network object.
   
   • **Translated Destination Address** = TelnetWebServer network object.
   
   • **Original Destination Port** = HTTP port object (system-defined).
   
   • **Translated Destination Port** = HTTP port object (system-defined).
e) Click Save.

**Step 7**  
Click **Save** on the NAT rule page.

---

## NAT and Site-to-Site VPN

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

The following figure shows a site-to-site tunnel connecting the Boulder and San Jose offices. For traffic that you want to go to the Internet (for example from 10.1.1.6 in Boulder to www.example.com), you need a public IP address provided by NAT to access the Internet. The below example uses interface PAT rules. However, for traffic that you want to go over the VPN tunnel (for example from 10.1.1.6 in Boulder to 10.2.2.78 in San Jose), you do not want to perform NAT; you need to exempt that traffic by creating an identity NAT rule. Identity NAT simply translates an address to the same address.
The following example explains the configuration for Firewall1 (Boulder).

**Before you begin**

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the devices in the VPN. In this example, we will assume the interface objects are security zones named `inside-boulder` and `outside-boulder` for the Firewall1 (Boulder) interfaces. To configure interface objects, select **Objects > Object Management**, then select **Interfaces**.

**Procedure**

**Step 1** Create the objects to define the various networks.

a) Choose **Objects > Object Management**.

b) Select **Network** from the table of contents and click **Add Network > Add Object**.

c) Identify the Boulder inside network.

Name the network object (for example, boulder-network) and enter the network address, 10.1.1.0/24.
d) Click Save.
e) Click Add Network > Add Object and define the inside San Jose network.
   Name the network object (for example, sanjose-network) and enter the network address 10.2.2.0/24.

![New Network Objects](image)

f) Click Save.

**Step 2** Configure manual identity NAT for the Boulder network when going over the VPN to San Jose on Firewall1 (Boulder).

a) Select Devices > NAT and create or edit a Firepower Threat Defense NAT policy.
b) Click Add Rule.
c) Configure the following properties:
   - **NAT Rule** = Manual NAT Rule.
   - **Type** = Static.

d) On the Interface Objects tab, configure the following:
   - **Source Interface Objects** = inside-boulder.
   - **Destination Interface Objects** = outside-boulder.

e) On the Translation tab, configure the following:
   - **Original Source** > Address = boulder-network object.
   - **Translated Source** > Address = boulder-network object.
   - **Original Destination** > Address = sanjose-network object.
   - **Translated Destination** = sanjose-network object.

*Note* Because you do not want to translate the destination address, you need to configure identity NAT for it by specifying the same address for the original and translated destination addresses. Leave all of the port fields blank. This rule configures identity NAT for both source and destination.

f) On the Advanced tab, select **Do not proxy ARP on Destination interface**.
Step 3

Configure manual dynamic interface PAT when going to the Internet for the inside Boulder network on Firewall1 (Boulder).

a) Click **Add Rule**.

b) Configure the following properties:

- **NAT Rule** = Manual NAT Rule.
- **Type** = Dynamic.
- **Insert Rule** = any position after the first rule. Because this rule will apply to any destination address, the rule that uses sanjose-network as the destination must come before this rule, or the sanjose-network rule will never be matched. The default is to place new manual NAT rules at the end of the "NAT Rules Before Auto NAT" section.

c) On the **Interface Objects** tab, configure the following:

- **Source Interface Objects** = inside-boulder.
- **Destination Interface Objects** = outside-boulder.

d) On the **Translation** tab, configure the following:

- **Original Source** = boulder-network object.
- **Translated Source** = **Destination Interface IP**. This option configures interface PAT using the interface contained in the destination interface object.
- **Original Destination > Address** = any (leave blank).
- **Translated Destination** = any (leave blank).
Step 4
If you are also managing Firewall2 (San Jose), you can configure similar rules for that device.

- The manual identity NAT rule would be for sanjose-network when the destination is boulder-network.
  Create new interface objects for the Firewall2 inside and outside networks.
- The manual dynamic interface PAT rule would be for sanjose-network when the destination is "any."

Rewriting DNS Queries and Responses Using NAT

You might need to configure the Firepower Threat Defense device to modify DNS replies by replacing the address in the reply with an address that matches the NAT configuration. You can configure DNS modification when you configure each translation rule. DNS modification is also known as DNS doctoring.

This feature rewrites the address in DNS queries and replies that match a NAT rule (for example, the A record for IPv4, the AAAA record for IPv6, or the PTR record for reverse DNS queries). For DNS replies traversing from a mapped interface to any other interface, the record is rewritten from the mapped value to the real value. Inversely, for DNS replies traversing from any interface to a mapped interface, the record is rewritten from the real value to the mapped value.

Following are the main circumstances when you would need to configure DNS rewrite on a NAT rule.

- The rule is NAT64 or NAT46, and the DNS server is on the outside network. You need DNS rewrite to convert between DNS A records (for IPv4) and AAAA records (for IPv6).
- The DNS server is on the outside, clients are on the inside, and some of the fully-qualified domain names that the clients use resolve to other inside hosts.
- The DNS server is on the inside and responds with private IP addresses, clients are on the outside, and the clients access fully-qualified domain names that point to servers that are hosted on the inside.

DNS Rewrite Limitations

Following are some limitations with DNS rewrite:

- DNS rewrite is not applicable for PAT because multiple PAT rules are applicable for each A or AAAA record, and the PAT rule to use is ambiguous.
If you configure a manual NAT rule, you cannot configure DNS modification if you specify the destination address as well as the source address. These kinds of rules can potentially have a different translation for a single address when going to A vs. B. Therefore, the Firepower Threat Defense device cannot accurately match the IP address inside the DNS reply to the correct twice NAT rule; the DNS reply does not contain information about which source/destination address combination was in the packet that prompted the DNS request.

- DNS rewrite is actually done on the xlate entry, not the NAT rule. Thus, if there is no xlate for a dynamic rule, rewrite cannot be done correctly. The same problem does not occur for static NAT.

- DNS rewrite does not rewrite DNS Dynamic Update messages (opcode 5).

The following topics provide examples of DNS rewrite in NAT rules.

### DNS64 Reply Modification

<table>
<thead>
<tr>

<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

The following figure shows an FTP server and DNS server on the outside IPv4 network. The system has a static translation for the outside server. In this case, when an inside IPv6 user requests the address for ftp.cisco.com from the DNS server, the DNS server responds with the real address, 209.165.200.225. Because you want inside users to use the mapped address for ftp.cisco.com (2001:DB8::D1A5:C8E1, where D1A5:C8E1 is the IPv6 equivalent of 209.165.200.225) you need to configure DNS reply modification for the static translation. This example also includes a static NAT translation for the DNS server, and a PAT rule for the inside IPv6 hosts.
Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named inside and outside. To configure interface objects, select Objects > Object Management, then select Interface.

Procedure

Step 1

Create the network objects for the FTP server, DNS server, inside network, and PAT pool.

a) Choose Objects > Object Management.
b) Select Network from the table of contents and click Add Network > Add Object.
c) Define the real FTP server address.
   Name the network object (for example, ftp_server) and enter the host address, 209.165.200.225.
d) Click Save.
e) Click Add Network > Add Object and define the FTP server's translated IPv6 address.

   Name the network object (for example, ftp_server_v6) and enter the host address, 2001:DB8::D1A5:C8E1.

![Image - FTP Server IPv6 Network Object]

f) Click Save.
g) Click Add Network > Add Object and define the DNS server's real address.

   Name the network object (for example, dns_server) and enter the host address, 209.165.201.15.

![Image - DNS Server Real Address Network Object]

h) Click Save.
i) Click Add Network > Add Object and define the DNS server's translated IPv6 address.

   Name the network object (for example, dns_server_v6) and enter the host address, 2001:DB8::D1A5:C90F (where D1A5:C90F is the IPv6 equivalent of 209.165.201.15).

![Image - DNS Server IPv6 Network Object]
j) Click **Save**.

k) Click **Add Network > Add Object** and define the inside IPv6 network.

Name the network object (for example, `inside_v6`) and enter the network address, 2001:DB8::/96.

l) Click **Save**.

m) Click **Add Network > Add Object** and define the IPv4 PAT pool for the inside IPv6 network.

Name the network object (for example, `ipv4_pool`) and enter the range 209.165.200.230-209.165.200.235.

n) Click **Save**.

**Step 2**

Configure the static NAT rule with DNS modification for the FTP server.

a) Select **Devices > NAT** and create or edit a Firepower Threat Defense NAT policy.

b) Click **Add Rule**.

c) Configure the following properties:

   - **NAT Rule** = Auto NAT Rule.
   - **Type** = Static.
d) On the **Interface Objects** tab, configure the following:
   - **Source Interface Objects** = outside.
   - **Destination Interface Objects** = inside.

e) On the **Translation** tab, configure the following:
   - **Original Source** = ftp_server network object.
   - **Translated Source > Address** = ftp_server_v6 network object.

f) On the **Advanced** tab, select the following options:
   - **Translate DNS replies that match this rule.**
   - **Net to Net Mapping**, because this is a one-to-one NAT46 translation.

g) Click **OK**.

**Step 3**

Configure the static NAT rule for the DNS server.

a) Click **Add Rule**.

b) Configure the following properties:
   - **NAT Rule** = Auto NAT Rule.
   - **Type** = Static.

c) On the **Interface Objects** tab, configure the following:
   - **Source Interface Objects** = outside.
   - **Destination Interface Objects** = inside.

d) On the **Translation** tab, configure the following:
   - **Original Source** = dns_server network object.
   - **Translated Source > Address** = dns_server_v6 network object.

e) On the **Advanced** tab, select **Net to Net Mapping**, because this is a one-to-one NAT46 translation.
f) Click OK.

**Step 4** Configure the dynamic NAT with a PAT pool rule for the inside IPv6 network.

a) Click **Add Rule**.

b) Configure the following properties:
   - **NAT Rule** = Auto NAT Rule.
   - **Type** = Dynamic.

c) On the **Interface Objects** tab, configure the following:
   - **Source Interface Objects** = inside.
   - **Destination Interface Objects** = outside.

d) On the **Translation** tab, configure the following:
   - **Original Source** = inside_v6 network object.
   - **Translated Source > Address** = leave this field empty.

e) On the **PAT Pool** tab, configure the following:
   - **Enable PAT Pool** = select this option.
   - **Translated Source > Address** = ipv4_pool network object.
f) Click OK.

**DNS Reply Modification, DNS Server on Outside**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>

</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Access Admin Administrator</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

The following figure shows a DNS server that is accessible from the outside interface. A server, ftp.cisco.com, is on the inside interface. You configure NAT to statically translate the ftp.cisco.com real address (10.1.3.14) to a mapped address (209.165.201.10) that is visible on the outside network.

In this case, you want to enable DNS reply modification on this static rule so that inside users who have access to ftp.cisco.com using the real address receive the real address from the DNS server, and not the mapped address.

When an inside host sends a DNS request for the address of ftp.cisco.com, the DNS server replies with the mapped address (209.165.201.10). The system refers to the static rule for the inside server and translates the address inside the DNS reply to 10.1.3.14. If you do not enable DNS reply modification, then the inside host attempts to send traffic to 209.165.201.10 instead of accessing ftp.cisco.com directly.
Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named inside and outside. To configure interface objects, select Objects > Object Management, then select Interface.

Procedure

Step 1 Create the network objects for the FTP server.
   a) Choose Objects > Object Management.
   b) Select Network from the table of contents and click Add Network > Add Object.
   c) Define the real FTP server address.

   Name the network object (for example, ftp_server) and enter the host address, 10.1.3.14.
d) Click **Save**.
e) Click **Add Network > Add Object** and define the FTP server's translated address.
   Name the network object (for example, ftp_server_outside) and enter the host address, 209.165.201.10.

![New Network Objects](image)

f) Click **Save**.

**Step 2**

Configure the static NAT rule with DNS modification for the FTP server.

a) Select **Devices > NAT** and create or edit a Firepower Threat Defense NAT policy.
b) Click **Add Rule**.
c) Configure the following properties:
   - **NAT Rule** = Auto NAT Rule.
   - **Type** = Static.

d) On the **Interface Objects** tab, configure the following:
   - **Source Interface Objects** = inside.
   - **Destination Interface Objects** = outside.

e) On the **Translation** tab, configure the following:
   - **Original Source** = ftp_server network object.
   - **Translated Source > Address** = ftp_server_outside network object.

f) On the **Advanced** tab, select **Translate DNS replies that match this rule**.
g) Click OK.

DNS Reply Modification, DNS Server on Host Network

</table>

The following figure shows an FTP server and DNS server on the outside. The system has a static translation for the outside server. In this case, when an inside user requests the address for ftp.cisco.com from the DNS server, the DNS server responds with the real address, 209.165.20.10. Because you want inside users to use the mapped address for ftp.cisco.com (10.1.2.56) you need to configure DNS reply modification for the static translation.
Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named inside and outside. To configure interface objects, select Objects > Object Management, then select Interface.

Procedure

Step 1

Create the network objects for the FTP server.

a) Choose Objects > Object Management.

b) Select Network from the table of contents and click Add Network > Add Object.

c) Define the real FTP server address.

Name the network object (for example, ftp_server) and enter the host address, 209.165.201.10.
d) Click **Save**.
e) Click **Add Network > Add Object** and define the FTP server's translated address.

Name the network object (for example, ftp_server_translated) and enter the host address, 10.1.2.56.

f) Click **Save**.

**Step 2**

Configure the static NAT rule with DNS modification for the FTP server.

a) Select **Devices > NAT** and create or edit a Firepower Threat Defense NAT policy.
b) Click **Add Rule**.
c) Configure the following properties:
   - **NAT Rule** = Auto NAT Rule.
   - **Type** = Static.

d) On the **Interface Objects** tab, configure the following:
   - **Source Interface Objects** = outside.
   - **Destination Interface Objects** = inside.

e) On the **Translation** tab, configure the following:
   - **Original Source** = ftp_server network object.
   - **Translated Source > Address** = ftp_server_translated network object.

f) On the **Advanced** tab, select **Translate DNS replies that match this rule**.
g) Click **OK**.

• Hybrid Interfaces, on page 1049
• Gateway VPNs, on page 1053
CHAPTER 48

Setting Up Virtual Switches

The following topics describe how to set up virtual switches in the Firepower System:

- Virtual Switches, on page 993
- Switched Interface Configuration, on page 993
- Virtual Switch Configuration, on page 998

Virtual Switches

You can configure a 7000 or 8000 Series device in a Layer 2 deployment so that it provides packet switching between two or more networks. In a Layer 2 deployment, you can configure virtual switches to operate as standalone broadcast domains, dividing your network into logical segments. A virtual switch uses the media access control (MAC) address from a host to determine where to send packets.

When you configure a virtual switch, the switch initially broadcasts packets through every available port on the switch. Over time, the switch uses tagged return traffic to learn which hosts reside on the networks connected to each port.

A virtual switch must contain two or more switched interfaces to handle traffic. For each virtual switch, traffic becomes limited to the set of ports configured as switched interfaces. For example, if you configure a virtual switch with four switched interfaces, packets sent in through one port for broadcast can only be sent out of the remaining three ports on the switch.

When you configure a physical switched interface, you must assign it to a virtual switch. You can also define additional logical switched interfaces on a physical port as needed. You can group multiple physical interfaces into a single logical switched interface called a link aggregation group (LAG). This single aggregate logical link provides higher bandwidth, redundancy, and load-balancing between two endpoints.

Caution

If a Layer 2 deployment fails for any reason, the device no longer passes traffic.

Switched Interface Configuration

You can set up switched interfaces to have either physical or logical configurations. You can configure physical switched interfaces for handling untagged VLAN traffic. You can also create logical switched interfaces for handling traffic with designated VLAN tags.
In a Layer 2 deployment, the system drops any traffic received on an external physical interface that does not have a switched interface waiting for it. If the system receives a packet with no VLAN tag and you have not configured a physical switched interface for that port, it drops the packet. If the system receives a VLAN-tagged packet and you have not configured a logical switched interface, it also drops the packet.

The system handles traffic that has been received with VLAN tags on switched interfaces by stripping the outermost VLAN tag on ingress before any rules evaluation or forwarding decisions. Packets leaving the device through a VLAN-tagged logical switched interface are encapsulated with the associated VLAN tag on egress.

Note that if you change the parent physical interface to inline or passive, the system deletes all the associated logical interfaces.

**Switched Interface Configuration Notes**

You can configure one or more physical ports on a managed device as switched interfaces. You must assign a physical switched interface to a virtual switch before it can handle traffic. You can configure link mode settings and MDI/MDIX settings only for copper interfaces.

---

**Note**

Interfaces on 8000 Series appliances do not support half-duplex options.

For each physical switched interface, you can add multiple logical switched interfaces. You must associate each logical interface with a VLAN tag to handle traffic received by the physical interface with that specific tag. You must assign a logical switched interface to a virtual switch to handle traffic.

When configuring a switched interface, the range within which you can set the MTU can vary depending on the Firepower System device model and interface type.

The range of MTU values can vary depending on the model of the managed device and the interface type.

---

**Caution**

Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 282 for more information.

To edit an existing logical switched interface, click the edit icon (🔧) next to the interface.

When you delete a logical switched interface, you remove it from the physical interface where it resides, as well as the virtual switch and security zone it is associated with.

**Related Topics**

- MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 472

Configuring Physical Switched Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device where you want to configure the switched interface, click the edit icon (-pencil).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Next to the interface you want to configure as a switched interface, click the edit icon (-pencil).

**Step 4** Click the Switched tab.

**Step 5** If you want to associate the switched interface with a security zone, do one of the following:

- Choose an existing security zone from the Security Zone drop-down list.
- Choose New to add a new security zone; see Creating Security Zone and Interface Group Objects, on page 349.

**Step 6** If you want to associate the switched interface with a virtual switch, do one of the following:

- Choose an existing virtual switch from the Virtual Switch drop-down list.
- Choose New to add a new virtual switch; see Adding Virtual Switches, on page 999.

**Step 7** Check the Enabled check box to allow the switched interface to handle traffic.

**Note** If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.

**Step 8** From the Mode drop-down list, choose an option to designate the link mode, or choose Autonegotiation to specify that the interface is configured to auto-negotiate speed and duplex settings.

Mode settings are available only for copper interfaces.

Interfaces on 8000 Series appliances do not support half-duplex options.

**Step 9** From the MDI/MDIX drop-down list, choose an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.

By default, MDI/MDIX is set to Auto-MDIX, which automatically handles switching between MDI and MDIX to attain link.

**Step 10** In the MTU field, enter a maximum transmission unit (MTU), which designates the largest size packet allowed. The range of MTU values can vary depending on the model of the managed device and the interface type.
Caution  Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 282 for more information.

Step 11  Click Save.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Adding Logical Switched Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

Procedure

Step 1  Choose Devices > Device Management.

Step 2  Next to the device where you want to add the switched interface, click the edit icon ( Modiﬁcation).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  Click Add Interface.

Step 4  Click Switched.

Step 5  From the Interface drop-down list, choose the physical interface that will receive the VLAN-tagged traffic.

Step 6  In the VLAN Tag field, enter a tag value that gets assigned to inbound and outbound traffic on this interface. The tag value can be any integer from 1 to 4094.

Step 7  If you want to associate the switched interface with a security zone, do one of the following:

• Choose an existing security zone from the Security Zone drop-down list.
• Choose New to add a new security zone; see Creating Security Zone and Interface Group Objects, on page 349.

Step 8  If you want to associate the switched interface with a virtual switch, do one of the following:

• Choose an existing virtual switch from the Virtual Switch drop-down list.
• Choose New to add a new virtual switch; see Adding Virtual Switches, on page 999.
Step 9  
Check the Enabled check box to allow the switched interface to handle traffic.

If you clear the check box, the interface becomes disabled and administratively taken down. If you disable a physical interface, you also disable all of the logical interfaces associated with it.

Step 10  
In the MTU field, enter a maximum transmission unit (MTU), which designates the largest size packet allowed. The range of MTU values can vary depending on the model of the managed device and the interface type.

Caution  
Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 282 for more information.

Step 11  
Click Save.

What to do next  
• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Deleting Logical Switched Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1  
Choose Devices > Device Management.

Step 2  
Next to the managed device that contains the switched interface you want to delete, click the edit icon (ientes). In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  
Next to the logical switched interface you want to delete, click the delete icon (ientes).

Step 4  
When prompted, confirm that you want to delete the interface.

What to do next  
• Deploy configuration changes; see Deploy Configuration Changes, on page 279.
Virtual Switch Configuration

Before you can use switched interfaces in a Layer 2 deployment, you must configure virtual switches and assign switched interfaces to them. A virtual switch is a group of switched interfaces that process inbound and outbound traffic through your network.

Virtual Switch Configuration Notes

You can add virtual switches from the Virtual Switches tab of the Device Management page. The Virtual Switches tab displays a list of all the virtual switches you have configured on a device. The page includes summary information about each switch.

Table 80: Virtual Switches Table View Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the virtual switch.</td>
</tr>
<tr>
<td>Interfaces</td>
<td>All switched interfaces that are assigned to the virtual switch. Interfaces that you have disabled from the Interfaces tab are not available.</td>
</tr>
<tr>
<td>Hybrid Interface</td>
<td>The optionally configured hybrid interface that ties the virtual switch to a virtual router.</td>
</tr>
<tr>
<td>Unicast Packets</td>
<td>Unicast packet statistics for the virtual switch, including:</td>
</tr>
<tr>
<td></td>
<td>• Unicast packets received</td>
</tr>
<tr>
<td></td>
<td>• Unicast packets forwarded (excludes drops by host)</td>
</tr>
<tr>
<td></td>
<td>• Unicast packets unintentionally dropped</td>
</tr>
<tr>
<td>Broadcast Packets</td>
<td>Broadcast packet statistics for the virtual switch, including:</td>
</tr>
<tr>
<td></td>
<td>• Broadcast packets received</td>
</tr>
<tr>
<td></td>
<td>• Broadcast packets forwarded</td>
</tr>
<tr>
<td></td>
<td>• Broadcast packets unintentionally dropped</td>
</tr>
</tbody>
</table>

You can also add switches as you configure switched interfaces. You can assign only switched interfaces to a virtual switch. If you want to create a virtual switch before you configure the switched interfaces on your managed devices, you can create an empty virtual switch and add interfaces to it later.

Tip

To edit an existing virtual switch, click the edit icon (📝) next to the switch.
Adding Virtual Switches

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device where you want to add the virtual switch, click the edit icon ( Eroted).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the Virtual Switches tab.

**Step 4** Click Add Virtual Switch.

**Step 5** Enter a name in the Name field.

**Step 6** From the Available list, choose one or more switched interfaces to add to the virtual switch.

**Tip** Interfaces that you have disabled from the Interfaces tab are not available; disabling an interface after you add it removes it from the configuration.

**Step 7** Click Add.

**Step 8** If you want to tie the virtual switch to a virtual router, choose a hybrid interface from the Hybrid Interface drop-down list.

**Step 9** Optionally, configure advanced settings for the switch; see Advanced Virtual Switch Settings, on page 999

**Step 10** Click Save.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Related Topics**

  Logical Hybrid Interfaces, on page 1049

**Advanced Virtual Switch Settings**

**Adding Static MAC Entries**

Over time, a virtual switch learns MAC addresses by tagging return traffic from the network. You can manually add a static MAC entry, which designates that a MAC address resides on a specific port. Regardless of whether you ever receive traffic from that port, the MAC address remains static in the table. You can specify one or more static MAC addresses for each virtual switch.
**Enabling Spanning Tree Protocol (STP) and Dropping Bridge Protocol Data Units (BPDU)**

STP is a network protocol used to prevent network loops. BPDU s are exchanged through the network, carrying information about network bridges. The protocol uses BPDU s to identify and select the fastest network links, if there are redundant links in the network. If a network link fails, Spanning Tree fails over to an existing alternate link.

**Note**

Cisco strongly recommends that you enable STP when configuring a virtual switch that you plan to deploy in a 7000 or 8000 Series device high-availability pair. Only enable STP if your virtual switch switches traffic between multiple network interfaces.

If your virtual switch routes traffic between VLANs, similar to a router on a stick, BPDU s enter and exit the device through different logical switched interfaces, but the same physical switched interface. As a result, STP identifies the device as a redundant network loop, which can cause issues in certain Layer 2 deployments. To prevent this, you can configure the virtual switch at the domain level to have the device drop BPDU s when monitoring traffic. You can only drop BPDU s if you disable STP.

**Note**

Drop BPDU s only if your virtual switch routes traffic between VLANs on a single physical interface.

**Enabling Strict TCP Enforcement**

To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed. Strict enforcement also blocks:

- non-SYN TCP packets for connections where the three-way handshake was not completed
- non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK
- non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established
- SYN packets on an established TCP connection from either the initiator or the responder

Note that if you associate the virtual switch with a logical hybrid interface, the switch uses the same strict TCP enforcement setting as the virtual router associated with the logical hybrid interface. You cannot specify strict TCP enforcement on the switch in this case.

**Configuring Advanced Virtual Switch Settings**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose Devices > Device Management.
Step 2  
Next to the device that contains the virtual switch you want to edit, click the edit icon (✏️).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  
Click the Virtual Switches tab.

Step 4  
Next to the virtual switch that you want to edit, click the edit icon (✏️).

Step 5  
Click the Advanced tab.

Step 6  
To add a static MAC entry, click Add.

Step 7  
In the MAC Address field, enter the address using the standard format of six groups of two hexadecimal digits separated by colons (for example, 01:23:45:67:89:AB).

**Note**  
Broadcast addresses (00:00:00:00:00:00 and FF:FF:FF:FF:FF:FF) cannot be added as static MAC addresses.

Step 8  
From the Interface drop-down list, choose the interface where you want to assign the MAC address.

Step 9  
Click OK.

Step 10  
If you want to enable the Spanning Tree Protocol, check the Enable Spanning Tree Protocol check box.

Step 11  
If you want to enable strict TCP enforcement, check the Strict TCP Enforcement check box.

If you associate the virtual switch with a logical hybrid interface, this option does not appear and the switch uses the same setting as the virtual router associated with the logical hybrid interface.

Step 12  
If you want to drop BPDUs at the domain level, check the Drop BPDUs check box.

Step 13  
Click Save.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

## Deleting Virtual Switches

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

When you delete a virtual switch, any switched interfaces assigned to the switch become available for inclusion in another switch.

**Procedure**

**Step 1**  
Choose Devices > Device Management.

**Step 2**  
Next to the managed device that contains the virtual switch you want to delete, click the edit icon (✏️).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Deleting Virtual Switches

Step 3  Click the **Virtual Switches** tab.

Step 4  Next to the virtual switch that you want to delete, click the delete icon ( ).

Step 5  When prompted, confirm that you want to delete the virtual switch.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 279.
Setting Up Virtual Routers

The following topics describe how to set up virtual routers in the Firepower System:

- Virtual Routers, on page 1003
- Routed Interfaces, on page 1004
- Configuring Physical Routed Interfaces, on page 1005
- Adding Logical Routed Interfaces, on page 1007
- Deleting Logical Routed Interfaces, on page 1009
- Configuring SFRP, on page 1010
- Virtual Router Configuration, on page 1011
- Adding Virtual Routers, on page 1012
- DHCP Relay, on page 1013
- Static Routes, on page 1015
- Dynamic Routing, on page 1017
- Virtual Router Filters, on page 1029
- Adding Virtual Router Authentication Profiles, on page 1032
- Viewing Virtual Router Statistics, on page 1033
- Deleting Virtual Routers, on page 1033

Virtual Routers

You can configure a managed device in a Layer 3 deployment so that it routes traffic between two or more interfaces. To route traffic, you must assign an IP address to each interface and assign the interfaces to the virtual router. The interfaces assigned to virtual routers can be physical, logical, or link aggregation group (LAG) interfaces.

You can configure the system to route packets by making packet forwarding decisions according to the destination address. Interfaces configured as routed interfaces receive and forward the Layer 3 traffic. Routers obtain the destination from the outgoing interface based on the forwarding criteria, and access control rules designate the security policies to be applied.

In Layer 3 deployments, you can define static routes. In addition, you can configure Routing Information Protocol (RIP) and Open Shortest Path First (OSPF) dynamic routing protocols. You can also configure a combination of static routes and RIP or static routes and OSPF.

Note that you can only configure virtual routers, physical routed interfaces, or logical routed interfaces on a 7000 or 8000 Series device.
If a Layer 3 deployment fails for any reason, the device no longer passes traffic.

**Caution**

Routed Interfaces

You can set up routed interfaces with either physical or logical configurations. You can configure physical routed interfaces for handling untagged VLAN traffic. You can also create logical routed interfaces for handling traffic with designated VLAN tags.

In a Layer 3 deployment, the system drops any traffic received on an external physical interface that does not have a routed interface waiting for it. The system drops a packet if:

- It receives a packet with no VLAN tag, and you have not configured a physical routed interface for that port.
- It receives a VLAN-tagged packet, and you have not configured a logical routed interface for that port.

The system handles traffic that has been received with VLAN tags on switched interfaces by stripping the outermost VLAN tag on ingress prior to any rules evaluation or forwarding decisions. Packets leaving the device through a VLAN-tagged logical routed interface are encapsulated with the associated VLAN tag on egress. The system drops any traffic received with a VLAN tag after the stripping process completes.

You can add static Address Resolution Protocol (ARP) entries to a routed interface. If an external host needs to know the MAC address of the destination IP address it needs to send traffic to on your local network, it sends an ARP request. When you configure static ARP entries, the virtual router responds with an IP address and associated MAC address.

Note that disabling the **ICMP Enable Responses** option for logical routed interfaces does not prevent ICMP responses in all scenarios. You can add network-based rules to an access control policy to drop packets where the destination IP is the routed interface’s IP and the protocol is ICMP.

If you have enabled the **Inspect Local Router Traffic** option on the managed device, the system drops the packets before they reach the host, thereby preventing any response.

The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution**

Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See **Snort® Restart Traffic Behavior**, on page 282 for more information.

If you change the parent physical interface to inline or passive, the system deletes all the associated logical interfaces.

**Related Topics**

- Advanced Device Settings, on page 448

Snort® Restart Scenarios, on page 281

Configuring Physical Routed Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can configure one or more physical ports on a managed device as routed interfaces. You must assign a physical routed interface to a virtual router before it can route traffic.

⚠️ Caution

Adding a routed interface pair on a 7000 or 8000 Series device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

Procedure

Step 1 Choose Devices > Device Management.

Step 2 Next to the device you want to modify, click the edit icon (✏).

   In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Next to the interface you want to modify, click the edit icon (✏).

Step 4 Click Routed to display the routed interface options.

Step 5 If you want to apply a security zone, do one of the following:

   • Choose an existing security zone from the Security Zone drop-down list.
   • Choose New to add a new security zone; see Creating Security Zone and Interface Group Objects, on page 349.

Step 6 If you want to specify a virtual router, do one of the following:

   • Choose an existing virtual router from the Virtual Router drop-down list.
   • Choose New to add a new virtual router; Adding Virtual Routers, on page 1012.

Step 7 Check the Enabled check box to allow the routed interface to handle traffic. If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.

Step 8 From the Mode drop-down list, choose an option to designate the link mode, or choose Autonegotiation to specify that the interface is configured to auto negotiate speed and duplex settings.

   Mode settings are available only for copper interfaces.

   Interfaces on 8000 Series appliances do not support half-duplex options.

Step 9 From the MDI/MDIX drop-down list, choose an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.
Normally, MDI/MDIX is set to Auto-MDIX, which automatically handles switching between MDI and MDIX to attain link.

MDI/MDIX settings are available only for copper interfaces.

**Step 10**

In the **MTU** field, choose a maximum transmission unit (MTU), which designates the largest size packet allowed.

The MTU is the Layer 2 MTU/MRU and not the Layer 3 MTU.

The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See **Snort® Restart Traffic Behavior**, on page 282 for more information.

**Step 11**

Next to **ICMP**, check the **Enable Responses** check box to allow the interface to respond to ICMP traffic such as pings and traceroute.

**Step 12**

Next to **IPv6 NDP**, check the **Enable Router Advertisement** check box to enable the interface to broadcast router advertisements.

**Step 13**

To add an IP address, click **Add**.

**Step 14**

In the **Address** field, enter the routed interface’s IP address and subnet mask using CIDR notation.

Note the following:

- You cannot add network and broadcast addresses, or the static MAC addresses 00:00:00:00:00:00 and FF:FF:FF:FF:FF:FF.
- You cannot add identical IP addresses, regardless of subnet mask, to interfaces in virtual routers.

**Step 15**

If your organization uses IPv6 addresses and you want to set the IP address of the interface automatically, check the **Address Autoconfiguration** check box next to the **IPv6** field.

**Step 16**

For **Type**, choose either **Normal** or **SFRP**.

For SFRP options, see **Configuring SFRP**, on page 1010 for more information.

**Step 17**

Click **OK**.

- To edit an IP address, click the edit icon (🛠).
- To delete an IP address, click the delete icon (🗑).

**Note** When adding an IP address to a routed interface of a 7000 or 8000 Series device in a high-availability pair, you must add a corresponding IP address to the routed interface on the high-availability pair peer.

**Step 18**

To add a static ARP entry, click **Add**.

**Step 19**

In the **IP Address** field, enter an IP address for the static ARP entry.

**Step 20**

In the **MAC Address** field, enter a MAC address to associate with the IP address. Use the standard address format of six groups of two hexadecimal digits separated by colons (for example, 01:23:45:67:89:AB).
Step 21  Click OK.

Tip  To edit a static ARP entry, click the edit icon (✍). To delete a static ARP entry, click the delete icon (🗑).

Step 22  Click Save.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics

MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 472
Snort® Restart Scenarios, on page 281

Adding Logical Routed Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Norton</td>
</tr>
</tbody>
</table>

For each physical routed interface, you can add multiple logical routed interfaces. You must associate each logical interface with a VLAN tag to handle traffic received by the physical interface with that specific tag. You must assign a logical routed interface to a virtual router to route traffic.

Caution

Adding a routed interface pair on 7000 or 8000 Series devices restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

Procedure

Step 1  Choose Devices > Device Management.

Step 2  Next to the device you want to modify, click the edit icon (✍).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  Click Add Interface.

Step 4  Click Routed to display the routed interface options.

Step 5  From the Interface drop-down list, choose the physical interface where you want to add the logical interface.

Step 6  In the VLAN Tag field, enter a tag value that gets assigned to inbound and outbound traffic on this interface. The value can be any integer from 1 to 4094.
Step 7
If you want to apply a security zone, do one of the following:

• Choose an existing security zone from the Security Zone drop-down list.
• Choose New to add a new security zone; see Creating Security Zone and Interface Group Objects, on page 349.

Step 8
If you want to specify a virtual router, do one of the following:

• Choose an existing virtual router from the Virtual Router drop-down list.
• Choose New to add a new virtual router; Adding Virtual Routers, on page 1012.

Step 9
Check the Enabled check box to allow the routed interface to handle traffic.

If you clear the check box, the interface becomes disabled and administratively taken down. If you disable a physical interface, you also disable all of the logical interfaces associated with it.

Step 10
In the MTU field, enter a maximum transmission unit (MTU), which designates the largest size packet allowed. The MTU is the Layer 2 MTU/MRU and not the Layer 3 MTU.

The range of MTU values can vary depending on the model of the managed device and the interface type.

Caution Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified.

Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 282 for more information.

Step 11
Next to ICMP, check the Enable Responses check box to communicate updates or error information to other routers, intermediary devices, or hosts.

Step 12
Next to IPv6 NDP, check the Enable Router Advertisement check box to enable the interface to broadcast router advertisements.

Step 13
To add an IP address, click Add.

Step 14
In the Address field, enter the IP address in CIDR notation.

Note the following:

• You cannot add network and broadcast addresses, or the static MAC addresses 00:00:00:00:00:00 and FF:FF:FF:FF:FF:FF.
• You cannot add identical IP addresses, regardless of subnet mask, to interfaces in virtual routers.

Step 15
If your organization uses IPv6 addresses and you want to set the IP address of the interface automatically, choose the Address Autoconfiguration check box next to the IPv6 field.

Step 16
For Type, choose either Normal or SFRP.

For SFRP options, see Configuring SFRP, on page 1010 for more information.

Step 17
Click OK.

• To edit an IP address, click the edit icon (📝).

• To delete an IP address, click the delete icon (🗑️).
When you add an IP address to a routed interface of a 7000 or 8000 Series device in a high-availability pair, you must add a corresponding IP address to the routed interface on the high-availability pair peer.

**Step 18**  
To add a static ARP entry, click **Add**.

**Step 19**  
In the **IP Address** field, enter an IP address for the static ARP entry.

**Step 20**  
In the **MAC Address** field, enter a MAC address to associate with the IP address. Use the standard address format of six groups of two hexadecimal digits separated by colons (for example, 01:23:45:67:89:AB).

**Step 21**  
Click **OK**. The static ARP entry is added.

**Tip**  
To edit a static ARP entry, click the edit icon ( Modi). To delete a static ARP entry, click the delete icon (  Modi).

**Step 22**  
Click **Save**.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

### Deleting Logical Routed Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

When you delete a logical routed interface, you remove it from the physical interface where it resides, as well as its assigned virtual router and security zone.

**Procedure**

**Step 1**  
Choose **Devices > Device Management**.

**Step 2**  
Next to the device you want to modify, click the edit icon ( Modi).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3**  
Next to the logical routed interface you want to delete, click the delete icon (  Modi).

**Step 4**  
When prompted, confirm that you want to delete the interface.
Configuring SFRP

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can configure Cisco Redundancy Protocol (SFRP) to achieve network redundancy for high availability on either a 7000 or 8000 Series device high-availability pair or individual devices. SFRP provides gateway redundancy for both IPv4 and IPv6 addresses. You can configure SFRP on routed and hybrid interfaces.

If the interfaces are configured on individual devices, they must be in the same broadcast domain. You must designate at least one of the interfaces as master and an equal number as backup. The system supports only one master and one backup per IP address. If network connectivity is lost, the system automatically promotes the backup to master to maintain connectivity.

The options you set for SFRP must be the same on all interfaces in a group of SFRP interfaces. Multiple IP addresses in a group must be in the same master/backup state. Therefore, when you add or edit an IP address, the state you set for that address propagates to all the addresses in the group. For security purposes, you must enter values for **Group ID** and **Shared Secret** that are shared among the interfaces in the group.

To enable SFRP IP addresses on a virtual router, you must also configure one non-SFRP IP address. Note that only one non-SFRP address should be configured per interface.

As all SFRPs in a group failover together, all SFRPs on the same virtual router should be in the same SFRP group. In addition, you should also set up an HA link interface on each device in a high-availability pair when using NAT, HA state sharing, or VPN. For more information on HA link interfaces, see Configuring HA Link Interfaces, on page 469

For 7000 or 8000 Series devices in a high-availability pair, you designate the shared secret and the system copies it to the high-availability pair peer along with the SFRP IP configuration. The shared secret authenticates peer data.

---

**Note**

Cisco does not recommend enabling more than one non-SFRP IP address on a 7000 or 8000 Series device high-availability pair's routed or hybrid interface where one SFRP IP address is already configured. The system does not perform NAT if a 7000 or 8000 Series device high-availability pair fails over while in standby mode.

**Procedure**

1. **Step 1** Choose Devices > Device Management.

2. **Step 2** Next to the device you want to modify, click the edit icon (-pencil).

   In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Step 3  
Next to the interface where you want to configure SFRP, click the edit icon ( ).

Step 4  
Choose the type of interface where you want to configure SFRP, either Routed or Hybrid.

Step 5  
You can configure SFRP while adding or editing an IP address. Click Add to add an IP address. To edit an IP address, click the edit icon ( ).

Step 6  
For Type, choose SFRP to display the SFRP options.

Step 7  
In the Group ID field, enter a value that designates a group of master or backup interfaces configured for SFRP.

Step 8  
For Priority, choose either Master or Backup to designate the preferred interface:

- For individual devices, you must set one interface to master on one device and the other to backup on a second device.
- For 7000 or 8000 Series device high-availability pairs, when you set one interface as master, the other automatically becomes the backup.

Step 9  
In the Shared Secret field, enter a shared secret.

The Shared Secret field populates automatically for a group in a 7000 or 8000 Series device high-availability pair.

Step 10  
In the Adv. Interval (seconds) field, enter an interval for route advertisements for Layer 3 traffic.

Step 11  
Click OK.

Step 12  
Click Save.

---

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

---

Virtual Router Configuration

Caution

Adding a virtual router on a 7000 or 8000 Series device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

Before you can use routed interfaces in a Layer 3 deployment, you must configure virtual routers and assign routed interfaces to them. A virtual router is a group of routed interfaces that route Layer 3 traffic.

You can assign only routed and hybrid interfaces to a virtual router.

To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed. Strict enforcement also blocks:

- non-SYN TCP packets for connections where the three-way handshake was not completed
• non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK
• non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the
  session is established
• SYN packets on an established TCP connection from either the initiator or the responder

Note that if you change the configuration of a Layer 3 interface to a non-Layer 3 interface or remove a Layer
3 interface from the virtual router, the router may fall into an invalid state. For example, if it is used in DHCPv6,
it may cause an upstream and downstream mismatch.

# Adding Virtual Routers

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

You can add virtual routers from the Virtual Routers tab of the device management page. You can also add
routers as you configure routed interfaces.

If you want to create a virtual router before you configure the interfaces on your managed devices, you can
create an empty virtual router and add interfaces to it later.

⚠️ **Caution**

Adding a virtual router on a 7000 or 8000 Series device restarts the Snort process when you deploy configuration
changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes
without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic
Behavior, on page 282 for more information.

## Procedure

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device you want to modify, click the edit icon (筆).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the Virtual Routers tab.

**Tip** If your devices are in a stack in a high-availability pair, choose the stack you want to modify from the
Selected Device drop-down list.

**Step 4** Click Add Virtual Router.

**Step 5** In the Name field, enter a name for the virtual router. You can use alphanumeric characters and spaces.

**Step 6** Configure IPv6 static routing, OSPFv3, and RIPng on your virtual router by checking or clearing the IPv6
Support check box.

**Step 7** If you do not want to enable strict TCP enforcement, clear the Strict TCP Enforcement check box. This
option is enabled by default.
Step 8 Choose one or more interfaces from the Available list under Interfaces, and click Add.

The Available list contains all enabled Layer 3 interfaces, routed and hybrid, on the device that you can assign to the virtual router.

**Tip** To remove a routed or hybrid interface from the virtual router, click the delete icon ( ). Disabling a configured interface from the Interfaces tab also removes it.

Step 9 Click Save.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

---

**DHCP Relay**

DHCP provides configuration parameters to Internet hosts. A DHCP client that has not yet acquired an IP address cannot communicate directly with a DHCP server outside its broadcast domain. To allow DHCP clients to communicate with DHCP servers, you can configure DHCP relay instances to handle cases where the client is not on the same broadcast domain as the server.

You can set up DHCP relay for each virtual router you configure. By default, this feature is disabled. You can enable either DHCPv4 relay or DHCPv6 relay.

---

**Note**

You cannot run a DHCPv6 Relay chain through two or more virtual routers running on the same device.

---

**Setting Up DHCPv4 Relay**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/N Network Admin</td>
</tr>
</tbody>
</table>

The following procedure explains how to set up DHCPv4 relay on a virtual router.

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device you want to modify, click the edit icon ( ).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the Virtual Routers tab.

**Step 4** Next to the virtual router you want to modify, click the edit icon ( ).
Step 5  Check the DHCPv4 check box.
Step 6  Under the Servers field, enter a server IP address.
Step 7  Click Add.
        You can add up to four DHCP servers.
Step 8  In the Max Hops field, enter the maximum number of hops from 1 to 255.
Step 9  Click Save.

What to do next
• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Setting Up DHCPv6 Relay

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You cannot run a DHCPv6 Relay chain through two or more virtual routers running on the same device.

Procedure

Step 1  Choose Devices > Device Management.
Step 2  Next to the device you want to modify, click the edit icon ( ).
        In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Step 3  Click the Virtual Routers tab.
Step 4  Next to the virtual router where you want to set up DHCP relay, click the edit icon ( ).
Step 5  Check the DHCPv6 check box.
Step 6  In the Interfaces field, check the check boxes next to one or more interfaces that have been assigned to the virtual router.
        Tip You cannot disable an interface from the Interfaces tab while it is configured for DHCPv6 Relay.
        You must first clear the DHCPv6 Relay interfaces check box and save the configuration.
Step 7  Next to a selected interface, click the drop-down icon and choose whether the interface relays DHCP requests Upstream, Downstream, or Both.
        Note You must include at least one downstream interface and one upstream interface. Choosing both means that the interface is both downstream and upstream.
Step 8  In the Max Hops field, enter the maximum number of hops from 1 to 255
Step 9  Click Save.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Static Routes

Static routing allows you to write rules about the IP addresses of traffic passing through a router. It is the simplest way of configuring path selection of a virtual router because there is no communication with other routers regarding the current topology of the network.

The Static Routes table includes summary information about each route, as described in the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Specifies whether this route is currently enabled or disabled.</td>
</tr>
<tr>
<td>Name</td>
<td>The name of the static route.</td>
</tr>
<tr>
<td>Destination</td>
<td>The destination network where traffic is routed.</td>
</tr>
<tr>
<td>Type</td>
<td>Specifies the action that is taken for this route, which will is one of the following:</td>
</tr>
<tr>
<td></td>
<td>• IP — designates that the route forwards packets to the address of a neighboring router.</td>
</tr>
<tr>
<td></td>
<td>• Interface — designates that the route forwards packets to an interface through which traffic is routed to hosts on a directly connected network.</td>
</tr>
<tr>
<td></td>
<td>• Discard — designates that the static route drops packets.</td>
</tr>
<tr>
<td>Gateway</td>
<td>The target IP address if you selected IP as the static route type or the interface if you selected Interface as the static route type.</td>
</tr>
<tr>
<td>Preference</td>
<td>Determines the route selection. If you have multiple routes to the same destination, the system selects the route with the higher preference.</td>
</tr>
</tbody>
</table>
Viewing the Static Routes Table

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device you want to view, click the edit icon (✏).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the **Virtual Routers** tab.

**Step 4** Next to the virtual router where you want to view static routes, click the edit icon (✏).

If a view icon (👁️) appears instead, the configuration belongs to a descendant domain, or you do not have permission to modify the configuration.

**Step 5** Click the **Static** tab.

---

Adding Static Routes

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device where you want to add the static route, click the edit icon (✏).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the **Virtual Routers** tab.

**Step 4** Next to the virtual router where you want to add the static route, click the edit icon (✏).

**Step 5** Click **Static** to display the static route options.

**Step 6** Click **Add Static Route**.

**Step 7** In the **Route Name** field, enter a name for the static route. You can use alphanumeric characters and spaces.

**Step 8** For **Enabled**, check the check box to specify that the route is currently enabled.

**Step 9** In the **Preference** field, enter a numerical value between 1 and 65535 to determine the route selection.
If you have multiple routes to the same destination, the system uses the route with the higher preference.

Step 10
From the Type drop-down list, choose the type of static route you are configuring.

Step 11
In the Destination field, enter the IP address for the destination network where traffic should be routed.

Step 12
In the Gateway field, you have two options:

- If you chose IP as the selected static route type, choose an IP address.
- If you chose Interface as the selected static route type, choose an enabled interface from the drop-down list.

Tip
Interfaces you have disabled from the Interfaces tab are not available; disabling an interface you have added removes it from the configuration.

Step 13
Click OK.

Step 14
Click Save.

What to do next
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Dynamic Routing

Dynamic, or adaptive, routing uses a routing protocol to alter the path that a route takes in response to a change in network conditions. The adaptation is intended to allow as many routes as possible to remain valid, that is, have destinations that can be reached in response to the change. This allows the network to “route around” damage, such as loss of a node or a connection between nodes, so long as other path choices are available. You can configure a router with no dynamic routing, or you can configure the Routing Information Protocol (RIP) or the Open Shortest Path First (OSPF) routing protocol.

RIP Configuration

Routing Information Protocol (RIP) is a dynamic routing protocol, designed for small IP networks, that relies on hop count to determine routes. The best routes use the fewest number of hops. The maximum number of hops allowed for RIP is 15. This hop limit also limits the size of the network that RIP can support.

Adding Interfaces for RIP Configuration

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

While configuring RIP, you must choose interfaces from those already included in the virtual router, where you want to configure RIP. Disabled interfaces are not available.
Procedure

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device you want to modify, click the edit icon (edit).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the **Virtual Routers** tab.

**Step 4** Next to the virtual router you want to modify, click the edit icon (edit).

**Step 5** Click **Dynamic Routing** to display the dynamic routing options.

**Step 6** Click **RIP** to display the RIP options.

**Step 7** Under **Interfaces**, click the add icon (add).

**Step 8** From the **Name** drop-down list, choose the interface where you want to configure RIP.

**Tip** Interfaces you have disabled from the Interfaces tab are not available; disabling an interface you have added removes it from the configuration.

**Step 9** In the **Metric** field, enter a metric for the interface. When routes from different RIP instances are available and all of them have the same preference, the route with the lowest metric becomes the preferred route.

**Step 10** From the **Mode** drop-down list, choose one of the following options:

- **Multicast** — default mode where RIP multicasts the entire routing table to all adjacent routers at a specified address.
- **Broadcast** — forces RIP to use broadcast (for example, RIPv1) even though multicast mode is possible.
- **Quiet** — RIP will not transmit any periodic messages to this interface.
- **No Listen** — RIP will send to this interface but not listen to it.

**Step 11** Click **Save**.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

---

**Configuring Authentication Settings for RIP Configuration**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

RIP authentication uses one of the authentication profiles you configured on the virtual router.
Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device you want to modify, click the edit icon (✏). In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click the **Virtual Routers** tab.

Step 4 Next to the virtual router where you want to add the RIP authentication profile, click the edit icon (✏).

Step 5 Click **Dynamic Routing** to display the dynamic routing options.

Step 6 Click **RIP** to display the RIP options.

Step 7 Under **Authentication**, choose an existing virtual router authentication profile from the **Profile** drop-down list, or choose **None**.

Step 8 Click **Save**.

What to do next

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

Configuring Advanced Settings for RIP Configuration

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can configure several advanced RIP settings pertaining to various timeout values and other features that affect the behavior of the protocol.

Caution

Changing any of the advanced RIP settings to incorrect values can prevent the router from communicating successfully with other RIP routers.

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device you want to modify, click the edit icon (✏). In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click the **Virtual Routers** tab.

Step 4 Next to the virtual router you want to modify, click the edit icon (✏).

Step 5 Click **Dynamic Routing** to display the dynamic routing options.

Step 6 Click **RIP** to display the RIP options.
Step 7  
In the **Preference** field, enter a numerical value (higher is better) for the preference of the routing protocol. The system prefers routes learned through RIP over static routes.

Step 8  
In the **Period** field, enter the interval, in seconds, between periodic updates. A lower number determines faster convergence, but larger network load.

Step 9  
In the **Timeout Time** field, enter a numerical value that specifies how old routes must be, in seconds, before being considered unreachable.

Step 10  
In the **Garbage Time** field, enter a numerical value that specifies how old routes must be, in seconds, before being discarded.

Step 11  
In the **Infinity** field, enter a numerical value that specifies a value for infinity distance in convergence calculations. Larger values will make protocol convergence slower.

Step 12  
From the **Honor** drop-down list, choose one of the following options to designate when requests for dumping routing tables should be honored:

- **Always** — always honor requests
- **Neighbor** — only honor requests sent from a host on a directly connected network
- **Never** — never honor requests

Step 13  
Click **Save**.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

### Adding Import Filters for RIP Configuration

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can add an import filter to designate which routes are accepted or rejected from RIP into the route table. Import filters are applied in the order they appear in the table.

When adding an import filter, you use one of the filters you configured on the virtual router.

Tip

To edit a RIP import filter, click the edit icon (edit). To delete a RIP import filter, click the delete icon (trash).

Before you begin

- Add a virtual router as described in Adding Virtual Routers, on page 1012.
- Configure a filter on the virtual router as described in Setting Up Virtual Router Filters, on page 1031.
Adding Export Filters for RIP Configuration

### What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

### Adding Export Filters for RIP Configuration

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can add an export filter to define which routes will be accepted or rejected from the route table to RIP. Export filters are applied in the order they appear in the table.

When adding an export filter, you use one of the filters you configured on the virtual router.

### Procedure

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device you want to modify, click the edit icon (✏️).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the Virtual Routers tab.

**Step 4** Next to the virtual router where you want to add the RIP virtual router filter, click the edit icon (✏️).

**Step 5** Click Dynamic Routing to display the dynamic routing options.

**Step 6** Click RIP to display the RIP options.

**Step 7** Under Import Filters, click the add icon (➕).

**Step 8** From the Name drop-down list, choose the filter you want to add as an import filter.

**Step 9** Next to Action, choose Accept or Reject.

**Step 10** Click OK.

**Tip**
To change the order of the import filters, click the move up (↑) and move down (▼) icons as needed. You can also drag the filters up or down in the list.

**Step 11** Click Save.
Step 4  Next to the virtual router where you want to add the RIP virtual router filter, click the edit icon (✏).
Step 5  Click **Dynamic Routing** to display the dynamic routing options.
Step 6  Click **RIP** to display the RIP options.
Step 7  Under **Export Filters**, click the add icon (➕).
Step 8  From the **Name** drop-down list, choose the filter you want to add as an export filter.
Step 9  Next to **Action**, choose **Accept** or **Reject**.
Step 10 Click **OK**.

**Tip**

To change the order of the export filters, click the move up (🎵) and move down (🎵) icons as needed. You can also drag the filters up or down in the list.

Step 11 Click **Save**.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

---

**OSPF Configuration**

Open Shortest Path First (OSPF) is an adaptive routing protocol that defines routes dynamically by obtaining information from other routers and advertising routes to other routers using link state advertisements. The router keeps information about the links between it and the destination to make routing decisions. OSPF assigns a cost to each routed interface, and considers the best routes to have the lowest costs.

**OSPF Routing Areas**

An OSPF network may be structured, or subdivided, into routing areas to simplify administration and optimize traffic and resource use. Areas are identified by 32-bit numbers, expressed either simply in decimal or often in octet-based dot-decimal notation.

By convention, area zero or 0.0.0.0 represents the core or backbone region of an OSPF network. You may choose to identify other areas. Often, administrators select the IP address of a main router in an area as the area's identification. Each additional area must have a direct or virtual connection to the backbone OSPF area. Such connections are maintained by an interconnecting router, known as the area border router (ABR). An ABR maintains separate link state databases for each area it serves and maintains summarized routes for all areas in the network.

**Adding OSPF Areas**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>

<td>Click Save.</td>
</tr>
</tbody>
</table>

### What to do next
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

### OSPF Area Interfaces

You can configure a subset of the interfaces assigned to the virtual router for OSPF. The following list describes the options you can specify on each interface.
Interfaces

Select the interface where you want to configure OSPF. Interfaces you have disabled from the Interfaces tab are not available.

Type

Select the type of OSPF interface from the following choices:

- **Broadcast** — On broadcast networks, flooding and hello messages are sent using multicasts, a single packet for all the neighbors. The option designates a router to be responsible for synchronizing the link state databases and originating network link state advertisements. This network type cannot be used on physically non-broadcast multiple-access (NBMP) networks and on unnumbered networks without proper IP prefixes.

- **Point-to-Point (PtP)** — Point-to-point networks connect just two routers together. No election is performed and no network link state advertisement is originated, which makes it simpler and faster to establish. This network type is useful not only for physically PtP interfaces, but also for broadcast networks used as PtP links. This network type cannot be used on physically NBMP networks.

- **Non-Broadcast** — On NBMP networks, the packets are sent to each neighbor separately because of the lack of multicast capabilities. Similar to broadcast networks, the option designates a router, which plays a central role in the propagation of link state advertisements. This network type cannot be used on unnumbered networks.

- **Autodetect** — The system determines the correct type based on the specified interface.

Cost

Specify the output cost of the interface.

Stub

Specify whether the interface should listen for OSPF traffic and transmit its own traffic.

Priority

Enter a numerical value that specifies the priority value used in designated router election. On every multiple access network, the system designates a router and backup router. These routers have some special functions in the flooding process. Higher priority increases preferences in this election. You cannot configure a router with a priority of 0.

Nonbroadcast

Specify whether hello packets are sent to any undefined neighbors. This switch is ignored on any NBMA network.

Authentication

Select the OSPF authentication profile that this interface uses from one of the authentication profiles you configured on the virtual router or select **None**. For more information about configuring authentication profiles, see Adding Virtual Router Authentication Profiles, on page 1032.
**Hello Interval**
Type the interval, in seconds, between the sending of hello messages.

**Poll**
Type the interval, in seconds, between the sending of hello messages for some neighbors on NBMA networks.

**Retrans Interval**
Type the interval, in seconds, between retransmissions of unacknowledged updates.

**Retrans Delay**
Type the estimated number of seconds it takes to transmit a link state update packet over the interface.

**Wait Time**
Type the number of seconds that the router waits between starting election and building adjacency.

**Dead Interval**
Type the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it. If this value is defined, it overrides the value calculated from dead count.

**Dead Count**
Type a numerical value that when multiplied by the hello interval specifies the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it.

To edit an OSPF area interface, click the edit icon ( Modi ). To delete an OSPF area interface, click the delete icon ( Del ). Disabling a configured interface from the Interfaces tab also deletes it.

---

**Adding OSPF Area Interfaces**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can configure a subset of the interfaces assigned to the virtual router for OSPF.

You can choose only one interface for use in an OSPF area.

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device where you want to add the OSPF interface, click the edit icon ( Modi ).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the Virtual Routers tab.
Step 4  
Next to the virtual router where you want to add the OSPF interface, click the edit icon ( ).

Step 5  
Click Dynamic Routing to display the dynamic routing options.

Step 6  
Click OSPF to display the OSPF options.

Step 7  
Under Areas, click the add icon ( ).

Step 8  
Click Interfaces.

Step 9  
Click the add icon ( ).

Step 10  
Take any of the actions as described in OSPF Area Interfaces, on page 1023.

Step 11  
If you want to add a network, click the add icon ( ) under Networks.

Step 12  
In the IP address field, enter an IP address for the neighbor receiving hello messages on non-broadcast networks from this interface.

Step 13  
Check the Eligible check box to indicate that the neighbor is eligible to receive messages.

Step 14  
Click OK.

Tip  
To edit a neighbor, click the edit icon ( ). To delete a neighbor, click the delete icon ( ).

Step 15  
Click OK.

Step 16  
Click Save.

Step 17  
Click Save.

What to do next  
• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Adding OSPF Area Vlinks

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

All areas in an OSPF autonomous system must be physically connected to the backbone area. In some cases where this physical connection is not possible, you can use a vlink to connect to the backbone through a non-backbone area. Vlinks can also be used to connect two parts of a partitioned backbone through a non-backbone area.

You must add a minimum of two OSPF areas before you can add a vlink.

Procedure

Step 1  
Choose Devices > Device Management.

Step 2  
Next to the device you want to modify, click the edit icon ( ).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Step 3
Click the Virtual Routers tab.

Step 4
Next to the virtual router you want to modify, click the edit icon ( ).

Step 5
Click Dynamic Routing to display the dynamic routing options.

Step 6
Click OSPF to display the OSPF options.

Step 7
Under Areas, click the add icon ( ).

Step 8
Click Vlinks.

Step 9
Click the add icon ( ).

Step 10
In the Router ID field, enter an IP address for the router.

Step 11
From the Authentication drop-down list, choose the authentication profile the vlink will use.

Step 12
In the Hello Interval field, enter the interval, in seconds, between sending of hello messages.

Step 13
In the Retrans Interval field, enter the interval, in seconds, between retransmissions of unacknowledged updates.

Step 14
In the Wait Time field, enter the number of seconds that the router waits between starting election and building adjacency.

Step 15
In the Dead Interval field, enter the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it. If this value is defined, it overrides the value calculated from dead count.

Step 16
In the Dead Count field, enter a numerical value that when multiplied by the hello interval, specifies the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it.

Step 17
Click OK.

Step 18
Click Save.

Step 19
Click Save.

What to do next
• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Adding Import Filters for OSPF Configuration

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can add an import filter to define which routes are accepted or rejected from OSPF into the route table. Import filters are applied in the order they appear in the table.

When adding an import filter, you use one of the filters you configured on the virtual router.

Procedure

Step 1
Choose Devices > Device Management.

Step 2
Next to the device you want to modify, click the edit icon ( ).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3**  
Click **Virtual Routers**.

**Step 4**  
Next to the virtual router you want to modify, click the edit icon (✏).

**Step 5**  
Click **Dynamic Routing** to display the dynamic routing options.

**Step 6**  
Click **OSPF** to display the OSPF options.

**Step 7**  
Under **Import Filters**, click the add icon (➕).

**Step 8**  
From the **Name** drop-down list, choose the filter you want to add as an import filter.

**Step 9**  
Next to **Action**, choose **Accept** or **Reject**.

**Step 10**  
Click **OK**.

**Tip**  
To change the order of the import filters, click the move up (▲) and move down (▼) icons as needed. You can also drag the filters up or down in the list.

**Step 11**  
Click **Save**.

---

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

**Adding Export Filters for OSPF Configuration**

<table>

You can add an export filter to define which routes will be accepted or rejected from the route table to OSPF. Export filters are applied in the order they appear in the table.

When adding an export filter, you use one of the filters you configured on the virtual router.

**Procedure**

**Step 1**  
Choose **Devices > Device Management**.

**Step 2**  
Next to the device you want to modify, click the edit icon (✏).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3**  
Click the **Virtual Routers** tab.

**Step 4**  
Next to the virtual router where you want to add the OSPF virtual router filter, click the edit icon (✏).

**Step 5**  
Click the **Dynamic Routing** tab to display the dynamic routing options.

**Step 6**  
Click **OSPF** to display the OSPF options.

**Step 7**  
Under **Export Filters**, click the add icon (➕).
Step 8 From the Name drop-down list, choose the filter you want to add as an export filter.

Step 9 Next to Action, choose Accept or Reject.

Step 10 Click OK.

Tip To change the order of the export filters, click the move up ( ▲ ) and move down ( ▼ ) icons as needed. You can also drag the filters up or down in the list.

Step 11 Click Save.

What to do next
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Virtual Router Filters

Filters provide a way to match routes for importing into the virtual router’s route table and for exporting routes to dynamic protocols. You can create and manage a list of filters. Each filter defines specific criteria to look for in routes that are defined statically or received from a dynamic protocol.

The Virtual Routers Filters table includes summary information about each filter you have configured on a virtual router, as described in the following table.

Table 82: Virtual Router Filters Table View Fields

<table>
<thead>
<tr>
<th>Field</th>

<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device you want to modify, click the edit icon (>Edit). In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the Virtual Routers tab.

**Step 4** Next to the virtual router you want to modify, click the edit icon (>Edit).

**Step 5** Click the Filter tab.

**Step 6** Click Add Filter.

**Step 7** In the Name field, enter a name for the filter. You can use alphanumeric characters only.

**Step 8** Under Protocol, choose All or choose the protocol that applies to the filter.

**Step 9** If you chose All, Static, or RIP as the Protocol, under From Router, enter the router IP addresses that this filter will attempt to match in a route.

*Note* You can also enter a /32 CIDR block for IPv4 addresses and a /128 prefix length for IPv6 addresses. All other address blocks are invalid for this field.

**Step 10** Click Add.

**Step 11** If you chose All, Static, or RIP as the Protocol, under Next Hop, enter the IP addresses for the gateways that this filter will attempt to match in a route.

*Note* You can also enter a /32 CIDR block for IPv4 addresses and a /128 prefix length for IPv6 addresses. All other address blocks are invalid for this field.

**Step 12** Click Add.

**Step 13** Under Destination Type, choose the options that apply to the filter.

**Step 14** Under Destination Network, enter the IP address of the network that this filter will attempt to match in a route.

**Step 15** Click Add.

**Step 16** If you chose All or OSPF as the Protocol, under Path Type, choose the options that apply to the filter. You must choose at least one path type.

**Step 17** If you chose OSPF as the Protocol, under Router ID, enter the IP address that serves as the router ID of the router advertising the route/network.

**Step 18** Click Add.

**Step 19** Click OK.
Adding Virtual Router Authentication Profiles

You can set up Authentication Profiles for use in RIP and OSPF configurations. You can configure a simple password or specify a shared cryptographic key. Simple passwords allow for every packet to carry eight bytes of the password. The system ignores received packets lacking this password. Cryptographic keys allow for validation, a 16-byte long digest generated from a password to be appended to every packet.

Note that for OSPF, each area can have a different authentication method. Therefore, you create authentication profiles that can be shared among many areas. You cannot add authentication for OSPFv3.

Procedure

Step 1 Choose Devices > Device Management.
Step 2 Next to the device you want to modify, click the edit icon ( ).
Step 3 Click the Virtual Routers tab.
Step 4 Next to the virtual router you want to modify, click the edit icon ( ).
Step 5 Click Authentication Profile.
Step 6 Click Add Authentication Profile.
Step 7 In the Authentication Profile Name field, enter a name for the authentication profile.
Step 8 From the Authentication Type drop down list, choose simple or cryptographic.
Step 9 In the Password field, enter a secure password.
Step 10 In the Confirm Password field, enter the password again to confirm it.
Step 11 Click OK.
Step 12 Click Save.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.
Viewing Virtual Router Statistics

You can view runtime statistics for each virtual router. The statistics display unicast packets, packets dropped, and separate routing tables for IPv4 and IPv6 addresses.

Procedure

Step 1 Choose Devices > Device Management.
Step 2 Next to the device where you want to view statistics, click the edit icon ( ).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Step 3 Click the Virtual Routers tab.
Step 4 Next to the virtual router where you want to view the router statistics, click the view icon ( ).

Deleting Virtual Routers

When you delete a virtual router, any routed interfaces assigned to the router become available for inclusion in another router.

Procedure

Step 1 Choose Devices > Device Management.
Step 2 Next to the device you want to modify, click the edit icon ( ).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Step 3 Click the Virtual Routers tab.
Step 4 Next to the virtual router that you want to delete, click the delete icon ( ).
Step 5 When prompted, confirm that you want to delete the virtual router.
What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.
CHAPTER 50

Aggregate Interfaces and LACP

The following topics explain aggregate interface configuration and how LACP functions on managed devices:

- About Aggregate Interfaces, on page 1035
- LAG Configuration, on page 1036
- Link Aggregation Control Protocol (LACP), on page 1040
- Adding Aggregate Switched Interfaces, on page 1041
- Adding Aggregate Routed Interfaces, on page 1043
- Adding Logical Aggregate Interfaces, on page 1046
- Viewing Aggregate Interface Statistics, on page 1047
- Deleting Aggregate Interfaces, on page 1047

About Aggregate Interfaces

In the Firepower System, you can group multiple physical Ethernet interfaces into a single logical link on managed devices configured in either a Layer 2 deployment that provides packet switching between networks, or a Layer 3 deployment that routes traffic between interfaces. This single aggregate logical link provides higher bandwidth, redundancy, and load-balancing between two endpoints.

You create aggregate links by creating a switched or routed link aggregation group, or LAG. When you create an aggregation group, a logical interface called an aggregate interface is created. To an upper layer entity a LAG looks like a single logical link and data traffic is transmitted through the aggregate interface. The aggregate link provides increased bandwidth by adding the bandwidth of multiple links together. It also provides redundancy by load-balancing traffic across all available links. If one link fails, the system automatically load-balances traffic across all remaining links.

The endpoints in a LAG can be two 7000 or 8000 Series devices, as shown in the illustration above, or a 7000 or 8000 Series device connected to a third-party access switch or router. The two devices do not have to match, but they must have the same physical configuration and they must support the IEEE 802.ad link aggregation standard. A typical deployment for a LAG might be to aggregate access links between two managed devices, or to create a point-to-point connection between a managed device and an access switch or a router.

Note that you cannot configure aggregate interfaces on NGIPSv devices or ASA FirePOWER modules.
LAG Configuration

There are two types of aggregate interfaces:

- switched — Layer 2 aggregate interfaces
- routed — Layer 3 aggregate interfaces

You implement link aggregation through the use of link aggregation groups (LAGs). You configure a LAG by creating an aggregate switched or routed interface and then associating a set of physical interfaces with the link. All of the physical interfaces must be of the same speed and medium.

You create aggregate links either dynamically or statically. Dynamic link aggregation uses Link Aggregation Control Protocol (LACP), a component of the IEEE 802.ad link aggregation standard, while static link aggregation does not. LACP enables each device on either end of the LAG to exchange link and system information to determine which links will be actively used in the aggregation. A static LAG configuration requires you to manually maintain link aggregations and deploy load-balancing and link selection policies.

When you create a switched or routed aggregate interface, a link aggregation group of the same type is created and numbered automatically. For example, when you create your first LAG (switched or routed), the aggregate interface can be identified by the lag0 label in the Interfaces tab for your managed device. When you associate physical and logical interfaces with this LAG, they appear nested below the primary LAG in a hierarchical tree menu. Note that a switched LAG can only contain switched physical interfaces, and a routed LAG can only contain routed physical interfaces.

Consider the following requirements when you configure a LAG:

- The Firepower System supports a maximum of 14 LAGs, and assigns a unique ID to each LAG interface in the range of 0 to 13. The LAG ID is not configurable.
- You must configure the LAG on both sides of the link, and you must set the interfaces on either side of the link to the same speed.
- You must associate at least two physical interfaces per LAG, up to a maximum of eight. A physical interface cannot belong to more than one LAG.
- Physical interfaces in a LAG cannot be used in any other mode of operation, either as inline or passive, or be used as part of another logical interface for tagged traffic.
- Physical interfaces in a LAG can span multiple NetMods, but cannot span multiple sensors (i.e. all physical interfaces must reside on the same device).
- A LAG cannot contain a stacking NetMod.

Aggregate Switched Interfaces

You can combine between two and eight physical ports on a managed device to create a switched LAG interface. You must assign a switched LAG interface to a virtual switch before it can handle traffic. A managed device can support up to 14 LAG interfaces.

The range of MTU values can vary depending on the model of the managed device and the interface type.
Caution

Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 282 for more information.

Related Topics
MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 472
Snort® Restart Scenarios, on page 281

Aggregate Routed Interfaces

You can combine between two and eight physical ports on a 7000 or 8000 Series device to create a routed LAG interface. You must assign a routed LAG interface to a virtual router before it can route traffic. A managed device can support up to 14 LAG interfaces.

You can add static Address Resolution Protocol (ARP) entries to a routed LAG interface. If an external host needs to know the MAC address of the destination IP address it needs to send traffic to on your local network, it sends an ARP request. When you configure static ARP entries, the virtual router responds with an IP address and associated MAC address.

Disabling the ICMP Enable Responses option for routed LAG interfaces does not prevent ICMP responses in all scenarios. You can still use access control rules to handle connections where the destination IP is the routed interface’s IP and the protocol is ICMP; see Port and ICMP Code Conditions, on page 304.

If you enable the Inspect Local Router Traffic option, the system blocks packets before they reach the host, thereby preventing any response. For more information about inspecting local router traffic, see Advanced Device Settings, on page 448.

The range of MTU values can vary depending on the model of the managed device and the interface type.

Caution

Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 282 for more information.

Related Topics
MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 472
Snort® Restart Scenarios, on page 281

Logical Aggregate Interfaces

For each switched or routed aggregate interface, you can add multiple logical interfaces. You must associate each logical LAG interface with a VLAN tag to handle traffic received by the LAG interface with that specific tag. You add logical interfaces to switched or routed aggregate interfaces in the same way you would add them to physical switched or routed interfaces.
When you create a LAG interface you also create an “untagged” logical interface by default, which is identified by the `lagn.0` label, where `n` is an integer from 0 to 13. To be operational, each LAG requires this one logical interface at a minimum. You can associate additional logical interfaces with any LAG to handle VLAN-tagged traffic. Each additional logical interface requires a unique VLAN tag. The Firepower System supports VLAN tags in the range of 1 through 4094.

You can also configure the Cisco Redundancy Protocol (SFRP) on a logical routed interface. SFRP allows devices to act as redundant gateways for specified IP addresses.

Note that disabling the **ICMP Enable Responses** option for logical routed interfaces does not prevent ICMP responses in all scenarios. You can add network-based rules to an access control policy to drop packets where the destination IP is the routed interface’s IP and the protocol is ICMP.

If you have enabled the **Inspect Local Router Traffic** option, which is an advanced setting on the managed device, it drops the packets before they reach the host, thereby preventing any response.

The range of MTU values can vary depending on the model of the managed device and the interface type.

Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See **Snort® Restart Traffic Behavior**, on page 282 for more information.

### Load-Balancing Algorithms

You assign an egress load-balancing algorithm to the LAG that determines how to distribute traffic to the LAG bundle’s member links. The load-balancing algorithm makes hashing decisions based on values in various packet fields, such as Layer 2 MAC addresses, Layer 3 IP addresses, and Layer 4 port numbers (TCP/UDP traffic). The load-balancing algorithm you select applies to all of the LAG bundle’s member links.

Choose the load-balancing algorithm that supports your deployment scenario from the following options when you configure a LAG:

- Destination IP
- Destination MAC
- Destination Port
- Source IP
- Source MAC
• Source Port
• Source and Destination IP
• Source and Destination MAC
• Source and Destination Port

Note: You should configure both ends of the LAG to have the same load-balancing algorithm. Higher layer algorithms will back off to lower layer algorithms as necessary (such as a Layer 4 algorithm backing off to Layer 3 for ICMP traffic).

**Link Selection Policies**

Link aggregation requires the speed and medium of each link to be the same at both endpoints. Because link properties can change dynamically, the link selection policy helps determine how the system manages the link selection process. A link selection policy that maximizes the highest port count supports link redundancy, while a link selection policy that maximizes total bandwidth supports overall link speed. A stable link selection policy attempts to minimize excessive changes in link states.

Note: You should configure both ends of the LAG to have the same link selection policy.

Choose the link selection policy that supports your deployment scenario from the following options:

- **Highest Port Count** — Choose this option for the highest total active port count to provide added redundancy.

- **Highest Total Bandwidth** — Choose this option to provide the highest total bandwidth for the aggregated link.

- **Stable** — Choose this option if your primary concern is link stability and reliability. Once you configure a LAG, the active links change only when absolutely necessary (such as link failure) rather than doing so for added port count or bandwidth.

- **LACP Priority** — Choose this option to use the LACP algorithm to determine which links are active in the LAG. This setting is appropriate if you have undefined deployment goals, or if the device at the other end of the LAG is not managed by the Firepower Management Center.

LACP is a key aspect of automating the link selection method that supports dynamic link aggregation. When LACP is enabled, a link selection policy based on LACP priority uses the following properties of LACP:

**LACP system priority**

You configure this value on each partnered device running LACP to determine which one is superior in link aggregation. The system with the lower value has the higher system priority. In dynamic link aggregation, the system with the higher LACP system priority sets the selected state of member links on its side first, then the system with the lower priority sets its member links accordingly. You can specify 0 to 65535. If you do not specify a value, the default priority is 32768.
LACP link priority
You configure this value on each link belonging to the aggregation group. The link priority determines the active and standby links in the LAG. Links with lower values have higher priority. If an active link goes down, the standby link with the highest priority is selected to replace the downed link. However, if two or more links have the same LACP link priority, the link with the lowest physical port number is selected as the standby link. You can specify 0 to 65535. If you do not specify a value, the default priority is 32768.

Link Aggregation Control Protocol (LACP)
Link Aggregation Control Protocol (LACP), a component of IEEE 802.3ad, is a method of exchanging system and port information to create and maintain LAG bundles. When you enable LACP, each device on either end of the LAG uses LACP to determine which links will be actively used in the aggregation. LACP provides availability and redundancy by exchanging LACP packets (or control messages) between links. It learns the capabilities of the links dynamically and informs the other links. Once LACP identifies correctly matched links, it facilitates grouping the links into the LAG. If a link fails, traffic continues on the remaining links. LACP must be enabled at both ends of the LAG for the link to be operational.

LACP
When you enable LACP, you need to specify a transmission mode for each end of the LAG that determines how LACP packets are exchanged between partnered devices. There are two options for LACP mode:

- **Active** — Choose this mode to place a device into an active negotiating state, in which the device initiates negotiations with remote links by sending LACP packets.

- **Passive** — Choose this mode to place a device into a passive negotiating state, in which the device responds to LACP packets it receives but does not initiate LACP negotiation.

**Note**
Both modes allow LACP to negotiate between links to determine if they can form a link bundle based on criteria such as port speed. However, you should avoid a passive-passive configuration, which essentially places both ends of the LAG in listening mode.

LACP has a timer which defines how often LACP packets are sent between devices. LACP exchanges packets at these rates:

- **Slow** — 30 seconds
- **Fast** — 1 second

The device where this option is applied expects to receive LACP packets with this frequency from the partner device on the other side of the LAG.
When a LAG is configured on a managed device that is part of a device stack, only the primary device participates in LACP communication with the partner system. All secondary devices forward LACP messages to the primary device. The primary device relays any dynamic LAG modifications to the secondary devices.

## Adding Aggregate Switched Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can combine between two and eight physical ports on a managed device to create a switched LAG interface. You must assign a switched LAG interface to a virtual switch before it can handle traffic. A managed device can support up to 14 LAG interfaces.

### Procedure

**Step 1** Choose Devices > Device Management.

**Step 2** Click the edit icon next to the device where you want to configure the switched LAG interface.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Choose Add Aggregate Interface from the Add drop-down menu.

**Step 4** Click Switched to display the switched LAG interface options.

**Step 5** If you want to apply a security zone, do one of the following:

- Choose an existing security zone from the Security Zone drop-down list.
- Choose New to add a new security zone; see Creating Security Zone and Interface Group Objects, on page 349.

**Step 6** Specify a virtual switch:

- Choose an existing virtual switch from the Virtual Switch drop-down list.
- Choose New to add a new virtual switch; see Adding Virtual Switches, on page 999.

**Step 7** Check the Enabled check box to allow the switched LAG interface to handle traffic.

If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.

**Step 8** From the Mode, choose an option to designate the link mode, or choose Autonegotiation to specify that the interface is configured to auto negotiate speed and duplex settings.

Mode settings are available only for copper interfaces.

Interfaces on 8000 Series appliances do not support half-duplex options. When links auto negotiate speed, all active links are selected for the LAG based on the same speed setting.
Step 9 From the MDI/MDIX drop-down list, choose an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDI. MDI/MDIX settings are available only for copper interfaces. By default, MDI/MDIX is set to Auto-MDI, which automatically handles switching between MDI and MDIX to attain link.

Step 10 Enter a maximum transmission unit (MTU) in the MTU field. The range within which you can set the MTU can vary depending on the Firepower System device model and interface type. See MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 472 for more information.

Step 11 Under Link Aggregation, choose one or more physical interfaces from Available Interfaces to add to the LAG bundle. 

Tip To remove physical interfaces from the LAG bundle, choose one or more physical interfaces and click the remove selected icon ( ). To remove all physical interfaces from the LAG bundle, click the remove all icon ( ). Deleting the LAG interface from the Interfaces tab also removes the interfaces.

Step 12 Choose an option from the Load-Balancing Algorithm drop-down list.

Step 13 Choose a Link Selection Policy from the drop-down list.

Tip Choose LACP Priority if you are configuring an aggregate interface between a Firepower System device and a third-party network device.

Step 14 If you chose LACP Priority as the Link Selection Policy, assign a value for System Priority and click the Configure Interface Priority link to assign a priority value for each interface in the LAG.

Step 15 Choose either Inner or Outer from the Tunnel Level drop-down list.

Note The tunnel level only applies to IPv4 traffic when Layer 3 load balancing is configured. The outer tunnel is always used for Layer 2 and IPv6 traffic. If the Tunnel Level is not explicitly set, the default is Outer.

Step 16 Under LACP, check the Enabled check box to allow the switched LAG interface to handle traffic using the Link Aggregation Control Protocol. If you clear the check box, the LAG interface becomes a static configuration and the Firepower System will use all of the physical interfaces selected for the aggregation.

Step 17 Click a Rate radio button to set the frequency that determines how often LACP control messages are received from the partner device:

- Click Slow to receive packets every 30 seconds.
- Click Fast to receive packets every 1 second.

Step 18 Click a Mode radio button to establish the listening mode of the device:

- Click Active to initiate negotiations with remote links by sending LACP packets to the partner device.
- Click Passive to respond to LACP packets received.

Step 19 Click Save.
What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics

MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 472

Adding Aggregate Routed Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can combine between two and eight physical ports on a managed device to create a routed LAG interface. You must assign a routed LAG interface to a virtual router before it can route traffic. A managed device can support up to 14 LAG interfaces.

Caution

Adding a routed interface pair on 7000 or 8000 Series devices restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

Procedure

Step 1
Choose Devices > Device Management.

Step 2
Click the edit icon (_pen) next to the device where you want to configure the routed LAG interface.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3
Choose Add Aggregate Interface from the Add drop-down menu.

Step 4
Click Routed to display the routed LAG interface options.

Step 5
If you want to apply a security zone, do one of the following:

- Choose an existing security zone from the Security Zone drop-down list.
- Choose New to add a new security zone; see Creating Security Zone and Interface Group Objects, on page 349.

Step 6
Specify a virtual router:

- Choose an existing virtual router from the Virtual Router drop-down list.
- Choose New to add a new virtual router; Adding Virtual Routers, on page 1012.

Step 7
Check the Enabled check box to allow the routed LAG interface to handle traffic.
If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.
Step 8  From the **Mode** drop-down list, choose an option to designate the link mode, or choose **Autonegotiation** to specify that the LAG interface is configured to auto negotiate speed and duplex settings.

Mode settings are available only for copper interfaces.

Interfaces on 8000 Series appliances do not support half-duplex options. When links auto negotiate speed, all active links are selected for the LAG based on the same speed setting.

Step 9  Choose an option from the **MDI/MDIX** drop-down list to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.

MDI/MDIX settings are available only for copper interfaces.

By default, MDI/MDIX is set to Auto-MDIX, which automatically handles switching between MDI and MDIX to attain link.

Step 10  Enter a maximum transmission unit (MTU) in the **MTU** field.

The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution**  Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 282 for more information.

Step 11  If you want to allow the LAG interface to respond to ICMP traffic such as pings and traceroute, check the **Enable Responses** check box next to **ICMP**.

Step 12  If you want to enable the LAG interface to broadcast router advertisements, check the **Enable Router Advertisement** check box next to **IPv6 NDP**.

Step 13  Click **Add** to add an IP address.

Step 14  In the **Address** field, enter the routed LAG interface’s IP address and subnet mask using CIDR notation.

Note the following:

- You cannot add network and broadcast addresses, or the static MAC addresses 00:00:00:00:00:00 and FF:FF:FF:FF:FF:FF.
- You cannot add identical IP addresses, regardless of subnet mask, to interfaces in virtual routers.

Step 15  If your organization uses IPv6 addresses and you want to set the IP address of the LAG interface automatically, check the **Address Autoconfiguration** check box next to the **IPv6** field.

Step 16  For **Type**, choose either Normal or SFRP.

Step 17  If you chose SFRP for **Type**, set options as described in **SFRP**.

Step 18  Click **OK**.

**Note**  When adding an IP address to a routed interface of a 7000 or 8000 Series device in a high-availability pair, you must add a corresponding IP address to the routed interface on the high-availability peer.

Step 19  Click **Add** to add a static ARP entry.

Step 20  Enter an IP address in the **IP Address** field.

Step 21  Enter a MAC address to associate with the IP address in the **MAC Address** field. Use the standard format (for example, 01:23:45:67:89:AB).
Step 22     Click **OK**.

Step 23     Under **Link Aggregation**, choose one or more physical interfaces from **Available Interfaces** to add to the LAG bundle.

**Tip**     To remove physical interfaces from the LAG bundle, choose one or more physical interfaces and click the remove selected icon ((pkt)). To remove all physical interfaces from the LAG bundle, click the remove all icon ((pkt)). Deleting the LAG interface from the **Interfaces** tab also removes the interfaces.

Step 24     Choose a **Load-Balancing Algorithm** from the drop-down list.

Step 25     Choose a **Link Selection Policy** from the drop-down list.

**Tip**     Choose **LACP Priority** if you are configuring an aggregate interface between a Firepower System device and a third-party network device.

Step 26     If you chose **LACP Priority** as the **Link Selection Policy**, assign a value for **System Priority** and click the **Configure Interface Priority** link to assign a priority value for each interface in the LAG.

Step 27     Choose either **Inner** or **Outer** from the **Tunnel Level** drop-down list.

**Note**     The tunnel level only applies to IPv4 traffic when Layer 3 load balancing is configured. The outer tunnel is always used for Layer 2 and IPv6 traffic. If the **Tunnel Level** is not explicitly set, the default is **Outer**.

Step 28     Under LACP, check the **Enabled** check box to allow the routed LAG interface to handle traffic using the Link Aggregation Control Protocol.

If you clear the check box, the LAG interface becomes a static configuration and the Firepower System will use all of the physical interfaces for the aggregation.

Step 29     Click a **Rate** radio button to set the frequency that determines how often LACP control messages are received from the partner device.

- Click **Slow** to receive packets every 30 seconds.
- Click **Fast** to receive packets every 1 second.

Step 30     Click a **Mode** radio button to establish the listening mode of the device.

- Click **Active** to initiate negotiations with remote links by sending LACP packets to the partner device.
- Click **Passive** to respond to LACP packets received.

Step 31     Click **Save**.

---

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes, on page 279**.

Adding Logical Aggregate Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

For each switched or routed aggregate interface, you can add multiple logical interfaces. You must associate each logical LAG interface with a VLAN tag to handle traffic received by the LAG interface with that specific tag. You add logical interfaces to switched or routed aggregate interfaces in the same way you would add them to physical switched or routed interfaces.

**Note**

When you create a LAG interface you also create an “untagged” logical interface by default, which is identified by the lag<n>.0 label, where <n> is an integer from 0 to 13. To be operational, each LAG requires this one logical interface at a minimum. You can associate additional logical interfaces with any LAG to handle VLAN-tagged traffic. Each additional logical interface requires a unique VLAN tag. The Firepower System supports VLAN tags in the range of 1 through 4094.

**Caution**

Adding a routed interface pair on 7000 or 8000 Series devices restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device where you want to add the logical LAG interface, click the edit icon ( ).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** From the Add drop-down menu, choose Add Logical Interface.

**Step 4** Click Switched to display the switched interface options, or click Routed to display the routed interface options.

**Step 5** Choose an available LAG from the Interface drop-down list. The aggregate interface is identified by the lag<n> label, where <n> is an integer from 0 to 13.

**Step 6** Configure the remaining settings appropriate to the interface type you chose:

- Switched — See Adding Logical Switched Interfaces, on page 996 for more information on adding a logical interface to a switched interface.
- Routed — See Adding Logical Routed Interfaces, on page 1007 for more information on adding a logical interface to a routed interface.
Viewing Aggregate Interface Statistics

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can view protocol and traffic statistics for each aggregate interface. The statistics show LACP protocol information such as LACP key and partner information, packets received, packets transmitter, and packets dropped. Statistics are further refined per member interface to show traffic and link information on a per-port basis.

Aggregate interface information is also presented to the dashboard via predefined dashboard widgets. The Current Interface Status widget shows the status of all interfaces on the appliance, enabled or unused. The Interface Traffic widget shows the rate of traffic received (Rx) and transmitted (Tx) on the appliance’s interfaces over the dashboard time range. See Predefined Dashboard Widgets, on page 198.

Procedure

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device where you want to view the logical aggregate interface statistics, click the edit icon (✏). In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Next to the interface where you want to view the interface statistics, click the view icon (🔍).

Deleting Aggregate Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

The aggregate interface can be identified by the lagn label, where n can be an integer from 0 to 13.

Procedure

**Step 1** Choose Devices > Device Management.
Deleting Aggregate Interfaces

Step 2  Next to the device where you want to delete the aggregate interface, click the edit icon (是一座建筑的图标). In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  Next to the aggregate interface you want to delete, click the delete icon (是一座建筑的图标).

Step 4  When prompted, confirm that you want to delete the aggregate interface.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.
CHAPTER 51

Hybrid Interfaces

The following topics describe how to configure local hybrid interfaces:

- About Hybrid Interfaces, on page 1049
- Logical Hybrid Interfaces, on page 1049
- Adding Logical Hybrid Interfaces, on page 1050
- Deleting Logical Hybrid Interfaces, on page 1052

About Hybrid Interfaces

You can configure logical hybrid interfaces on managed devices that allow the Firepower System to bridge traffic between virtual routers and virtual switches. If IP traffic received on interfaces in a virtual switch is addressed to the MAC address of an associated hybrid logical interface, the system handles it as Layer 3 traffic and either routes or responds to the traffic depending on the destination IP address. If the system receives any other traffic, it handles it as Layer 2 traffic and switches it appropriately. You cannot configure logical hybrid interfaces on an NGIPSv device.

Note that hybrid interfaces that are not associated with both a virtual switch and a virtual router are not available for routing, and do not generate or respond to traffic.

Logical Hybrid Interfaces

You must associate a logical hybrid interface with a virtual router and virtual switch to bridge traffic between Layer 2 and Layer 3. You can only associate a single hybrid interface with a virtual switch. However, you can associate multiple hybrid interfaces with a virtual router.

You can also configure the Cisco Redundancy Protocol (SFRP) on a logical hybrid interface. SFRP allows devices to act as redundant gateways for specified IP addresses.

Note that disabling the ICMP Enable Responses option for hybrid interfaces does not prevent ICMP responses in all scenarios. You can add network-based rules to an access control policy to drop packets where the destination IP is the hybrid interface’s IP and the protocol is ICMP.

If you have enabled the Inspect Local Router Traffic option on the managed device, it drops the packets before they reach the host, thereby preventing any response.

The range of MTU values can vary depending on the model of the managed device and the interface type.
Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 282 for more information.

**Related Topics**
- Configuring SFRP, on page 1010
- Advanced Device Settings, on page 448

## Adding Logical Hybrid Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Caution**
Adding a routed interface pair on 7000 or 8000 Series devices restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

### Procedure

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device where you want to add the hybrid interface, click the edit icon (✏️). In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** From the Add drop-down menu, choose Add Logical Interface.

**Step 4** Click Hybrid to display the hybrid interface options.

**Step 5** In the Name field, enter a name for the interface.

**Step 6** From the Virtual Router drop-down list, choose an existing virtual router, choose None, or choose New to add a new virtual router.

**Note** If you add a new virtual router, you must configure it on the Device Management page after you finish setting up the hybrid interface. See Adding Virtual Routers, on page 1012.

**Step 7** From the Virtual Switch drop-down list, choose an existing virtual switch, choose None, or choose New to add a new virtual switch.
If you add a new virtual switch, you must configure it on the Device Management page after you finish setting up the hybrid interface. See Adding Virtual Switches, on page 999.

**Note** If you clear the check box, the interface becomes disabled and administratively taken down.

**Step 8** Check the **Enabled** check box to allow the hybrid interface to handle traffic.

**Step 9** In the **MTU** field, enter a maximum transmission unit (MTU), which designates the largest size packet allowed. The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 282 for more information.

**Step 10** Next to **ICMP**, check the **Enable Responses** check box to allow the interface to respond to ICMP traffic such as pings and traceroute.

**Step 11** Next to **IPv6 NDP**, check the **Enable Router Advertisement** check box to enable the interface to broadcast router advertisements. You can only enable this option if you added IPv6 addresses.

**Step 12** To add an IP address, click **Add**.

**Step 13** In the **Address** field, enter the IP address and subnet mask. Note the following:

- You cannot add network and broadcast addresses, or the static MAC addresses 00:00:00:00:00:00 and FF:FF:FF:FF:FF:FF.
- You cannot add identical IP addresses, regardless of subnet mask, to interfaces in virtual routers.

**Step 14** Optionally if you have IPv6 addresses, next to the **IPv6** field, check the **Address Autoconfiguration** check box to set the IP address of the interface automatically.

**Step 15** For **Type**, choose either Normal or SFRP.

**Step 16** If you chose SFRP for **Type**, set options as described in SFRP.

**Step 17** Click **OK**.

**Step 18** Click **Save**.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Related Topics**

- MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 472

<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device where you want to delete the logical hybrid interface, click the edit icon (-pencil).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Next to the logical hybrid interface you want to delete, click the delete icon (-trash).

**Step 4** When prompted, confirm that you want to delete the interface.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.
Gateway VPNs

The following topics describe how to manage your VPN deployment:

- Gateway VPN Basics, on page 1053
- VPN Deployments, on page 1054
- VPN Deployment Management, on page 1056
- VPN Deployment Status, on page 1067
- VPN Statistics and Logs, on page 1068

Gateway VPN Basics

A virtual private network (VPN) is a network connection that establishes a secure tunnel between endpoints via a public source, such as the internet or other network. You can configure the Firepower System to build secure VPN tunnels between the virtual routers of Firepower managed devices. The system builds tunnels using the Internet Protocol Security (IPsec) protocol suite.

After the VPN connection is established, the hosts behind the local gateway can connect to the hosts behind the remote gateway through the secure VPN tunnel. A connection consists of the IP addresses and host names of the two gateways, the subnets behind them, and the shared secrets for the two gateways to authenticate to each other.

The VPN endpoints authenticate to each other with either the Internet Key Exchange (IKE) version 1 or version 2 protocol to create a security association for the tunnel. The system uses either the IPsec authentication header (AH) protocol or the IPsec encapsulating security payload (ESP) protocol to authenticate the data entering the tunnel. The ESP protocol encrypts the data as well as providing the same functionality as AH.

If you have access control policies in your deployment, the system does not send VPN traffic until it has passed through access control. In addition, the system does not send tunnel traffic to the public source when the tunnel is down.

To configure and deploy VPN for Firepower, you must have a VPN license enabled on each of your target managed devices. Additionally, VPN features are only available on 7000 and 8000 Series devices.

IPsec

The IPsec protocol suite defines how IP packets across a VPN tunnel are hashed, encrypted, and encapsulated in the ESP or AH security protocol. The Firepower System uses the hash algorithm and encryption key of the Security Association (SA), which becomes established between the two gateways by the Internet Key Exchange (IKE) protocol.
Security associations (SA) establish shared security attributes between two devices and allow VPN endpoints to support secure communication. An SA allows two VPN endpoints to handle the parameters for how the VPN tunnel is secured between them.

The system uses the Internet Security Association and Key Management Protocol (ISAKMP) during the initial phase of negotiating the IPsec connection to establish the VPN between endpoints and the authenticated key exchange. The IKE protocol resides within ISAKMP.

The AH security protocol provides protection for packet headers and data, but it cannot encrypt them. ESP provides encryption and protection for packets, but it cannot secure the outermost IP header. In many cases, this protection is not required, and most VPN deployments use ESP more frequently than AH because of its encryption capabilities. Since VPN only operates in tunnel mode, the system encrypts and authenticates the entire packet from Layer 3 and up in the ESP protocol. ESP in tunnel mode encrypts the data as well as providing the latter’s encryption capabilities.

**IKE**

The Firepower System uses the IKE protocol to mutually authenticate the two gateways against each other as well as to negotiate the SA for the tunnel. The process consists of two phases.

IKE phase 1 establishes a secure authenticated communication channel by using the Diffie-Hellman key exchange to generate a pre-shared key to encrypt further IKE communications. This negotiation results in a bidirectional ISAKMP security association. The system allows you to perform the authentication using a pre-shared key. Phase 1 operates in main mode, which seeks to protect all data during the negotiation, while also protecting the identity of the peers.

During IKE phase 2, the IKE peers use the secure channel established in phase 1 to negotiate security associations on behalf of IPsec. The negotiation results in a minimum of two unidirectional security associations, one inbound and one outbound.

**VPN Deployments**

A VPN deployment specifies the endpoints and networks that are included in a VPN and how they connect to each other. After you configure a VPN deployment on the Firepower Management Center, you can then deploy it to your managed devices or devices managed by another Firepower Management Center.

The system supports three types of VPN deployments: point-to-point, star, and mesh.

**Point-to-Point VPN Deployments**

In a point-to-point VPN deployment, two endpoints communicate directly with each other. You configure the two endpoints as peer devices, and either device can start the secured connection. Each of the devices in this configuration must be a VPN-enabled managed device.

The following diagram displays a typical point-to-point VPN deployment.
**Star VPN Deployments**

In a star VPN deployment, a central endpoint (hub node) establishes a secure connection with multiple remote endpoints (leaf nodes). Each connection between the hub node and an individual leaf node is a separate VPN tunnel. The hosts behind any of the leaf nodes can communicate with each other through the hub node.

Star deployments commonly represent a VPN that connects an organization’s main and branch office locations using secure connections over the Internet or other third-party network. Star VPN deployments provide all employees with controlled access to the organization’s network.

In a typical star deployment, the hub node is located at the main office. Leaf nodes are located at branch offices and start most of the traffic. Each of the nodes must be a VPN-enabled managed device.

Star deployments only support IKE version 2.

The following diagram displays a typical star VPN deployment.
Mesh VPN Deployments

In a mesh VPN deployment, all endpoints can communicate with every other endpoint by an individual VPN tunnel. The mesh deployment offers redundancy so that when one endpoint fails, the remaining endpoints can still communicate with each other. This type of deployment commonly represents a VPN that connects a group of decentralized branch office locations. The number of VPN-enabled managed devices you deploy in this configuration depends on the level of redundancy you require. Each of the endpoints must be a VPN-enabled managed device.

The following diagram displays a typical mesh VPN deployment.

VPN Deployment Management

On the VPN page (Devices > VPN), you can view all of your current VPN deployments by name and the endpoints contained in the deployment. Options on this page allow you to view the status of a VPN deployment, create a new deployment, deploy to managed devices, and edit or delete a deployment.

Note that when you register a device to a Firepower Management Center, deployed VPN deployments sync to the Firepower Management Center during registration.

Related Topics
Managing VPN Deployments, on page 1062
VPN Deployment Options

When you create a new VPN deployment you must, at minimum, give it a unique name, specify a deployment type, and designate a preshared key. You can select from three types of deployment, each containing a group of VPN tunnels:

- Point-to-point (PTP) deployments establish a VPN tunnel between two endpoints.
- Star deployments establish a group of VPN tunnels connecting a hub endpoint to a group of leaf endpoints.
- Mesh deployments establish a group of VPN tunnels among a set of endpoints.

Only Cisco managed devices can be used as endpoints in VPN deployments. Third-party endpoints are not supported.

You must define a pre-shared key for VPN authentication. You can specify a default key to use in all of the VPN connections you generate in a deployment. For point-to-point deployments, you can specify a preshared key for each endpoint pair.

In a multidomain deployment, you can configure a VPN deployment across domains; that is, you can assign endpoints to devices that belong to different domains. In such cases, you can view but not modify the ancestor deployment in the related descendant domains. When you drill down for deployment details, the system displays information for devices that belong to the current domain only.

Point-to-Point VPN Deployment Options

When configuring a point-to-point VPN deployment, you define a group of endpoint pairs and then create a VPN between the two nodes in each pair.

The following list describes the options you can specify in your deployment.

**Name**

Specify a unique name for the deployment.

**Type**

Click **PTP** to specify that you are configuring a point-to-point deployment.

**Pre-shared Key**

Define a unique pre-shared key for authentication. The system uses this key for all the VPNs in your deployment, unless you specify a pre-shared key for each endpoint pair.

**Device**

You can choose a managed device, including a device stack or device high-availability pair, as an endpoint for your deployment. For Cisco-managed devices not managed by the Firepower Management Center you are using, choose **Other** and then specify an IP address for the endpoint.

**Virtual Router**

If you chose a managed device as your endpoint, choose a virtual router that is currently applied to the selected device. You cannot choose the same virtual router for more than one endpoint.

**Interface**

If you chose a managed device as your endpoint, choose a routed interface that is assigned to the virtual router you specified.
IP Address
- If you chose a managed device as an endpoint, choose an IP address that is assigned to the specified routed interface.
- If the managed device is a device high-availability pair, you can choose only from a list of SFRP IP addresses.
- If you choose a managed device not managed by the Firepower Management Center, specify an IP address for the endpoint.

Protected Networks
Specify the networks in your deployment that are encrypted. Enter a subnet with CIDR block for each network. IKE version 1 only supports a single protected network.

Note that VPN endpoints cannot have the same IP address and that protected networks in a VPN endpoint pair cannot overlap. If a list of protected networks for an endpoint contains one or more IPv4 or IPv6 entry, the other endpoint's protected network must have at least one entry of the same type (i.e., IPv4 or IPv6). If it does not, then the other endpoint's IP address must be of the same type and must not overlap with the entries in the protected network. (Use /32 CIDR address blocks for IPv4 and /128 CIDR address blocks for IPv6). If both of these checks fail, the endpoint pair is invalid.

Internal IP
Check the check box if the endpoint resides behind a firewall with network address translation.

Public IP
If you checked the Internal IP check box, specify a public IP address for the firewall. If the endpoint is a responder, you must specify this value.

Public IKE Port
If you checked the Internal IP check box, specify a single numerical value from 1 to 65535 for the UDP port on the firewall that is being port-forwarded to the internal endpoint. If the endpoint is a responder and the port on the firewall being forwarded is not 500 or 4500, you must specify this value.

Use Deployment Key
Check the check box to use the pre-shared key defined for the deployment. Clear the check box to specify a pre-shared key for VPN authentication for this endpoint pair.

Pre-shared Key
If you cleared the Use Deployment Key check box, specify a pre-shared key in this field.

Related Topics
Configuring Point-to-Point VPN Deployments, on page 1063

Star VPN Deployment Options
When configuring a star VPN deployment, you define a single hub node endpoint and a group of leaf node endpoints. You must define the hub node endpoint and at least one leaf node endpoint to configure the deployment.

The following list describes the options you can specify in your deployment.

Name
Specify a unique name for the deployment.
Type

Click **Star** to specify that you are configuring a star deployment.

Pre-shared Key

Define a unique pre-shared key for authentication.

Device

You can choose a managed device, including a device stack or device high-availability pair, as an endpoint for your deployment. For Cisco-managed devices not managed by the Firepower Management Center you are using, choose **Other** and then specify an IP address for the endpoint.

Virtual Router

If you chose a managed device as your endpoint, choose a virtual router that is currently applied to the selected device. You cannot choose the same virtual router for more than one endpoint.

Interface

If you chose a managed device as your endpoint, choose a routed interface that is assigned to the selected virtual router.

IP Address

- If you chose a managed device as an endpoint, choose an IP address that is assigned to the specified routed interface.
- If the managed device is a device high-availability pair, you can choose only from a list of SFRP IP addresses.
- If you chose a managed device **not** managed by the Firepower Management Center, specify an IP address for the endpoint.

Protected Networks

Specify the networks in your deployment that are encrypted. Enter a subnet with CIDR block for each network.

Note that VPN endpoints cannot have the same IP address and that protected networks in a VPN endpoint pair cannot overlap. If a list of protected networks for an endpoint contains one or more IPv4 or IPv6 entry, the other endpoint's protected network must have at least one entry of the same type (i.e., IPv4 or IPv6). If it does not, then the other endpoint's IP address must be of the same type and must not overlap with the entries in the protected network. (Use /32 CIDR address blocks for IPv4 and /128 CIDR address blocks for IPv6). If both of these checks fail, the endpoint pair is invalid.

Internal IP

Check the check box if the endpoint resides behind a firewall with network address translation.

Public IP

If you checked the **Internal IP** check box, specify a public IP address for the firewall. If the endpoint is a responder, you must specify this value.

Public IKE Port

If you checked the **Internal IP** check box, specify a single numerical value from 1 to 65535 for the UDP port on the firewall that is being port-forwarded to the internal endpoint. If the endpoint is a responder and the port on the firewall being forwarded is not 500 or 4500, you must specify this value.
Mesh VPN Deployment Options

When configuring a mesh VPN deployment, you define a group of VPNs to link any two points for a given set of endpoints.

The following list describes the options you can specify in your deployment.

Name
Specify a unique name for the deployment.

Type
Click Mesh to specify that you are configuring a mesh deployment.

Pre-shared Key
Define a unique pre-shared key for authentication.

Device
You can choose a managed device, including a device stack or device high-availability pair, as an endpoint for your deployment. For Cisco-managed devices not managed by the Firepower Management Center you are using, choose Other and then specify an IP address for the endpoint.

Virtual Router
If you chose a managed device as your endpoint, choose a virtual router that is currently applied to the specified device. You cannot choose the same virtual router for more than one endpoint.

Interface
If you chose a managed device as your endpoint, choose a routed interface that is assigned to the specified virtual router.

IP Address
- If you chose a managed device as an endpoint, choose an IP address that is assigned to the selected routed interface.
- If the managed device is a device high-availability pair, you can choose only from a list of SFRP IP addresses.
- If you chose a managed device not managed by the Firepower Management Center, specify an IP address for the endpoint.

Protected Networks
Specify the networks in your deployment that are encrypted. Enter a subnet with CIDR block for each network. IKE version 1 only supports a single protected network.

Note that VPN endpoints cannot have the same IP address and that protected networks in a VPN endpoint pair cannot overlap. If a list of protected networks for an endpoint contains one or more IPv4 or IPv6 entry, the other endpoint's protected network must have at least one entry of the same type (i.e., IPv4 or IPv6). If it does not, then the other endpoint's IP address must be of the same type and must not overlap with the entries in the protected network. (Use /32 CIDR address blocks for IPv4 and /128 CIDR address blocks for IPv6). If both of these checks fail, the endpoint pair is invalid.
Internal IP
Check the check box if the endpoint resides behind a firewall with network address translation.

Public IP
If you checked the Internal IP check box, specify a public IP address for the firewall. If the endpoint is a responder, you must specify this value.

Public IKE Port
If you checked the Internal IP check box, specify a single numerical value from 1 to 65535 for the UDP port on the firewall that is being port-forwarded to the internal endpoint. If the endpoint is a responder and the port on the firewall being forwarded is not 500 or 4500, you must specify this value.

Related Topics
Configuring Mesh VPN Deployments, on page 1064

Advanced VPN Deployment Options
VPN deployments contain some common settings that can be shared among the VPNs in a deployment. Each VPN can use the default settings or you can override the default settings. Advanced settings typically require little or no modification and are not common to every deployment.

The following list describes the advanced options you can specify in your deployment.

Other Algorithm Allowed
Check the check box to enable auto negotiation to an algorithm not listed in the Algorithm list, but proposed by the remote peer.

Algorithm
Specify the phase one and phase two algorithm proposals to secure data in your deployment. Choose Cipher, Hash, and Diffie-Hellman (DH) group authentication messages for both phases.

IKE Life Time
Specify a numerical value and choose a time unit for the maximum IKE SA renegotiation interval. You can specify a minimum of 15 minutes and a maximum of 30 days.

IKE v2
Check the check box to specify that the system uses IKE version 2. This version supports the star deployment and multiple protected networks.

Life Time
Specify a numerical value and select a time unit for the maximum SA renegotiation interval. You can specify a minimum of 5 minutes and a maximum of 24 hours.

Life Packets
Specify the number of packets that can be transmitted over an IPsec SA before it expires. You can use any integer between 0 and 18446744073709551615.

Life Bytes
Specify the number of bytes that can be transmitted over an IPsec SA before it expires. You can use any integer between 0 and 18446744073709551615.
AH

Check the check box to specify that the system uses the authentication header security protocol for the data to be protected. Clear the check box to use encryption service payload (ESP) protocol.

Managing VPN Deployments

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>VPN</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Caution
Adding or removing a VPN on a 7000 or 8000 Series device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

Procedure

Step 1 Choose Devices > VPN.
Step 2 Manage your VPN deployments:

- Add — To create a new VPN deployment, click Add VPN > Firepower Device, and continue as follows depending on deployment type:
  - Configuring Mesh VPN Deployments, on page 1064
  - Configuring Point-to-Point VPN Deployments, on page 1063
  - Configuring Star VPN Deployments, on page 1063

- Edit — To modify the settings in an existing VPN deployment, click the edit icon ( ); see Editing VPN Deployments, on page 1066.

- Delete — To delete a VPN deployment, click the delete icon ( ).

- Deploy—Click Deploy; see Deploy Configuration Changes, on page 279.

- View VPN status — To view the status of an existing VPN deployment, click the status icon; see Viewing VPN Status, on page 1067.

Before you begin

If you are using managed devices as endpoints, create a virtual router and apply it to the appropriate device.

Note

You cannot use the same virtual router for more than one endpoint. For more information, see Setting Up Virtual Routers, on page 1003

Procedure

Step 1 Choose Devices > VPN.
Step 2 Click Add VPN > Firepower Device.
Step 3 Enter a unique Name.
Step 4 Verify that PTP is chosen as the Type.
Step 5 Enter a unique Pre-shared Key.
Step 6 Next to Node Pairs, click the add icon ( ).
Step 7 Configure the VPN deployment options described in Point-to-Point VPN Deployment Options, on page 1057.
Step 8 Under Node A, next to Protected Networks, click the add icon ( ).
Step 9 Enter a CIDR block for the protected network.
Step 10 Click OK.
Step 11 Repeat step 8 through step 10 for Node B.
Step 12 Click Save.
The endpoint pair is added to your deployment.
Step 13 Click Save to finish configuring your deployment.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays VPN deployments created in the current domain, which you can edit. It also displays VPN deployments created in ancestor domains if one of the endpoint devices belongs to your domain. You cannot edit VPN deployments created in ancestor domains. To view and edit VPN deployments created in a lower domain, switch to that domain.

Procedure

Step 1
Choose Devices > VPN.
Step 2  Click the edit icon (✍).

If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3  Click the Advanced tab.

Step 4  Configure the advanced settings, as described in Advanced VPN Deployment Options, on page 1061.

Step 5  Next to Algorithms, click the add icon (➕).

Step 6  Chose Cipher, Hash, and Diffie-Hellman (DH) group authentication messages for both phases.

Step 7  Click OK.

Step 8  Click Save.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Editing VPN Deployments

⚠️

Caution

Two users should not edit the same deployment simultaneously; however, note that the web interface does not prevent simultaneous editing.

In a multidomain deployment, the system displays VPN deployments created in the current domain, which you can edit. It also displays VPN deployments created in ancestor domains if one of the endpoint devices belongs to your domain. You cannot edit VPN deployments created in ancestor domains. To view and edit VPN deployments created in a lower domain, switch to that domain.

Procedure

Step 1  Choose Devices > VPN.

Step 2  Click the edit icon (✍).

If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3  Modify the desired settings:

• Advanced settings; see Configuring Advanced VPN Deployment Settings, on page 1065.
• Mesh deployment settings; see Configuring Mesh VPN Deployments, on page 1064.
• Point-to-point deployment settings; see Configuring Point-to-Point VPN Deployments, on page 1063.
• Star deployment settings; see Configuring Star VPN Deployments, on page 1063.
You cannot edit the deployment type after you initially save the deployment. To change the deployment type, you must delete the deployment and create a new one.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

### VPN Deployment Status

After you configure a VPN deployment, you can view the status of your configured VPN tunnels. The VPN page displays a status icon for each VPN deployment once it has been deployed:

- The (✔️) icon designates that all VPN endpoints are up.
- The (❌) icon designates that all VPN endpoints are down.
- The (⚠️) icon designates that some endpoints are up, while others are down.

You can click a status icon to view the deployment status along with basic information about the endpoints in the deployment, such as endpoint name and IP address. The VPN status updates every minute or when a status change occurs, such as an endpoint going down or coming up.

**Related Topics**

Viewing VPN Status, on page 1067

</tr>
</tbody>
</table>

In a multidomain deployment, the system displays VPN deployments created in the current domain. It also displays VPN deployments created in ancestor domains if one of the endpoint devices belongs to your domain. To view VPN deployments created in a lower domain, switch to that domain.

**Procedure**

**Step 1** Choose Devices > VPN.
**Step 2** Click the VPN status icon next to the deployment where you want to view the status.
**Step 3** Click OK.
VPN Statistics and Logs

After you configure a VPN deployment, you can view statistics about the data traversing your configured VPN tunnels. In addition, you can view the latest VPN system and IKE logs for each endpoint.

The system displays the following statistics:

**Endpoint**
- The device path to the routed interface and IP address designated as the VPN endpoint.

**Status**
- Whether the VPN connection is up or down.

**Protocol**
- The protocol used for encryption, either ESP or AH.

**Packets Received**
- The number of packets per interface the VPN tunnel receives during an IPsec SA negotiation.

**Packets Forwarded**
- The number of packets per interface the VPN tunnel transmits during an IPsec SA negotiation.

**Bytes Received**
- The number of bytes per interface the VPN tunnel receives during an IPsec SA negotiation.

**Bytes Forwarded**
- The number of bytes per interface the VPN tunnel transmits during an IPsec SA negotiation.

**Time Created**
- The date and time the VPN connection was created.

**Time Last Used**
- The last time a user initiated a VPN connection.

**NAT Traversal**
- If "Yes" is displayed, at least one of the VPN endpoints resides behind a device with network address translation.

**IKE State**
- The state of the IKE SA: connecting, established, deleting, or destroying.

**IKE Event**
- The IKE SA event: reauthentication or rekeying.

**IKE Event Time**
- The time in seconds the next event should occur.

**IKE Algorithm**
- The IKE algorithm being used by the VPN deployment.
IPsec State

The state of the IPsec SA: installing, installed, updating, rekeying, deleting, and destroying.

IPsec Event

Notification of when the IPsec SA event is rekeying.

IPsec Event Time

The time in seconds until the next event should occur.

IPsec Algorithm

IPsec algorithm being used by the VPN deployment.

CHAPTER 53

Getting Started with Access Control Policies

The following topics describe how to start using access control policies:

- Introduction to Access Control, on page 1073
- Managing Access Control Policies, on page 1078
- Creating a Basic Access Control Policy, on page 1079
- Editing an Access Control Policy, on page 1081
- Managing Access Control Policy Inheritance, on page 1082
- Setting Target Devices for an Access Control Policy, on page 1086
- Access Control Policy Advanced Settings, on page 1086

Introduction to Access Control

Access control is a hierarchical policy-based feature that allows you to specify, inspect, and log (non-fast-pathed) network traffic. Especially useful in multidomain deployments, you can nest access control policies, where each policy inherits the rules and settings from an ancestor (or base) policy. You can enforce this inheritance, or allow lower-level policies to override their ancestors. Each managed device can be targeted by one access control policy.

The data that the policy’s target devices collect about your network traffic can be used to filter and control that traffic based on:

- simple, easily determined transport and network layer characteristics: source and destination, port, protocol, and so on
- the latest contextual information on the traffic, including characteristics such as reputation, risk, business relevance, application used, or URL visited
- realm, user, user group, or ISE attribute
- custom Security Group Tag (SGT)
- characteristics of encrypted traffic; you can also decrypt this traffic for further analysis
- whether unencrypted or decrypted traffic contains a prohibited file, detected malware, or intrusion attempt

Each type of traffic inspection and control occurs where it makes the most sense for maximum flexibility and performance. For example, reputation-based blacklisting uses simple source and destination data, so it can block prohibited traffic early in the process. In contrast, detecting and blocking intrusions and exploits is a last-line defense.
Although you can configure the system without licensing your deployment, many features require that you enable the appropriate licenses before you deploy. Also, some features are only available on certain device models. Warning icons and confirmation dialog boxes designate unsupported features.

For the system to affect traffic, you must deploy relevant configurations to managed devices using routed, switched, or transparent interfaces, or inline interface pairs. Sometimes, the system prevents you from deploying inline configurations to passively deployed devices, including inline devices in tap mode. In other cases, the policy may deploy successfully, but attempting to block or alter traffic using passively deployed devices can have unexpected results. For example, the system may report multiple beginning-of-connection events for each blocked connection, because blocked connections are not blocked in passive deployments.

Access Control Policy Components

A newly created access control policy directs its target devices to handle all traffic using its default action. In the following graphic, the default action uses the Balanced Security and Connectivity intrusion policy to inspect traffic before allowing it to its final destination.

The following list describes the configurations you can change after you create a simple policy.

You can only edit access control policies that were created in the current domain. Also, you cannot edit settings that are locked by an ancestor access control policy.

Name and Description

Each access control policy must have a unique name. A description is optional.

Inheritance Settings

Policy inheritance allows you to create a hierarchy of access control policies. A parent (or base) policy defines and enforces default settings for its descendants, which is especially useful in multidomain deployments.
A policy’s inheritance settings allow you to select its base policy. You can also lock settings in the current policy to force any descendants to inherit them. Descendant policies can override unlocked settings.

**Policy Assignment**

Each access control policy identifies the devices that use it. Each device can be targeted by only one access control policy. In a multidomain deployment, you can require that all the devices in a domain use the same base policy.

**Rules**

Access control rules provide a granular method of handling network traffic. Rules in an access control policy are numbered, starting at 1, including rules inherited from ancestor policies. The system matches traffic to access control rules in top-down order by ascending rule number.

Usually, the system handles network traffic according to the first access control rule where all the rule’s conditions match the traffic. Conditions can be simple or complex, and their use often depends on certain licenses.

**Default Action**

The default action determines how the system handles and logs traffic that is not handled by any other access control configuration. The default action can block or trust all traffic without further inspection, or inspect traffic for intrusions and discovery data.

Although an access control policy can inherit its default action from an ancestor policy, you cannot enforce this inheritance.

**Security Intelligence**

Security Intelligence is a first line of defense against malicious internet content. This feature allows you to blacklist (block) connections based on the latest IP address, URL, and domain name reputation intelligence. To ensure continual access to vital resources, you can override blacklists with custom whitelists.

**HTTP Responses**

When the system blocks a user’s website request, you can either display a generic system-provided response page, or a custom page. You can also display a page that warns users, but also allows them to continue to the originally requested site.

**Advanced Access Control Options**

Advanced access control policy settings typically require little or no modification. Often, the default settings are appropriate. Advanced settings you can modify include traffic preprocessing, SSL inspection, identity, and various performance options.

**Related Topics**

*Rule Management: Common Characteristics*, on page 293

---

**Access Control Policy Default Action**

In a simple access control policy, the default action specifies how target devices handle all traffic. In a more complex policy, the default action handles traffic that:

- is not trusted by Intelligent Application Bypass
- is not blacklisted by Security Intelligence
• is not blocked by SSL inspection (encrypted traffic only)
• matches none of the rules in the policy (except Monitor rules, which match and log—but do not handle or inspect—traffic)

The access control policy default action can block or trust traffic without further inspection, or inspect traffic for intrusions and discovery data.

**Note**

You cannot perform file or malware inspection on traffic handled by the default action. Logging for connections handled by the default action is initially disabled, though you can enable it.

If you are using policy inheritance, the default action for the lowest-level descendant determines final traffic handling. Although an access control policy can inherit its default action from its base policy, you cannot enforce this inheritance.

The following table describes the types of inspection you can perform on traffic handled by each default action.

**Table 83: Access Control Policy Default Actions**

<table>
<thead>
<tr>
<th>Default Action</th>
<th>Effect on Traffic</th>
<th>Inspection Type and Policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Control: Block All Traffic</td>
<td>block without further inspection</td>
<td>none</td>
</tr>
<tr>
<td>Access Control: Trust All Traffic</td>
<td>trust (allow to its final destination without further inspection)</td>
<td>none</td>
</tr>
<tr>
<td>Intrusion Prevention</td>
<td>allow, as long as it is passed by the intrusion policy you specify</td>
<td>intrusion, using the specified intrusion policy and associated variable set, and discovery, using the network discovery policy</td>
</tr>
<tr>
<td>Network Discovery Only</td>
<td>allow</td>
<td>discovery only, using the network discovery policy</td>
</tr>
<tr>
<td>Inherit from base policy</td>
<td>defined in base policy</td>
<td>defined in base policy</td>
</tr>
</tbody>
</table>

The following diagram illustrates the table.

The following diagrams illustrate the **Block All Traffic** and **Trust All Traffic** default actions.
The following diagrams illustrate the Intrusion Prevention and Network Discovery Only default actions.

Tip

The purpose of Network Discovery Only is to improve performance in a discovery-only deployment. Different configurations can disable discovery if you are only interested in intrusion detection and prevention.

Performance Considerations for Limited Deployments, on page 289
Logging Connections with a Policy Default Action, on page 2048

Access Control Policy Inheritance

Access control uses a hierarchical policy-based implementation that complements multitenancy. Just as you create a domain hierarchy, you can create a corresponding hierarchy of access control policies. A descendant, or child, access control policy inherits rules and settings from its direct parent, or base, policy. That base policy may have its own parent policy from which it inherits rules and settings, and so on.

An access control policy’s rules are nested between its parent policy’s Mandatory and Default rule sections. This implementation enforces Mandatory rules from ancestor policies, but allows the current policy to write rules that preempt Default rules from ancestor policies.

You can lock the following settings to enforce them in all descendant policies. Descendant policies can override unlocked settings.

- Security Intelligence — Blacklisting and whitelisting connections based on the latest IP address, URL, and domain name reputation intelligence.
• HTTP Response pages — Displaying a custom or system-provided response page when you block a user's website request.

• Advanced settings — Specifying associated subpolicies, network analysis settings, performance settings, and other general options.

Although an access control policy can inherit its default action from an ancestor policy, you cannot enforce this inheritance.

**Policy Inheritance and Multitenancy**

In a typical multidomain deployment, access control policy hierarchy corresponds to domain structure, and you apply the lowest-level access control policy to managed devices. This implementation allows selective access control enforcement at a higher domain level, while lower-level domain administrators can tailor deployment-specific settings. (You must use roles, not policy inheritance and enforcement alone, to restrict administrators in descendant domains.)

For example, as a Global domain administrator for your organization, you can create an access control policy at the Global level. You can then require that all your devices, which are divided into subdomain by function, use that Global-level policy as a base policy.

When subdomain administrators log into the Firepower Management Center to configure access control, they can deploy the Global-level policy as-is. Or, they can create and deploy a descendant access control policy within the boundaries of the Global-level policy.

Although the most useful implementation of access control inheritance and enforcement complements multitenancy, you can create a hierarchy of access control policies within a single domain. You can also assign and deploy access control policies at any level.

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

The Firepower System allows you to edit system-provided access control policies and create custom access control policies. Depending on your devices' initial configurations, system-provided policies can include:

• Default Access Control—Blocks all traffic without further inspection.

• Default Intrusion Prevention—Allows all traffic, but also inspects with the Balanced Security and Connectivity intrusion policy and default intrusion variable set.
• Default Network Discovery—Allows all traffic while inspecting it for discovery data but not intrusions or exploits.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

**Procedure**

**Step 1** Choose Policies > Access Control.

**Step 2** Manage access control policies:

• Copy—Click the copy icon (COPY)..
• Create—Click New Policy; see Creating a Basic Access Control Policy, on page 1079.
• Delete—Click the delete icon (DELETE).
• Deploy—Click Deploy; see Deploy Configuration Changes, on page 279.
• Edit—Click the edit icon (EDIT); see Editing an Access Control Policy, on page 1081
• Inheritance—Click the plus icon (INHERITANCE) next to a policy with descendants to expand your view of the policy's hierarchy.
• Import/Export—Click Import/Export; see Configuration Import and Export, on page 165.
• Report—Click the report icon (REPORT); see Generating Current Policy Reports, on page 288.

**Related Topics**

Out-of-Date Policies, on page 288

**Creating a Basic Access Control Policy**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

When you create a new access control policy, you must, at minimum, choose a default action.

In most cases, logging of connections handled by a default action is initially disabled. An exception occurs if you create a subpolicy in a multidomain deployment. In that case, the system enables connection logging according to the logging configuration of the inherited default action.
Procedure

**Step 1** Choose Policies > Access Control.

**Step 2** Click New Policy.

**Step 3** Enter a unique Name and, optionally, a Description.

**Step 4** Optionally, choose a base policy from the Select Base Policy drop-down list.

If an access control policy is enforced on your domain, this step is not optional. You must choose the enforced policy or one of its descendants as the base policy.

**Step 5** Specify the initial Default Action:

- If you chose a base policy, your new policy inherits its default action. You cannot change it here.
- **Block all traffic** creates a policy with the Access Control: Block All Traffic default action.
- **Intrusion Prevention** creates a policy with the Intrusion Prevention: Balanced Security and Connectivity default action, associated with the default intrusion variable set.
- **Network Discovery** creates a policy with the Network Discovery Only default action.

**Tip** If you want to trust all traffic by default, or if you chose a base policy and do not want to inherit the default action, you can change the default action later.

**Caution** Changing the total number of intrusion policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information. You change the total number of intrusion policies by adding an intrusion policy that is not currently used, or by removing the last instance of an intrusion policy. You can use an intrusion policy in an access control rule, as the default action, or as the default intrusion policy.

**Step 6** Optionally, choose the Available Devices where you want to deploy the policy, then click Add to Policy (or drag and drop) to add the selected devices. To narrow the devices that appear, type a search string in the Search field.

If you want to deploy this policy immediately, you must perform this step.

**Step 7** Click Save.

What to do next

- Optionally, further configure the new policy as described in Editing an Access Control Policy, on page 1081.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics

- Access Control Policy Default Action, on page 1075

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Only one person should edit a policy at a time, using a single browser window. If multiple users save the same policy, the last saved changes are retained. For your convenience, the system displays information on who (if anyone) is currently editing each policy. To protect the privacy of your session, a warning appears after 30 minutes of inactivity on the policy editor. After 60 minutes, the system discards your changes.

**Procedure**

**Step 1** Choose Policies > Access Control.

**Step 2** Click the edit icon ( ), next to the access control policy you want to edit.

If a view icon ( ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Edit your access control policy:

- **Name and Description**—Click either field and enter new information.
- **Default Action**—Choose a value from the Default Action drop-down list.

**Caution** Changing the total number of intrusion policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information. You change the the total number of intrusion policies by adding an intrusion policy that is not currently used, or by removing the last instance of an intrusion policy. You can use an intrusion policy in an access control rule, as the default action, or as the default intrusion policy.

- **Default Action Variable Set**—To change the variable set associated with an Intrusion Prevention default action, click the variables icon ( ). In the popup window that appears, select a new variable set and click OK. You can also click the edit icon ( ) to edit the selected variable set in a new window. For more information, see Managing Variables, on page 366.

- **Default Action Logging**—To configure logging for connections handled by the default action, click the logging icon ( ); see Logging Connections with a Policy Default Action, on page 2048.

- **HTTP Responses**—To specify what the user sees in a browser when the system blocks a website request, click the HTTP Responses tab; see Choosing HTTP Response Pages, on page 1114.

- **Inheritance: Change Base Policy**—To change the base access control policy for this policy, click Inheritance Settings; see Choosing a Base Access Control Policy, on page 1083.
• Inheritance: Lock Settings in Descendants—To enforce this policy’s settings in its descendant policies, click Inheritance Settings; see Locking Settings in Descendant Access Control Policies, on page 1084.

• Policy Assignment: Targets—To identify the managed devices targeted by this policy, click Policy Assignment; see Setting Target Devices for an Access Control Policy, on page 1086.

• Policy Assignment: Required in Domains—To enforce this policy in a subdomain, click Policy Assignment; see Requiring an Access Control Policy in a Domain, on page 1085.

• Rules—To manage access control rules, and to inspect and block malicious traffic using intrusion and file policies, click the Rules tab; see Creating and Editing Access Control Rules, on page 1096.

• Security Intelligence—To immediately blacklist (block) connections based on the latest reputation intelligence, click the Security Intelligence tab; see Configure Security Intelligence, on page 1119.

• Advanced Options—To set preprocessing, SSL inspection, identity, performance, and other advanced options, click the Advanced tab; see Access Control Policy Advanced Settings, on page 1086.

• Warnings—To view a list of warnings or errors in your access control policy (and its descendant and associated policies), click Show Warnings. Warnings and errors mark configurations that could adversely affect traffic analysis and flow or prevent the policy from deploying. If there are no warnings, the button does not appear.

Step 4 Click Save.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Managing Access Control Policy Inheritance

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1 Edit the access control policy whose inheritance settings you want to change; see Editing an Access Control Policy, on page 1081.

Step 2 Manage policy inheritance:

• Change Base Policy — To change the base access control policy for this policy, click Inheritance Settings and proceed as described in Choosing a Base Access Control Policy, on page 1083.
• Lock Settings in Descendants — To enforce this policy's settings in its descendant policies, click **Inheritance Settings** and proceed as described in Locking Settings in Descendant Access Control Policies, on page 1084.

• Required in Domains — To enforce this policy in a subdomain, click **Policy Assignment** and proceed as described in Requiring an Access Control Policy in a Domain, on page 1085.

• Inherit Settings from Base Policy — To inherit settings from a base access control policy, click the **Security Intelligence**, **HTTP Responses**, or **Advanced** tab and proceed as directed in Inheriting Access Control Policy Settings from the Base Policy, on page 1084.

---

**What to do next**

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

---

### Choosing a Base Access Control Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can use one access control policy as the base (parent) for another. By default, a child policy inherits its settings from its base policy, though you can change unlocked settings.

When you change the base policy for the current access control policy, the system updates the current policy with any locked settings from the new base policy.

**Procedure**

**Step 1**
In the access control policy editor, click **Inheritance Settings**.

**Step 2**
Choose a policy from the **Select Base Policy** drop-down list.

In a multidomain deployment, an access control policy may be required in the current domain. You can choose only the enforced policy or one of its descendants as the base policy.

**Step 3**
Click **Save**.

---

**What to do next**

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.
Inheriting Access Control Policy Settings from the Base Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access/Network Admin</td>
</tr>
</tbody>
</table>

A new child policy inherits many settings from its base policy. If these settings are unlocked in the base policy, you can override them.

If you later reinherit the settings from the base policy, the system displays the base policy's settings and dims the controls. However, the system saves the overrides you made, and restores them if you disable inheritance again.

**Procedure**

**Step 1** In the access control policy editor, click the Security Intelligence, HTTP Responses, or Advanced tab.

**Step 2** Check the Inherit from base policy check box for each setting you want to inherit.

If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration.

**Step 3** Click Save.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Locking Settings in Descendant Access Control Policies

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access/Network Admin</td>
</tr>
</tbody>
</table>

Lock a setting in an access control policy to enforce the setting in all descendant policies. Descendant policies can override unlocked settings.

When you lock settings, the system saves overrides already made in descendant polices so that the overrides can be restored if you unlock settings again.

**Procedure**

**Step 1** In the access control policy editor, click Inheritance Settings.

**Step 2** In the Child Policy Inheritance Settings area, check the settings you want to lock.

If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration.
Step 3  
Click **OK** to save the inheritance settings.

Step 4  
Click **Save** to save the access control policy.

**What to do next**

- Deploy configuration changes; see *Deploy Configuration Changes, on page 279.*

---

**Requiring an Access Control Policy in a Domain**

<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can require that every device in a domain use the same base access control policy or one of its descendant policies.

**Before you begin**

- Configure at least one domain other than the Global domain.

**Procedure**

Step 1  
In the access control policy editor, click **Policy Assignments**.

Step 2  
Click the **Required on Domains** tab.

Step 3  
Build your domain list:

- **Add** — Select the domains where you want to enforce the current access control policy, then click **Add** or drag and drop into the list of selected domains.

- **Delete** — Click the delete icon (❌) next to a leaf domain, or right-click an ancestor domain and choose **Delete Selected**.

- **Search** — Type a search string in the search field. Click the clear icon (❌) to clear the search.

Step 4  
Click **OK** to save the domain enforcement settings.

Step 5  
Click **Save** to save the access control policy.

**What to do next**

- Deploy configuration changes; see *Deploy Configuration Changes, on page 279.*
Setting Target Devices for an Access Control Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

An access control policy specifies the devices that use it. Each device can be targeted by only one access control policy. In multidomain deployments, you can require that all the devices in a domain use the same base policy.

**Procedure**

**Step 1**
In the access control policy editor, click **Policy Assignments**.

**Step 2**
On the **Targeted Devices** tab, build your target list:

- **Add** — Select one or more Available Devices, then click **Add to Policy** or drag and drop into the list of Selected Devices.
- **Delete** — Click the delete icon (Trash) next to a single device, or select multiple devices, right-click, then choose **Delete Selected**.
- **Search** — Type a search string in the search field. Click the clear icon (X) to clear the search.

Under **Impacted Devices**, the system lists the devices whose assigned access control policies are children of the current policy. Any change to the current policy affects these devices.

**Step 3**
Optionally, click the **Required on Domains** tab to require that all the devices in the subdomains you choose use the same base policy. See **Requiring an Access Control Policy in a Domain**, on page 1085.

**Step 4**
Click **OK** to save your targeted device settings.

**Step 5**
Click **Save** to save the access control policy.

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

### Access Control Policy Advanced Settings

Advanced access control policy settings typically require little or no modification. The default settings are appropriate for most deployments. Note that many of the advanced preprocessing and performance options in access control policies may be modified by rule updates as described in **Update Intrusion Rules**, on page 143.

If a view icon (View) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
Caution

See Configurations that Restart the Snort Process When Deployed or Activated, on page 283 for a list of advanced setting modifications that restart the Snort process, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

General Settings

To customize the number of characters you store for each URL requested by your users, see Limiting Logging of Long URLs, on page 2049.

To customize the length of time before you re-block a website after a user bypasses an initial block, see Setting the User Bypass Timeout for a Blocked Website, on page 1116.

Disable Retry URL cache miss lookup to allow the system to immediately pass traffic to a URL without a cloud lookup when the category is not cached. The system treats URLs that require a cloud lookup as Uncategorized until the cloud lookup completes with a different category.

To inspect traffic when you deploy configuration changes unless specific configurations require restarting the Snort process, ensure that Inspect traffic during policy apply is set to its default value (enabled). When this option is enabled, resource demands could result in a small number of packets dropping without inspection. See Snort® Restart Scenarios, on page 281 for more information.

Associated Policies

Use advanced settings to associate subpolicies (SSL, identity, prefilter) with access control; see Associating Other Policies with Access Control, on page 1088.

Network Analysis and Intrusion Policies

Advanced network analysis and intrusion policy settings allow you to:

• Change the access control policy’s default intrusion policy and associated variable set, which are used to initially inspect traffic before the system can determine exactly how to inspect that traffic.

• Change the access control policy’s default network analysis policy, which governs many preprocessing options.

• Use custom network analysis rules and network analysis policies to tailor preprocessing options to specific security zones, networks, and VLANs.

For more information, see Advanced Access Control Settings for Network Analysis and Intrusion Policies, on page 1495.

File and Malware Settings

File and Malware Inspection Performance and Storage Tuning, on page 1269 provides information on performance options for file control and AMP for Networks.

Intelligent Application Bypass Settings

Intelligent Application Bypass (IAB) is an expert-level configuration that specifies applications to bypass or test for bypass if traffic exceeds a combination of inspection performance and flow thresholds. For more information, see Intelligent Application Bypass, on page 1149.
Transport/Network Layer Preprocessor Settings

Advanced transport and network preprocessor settings apply globally to all networks, zones, and VLANs where you deploy your access control policy. You configure these advanced settings in an access control policy rather than in a network analysis policy. For more information, see Advanced Transport/Network Preprocessor Settings, on page 1583.

Detection Enhancement Settings

Advanced detection enhancement settings allow you to configure adaptive profiles so you can:

- Use file policies and applications in access control rules.
- Use service metadata in intrusion rules.
- In passive deployments, improve reassembly of packet fragments and TCP streams based on your network’s host operating systems.

For more information, see Adaptive Profiles, on page 1637.

Performance Settings and Latency-Based Performance Settings

About Intrusion Prevention Performance Tuning, on page 1481 provides information on improving the performance of your system as it analyzes traffic for attempted intrusions.

For information specific to latency-based performance settings, see Packet and Intrusion Rule Latency Threshold Configuration, on page 1485.

Associating Other Policies with Access Control

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

Use an access control policy's advanced settings to associate one of each of the following subpolicies with the access control policy:

- SSL policy—Monitors, decrypts, blocks, or allows application layer protocol traffic encrypted with Secure Socket Layer (SSL) or Transport Layer Security (TLS).

  Caution

  Adding or removing an SSL policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

- Identity policy—Performs user authentication based on the realm and authentication method associated with the traffic.
- Prefilter policy—Performs early traffic handling using limited network (layer 4) outer-header criteria.
**Procedure**

**Step 1**  
In the access control policy editor, click the **Advanced** tab.

**Step 2**  
Click the edit icon (>Edit) in the appropriate Policy Settings area.

If a view icon (>) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 3**  
Choose a policy from the drop-down list.  
If you choose a user-created policy, you can click the edit icon that appears to edit the policy.

**Step 4**  
Click **OK**.

**Step 5**  
Click **Save** to save the access control policy.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Access Control Rules

The following topics describe how to configure access control rules:

- Introduction to Access Control Rules, on page 1091
- Adding an Access Control Rule Category, on page 1095
- Creating and Editing Access Control Rules, on page 1096
- Enabling and Disabling Access Control Rules, on page 1098
- Positioning an Access Control Rule, on page 1098
- Access Control Rule Actions, on page 1099
- Access Control Rule Comments, on page 1102

Introduction to Access Control Rules

Within an access control policy, access control rules provide a granular method of handling network traffic across multiple managed devices.

Note

8000 Series fastpathing, prefilter evaluation, Security Intelligence filtering, SSL inspection, user identification, and some decoding and preprocessing occur before access control rules evaluate network traffic.

The system matches traffic to access control rules in the order you specify. In most cases, the system handles network traffic according to the first access control rule where all the rule’s conditions match the traffic.

Each rule also has an action, which determines whether you monitor, trust, block, or allow matching traffic. When you allow traffic, you can specify that the system first inspect it with intrusion or file policies to block any exploits, malware, or prohibited files before they reach your assets or exit your network.

The following scenario summarizes the ways that traffic can be evaluated by access control rules in an inline, intrusion prevention deployment.
In this scenario, traffic is evaluated as follows:

- **Rule 1: Monitor** evaluates traffic first. Monitor rules track and log network traffic but do not affect traffic flow. The system continues to match traffic against additional rules to determine whether to permit or deny it.

- **Rule 2: Trust** evaluates traffic next. Matching traffic is allowed to pass to its destination without further inspection, though it is still subject to identity requirements and rate limiting. Traffic that does not match continues to the next rule.

- **Rule 3: Block** evaluates traffic third. Matching traffic is blocked without further inspection. Traffic that does not match continues to the final rule.

- **Rule 4: Allow** is the final rule. For this rule, matching traffic is allowed; however, prohibited files, malware, intrusions, and exploits within that traffic are detected and blocked. Remaining non-prohibited, non-malicious traffic is allowed to its destination, though it is still subject to identity requirements and rate limiting. You can configure Allow rules that perform only file inspection, or only intrusion inspection, or neither.

- **Default Action** handles all traffic that does not match any of the rules. In this scenario, the default action performs intrusion prevention before allowing non-malicious traffic to pass. In a different deployment, you might have a default action that trusts or blocks all traffic, without further inspection. (You cannot perform file or malware inspection on traffic handled by the default action.)

Traffic you allow, whether with an access control rule or the default action, is automatically eligible for inspection for host, application, and user data by the network discovery policy. You do not explicitly enable discovery, although you can enhance or disable it. However, allowing traffic does not automatically guarantee discovery data collection. The system performs discovery only for connections involving IP addresses that are explicitly monitored by your network discovery policy; additionally, application discovery is limited for encrypted sessions.

Note that access control rules handle encrypted traffic when your SSL inspection configuration allows it to pass, or if you do not configure SSL inspection. However, some access control rule conditions require unencrypted traffic, so encrypted traffic may match fewer rules. Also, by default, the system disables intrusion and file inspection of encrypted payloads. This helps reduce false positives and improve performance when an encrypted connection matches an access control rule that has intrusion and file inspection configured.
Access Control Rule Management

The Rules tab of the access control policy editor allows you to add, edit, categorize, search, move, enable, disable, delete, and otherwise manage access control rules in the current policy.

For each access control rule, the policy editor displays its name, a summary of its conditions, the rule action, and icons that communicate the rule’s inspection options or status. These icons represent:

- intrusion policy option (itt)
- file policy option (ll)
- Safe Search option (ss)
- YouTube EDU option (yu)
- logging option (lg)
- Original Client option (oc)
- comments (cmt)
- warnings (warn)
- errors (err)
- important information (imp)

Disabled rules are dimmed and marked (disabled) beneath the rule name.

To create or edit a rule, use the access control rule editor. You can:

- Configure basic properties such as the rule’s name, state, position, and action in the upper portion of the editor.
- Add conditions using the tabs on the left side of the lower portion of the editor.
- Use the tabs on the right side of the lower portion to configure inspection and logging options, and also to add comments to the rule. For your convenience, the editor lists the rule’s inspection and logging options regardless of which tab you are viewing.

Note

Properly creating and ordering access control rules is a complex task, but one that is essential to building an effective deployment. If you do not plan your policy carefully, rules can preempt other rules, require additional licenses, or contain invalid configurations. To help ensure that the system handles traffic as you expect, the access control policy interface has a robust warning and error feedback system for rules.

Access Control Rule Components

In addition to its unique name, each access control rule has the following basic components:

State
By default, rules are enabled. If you disable a rule, the system does not use it and stops generating warnings and errors for that rule.

Position
Rules in an access control policy are numbered, starting at 1. If you are using policy inheritance, rule 1 is the first rule in the outermost policy. The system matches traffic to rules in top-down order by ascending rule number. With the exception of Monitor rules, the first rule that traffic matches is the rule that handles that traffic.

Rules can also belong to a section and a category, which are organizational only and do not affect rule position. Rule position goes across sections and categories.

Section and Category
To help you organize access control rules, every access control policy has two system-provided rule sections, Mandatory and Default. To further organize access control rules, you can create custom rule categories inside the Mandatory and Default sections.

If you are using policy inheritance, the current policy's rules are nested between its parent policy's Mandatory and Default sections.

Conditions
Conditions specify the specific traffic the rule handles. Conditions can be simple or complex; their use often depends on license.

Action
A rule's action determines how the system handles matching traffic. You can monitor, trust, block, or allow (with or without further inspection) matching traffic. The system does not perform deep inspection on trusted, blocked, or encrypted traffic.

Inspection
Deep inspection options govern how the system inspects and blocks malicious traffic you would otherwise allow. When you allow traffic with a rule, you can specify that the system first inspect it with intrusion or file policies to block any exploits, malware, or prohibited files before they reach your assets or exit your network.

Logging
A rule's logging settings govern the records the system keeps of the traffic it handles. You can keep a record of traffic that matches a rule. In general, you can log sessions at the beginning or end of a connection, or both. You can log connections to the database, as well as to the system log (syslog) or to an SNMP trap server.

Comments
Each time you save changes to an access control rule, you can add comments.
Access Control Rule Order

Rules in an access control policy are numbered, starting at 1. The system matches traffic to access control rules in top-down order by ascending rule number.

In most cases, the system handles network traffic according to the first access control rule where all the rule’s conditions match the traffic. Except Monitor rules (which log traffic but do not affect traffic flow), the system does not continue to evaluate traffic against additional, lower-priority rules after that traffic matches a rule.

To help you organize access control rules, every access control policy has two system-provided rule sections, Mandatory and Default. To further organize, you can create custom rule categories inside the Mandatory or Default sections. After you create a category, you cannot move it, although you can delete it, rename it, and move rules into, out of, within, and around it. The system assigns rule numbers across sections and categories.

If you use policy inheritance, the current policy’s rules are nested between its parent policy's Mandatory and Default rule sections. Rule 1 is the first rule in the outermost policy, not the current policy, and the system assigns rule numbers across policies, sections, and categories.

Any predefined user role that allows you to modify access control policies also allows you to move and modify access control rules within and among rules categories. You can, however, create custom roles that restrict users from moving and modifying rules. Any user who is allowed to modify access control policies can add rules to custom categories and modify rules in them without restriction.

Proper access control rule order reduces the resources required to process network traffic, and prevents rule preemption. Although the rules you create are unique to every organization and deployment, there are a few general guidelines to follow when ordering rules that can optimize performance while still addressing your needs.

Adding an Access Control Rule Category

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>
You can divide an access control policy's Mandatory and Default rule sections into custom categories. After you create a category, you cannot move it, although you can delete it, rename it, and move rules into, out of, within, and around it. The system assigns rule numbers across sections and categories.

**Procedure**

**Step 1**
In the access control policy editor, click **Add Category**.

*Tip* If your policy already contains rules, you can click a blank area in the row for an existing rule to set the position of the new category before you add it. You can also right-click an existing rule and select **Insert new category**.

**Step 2**
Enter a **Name**.

**Step 3**
From the **Insert** drop-down list, choose where you want to add the category:

- To insert a category below all existing categories in a section, choose **into Mandatory** or **into Default**.
- To insert a category above an existing category, choose **above category**, then choose a category.
- To insert a category above or below an access control rule, choose **above rule** or **below rule**, then enter an existing rule number.

**Step 4**
Click **OK**.

**Step 5**
Click **Save** to save the policy.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

---

**Creating and Editing Access Control Rules**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

---

**Caution**

Changing the total number of intrusion policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information. You change the the total number of intrusion policies by adding an intrusion policy that is not currently used, or by removing the last instance of an intrusion policy. You can use an intrusion policy in an access control rule, as the default action, or as the default intrusion policy.
Procedure

Step 1
In the access control policy editor, you have the following options:

- To add a new rule, click **Add Rule**.
- To edit an existing rule, click the edit icon (-update).

If a view icon (-view) appears next to a rule instead, the rule belongs to an ancestor policy, or you do not have permission to modify the rule.

Step 2
Enter a **Name**.

Step 3
Configure the rule components, or accept the defaults:

- **Enabled**—Specify whether the rule is **Enabled**.
- **Position**—Specify the rule position; see Access Control Rule Order, on page 1095.
- **Action**—Choose a rule **Action**; see Access Control Rule Actions, on page 1099.
- **Conditions**—Click the tab corresponding to the condition you want to add. See Rule Condition Types, on page 294 for more information.
- **Deep Inspection**—For Allow and Interactive Block rules, click the intrusion inspection icon (-update icon) or the file and malware inspection icon (-update icon) to configure the rule’s **Inspection** options. If the icon is dimmed, no policy of that type is selected for the rule. See Access Control Using Intrusion and File Policies, on page 1105 for more information.
- **Content Restriction**—Click the Safe Search icon (-update icon) or YouTube EDU icon (-update icon) to configure content restriction settings on the **Applications** tab of the rule editor. If the icons are dimmed, content restriction is disabled for the rule. See About Content Restriction, on page 1157 for more information.
- **Logging**—Click an active (blue) logging icon (-update icon) to specify **Logging** options. If the icon is dimmed, connection logging is disabled for the rule. See Connection Logging Strategies, on page 2038 for more information.
- **Comments**—Click the number in the comment column to add **Comments**. The number indicates how many comments the rule already contains. See Access Control Rule Comments, on page 1102 for more information.

Step 4
Save the rule.

Step 5
Click **Save** to save the policy.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you create an access control rule, it is enabled by default. If you disable a rule, the system does not use it to evaluate network traffic and stops generating warnings and errors for that rule. When viewing the list of rules in an access control policy, disabled rules are grayed out, although you can still modify them.

Tip
You can also enable or disable an access control rule using the rule editor.

Procedure

Step 1
In the access control policy editor, right-click the rule and choose a rule state.

If a view icon (__) appears next to a rule instead, the rule belongs to an ancestor policy, or you do not have permission to modify the rule.

Step 2
Click Save.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

You can move an existing rule within, but not between, access control policies. When you add or move a rule to a category, the system places it last in the category.

Tip
You can move multiple rules at once by selecting the rules then cutting and pasting using the right-click menu.
Procedure

Step 1 In the access control rule editor, you have the following options:

- If you are adding a new rule, use the Insert drop-down list.
- If you are editing an existing rule, click Move.

Step 2 Choose where you want to move or insert the rule:

- Choose into Mandatory or into Default.
- Choose a into Category, then choose the user-defined category.
- Choose above rule or below rule, then type the appropriate rule number.

Step 3 Click Save.

Step 4 Click Save to save the policy.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Access Control Rule Actions

Every access control rule has an action that determines how the system handles and logs matching traffic. You can monitor, trust, block, or allow (with or without further inspection).

The access control policy’s default action handles traffic that does not meet the conditions of any non-Monitor access control rule.

Access Control Rule Monitor Action

The Monitor action does not affect traffic flow; matching traffic is neither immediately permitted nor denied. Rather, traffic is matched against additional rules to determine whether to permit or deny it. The first non-Monitor rule matched determines traffic flow and any further inspection. If there are no additional matching rules, the system uses the default action.

Because the primary purpose of Monitor rules is to track network traffic, the system automatically logs end-of-connection events for monitored traffic. That is, connections are logged even if the traffic matches no other rules and you do not enable logging on the default action.

Note

If locally-bound traffic matches a Monitor rule in a Layer 3 deployment, that traffic may bypass inspection. To ensure inspection of the traffic, enable Inspect Local Router Traffic in the advanced device settings for the managed device routing the traffic.

Related Topics

Logging for Monitored Connections, on page 2042
Access Control Rule Trust Action

The **Trust** action allows traffic to pass without deep inspection or network discovery. Trusted traffic is still subject to identity requirements and rate limiting.

![Trust Action Diagram]

**Related Topics**
- [Logging for Trusted Connections](#), on page 2043

Access Control Rule Blocking Actions

The **Block** and **Block with reset** actions deny traffic without further inspection of any kind. Block with reset rules also reset the connection.

![Block/Block with Reset Action Diagram]

When you block web requests, you can display a *HTTP response page*; see [HTTP Response Pages and Interactive Blocking](#), on page 1113.

**Related Topics**
- [Logging for Blocked Connections](#), on page 2043
- [About HTTP Response Pages](#), on page 1113

Access Control Rule Interactive Blocking Actions

The **Interactive Block** and **Interactive Block with reset** actions give users a chance to bypass a website block by clicking through or by refreshing a customizable warning page, called an *HTTP response page*. Interactive Block with reset rules also reset the connection. For detailed information, see [HTTP Response Pages and Interactive Blocking](#), on page 1113.
If a user bypasses the block, the rule mimics an Allow rule. Therefore, you can associate either type of Interactive Block rule with a file and intrusion policy to inspect this user-allowed traffic. The system can also inspect with network discovery.

If a user does not (or cannot) bypass the block, the rule mimics a Block rule. Matching traffic is denied without further inspection.

Related Topics
- Logging for Allowed Connections, on page 2044
- SSL Rule Blocking Actions, on page 1202

Access Control Rule Allow Action

The **Allow** action allows matching traffic to pass, though it is still subject to identity requirements and rate limiting.

Optionally, you can use deep inspection to further inspect and block unencrypted or decrypted traffic before it reaches its destination:

- You can use an intrusion policy to analyze network traffic according to intrusion detection and prevention configurations, and drop offending packets depending on the configuration.
- You can perform file control using a file policy. File control allows you to detect and block your users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols.
- You can perform network-based advanced malware protection (AMP), also using a file policy. AMP for Networks can inspect files for malware, and block detected malware depending on the configuration.

The following diagram illustrates the types of inspection performed on traffic that meets the conditions of an Allow rule (or a user-bypassed Interactive Block rule. Notice that file inspection occurs before intrusion inspection; blocked files are not inspected for intrusion-related exploits.
For simplicity, the diagram displays traffic flow for situations where both (or neither) an intrusion and a file policy are associated with an access control rule. You can, however, configure one without the other. Without a file policy, traffic flow is determined by the intrusion policy; without an intrusion policy, traffic flow is determined by the file policy.

Regardless of whether the traffic is inspected or dropped by an intrusion or file policy, the system can inspect it using network discovery. However, allowing traffic does not automatically guarantee discovery inspection. The system performs discovery only for connections involving IP addresses that are explicitly monitored by your network discovery policy; additionally, application discovery is limited for encrypted sessions.

**Access Control Rule Comments**

When you create or edit an access control rule, you can add a comment. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change. You can display a list of all comments for a rule along with the user who added each comment and the date the comment was added.

When you save a rule, all comments made since the last save become read-only.

Step 2  Click New Comment.
Step 3  Enter your comment and click OK. You can edit or delete this comment until you save the rule.
Step 4  Click Save.
Step 5  Click Save to save the policy.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.
Access Control Using Intrusion and File Policies

The following topics describe how to configure access control policies to use intrusion and file policies:

- About Deep Inspection, on page 1105
- Access Control Traffic Handling, on page 1106
- File and Intrusion Inspection Order, on page 1107
- Access Control Rule Configuration to Perform File Control and Malware Protection, on page 1108
- Access Control Rule Configuration to Perform Intrusion Prevention, on page 1110

About Deep Inspection

Intrusion and file policies work together as the last line of defense before traffic is allowed to its destination:

- Intrusion policies govern the system’s intrusion prevention capabilities.
- File policies govern the system’s file control and AMP for Networks capabilities.

Access control occurs before deep inspection; access control rules and the access control default action determine which traffic is inspected by intrusion and file policies.

By associating an intrusion or file policy with an access control rule, you are telling the system that before it passes traffic that matches the access control rule’s conditions, you first want to inspect the traffic with an intrusion policy, a file policy, or both.

By default, the system disables intrusion and file inspection of encrypted payloads. This helps reduce false positives and improve performance when an encrypted connection matches an access control rule that has intrusion and file inspection configured.

The system can also receive AMP for Endpoints data from the AMP cloud, then present this data alongside any AMP for Networks data.

Related Topics

- How Policies Examine Traffic For Intrusions, on page 1276
- File Policies, on page 1247
Access Control Traffic Handling

Access control rules provide a granular method of handling network traffic across multiple managed devices. The system matches traffic to access control rules in the order you specify. In most cases, the system handles network traffic according to the first access control rule where all the rule’s conditions match the traffic. An access control rule’s action determines how the system handles matching traffic. You can monitor, trust, block, or allow (with or without further inspection) matching traffic.

The following diagram shows the flow of traffic in an inline intrusion prevention and AMP for Networks deployment, as governed by an access control policy that contains four different types of access control rules and a default action.

In the scenario above, the first three access control rules in the policy—Monitor, Trust, and Block—cannot inspect matching traffic. Monitor rules track and log but do not inspect network traffic, so the system continues to match traffic against additional rules to determine whether to permit or deny it. Trust and Block rules handle matching traffic without further inspection of any kind, while traffic that does not match continues to the next access control rule.

The fourth and final rule in the policy, an Allow rule, invokes various other policies to inspect and handle matching traffic, in the following order:

- **Discovery: Network Discovery Policy**—First, the network discovery policy inspects traffic for discovery data. Discovery is passive analysis and does not affect the flow of traffic. Although you do not explicitly enable discovery, you can enhance or disable it. However, allowing traffic does not automatically guarantee discovery data collection. The system performs discovery only for connections involving IP addresses that are explicitly monitored by your network discovery policy.

- **AMP for Networks and File Control: File Policy**—After traffic is inspected by discovery, the system can inspect it for prohibited files and malware. AMP for Networks detects and optionally blocks malware in many types of files, including PDFs, Microsoft Office documents, and others. If your organization wants to block not only the transmission of malware files, but all files of a specific type (regardless of whether the files contain malware), file control allows you to monitor network traffic for transmissions of specific file types, then either block or allow the file.

- **Intrusion Prevention: Intrusion Policy**—After file inspection, the system can inspect traffic for intrusions and exploits. An intrusion policy examines decoded packets for attacks based on patterns, and can block...
or alter malicious traffic. Intrusion policies are paired with variable sets, which allow you to use named values to accurately reflect your network environment.

- **Destination**—Traffic that passes all the checks described above passes to its destination.

An Interactive Block rule (not shown in the diagram) has the same inspection options as an Allow rule. This is so you can inspect traffic for malicious content when a user bypasses a blocked website by clicking through a warning page.

Traffic that does not match any of the non-Monitor access control rules in the policy is handled by the default action. In this scenario, the default action is an Intrusion Prevention action, which allows traffic to its final destination as long as it is passed by the intrusion policy you specify. In a different deployment, you might have a default action that trusts or blocks all traffic without further inspection. Note that the system can inspect traffic allowed by the default action for discovery data and intrusions, but not prohibited files or malware. You **cannot** associate a file policy with the access control default action.

**Note**

Sometimes, when a connection is analyzed by an access control policy, the system must process the first few packets in that connection, **allowing them to pass**, before it can decide which access control rule (if any) will handle the traffic. However, so these packets do not reach their destination uninspected, you can use an intrusion policy—called the default intrusion policy—to inspect them and generate intrusion events.

---

**File and Intrusion Inspection Order**

In your access control policy, you can associate multiple Allow and Interactive Block rules with different intrusion and file policies to match inspection profiles to various types of traffic.

**Note**

Traffic allowed by an Intrusion Prevention or Network Discovery Only default action can be inspected for discovery data and intrusions, but cannot be inspected for prohibited files or malware. You **cannot** associate a file policy with the access control default action.

You do not have to perform both file and intrusion inspection in the same rule. For a connection matching an Allow or Interactive Block rule:

- without a file policy, traffic flow is determined by the intrusion policy
- without an intrusion policy, traffic flow is determined by the file policy
- without either, allowed traffic is inspected by network discovery only

**Tip**

The system does not perform any kind of inspection on trusted traffic. Although configuring an Allow rule with neither an intrusion nor file policy passes traffic like a Trust rule, Allow rules let you perform discovery on matching traffic.

The diagram below illustrates the types of inspection you can perform on traffic that meets the conditions of either an Allow or user-bypassed Interactive Block access control rule. For simplicity, the diagram displays
traffic flow for situations where both (or neither) an intrusion and a file policy are associated with a single access control rule.

For any single connection handled by an access control rule, file inspection occurs before intrusion inspection. That is, the system does not inspect files blocked by a file policy for intrusions. Within file inspection, simple blocking by type takes precedence over malware inspection and blocking.

For example, consider a scenario where you normally want to allow certain network traffic as defined in an access control rule. However, as a precaution, you want to block the download of executable files, examine downloaded PDFs for malware and block any instances you find, and perform intrusion inspection on the traffic.

You create an access control policy with a rule that matches the characteristics of the traffic you want to provisionally allow, and associate it with both an intrusion policy and a file policy. The file policy blocks the download of all executables, and also inspects and blocks PDFs containing malware:

- First, the system blocks the download of all executables, based on simple type matching specified in the file policy. Because they are immediately blocked, these files are subject to neither malware nor intrusion inspection.

- Next, the system performs malware cloud lookups for PDFs downloaded to a host on your network. Any PDFs with a malware disposition are blocked, and are not subject to intrusion inspection.

- Finally, the system uses the intrusion policy associated with the access control rule to inspect any remaining traffic, including files not blocked by the file policy.

**Note**

Until a file is detected and blocked in a session, packets from the session may be subject to intrusion inspection.

## Access Control Rule Configuration to Perform File Control and Malware Protection

An access control policy can have multiple access control rules associated with file policies. You can configure file inspection for any Allow or Interactive Block access control rule, which permits you to match different file and malware inspection profiles against different types of traffic on your network before it reaches its final destination.
When the system detects a prohibited file (including malware) according to the settings in the file policy, it automatically logs an event to the Firepower Management Center database. If you do not want to log file or malware events, you can disable this logging on a per-access-control-rule basis.

The system also logs the end of the associated connection to the Firepower Management Center database, regardless of the logging configuration of the invoking access control rule.

### Configuring an Access Control Rule to Perform File Control and AMP

**Caution**

Selecting Detect Files or Block Files, enabling or disabling Store files in a Detect Files or Block Files rule, or adding the first or removing the last file rule that combines the Malware Cloud Lookup or Block Malware file rule action with an analysis option (Spero Analysis or MSEXE, Dynamic Analysis, or Local Malware Analysis) or a store files option (Malware, Unknown, Clean, or Custom), restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

**Before you begin**

- Adaptive profiling **must** be enabled (its default state) as described in Configuring Adaptive Profiles, on page 1639 for access control rules to perform file control, including AMP.

**Procedure**

**Step 1** In the access control rule editor, choose an **Action** of Allow, Interactive Block, or Interactive Block with reset.

**Step 2** Click the **Inspection** tab.

**Step 3** Choose a **Malware Policy** (file policy) to inspect traffic that matches the access control rule, or choose **None** to disable file inspection for matching traffic.

**Step 4** (Optional) Disable logging of file or malware events for matching connections by clicking the **Logging** tab and unchecking **Log Files**.

**Note** Cisco recommends you leave file and malware event logging enabled.

**Step 5** Save the rule.

**Step 6** Click **Save** to save the policy.
Access Control Rule Configuration to Perform Intrusion Prevention

An access control policy can have multiple access control rules associated with intrusion policies. You can configure intrusion inspection for any Allow or Interactive Block access control rule, which permits you to match different intrusion inspection profiles against different types of traffic on your network before it reaches its final destination.

Whenever the system uses an intrusion policy to evaluate traffic, it uses an associated variable set. Variables in a set represent values commonly used in intrusion rules to identify source and destination IP addresses and ports. You can also use variables in intrusion policies to represent IP addresses in rule suppressions and dynamic rule states.

Even if you use system-provided intrusion policies, Cisco strongly recommends you configure the system’s intrusion variables to accurately reflect your network environment. At a minimum, modify default variables in the default set.

Understanding System-Provided and Custom Intrusion Policies

Cisco delivers several intrusion policies with the Firepower System. By using system-provided intrusion policies, you can take advantage of the experience of the Cisco Talos Security Intelligence and Research Group (Talos). For these policies, Talos sets intrusion and preprocessor rule states, as well as provides the initial configurations for advanced settings. You can use system-provided policies as-is, or you can use them as the base for custom policies. Building custom policies can improve the performance of the system in your environment and provide a focused view of the malicious traffic and policy violations occurring on your network.

Connection and Intrusion Event Logging

When an intrusion policy invoked by an access control rule detects an intrusion and generates an intrusion event, it saves that event to the Firepower Management Center. The system also automatically logs the end of the connection where the intrusion occurred to the Firepower Management Center database, regardless of the logging configuration of the access control rule.

Related Topics

Predefined Default Variables, on page 356
Access Control Rule Configuration and Intrusion Policies

In addition to custom intrusion policies that you create, the system provides two custom policies: Initial Inline Policy and Initial Passive Policy. These two intrusion policies use the Balanced Security and Connectivity intrusion policy as their base. The only difference between them is their Drop When Inline setting, which enables drop behavior in the inline policy and disables it in the passive policy.

The number of unique intrusion policies you can use in a single access control policy depends on the model of the target devices; more powerful devices can handle more. Every unique pair of intrusion policy and variable set counts as one policy. Although you can associate a different intrusion policy-variable set pair with each Allow and Interactive Block rule (as well as with the default action), you cannot deploy an access control policy if the target devices have insufficient resources to perform inspection as configured.

Configuring an Access Control Rule to Perform Intrusion Prevention

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

Caution

Changing the total number of intrusion policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information. You change the the total number of intrusion policies by adding an intrusion policy that is not currently used, or by removing the last instance of an intrusion policy. You can use an intrusion policy in an access control rule, as the default action, or as the default intrusion policy.

Procedure

Step 1  In the access control policy editor, create a new rule or edit an existing rule; see Access Control Rule Components, on page 1094.

Step 2  Ensure the rule action is set to Allow, Interactive Block, or Interactive Block with reset.

Step 3  Click the tab.

Step 4  Choose a system-provided or custom Intrusion Policy, or choose None to disable intrusion inspection for traffic that matches the access control rule.

Step 5  If you want to change the variable set associated with the intrusion policy, choose a value from the Variable Set drop-down list.

Step 6  Click Save to save the rule.

Step 7  Click Save to save the policy.
What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics

- Variable Sets, on page 354
- Snort® Restart Scenarios, on page 281
HTTP Response Pages and Interactive Blocking

The following topics describe how to configure custom pages to display when the system blocks web requests:

- About HTTP Response Pages, on page 1113
- Choosing HTTP Response Pages, on page 1114
- Interactive Blocking with HTTP Response Pages, on page 1115

About HTTP Response Pages

As part of access control, you can configure an HTTP response page to display when the system blocks web requests, using either access control rules or the access control policy default action.

You can choose a generic system-provided response page, or you can enter custom HTML. The response page displayed depends on how you block the session:

- Block or Block with reset—A blocked session times out or resets. The Block Response Page overrides the default browser or server page that explains that the connection was denied.

- Interactive Block or Interactive Block with reset—The system can display an Interactive Block Response Page to warn users, but also allow them to click a button (or refresh the page) to load the originally requested site. Users may have to refresh after bypassing the response page to load page elements that did not load.

HTTP response pages do not always appear when the system blocks web traffic; see Limitations to HTTP Response Pages, on page 1113.

Limitations to HTTP Response Pages

HTTP response pages do not always appear when the system blocks web traffic.

Configurations Other Than Access Control Rules

The system displays a response page only for unencrypted or decrypted connections blocked (or interactively blocked) either by access control rules or by the access control policy default action. The system does not display a response page for:

- Tunnels and other connections blocked by a prefilter policy
- Connections blacklisted by Security Intelligence
• Encrypted connections blocked by an SSL policy

Promoted Access Control Rules

The system does not display a response page when web traffic is blocked as a result of a promoted access control rule (an early-placed blocking rule with only simple network conditions).

Before URL Identification

The system does not display a response page when web traffic is blocked before the system identifies the requested URL; see Guidelines and Limitations for URL Filtering, on page 316.

Encrypted Traffic

The system displays a response page for connections decrypted by the SSL policy, then blocked (or interactively blocked) either by access control rules or by the access control policy default action. In these cases, the system encrypts the response page and sends it at the end of the reencrypted SSL stream. However, the system does not display a response page for encrypted connections blocked by access control rules (or any other configuration). Access control rules evaluate encrypted connections if you did not configure an SSL policy, or your SSL policy passes encrypted traffic.

For example, the system cannot decrypt HTTP/2 or SPDY sessions. If web traffic encrypted using one of these protocols reaches access control rule evaluation, the system does not display a response page if the session is blocked.

Choosing HTTP Response Pages

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Reliable display of HTTP response pages depends on your network configuration, traffic loads, and size of the page. Smaller pages are more likely to display successfully.

Procedure

**Step 1**

In the access control policy editor, click the **HTTP Responses** tab.

If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 2**

Choose the **Block Response Page** and **Interactive Block Response Page**:

• System-provided—Displays a generic response. Click the view icon (춰) to view the code for this page.
• Custom—Create a custom response page. A pop-up window appears, prepopulated with system-provided code that you can replace or modify by clicking the edit icon (편집). A counter shows how many characters you have used.
Step 3

Click **Save** to save the policy.

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

---

**Interactive Blocking with HTTP Response Pages**

When you configure interactive blocking, users can load an originally requested site after reading a warning. Users may have to refresh after bypassing the response page to load page elements that did not load.

---

**Tip**

To quickly disable interactive blocking for the whole access control policy, display neither the system-provided page nor a custom page. The system then blocks all connections without interaction.

If a user does not bypass an interactive block, matching traffic is denied without further inspection. If a user bypasses an interactive block, the access control rule allows the traffic, although the traffic may still be subject to deep inspection and blocking.

By default, a user bypass is in effect for 10 minutes (600 seconds) without displaying the warning page on subsequent visits. You can set the duration to as long as a year, or you can force the user to bypass the block every time. This limit applies to every Interactive Block rule in the policy. You cannot set the limit per rule.

Logging options for interactively blocked traffic are identical to those in allowed traffic, but if a user does not bypass the interactive block, the system can log only beginning-of-connection events. When the system initially warns the user, it marks any logged beginning-of-connection event with the **Interactive Block** or **Interactive Block with reset** action. If the user bypasses the block, additional connection events logged for the session have an action of **Allow**.

---

**Configuring Interactive Blocking**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**

As part of access control, configure an access control rule that matches web traffic; see **Creating and Editing Access Control Rules**, on page 1096:

- **Action**—Set the rule action to **Interactive Block** or **Interactive Block with reset**; see **Access Control Rule Interactive Blocking Actions**, on page 1100.

---
• Conditions—Use URL conditions to specify the web traffic to interactively block; see URL Conditions (URL Filtering), on page 311.
• Logging—Assume users will bypass the block and choose logging options accordingly; see Logging for Allowed Connections, on page 2044.
• Inspection—Assume users will bypass the block and choose deep inspection options accordingly; see Access Control Using Intrusion and File Policies, on page 1105.

**Step 2** (Optional) On the access control policy **HTTP Responses** tab, choose a custom interactive-block HTTP response page; see Choosing HTTP Response Pages, on page 1114.

**Step 3** (Optional) On the access control policy **Advanced** tab, change the user bypass timeout; see Setting the User Bypass Timeout for a Blocked Website, on page 1116.

After a user bypasses a block, the system allows the user to browse to that page without warning until the timeout period elapses.

**Step 4** Save the access control policy.

**Step 5** Deploy configuration changes; see Deploy Configuration Changes, on page 279.

### Setting the User Bypass Timeout for a Blocked Website

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Admin/Access/Admin/Network/Network/Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** In the access control policy editor, click the **Advanced** tab.

**Step 2** Click the edit icon (-pencil) next to General Settings.

If a view icon (-eye) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck Inherit from base policy to enable editing.

**Step 3** In the Allow an Interactive Block to bypass blocking for (seconds) field, type the number of seconds that must elapse before the user bypass expires. Specifying zero forces your users to bypass the block every time.

**Step 4** Click OK.

**Step 5** Click Save to save the policy.

**What to do next**

* Deploy configuration changes; see Deploy Configuration Changes, on page 279.
CHAPTER 57

Security Intelligence Blacklisting

The following topics provide an overview of Security Intelligence, including use for blacklisting and whitelisting traffic and basic configuration.

• About Security Intelligence, on page 1117
• Requirements for Security Intelligence, on page 1118
• Guidelines for Security Intelligence, on page 1118
• Configure Security Intelligence, on page 1119
• Troubleshooting Security Intelligence, on page 1122

About Security Intelligence

As an early line of defense against malicious internet content, Security Intelligence uses reputation intelligence to quickly block connections to or from IP addresses, URLs, and domain names. This is called Security Intelligence blacklisting.

Security Intelligence is an early phase of access control, before the system performs more resource-intensive evaluation. Blacklisting improves performance by quickly excluding traffic that does not require inspection.

Note

You cannot blacklist fastpathed traffic. 8000 Series fastpathing and prefILTER evaluation occur before Security Intelligence filtering. Fastpathed traffic bypasses all further evaluation, including Security Intelligence.

Although you can configure custom blacklists, Cisco provides access to regularly updated intelligence feeds. Sites representing security threats such as malware, spam, botnets, and phishing appear and disappear faster than you can update and deploy custom configurations.

You can refine Security Intelligence blacklisting with whitelists and monitor-only blacklists. These mechanisms exempt traffic from being blacklisted, but do not automatically trust or fastpath matching traffic. Traffic whitelisted or monitored at the Security Intelligence stage is intentionally subject to further analysis with the rest of access control.

Related Topics

Security Intelligence Lists and Feeds, on page 370
Configurable Connection Logging, on page 2038
Using Connection and Security Intelligence Event Tables, on page 2071
Requirements for Security Intelligence

If you want to whitelist, blacklist, or monitor specific IP addresses, URLs, or domain names, you must configure custom objects, lists, or feeds. You have the following options:

- To configure network, URL, or DNS feeds, see Creating Security Intelligence Feeds, on page 375.
- To configure network, URL, or DNS lists, see Updating Security Intelligence Lists, on page 377.
- To configure network objects and object groups, see Creating Network Objects, on page 346.
- To configure URL objects and object groups, see Creating URL Objects, on page 352.

Blacklisting, whitelisting, or monitoring traffic based on a DNS list or feed also requires that you:

- Create a DNS policy. See Creating Basic DNS Policies, on page 1127 for more information.
- Configure DNS rules that reference your DNS lists or feeds. See Creating and Editing DNS Rules, on page 1129 for more information.

Because you deploy the DNS policy as part of your access control policy, you must associate both policies. See DNS Policy Deploy, on page 1136 for more information.

Guidelines for Security Intelligence

Security Intelligence strategies include using:

- Cisco-provided feeds—Cisco provides access to regularly updated intelligence feeds. Sites representing security threats such as malware, spam, botnets, and phishing appear and disappear faster than you can update and deploy custom configurations.
- Third-party feeds—Supplement Cisco-provided feeds with third-party reputation feeds, which are dynamic lists that the Firepower Management Center downloads from the internet on a regular basis.
- Global and custom blacklists—Blacklist specific IP addresses, URLs, or domain names. To improve performance, you may want to target enforcement, for example, restricting spam blacklisting to a security zone that handles email traffic.
- Whitelists to eliminate false positives—When a blacklist is too broad in scope, or preemptively blocks traffic that you want to further analyze with the rest of access control, you can override a blacklist with a custom whitelist.
- Monitoring instead of blacklisting—Especially useful in passive deployments and for testing feeds before you implement them; you can merely monitor and log the violating sessions instead of blocking them, generating end-of-connection events.

Note

In passive deployments, to optimize performance, we recommend that you use monitor-only settings. Managed devices that are deployed passively cannot affect traffic flow; there is no advantage to configuring the system to block traffic. Additionally, because blocked connections are not actually blocked in passive deployments, the system may report multiple beginning-of-connection events for each blocked connection.
Example: Whitelisting

If a reputable feed improperly blocks your access to vital resources but is overall useful to your organization, you can whitelist only the improperly classified IP addresses, rather than removing the whole feed from the blacklist.

Example: Security Intelligence by Zone

You can whitelist an improperly classified URL, but then restrict the whitelist object using a security zone used by those in your organization who need to access those URLs. That way, only those with a business need can access the whitelisted URLs. Or, you could use a third-party spam feed to blacklist traffic on an email server security zone.

Example: Monitor-Only Blacklisting

Consider a scenario where you want to test a third-party feed before you implement blocking using that feed. When you set the feed to monitor-only, the system allows connections that would have been blocked to be further analyzed by the system, but also logs a record of each of those connections for your evaluation.

Configure Security Intelligence

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Each access control policy has Security Intelligence options. You can whitelist or blacklist network objects, URL objects and lists, and Security Intelligence feeds and lists, all of which you can constrain by security zone. You can also associate a DNS policy with your access control policy, and whitelist or blacklist domain names.

The number of objects in the whitelists plus the number in the blacklists cannot exceed 255 network objects, or 32767 URL objects and lists.

Note

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.
From the Security Intelligence tab in an access control policy, adding multiple objects to a whitelist or blacklist, or deleting multiple objects, sometimes restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information. Note that whether the Snort process restarts can vary by device, depending on the memory available for inspection.

**Caution**

Before you begin

In passive deployments, or if you want to set Security Intelligence filtering to monitor-only, enable logging; see Logging Connections with Security Intelligence, on page 2047.

**Procedure**

**Step 1**

In the access control policy editor, click the **Security Intelligence** tab.

If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 2**

You have the following options:

- Click the **Networks** tab to add network objects.
- Click the **URLs** tab to add URL objects.

**Step 3**

Find the **Available Objects** you want to add to the whitelist or blacklist. You have the following options:

- Search the available objects by typing in the **Search by name or value** field. Clear the search string by clicking reload (🔍) or clear (✗).

- If no existing list or feed meets your needs, click the add icon (➕), select **New Network List** or **New URL List**, and proceed as described in Creating Security Intelligence Feeds, on page 375 or Uploading New Security Intelligence Lists to the Firepower Management Center, on page 376.

- If no existing object meets your needs, click the add icon (➕), select **New Network Object** or **New URL Object**, and proceed as described in Creating Network Objects, on page 346.

Security Intelligence ignores IP address blocks using a /0 netmask.

**Step 4**

Choose one or more **Available Objects** to add.

**Step 5**

(Optional) Choose an **Available Zone** to constrain the selected objects by zone.

You cannot constrain system-provided Security Intelligence lists by zone.

**Step 6**

Click **Add to Whitelist** or **Add to Blacklist**, or click and drag the selected objects to either list.

To remove an object from a whitelist or blacklist, click its delete icon (🗑) To remove multiple objects, choose the objects and right-click to **Delete Selected**.

**Step 7**

(Optional) Set blacklisted objects to monitor-only by right-clicking the object under **Blacklist**, then choosing **Monitor-only (do not block)**.
You cannot set system-provided Security Intelligence lists to monitor only.

**Step 8**
Choose a DNS policy from the **DNS Policy** drop-down list; see DNS Policy Overview, on page 1125.

**Step 9**
Click **Save**.

---

**What to do next**
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Related Topics**
- Security Intelligence Lists and Feeds, on page 370
- Snort® Restart Scenarios, on page 281

## Security Intelligence Options

Use the Security Intelligence tab in the access control policy editor to configure network (IP address) and URL Security Intelligence, and to associate the access control policy with a DNS policy.

### Object, Zone, and Blacklist Icons

On the Security Intelligence tab of the access control policy editor, each type of object or zone is distinguished with a different icon.

In the blacklist, objects set to block are marked with the block icon (❌) while monitor-only objects are marked with the monitor icon (⚠️). Monitor-only allows the system to handle connections involving blacklisted IP addresses and URLs using access control, but also logs the connection’s match to the blacklist.

Because the whitelist overrides the blacklist, if you add the same object to both lists, the system displays the blacklisted object with a strikethrough.

### Zone Constraints

Except for the system-provided Global lists, you can constrain Security Intelligence filtering by zone. To enforce Security Intelligence filtering for an object on multiple zones, you must add the object to the whitelist or blacklist separately for each zone.

### Logging

Security Intelligence logging, enabled by default, logs all blocked and monitored connections handled by an access control policy’s target devices. However, the system does not log whitelist matches; logging of whitelisted connections depends on their eventual disposition. You must enable logging for blacklisted connections before you can set blacklisted objects to monitor-only.

### Security Intelligence Categories

### Troubleshooting Security Intelligence

#### Troubleshooting Memory Use

**Symptoms:** Connections that should be blacklisted by Security Intelligence are instead evaluated by access control rules. The Security Intelligence health module alerts that it is out of memory.

**Cause:** Memory limitations. Cisco Intelligence Feeds are based on the latest threat intelligence from Cisco Talos Security Intelligence and Research Group (Talos). These feeds tend to get larger as time passes. When a Firepower device receives a feed update, it loads as many entries as it can into the memory it has allocated for Security Intelligence. When a device cannot load all the entries, it may not block traffic as expected. Some connections that should be blacklisted instead continue to be evaluated by access control rules.

**Affected platforms:** Lower-memory devices are most likely to have this issue, especially if you blacklist a lot of Security Intelligence categories or are also filtering URLs based on category and reputation. These devices include Firepower 7010, 7020, and 7030; ASA 5506, 5508, 5516, 5512, 5515, and 5525; NGIPSv.
**Workaround:** If you think this is happening, redeploy configurations to the affected devices. This can allocate more memory to Security Intelligence. If the issue persists, contact Cisco Technical Assistance Center (TAC), who can help you verify the issue and propose a solution appropriate to your deployment.
DNS Policies

The following topics explain DNS policies, DNS rules, and how to deploy DNS policies to managed devices.

- DNS Policy Overview, on page 1125
- DNS Policy Components, on page 1125
- DNS Rules, on page 1129
- DNS Policy Deploy, on page 1136

DNS Policy Overview

DNS-based Security Intelligence allows you to whitelist or blacklist traffic based on the domain name requested by a client. Cisco provides domain name intelligence you can use to filter your traffic; you can also configure custom lists and feeds of domain names tailored to your deployment.

Traffic blacklisted by a DNS policy is immediately blocked and therefore is not subject to any further inspection—not for intrusions, exploits, malware, and so on, but also not for network discovery. You can override blacklisting with whitelisting to force access control rule evaluation, and, recommended in passive deployments, you can use a “monitor-only” setting for Security Intelligence filtering. This allows the system to analyze connections that would have been blacklisted, but also logs the match to the blacklist and generates an end-of-connection Security Intelligence event.

Note

DNS-based Security Intelligence may not work as intended for a domain name unless the DNS server deletes a domain cache entry due to expiration, or a client’s DNS cache or the local DNS server’s cache is cleared or expires.

You configure DNS-based Security Intelligence using a DNS policy and associated DNS rules. To deploy it to your devices, you must associate your DNS policy with an access control policy, then deploy your configuration to managed devices.

DNS Policy Components

A DNS policy allows you to whitelist or blacklist connections based on domain name. The following list describes the configurations you can change after creating a DNS policy.
Name and Description

Each DNS policy must have a unique name. A description is optional.

In a multidomain deployment, policy names must be unique within the domain hierarchy. The system may identify a conflict with the name of a policy you cannot view in your current domain.

Rules

Rules provide a granular method of handling network traffic based on the domain name. Rules in a DNS policy are numbered, starting at 1. The system matches traffic to DNS rules in top-down order by ascending rule number.

When you create a DNS policy, the system populates it with a default Global DNS Whitelist rule and a default Global DNS Blacklist rule. Both rules are fixed to the first position in their respective categories. You cannot modify these rules, but you can disable them.

In a multidomain deployment, the system also adds Descendant DNS Whitelists and Descendant DNS Blacklists rules to DNS policies in ancestor domains. These rules are fixed to the second position in their respective categories.

Note

If multitenancy is enabled for your Firepower Management Center, the system is organized into a hierarchy of domains, including ancestor and descendant domains. These domains are distinct and separate from the domain names used in DNS management.

A descendant list contains the domains whitelisted or blacklisted by Firepower System subdomain users. From an ancestor domain, you cannot view the contents of descendant lists. If you do not want subdomain users to whitelist or blacklist domains:

- disable the descendant list rules, and
- enforce Security Intelligence using the access control policy inheritance settings

The system evaluates rules in the following order:

- Global DNS Whitelist rule (if enabled)
- Descendant DNS Whitelists rule (if enabled)
- Whitelist rules
- Global DNS Blacklist rule (if enabled)
- Descendant DNS Blacklists rule (if enabled)
- Blacklist and Monitor rules

Usually, the system handles DN-based network traffic according to the first DNS rule where all the rule’s conditions match the traffic. If no DNS rules match the traffic, the system continues evaluating the traffic based on the associated access control policy's rules. DNS rule conditions can be simple or complex.
Creating Basic DNS Policies

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network/</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose Policies > Access Control > DNS.
**Step 2** Click Add DNS Policy.
**Step 3** Give the policy a unique Name and, optionally, a Description.
**Step 4** Click Save.

**What to do next**

- Optionally, further configure the new policy as described in Logging Connections with Security Intelligence, on page 2047.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Editing DNS Policies

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network/</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Only one person should edit a DNS policy at a time, using a single browser window. If multiple users attempt to save the same policy, only the first set of saved changes are retained.

To protect the privacy of your session, after thirty minutes of inactivity on the policy editor, a warning appears. After sixty minutes, the system discards your changes.

**Procedure**

**Step 1** Choose Policies > Access Control > DNS.
**Step 2** Click the edit icon (📝) next to the DNS policy you want to edit.

If a view icon (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Edit your DNS policy:
• Name and Description—To change the name or description, click the field and type the new information.
• Rules—To add, categorize, enable, disable, or otherwise manage DNS rules, click the Rules tab and proceed as described in Creating and Editing DNS Rules, on page 1129.

Step 4 Click Save.

What to do next
• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Managing DNS Policies

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

Use the DNS Policy page (Policies > Access Control > DNS) to manage custom DNS policies. In addition to custom policies that you create, the system provides the Default DNS Policy, which uses the default blacklist and whitelist. You can edit and use this system-provided custom policy. In a multidomain deployment, this default policy uses the default Global DNS Blacklist, Global DNS Whitelist, Descendant DNS Blacklists, and Descendant DNS Whitelists, and can only be edited in the Global domain.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Procedure

Step 1 Choose Policies > Access Control > DNS.
Step 2 Manage your DNS policy:

• Compare—To compare DNS policies, click Compare Policies and proceed as described in Comparing Policies, on page 287.
• Copy—To copy a DNS policy, click the copy icon ( ) and proceed as described in Editing DNS Policies, on page 1127.
• Create—To create a new DNS policy, click Add DNS Policy and proceed as described in Creating Basic DNS Policies, on page 1127.
• Delete—To delete a DNS policy, click the delete icon ( ), then confirm you want to delete the policy.
• Edit—To modify an existing DNS policy, click the edit icon ( ) and proceed as described in Editing DNS Policies, on page 1127.
DNS Rules

DNS rules handle traffic based on the domain name requested by a host. As part of Security Intelligence, this evaluation happens after any traffic decryption, and before access control evaluation.

The system matches traffic to DNS rules in the order you specify. In most cases, the system handles network traffic according to the first DNS rule where all the rule’s conditions match the traffic. When you create DNS rules, the system places whitelist rules before monitor and blacklist rules, and evaluates traffic against whitelist rules first.

In addition to its unique name, each DNS rule has the following basic components:

**State**

By default, rules are enabled. If you disable a rule, the system does not use it to evaluate network traffic, and stops generating warnings and errors for that rule.

**Position**

Rules in a DNS policy are numbered, starting at 1. The system matches traffic to rules in top-down order by ascending rule number. With the exception of Monitor rules, the first rule that traffic matches is the rule that handles that traffic.

**Conditions**

Conditions specify the specific traffic the rule handles. A DNS rule must contain a DNS feed or list condition, and can also match traffic by security zone, network, or VLAN.

**Action**

A rule’s action determines how the system handles matching traffic:

- Whitelisted traffic is allowed, subject to further access control inspection.
- Monitored traffic is subject to further evaluation by remaining DNS blacklist rules. If the traffic does not match a DNS blacklist rule, it is inspected with access control rules. The system logs a Security Intelligence event for the traffic.
- Blacklisted traffic is dropped without further inspection. You can also return a Domain Not Found response, or redirect the DNS query to a sinkhole server.

</tr>
</tbody>
</table>

*Firepower Management Center Configuration Guide, Version 6.1*
In a DNS policy, you can add up to a total of 32767 DNS lists to the whitelist and blacklist rules; that is, the number of lists in the DNS policy cannot exceed 32767.

Procedure

**Step 1**
In the DNS policy editor, you have the following options:
- To add a new rule, click **Add DNS Rule**.
- To edit an existing rule, click the edit icon (✍).

**Step 2**
Enter a **Name**.

**Step 3**
Configure the rule components, or accept the defaults:
- **Action**—Choose a rule **Action**; see DNS Rule Actions, on page 1131.
- **Conditions**—Configure the rule’s conditions; see DNS Rule Conditions, on page 1133.
- **Enabled**—Specify whether the rule is **Enabled**.

**Step 4**
Click **Save**.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

DNS Rule Management

The **Rules** tab of the DNS policy editor allows you to add, edit, move, enable, disable, delete, and otherwise manage DNS rules within your policy.

For each rule, the policy editor displays its name, a summary of its conditions, and the rule action. Other icons represent warnings (⚠️), errors (خطأ), and other important information (ℹ️). Disabled rules are dimmed and marked (disabled) beneath the rule name.

Enabling and Disabling DNS Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

When you create a DNS rule, it is enabled by default. If you disable a rule, the system does not use it to evaluate network traffic and stops generating warnings and errors for that rule. When viewing the list of rules in a DNS policy, disabled rules are dimmed, although you can still modify them. Note that you can also enable or disable a DNS rule using the DNS rule editor.
Procedure

**Step 1**  
In the DNS policy editor, right-click the rule and choose a rule state.

**Step 2**  
Click **Save**.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

DNS Rule Order Evaluation

Rules in a DNS policy are numbered, starting at 1. The system matches traffic to DNS rules in top-down order by ascending rule number. In most cases, the system handles network traffic according to the first DNS rule where all the rule’s conditions match the traffic:

- For Monitor rules, the system logs the traffic, then continues evaluating traffic against lower-priority DNS blacklist rules.

- For non-Monitor rules, the system does **not** continue to evaluate traffic against additional, lower-priority DNS rules after that traffic matches a rule.

Note the following regarding rule order:

- The Global Whitelist is always first, and takes precedence over all other rules.

- The Descendant DNS Whitelists rule only appears in multidomain deployments, in non-leaf domains. It is always second, and takes precedence over all other rules except the Global Whitelist.

- The Whitelist section precedes the Blacklist section; whitelist rules always take precedence over other rules.

- The Global Blacklist is always first in the Blacklist section, and takes precedence over all other Monitor and blacklist rules.

- The Descendant DNS Blacklists rule only appears in multidomain deployments, in non-leaf domains. It is always second in the Blacklist section, and takes precedence over all other Monitor and blacklist rules except the Global Blacklist.

- The Blacklist section contains Monitor and blacklist rules.

- When you first create a DNS rule, the system positions it last in the Whitelist section if you assign a **Whitelist** action, or last in the Blacklist section if you assign any other action.

You can drag and drop rules to reorder them.

DNS Rule Actions

Every DNS rule has an **action** that determines the following for matching traffic:

- handling—foremost, the rule action governs whether the system will whitelist, monitor, or blacklist traffic that matches the rule’s conditions
• logging—the rule action determines when and how you can log details about matching traffic

Keep in mind that only devices deployed inline can blacklist traffic. Devices deployed passively or in tap mode can whitelist and log, but not affect, traffic.

**Whitelist Action**

The **Whitelist** action allows matching traffic to pass. When you whitelist traffic, it is subject to further inspection either by a matching access control rule, or the access control policy’s default action.

The system does not log whitelist matches. However, logging of whitelisted connections depends on their eventual disposition.

**Monitor Action**

The **Monitor** action does not affect traffic flow; matching traffic is neither immediately whitelisted nor blacklisted. Rather, traffic is matched against additional rules to determine whether to permit or deny it. The first non-Monitor DNS rule matched determines whether the system blacklists the traffic. If there are no additional matching rules, the traffic is subject to access control evaluation.

For connections monitored by a DNS policy, the system logs end-of-connection Security Intelligence and connection events to the Firepower Management Center database.

**Blacklist Actions**

The blacklist actions blacklist traffic without further inspection of any kind:

- The **Drop** action drops the traffic.
- The **Domain Not Found** action returns a non-existent internet domain response to the DNS query, which prevents the client from resolving the DNS request.
- The **Sinkhole** action returns a sinkhole object's IPv4 or IPv6 address in response to the DNS query. The sinkhole server can log, or log and block, follow-on connections to the IP address. If you configure a Sinkhole action, you must also configure a sinkhole object.

For a connection blacklisted based on the **Drop** or **Domain Not Found** actions, the system logs beginning-of-connection Security Intelligence and connection events. Because blacklisted traffic is immediately denied without further inspection, there is no unique end of connection to log.

For a connection blacklisted based on the **Sinkhole** action, logging depends on the sinkhole object configuration. If you configure your sinkhole object to only log sinkhole connections, the system logs end-of-connection connection events for the follow-on connection. If you configure your sinkhole object to log and block sinkhole connections, the system logs beginning-of-connection connection events for the follow-on connection, then blocks that connection.

**Note**

On an ASA FirePOWER device, if you configure a DNS rule with a sinkhole action, and traffic matches the rule, the ASA blocks the follow-on sinkhole connection by default. As a workaround, run the following commands from the ASA command line:

```
asa(config)# policy-map global_policy
asa(config-pmap)# class inspection_default
asa(config-pmap-c)# no inspect dns preset_dns_map
```

If the ASA continues to block the connection, contact Support.
DNS Rule Conditions

A DNS rule’s conditions identify the type of traffic that rule handles. Conditions can be simple or complex. You must define a DNS feed or list condition within a DNS rule. You can also optionally control traffic by security zone, network, or VLAN.

When adding conditions to a DNS rule:

• If you do not configure a particular condition for a rule, the system does not match traffic based on that criterion.

• You can configure multiple conditions per rule. Traffic must match all the conditions in the rule for the rule to apply to traffic. For example, a rule with a DNS feed or list condition and network condition but no VLAN tag condition evaluates traffic based on the domain name and source or destination, regardless of any VLAN tagging in the session.

• For each condition in a rule, you can add up to 50 criteria. Traffic that matches any of a condition’s criteria satisfies the condition. For example, you can use a single rule to blacklist traffic based on up to 50 DNS lists and feeds.

Controlling Traffic Based on DNS and Security Zone

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Zone conditions in DNS rules allow you to control traffic by its source and destination security zones. A security zone is a grouping of one or more interfaces, which may be located across multiple devices. An option you choose during a device’s initial setup, called its detection mode, determines how the system initially configures the device’s interfaces, and whether those interfaces belong to a security zone.

Procedure

Step 1  In the DNS rule editor, click the Zones tab.
Step 2  Find and select the zones you want to add from the Available Zones. To search for zones to add, click the Search by name prompt above the Available Zones list, then type a zone name. The list updates as you type to display matching zones.
Step 3  Click to select a zone, or right-click and then select Select All.
Step 4  Click Add to Source, or drag and drop.
Step 5  Save or continue editing the rule.
What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

## Controlling Traffic Based on DNS and Network

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

Network conditions in DNS rules allow you to control traffic by its source IP address. You can explicitly specify the source IP addresses for the traffic you want to control.

### Procedure

**Step 1** In the DNS rule editor, click the Networks tab.

**Step 2** Find and select the networks you want to add from the Available Networks, as follows:

- To add a network object on the fly, which you can then add to the condition, click the add icon (+) above the Available Networks list and proceed as described in Creating Network Objects, on page 346.

- To search for network objects to add, click the Search by name or value prompt above the Available Networks list, then type an object name or the value of one of the object’s components. The list updates as you type to display matching objects.

**Step 3** Click Add to Source, or drag and drop.

**Step 4** Add any source IP addresses or address blocks that you want to specify manually. Click the Enter an IP address prompt below the Source Networks list; then type an IP address or address block and click Add.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

**Step 5** Save or continue editing the rule.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

## Controlling Traffic Based on DNS and VLAN

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>
VLAN conditions in DNS rules allow you to control VLAN-tagged traffic. The system uses the innermost VLAN tag to identify a packet by VLAN.

When you build a VLAN-based DNS rule condition, you can manually specify VLAN tags. Alternately, you can configure VLAN conditions with VLAN tag objects, which are reusable and associate a name with one or more VLAN tags.

**Procedure**

**Step 1**
In the DNS rule editor, select the **VLAN Tags** tab.

**Step 2**
Find and select the VLANs you want to add from the **Available VLAN Tags**, as follows:

- To add a VLAN tag object on the fly, which you can then add to the condition, click the add icon (➕) above the Available VLAN Tags list and proceed as described in Creating VLAN Tag Objects, on page 350.

- To search for VLAN tag objects and groups to add, click the **Search by name or value** prompt above the **Available VLAN Tags** list, then type either the name of the object, or the value of a VLAN tag in the object. The list updates as you type to display matching objects.

**Step 3**
Click **Add to Rule**, or drag and drop.

**Step 4**
Add any VLAN tags that you want to specify manually. Click the **Enter a VLAN Tag** prompt below the **Selected VLAN Tags** list; then type a VLAN tag or range and click **Add**. You can specify any VLAN tag from 1 to 4094; use a hyphen to specify a range of VLAN tags.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal VLAN tags to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

**Step 5**
Save or continue editing the rule.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Controlling Traffic Based on DNS List, Feed, or Category**

<table>
<thead>
<tr>
<th>Smart License</th>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

DNS conditions in DNS rules allow you to control traffic if a DNS list, feed, or category contains the domain name requested by the client. You must define a DNS condition in a DNS rule.

Regardless of whether you add a global or custom whitelist or blacklist to a DNS condition, the system applies the configured rule action to the traffic. For example, if you add the Global Whitelist to a rule, and configure a **Drop** action, the system blacklists all traffic that should have been whitelisted.
Procedure

**Step 1**  In the DNS rule editor, click the **DNS** tab.

**Step 2**  Find and select the DNS lists and feeds you want to add from the **DNS Lists and Feeds**, as follows:

- To add a DNS list or feed on the fly, which you can then add to the condition, click the add icon (throat) above the **DNS Lists and Feeds** list and proceed as described in **Creating Security Intelligence Feeds**, on page 375.

- To search for DNS lists, feeds, or categories to add, click the **Search by name or value** prompt above the **DNS Lists and Feeds** list, then type an object name or the value of one of the object’s components. The list updates as you type to display matching objects.

**Step 3**  Click **Add to Rule**, or drag and drop.

**Step 4**  Save or continue editing the rule.

What to do next

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

**DNS Policy Deploy**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
</tr>
</tbody>
</table>

After you finish updating your DNS policy configuration, you must deploy it as part of access control configuration.

- Associate your DNS policy with an access control policy, as described in **Configure Security Intelligence**, on page 1119.

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.
Prefiltering and Prefilter Policies

The following topics describe how to configure prefiltering:

- Introduction to Prefiltering, on page 1137
- Prefiltering vs Access Control, on page 1138
- About Prefilter Policies, on page 1140
- Configuring Prefiltering, on page 1141
- Tunnel Zones and Prefiltering, on page 1145

Introduction toPrefiltering

Prefiltering is the first phase of access control, before the system performs more resource-intensive evaluation. Prefilter policies deployed to managed devices use limited outer-header criteria to quickly handle traffic.

Contrasted with the rest of access control, which uses inner headers and has more robust inspection capabilities, prefiltering is simple, fast, and early.

Configure prefiltering if you want to:

- Improve performance— The sooner you exclude traffic that does not require inspection, the better. You can fastpath or block certain types of plaintext, passthrough tunnels based on their outer encapsulation headers, without inspecting their encapsulated connections. You can also fastpath or block any other connections that benefit from early handling.

- Tailor deep inspection to encapsulated traffic—You can rezone certain types of tunnels, so that you can later handle their encapsulated connections using the same inspection criteria. Rezoning is necessary because after prefiltering, access control uses inner headers.

For details, see Prefiltering vs Access Control, on page 1138.

Prefiltering Model Restrictions

In the Firepower System, prefiltering is supported on Firepower Threat Defense devices only.

Prefilter policies deployed to Classic devices (7000 and 8000 Series, NGIPSv, ASA FirePOWER) have no effect. Instead, use early-placed Trust and Block access control rules to approximate prefilter functionality, keeping in mind the differences between the two features.

Also:
• 8000 Series devices—Device-specific fastpath rules can bypass access control (but cannot block traffic); see Configuring Fastpath Rules (8000 Series), on page 453.

• Classic devices—All Classic devices can match entire GRE-encapsulated tunnels using access control rules, with some limitations; see Port and ICMP Code Conditions, on page 304.

Prefiltering vs Access Control

Prefilter and access control policies both allow you to block and trust traffic, though the prefiltering "trust" functionality is called "fastpathing" because it skips more inspection. The following table explains this and other differences between prefiltering and access control, to help you decide whether to configure custom prefiltering.

If you do not configure custom prefiltering, you can only approximate—not replicate—prefilter functionality with early-placed Block and Trust rules in the access control policy.

| Bypass capability              | Fastpath rule action. Fastpathing traffic in the prefilter stage bypasses all further inspection and handling, including:  
  - Security Intelligence  
  - authentication requirements imposed by an identity policy  
  - SSL decryption  
  - access control rules  
  - deep inspection of packet payloads  
  - discovery  
  - rate limiting | Trust rule action. Traffic trusted by access control rules is only exempt from deep inspection and discovery. | Introduction to Access Control Rules, on page 1091                               |
| Rule criteria                  | Limited. Rules in the prefilter policy use simple network criteria: IP address, VLAN tag, port, and protocol.  
  For tunnels, tunnel endpoint conditions specify the IP address of the routed interfaces of the network devices on either side of the tunnel. | Robust. Access control rules use network criteria, but also user, application, requested URL, and other contextual information available in packet payloads.  
  Network conditions specify the IP address of source and destination hosts. | Tunnel vs Prefilter Rules, on page 1142  
  Rule Condition Types, on page 294                                      |
| IP headers used (tunnel handling) | Outermost. Using outer headers allows you to handle entire plaintext, passthrough tunnels.  
  For nonencapsulated traffic, prefiltering still uses "outer" headers—which in this case are the only headers. | Innermost possible. For a nonencrypted tunnel, access control acts on its individual encapsulated connections, not the tunnel as a whole. | Passthrough Tunnels and Access Control, on page 1140 |
| Rezone encapsulated connections for further analysis | Rezones tunneled traffic. Tunnel zones allow you to tailor subsequent inspection to prefiltered, encapsulated traffic. | Uses tunnel zones. Access control uses the tunnel zones you assign during prefiltering. | Tunnel Zones and Prefiltering, on page 1145 |
| Connection logging            | Fastpathed and blocked traffic only. Allowed connections may still be logged by other configurations. | Any connection. | Configurable Connection Logging, on page 2038 |
Passthrough Tunnels and Access Control

Plaintext (nonencrypted) tunnels can encapsulate multiple connections, often flowing between discontinuous networks. These tunnels are especially useful for routing custom protocols over IP networks, IPv6 traffic over IPv4 networks, and so on.

An outer encapsulation header specifies the source and destination IP addresses of the tunnel endpoints—the routed interfaces of the network devices on either side of the tunnel. Inner payload headers specify the source and destination IP addresses of the encapsulated connections' actual endpoints.

Often, network security devices handle plaintext tunnels as passthrough traffic. That is, the device is not one of the tunnel endpoints. Instead, it is deployed between the tunnel endpoints and monitors the traffic flowing between them.

Some network security devices, such as Cisco ASA firewalls running Cisco ASA Software (rather than Firepower Threat Defense), enforce security policies using outer IP headers. Even for plaintext tunnels, these devices have no control over or insight into individual encapsulated connections and their payloads.

By contrast, the Firepower System leverages access control as follows:

- Outer header evaluation—First, prefiltering uses outer headers to handle traffic. You can block or fastpath entire plaintext, passthrough tunnels at this stage.
- Inner header evaluation—Next, the rest of access control (and other features such as QoS) use the innermost detectable level of headers to ensure the most granular level of inspection and handling possible.

If a passthrough tunnel is not encrypted, the system acts on its individual encapsulated connections at this stage. You must rezone a tunnel (see Tunnel Zones and Prefiltering, on page 1145) to act on all its encapsulated connections.

Access control has no insight into encrypted passthrough tunnels. For example, access control rules see a passthrough VPN tunnel as one connection. The system handles the entire tunnel using only the information in its outer, encapsulation header.

About Prefilter Policies

Prefiltering is a policy-based feature. In the Firepower System, an access control policy is a master configuration that invokes subpolicies and other configurations, including a prefilter policy.

Policy Components: Rules and Default Action

In a prefilter policy, tunnel rules, prefilter rules, and a default action handle network traffic:

- Tunnel and prefilter rules—First, rules in a prefilter policy handle traffic in the order you specify. Tunnel rules match specific tunnels only and support rezoning. Prefilter rules have a wider range of constraints and do not support rezoning. For more information, see Tunnel vs Prefilter Rules, on page 1142.
• Default action (tunnels only)—If a tunnel does not match any rules, the default action handles it. The default action can block these tunnels, or continue access control on their individual encapsulated connections. You cannot rezone tunnels with the default action.

    There is no default action for nonencapsulated traffic. If a nonencapsulated connection does not match any prefilter rules, the system continues with access control.

**Connection Logging**

You can log connections fastpathed and blocked by the prefilter policy; see [Configurable Connection Logging](#), on page 2038.

Connection events contain information on whether and how logged connections—including entire tunnels—were prefiltered. You can view this information in event views (workflows), dashboards, and reports, and use it as correlation criteria. Keep in mind that because fastpathed and blocked connections are not subject to deep inspection, associated connection events contain limited information.

**Default Prefilter Policy**

Every access control policy has an associated prefilter policy.

The system uses a default policy if you do not configure custom prefiltering. Initially, this system-provided policy passes all traffic to the next phase of access control. You can change the policy's default action and configure its logging options, but you cannot add rules to it or delete it.

**Prefilter Policy Inheritance and Multitenancy**

Access control uses a hierarchical implementation that complements multitenancy. Along with other advanced settings, you can lock a prefilter policy association, enforcing that association in all descendant access control policies. For more information, see [Access Control Policy Inheritance](#), on page 1077.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain. The default prefilter policy belongs to the Global domain.

---

**Configuring Prefiltering**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

To perform custom prefiltering, configure and deploy prefilter policies to managed devices, as a part of access control.

Only one person should edit a policy at a time, using a single browser window. If multiple users save the same policy, the last saved changes are retained. For your convenience, the system displays information on who (if anyone) is currently editing each policy. To protect the privacy of your session, a warning appears after 30 minutes of inactivity on the policy editor. After 60 minutes, the system discards your changes.
Procedure

**Step 1** Choose **Policies > Access Control > Prefilter**.

**Step 2** Click **New Policy** to create a custom prefilter policy.

A new prefilter policy has no rules and a default action of Analyze all tunnel traffic. It performs no logging or tunnel rezoning. You can also copy (-olds) or edit (olds) an existing policy.

**Step 3** Configure the prefilter policy's default action and its logging options.

- Default action—Choose a default action for supported plaintext, passthrough tunnels: **Analyze all tunnel traffic** (with access control) or **Block all tunnel traffic**.
- Default action logging—Click the logging icon (olds) next to the default action; see **Logging Connections with a Policy Default Action**, on page 2048. You can configure default action logging for blocked tunnels only.

**Step 4** Configure tunnel and prefilter rules.

In a custom prefilter policy, you can use both kinds of rule, in any order. Create rules depending on the specific type of traffic you want to match and the actions or further analysis you want to perform; see **Tunnel vs Prefilter Rules**, on page 1142.

**Caution** Exercise caution when using tunnel rules to assign tunnel zones. Connections in rezoned tunnels may not match security zone constraints in later evaluation. For more information, see **Tunnel Zones and Prefiltering**, on page 1145.

For detailed information on configuring rule components, see **Tunnel and Prefilter Rule Components**, on page 1143 and **Rule Management: Common Characteristics**, on page 293.

**Step 5** Evaluate rule order. To move a rule, click and drag or use the right-click menu to cut and paste.

Properly creating and ordering rules is a complex task, but one that is essential to building an effective deployment. If you do not plan carefully, rules can preempt other rules or contain invalid configurations. For more information, see **Rule Performance Guidelines**, on page 327.

**Step 6** Save the prefilter policy.

**Step 7** For configurations that support tunnel zone constraints, appropriately handle rezoned tunnels.

Match connections in rezoned tunnels by using tunnel zones as source zone constraints; see **Configuring Interface Conditions**, on page 299.

**Step 8** Associate the prefilter policy with the access control policy deployed to your managed devices.

See **Associating Other Policies with Access Control**, on page 1088.

**Step 9** Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

---

**Tunnel vs Prefilter Rules**

Whether you configure a tunnel or prefilter rule depends on the specific type of traffic you want to match and the actions or further analysis you want to perform.
<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Tunnel Rules</th>
<th>Prefilter Rules</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary function</td>
<td>Quickly fastpath, block, or rezone plaintext, passthrough tunnels.</td>
<td>Quickly fastpath or block any other connection that benefits from early handling.</td>
</tr>
<tr>
<td>Encapsulation and port/protocol criteria</td>
<td>Encapsulation conditions match only plaintext tunnels over selected protocols, listed in Encapsulation Conditions, on page 306.</td>

</table>

### Tunnel and Prefilter Rule Components

**State (Enabled/Disabled)**

By default, rules are enabled. If you disable a rule, the system does not use it and stops generating warnings and errors for that rule.

**Position**

Rules are numbered, starting at 1. The system matches traffic to rules in top-down order by ascending rule number. The first rule that traffic matches is the rule that handles that traffic, regardless of rule type (tunnel vs prefilter).

**Action**

A rule's action determines how the system handles and logs matching traffic:

- **Fastpath**—Exempts matching traffic from all further inspection and control, including access control, identity requirements, and rate limiting. Fastpathing a tunnel fastpaths all encapsulated connections.

- **Block**—Blocks matching traffic without further inspection of any kind. Blocking a tunnel blocks all encapsulated connections.

- **Analyze**—Allows traffic to continue to be analyzed by the rest of access control, using inner headers. If passed by access control and any related deep inspection, this traffic may also be rate limited. For tunnel rules, enables rezoning with the Assign Tunnel Zone option.
Direction (Tunnel Rules Only)
A tunnel rule's direction determines how the system source and destination criteria:

- Match tunnels only from source (unidirectional)—Match source-to-destination traffic only. Matching traffic must originate from one of the specified source interfaces or tunnel endpoints, and leave through one of the destination interfaces or tunnel endpoints.

- Match tunnels from source and destination (bidirectional)—Match both source-to-destination traffic and destination-to-source traffic. The effect is identical to writing two unidirectional rules, one the mirror of the other.

Prefilter rules are always unidirectional.

Assign Tunnel Zone (Tunnel Rules Only)
In a tunnel rule, assigning a tunnel zone (whether existing or created on the fly), rezones matching tunnels. Rezoning requires the Analyze action.

Rezoning a tunnel allows other configurations—such as access control rules—to recognize all the tunnel's encapsulated connections as belonging together. By using a tunnel's assigned tunnel zone as an interface constraint, you can tailor inspection to its encapsulated connections. For more information, see Tunnel Zones and Prefiltering, on page 1145.

Caution
Exercise caution when assigning tunnel zones. Connections in rezoned tunnels may not match security zone constraints in later evaluation. See Using Tunnel Zones, on page 1145 for a brief walkthrough of a tunnel zone implementation, and a discussion of the implications of rezoning without explicitly handling rezoned traffic.

Conditions
Conditions specify the specific traffic the rule handles. Traffic must match all a rule's conditions to match the rule. Each condition type has its own tab in the rule editor.

You can prefILTER traffic using the following outer-header constraints:

- Interface—Interface Conditions, on page 297
- Network—Tunnel Endpoint Conditions, on page 302 or Network Conditions, on page 299
- Port—Encapsulation Conditions, on page 306 or Port and ICMP Code Conditions, on page 304
- VLAN—VLAN Conditions, on page 303

You must constrain tunnel rules by encapsulation protocol.

Logging
A rule's logging settings govern the records the system keeps of the traffic it handles.

In tunnel and prefILTER rules, you can log fastpathed and blocked traffic (the Fastpath and Block actions). For traffic subject to further analysis (the Analyze action), logging in the prefILTER policy is disabled, although matching connections may still be logged by other configurations. For more information, see Logging Connections with Tunnel and Prefilter Rules, on page 2045.
Comments

Each time you save changes to a rule you can add comments. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change.

You cannot edit or delete these comments after you save the rule.

Related Topics

Rule Performance Guidelines, on page 327

Tunnel Zones and Prefiltering

Tunnel zones allow you to use prefiltering to tailor subsequent traffic handling to encapsulated connections.

A special mechanism is required because usually, the system handles traffic using the innermost detectable level of headers. This ensures the most granular level of inspection possible. But it also means that if a passthrough tunnel is not encrypted, the system acts on its individual encapsulated connections; see Passthrough Tunnels and Access Control, on page 1140.

Tunnel zones solve this problem. During the first phase of access control (prefiltering) you can use outer headers to identify certain types of plaintext, pasthrough tunnels. Then, you can rezone those tunnels by assigning a custom tunnel zone.

Rezoning a tunnel allows other configurations—such as access control rules—to recognize all the tunnel's encapsulated connections as belonging together. By using a tunnel's assigned tunnel zone as an interface constraint, you can tailor inspection to its encapsulated connections.

Despite its name, a tunnel zone is not a security zone. A tunnel zone does not represent a set of interfaces. It is more accurate to think of a tunnel zone as a tag that, in some cases, replaces the security zone associated with an encapsulated connection.

Caution

For configurations that support tunnel zone constraints, connections in rezoned tunnels do not match security zone constraints. For example, after you rezone a tunnel, access control rules can match its encapsulated connections with their newly assigned tunnel zone, but not with any original security zone.

See Using Tunnel Zones, on page 1145 for a brief walkthrough of a tunnel zone implementation, and a discussion of the implications of rezoning without explicitly handling rezoned traffic.

Configurations Supporting Tunnel Zone Constraints

Only access control rules support tunnel zone constraints.

No other configurations support tunnel zone constraints. For example, you cannot use QoS to rate limit a plaintext tunnel as a whole; you can only rate limit its individual encapsulated sessions.

Using Tunnel Zones

<table>

</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>
This example procedure summarizes how you might rezone GRE tunnels for further analysis, using tunnel zones. You can adapt the concepts described in this example to other scenarios where you need to tailor traffic inspection to connections encapsulated in plaintext, passthrough tunnels.

Consider a Firepower System deployment where your organization's internal traffic flows through the Trusted security zone. The Trusted security zone represents a set of sensing interfaces across multiple managed devices deployed in various locations. Your organization's security policy requires that you allow internal traffic after deep inspection for exploits and malware.

Internal traffic sometimes includes plaintext, passthrough, GRE tunnels between particular endpoints. Because the traffic profile of this encapsulated traffic is different from your "normal" interoffice activity—perhaps it is known and benign—you can limit inspection of certain encapsulated connections while still complying with your security policy.

In this example, after you deploy configuration changes:

- Plaintext, passthrough, GRE-encapsulated tunnels detected in the Trusted zone have their individual encapsulated connections evaluated by one set of intrusion and file policies.
- All other traffic in the Trusted zone is evaluated with a different set of intrusion and file policies.

You accomplish this task by rezoning GRE tunnels. Rezoning ensures that access control associates GRE-encapsulated connections with a custom tunnel zone, rather than their original Trusted security zone.

Rezoning is required due to the way the Firepower System and access control handle encapsulated traffic; see Passthrough Tunnels and Access Control, on page 1140 and Tunnel Zones and Prefiltering, on page 1145.

**Procedure**

---

**Step 1** Configure custom intrusion and file policies that tailor deep inspection to encapsulated traffic, and another set of intrusion and file policies tailored to nonencapsulated traffic.

**Step 2** Configure custom prefiltering to rezone GRE tunnels flowing through the Trusted security zone.

Create a custom prefilter policy and associate it with access control. In that custom prefilter policy, create a tunnel rule (in this example, `GRE_tunnel_rezone`) and a corresponding tunnel zone (`GRE_tunnel`). For more information, see Configuring Prefiltering, on page 1141.

---

<table>
<thead>
<tr>
<th>Table 84: GRE_tunnel_rezone Tunnel Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule Component</td>
</tr>
<tr>
<td>Interface object condition</td>
</tr>
<tr>
<td>Tunnel endpoint condition</td>
</tr>
<tr>
<td>Encapsulation condition</td>
</tr>
<tr>
<td>Assign Tunnel Zone</td>
</tr>
</tbody>
</table>
Step 3
Configure access control to handle connections in rezoned tunnels.

In the access control policy deployed to your managed devices, configure a rule (in this example, `GRE_inspection`) that handles the traffic you rezoned. For more information, see Creating and Editing Access Control Rules, on page 1096.

**Table 85: GRE_inspection Access Control Rule**

<table>
<thead>
<tr>
<th>Rule Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security zone condition</td>
<td>Match rezoned tunnels by using the GRE_tunnel security zone as a Source Zone constraint; see Interface Conditions, on page 297.</td>
</tr>
<tr>
<td>Action</td>
<td>Allow, with deep inspection enabled. Choose the file and intrusion policies tailored to inspect encapsulated internal traffic.</td>
</tr>
</tbody>
</table>

**Caution**
If you skip this step, the rezoned connections may match any access control rule not constrained by security zone. If the rezoned connections do not match any access control rules, they are handled by the access control policy default action. Make sure this is your intent.

Step 4
Configure access control to handle nonencapsulated connections flowing through the Trusted security zone.

In the same access control policy, configure a rule (in this example, `internal_default_inspection`) that handles non-rezoned traffic in the Trusted security zone.

**Table 86: internal_default_inspection Access Control Rule**

<table>
<thead>
<tr>
<th>Rule Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security zone condition</td>
<td>Match non-rezoned internal-only traffic by using the Trusted security zone as both a Source Zone and Destination Zone constraint.</td>
</tr>
<tr>
<td>Action</td>
<td>Allow, with deep inspection enabled. Choose the file and intrusion policies tailored to inspect nonencapsulated internal traffic.</td>
</tr>
</tbody>
</table>

Step 5
Evaluate the position of the new access control rules relative to preexisting rules. Change rule order if necessary. If you place the two new access control rules next to each other, it does not matter which you place first. Because you rezoned GRE tunnels, the two rules cannot preempt each other.

Step 6
Save all changed configurations.

**What to do next**
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Procedure**

**Step 1**  Choose **Objects > Object Management**.
**Step 2**  Chose **Tunnel Zone** from the list of object types.
**Step 3**  Click **Add Tunnel Zone**.
**Step 4**  Enter a **Name** and, optionally, a **Description**.
**Step 5**  Click **Save**.

**What to do next**

- Assign tunnel zones to plaintext, passthrough tunnels as part of custom prefiltering; see Configuring Prefiltering, on page 1141.
The following topics describe how to configure access control polices to use Intelligent Application Bypass (IAB)

- Introduction to IAB, on page 1149
- IAB Options, on page 1150
- Configuring IAB, on page 1152
- IAB Logging and Analysis, on page 1153

**Introduction to IAB**

IAB identifies applications that you trust to traverse your network without further inspection if performance and flow thresholds are exceeded. For example, if a nightly backup significantly impacts system performance, you can configure thresholds that, if exceeded, trust traffic generated by your backup application. Optionally, you can configure IAB so that, when an inspection performance threshold is exceeded, IAB trusts all traffic that exceeds any flow bypass threshold, regardless of the application type. This option requires Version 6.1.0.3 or a subsequent 6.1.0.x patch.

The system implements IAB on traffic allowed by access control rules or the access control policy's default action, before the traffic is subject to deep inspection. A test mode allows you to determine whether thresholds are exceeded and, if so, to identify the application flows that would have been bypassed if you had actually enabled IAB (called bypass mode).

The following graphic illustrates the IAB decision-making process:
IAB Options

State
Enables or disables IAB.

Performance Sample Interval
Specifies the time in seconds between IAB performance sampling scans, during which the system collects system performance metrics for comparison to IAB performance thresholds. A value of 0 disables IAB.

Bypassable Applications and Filters
This feature provides two mutually exclusive options:
Applications/Filters
Provides an editor where you can specify bypassable applications and sets of applications (filters). See Application Conditions (Application Control), on page 306.

All applications including unidentified applications
When an inspection performance threshold is exceeded, trusts all traffic that exceeds any flow bypass threshold, regardless of the application type. This option requires Version 6.1.0.3 or a subsequent 6.1.0.x patch.

Performance and Flow Thresholds
You must configure at least one inspection performance threshold and one flow bypass threshold. When a performance threshold is exceeded, the system examines flow thresholds and, if one threshold is exceeded, trusts the specified traffic. If you enable more than one of either, only one of each must be exceeded.

Inspection performance thresholds provide intrusion inspection performance limits that, if exceeded, trigger the inspection of flow thresholds. IAB does not use inspection performance thresholds set to 0. You can configure one or more of the following inspection performance thresholds:

Drop Percentage
Average packets dropped as a percentage of total packets, when packets are dropped because of performance overloads caused by expensive intrusion rules, file policies, decompression, and so on. This does not refer to packets dropped by normal configurations such as intrusion rules. Note that specifying an integer greater than 1 activates IAB when the specified percentage of packets is dropped. When you specify 1, any percentage from 0 through 1 activates IAB. This allows a small number of packets to activate IAB.

Processor Utilization Percentage
Average percentage of processor resources used.

Package Latency
Average packet latency in microseconds.

Flow Rate
The rate at which the system processes flows, measured as the number of flows per second. Note that this option configures IAB to measure flow rate, not flow count.

Flow bypass thresholds provide flow limits that, if exceeded, trigger IAB to trust bypassable application traffic in bypass mode or allow application traffic subject to further inspection in test mode. IAB does not use flow bypass thresholds set to 0. You can configure one or more of the following flow bypass thresholds:

Bytes per Flow
The maximum number of kilobytes a flow can include.

Packets per Flow
The maximum number of packets a flow can include.

Flow Duration
The maximum number of seconds a flow can remain open.

Flow Velocity
The maximum transfer rate in kilobytes per second.
Configuring IAB

Not all deployments require IAB, and those that do might use it in a limited fashion. Do not enable IAB unless you have expert knowledge of your network traffic, especially application traffic, and system performance, including the causes of predictable performance issues. Before you run IAB in bypass mode, make sure that trusting the specified traffic does not expose you to risk.

Procedure

**Step 1**
In the access control policy editor, click the Advanced tab, then click the edit icon (扈) next to Intelligent Application Bypass Settings.

If a view icon (扈) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck Inherit from base policy to enable editing.

**Step 2**
Configure IAB options:

- **State**—Turn IAB Off or On, or enable IAB in Test mode.
- **Performance Sample Interval**—Enter the time in seconds between IAB performance-sampling scans. If you enable IAB, even in test mode, enter a non-zero value. Entering 0 disables IAB.
- **Bypassable Applications and Filters**—Choose from:
  - Click the number of bypassed applications and filters and specify the applications whose traffic you want to bypass; see Configuring Application Conditions and Filters, on page 307.
  - Click All applications including unidentified applications so that, when an inspection performance threshold is exceeded, IAB trusts all traffic that exceeds any flow bypass threshold, regardless of the application type. This option requires Version 6.1.0.3 or a subsequent 6.1.0.x patch.
  - Inspection Performance Thresholds—Click Configure and enter at least one threshold value.
  - Flow Bypass Thresholds—Click Configure and enter at least one threshold value.

You must specify at least one inspection performance threshold and one flow bypass threshold; both must be exceeded for IAB to trust traffic. If you enter more than one threshold of each type, only one of each type must be exceeded. For detailed information, see IAB Options, on page 1150.

**Step 3**
Click OK to save IAB settings.

**Step 4**
Click Save to save the policy.
What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

IAB Logging and Analysis

IAB forces an end-of-connection event that logs bypassed flows and flows that would have been bypassed, regardless of whether you have enabled connection logging. Connection events indicate flows that are bypassed in bypass mode or that would have been bypassed in test mode. Custom dashboard widgets and reports based on connection events can display long-term statistics for bypassed and would-have-bypassed flows.

IAB Connection Events

<table>
<thead>
<tr>
<th>Action</th>
<th>When Reason includes Intelligent App Bypass:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow</td>
<td>indicates that the applied IAB configuration was in test mode and traffic for the application specified by Application Protocol remains available for inspection.</td>
</tr>
<tr>
<td>Trust</td>
<td>indicates that the applied IAB configuration was in bypass mode and traffic for the application specified by Application Protocol has been trusted to traverse the network without further inspection.</td>
</tr>
</tbody>
</table>

Reason

Intelligent App Bypass indicates that IAB triggered the event in bypass or test mode.

Application Protocol

This field displays the application protocol that triggered the event.

Example

In the following truncated graphic, some fields are omitted. The graphic shows the Action, Reason, and Application Protocol fields for two connection events resulting from different IAB settings in two separate access control policies.

For the first event, the Trust action indicates that IAB was enabled in bypass mode and Bonjour protocol traffic was trusted to pass without further inspection.

For the second event, the Allow action indicates that IAB was enabled in test mode, so Ubuntu Update Manager traffic was subject to further inspection but would have been bypassed if IAB had been in bypass mode.
Example

In the following truncated graphic, some fields are omitted. The flow in the second event was both bypassed (Action: Trust; Reason: Intelligent App Bypass) and inspected by an intrusion rule (Reason: Intrusion Monitor). The Intrusion Monitor reason indicates that an intrusion rule set to Generate Events detected but did not block an exploit during the connection. In the example, this happened before the application was detected. After the application was detected, IAB recognized the application as bypassable and trusted the flow.

IAB Custom Dashboard Widgets

You can create a Custom Analysis dashboard widget to display long-term IAB statistics based on connection events. Specify the following when creating the widget:

- **Preset**: None
- **Table**: Application Statistics
- **Field**: any
- **Aggregate**: either of:
  - IAB Bypassed Connections
  - IAB Would Bypass Connections
- **Filter**: any

Examples

In the following Custom Analysis dashboard widget examples:

- The *Bypassed* example shows statistics for application traffic bypassed because the applications were specified as bypassable and IAB was enabled in bypass mode in the deployed access control policy.

- The *Would Have Bypassed* example shows statistics for application traffic that would have been bypassed because the applications were specified as bypassable and IAB was enabled in test mode in the deployed access control policy.
IAB Custom Reports

You can create a custom report to display long-term IAB statistics based on connection events. Specify the following when creating the report:

- **Table**: Application Statistics
- **Preset**: None
- **Filter**: any
- **X-Axis**: any
- **Y-Axis**: either of:
  - IAB Bypassed Connections
  - IAB Would Bypass Connections

Examples

The following graphic shows two abbreviated report examples:

- The *Bypassed* example shows statistics for application traffic bypassed because the applications were specified as bypassable and IAB was enabled in bypass mode in the deployed access control policy.

- The *Would Have Bypassed* example shows statistics for application traffic that would have been bypassed because the applications were specified as bypassable and IAB was enabled in test mode in the deployed access control policy.
IAB Logging and Analysis

CHAPTER 61

Access Control Using Content Restriction

The following topics describe how to configure access control policies to use content restriction features:

- About Content Restriction, on page 1157
- Using Access Control Rules to Enforce Content Restriction, on page 1158
- Using a DNS Sinkhole to Enforce Content Restriction, on page 1160

About Content Restriction

Major search engines and content delivery services provide features that allow you to restrict search results and website content. For example, schools use content restriction features to comply with the Children's Internet Protection Act (CIPA).

When implemented by search engines and content delivery services, you can enforce content restriction features only for individual browsers or users. The Firepower System allows you to extend these features to your entire network.

The system allows you to enforce:

- **Safe Search**—Supported in many major search engines, this service filters out explicit and adult-oriented content that business, government, and education environments classify as objectionable. The system does not restrict a user's ability to access the home pages for supported search engines.

- **YouTube EDU**—This service filters YouTube content for an educational environment. It allows schools to set access for educational content while limiting access to noneducational content. YouTube EDU is a different feature than YouTube Restricted Mode, which enforces restrictions on YouTube searches as part of Google's Safe Search feature. YouTube Restricted Mode is a subfeature of Safe Search. With YouTube EDU, users access the YouTube EDU home page, rather than the standard YouTube home page.

You can use two methods to configure the system to enforce these features:

**Method: Access Control Rules**

Content restriction features communicate the restricted status of a search or content query via an element in the request URI, an associated cookie, or a custom HTTP header element. You can configure access control rules to modify these elements as the system processes traffic.

**Method: DNS Sinkhole**

For Google searches, you can configure the system to redirect traffic to the Google SafeSearch Virtual IP Address (VIP), which imposes filters for Safe Search (including YouTube Restricted Mode).
The table below describes the differences between these enforcement methods.

**Table 87: Comparison of Content Restriction Methods**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Method: Access Control Rules</th>
<th>Method: DNS Sinkhole</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported devices</td>
<td>Any</td>
<td>Firepower Threat Defense only</td>
</tr>
<tr>
<td>Search engines supported</td>
<td>Any tagged safe search supported in the Applications tab of the rule editor</td>
<td>Google only</td>
</tr>
<tr>
<td>YouTube Restricted Mode</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>supported</td>
<td></td>
<td></td>
</tr>
<tr>
<td>YouTube EDU supported</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>SSL policy required</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Hosts must be using IPv4</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Connection event logging</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

When determining which method to use, consider the following limitations:

- The access control rules method requires an SSL policy, which impacts performance.
- The Google SafeSearch VIP supports IPv4 traffic only. If you configure a DNS sinkhole to manage Google searches, any hosts on the affected network must be using IPv4.

The system logs different values for the Reason field in connection events, depending on the method:

- Access Control Rules—Content Restriction
- DNS Sinkhole—DNS Block

---

**Using Access Control Rules to Enforce Content Restriction**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Caution**

To avoid rule preemption, position rules governing YouTube EDU above rules governing Safe Search in both SSL and access control policies; see Content Restriction Rule Order, on page 330.
### Procedure

**Step 1** Create an SSL policy; see Create Basic SSL Policies, on page 1189.

**Step 2** Add SSL rules for handling Safe Search and YouTube EDU traffic:

- Choose **Decrypt - Resign** as the **Action** for the rules. The system does not support any other action for content restriction handling.

- In the **Applications** tab, add selections to the **Selected Applications and Filters** list:
  - YouTube EDU—Add the **YouTube** and **YouTube Upload** applications.
  - Safe Search—Add the **Category: search engine** filter.

For more information, see Adding an Application Condition to an SSL Rule, on page 1223.

**Step 3** Set rule positions for the SSL rules you added. Click and drag, or use the right-click menu to cut and paste. To avoid preemption, position the Safe Search rule after the YouTube EDU rule.

**Step 4** Create or edit an access control policy, and associate the SSL policy with the access control policy.

For more information, see Associating Other Policies with Access Control, on page 1088.

**Step 5** In the access control policy, add rules for handling Safe Search and YouTube EDU traffic:

- Choose **Allow** as the **Action** for the rules. The system does not allow any other action for content restriction handling.

- In the **Applications** tab, click the dimmed icon for either Safe Search (.seek) or YouTube EDU (Cached), and set related options; see Safe Search Options for Access Control Rules, on page 1160 and YouTube EDU Options for Access Control Rules, on page 1160.

  These icons are disabled, rather than dimmed, if you choose any **Action** other than **Allow** for the rule. You cannot enable Safe Search and YouTube EDU restrictions for the same access control rule.

- In the **Applications** tab, refine application selections in the **Selected Applications and Filters** list.

  In most cases, enabling Safe Search or YouTube EDU populates the **Selected Applications and Filters** list with the appropriate values. The system does not automatically populate the list if a Safe Search or YouTube application is already present in the list when you enable the feature. If applications do not populate as expected, manually add them as follows:

  - YouTube EDU—Add the **YouTube** and **YouTube Upload** applications.
  - Safe Search—Add the **Category: search engine** filter.

For more information, see Configuring Application Conditions and Filters, on page 307.

**Step 6** Set rule positions for the access control rules you added. Click and drag, or use the right-click menu to cut and paste.

To avoid preemption, position the Safe Search rule after the YouTube EDU rule.

**Step 7** Configure the HTTP response page that the system displays when it blocks restricted content; see Choosing HTTP Response Pages, on page 1114.
Step 8 Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Safe Search Options for Access Control Rules

The Firepower System supports Safe Search filtering for specific search engines only. For a list of supported search engines, see applications tagged safesearch supported in the Applications tab of the access control rule editor. For a list of unsupported search engines, see applications tagged safesearch unsupported.

When enabling Safe Search for an access control rule, set the following parameters:

Enable Safe Search
  Enables Safe Search filtering for traffic that matches this rule.

Unsupported Search Traffic
  Specifies the action you want the system to take when it processes traffic from unsupported search engines. If you choose Block or Block with Reset, you must also configure the HTTP response page that the system displays when it blocks restricted content; see Choosing HTTP Response Pages, on page 1114.

YouTube EDU Options for Access Control Rules

When enabling YouTube EDU for an access control rule, set the following parameters:

Enable YouTube EDU
  Enables YouTube EDU filtering for traffic that matches this rule.

Custom ID
  Specifies the value that uniquely identifies a school or district network in the YouTube EDU initiative. YouTube provides this ID when a school or district registers for a YouTube EDU account.

Note
  If you check Enable YouTube EDU, you must enter a Custom ID. This ID is defined externally by YouTube. The system does not validate what you enter against the YouTube system. If you enter an invalid ID, YouTube EDU restrictions may not perform as expected.

Using a DNS Sinkhole to Enforce Content Restriction

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Firepower Threat</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Defense</td>
<td></td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

Typically, a DNS sinkhole directs traffic away from a particular target. This procedure describes how to configure a DNS sinkhole to redirect traffic to the Google SafeSearch Virtual IP Address (VIP), which imposes content filters on Google and YouTube search results.

Because Google SafeSearch uses a single IPv4 address for the VIP, hosts must use IPv4 addressing.
If your network includes proxy servers, this content restriction method is not effective unless you position your Firepower Threat Defense devices between the proxy servers and the Internet.

Caution
This procedure describes enforcing content restriction for Google searches only. To enforce content restriction for other search engines, see Using Access Control Rules to Enforce Content Restriction, on page 1158.

Procedure

Step 1 Obtain a list of supported Google domains via the following URL: https://www.google.com/supported_domains.

Step 2 Create a custom DNS list on your local computer, and add the following entries:

- To enforce Google SafeSearch, add an entry for each supported Google domain.
- To enforce YouTube Restricted Mode, add a "youtube.com" entry.

The custom DNS list must be in text file (.txt) format. Each line of the text file must specify an individual domain name, stripped of any leading periods. For example, the supported domain ".google.com" must appear as "google.com".

Step 3 Upload the custom DNS list to the Firepower Management Center; see Uploading New Security Intelligence Lists to the Firepower Management Center, on page 376.

Step 4 Determine the IPv4 address for the Google SafeSearch VIP. For example, run nslookup on forcesafesearch.google.com.

Step 5 Create a sinkhole object for the SafeSearch VIP; see Creating Sinkhole Objects, on page 378.

Use the following values for this object:

- IPv4 Address—Enter the SafeSearch VIP address.
- IPv6 Address—Enter the IPv6 loopback address (::1).
- Log Connections to Sinkhole—Click this radio button.
- Type—Choose None.

Step 6 Create a basic DNS policy; see Creating Basic DNS Policies, on page 1127.

Step 7 Add a DNS rule for the sinkhole; see Creating and Editing DNS Rules, on page 1129.

For this rule:

- Check the Enabled check box.
- Choose Sinkhole from the Action drop-down list.
- Choose the sinkhole object you created from the Sinkhole drop-down list.
- Add the custom DNS list you created to the Selected Items list on the DNS tab.
- (Optional) Choose a network in the Networks tab to limit content restriction to specific users. For example, if you want to limit content restriction to student users, assign students to a different subnet than faculty, and specify that subnet in this rule.
**Step 8**  Associate the DNS policy with an access control policy; see *Associating Other Policies with Access Control*, on page 1088.

**Step 9**  Deploy configuration changes; see *Deploy Configuration Changes*, on page 279.
PART XVI

Encrypted Traffic Handling

- Understanding Traffic Decryption, on page 1165
- Start Creating SSL Policies, on page 1185
- Getting Started with SSL Rules, on page 1193
- Decryption Tuning Using SSL Rules, on page 1211
Understanding Traffic Decryption

The following topics provide an overview of SSL inspection, describe the prerequisites for SSL inspection configuration, and detail deployment scenarios.

- About Traffic Decryption, on page 1165
- SSL Handshake Processing, on page 1166
- SSL Inspection Requirements, on page 1169
- SSL Inspection Appliance Deployment Scenarios, on page 1170
- History for SSL, on page 1184

About Traffic Decryption

By default, the Firepower System cannot inspect traffic encrypted with the Secure Socket Layer (SSL) protocol or its successor, the Transport Layer Security (TLS) protocol. The SSL inspection feature allows you to either block encrypted traffic without inspecting it, or inspect encrypted or decrypted traffic with access control. As the system handles encrypted sessions, it logs details about the traffic. The combination of inspecting encrypted traffic and analyzing encrypted session data allows greater awareness and control of the encrypted applications and traffic in your network.

SSL inspection is a policy-based feature. In the Firepower System, an access control policy is a master configuration that invokes subpolicies and other configurations, including an SSL policy. If you associate an SSL policy with access control, the system uses that SSL policy to handle encrypted sessions before it evaluates them with access control rules. If you do not configure SSL inspection, or your devices do not support it, access control rules handle all encrypted traffic.

Note that access control rules also handle encrypted traffic when your SSL inspection configuration allows it to pass. However, some access control rule conditions require unencrypted traffic, so encrypted traffic might match fewer rules. Also, by default, the system disables intrusion and file inspection of encrypted payloads. This helps reduce false positives and improves performance when an encrypted connection matches an access control rule that has intrusion and file inspection configured.

If the system detects an SSL handshake over a TCP connection, it determines whether it can decrypt the detected traffic. If it cannot, it applies a configured action:

- Block the encrypted traffic
- Block the encrypted traffic and reset the TCP connection
- Not decrypt the encrypted traffic
If the system can decrypt the traffic, it blocks the traffic without further inspection, evaluates undecrypted traffic with access control, or decrypt it using one of the following methods:

- Decrypt with a known private key. When an external host initiates an SSL handshake with a server on your network, the system matches the exchanged server certificate with a server certificate previously uploaded to the system. It then uses the uploaded private key to decrypt the traffic.

- Decrypt by resigning the server certificate. When a host on your network initiates an SSL handshake with an external server, the system resigns the exchanged server certificate with a previously uploaded certificate authority (CA) certificate. It then uses the uploaded private key to decrypt the traffic.

Decrypted traffic is subject to the same traffic handling and analysis as originally unencrypted traffic: network, reputation, and user-based access control; intrusion detection and prevention; Cisco Advanced Malware Protection (Cisco AMP); and discovery. If the system does not block the decrypted traffic post-analysis, it re-encrypts the traffic before passing it to the destination host.

SSL Handshake Processing

In this documentation, the term SSL handshake represents the two-way handshake that initiates encrypted sessions in both the SSL protocol and its successor protocol, TLS.

In a passive deployment, the Firepower System observes a copy of the handshake, but does not process the actual handshake. In an inline deployment, the Firepower System processes the SSL handshake, potentially modifying the ClientHello message and acting as a TCP proxy server for the session.

After the client establishes a TCP connection with the server (after it successfully completes the TCP three-way handshake), the managed device monitors the TCP session for any attempt to initiate an encrypted session. The SSL handshake establishes an encrypted session via the exchange of specialized packets between client and server. In the SSL and TLS protocols, these specialized packets are called handshake messages. The handshake messages communicate which encryption attributes both the client and server support:

- ClientHello—The client specifies multiple supported values for each encryption attribute.

- ServerHello—The server specifies a single supported value for each encryption attribute, which determines which encryption method the system uses during the secure session.

Although the data transmitted in the session is encrypted, the handshake messages are not.

After an SSL handshake completes, the managed device caches encrypted session data, which allows session resumption without requiring the full handshake. The managed device also caches server certificate data, which allows faster handshake processing in subsequent sessions.

ClientHello Message Handling

The client sends the ClientHello message to the server that acts as the packet destination if a secure connection can be established. The client sends the message to initiate the SSL handshake or in response to a Hello Request message from the destination server.

If you configure SSL inspection, when a managed device receives a ClientHello message, the system attempts to match the message to SSL rules that have the Decrypt - Resign action. The match relies on data from the ClientHello message and from cached server certificate data. Possible data includes:
### Table 88: Data Availability for SSL Rule Conditions

<table>
<thead>
<tr>
<th>SSL Rule Condition</th>
<th>Data Present In</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zones</td>
<td>ClientHello</td>
</tr>
<tr>
<td>Networks</td>
<td>ClientHello</td>
</tr>
<tr>
<td>VLAN Tags</td>
<td>ClientHello</td>
</tr>
<tr>
<td>Ports</td>
<td>ClientHello</td>
</tr>
<tr>
<td>Users</td>
<td>ClientHello</td>
</tr>
<tr>
<td>Applications</td>

<td>server Certificate (potentially cached)</td>
</tr>
<tr>
<td>Cipher Suites</td>
<td>ServerHello</td>
</tr>
<tr>
<td>Versions</td>
<td>ServerHello</td>
</tr>
</tbody>
</table>

If the ClientHello message does not match a **Decrypt - Resign** rule, the system does not modify the message. It then determines whether the message passes access control evaluation (which can include deep inspection). If the message passes, the system transmits it to the destination server.

If the message matches a **Decrypt - Resign** rule, the system modifies the ClientHello message as follows:

- **Compression methods**—Strips the `compression_methods` element, which specifies the compression methods the client supports. The Firepower System cannot decrypt compressed sessions. This modification reduces the Compressed Session type of undecryptable traffic.

- **Cipher suites**—Strips cipher suites from the `cipher_suites` element if the Firepower System does not support them. If the Firepower System does not support any of the specified cipher suites, the system transmits the original, unmodified element. This modification reduces the Unknown Cipher Suite and Unsupported Cipher Suite types of undecryptable traffic.

- **Session identifiers**—Strips any value from the `Session Identifier` element and the `SessionTicket` extension that does not match cached session data. If a ClientHello value matches cached data, an interrupted session can resume without the client and server performing the full SSL handshake. This modification increases the chances of session resumption and reduces the Session Not Cached type of undecryptable traffic.

- **Elliptic curves**—Strips elliptic curves from the `Supported Elliptic Curves` extension if the Firepower System does not support them. If the Firepower System does not support any of the specified elliptic curves, the managed device removes the extension and strips any related cipher suites from the `cipher_suites` element.

- **ALPN extensions**—Strips any value from the Application-Layer Protocol Negotiation (ALPN) extension that is unsupported in the Firepower System (for example, the SPDY and HTTP/2 protocols). This
modification only occurs if the message matches an SSL rule associated with content restriction features. For more information, see About Content Restriction, on page 1157.

• Other Extensions—Strips the Extended Master Secret, Next Protocol Negotiation (NPN), and TLS Channel IDs extensions.

The system performs these ClientHello modifications by default. If your SSL policy is configured correctly, this default behavior results in more frequent decryption of traffic. To tune the default behavior for your individual network, contact Support.

After the system modifies the ClientHello message, it determines whether the message passes access control evaluation (which can include deep inspection). If the message passes, the system transmits it to the destination server.

Direct communication between the client and server is no longer possible during the SSL handshake, because after message modification the Message Authentication Codes (MACs) computed by the client and server no longer match. For all subsequent handshake messages (and for the encrypted session once established), the managed device acts as a man-in-the-middle (MITM). It creates two SSL sessions, one between client and managed device, one between managed device and server. As a result, each session contains different cryptographic session details.

The cipher suites that the Firepower System can decrypt are frequently updated and do not correspond directly to the cipher suites you can use in SSL rule conditions. For the current list of decryptable cipher suites, contact Support.

Encrypted Traffic Inspection with a Re-signed Certificate in an Inline Deployment, on page 1181

ServerHello and Server Certificate Message Handling

The ServerHello message is the response to a ClientHello message in a successful SSL handshake. After a managed device processes a ClientHello message and transmits it to the destination server, the server determines whether it supports the decryption attributes the client specified in the message. If it does not support those attributes, the server sends a handshake failure alert to the client. If it supports those attributes, the server sends the ServerHello message. If the agreed-upon key exchange method uses certificates for authentication, the server Certificate message immediately follows the ServerHello message.

When the managed device receives these messages, it attempts to match them with SSL rules. These messages contain information that was absent from either the ClientHello message or the session data cache. Specifically, the system can potentially match these messages on Distinguished Names, Certificate Status, Cipher Suites, and Versions conditions.

If the messages do not match any SSL rules, the managed device performs the default action for the SSL policy. For more information, see SSL Policy Default Actions, on page 1186.

If the messages match an SSL rule, the managed device continues as appropriate:
Action: Monitor
The SSL handshake continues to completion. The managed device tracks and logs but does not decrypt encrypted traffic.

Action: Block or Block with Reset
The managed device blocks the SSL session. If appropriate, it also resets the TCP connection.

Action: Do Not Decrypt
The SSL handshake continues to completion. The managed device does not decrypt the application data exchanged during the SSL session.

Action: Decrypt - Known Key
The managed device attempts to match the server certificate data to a certificate previously imported into the Firepower Management Center.

If it matches the certificate to a known certificate, the SSL handshake continues to completion. The managed device uses the uploaded private key to decrypt and reencrypt the application data exchanged during the SSL session.

If the server changes its certificate between the initial connection with the client and subsequent connections, you must import the new server certificate in the Firepower Management Center for future connections to be decrypted.

Action: Decrypt - Resign
The managed device processes the server certificate message and re-signs the server certificate with the previously imported or generated certificate authority (CA). The SSL handshake continues to completion. The managed device then uses the uploaded private key to decrypt and reencrypt the application data exchanged during the SSL session.

### SSL Inspection Requirements

How you deploy the appliances on your network, in addition to your configuration settings and licenses, influences the actions you can take to control and decrypt encrypted traffic. Review your list of mapped actions, existing network deployment, and overall requirements to determine whether one or the other type of deployment better suits your organization.

Devices configured and deployed with inline, routed, switched, or hybrid interfaces can modify the flow of traffic. These devices can monitor, block, allow, and decrypt incoming and outgoing traffic.

Devices configured and deployed with passive or inline (tap mode) interfaces cannot affect the flow of traffic. They can only monitor, allow, and decrypt incoming traffic. Note that passive deployments do not support decrypting traffic encrypted with the ephemeral Diffie-Hellman (DHE) or the elliptic curve Diffie-Hellman (ECDHE) cipher suites.

SSL inspection requires public key certificates and paired private keys for certain features. You must upload certificates and paired private keys to the Firepower Management Center to decrypt and control traffic based on encryption session characteristics.

### SSL Rules Configuration Prerequisite Information

SSL inspection relies on a significant amount of supporting public key infrastructure (PKI) information. Consider your organization’s traffic patterns to determine the matching rule conditions you can configure.
**Table 89: SSL Rule Condition Prerequisites**

<table>
<thead>
<tr>
<th>To match on...</th>
<th>Collect the...</th>
</tr>
</thead>
<tbody>
<tr>
<td>detected server certificates, including self-signed server certificates</td>
<td>server certificate</td>
</tr>
<tr>
<td>trusted server certificates</td>
<td>CA certificate</td>
</tr>
<tr>
<td>detected server certificate subject or issuer</td>
<td>server certificate subject DN or issuer DN</td>
</tr>
</tbody>
</table>

Decide whether you want to not decrypt, block, monitor, or decrypt the encrypted traffic you match your rules against. Map these decisions to SSL rule actions, undecryptable traffic actions, and the SSL policy default action.

**Table 90: SSL Decryption Prerequisites**

<table>
<thead>
<tr>
<th>To decrypt...</th>
<th>Collect...</th>
</tr>
</thead>
<tbody>
<tr>
<td>incoming traffic to a server you control</td>
<td>the server’s certificate file and paired private key file</td>
</tr>
<tr>
<td>outgoing traffic to an external server</td>
<td>a CA certificate file and paired private key file</td>
</tr>
</tbody>
</table>
|                                                          | You can also generate a CA certificate and private key.

After you have collected this information, upload it to the system and configure reusable objects.

## SSL Inspection Appliance Deployment Scenarios

This section presents several scenarios in which the Life Insurance Example, Inc. life insurance company (LifeIns) uses SSL inspection on encrypted traffic to help audit their processes. Based on their business processes, LifeIns plans to deploy:

- one 7000 or 8000 Series device in a passive deployment for the Customer Service department
- one 7000 or 8000 Series device in an inline deployment for the Underwriting Department
- one Firepower Management Center to manage both devices

### Customer Service Business Processes

LifeIns created a customer-facing website for their customers. LifeIns receives encrypted questions and requests regarding policies from prospective customers through their website and through e-mail. LifeIns’s Customer Service department processes them and returns the requested information within 24 hours. Customer Service wants to expand its incoming contact metrics collection. LifeIns has an established internal audit review for Customer Service.
LifeIns also receives encrypted applications online. The Customer Service department processes the applications within 24 hours before sending the case file to the Underwriting department. Customer Service filters out any obvious false applications sent through the online form, which consumes a fair portion of their time.

Underwriting Business Processes

LifeIns’s underwriters submit encrypted medical information requests online to the Medical Repository Example, LLC medical data repository (MedRepo). MedRepo reviews the requests and transmits the encrypted records to LifeIns within 72 hours. The underwriters subsequently underwrite an application and submit policy and rate decisions. Underwriting wants to expand its metrics collection.

Lately, an unknown source has been sending spoofed responses to LifeIns. Though LifeIns’s underwriters receive training on proper Internet use, LifeIns’s IT department first wants to analyze all encrypted traffic that takes the form of medical responses, then wants to block all spoof attempts.

LifeIns places junior underwriters on six-month training periods. Lately, these underwriters have been incorrectly submitting encrypted medical regulation requests to MedRepo’s customer service department. MedRepo has submitted multiple complaints to LifeIns in response. LifeIns plans on extending their new underwriter training period to also audit underwriter requests to MedRepo.

Traffic Decryption in a Passive Deployment

LifeIns’s business requirements state that Customer Service must:

- process all requests and applications within 24 hours
- improve its incoming contact metrics collection process
- identify and discard incoming false applications

Customer Service does not require additional audit review.

LifeIns plans to passively deploy a Customer Service managed device.

Traffic from an external network goes to LifeIns’s router. The router routes traffic to the Customer Service department, and mirrors a copy of the traffic to the managed device for inspection.

On the managing Firepower Management Center, a user in the Access Control and SSL Editor custom role configures SSL inspection to:

- log all encrypted traffic sent to the Customer Service department
• decrypt encrypted traffic sent using the online application form to Customer Service
• not decrypt all other encrypted traffic sent to Customer service, including traffic sent using the online request form

The user also configures access control to inspect the decrypted application form traffic for fake application data and log when fake data is detected.

In the following scenarios, the user submits an online form to Customer Service. The user’s browser establishes a TCP connection with the server, then initiates an SSL handshake. The managed device receives a copy of this traffic. The client and server complete the SSL handshake, establishing the encrypted session. Based on handshake and connection details, the system logs the connection and acts upon the copy of the encrypted traffic.

**Encrypted Traffic Monitoring in a Passive Deployment**

For all SSL-encrypted traffic sent to Customer Service, the managed device logs the connection.

1. The user submits the plain text request (info). The client encrypts this (AaBb) and sends the encrypted traffic to Customer Service.

2. LifeIns’s router receives the encrypted traffic and routes it to the Customer Service department server. It also mirrors a copy to the managed device.

3. The Customer Service department server receives the encrypted information request (AaBb) and decrypts it to plain text (info).

4. The managed device does not decrypt the traffic. The access control policy continues to process the encrypted traffic and allows it. The device generates a connection event after the session ends.

5. The Firepower Management Center receives the connection event.
Undecrypted Encrypted Traffic in a Passive Deployment

For all SSL-encrypted traffic that contains requests about policies, the managed device allows the traffic without decrypting it and logs the connection.

The following steps occur:

1. The user submits the plain text request (info). The client encrypts this (AaBb) and sends the encrypted traffic to Customer Service.
2. LifeIns's router receives the encrypted traffic and routes it to the Customer Service department server. It also mirrors a copy to the managed device.
3. The Customer Service department server receives the encrypted information request (AaBb) and decrypts it to plain text (info).
4. The managed device does not decrypt the traffic. The access control policy continues to process the encrypted traffic and allows it. The device generates a connection event after the session ends.
5. The Firepower Management Center receives the connection event.

Encrypted Traffic Inspection with a Private Key in a Passive Deployment

For all SSL-encrypted traffic that contains application form data, the system decrypts the traffic and logs the connection.

Note

In a passive deployment, if traffic is encrypted with either the DHE or ECDHE cipher suite, you cannot decrypt it with a known private key.

For traffic with legitimate application form information, the system logs the connection.
The following steps occur:

1. The user submits the plain text request (form). The client encrypts this (AaBb) and sends the encrypted traffic to Customer Service.

2. LifeIns's router receives the encrypted traffic and routes it to the Customer Service department server. It also mirrors a copy to the managed device.

3. The Customer Service department server receives the encrypted information request (AaBb) and decrypts it to plain text (form).

4. The managed device uses the session key obtained with the uploaded known private key to decrypt the encrypted traffic to plain text (form).

   The access control policy continues to process the decrypted traffic and does not find fake application information. The device generates a connection event after the session ends.

5. The Firepower Management Center receives a connection event with information about the encrypted and decrypted traffic.

In contrast, if the decrypted traffic contains fake application data, the system logs the connection and the fake data.
The following steps occur:

1. The user submits the plain text request \( \text{fake} \). The client encrypts this \( \text{CcDd} \) and sends the encrypted traffic to Customer Service.

2. LifeIns's router receives the encrypted traffic and routes it to the Customer Service department server. It also mirrors a copy to the managed device.

3. The Customer Service department server receives the encrypted information request \( \text{CcDd} \) and decrypts it to plain text \( \text{fake} \).

4. The managed device uses the session key obtained with the uploaded known private key to decrypt the encrypted traffic to plain text \( \text{fake} \).

   The access control policy continues to process the decrypted traffic and finds fake application information. The device generates an intrusion event. After the session ends, it generates a connection event.

5. The Firepower Management Center receives a connection event with information about the encrypted and decrypted traffic, and an intrusion event for the fake application data.

**Traffic Decryption in an Inline Deployment**

LifeIns’s business requirements state that Underwriting must:
- audit new and junior underwriters, verifying that their information requests to MedRepo comply with all applicable regulations
- improve its underwriting metrics collection process
- examine all requests that appear to come from MedRepo, then drop any spoofing attempts
- drop all improper regulatory requests to MedRepo’s Customer Service department from the Underwriting department
- not audit senior underwriters

LifeIns plans to deploy a device in an inline deployment for the Underwriting department.
Traffic from MedRepo’s network goes to MedRepo’s router. It routes traffic to LifeIns’s network. The managed device receives the traffic, passes allowed traffic to LifeIns’s router, and sends events to the managing Firepower Management Center. LifeIns’s router routes traffic to the destination host.

On the managing Firepower Management Center, a user in the Access Control and SSL Editor custom role configures an SSL access control rule to:

- log all encrypted traffic sent to the Underwriting department
- block all encrypted traffic incorrectly sent from LifeIns’s underwriting department to MedRepo’s customer service department
- decrypt all encrypted traffic sent from MedRepo to LifeIns’s underwriting department, and from LifeIns’s junior underwriters to MedRepo’s requests department
- not decrypt encrypted traffic sent from the senior underwriters

The user also configures access control to inspect decrypted traffic with a custom intrusion policy and:

- block decrypted traffic if it contains a spoof attempt, and log the spoof attempt
- block decrypted traffic that contains information not compliant with regulations, and log the improper information
- allow all other encrypted and decrypted traffic

The system reencrypts allowed decrypted traffic before sending it to the destination host.

You can also cause the system to decrypt and resign the traffic using an SSL access control rule with the action Decrypt - Resign. If traffic matches the SSL rule, after the system modifies the ClientHello message, it determines whether the message passes access control evaluation (which can include deep inspection). If the message passes, the system transmits it to the destination server. For more information, see ClientHello Message Handling, on page 1166

In the following scenarios, the user submits information online to a remote server. The user’s browser establishes a TCP connection with the server, then initiates an SSL handshake. The managed device receives this traffic; based on handshake and connection details, the system logs the connection and acts on the traffic. If the system blocks the traffic, it also closes the TCP connection. Otherwise, the client and server complete the SSL handshake, establishing the encrypted session.
Encrypted Traffic Monitoring in an Inline Deployment

For all SSL-encrypted traffic sent to and from the Underwriting department, the system logs the connection.

The following steps occur:

1. The user submits the plain text request (help). The client encrypts this (AaBb) and sends the encrypted traffic to MedRepo’s Requests department server.

2. LifeIns’s router receives the encrypted traffic and routes it to the Requests department server.

3. The managed device does not decrypt the traffic.
   
   The access control policy continues to process the encrypted traffic and allows it, then generates a connection event after the session ends.

4. The external router receives the traffic and routes it to the Requests department server.

5. The Underwriting department server receives the encrypted information request (AaBb) and decrypts it to plain text (help).

6. The Firepower Management Center receives the connection event.

Undecrypted Encrypted Traffic in an Inline Deployment

For all SSL-encrypted traffic originating from the senior underwriters, the managed device allows the traffic without decrypting it and logs the connection.
The following steps occur:

1. The user submits the plain text request (help). The client encrypts this (AaBb) and sends the encrypted traffic to MedRepo’s Requests department server.

2. LifeIns’s router receives the encrypted traffic and routes it to the Requests department server.

3. The managed device does not decrypt this traffic.
   
   The access control policy continues to process the encrypted traffic and allows it, then generates a connection event after the session ends.

4. The external router receives the traffic and routes it to the Requests department server.

5. The Requests department server receives the encrypted information request (AaBb) and decrypts it to plain text (help).

6. The Firepower Management Center receives the connection event.

**Encrypted Traffic Blocking in an Inline Deployment**

For all SMTPS email traffic improperly sent from LifeIns’s underwriting department to MedRepo’s Customer Service department, the system blocks the traffic during the SSL handshake without further inspection and logs the connection.
The following steps occur:

1. Having received the request to establish an SSL handshake from a client’s browser, the Customer Service department server sends the server certificate (cert) as the next step in the SSL handshake to the LifeIns underwriter.

2. MedRepo’s router receives the certificate and routes it to the LifeIns underwriter.

3. The managed device blocks the traffic without further inspection and ends the TCP connection. It generates a connection event.

4. The internal router does not receive the blocked traffic.

5. The underwriter does not receive the blocked traffic.

6. The Firepower Management Center receives the connection event.

Encrypted Traffic Inspection with a Private Key in an Inline Deployment

For all SSL-encrypted traffic sent from MedRepo to LifeIns’s underwriting department, the system uses an uploaded server private key to obtain session keys, then decrypts the traffic and logs the connection. Legitimate traffic is allowed and reencrypted before being sent to the Underwriting department.
The following steps occur:

1. The user submits the plain text request (`stats`). The client encrypts this (`AaBbC`) and sends the encrypted traffic to the Underwriting department server.

2. The external router receives the traffic and routes it to the Underwriting department server.

3. The managed device uses the session key obtained with the uploaded known private key to decrypt this traffic to plain text (`stats`).

   The access control policy continues to process the decrypted traffic with the custom intrusion policy and does not find a spoof attempt. The device passes the encrypted traffic (`AaBbC`), then generates a connection event after the session ends.

4. The internal router receives the traffic and routes it to the Underwriting department server.

5. The Underwriting department server receives the encrypted information (`AaBbC`) and decrypts it to plain text (`stats`).

6. The Firepower Management Center receives the connection event with information about the encrypted and decrypted traffic.

In contrast, any decrypted traffic that is a spoof attempt is dropped. The system logs the connection and the spoof attempt.
The following steps occur:

1. The user submits the plaintext request (spoof), altering the traffic to appear to originate from MedRepo, LLC. The client encrypts this (FfGgH) and sends the encrypted traffic to the Underwriting department server.

2. The managed device uses the session key obtained with the uploaded known private key to decrypt this traffic to plaintext (spoof).

   The access control policy continues to process the decrypted traffic with the custom intrusion policy and finds a spoof attempt. The device blocks the traffic, then generates an intrusion event. It generates a connection event after the session ends.

3. The internal router does not receive the blocked traffic.

4. The Underwriting department server does not receive the blocked traffic.

5. The Firepower Management Center receives a connection event with information about the encrypted and decrypted traffic, and an intrusion event for the spoofing attempt.

Encrypted Traffic Inspection with a Re-signed Certificate in an Inline Deployment

For all SSL-encrypted traffic sent from the new and junior underwriters to MedRepo’s requests department, the system uses a re-signed server certificate to obtain session keys, then decrypts the traffic and logs the connection. Legitimate traffic is allowed and reencrypted before being sent to MedRepo.

---

**Note**

When decrypting traffic in an inline deployment by re-signing the server certificate, the device acts as a man-in-the-middle. It creates two SSL sessions, one between client and managed device, one between managed device and server. As a result, each session contains different cryptographic session details.
The following steps occur:

1. The user submits the plain text request \( \text{help} \). The client encrypts this \((\text{AaBb})\) and sends the encrypted traffic to the Requests department server.

2. The internal router receives the traffic and routes it to the Requests department server.

3. The managed device uses the session key obtained with a re-signed server certificate and private key to decrypt this traffic to plain text \((\text{help})\).

   The access control policy continues to process the decrypted traffic with the custom intrusion policy and does not find an improper request. The device reencrypts the traffic \((\text{CcDd})\), allowing it to pass. It generates a connection event after the session ends.

4. The external router receives the traffic and routes it to the Requests department server.

5. The Requests department server receives the encrypted information \((\text{CcDd})\) and decrypts it to plain text \((\text{help})\).

6. The Firepower Management Center receives the connection event with information about the encrypted and decrypted traffic.

\[\text{Note}\]

Traffic encrypted with a re-signed server certificate causes client browsers to warn that the certificate is not trusted. To avoid this, add the CA certificate to the organization’s domain root trusted certificates store or the client trusted certificates store.

In contrast, any decrypted traffic that contains information that does not meet regulatory requirements is dropped. The system logs the connection and the non-conforming information.
The following steps occur:

1. The user submits the plain text request (regs), which does not comply with regulatory requirements. The client encrypts this (EeFf) and sends the encrypted traffic to the Requests department server.

2. The internal router receives the traffic and routes it to the Requests department server.

3. The managed device uses the session key obtained with a re-signed server certificate and private key to decrypt this traffic to plain text (regs).

   The access control policy continues to process the decrypted traffic with the custom intrusion policy and finds an improper request. The device blocks the traffic, then generates an intrusion event. It generates a connection event after the session ends.

4. The external router does not receive the blocked traffic.

5. The Requests department server does not receive the blocked traffic.

6. The Firepower Management Center receives a connection event with information about the encrypted and decrypted traffic, and an intrusion event for the improper request.
History for SSL

<table>
<thead>
<tr>
<th>Feature</th>
<th>Version</th>
<th>Details</th>
</tr>
</thead>
</table>
| SafeSearch | 6.1.0 | • The system displays an HTTP response page for connections decrypted by the SSL policy, then blocked (or interactively blocked) either by access control rules or by the access control policy default action. In these cases, the system encrypts the response page and sends it at the end of the reencrypted SSL stream.  
• SafeSearch filters objectionable content and stops people from searching adult sites. |

Start Creating SSL Policies

The following topics provide an overview of SSL policy creation, configuration, management, and logging.

- SSL Policies Overview, on page 1185
- SSL Policy Default Actions, on page 1186
- Default Handling Options for Undecryptable Traffic, on page 1186
- Manage SSL Policies, on page 1188
- Create Basic SSL Policies, on page 1189
- Set Default Handling for Undecryptable Traffic, on page 1189
- Editing an SSL Policy, on page 1190

SSL Policies Overview

An SSL policy determines how the system handles encrypted traffic on your network. You can configure one or more SSL policies, associate an SSL policy with an access control policy, then deploy the access control policy to a managed device. When the device detects a TCP handshake, the access control policy first handles and inspects the traffic. If it subsequently identifies an SSL-encrypted session over the TCP connection, the SSL policy takes over, handling and decrypting the encrypted traffic.

Caution

Adding or removing an SSL policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

The simplest SSL policy, as shown in the following diagram, directs the device where it is deployed to handle encrypted traffic with a single default action. You can set the default action to block decryptable traffic without further inspection, or to inspect undecrypted decryptable traffic with access control. The system can then either allow or block the encrypted traffic. If the device detects undecryptable traffic, it either blocks the traffic without further inspection or does not decrypt it, inspecting it with access control.
A more complex SSL policy can handle different types of undecryptable traffic with different actions, control traffic based on whether a certificate authority (CA) issued or trusts the encryption certificate, and use SSL rules to exert granular control over encrypted traffic logging and handling. These rules can be simple or complex, matching and inspecting encrypted traffic using multiple criteria.

**Related Topics**

- SSL Rule Conditions, on page 1199

## SSL Policy Default Actions

The default action for an SSL policy determines how the system handles decryptable encrypted traffic that does not match any non-monitor rule in the policy. When you deploy an SSL policy that does not contain any SSL rules, the default action determines how all decryptable traffic on your network is handled. Note that the system does not perform any kind of inspection on encrypted traffic blocked by the default action.

**Table 91: SSL Policy Default Actions**

</table>

When you first create an SSL policy, logging connections that are handled by the default action is disabled by default. Because the logging settings for the default action also apply to undecryptable traffic handling, logging connections handled by the undecryptable traffic actions is disabled by default.

Note that if your browser uses certificate pinning to verify a server certificate, you cannot decrypt this traffic by re-signing the server certificate.
Manage SSL Policies

<table>

In the SSL policy editor, you can:

- Configure your policy.
- Add, edit, delete, enable, disable, and organize SSL rules.
- Add trusted CA certificates.
- Determine the handling for encrypted traffic the system cannot decrypt.
- Log traffic that is handled by the default action and undecryptable traffic actions.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Procedure

**Step 1**  Choose Policies > Access Control > SSL.

**Step 2**  Manage SSL policies:

- Associate—To associate an SSL policy with an access control policy, see Associating Other Policies with Access Control, on page 1088.
- Compare—Click Compare Policies; see Comparing Policies, on page 287.
- Copy—Click the copy icon (COPY).  
- Create—Click New Policy; see Create Basic SSL Policies, on page 1189.
- Delete—Click the delete icon (DELETE). If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Deploy—Click Deploy; see Deploy Configuration Changes, on page 279.
- Edit—Click the edit icon (EDIT); see Editing an SSL Policy, on page 1190. If a view icon (EDIT) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Import/Export—See About Configuration Import/Export, on page 165.
- Report—Click the report icon (REPORT); see Generating Current Policy Reports, on page 288.

</tbody>
</table>

To configure an SSL policy, you must give the policy a unique name and specify a default action.

Procedure

**Step 1** Choose Policies > Access Control > SSL.
**Step 2** Click New Policy.
**Step 3** Give the policy a unique Name and, optionally, a Description.
**Step 4** Specify the Default Action; see SSL Policy Default Actions, on page 1186.
**Step 5** Configure logging options for the default action as described in Logging Connections with a Policy Default Action, on page 2048.
**Step 6** Click Save.

**What To Do Next**
- Configure rules to add to your SSL policy; see Creating and Modifying SSL Rules, on page 1197.
- Set the default handling for undecryptable traffic; see Set Default Handling for Undecryptable Traffic, on page 1189.
- Configure logging options for default handling of undecryptable traffic; see Logging Connections with a Policy Default Action, on page 2048.
- Associate the SSL policy with an access control policy as described in Associating Other Policies with Access Control, on page 1088.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Set Default Handling for Undecryptable Traffic

<table>
<thead>

<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can set undecryptable traffic actions at the SSL policy level to handle certain types of encrypted traffic the system cannot decrypt or inspect. When you deploy an SSL policy that does contain no SSL rules, the undecryptable traffic actions determine how all undecryptable encrypted traffic on your network is handled.

Depending on the type of undecryptable traffic, you can choose to:
• Block the connection.
• Block the connection, then reset it. This option is preferrable for connectionless protocols like UDP, which keep trying to connect until the connection is blocked.
• Inspect the encrypted traffic with access control.
• Inherit the default action from the SSL policy.

Procedure

Step 1
In the SSL policy editor, click the **Undecryptable Actions** tab.

Step 2
For each field, choose either the SSL policy's default action or another action you want to take on the type of undecryptable traffic. See Default Handling Options for Undecryptable Traffic, on page 1186 and SSL Policy Default Actions, on page 1186 for more information.

Step 3
Click **Save** to save the policy.

What to do next

• Configure default logging for connections handled by the undecryptable traffic actions; see Logging Connections with a Policy Default Action, on page 2048.

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Editing an SSL Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Only one person should edit a policy at a time, using a single browser window. If multiple users save the same policy, the last saved changes are retained. For your convenience, the system displays information on who (if anyone) is currently editing each policy. To protect the privacy of your session, a warning appears after 30 minutes of inactivity on the policy editor. After 60 minutes, the system discards your changes.

Procedure

Step 1
Choose **Policies > Access Control > SSL**.

Step 2
Click the edit icon (📝) next to the SSL policy you want to configure.

If a view icon (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3
Configure the SSL policy:
• Describe—If you want to update your SSL policy description, click the **Description** field and enter the new description.

• Log—If you want to log connections for undecryptable traffic handling and traffic that does not match SSL rules, see [Logging Connections with a Policy Default Action](onpage2048).

• Rename—If you want to rename your SSL policy, click the **Name** field and enter the new name.

• Set the default action—If you want to configure how your SSL policy handles traffic that does not match SSL rules, see [SSL Policy Default Actions](onpage1186).

• Set the default action for undecryptable traffic—If you want to configure how your SSL policy handles undecryptable traffic, see [Set Default Handling for Undecryptable Traffic](onpage1189).

• Trust—If you want to add trusted CA certificates to your SSL policy, see [Trusting External Certificate Authorities](onpage1232).

### Step 4
Edit the rules in your SSL policy:

• Add—If you want to add a rule, click **Add Rule**.

• Copy—If you want to copy a rule, right-click a selected rule and choose **Copy**.

• Cut—If you want to cut a rule, right-click a selected rule and choose **Cut**.

• Delete—If you want to delete a rule, click the delete icon (delete icon) next to the rule, then click **OK**.

• Disable—If you want to disable an enabled rule, right-click a selected rule, choose **State**, then choose **Disable**.

• Display—If you want to display the configuration page for a specific rule attribute, click the name, value, or icon in the column for the condition on the row for the rule. For example, click the name or value in the **Source Networks** column to display the Networks page for the selected rule. See [Network-Based SSL Rule Conditions](onpage1212) for more information.

• Edit—If you want to edit a rule, click the edit icon (edit icon) next to the rule.

• Enable—If you want to enable a disabled rule, right-click a selected rule, choose **State**, then choose **Enable**. Disabled rules are dimmed and marked (disabled) beneath the rule name.

• Paste—If you want to paste a cut or copied rule, right-click a selected rule and choose **Paste Above** or **Paste Below**.

### Step 5
Save or discard your configuration:

• To save your changes and continue editing, click **Save**.

• To discard your changes, click **Cancel** and, if prompted, click **OK**.

### What to do next

• If the SSL policy is not already associated with an access control policy, associate it as described in [Associating Other Policies with Access Control](onpage1088).
• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

SSL Rules Overview

Within an SSL policy, SSL rules provide a granular method of handling encrypted traffic across multiple managed devices, whether blocking the traffic without further inspection, not decrypting the traffic and inspecting it with access control, or decrypting the traffic for access control analysis.

SSL Rule Traffic Handling

The system matches traffic to SSL rules in the order you specify. In most cases, the system handles encrypted traffic according to the first SSL rule where all the rule’s conditions match the traffic. Conditions can be simple or complex; you can control traffic by security zone, network or geographical location, VLAN, port, application, requested URL, user, certificate, certificate distinguished name, certificate status, cipher suite, or encryption protocol version.

Each rule also has an action, which determines whether you monitor, block, or inspect matching encrypted or decrypted traffic with access control. Note that the system does not further inspect encrypted traffic it blocks. It does inspect encrypted and undecryptable traffic with access control. However, some access control rule conditions require unencrypted traffic, so encrypted traffic may match fewer rules. Also, by default, the system disables intrusion and file inspection of encrypted payloads.

The following scenario summarizes the ways that SSL rules handle traffic in an inline deployment.
In this scenario, traffic is evaluated as follows:

- **Undecryptable Traffic Action** evaluates encrypted traffic first. For traffic the system cannot decrypt, the system either blocks it without further inspection or passes it for access control inspection. Encrypted traffic that does not match continues to the next rule.

- **SSL Rule 1: Monitor** evaluates encrypted traffic next. Monitor rules track and log encrypted traffic but do not affect traffic flow. The system continues to match traffic against additional rules to determine whether to permit or deny it.

- **SSL Rule 2: Do Not Decrypt** evaluates encrypted traffic third. Matching traffic is not decrypted; the system inspectst this traffic with access control, but not file or intrusion inspection. Traffic that does not match continues to the next rule.

- **SSL Rule 3: Block** evaluates encrypted traffic fourth. Matching traffic is blocked without further inspection. Traffic that does not match continues to the next rule.

- **SSL Rule 4: Decrypt - Known Key** evaluates encrypted traffic fifth. Matching traffic incoming to your network is decrypted using a private key you upload. The decrypted traffic is then evaluated against access control rules. Access control rules handle decrypted and unencrypted traffic identically. The
system can block traffic as a result of this additional inspection. All remaining traffic is reencrypted before being allowed to the destination. Traffic that does not match the SSL rule continues to the next rule.

• **SSL Rule 5: Decrypt - Resign** is the final rule. If traffic matches this rule, the system re-signs the server certificate with an uploaded CA certificate, then acts as a man-in-the-middle to decrypt traffic. The decrypted traffic is then evaluated against access control rules. Access control rules treat decrypted and unencrypted traffic identically. The system can block traffic as a result of this additional inspection. All remaining traffic is reencrypted before being allowed to the destination. Traffic that does not match the SSL rule continues to the next rule.

• **SSL Policy Default Action** handles all traffic that does not match any of the SSL rules. The default action either blocks encrypted traffic without further inspection or does not decrypt it, passing it for access control inspection.

### Encrypted Traffic Inspection Configuration

You must create reusable public key infrastructure (PKI) objects to control encrypted traffic based on encrypted session characteristics and decrypt encrypted traffic. You can add this information on the fly when uploading trusted certificate authority (CA) certificates to the SSL policy and creating SSL rule conditions, creating the associated object in the process. However, configuring these objects ahead of time reduces the chance of improper object creation.

### Decrypting Encrypted Traffic with Certificates and Paired Keys

The system can decrypt incoming encrypted traffic if you configure an internal certificate object by uploading the server certificate and private key used to encrypt the session. If you reference that object in an SSL rule with an action of **Decrypt - Known Key** and traffic matches that rule, the system uses the uploaded private key to decrypt the session.

The system can also decrypt outgoing traffic if you configure an internal CA object by uploading a CA certificate and private key. If you reference that object in an SSL rule with an action of **Decrypt - Resign** and traffic matches that rule, the system re-signs the server certificate passed to the client browser, then acts as a man-in-the-middle to decrypt the session. You can optionally replace the self-signed certificate key only and not the entire certificate, in which case users see a self-signed certificate key notice in the browser.

### Controlling Traffic Based on Encrypted Session Characteristics

The system can control encrypted traffic based on the cipher suite or server certificate used to negotiate the session. You can configure one of several different reusable objects and reference the object in an SSL rule condition to match traffic. The following table describes the different types of reusable objects you can configure:

<table>
<thead>
<tr>
<th>If you configure...</th>
<th>You can control encrypted traffic based on whether...</th>
</tr>
</thead>
<tbody>
<tr>
<td>a cipher suite list containing one or more cipher suites</td>
<td>the cipher suite used to negotiate the encrypted session matches a cipher suite in the cipher suite list</td>
</tr>
</tbody>
</table>
If you configure... | You can control encrypted traffic based on whether...
---|---

| a trusted CA object by uploading a CA certificate your organization trusts | the trusted CA trusts the server certificate used to encrypt the session, whether:  
  • the CA issued the certificate directly  
  • the CA issued a certificate to an intermediate CA that issued the server certificate |
| an external certificate object by uploading a server certificate | the server certificate used to encrypt the session matches the uploaded server certificate |
| a distinguished name object containing a certificate subject or issuer distinguished name | the subject or issuer common name, country, organization, or organizational unit on the certificate used to encrypt the session matches the configured distinguished name |

SSL Rule Components

In addition to its unique name, each SSL rule has the following basic components.

**State**

By default, rules are enabled. If you disable a rule, the system does not use it to evaluate network traffic, and stops generating warnings and errors for that rule.

**Position**

Rules in an SSL policy are numbered, starting at 1. The system matches traffic to rules in top-down order by ascending rule number. With the exception of Monitor rules, the first rule that traffic matches is the rule that handles that traffic.

**Conditions**

Conditions specify the specific traffic the rule handles. Conditions can match traffic by security zone, network or geographical location, VLAN, port, application, requested URL, user, certificate, certificate subject or issuer, certificate status, cipher suite, or encryption protocol version. The use of conditions can depend on target device licenses.

**Action**

A rule’s action determines how the system handles matching traffic. You can monitor, allow, block, or decrypt encrypted matching traffic. Decrypted and allowed encrypted traffic is subject to further inspection. Note that the system does not perform inspection on blocked encrypted traffic.
Logging

A rule’s logging settings govern the records the system keeps of the traffic it handles. You can keep a record of traffic that matches a rule. You can log a connection when the system blocks an encrypted session or allows it to pass without decryption, according to the settings in an SSL policy. You can also force the system to log connections that it decrypts for further evaluation by access control rules, regardless of how the system later handles or inspects the traffic. You can log connections to the Firepower Management Center database, as well as to the system log (syslog) or to an SNMP trap server.

Tip

Properly creating and ordering SSL rules is a complex task. If you do not plan your policy carefully, rules can preempt other rules, require additional licenses, or contain invalid configurations. To help ensure that the system handles traffic as you expect, the SSL policy interface has a robust warning and error feedback system for rules.

Creating and Modifying SSL Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** Choose Policies > Access Control > SSL.

**Step 2** Click the edit icon (✍️) next to the SSL policy.

If a view icon (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** You have the following choices:

- To add a new rule, click Add Rule.
- To edit an existing rule, click the edit icon (✍️).

**Step 4** Enter a Name.
Step 5  Configure the rule components, as summarized above. You can configure the following, or accept the defaults:

- Specify whether the rule is Enabled.
- Specify the rule position; see SSL Rule Order Evaluation, on page 1198.
- Choose a rule Action; see Configuring SSL Rule Actions, on page 1205.
- Configure the rule’s conditions; see SSL Rule Condition Types, on page 1200.
- Specify Logging options; see Logging Decryptable Connections with SSL Rules, on page 2046.

Step 6  Click Save.

What to do next
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

SSL Rule Order Evaluation

When you first create an SSL rule, you specify its position using the Insert drop-down list in the rule editor. SSL rules in an SSL policy are numbered, starting at 1. The system matches traffic to SSL rules in top-down order by ascending rule number.

In most cases, the system handles network traffic according to the first SSL rule where all the rule’s conditions match the traffic. Except in the case of Monitor rules (which log traffic but do not affect traffic flow), the system does not continue to evaluate traffic against additional, lower-priority rules after that traffic matches a rule.

Proper SSL rule order reduces the resources required to process network traffic, and prevents rule preemption. Although the rules you create are unique to every organization and deployment, there are a few general guidelines to follow when ordering rules that can optimize performance while still addressing your needs.

In addition to ordering rules by number, you can group rules by category. By default the system provides three categories: Administrator, Standard, and Root. You can add custom categories, but you cannot delete the system-provided categories or change their order.

Adding an SSL Rule to a Rule Category

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>
Procedure

Step 1
In the SSL rule editor, from the **Insert** drop-down list, select **Into Category**, then select the category you want to use.

Step 2
Click **Save**.

Tip
When you save the rule, it is placed last in that category.

What to do next
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

### Positioning an SSL Rule by Number

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1
In the SSL rule editor, from the **Insert** drop-down list, select **above rule** or **below rule**, then type the appropriate rule number.

Step 2
Click **Save**.

Tip
When you save the rule, it is placed where you specified.

What to do next
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

### SSL Rule Conditions

An SSL rule’s conditions identify the type of encrypted traffic that rule handles. Conditions can be simple or complex, and you can specify more than one condition type per rule. Only if traffic meets all the conditions in a rule does the rule apply to the traffic.

If you do not configure a particular condition for a rule, the system does not match traffic based on that criterion. For example, a rule with a certificate condition but no version condition evaluates traffic based on the server certificate used to negotiate the session, regardless of the session SSL or TLS version.

Every SSL rule has an associated action that determines the following for matching encrypted traffic:
**SSL Rule Condition Types**

When you add or edit an SSL rule, use the tabs on the left side of the lower portion of the rule editor to add and edit rule conditions.

<table>
<thead>
<tr>
<th>This Condition...</th>
<th>Matches Encrypted Traffic...</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zones</td>
<td>entering or leaving a device via an interface in a specific security zone</td>
<td>A security zone is a logical grouping of one or more interfaces according to your deployment and security policies. Interfaces in a zone may be located across multiple devices.</td>

SSL Rule Actions

SSL Rule Monitor Action

The Monitor action does not affect encrypted traffic flow; matching traffic is neither immediately permitted nor denied. Rather, traffic is matched against additional rules, if present, to determine whether to trust, block, or decrypt it. The first non-Monitor rule matched determines traffic flow and any further inspection. If there are no additional matching rules, the system uses the default action.

Because the primary purpose of Monitor rules is to track network traffic, the system automatically logs end-of-connection events for monitored traffic to the Firepower Management Center database, regardless of the logging configuration of the rule or default action that later handles the connection.

SSL Rule Do Not Decrypt Action

The Do not decrypt action passes encrypted traffic for evaluation by the access control policy’s rules and default action. Because some access control rule conditions require unencrypted traffic, this traffic may match fewer rules. The system cannot perform deep inspection on encrypted traffic, such as intrusion or file inspection.

Typical reasons for a Do not decrypt rule include:

- When decrypting SSL traffic is prohibited by law.
- Sites you know you can trust.
- Sites you can disrupt by inspecting traffic (such as Windows Update).

For more information, see Default Handling Options for Undecryptable Traffic, on page 1186

SSL Rule Blocking Actions

The Block and Block with reset actions are analogous to the access control rule actions Block and Block with reset. These actions prevent the client and server from establishing the SSL-encrypted session and passing encrypted traffic. Block with reset rules also reset the connection.

Note that the system does not display the configured response page for blocked encrypted traffic. Instead, users requesting prohibited URLs have their connection either reset or time out.

Tip

Note that you cannot use the Block or Block with reset action in a passive or inline (tap mode) deployment, as the device does not directly inspect the traffic. If you create a rule with the Block or Block with reset action that contains passive or inline (tap mode) interfaces within a security zone condition, the policy editor displays a warning icon (⚠️) next to the rule.

About HTTP Response Pages, on page 1113
SSL Rule Decrypt Actions

The **Decrypt - Known Key** and **Decrypt - Resign** actions decrypt encrypted traffic. The system inspects decrypted traffic with access control. Access control rules handle decrypted and unencrypted traffic identically — you can inspect it for discovery data as well as detect and block intrusions, prohibited files, and malware. The system reencrypts allowed traffic before passing it to its destination.

SSL Rule Decryption Mechanism and Guidelines

When you configure the **Decrypt - Known Key** action, you can associate one or more server certificates and paired private keys with the action. If traffic matches the rule, and the certificate used to encrypt the traffic matches the certificate associated with the action, the system uses the appropriate private key to obtain the session encryption and decryption keys. Because you must have access to the private key, this action is best suited to decrypt traffic incoming to servers your organization controls.

Similarly, you can associate one Certificate Authority certificate and private key with the **Decrypt - Resign** action. If traffic matches this rule, the system re-signs the server certificate with the CA certificate, then acts as a man-in-the-middle. It creates two SSL sessions, one between client and managed device, one between managed device and server. Each session contains different cryptographic session details, and allows the system to decrypt and reencrypt traffic. This action is more suited for outgoing traffic, as you replace the certificate’s private key with one you control to obtain the session keys.

Re-signing a server certificate involves either replacing the certificate’s public key with a CA certificate public key, or replacing the entire certificate. Normally, if you replace an entire server certificate, the client browser warns the certificate is not signed by a trusted authority when establishing the SSL connection. However, if your client’s browser trusts the CA in the policy, the browser does not warn that the certificate is not trusted. If the original server certificate is self-signed, the system replaces the entire certificate, and trusts the re-signing CA, but the user’s browser does not warn that the certificate is self-signed. In this case, replacing only the server certificate public key causes the client browser does warn that the certificate is self-signed.

If you configure a rule with the **Decrypt - Resign** action, the rule matches traffic based on the referenced internal CA certificate’s signature algorithm type, in addition to any configured rule conditions. Because you associate one CA certificate with a **Decrypt - Resign** action, you cannot create an SSL rule that decrypts multiple types of outgoing traffic encrypted with different signature algorithms. In addition, any external certificate objects and cipher suites you add to the rule must match the associated CA certificate encryption algorithm type. You can optionally replace the self-signed certificate key only and not the entire certificate, in which case users see a self-signed certificate key notice in the browser.

For example, outgoing traffic encrypted with an elliptic curve (EC) algorithm matches a **Decrypt - Resign** rule only if the action references an EC-based CA certificate; you must add EC-based external certificates and cipher suites to the rule if you want to create certificate and cipher suite rule conditions. Similarly, a **Decrypt - Resign** rule that references an RSA-based CA certificate matches only outgoing traffic encrypted with an RSA algorithm; outgoing traffic encrypted with an EC algorithm does not match the rule, even if all other configured rule conditions match.

Note the following:

- You cannot use the **Decrypt - Known Key** action in a passive deployment if the cipher suite used to establish the SSL connection applies either the Diffie-Hellman ephemeral (DHE) or the elliptic curve Diffie-Hellman ephemeral (ECDHE) key exchange algorithm. If your SSL policy targets a device with passive or inline (tap mode) interfaces, and contains a **Decrypt - Known Key** rule with a cipher suite condition containing either a DHE or an ECDHE cipher suite, the system displays an information icon
next to the rule. If you later add a zone condition to the SSL rule that contains passive or inline (tap mode) interfaces, the system displays a warning icon.

- You cannot use the Decrypt - Resign action in a passive or inline (tap mode) deployment because the device does not directly inspect traffic. If you create a rule with the Decrypt - Resign action that contains passive or inline (tap mode) interfaces within a security zone, the policy editor displays a warning icon (⚠️) next to the rule. If your SSL policy targets a device with passive or inline (tap mode) interfaces, and contains a Decrypt - Resign rule, the system displays an information icon (ℹ️) next to the rule. If you deploy an SSL policy that contains a Decrypt - Resign rule to a device with passive or inline (tap mode) interfaces, any SSL sessions that match the rule fail.

- If the client does not trust the CA used to re-sign the server certificate, it warns the user that the certificate should not be trusted. To prevent this, import the CA certificate into the client trusted CA store. Alternatively, if your organization has a private PKI, you can issue an intermediate CA certificate signed by the root CA which is automatically trusted by all clients in the organization, then upload that CA certificate to the device.

- You can add an anonymous cipher suite to the Cipher Suite condition in an SSL rule, but keep in mind:
  - The system automatically strips anonymous cipher suites during ClientHello processing. For the system to use the rule, you must also configure your SSL rules in an order that prevents ClientHello processing. For more information, see SSL Rule Order, on page 330.
  - You cannot use the Decrypt - Resign or Decrypt - Known Key action in the rule, because the system cannot decrypt traffic encrypted with an anonymous cipher suite.

- The system cannot decrypt traffic if an HTTP proxy is positioned between a client and your managed device, and the client and server establish a tunneled SSL connection using the CONNECT HTTP method. The Handshake Errors undecryptable action determines how the system handles this traffic.

- The system cannot decrypt traffic in the captive portal authentication connection between a captive portal user's web browser and the captive portal daemon on the managed device.

- You cannot match on Distinguished Name or Certificate conditions when creating an SSL rule with a Decrypt - Known Key action. The assumption is that if this rule matches traffic, the certificate, subject DN, and issuer DN already match the certificate associated with the rule.

- If you create an internal CA object and choose to generate a certificate signing request (CSR), you cannot use this CA for a Decrypt - Resign action until you upload the signed certificate to the object.

- If you configure a rule with the Decrypt - Resign action, and mismatch signature algorithm type for one or more external certificate objects or cipher suites, the policy editor displays an information icon (ℹ️) next to the rule. If you mismatch signature algorithm type for all external certificate objects, or all cipher suites, the policy displays a warning icon (⚠️) next to the rule, and you cannot deploy the access control policy associated with the SSL policy.

- If the customer's browser uses certificate pinning to verify a server certificate, you cannot decrypt this traffic by re-signing the server certificate. To allow this traffic, configure an SSL rule with the Do not decrypt action to match the server certificate common name or distinguished name.
• If decrypted traffic matches an access control rule with an action of **Interactive Block** or **Interactive Block with reset**, the system displays a response page.

• If you enable the **Normalize Excess Payload** option in the inline normalization preprocessor, when the preprocessor normalizes decrypted traffic, it might drop a packet and replace it with a trimmed packet. This does not end the SSL session. If the traffic is allowed, the trimmed packet is encrypted as part of the SSL session.

### Configuring SSL Rule Actions

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**

In the SSL policy editor, you have the following options:

- To add a new rule, click **Add Rule**.

- To edit an existing rule, click the edit icon (✏).

**Step 2**

Select a rule action from the **Action** drop-down list:

- To block encrypted traffic, select **Block**.

- To block encrypted traffic and reset the connection, select **Block with reset**.

- To decrypt incoming traffic, see Configuring a Decrypt - Known Key Action, on page 1206 for more information.

- To decrypt outgoing traffic, see Configuring a Decrypt - Resign Action, on page 1206 for more information.

- To log encrypted traffic, select **Monitor**.

- To not decrypt encrypted traffic, select **Do not decrypt**.

**Step 3**

Click **Add**.

**What to do next**

- Configure rule conditions, as described in Network-Based SSL Rule Conditions, on page 1212, User-Based SSL Rule Conditions, on page 1218, Reputation-Based SSL Rule Conditions, on page 1219, and Server Certificate-Based SSL Rule Conditions, on page 1226.

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.
Configuring a Decrypt - Resign Action

### Procedure

**Step 1**
In the SSL rule editor, select **Decrypt - Resign** from the **Action** list.

**Step 2**
Select an internal CA certificate object from the list.

**Step 3**
To replace only the certificate public key instead of the entire certificate, you must check **Replace Key Only**. Because you're replacing the public key only, users get a self-signed certificate notice in the browser.

**Step 4**
Click **Add**.

### What to do next
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Configuring a Decrypt - Known Key Action

### Procedure

**Step 1**
In the SSL rule editor, select **Decrypt - Known Key** from the **Action** drop-down list.

**Step 2**
Click the **Click to select decryption certs** field.

**Step 3**
Select one or more internal certificate objects in the **Available Certificates** list, then click **Add to Rule**.

**Step 4**
Click **OK**.

**Step 5**
Click **Add**.

### What to do next
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.
SSL Rules Management

The Rules tab of the SSL policy editor allows you to add, edit, search, move, enable, disable, delete, and otherwise manage SSL rules within your policy.

SSL Rule Search

You can search the list of SSL rules for matching values using an alphanumeric string, including spaces and printable, special characters. The search inspects the rule name and any rule condition you have added to the rule. For rule conditions, the search matches any name or value you can add for each condition type (zone, network, application, and so on). This includes individual object names or values, group object names, individual object names or values within a group, and literal values.

You can use complete or partial search strings. The column for matching values is highlighted for each matching rule. For example, if you search on all or part of the string 100Bao, at a minimum, the Applications column is highlighted for each rule where you have added the 100Bao application. If you also have a rule named 100Bao, both the Name and Applications columns are highlighted.

You can navigate to each previous or next matching rule. A status message displays the current match and the total number of matches.

Matches may occur on any page of a multi-page rule list. When the first match is not on the first page, the page where the first match occurs is displayed. Selecting the next match when you are at the last match takes you to the first match, and selecting the previous match when you are at the first match takes you to the last match.

Searching SSL Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1
In the SSL policy editor, click the Search Rules prompt, type a search string, then press Enter.

Tip Columns for rules with matching values are highlighted, with differentiated highlighting for the indicated (first) match.

Step 2
Find the rules you are interested in:

- To navigate between matching rules, click the next-match ( Worse) or previous-match ( Better) icon.
- To refresh the page and clear the search string and any highlighting, click the clear icon (X).
Enabling and Disabling SSL Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

When you create an SSL rule, it is enabled by default. If you disable a rule, the system does not use it to evaluate network traffic and stops generating warnings and errors for that rule. When viewing the list of rules in an SSL policy, disabled rules are grayed out, although you can still modify them. Note that you can also enable or disable an SSL rule using the rule editor.

**Procedure**

**Step 1**
In the SSL policy editor, right-click a rule and choose a rule state.

**Step 2**
Click **Save**.

**What to do next**
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Moving an SSL Rule

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**
In the SSL policy editor, select the rules by clicking in a blank area for each rule.

**Step 2**
Right-click the rule and select **Cut**.

**Step 3**
Right-click a blank area for a rule next to where you want to paste the cut rules and select **Paste above** or **Paste below**.

**Tip**
You cannot copy and paste SSL rules between two different SSL policies.

**Step 4**
Click **Save**.

**What to do next**
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.
Adding a New SSL Rule Category

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can create custom categories between the Standard Rules and Root Rules categories to further organize your rules without having to create additional policies. You can rename and delete categories that you add. You cannot move these categories, but you can move rules into, within, and out of them.

**Procedure**

**Step 1**
In the SSL policy editor, click **Add Category**.

**Tip**
If your policy already contains rules, you can click a blank area in the row for an existing rule to set the position of the new category before you add it. You can also right-click an existing rule and select **Insert new category**.

**Step 2**
Type a **Name**.

**Step 3**
You have the following choices:

- Select **above Category** from the first **Insert** drop-down list, then select the category above which you want to position the rule from the second drop-down list.

- Select **below rule** from the drop-down list, then enter an existing rule number. This option is valid only when at least one rule exists in the policy.

- Select **above rule** from the drop-down list, then, enter an existing rule number. This option is valid only when at least one rule exists in the policy.

**Step 4**
Click **OK**.

**Tip**
Rules in a category you delete are added to the category above.

**Step 5**
Click **Save**.

**Troubleshoot SSL Rules**

Properly configuring SSL rules is a complex task, but one that is essential to building an effective deployment that handles encrypted traffic. Rules can preempt each other, require additional licenses, or contain invalid configurations. Thoughtfully configured rules can also reduce the resources required to process network traffic. Creating overly complex rules and ordering rules the wrong way can adversely affect performance. For detailed information, see Rule Performance Guidelines, on page 327.

**Invalid Configuration Warnings for SSL Rules**

Because outside settings that the SSL policy depends on may change, an SSL policy setting that was valid might become invalid. Consider the following examples:
• A rule that contains a URL category condition might be valid until you target a device that does not have a URL Filtering license. At that point, an error icon is displayed next to the rule, and you cannot deploy the policy to that device until you edit or delete the rule, retarget the policy, or enable the appropriate license.

• If you create a Decrypt - Resign rule, and later add a security zone with passive interfaces to a zone condition, the system displays a warning icon next to the rule. Because you cannot decrypt traffic by re-signing a certificate in a passive deployment, the rule has no effect until you remove the passive interfaces from the rule or change the rule action.

• If you add a user or group to a rule, then change your realm settings to exclude that user or group, the rule has no effect. (The same applies to disabling the realm.)

• If you place Do Not Decrypt rules that match on ServerHello or server Certificate conditions (certificate, distinguished names, certificate status, cipher suites, version) before Decrypt - Resign rules that match on ClientHello conditions (zones, networks, VLAN tags, ports, users, applications, categories), you can preempt ClientHello modification and increase the number of undecrypted sessions.

If the system identifies rules in this configuration, it displays a warning icon next to the rules that use ServerHello or server Certificate conditions.

Decryption Tuning Using SSL Rules

The following topics provide an overview of how to configure SSL rule conditions:

- SSL Rule Conditions Overview, on page 1211
- Network-Based SSL Rule Conditions, on page 1212
- User-Based SSL Rule Conditions, on page 1218
- Reputation-Based SSL Rule Conditions, on page 1219
- Server Certificate-Based SSL Rule Conditions, on page 1226

SSL Rule Conditions Overview

A basic SSL rule applies its rule action to all encrypted traffic inspected by the device. To better control and decrypt encrypted traffic, you can configure rule conditions to handle and log specific types of traffic. Each SSL rule can contain 0, 1, or more rule conditions; a rule only matches traffic if the traffic matches every condition in that SSL rule.

When traffic matches a rule, the device applies the configured rule action to the traffic. When the connection ends, the device logs the traffic if configured to do so.

Each rule condition allows you to specify one or more properties of traffic you want to match against; these properties include details of:

- the flow of traffic, including the security zone through which it travels, IP address and port, country of origin or destination, and origin or destination VLAN
- the user associated with a detected IP address
- the traffic payload, including the application detected in the traffic
- the connection encryption, including the SSL/TLS protocol version and cipher suite and server certificate used to encrypt the connection
- the category and reputation of the URL specified in the server certificate’s distinguished name
Network-Based SSL Rule Conditions

SSL rules within SSL policies exert granular control over encrypted traffic logging and handling. Network-based conditions allow you to manage which encrypted traffic can traverse your network, using one or more of the following criteria:

- **Zone conditions** in SSL rules allow you to control encrypted traffic by its source and destination security zones. A security zone is a grouping of one or more interfaces, which may be located across multiple devices. An option you choose during a device’s initial setup, called its detection mode, determines how the system initially configures the device’s interfaces, and whether those interfaces belong to a security zone.

- **Network conditions** in SSL rules allow you to control and decrypt encrypted traffic by its source and destination IP address. You can either explicitly specify the source and destination IP addresses for the encrypted traffic you want to control, or use the geolocation feature, which associates IP addresses with geographical locations, to control encrypted traffic based on its source or destination country or continent.

- **VLAN conditions** in SSL rules allow you to control VLAN-tagged traffic. The system uses the innermost VLAN tag to identify a packet by VLAN.

- **Port conditions** in SSL rules allow you to control encrypted traffic by its source and destination TCP port.

You can combine network-based conditions with each other and with other types of conditions to create an SSL rule. These SSL rules can be simple or complex, matching and inspecting traffic using multiple conditions.

**Related Topics**

Firepower System IP Address Conventions, on page 13

Network Zone SSL Rule Conditions

You can add a maximum of 50 zones to each of the **Sources Zones** and **Destination Zones** in a single zone condition:

- To match encrypted traffic leaving the device from an interface in the zone, add that zone to the **Destination Zones**.

  Because devices deployed passively do not transmit traffic, you cannot use a zone comprised of passive interfaces in a **Destination Zone** condition.

- To match encrypted traffic entering the device from an interface in the zone, add that zone to the **Source Zones**.

If you add both source and destination zone conditions to a rule, matching traffic must originate from one of the specified source zones and egress through one of the destination zones.

Note that just as all interfaces in a zone must be of the same type (all inline, all passive, all switched, or all routed), all zones used in a zone condition for an SSL rule must be of the same type. That is, you cannot write a single rule that matches encrypted traffic to or from zones of different types.

Warning icons indicate invalid configurations, such as zones that contain no interfaces. For details, hover your pointer over the icon.
## Controlling Encrypted Traffic by Network Zone

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

### Procedure

**Step 1**  
In the SSL rule editor, select the Zones tab.

**Step 2**  
Find the zones you want to add from the Available Zones. To search for zones to add, click the **Search by name** prompt above the Available Zones list, then type a zone name. The list updates as you type to display matching zones.

**Step 3**  
Click to select a zone. To select all zones, right-click and then select **Select All**.

**Step 4**  
Click **Add to Source** or **Add to Destination**.

**Tip**  
You can also drag and drop selected zones.

**Step 5**  
Save or continue editing the rule.

### Example

As a simple example, when you register a device with an **Inline** detection mode, the Firepower Management Center creates two zones: Internal and External, and assigns the first pair of interfaces on the device to those zones. Hosts connected to the network on the Internal side represent your protected assets.

To extend this scenario, you could deploy additional identically configured devices—managed by the same Firepower Management Center—to protect similar resources in several different locations. Like the first device, each of these devices protects the assets in its Internal security zone.

### Note

You are not required to group all internal (or external) interfaces into a single zone. Choose the grouping that makes sense for your deployment and security policies.

In this deployment, you may decide that although you want these hosts to have unrestricted access to the Internet, you nevertheless want to protect them by decrypting and inspecting incoming encrypted traffic.

To accomplish this, configure an SSL rule with a zone condition where the **Destination Zone** is set to Internal. This simple SSL rule matches traffic that leaves the device from any interface in the Internal zone.

### What to do next

- Deploy configuration changes; see **Deploy Configuration Changes, on page 279**.
Network or Geolocation SSL Rule Conditions

When you build a network-based SSL rule condition, you can manually specify IP address and geographical locations. Alternately, you can configure network conditions with network and geolocation objects, which are reusable and associate a name with one or more IP addresses, address blocks, countries, continents, and so on.

You can add a maximum of 50 items to each of the Source Networks and Destination Networks in a single network condition, and you can mix network and geolocation-based configurations:

- To match encrypted traffic from an IP address or geographical location, configure the Source Networks.
- To match encrypted traffic to an IP address or geographical location, configure the Destination Networks.

If you add both source and destination network conditions to a rule, matching encrypted traffic must originate from one of the specified IP addresses and be destined for one of the destination IP addresses.

When building a network condition, warning icons indicate invalid configurations. For details, hover your pointer over the icon.

Controlling Encrypted Traffic by Network or Geolocation

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

Before you begin

- Update the geolocation database (GeoDB) on your Firepower Management Center as described in Update the Geolocation Database (GeoDB), on page 141.

Procedure

Step 1  In the SSL rule editor, select the Networks tab.
Step 2  Find the networks you want to add from the Available Networks, as follows:
• Click the Networks tab to display network objects and groups to add; click the Geolocation tab to display geolocation objects.

• To add a network object on the fly, which you can then add to the condition, click the add icon (+) above the Available Networks list.

• To search for network or geolocation objects to add, select the appropriate tab, click the Search by name or value prompt above the Available Networks list, then type an object name or the value of one of the object’s components. The list updates as you type to display matching objects.

**Step 3**
To select an object, click it. To select all objects, right-click and then select Select All.

**Step 4**
Click Add to Source or Add to Destination.

**Tip**
You can also drag and drop selected objects.

**Step 5**
Add any source or destination IP addresses or address blocks that you want to specify manually. Click the Enter an IP address prompt below the Source Networks or Destination Networks list; then type an IP address or address block and click Add.

**Step 6**
Save or continue editing the rule.

---

**Example**

The following graphic shows the network condition for an SSL rule that blocks encrypted connections originating from your internal network and attempting to access resources either in the Cayman Islands or an offshore holding corporation server at 182.16.0.3.

<table>
<thead>
<tr>
<th>Source Networks (1)</th>
<th>Destination Networks (2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.0.0/16</td>
<td>182.15.0.3</td>
</tr>
<tr>
<td>Cayman Islands</td>
<td></td>
</tr>
</tbody>
</table>

The example manually specifies the offshore holding corporation’s server IP address, and uses a system-provided Cayman Islands geolocation object to represent Cayman Island IP addresses.

**What to do next**

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Related Topics**

Network Objects, on page 345
Firepower System IP Address Conventions, on page 13

---

**VLAN SSL Rule Conditions**

When you build a VLAN-based SSL rule condition, you can manually specify a VLAN tag from 1 to 4094. Alternately, you can configure VLAN conditions with VLAN tag objects, which are reusable and associate a name with one or more VLAN tags.
After you create a VLAN tag object, you can use it not only to build SSL rules, but also to represent VLAN tags in various other places in the system’s web interface. You can create VLAN tag objects either using the object manager or on-the-fly while you are configuring access control rules.

You can add a maximum of 50 items to the Selected VLAN Tags in a single VLAN tag condition. When building a VLAN tag condition, warning icons indicate invalid configurations. For details, hover your pointer over the icon.

## Controlling Encrypted VLAN Traffic

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

### Procedure

**Step 1** In the SSL rule editor, select the VLAN Tags tab.

**Step 2** Find the VLANs you want to add from the Available VLAN Tags, as follows:

- To add a VLAN tag object on the fly, which you can then add to the condition, click the add icon (●) above the Available VLAN Tags list.
- To search for VLAN tag objects and groups to add, click the Search by name or value prompt above the Available VLAN Tags list, then type either the name of the object, or the value of a VLAN tag in the object. The list updates as you type to display matching objects.

**Step 3** To select an object, click it. To select all objects, right-click and then select Select All.

**Step 4** Click Add to Rule.

**Tip** You can also drag and drop selected objects.

**Step 5** Add any VLAN tags that you want to specify manually. Click the Enter a VLAN Tag prompt below the Selected VLAN Tags list; then type a VLAN tag or range and click Add. You can specify any VLAN tag from 1 to 4094; use a hyphen to specify a range of VLAN tags.

**Step 6** Save or continue editing the rule.

### Example

The following graphic shows a VLAN tag condition for an SSL rule that matches encrypted traffic on public-facing VLANs (represented by a VLAN tag object group), as well as the manually added VLAN 42.
What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics

- VLAN Tag Objects, on page 350

Port SSL Rule Conditions

When you build a port-based SSL rule condition, you can manually specify TCP ports. Alternately, you can configure port conditions with port objects, which are reusable and associate a name with one or more ports.

You can add a maximum of 50 items to each of the Selected Source Ports and Selected Destination Ports lists in a single network condition:

- To match encrypted traffic from a TCP port, configure the Selected Source Ports.
- To match encrypted traffic to a TCP port, configure the Selected Destination Ports.
- To match encrypted traffic both originating from TCP Selected Source Ports and destined for TCP Selected Destination Ports, configure both.

You can only configure the Selected Source Ports and Selected Destination Ports lists with TCP ports. Port objects containing non-TCP ports are greyed out in the Available Ports list.

When building a port condition, warning icons indicate invalid configurations. For example, you can use the object manager to edit in-use port objects so that the rules that use those object groups become invalid. For details, hover your pointer over the icon.

Controlling Encrypted Traffic by Port

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1

In the SSL rule editor, select the Ports tab.
Step 2 Find the TCP ports you want to add from the Available Ports, as follows:

- To add a TCP port object on the fly, which you can then add to the condition, click the add icon above the Available Ports list.
- To search for TCP-based port objects and groups to add, click the Search by name or value prompt above the Available Ports list, then type either the name of the object, or the value of a port in the object. The list updates as you type to display matching objects. For example, if you type 443, the Firepower Management Center displays the system-provided HTTPS port object.

Step 3 To select a TCP-based port object, click it. To select all TCP-based port objects, right-click and then select Select All. If the object includes non-TCP-based ports, you cannot add it to your port condition.

Step 4 Click Add to Source or Add to Destination.

Tip You can also drag and drop selected objects.

Step 5 Enter a Port under the Selected Source Ports or Selected Destination Ports list to manually specify source or destination ports. You can specify a single port with a value from 0 to 65535.

Step 6 Click Add.

Note The Firepower Management Center will not add a port to a rule condition that results in an invalid configuration.

Step 7 Save or continue editing the rule.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics

Port Objects, on page 346

User-Based SSL Rule Conditions

You can configure SSL rules to match traffic based on realm, group, or user. Realm, group, and user conditions in SSL rules allow you to perform user control to manage which traffic can traverse your network by associating authoritative users with IP addresses.

For traffic to match an SSL rule with a user condition, the IP address of either the source or destination host in the monitored session must be associated with a logged in authoritative user. You can control traffic based on realms, individual users, or the groups those users belong to.
Controlling Encrypted Traffic Based on User

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Before you begin**

- Configure one or more authoritative user identity sources as described in User Identity Sources, on page 1721.
- Configure a realm as described in Create a Realm, on page 1776.

**Procedure**

**Step 1**
In the SSL rule editor, select the Users tab.

**Step 2**
Search by name or value above the Available Realms list and select a realm.

**Step 3**
Search by name or value above the Available Users list and select a user or group.

**Step 4**
Click Add to Rule.

**Tip**
You can also drag and drop selected users and groups.

**Step 5**
Save or continue editing the rule.

**What to do next**
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Reputation-Based SSL Rule Conditions**

Reputation-based conditions in SSL rules allow you to manage which encrypted traffic can traverse your network, by contextualizing your network traffic and limiting it where appropriate. SSL rules govern the following types of reputation-based control:

- Application conditions allow you to perform application control. When the system analyzes encrypted IP traffic, it can identify and classify commonly used encrypted applications on your network prior to decrypting the encrypted session. The system uses this discovery-based application awareness feature to allow you to control encrypted application traffic on your network.

  Within a single SSL rule, you can select individual applications, including custom applications. You can use system-provided application filters, which are named sets of applications organized according to its basic characteristics: type, risk, business relevance, and categories.

- URL conditions allow you to control web traffic based on websites’ assigned category and reputation.
Selected Applications and Filters in SSL Rules

Cisco frequently updates and adds additional detectors via system and vulnerability database (VDB) updates. You can also create your own detectors and assign characteristics (risk, relevance, and so on) to the applications they detect. By using filters based on application characteristics, you can ensure that the system uses the most up-to-date detectors to monitor application traffic.

For traffic to match an SSL rule with an application condition, the traffic must match one of the filters or applications that you add to a Selected Applications and Filters list.

Note
When you filter application traffic using access control rules, you can use application tags as a criterion to filter. However, you cannot use application tags to filter encrypted traffic because there is no benefit. All applications that the system can detect in encrypted traffic are tagged SSL Protocol; applications without this tag can only be detected in unencrypted or decrypted traffic.

In a single application condition, you can add a maximum of 50 items to the Selected Applications and Filters list. Each of the following counts as an item:

- One or more filters from the Application Filters list, individually or in custom combination. This item represents set of applications, grouped by characteristic.
- A filter created by saving search of the applications in the Available Applications list. This item represents a set of applications, grouped by substring match.
- An individual application from the Available Applications list.

In the web interface, filters added to a condition are listed above and separately from individually added applications.

Note that when you deploy an SSL policy, for each rule with an application condition, the system generates a list of unique applications to match. In other words, you may use overlapping filters and individually specified applications to ensure complete coverage.

Application Filters in SSL Rules

When building an application condition in an SSL rule, use the Application Filters list to create a set of applications, grouped by characteristic, whose traffic you want to match.

For your convenience, the system characterizes each application by type, risk, business relevance, category, and tag. You can use these criteria as filters or create custom combinations of filters to perform application control.

Note that the mechanism for filtering applications within an SSL rule is the same as that for creating reusable, custom application filters using the object manager. You can also save many filters you create on-the-fly in access control rules as new, reusable filters. You cannot save a filter that includes another user-created filter because you cannot nest user-created filters.

Understanding How Filters Are Combined

When you select filters, singly or in combination, the Available Applications list updates to display only the applications that meet your criteria. You can select system-provided filters in combination, but not custom filters.
The system links multiple filters of the same filter type with an OR operation. For example, if you select the Medium and High filters under the Risks type, the resulting filter is:

**Risk: Medium OR High**

If the Medium filter contained 110 applications and the High filter contained 82 applications, the system displays all 192 applications in the **Available Applications** list.

The system links different types of filters with an AND operation. For example, if you select the Medium and High filters under the Risks type, and the Medium and High filters under the Business Relevance type, the resulting filter is:

**Risk: Medium OR High**

**AND**

**Business Relevance: Medium OR High**

In this case, the system displays only those applications that are included in both the Medium or High Risk type AND the Medium or High Business Relevance type.

**Finding and Selecting Filters**

To select filters, click the arrow next to a filter type to expand it, then select or clear the check box next to each filter whose applications you want to display or hide. You can also right-click a Cisco-provided filter type (**Risks**, **Business Relevance**, **Types**, or **Categories**) and select **Check All** or **Uncheck All**.

To search for filters, click the **Search by name** prompt above the **Available Filters** list, then type a name. The list updates as you type to display matching filters.

After you are done selecting filters, use the **Available Applications** list to add those filters to the rule.

**Related Topics**

- **Application Filters**, on page 350

**Available Applications in SSL Rules**

When building an application condition in an SSL rule, use the **Available Applications** list to select the applications whose traffic you want to match.

**Browsing the List of Applications**

When you first start to build the condition the list is unconstrained, and displays every application the system detects, 100 at a time:

- To page through the applications, click the arrows underneath the list.
- To display a pop-up window with summary information about the application’s characteristics, as well as Internet search links that you can follow, click the information icon (ⓘ) next to an application.

**Finding Applications to Match**

To help you find the applications you want to match, you can constrain the **Available Applications** list in the following ways:

- To search for applications, click the **Search by name** prompt above the list, then type a name. The list updates as you type to display matching applications.
• To constrain the applications by applying a filter, use the Application Filters list. The Available Applications list updates as you apply filters.

Once constrained, an All apps matching the filter option appears at the top of the Available Applications list.

If you select one or more filters in the Application Filters list and also search the Available Applications list, your selections and the search-filtered Available Applications list are combined using an AND operation. That is, the All apps matching the filter condition includes all the individual conditions currently displayed in the Available Applications list as well as the search string entered above the Available Applications list.

Selecting Single Applications to Match in a Condition

After you find an application you want to match, click to select it. To select all applications in the current constrained view, right-click and select Select All.

In a single application condition, you can match a maximum of 50 applications by selecting them individually; to add more than 50 you must either create multiple SSL rules or use filters to group applications.

Selecting All Applications Matching a Filter for a Condition

Once constrained by either searching or using the filters in the Application Filters list, the All apps matching the filter option appears at the top of the Available Applications list.

This option allows you to add the entire set of applications in the constrained Available Applications list to the Selected Applications and Filters list, at once. In contrast to adding applications individually, adding this set of applications counts as only one item against the maximum of 50, regardless of the number of individual application that comprise it.

When you build an application condition this way, the name of the filter you add to the Selected Applications and Filters list is a concatenation of the filter types represented in the filter plus the names of up to three filters for each type. More than three filters of the same type are followed by an ellipsis (...). For example, the following filter name includes two filters under the Risks type and four under Business Relevance:

Risks: Medium, High Business Relevance: Low, Medium, High,...

Filter types that are not represented in a filter you add with All apps matching the filter are not included in the name of the filter you add. The instructional text that is displayed when you hover your pointer over the filter name in the Selected Applications and Filters list indicates that these filter types are set to any; that is, these filter types do not constrain the filter, so any value is allowed for these.

You can add multiple instances of All apps matching the filter to an application condition, with each instance counting as a separate item in the Selected Applications and Filters list. For example, you could add all high risk applications as one item, clear your selections, then add all low business relevance applications as another item. This application condition matches applications that are high risk OR have low business relevance.

Application-Based SSL Rule Condition Requirements

For encrypted traffic to match an SSL rule with an application condition, the traffic must match one of the filters or applications that you add to a Selected Applications and Filters list.
You can add a maximum of 50 items per condition, and filters added to a condition are listed above and separately from individually added applications. When building an application condition, warning icons indicate invalid configurations. For details, hover your pointer over the icon.

### Adding an Application Condition to an SSL Rule

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

#### Procedure

**Step 1**  
In the SSL rule editor, select the Applications tab.

**Step 2**  
If you want to constrain the list of applications displayed in the Available Applications list, you must select one or more filters in the Application Filters list. For more information, see Application Filters in SSL Rules, on page 1220.

**Step 3**  
Find and select the applications you want to add from the Available Applications list. You can search for and select individual applications, or, when the list is constrained, All apps matching the filter. For more information, see Available Applications in SSL Rules, on page 1221.

**Step 4**  
Click Add to Rule.

**Tip**  
Click Clear All Filters to clear your existing selections. You can also drag and drop selected applications and filters.

**Step 5**  
Save or continue editing the rule.

### Example

The following graphic shows the application condition for an SSL rule that decrypts a custom group of applications for MyCompany, all applications with high risk and low business relevance, gaming applications, and some individually selected applications.
Limitations to Encrypted Application Control

Encrypted Application Identification

The system can identify unencrypted applications that become encrypted using StartTLS. This includes such applications as SMTPS, POPS, FTPS, TelnetS, and IMAPS. In addition, it can identify certain encrypted applications based on the Server Name Indication in the TLS ClientHello message, or the server certificate subject distinguished name value.

Speed of Application Identification

The system cannot perform application control on encrypted traffic before:

- an encrypted connection is established between a client and server, and
- the system identifies the application in the encrypted session

This identification occurs after the server certificate exchange. If traffic exchanged during the SSL handshake matches all other conditions in an SSL rule containing an application condition but the identification is not complete, the SSL policy allows the packet to pass. This behavior allows the handshake to complete so that applications can be identified. For your convenience, affected rules are marked with an information icon (i).

After the system completes its identification, the system applies the SSL rule action to the remaining session traffic that matches its application condition.

Automatically Enabling Application Detectors

At least one detector must be enabled for each application rule condition in the policy. If no detector is enabled for an application, the system automatically enables all system-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application.

<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Procedure

**Step 1**
In the SSL rule editor, select the Category tab.

**Step 2**
Find the categories of URL you want to add from the Categories list. To match encrypted web traffic regardless of category, select Any category. To search for categories to add, click the Search by name or value prompt above the Categories list, then type the category name. The list updates as you type to display matching categories.

**Step 3**
To select a category, click it.

**Tip** Although you can right-click and Select All categories, adding all categories this way exceeds the 50-item maximum for an SSL rule. Instead, use Any.

**Step 4**
If you want to qualify your category selections, you must click a reputation level from the Reputations list. You can only select one reputation level. If you do not specify a reputation level, the system defaults to Any, meaning all levels.

- If the rule blocks web access or decrypts traffic (the rule action is Block, Block with reset, Decrypt - Known Key, Decrypt - Resign, or Monitor) selecting a reputation level also selects all reputations more severe than that level. For example, if you configure a rule to block Suspicious sites (level 2), it also automatically blocks High Risk (level 1) sites.

- If the rule allows web access, subject to access control (the rule action is Do not decrypt), selecting a reputation level also selects all reputations less severe than that level. For example, if you configure a rule to allow Benign sites (level 4), it also automatically allows Well known (level 5) sites.

**Note** If you change the rule action for a rule, the system automatically changes the reputation levels in URL conditions according to the above points.

**Step 5**
Click Add to Rule to add the selected items to the Selected Categories list.

**Tip** You can also drag and drop selected items.

**Step 6**
Save or continue editing the rule.

**Example**
The following graphic shows the URL condition for an example access control rule that blocks: all malware sites, all high-risk sites, and all non-benign social networking sites.
The following table summarizes how you build the condition shown in the graphic above.

**Table 94: Example: Building A URL Condition**

<table>
<thead>
<tr>
<th>To block...</th>
<th>Select this Category or URL Object...</th>
<th>And this Reputation...</th>
</tr>
</thead>
<tbody>
<tr>
<td>malware sites, regardless of reputation</td>
<td>Malware Sites</td>
<td>Any</td>
</tr>
<tr>
<td>any URL with a high risk (level 1)</td>
<td>Any</td>
<td>1 - High Risk</td>
</tr>
<tr>
<td>social networking sites with a risk greater than benign (levels 1 through 3)</td>
<td>Social Network</td>
<td>3 - Benign sites with security risks</td>
</tr>
</tbody>
</table>

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Server Certificate-Based SSL Rule Conditions**

SSL rules can handle and decrypt encrypted traffic based on server certificate characteristics. You can configure SSL rules based on the following server certificate attributes:

- Distinguished name conditions allow you to handle and inspect encrypted traffic based on the CA that issued a server certificate, or the certificate holder. Based on the issuer distinguished name, you can handle traffic based on the CA that issued a site’s server certificate.

- Certificate conditions in SSL rules allow you to handle and inspect encrypted traffic based on the server certificate used to encrypt that traffic. You can configure a condition with one or more certificates; traffic matches the rule if the certificate matches any of the condition’s certificates.

- Certificate status conditions in SSL rules allow you to handle and inspect encrypted traffic based on the status of the server certificate used to encrypt the traffic, including whether a certificate is valid, revoked, expired, not yet valid, self-signed, signed by a trusted CA, whether the Certificate Revocation List (CRL) is valid; whether the Server Name Indication (SNI) in the certificate matches the server in the request.

- Cipher suite conditions in SSL rules allow you to handle and inspect encrypted traffic based on the cipher suite used to negotiate the encrypted session.

- Session conditions in SSL rules allow you to inspect encrypted traffic based on the SSL or TLS version used to encrypt the traffic.
To detect multiple cipher suites in a rule, the certificate issuer, or the certificate holder, you can create reusable cipher suite list and distinguished name objects and add them to your rule. To detect the server certificate and certain certificate statuses, you must create external certificate and external CA objects for the rule.

**Certificate Distinguished Name SSL Rule Conditions**

When configuring the rule condition, you can manually specify a literal value, reference a distinguished name object, or reference a distinguished name group containing multiple objects.

---

**Note**

You cannot configure a distinguished name condition if you also choose the Decrypt - Known Key action. Because that action requires you to choose a server certificate to decrypt traffic, the certificate already matches the traffic.

You can match against multiple subject and issuer distinguished names in a single certificate status rule condition; only one common or distinguished name needs to match to match the rule.

If you add a distinguished name manually, it can contain the common name attribute (CN). If you add a common name without CN=, the system prepends CN= before saving the object.

You can also add a distinguished name with one each of the following attributes, separated by commas: C, CN, O, OU.

In a single DN condition, you can add a maximum of 50 literal values and distinguished name objects to the Subject DNs, and 50 literal values and distinguished name objects to the Issuer DNs.

The system-provided DN object group, Cisco-Undecryptable-Sites, contains websites whose traffic the system cannot decrypt. You can add this group to a DN condition to block or not decrypt traffic to or from these websites, without wasting system resources attempting to decrypt that traffic. You can modify individual entries in the group. You cannot delete the group. System updates can modify the entries on this list, but the system preserves user changes.

The first time the system detects an encrypted session to a new server, DN data is not available for ClientHello processing, which can result in an undecrypted first session. After the initial session, the managed device caches data from the server Certificate message. For subsequent connections from the same client, the system can match the ClientHello message conclusively to rules with DN conditions and process the message to maximize decryption potential.

**Controlling Encrypted Traffic by Certificate Distinguished Name**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**

In the SSL rule editor, select the DN tab.

**Step 2**

Find the distinguished names you want to add from the Available DNs, as follows:
• To add a distinguished name object on the fly, which you can then add to the condition, click the add icon ( ) above the Available DNs list.

• To search for distinguished name objects and groups to add, click the Search by name or value prompt above the Available DNs list, then type either the name of the object, or a value in the object. The list updates as you type to display matching objects.

**Step 3**  
To select an object, click it. To select all objects, right-click and then select Select All.

**Step 4**  
Click Add to Subject or Add to Issuer.

**Tip**  
You can also drag and drop selected objects.

**Step 5**  
Add any literal common names or distinguished names that you want to specify manually. Click the Enter DN or CN prompt below the Subject DNs or Issuer DNs list; then type a common name or distinguished name and click Add.

**Step 6**  
Add or continue editing the rule.

### Example

The following graphic illustrates a distinguished name rule condition searching for certificates issued to goodbakery.example.com or issued by goodca.example.com. Traffic encrypted with these certificates is allowed, subject to access control.

![Subject DNs (1) and Issuer DNs (1)](#)

The following graphic illustrates a distinguished name rule condition searching for certificates issued to badbakery.example.com and associated domains, or certificates issued by badca.example.com. Traffic encrypted with these certificates is decrypted using a re-signed certificate.

![Subject DNs (3) and Issuer DNs (1)](#)

### What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

### Related Topics

Distinguished Name Objects, on page 385
Certificate SSL Rule Conditions

When you build a certificate-based SSL rule condition, you can upload a server certificate; you save the certificate as an external certificate object, which is reusable and associates a name with a server certificate. Alternately, you can configure certificate conditions with existing external certificate objects and object groups.

You can search the Available Certificates field in the rule condition based for external certificate objects and object groups based on the following certificate distinguished name characteristics:

- subject or issuer common name (CN)
- subject or issuer organization (O)
- subject or issuer organizational unit (OU)

You can choose to match against multiple certificates in a single certificate rule condition; if the certificate used to encrypt the traffic matches any of the uploaded certificates, the encrypted traffic matches the rule.

You can add a maximum of 50 external certificate objects and external certificate object groups to the Selected Certificates in a single certificate condition.

Note the following:

- You cannot configure a certificate condition if you also select the Decrypt - Known Key action. Because that action requires you to select a server certificate to decrypt traffic, the implication is that the certificate already matches the traffic.

- If you configure a certificate condition with an external certificate object, any cipher suites you add to a cipher suite condition, or internal CA objects you associate with the Decrypt - Resign action, must match the external certificate’s signature algorithm type. For example, if your rule’s certificate condition references an EC-based server certificate, any cipher suites you add, or CA certificates you associate with the Decrypt - Resign action, must also be EC-based. If you mismatch signature algorithm types in this case, the policy editor displays a warning icon next to the rule.

- The first time the system detects an encrypted session to a new server, certificate data is not available for ClientHello processing, which can result in an undecrypted first session. After the initial session, the managed device caches data from the server Certificate message. For subsequent connections from the same client, the system can match the ClientHello message conclusively to rules with certificate conditions and process the message to maximize decryption potential.

Controlling Encrypted Traffic by Certificate

External Certificate Objects, on page 395

Certificate Status SSL Rule Conditions

For each certificate status SSL rule condition you configure, you can match traffic against the presence or absence of a given status. You can select several statuses in one rule condition; if the certificate matches any of the selected statuses, the rule matches the traffic.

You can choose to match against the presence or absence of multiple certificate statuses in a single certificate status rule condition; the certificate needs to match only one of the criteria to match the rule.

The following table describes how the system evaluates encrypted traffic based on the encrypting server certificate’s status.

Table 95: Certificate Status Rule Condition Criteria

<table>
<thead>
<tr>
<th>Status Check</th>
<th>Status Set to Yes</th>
<th>Status Set to No</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revoked</td>
<td>The policy trusts the CA that issued the server certificate, and the CA certificate uploaded to the policy contains a CRL that revokes the server certificate.</td>
<td>The policy trusts the CA that issued the server certificate, and the CA certificate uploaded to the policy does not contain a CRL that revokes the certificate.</td>
</tr>
<tr>
<td>Self-signed</td>
<td>The detected server certificate contains the same subject and issuer distinguished name.</td>
<td>The detected server certificate contains different subject and issuer distinguished names.</td>
</tr>
</tbody>
</table>
### Certificate Status SSL Rule Conditions

<table>
<thead>
<tr>
<th>Status Check</th>
<th>Status Set to Yes</th>
<th>Status Set to No</th>
</tr>
</thead>
<tbody>
<tr>
<td>Valid</td>
<td>All of the following are true:</td>
<td>At least one of the following is true:</td>
</tr>
<tr>
<td></td>
<td>• The policy trusts the CA that issued the certificate</td>
<td>• The policy does not trust the CA that issued the certificate</td>
</tr>
<tr>
<td></td>
<td>• The signature is valid</td>
<td>• The signature is invalid</td>
</tr>
<tr>
<td></td>
<td>• The issuer is valid</td>
<td>• The issuer is invalid</td>
</tr>
<tr>
<td></td>
<td>• None of the policy’s trusted CAs revoked the certificate.</td>
<td>• A trusted CA in the policy revoked the certificate.</td>
</tr>
<tr>
<td></td>
<td>• The current date is between the certificate Valid From and Valid To date</td>
<td>• The current date is before the certificate Valid From date</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The current date is after the certificate Valid To date</td>
</tr>
<tr>
<td>Invalid signature</td>
<td>The certificate’s signature cannot be properly validated against the certificate’s content.</td>
<td>The certificate’s signature is properly validated against the certificate’s content.</td>
</tr>
<tr>
<td>Invalid issuer</td>
<td>The issuer CA certificate is not stored in the policy’s list of trusted CA certificates.</td>
<td>The issuer CA certificate is stored in the policy’s list of trusted CA certificates.</td>
</tr>
<tr>
<td>Expired</td>
<td>The current date is after the certificate Valid To date.</td>
<td>The current date is before or on the certificate Valid To date.</td>
</tr>
<tr>
<td>Not yet valid</td>
<td>The current date is before the certificate Valid From date.</td>
<td>The current date is after or on the certificate Valid From date.</td>
</tr>
<tr>
<td>Server mismatch</td>
<td>The server name does not match the server's Server Name Indication (SNI) name, which could indicate an attempt to spoof the server name.</td>
<td>The server name matches the SNI name of the server to which the client is requesting access.</td>
</tr>
</tbody>
</table>

Note that even though a certificate might match more than one status, the rule causes an action to be taken on the traffic only once.

Checking whether a CA issued or revoked a certificate requires uploading root and intermediate CA certificates and associated CRLs as objects. You then add these trusted CA objects to an SSL policy’s list of trusted CA certificates.

The first time the system detects an encrypted session to a new server, certificate status is not available for ClientHello processing, which can result in an undecrypted first session. After the initial session, the managed device caches data from the server Certificate message. For subsequent connections from the same client, the system can match the ClientHello message conclusively to rules with certificate status conditions and process the message to maximize decryption potential.
You can trust CAs by adding root and intermediate CA certificates to your SSL policy, then use these trusted CAs to verify server certificates used to encrypt traffic.

If a trusted CA certificate contains an uploaded certificate revocation list (CRL), you can also verify whether a trusted CA revoked the encryption certificate.

Procedure

Step 1  In the SSL rule editor, select the Trusted CA Certificates tab.

Step 2  Find the trusted CAs you want to add from the Available Trusted CAs, as follows:

- To add a trusted CA object on the fly, which you can then add to the condition, click the add icon (✓) above the Available Trusted CAs list.
- To search for trusted CA objects and groups to add, click the Search by name or value prompt above the Available Trusted CAs list, then type either the name of the object, or a value in the object. The list updates as you type to display matching objects.

Step 3  To select an object, click it. To select all objects, right-click and then select Select All.

Step 4  Click Add to Rule.

Tip  You can also drag and drop selected objects.

Step 5  Add or continue editing the rule.

What to do next

- Add a certificate status SSL rule condition to your SSL rule. See Matching Traffic on Certificate Status, on page 1233 for more information.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics

Related Topics

Trusted Certificate Authority Objects, on page 393

Trusted External Certificate Authority Configuration

Verified server certificates include certificates signed by trusted CAs. After you add trusted CA certificates to the SSL policy, you can configure an SSL rule with certificate status conditions to match against this traffic.
Upload all certificates within a root CA’s chain of trust to the list of trusted CA certificates, including the root CA certificate and all intermediate CA certificates. Otherwise, it is more difficult to detect trusted certificates issued by intermediate CAs. Also, if you configure certificate status conditions to trust traffic based on the root issuer CA, all traffic within a trusted CA’s chain of trust can be allowed without decryption, rather than unnecessarily decrypting it.

When you create an SSL policy, the system populates the Trusted CA Certificates tab with a default Trusted CA object group, Cisco Trusted Authorities.

You can modify individual entries in the group, and choose whether to include this group in your SSL policy. You cannot delete the group. System updates can modify the entries on this list, but user changes are preserved.

### Matching Traffic on Certificate Status

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Before you begin**

- Add a trusted CA object or group to your SSL policy. See Trusting External Certificate Authorities, on page 1232 for more information.

**Procedure**

1. **Step 1** In the Firepower Management Center, choose **Policies > Access Control > SSL**.
2. **Step 2** Add a new policy or edit an existing policy.
3. **Step 3** Add a new SSL rule or edit an existing rule.
4. **Step 4** In the Add Rule or Editing Rule dialog box, choose the **Cert Status** tab.
5. **Step 5** For each certificate status, you have the following options:
   - Choose **Yes** to match against the presence of that certificate status.
   - Choose **No** to match against the absence of that certificate status.
   - Choose **Any** to skip the condition when matching the rule. In other words, choosing **Any** means the rule matches whether the certificate status is present or absent.
6. **Step 6** Add or continue editing the rule.

**Example**

The organization trusts the Verified Authority certificate authority. The organization does not trust the Spammer Authority certificate authority. The system administrator uploads the Verified Authority
certificate and an intermediate CA certificate issued by Verified Authority to the system. Because Verified Authority revoked a certificate it previously issued, the system administrator uploads the CRL that Verified Authority provided.

The following graphic illustrates a certificate status rule condition checking for valid certificates, those issued by a Verified Authority, are not on the CRL, and still within the Valid From and Valid To date. Because of the configuration, traffic encrypted with these certificates is not decrypted and inspected with access control.

The following graphic illustrates a certificate status rule condition checking for the absence of a status. In this case, because of the configuration, it matches against traffic encrypted with a certificate that has not expired and monitors that traffic.

The following graphic illustrates a certificate status rule condition that matches on the presence or absence of several statuses. Because of the configuration, if the rule matches incoming traffic encrypted with a certificate issued by an invalid user, self-signed, invalid, or expired, it decrypts the traffic with a known key.

The following graphic illustrates a certificate status rule condition that matches if the SNI of the request matches the server name or if the CRL is not valid. Because of the configuration, if the rule matches either condition, traffic is blocked.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.
Cipher Suite SSL Rule Conditions

Cisco provides predefined cipher suites you can add to a cipher suite rule condition. You can also add cipher suite list objects containing multiple cipher suites.

You cannot add new cipher suites. You can neither modify nor delete predefined cipher suites.

You can add a maximum of 50 cipher suites and cipher suite lists to the Selected Cipher Suites in a single cipher suite condition. The system supports adding the following cipher suites to a cipher suite condition:

- SSL_RSA_FIPS_WITH_3DES_EDE_CBC_SHA
- SSL_RSA_FIPS_WITH_DES_CBC_SHA
- TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA
- TLS_DHE_RSA_WITH_AES_128_CBC_SHA
- TLS_DHE_RSA_WITH_AES_128_CBC_SHA256
- TLS_DHE_RSA_WITH_AES_128_GCM_SHA256
- TLS_DHE_RSA_WITH_AES_128_GCM_SHA256
- TLS_DHE_RSA_WITH_AES_256_CBC_SHA
- TLS_DHE_RSA_WITH_AES_256_CBC_SHA256
- TLS_DHE_RSA_WITH_AES_256_GCM_SHA384
- TLS_DHE_RSA_WITH_CAMELLIA_128_CBC_SHA
- TLS_DHE_RSA_WITH_CAMELLIA_128_CBC_SHA256
- TLS_DHE_RSA_WITH_CAMELLIA_256_CBC_SHA
- TLS_DHE_RSA_WITH_CAMELLIA_256_CBC_SHA256
- TLS_ECDHE_ECDSA_WITH_3DES_EDE_CBC_SHA
- TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA
- TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256
- TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256
- TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA
- TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA256
- TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384
- TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
- TLS_ECDHE_ECDSA_WITH_NULL_SHA
- TLS_ECDHE_ECDSA_WITH_RC4_128_SHA
- TLS_ECDHE_RSA_WITH_3DES_EDE_CBC_SHA
- TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA
- TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256
- TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256
- TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA
- TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA256
- TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384
- TLS_ECDHE_RSA_WITH_NULL_SHA
- TLS_ECDHE_RSA_WITH_RC4_128_SHA
- TLS_RSA_WITH_3DES_EDE_CBC_SHA
- TLS_RSA_WITH_AES_128_CBC_SHA
- TLS_RSA_WITH_AES_128_CBC_SHA256
- TLS_RSA_WITH_AES_128_GCM_SHA256
- TLS_RSA_WITH_AES_256_CBC_SHA
- TLS_RSA_WITH_AES_256_CBC_SHA256
- TLS_RSA_WITH_AES_256_GCM_SHA384
- TLS_RSA_WITH_CAMELLIA_128_CBC_SHA
- TLS_RSA_WITH_CAMELLIA_128_CBC_SHA256
- TLS_RSA_WITH_CAMELLIA_256_CBC_SHA
- TLS_RSA_WITH_CAMELLIA_256_CBC_SHA256
- TLS_RSA_WITH_DES_CBC_SHA
- TLS_RSA_WITH_NULL_MD5
- TLS_RSA_WITH_NULL_SHA
- TLS_RSA_WITH_RC4_128_MD5
- TLS_RSA_WITH_RC4_128_SHA

Note the following:
- If you add cipher suites not supported for your deployment, you cannot deploy your configuration. For example, passive deployments do not support decrypting traffic with the any of the ephemeral...
Diffie-Hellman (DHE) or ephemeral elliptic curve Diffie-Hellman (ECDHE) cipher suites. Creating a rule with these cipher suites prevents you from deploying your access control policy.

• If you configure a cipher suite condition with a cipher suite, any external certificate objects you add to a certificate condition, or internal CA objects you associate with the Decrypt - Resign action, must match the cipher suite’s signature algorithm type. For example, if your rule’s cipher suite condition references an EC-based cipher suite, any server certificates you add, or CA certificates you associate with the Decrypt - Resign action, must also be EC-based. If you mismatch signature algorithm types in this case, the policy editor displays a warning icon next to the rule.

• You can add an anonymous cipher suite to the Cipher Suite condition in an SSL rule, but keep in mind:
  • The system automatically strips anonymous cipher suites during ClientHello processing. For the system to use the rule, you must also configure your SSL rules in an order that prevents ClientHello processing. For more information, see SSL Rule Order, on page 330.
  • You cannot use either the Decrypt - Resign or Decrypt - Known Key action in the rule, because the system cannot decrypt traffic encrypted with an anonymous cipher suite.

• When specifying a cipher suite as a rule condition, consider that the rule matches on the negotiated cipher suite in the ServerHello message, rather than on the full list of cipher suites specified in the ClientHello message. During ClientHello processing, the managed device strips unsupported cipher suites from the ClientHello message. However, if this results in all specified cipher suites being stripped, the system retains the original list. If the system retains unsupported cipher suites, subsequent evaluation results in an undecrypted session.

Controlling Encrypted Traffic by Cipher Suite

<table>
<thead>
<tr>

Cipher Suite Lists, on page 384

Encryption Protocol Version SSL Rule Conditions

You can choose to match against traffic encrypted with SSL version 3.0, or TLS version 1.0, 1.1, or 1.2. By default, all protocol versions are selected when you create a rule; if you select multiple versions, encrypted traffic that matches any of the selected versions matches the rule. You must select at least one protocol version when saving the rule condition.

You cannot select SSL v2.0 in a version rule condition; the system does not support decrypting traffic encrypted with SSL version 2.0. You can configure an undecryptable action to allow or block this traffic without further inspection.

Controlling Traffic by Encryption Protocol Version

Advanced Malware Protection (AMP) and File Control

- File Policies and Advanced Malware Protection, on page 1241
- File and Malware Inspection Performance and Storage Tuning, on page 1269
File Policies and Advanced Malware Protection

The following topics provide an overview of file control, file policies, file rules, AMP cloud connections, and dynamic analysis connections.

- About File Policies and Advanced Malware Protection, on page 1241
- File Control and Cisco AMP Basics, on page 1242
- File Policies, on page 1247
- File Rules, on page 1253
- Cloud Connections, on page 1258
- Collective Security Intelligence Communications Configuration, on page 1266

About File Policies and Advanced Malware Protection

Malicious software, or malware, can enter your organization’s network via multiple routes. To help you identify and mitigate the effects of malware, Advanced Malware Protection (AMP for Networks, formerly called AMP for Firepower) can detect, track, store, analyze, and optionally block the transmission of malware in network traffic.

You configure AMP for Networks and file control (which allows control over all files of a specific type regardless of whether the files contain malware) as part of your overall access control configuration. File policies that you create and associate with access control rules handle network traffic that matches the rules. You can download files detected in that traffic and run local malware analysis to determine whether the files contain malware. You can also submit files to the AMP Threat Grid cloud for dynamic analysis to determine whether the files represent malware.

The system automatically enables file event, malware event, and captured file logging for active file policies. When a file policy generates a file or malware event, or captures a file, the system also automatically logs the end of the associated connection to the Firepower Management Center database.

---

Note

File events generated by inspecting NetBIOS-ssn (SMB) traffic do not immediately generate connection events because the client and server establish a persistent connection. The system generates connection events after the client or server ends the session.

To further target your analysis, you can use a malware file’s network file trajectory page to track the spread of an individual threat across hosts over time, allowing you to concentrate outbreak control and prevention efforts where most useful.
If your organization uses AMP for Endpoints, the system can import and display endpoint-based data alongside any data gathered by AMP for Networks. Importing this data does not require a license.

If your organization requires additional security or wants to limit outside connections, you can use a Cisco AMP Private Cloud Virtual Appliance (AMPv). AMPv privately collects AMP for Endpoints events and forwards them to the Firepower Management Center.

File Control and Cisco AMP Basics

AMP for Networks

AMP for Networks allows you to detect, store, track, analyze, and block malware on your network using managed devices deployed inline. AMP for Networks can block many types of malware files, including PDFs and Microsoft Office documents.

File Detection and Storage

With AMP for Networks, managed devices monitor network traffic for transmissions of certain file types. When a device detects an eligible file, it sends the file's SHA-256 hash value to the Firepower Management Center. The Firepower Management Center performs a malware cloud lookup, querying the AMP cloud for the file's disposition. The device can also store an eligible file to its hard drive or malware storage pack using the file storage feature. You can view captured file information under Analysis > files > Captured Files, and download a copy for offline analysis.

File Analysis

The system applies several methods of file inspection and analysis to determine whether a file contains malware.

Based on your configuration, you can either inspect a file the first time the system detects it, and wait for a cloud lookup result, or pass the file on this first detection without waiting for the cloud lookup result.

Based on whether you enable the option in a file rule, the system inspects files in the following order:

Spero Analysis

If the file is an eligible executable file, the device can analyze the file's structure and submit the resulting Spero signature to the AMP Threat Grid cloud. The cloud uses this signature to determine if the file contains malware.

Local Malware Analysis

Using a local malware inspection engine, the device examines an eligible file, blocks it if the file contains malware and the file rule is configured to do so, and generates malware events.

The device also generates a file composition report detailing a file's properties, embedded objects, and possible malware.
Dynamic Analysis

If the device preclassifies files as possible malware, it submits these files to the AMP Threat Grid cloud or an AMP Threat Grid on-premises appliance for dynamic analysis, regardless of whether the device stores the file.

The AMP Threat Grid cloud or on-premises AMP Threat Grid appliance runs the file in a sandbox environment to determine whether the file is malicious, and returns a threat score that describes the likelihood a file contains malware. From the threat score, you can view a dynamic analysis summary report that details why the cloud assigned the threat score.

File and Malware Events and Captured Files

Based on the file analysis results, you can review captured files and generated malware and file events using tables on pages available under the Analysis > Files options. When available, you can examine a file's composition, disposition, threat score, and dynamic analysis summary report for further insight into the malware analysis. You can also access the network file trajectory, which displays a map of how the file traversed your network, passing among hosts, as well as various file properties.

Archive Files

The system can inspect up to three levels of nested files beneath the outermost archive file (level 0) if the file is an archive (such as .zip or .rar archive files). You can inspect archive files as large as the Maximum file size to store advanced access control setting.

If any individual file matches a file rule with a block action, the system blocks the entire archive, not just the individual file. The system can also block archives that exceed a specified level of nesting, or whose contents are encrypted or otherwise cannot be inspected.

File Tracking

If a file has a disposition in the AMP cloud that you know to be incorrect, you can add the file’s SHA-256 value to a file list:

- To treat a file as if the AMP cloud assigned a clean disposition, add the file to the clean list.
- To treat a file as if the AMP cloud assigned a malware disposition, add the file to the custom detection list.

On subsequent detection, the device either allows or blocks the file without reevaluating the file's disposition. You can use the clean list or custom detection list per file policy.

Note

You must configure a rule in the file policy to either perform a malware cloud lookup or block malware on matching files to calculate a file's SHA-256 value.

Related Topics

File Lists, on page 379

Malware Dispositions

The system determines file dispositions based on the disposition returned by the AMP cloud. To improve performance, if the system already knows the disposition for a file based on its SHA-256 value, the Firepower Management Center uses the cached disposition rather than querying the AMP cloud. Based on its disposition,
the system can block the file. If any nested file inside an archive file is blocked, the system blocks the entire archive file.

A file can have one of the following file dispositions as a result of addition to a file list, or due to threat score:

- **Malware** indicates that the AMP cloud categorized the file as malware, local malware analysis identified malware, or the file’s threat score exceeded the malware threshold defined in the file policy.
- **Clean** indicates that the AMP cloud categorized the file as clean, or that a user added the file to the clean list.
- **Unknown** indicates that the system queried the AMP cloud, but the file has not been assigned a disposition; in other words, the AMP cloud has not categorized the file.
- **Custom Detection** indicates that a user added the file to the custom detection list.
- **Unavailable** indicates that the system could not query the AMP cloud. You may see a small percentage of events with this disposition; this is expected behavior.

Archive files have dispositions based on the dispositions assigned to the files inside the archive. All archives that contain identified malware files receive a disposition of **Malware**. Archives without identified malware files receive a disposition of **Unknown** if they contain any unknown files, and a disposition of **Clean** if they contain only clean files.

### Table 96: Archive File Disposition by Contents

<table>
<thead>
<tr>
<th>Archive File Disposition</th>
<th>Number of Unknown Files</th>
<th>Number of Clean Files</th>
<th>Number of Malware Files</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unknown</td>
<td>1 or more</td>
<td>Any</td>
<td>0</td>
</tr>
<tr>
<td>Clean</td>
<td>0</td>
<td>1 or more</td>
<td>0</td>
</tr>
<tr>
<td>Malware</td>
<td>Any</td>
<td>Any</td>
<td>1 or more</td>
</tr>
</tbody>
</table>

Archive files, like other files, may have dispositions of **Custom Detection** or **Unavailable** if the conditions for those dispositions apply.

**Tip**

If you see several **Unavailable** malware events in quick succession, make sure the Firepower Management Center can contact the AMP cloud.

Note that file dispositions can change. For example, the AMP cloud can determine that a file that was previously thought to be clean is now identified as malware, or the reverse—that a malware-identified file is actually clean. When the disposition changes for a file you queried in the last week, the AMP cloud notifies the system so it can automatically take action the next time it detects that file being transmitted. A changed disposition is called a **retrospective** disposition.

Dispositions returned from an AMP cloud query, associated threat scores, and dispositions assigned by local malware analysis, have a time-to-live (TTL) value. After a disposition has been held for the duration specified in the TTL value without update, the system purges the cached information. Dispositions and associated threat scores have the following TTL values:

- **Clean** — 4 hours
- **Unknown** — 1 hour
Malware — 1 hour

If a query against the cache identifies a cached disposition that timed out, the system re-queries the AMP cloud for a new disposition.

File Control without AMP for Networks

If your organization wants to block not only the transmission of malware files, but all files of a specific type (regardless of whether the files contain malware), the file control feature allows you to cast a wider net. As with AMP for Networks, managed devices monitor network traffic for transmissions of specific file types, then either block or allow the file.

File control is supported for all file types where the system can detect malware, plus many additional file types. These file types are grouped into basic categories, including multimedia (swf, mp3), executables (exe, torrent), and PDFs. Note that file control, unlike AMP for Networks, does not require queries of the AMP cloud.

AMP for Endpoints

AMP for Endpoints is Cisco’s enterprise-class Advanced Malware Protection solution that discovers, understands, and blocks advanced malware outbreaks, advanced persistent threats, and targeted attacks. The following diagram details the general flow of information using AMP for Endpoints.

If your organization uses AMP for Endpoints, individual users install lightweight connectors on endpoints: computers and mobile devices. Connectors can inspect files upon upload, download, execution, open, copy, move, and so on. These connectors communicate with the AMP cloud to determine if inspected files contain malware.

When a file is positively identified as malware, the AMP cloud sends the threat identification to the Firepower Management Center. The AMP cloud can also send other kinds of information to the Firepower Management Center, including data on scans, quarantines, blocked executions, and cloud recalls. The Firepower Management Center logs this information as malware events.

AMP for Endpoints can generate indications of compromise (IOC) when a host’s security may be compromised. The Firepower System can display this IOC information for its monitored hosts. Cisco occasionally develops new IOC types for endpoint-based malware events, which the system automatically downloads.

With AMP for Endpoints, you can not only configure Management Center-initiated remediations and alerts based on malware events, but you can also use the AMP for Endpoints management console help you mitigate the effect of malware. The management console provides a robust, flexible web interface where you control all aspects of your AMP for Endpoints deployment and manage all phases of an outbreak. You can:
• configure custom malware detection policies and profiles for your entire organization, as well as perform flash and full scans on all your users’ files

• perform malware analysis, including view heat maps, detailed file information, network file trajectory, and threat root causes

• configure multiple aspects of outbreak control, including automatic quarantines, application blocking to stop non-quarantined executables from running, and exclusion lists

• create custom protections, block execution of certain applications based on group policy, and create custom whitelists

Tip For detailed information on AMP for Endpoints, see the AMP for Endpoints management console.

AMP for Networks vs. AMP for Endpoints

You can use the Firepower System to work with data from both AMP for Networks and AMP for Endpoints. Because AMP for Endpoints malware detection is performed at the endpoint at download or execution time, while managed devices detect malware in network traffic, the information in the two types of malware events is different. For example, endpoint-based malware events contain information on file path, invoking client application, and so on, while malware detections in network traffic contain port, application protocol, and originating IP address information about the connection used to transmit the file.

As another example, for network-based malware events, user information represents the user most recently logged into the host where the malware was destined, as determined by network discovery. But AMP for Endpoints-reported users represent the user currently logged into the endpoint where the malware was detected.

Note Depending on your deployment, endpoints monitored by AMP for Endpoints may not be the same hosts as those monitored by AMP for Networks. For this reason, endpoint-based malware events do not add hosts to the network map. However, the system uses IP and MAC address data to tag monitored hosts with indications of compromise obtained from your AMP for Endpoints deployment. If two different hosts monitored by different AMP solutions have the same IP and MAC address, the system can incorrectly tag monitored hosts with AMP for Endpoints IOCs.

The following table summarizes the differences between the two strategies.

Table 97: Network vs Endpoint-Based Advanced Malware Protection Strategies

**File Policies**

A file policy is a set of configurations that the system uses to perform AMP for Networks and file control, as part of your overall access control configuration. This association ensures that before the system passes a file in traffic that matches an access control rule’s conditions, it first inspects the file. Consider the following diagram of a simple access control policy in an inline deployment.
The policy has two access control rules, both of which use the Allow action and are associated with file policies. The policy’s default action is also to allow traffic, but without file policy inspection. In this scenario, traffic is handled as follows:

- Traffic that matches Rule 1 is inspected by File Policy A.
- Traffic that does not match Rule 1 is evaluated against Rule 2. Traffic that matches Rule 2 is inspected by File Policy B.
- Traffic that does not match either rule is allowed; you cannot associate a file policy with the default action.

You can associate a single file policy with an access control rule whose action is Allow, Interactive Block, or Interactive Block with reset. The system then uses that file policy to inspect network traffic that meets the conditions of the access control rule.

By associating different file policies with different access control rules, you have granular control over how you identify and block files transmitted on your network. Note, however, that you cannot use a file policy to inspect traffic handled by the access control default action.

**File Policy Advanced Configuration**

**Advanced File Inspection Configuration Notes**

In a file policy, you can configure advanced options to block files on the custom detection list, allow files on the clean list, and set a threshold threat score above which files are considered malware.

You can also configure your file policy to inspect the contents of archive files, allowing you to analyze and block archive files according to your organization’s needs. All features applicable to uncompressed files (such as dynamic analysis and file storage) are available for nested files inside archive files.
**Archive File Inspection Notes**

Some archive files contain additional archive files (and so on). The level at which a file is nested is its *archive file depth*. Note that the top-level archive file is not considered in the depth count; depth begins at 1 with the first nested file.

Although the system can only inspect up to 3 levels of nested archive files, you can configure your file policy to block archive files that exceed that depth (or a lower maximum depth that you specify). If you want to restrict nested archives further, you have the option to configure a lower maximum file depth of 2 or 1.

If you choose not to block files that exceed the maximum archive file depth of 3, when archive files that contain some extractable contents and some contents nested at a depth of 3 or greater appear in monitored traffic, the system examines and reports data only for the files it was able to inspect.

---

**Note**

If traffic that contains an archive file is blacklisted or whitelisted by Security Intelligence, or if the top-level archive file’s SHA-256 value is on the custom detection list, the system does not inspect the contents of the archive file. If a nested file is blacklisted, the entire archive is blocked; however, if a nested file is whitelisted, the archive is not automatically passed (depending on any other nested files and characteristics).

If your file policy is configured to inspect archive file contents, you can use the context menu in a table on pages under the Analysis > Files menu, and the network file trajectory viewer to view information about the files inside an archive when the archive file appears in a file event, malware event, or as a captured file.

All file contents of the archive are listed in table form, with a short summary of their relevant information: name, SHA-256 hash value, type, category, and archive depth. A network file trajectory icon appears by each file, which you can click to view further information about that specific file.

Note that you can only inspect archive files as large as the **Maximum file size to store** advanced access control setting.

**File Policy Configuration Notes and Limitations**

- For a new policy, the web interface indicates that the policy is not in use. If you are editing an in-use file policy, the web interface tells you how many access control policies use the file policy. In either case, you can click the text to jump to the Access Control Policies page.

- For an access control policy using a file policy with **Block Malware** rules for FTP, if you set the default action to an intrusion policy with **Drop when Inline** disabled, the system generates events for detected files or malware matching the rules, but does not drop the files. To block FTP file transfers and use an intrusion policy as the default action for the access control policy where you select the file policy, you must select an intrusion policy with **Drop when Inline** enabled.

---

**Managing File Policies**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat (file control) Malware (AMP for Networks)</td>
<td>Protection (file control) Malware (AMP for Networks)</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin</td>
</tr>
</tbody>
</table>
The File Policies page displays a list of existing file policies along with their last-modified dates. You can use this page to manage your file policies.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

---

**Note**

The system checks the AMP cloud for updates to the list of file types eligible for dynamic analysis (no more than once a day). If the list of eligible file types changes, this constitutes a change in the file policy; any access control policy using the file policy is marked out-of-date if deployed to any devices. You must deploy policies before the updated file policy can take effect on the device.

---

**Procedure**

**Step 1**
Select Policies > Access Control > Malware & File.

**Step 2**
Manage your file policies:

- **Compare** — Click Compare Policies; see Comparing Policies, on page 287.
- **Create** — To create a file policy, click New File Policy and proceed as described in Creating a File Policy, on page 1250.
- **Copy** — To copy a file policy, click the copy icon ( COPY ).
  
  If a view icon ( VIEW ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- **Delete** — If you want to delete a file policy, click the delete icon ( DELETE ), then click Yes and OK as prompted.
  
  If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- **Deploy** — Click Deploy; see Deploy Configuration Changes, on page 279.
- **Edit** — If you want to modify an existing file policy, click the edit icon ( EDIT ).
- **Report** — Click the report icon ( REPORT ); see Generating Current Policy Reports, on page 288.

---

**Creating a File Policy**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat (file control)</td>

<td>Admin/Access Admin</td>
</tr>
<tr>
<td>Malware (AMP for Networks)</td>
<td>Malware (AMP for Networks)</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin</td>
</tr>
</tbody>
</table>
Procedure

Step 1  Select Policies > Access Control > Malware & File.

Tip  To make a copy of an existing file policy, click the copy icon (COPY), then type a unique name for the new policy in the dialog box that appears. You can then modify the copy.

Step 2  Click New File Policy.

Step 3  Enter a Name and optional Description for your new policy.

Step 4  Click Save.

Step 5  Add one or more rules to the file policy as described in Creating File Rules, on page 1257.

Step 6  Optionally, select the Advanced tab and configure advanced options as described in Advanced and Archive File Inspection Options, on page 1251.

Step 7  Save the file policy.

What to do next

• Add the file policy to an access control rule as described in Access Control Rule Configuration to Perform File Control and Malware Protection, on page 1108.

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Advanced and Archive File Inspection Options

The Advanced tab in the file policy editor has the following general options:

• First Time File Analysis—Submit a file for file analysis that the system detects for the first time. The file must match a rule configured to perform a malware cloud lookup and Spero, local malware, or dynamic analysis. If you disable this option, files detected for the first time are marked with an Unknown disposition.

• Enable Custom Detection List—Block files on the custom detection list.

• Enable Clean List—Allow files on the clean list.

• Mark files as malware based on dynamic analysis threat score—Set a threshold threat score; files with scores equal or worse than the threshold are considered malware.

  If you select lower threshold values, you increase the number of files treated as malware. Depending on the action selected in your file policy, this can result in an increase of blocked files.

The Advanced tab in the file policy editor has the following archive file inspection options:

• Inspect Archives—Enables inspection of the contents of archive files, for archive files as large as the Maximum file size to store advanced access control setting.
Enabling or disabling **Inspect Archives** restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See **Snort® Restart Traffic Behavior**, on page 282 for more information.

- **Block Encrypted Archives**—Blocks archive files that have encrypted contents.
- **Block Uninspectable Archives**—Blocks archive files with contents that the system is unable to inspect for reasons other than encryption. This usually applies to corrupted files, or those that exceed your specified maximum archive depth.
- **Max Archive Depth**—Blocks nested archive files that exceed the specified depth. The top-level archive file is not considered in this count; depth begins at 1 with the first nested file.

**Related Topics**

</tr>
</tbody>
</table>

**Procedure**

**Step 1** Select Policies > Access Control > Malware & File.

**Step 2** Click the edit icon (✏) next to the file policy you want to edit. If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** You have the following options:

- Add a file rule by selecting Add File Rule. For more information, see File Rules, on page 1253.
- Edit an existing file rule by clicking the edit icon (✏) next to the rule you want to edit.
- Configure advanced options as described in Advanced and Archive File Inspection Options, on page 1251.

**Note** The file policy editor displays how many access control policies use the file policy you are currently editing. You can click the notification to display a list of the parent policies and, optionally, continue to the Access Control Policies page.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.
### File Rules

A file policy, like its parent access control policy, contains rules that determine how the system handles files that match the conditions of each rule. You can configure separate file rules to take different actions for different file types, application protocols, or directions of transfer.

Once a file matches a rule, the rule can:

- allow or block files based on simple file type matching
- block files based on disposition
- store captured files to the device
- submit captured files for local malware, Spero, or dynamic analysis

In addition, the file policy can:

- automatically treat a file as if it is clean or malware based on entries in the clean list or custom detection list
- treat a file as if it is malware if the file’s threat score exceeds a configurable threshold
- inspect the contents of archive files (such as .zip or .rar)
- block archive files whose contents are encrypted, nested beyond a specified maximum archive depth, or otherwise uninspectable

### File Rule Components

*Table 98: File Rule Components*

<table>
<thead>
<tr>
<th>File Rule Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application protocol</td>
<td>The system can detect and inspect files transmitted via FTP, HTTP, SMTP, IMAP, POP3, and NetBIOS-ssn (SMB). <strong>Any</strong>, the default, detects files in HTTP, SMTP, IMAP, POP3, FTP, and NetBIOS-ssn (SMB) traffic. To improve performance, you can restrict file detection to only one of those application protocols on a per-file rule basis.</td>
</tr>
<tr>
<td>direction of transfer</td>
<td>You can inspect incoming FTP, HTTP, IMAP, POP3, and NetBIOS-ssn (SMB) traffic for downloaded files; you can inspect outgoing FTP, HTTP, SMTP, and NetBIOS-ssn (SMB) traffic for uploaded files. <strong>Tip</strong> Use <strong>Any</strong> to detect files over multiple application protocols, regardless of whether users are sending or receiving.</td>
</tr>
</tbody>
</table>
The system can detect various types of files. These file types are grouped into basic categories, including multimedia (swf, mp3), executables (exe, torrent), and PDFs. You can configure file rules that detect individual file types, or on entire categories of file types.

For example, you could block all multimedia files, or just ShockWave Flash (swf) files. Or, you could configure the system to alert you when a user downloads a BitTorrent (torrent) file.

For a list of file types the system can inspect, select Policies > Access Control > Malware & File, create a temporary new file policy, then click Add Rule. Select a file type category and the file types that the system can inspect appear in the File Types list.

Note: Frequently triggered file rules can affect system performance. For example, detecting multimedia files in HTTP traffic (YouTube, for example, transmits significant Flash content) could generate an overwhelming number of events.

A file rule’s action determines how the system handles traffic that matches the conditions of the rule.

Depending on the selected action, you can configure whether the system stores the file or performs Spero, local malware, or dynamic analysis on a file. If you select a Block action, you can also configure whether the system also resets the blocked connection.

Note: File rules are evaluated in rule-action, not numerical, order.

### File Rule Actions and Evaluation Order

To be effective, a file policy must contain one or more rules. File rules give you granular control over which file types you want to log, block, or scan for malware.

Each file rule has an associated action that determines how the system handles traffic that matches the conditions of the rule. You can set separate rules within a file policy to take different actions for different file types, application protocols, or directions of transfer. Simple blocking takes precedence over malware inspection and blocking, which takes precedence over simple detection and logging.

The file rule actions are as follows, in rule-action order:

- *Block Files* rules allow you to block specific file types. You can configure options to reset the connection when a file transfer is blocked, and store captured files to the managed device.
• **Block Malware** rules allow you to calculate the SHA-256 hash value of specific file types, query the AMP cloud to determine if files traversing your network contain malware, then block files that represent threats.

• **Malware Cloud Lookup** rules allow you to obtain and log the disposition of files traversing your network, while still allowing their transmission.

• **Detect Files** rules allow you to log the detection of specific file types to the database, while still allowing their transmission.

⚠️ **Caution**

Selecting **Detect Files** or **Block Files**, enabling or disabling **Store files** in a **Detect Files** or **Block Files** rule, or adding the first or removing the last file rule that combines the Malware Cloud Lookup or Block Malware file rule action with an analysis option (Spero Analysis or MSEXE, Dynamic Analysis, or Local Malware Analysis) or a store files option (Malware, Unknown, Clean, or Custom), restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See **Snort® Restart Traffic Behavior, on page 282** for more information.

Depending on the file rule action, you can configure options to reset the connection when a file transfer is blocked, store captured files to the managed device, locally analyze files for malware, submit captured files to the AMP cloud for dynamic and Spero analysis, and store files that cannot be currently submitted to the cloud for later submission.

File Policy Notes and Limitations

File Rule Configuration Notes and Limitations

- A rule configured to block files in a passive deployment does not block matching files. Because the connection continues to transmit the file, if you configure the rule to log the beginning of the connection, you may see multiple events logged for this connection.

- If a file rule is configured with a Malware Cloud Lookup or Block Malware action and the Firepower Management Center cannot establish connectivity with the AMP cloud, the system cannot perform any configured rule action options until connectivity is restored.

- Cisco recommends that you enable Reset Connection for the Block Files and Block Malware actions to prevent blocked application sessions from remaining open until the TCP connection resets. If you do not reset connections, the client session will remain open until the TCP connection resets itself.

- If you are monitoring high volumes of traffic, do not store all captured files, or submit all captured files for dynamic analysis. Doing so can negatively impact system performance.

- You cannot perform malware analysis on all file types detected by the system. After you select values from the Application Protocol, Direction of Transfer, and Action drop-down lists, the system constrains the list of file types.

File Detection Notes and Limitations

- If adaptive profiling is not enabled, access control rules cannot perform file control, including AMP.

- If a file matches a rule with an application protocol condition, file event generation occurs after the system successfully identifies a file’s application protocol. Unidentified files do not generate file events.

- FTP transfers commands and data over different channels. In a passive or inline tap mode deployment, the traffic from an FTP data session and its control session may not be load-balanced to the same internal resource.

- If the total number of bytes for all file names for files in a POP3, POP, SMTP, or IMAP session exceeds 1024, file events from the session may not reflect the correct file names for files that were detected after the file name buffer filled.

- When transmitting text-based files over SMTP, some mail clients convert newlines to the CRLF newline character standard. Since Mac-based hosts use the carriage return (CR) character and Unix/Linux-based hosts use the line feed (LF) character, newline conversion by the mail client can modify the size of the file. Note that some mail clients default to newline conversion when processing an unrecognizable file type.

File Blocking Notes and Limitations

- If an end-of-file marker is not detected for a file, regardless of transfer protocol, the file will not be blocked by a Block Malware rule or the custom detection list. The system waits to block the file until the entire file has been received, as indicated by the end-of-file marker, and blocks the file after the marker is detected.
• If the end-of-file marker for an FTP file transfer is transmitted separately from the final data segment, the marker will be blocked and the FTP client will indicate that the file transfer failed, but the file will actually completely transfer to disk.

• File rules with **Block Files** and **Block Malware** actions block automatic resumption of file download via HTTP by blocking new sessions with the same file, URL, server, and client application detected for 24 hours after the initial file transfer attempt occurs.

• In rare cases, if traffic from an HTTP upload session is out of order, the system cannot reassemble the traffic correctly and therefore will not block it or generate a file event.

• If you transfer a file over NetBIOS-ssn (such as an SMB file transfer) that is blocked with a **Block Files** rule, you may see a file on the destination host. However, the file is unusable because it is blocked after the download starts, resulting in an incomplete file transfer.

• If you create file rules to detect or block files transferred over NetBIOS-ssn (such as an SMB file transfer), the system does not inspect files transferred in an established TCP or SMB session started before you deploy an access control policy invoking the file policy so those files will not be detected or blocked.

• If you configure Firepower Threat Defense high availability, and failover occurs while the original active device is identifying the file, the file type is not synced. Even if your file policy blocks that file type, the new active device downloads the file.

---

**Creating File Rules**

**Caution**

Selecting **Detect Files** or **Block Files**, enabling or disabling **Store files** in a **Detect Files** or **Block Files** rule, or adding the first or removing the last file rule that combines the **Malware Cloud Lookup** or **Block Malware** file rule action with an analysis option (**Spero Analysis** or **MSEXE**, **Dynamic Analysis**, or **Local Malware Analysis**) or a store files option (**Malware**, **Unknown**, **Clean**, or **Custom**), restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See **Snort® Restart Traffic Behavior**, on page 282 for more information.

### Procedure

**Step 1**

In the file policy editor, click **Add File Rule**.

**Step 2**

Select an **Application Protocol** and **Direction of Transfer** as described in **File Rule Components**, on page 1253.

**Step 3**

Select one or more **File Types**.

The file types you see depend on the selected application protocol, direction of transfer, and action.
You can filter the list of file types in the following ways:

- Select one or more **File Type Categories**, then click **All types in selected Categories**.
- Search for a file type by its name or description. For example, type **Windows** in the **Search name and description** field to display a list of Microsoft Windows-specific files.

**Tip** Hover your pointer over a file type to view its description.

**Step 4** Select a file rule **Action** as described in File Rule Actions and Evaluation Order, on page 1254.

**Step 5** Depending on the action you selected, configure whether you want to:

- reset the connection after blocking the file
- store a matching file
- enable Spero analysis
- enable local malware analysis
- enable dynamic analysis and capacity handling

as described in File Rule Actions and Evaluation Order, on page 1254.

**Step 6** Click **Add**.

**Step 7** Click **Save** to save the policy.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Related Topics**

- Snort® Restart Scenarios, on page 281

---

**Cloud Connections**

The Firepower System provides connections to the following public cloud-based servers to help you perform Cisco Advanced Malware Protection (AMP):

- AMP cloud—allows you to retrieve AMP for Networks malware dispositions and updates, and AMP for Endpoints scan records, malware detections, quarantines, and indications of compromise (IOC)
- AMP Threat Grid cloud—allows you to submit eligible files for dynamic analysis, and retrieve threat scores and dynamic analysis reports

Depending on your organization's privacy or security needs, you can also deploy private cloud servers:

- An AMP Private Cloud Virtual Appliance (AMPv) acts as a compressed, on-premises AMP cloud, as well as an anonymized proxy to connect to the public AMP cloud.
- An AMP Threat Grid appliance acts as an on-premises AMP Threat Grid cloud that does not contact the public AMP Threat Grid cloud.
AMP Cloud Connections

The Advanced Malware Protection (AMP) cloud is a Cisco-hosted server that uses big data analytics and continuous analysis to help you detect and block malware on your network. Both Cisco AMP solutions use the AMP cloud:

- AMP for Networks uses the AMP cloud to retrieve dispositions for possible malware detected in network traffic by managed devices, and obtain local malware analysis and file pre-classification updates.

- AMP for Endpoints is Cisco’s enterprise-class AMP solution. Individual users install lightweight connectors on their computers and mobile devices that communicate with the AMP cloud. The Firepower Management Center can then import records of scans, malware detections, and quarantines, as well as indications of compromise (IOC).

Depending on your deployment, endpoints monitored by AMP for Endpoints may not be the same hosts as those monitored by AMP for Networks. For this reason, endpoint-based malware events do not add hosts to the network map. However, the system uses IP and MAC address data to tag monitored hosts with indications of compromise obtained from your AMP for Endpoints deployment. If two different hosts monitored by different AMP solutions have the same IP and MAC address, the system can incorrectly tag monitored hosts with AMP for Endpoints IOCs.

Use the AMP Management page (AMP > AMP Management) to manage connections to the AMP cloud. By default, a connection to the United States (US) AMP public cloud is configured and enabled for AMP for Networks. You cannot delete or disable an AMP for Networks cloud connection, but you can switch between the European Union (EU) and United States (US) AMP clouds, or configure a private cloud (AMPv) connection.

To add a separate FireAMP connection for endpoints, you must have an account in the FireAMP portal. An AMP for Endpoints connection that has not registered successfully to the portal does not disable AMP for Networks.

Requirements for AMP Cloud Connections

- AMP for networks - The system uses port 443 to perform malware cloud lookups for AMP for networks, whether you use a public or private AMP cloud. You must open that port outbound for communications from the Firepower Management Center.

- AMP for endpoints - The system uses port 443/HTTPS to connect to the Cisco cloud (public or private) to receive endpoint-based malware events. You must open that port, both inbound and outbound, for communications with the Firepower Management Center. Additionally, the Firepower Management Center must have direct access to the Internet. The default health policy includes the AMP Status Monitor, which warns you if the Firepower Management Center cannot connect to the cloud after an initial successful connection, or if the connection is deregistered using the AMP portal.

To use the legacy port for AMP communications, see Collective Security Intelligence Communications Configuration Options, on page 1266.

AMP and High Availability

Although they share file policies and related configurations, Firepower Management Centers in a high availability pair share neither cloud connections nor captured files, file events, and malware events. To ensure continuity of operations, and to ensure that detected files’ malware dispositions are the same on both Firepower Management Centers, both Active and Standby Firepower Management Centers must have access to the cloud.
In high availability configurations, you must configure AMP cloud connections independently on the Active and Standby instances of the Firepower Management Center; these configurations are not synchronized. These requirements apply to both public and private AMP clouds.

**AMP Cloud Connections and Multitenancy**

In a multidomain deployment, you configure the AMP for Networks connection at the Global level only. Each Firepower Management Center can have only one AMP for Networks connection. You can configure AMP for Endpoints connections at any domain level, provided you use a separate AMP for Endpoints account for each connection. For example, each client of an MSSP might have its own AMP for Endpoints deployment.

*Caution*

Cisco *strongly* recommends you configure AMP for Endpoints connections at the leaf level only, especially if your leaf domains have overlapping IP space. If multiple subdomains have hosts with the same IP-MAC address pair, the system could save endpoint-based malware events to the wrong leaf domain, or associate IOCs with the wrong hosts.

## Configuring an AMP for Endpoints Cloud Connection

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If your organization has deployed AMP for Endpoints, you can import threat identifications, indications of compromise (IOC), and other malware-related information from the AMP cloud to the system. You must configure an AMP for Endpoints connection even if you already have a AMP for Networks connection configured.

*Caution*

In a multidomain deployment, Cisco *strongly* recommends you configure AMP for Endpoints connections at the leaf level only, especially if your leaf domains have overlapping IP space. If multiple subdomains have hosts with the same IP-MAC address pair, the system could save endpoint-based malware events to the wrong leaf domain, or associate IOCs with the wrong hosts.

**Before you begin**

- If you are connecting to the AMP cloud after either restoring your Firepower Management Center to factory defaults or reverting to a previous version, use the AMP for Endpoints management console to remove the previous connection.

**Procedure**

**Step 1** Choose AMP > AMP Management.

**Step 2** Click Create AMP Cloud Connection.

**Step 3** From the Cloud Name drop-down list, choose the cloud you want to use:

- For the European Union AMP cloud, choose EU Cloud.
• For the United States AMP cloud, choose **US Cloud**.

• For AMPv, choose **Private Cloud** and proceed as described in *Cisco AMP Private Clouds*, on page 1261.

**Step 4** Check the **Use for AMP for Firepower** check box if you want to use this cloud for AMP for Networks and AMP for Endpoints.

In a multidomain deployment, this check box appears only in the Global domain. Each Firepower Management Center can have only one AMP for Networks connection.

**Step 5** Click **Register**.

A spinning state icon indicates that a connection is pending, for example, after you configure a connection on the Firepower Management Center, but before you authorize it using the AMP for Endpoints management console. A failed or denied icon (❌) indicates that the cloud denied the connection or the connection failed for another reason.

**Step 6** Confirm that you want to continue to the AMP for Endpoints management console, then log into the management console.

**Step 7** Using the management console, authorize the AMP cloud to send AMP for Endpoints data to the Firepower Management Center.

**Step 8** If you want to restrict the data you receive, select specific groups within your organization for which you want to receive information.

By default, the AMP cloud sends data for all groups. To manage groups, choose **Management > Groups** on the AMP for Endpoints management console. For detailed information, see the management console online help.

**Step 9** Click **Allow** to enable the connection and start the transfer of data.

Clicking **Deny** returns you to the Firepower Management Center, where the connection is marked as denied. If you navigate away from the Applications page on the AMP for Endpoints management console, and neither deny nor allow the connection, the connection is marked as pending on the Firepower Management Center’s web interface. The health monitor does **not** alert you of a failed connection in either of these situations. If you want to connect to the AMP cloud later, delete the failed or pending connection, then recreate it.

Incomplete registration of an AMP for Endpoints connection does not disable the AMP for Networks connection.

---

**What to do next**

In high availability configurations, you must configure AMP cloud connections independently on the Active and Standby instances of the Firepower Management Center; these configurations are not synchronized.

**Cisco AMP Private Clouds**

You can configure a Cisco AMP Private Cloud Virtual Appliance (AMPv) to collect AMP endpoint data on your network. AMPv is a proprietary Cisco virtual machine that acts as a compressed, on-premises version of the AMP cloud.

All AMP for Endpoints connectors send data to AMPv, which forwards that data to the Firepower Management Center. AMPv does not share any of your endpoint data over an external connection. The Firepower Management Center connects to the public AMP cloud for disposition queries for files detected in network traffic and receipt of retrospective malware events.
Your organization may have privacy or security concerns that make frequent or direct connections between your monitored network and the AMP cloud difficult or impossible. In these situations, you can configure a Cisco AMP Private Cloud Virtual Appliance (AMPv). AMPv is a proprietary Cisco virtual machine that acts as a compressed, on-premises version of the AMP cloud, as well as a secure mediator between your network and the AMP cloud. Connecting a Firepower Management Center to AMPv disables existing direct connections to the AMP cloud.

All connections to the AMP cloud—whether for AMP for Networks or AMP for Endpoints—funnel through AMPv, which acts as an anonymized proxy to ensure the security and privacy of your monitored network. This includes disposition queries for files detected in network traffic, receiving of retrospective malware events, importing AMP for Endpoints data, and so on. AMPv does not share any of your endpoint data over an external connection.

Each private cloud can support as many as 10,000 AMP for Endpoints connectors, and you can configure multiple private clouds.

Use the AMP Management page (AMP > AMP Management) on the Firepower Management Center to manage connections to AMPv.

---

**Note**

Dynamic analysis, a component of AMP for Networks, requires that managed devices have direct or proxied access to the AMP Threat Grid cloud or an on-premises AMP Threat Grid appliance on port 443. AMPv does not support dynamic analysis, nor does AMPv support anonymized retrieval of threat intelligence for other features that rely on Cisco Collective Security Intelligence (CSI), such as URL and Security Intelligence filtering.

---

**Connecting to AMPv**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Malware (AMP for Networks)</td>
<td>Malware (AMP for Networks)</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td>Any (AMP for Endpoints)</td>
<td>Any (AMP for Endpoints)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Before you begin**

- Configure your Cisco AMP private cloud or clouds according to the directions in the AMPv documentation. During configuration, note the private cloud host name. You will need this host name later to configure the connection on the Firepower Management Center.

- Make sure the Firepower Management Center can communicate with AMPv, and confirm that AMPv has internet access so it can communicate with the AMP cloud.

**Procedure**

**Step 1** Choose **AMP > AMP Management**.

**Step 2** Click **Create AMP Cloud Connection**.

**Step 3** From the **Cloud Name** drop-down list, choose **Private Cloud**.
Step 4

Enter a Name.

This information appears in malware events that are generated or transmitted by AMPv.

Step 5

In the Host field, enter the private cloud host name that you configured when you set up AMPv.

Step 6

Click Browse next to the Certificate Upload Path field to browse to the location of a valid TLS or SSL encryption certificate for AMPv. For more information, see the AMPv documentation.

Step 7

Check the Use for AMP for Firepower check box if you want to use this private cloud for AMP for Networks and AMP for Endpoints.

If you configured a different private cloud to handle AMP for Networks communications, you can clear this check box; if this is your only AMPv connection, you cannot.

In a multidomain deployment, this check box appears only in the Global domain. Each Firepower Management Center can have only one AMP for Networks connection.

Step 8

To communicate with AMPv using a proxy, check the Use Proxy for Connection check box.

Step 9

Click Register, confirm that you want to disable existing direct connections to the AMP cloud, and finally confirm that you want to continue to the AMPv management console to complete registration.

Step 10

Log into the management console and complete the registration process. For further instructions, see the AMPv documentation.

What to do next

In high availability configurations, you must configure AMP cloud connections independently on the Active and Standby instances of the Firepower Management Center; these configurations are not synchronized.

Managing AMP Cloud and AMPv Connections

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Malware (AMP for Networks)</td>
<td>Malware (AMP for Networks)</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td>Any (AMP for Endpoints)</td>
<td>Any (AMP for Endpoints)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Use the Firepower Management Center to delete an AMP cloud or AMPv connection if you no longer want to receive malware-related information from the cloud. Note that deregistering a connection using the AMP for Endpoints or AMPv management console does not remove the connection from the system. Deregistered connections display a failed state on the Firepower Management Center web interface.

You can also temporarily disable a connection. When you reenable a cloud connection, the cloud resumes sending data to the system, including queued data from the disabled period.

Caution

For disabled connections, the AMP cloud and AMPv can store malware events, indications of compromise, and so on until you re-enable the connection. In rare cases—for example, with a very high event rate or a long-term disabled connection—the cloud may not be able to store all information generated while the connection is disabled.
In a multidomain deployment, the system displays connections created in the current domain, which you can manage. It also displays connections created in ancestor domains, which you cannot manage. To manage connections in a lower domain, switch to that domain. Each Firepower Management Center can have only one AMP for Networks connection, which belongs to the Global domain.

**Procedure**

**Step 1** Select **AMP > AMP Management**.

**Step 2** Manage your AMP cloud connections:

- **Delete** — Click the delete icon (>Delete<), then confirm your choice.
- **Enable or Disable** — Click the slider, then confirm your choice.

**What to do next**

In high availability configurations, you must configure AMP cloud connections independently on the Active and Standby instances of the Firepower Management Center; these configurations are not synchronized.

**Dynamic Analysis Connections**

The AMP Threat Grid cloud runs files in a sandbox environment. AMP for Networks uses the cloud to retrieve threat scores and dynamic analysis reports for dynamic analysis-submitted files. With the appropriate license, the system automatically has access to the cloud.

If your organization's security policy does not allow the Firepower System to send files outside of your network, you can configure an on-premises AMP Threat Grid appliance. See the *Cisco AMP Threat Grid Appliance Setup and Configuration Guide* for more information.

Use the Dynamic Analysis Connections page (**AMP > Dynamic Analysis Connections**) on the Firepower Management Center to manage public dynamic analysis connections to the AMP Threat Grid cloud and a private dynamic analysis connection to an on-premises AMP Threat Grid appliance.

**Viewing the Default Dynamic Analysis Connection**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network/Network Admin</td>
</tr>
</tbody>
</table>

By default, the Firepower Management Center can connect to the public AMP Threat Grid cloud for file submission and report retrieval. You can neither configure nor delete this connection.

**Procedure**

**Step 1** Choose **AMP > Dynamic Analysis Connections**.
Step 2  Click the edit icon ( ).

---

### Threat Grid On-Premises Appliance

If your organization has privacy or security concerns with submitting files to the public AMP Threat Grid cloud, you can deploy an on-premises AMP Threat Grid appliance. Like the public cloud, the on-premises appliance runs eligible files in a sandbox environment, and returns a threat score and dynamic analysis report to the Firepower System. However, the on-premises appliance does not communicate with the public cloud, or any other system external to your network.

You can connect one on-premises AMP Threat Grid appliance to the Firepower Management Center. See the *Cisco AMP Threat Grid Appliance Setup and Configuration Guide* for more information.

If you configure a dynamic analysis connection to an on-premises appliance, the system uses the public AMP cloud to perform malware cloud lookups, and verify that files have not been previously submitted for dynamic analysis.

The system also uses the default public dynamic analysis connection to the AMP cloud for public report retrieval. If your on-premises appliance did not generate a dynamic analysis report for the file, the system queries the public AMP cloud for the dynamic analysis report. Unless your organization submits a file, you can only view a scrubbed report containing limited data.

### Configuring an On-Premises Dynamic Analysis Connection

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Malware</td>

<td>Any</td>
<td>Global only</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

If you install an on-premises AMP Threat Grid appliance on your network, you can configure a dynamic analysis connection to submit files and retrieve reports from the appliance. When configuring the on-premises appliance dynamic analysis connection, you register the Firepower Management Center to the on-premises appliance.

**Before you begin**

- Set up an on-premises AMP Threat Grid appliance; see the *Cisco AMP Threat Grid Appliance Setup and Configuration Guide*.

- Download the public key certificate from the AMP Threat Grid appliance to use for logins to the on-premises appliance; see the *Cisco AMP Threat Grid Appliance Administrator's Guide*.

- Configure a proxy if you want to connect to the on-premises appliance using a proxy; see Configure Firepower Management Center Management Interfaces, on page 755.

**Procedure**

**Step 1**  Choose AMP > Dynamic Analysis Connections.

**Step 2**  Click Add New Connection.
Collective Security Intelligence Communications Configuration

The Firepower System uses Cisco’s Collective Security Intelligence (CSI) for reputation, risk, and threat intelligence. With the correct licenses, you can specify communications options for the URL Filtering and AMP for Networks features.

URL Filtering and Cisco CSI

URL filtering based on category and reputation requires a data set provided by Cisco Collective Security Intelligence Communications (Cisco CSI.)

Generally, by default, when a valid URL Filtering license is applied to an active device, the URL category and reputation data set is downloaded from the Cisco CSI cloud to the Firepower Management Center and pushed to devices. This locally stored data set is updated periodically.

When a user on the network accesses a URL that is addressed by a policy, the system looks for a match in the local (downloaded) data set. If there is no match, the system checks a cache of results previously looked up in the Cisco CSI cloud. If there is still no match, the system looks up the URL in the Cisco CSI cloud and adds the result to the cache.

See also Additional Information on URL Filtering with Category and Reputation, on page 313.

Collective Security Intelligence Communications Configuration Options

URL Filtering Options

Enable URL Filtering

Allows traffic filtering based on a website’s general classification, or category, and risk level, or reputation. Adding a URL Filtering license automatically enables Enable URL Filtering. URL filtering must be enabled before you can choose other URL filtering options.
When you enable URL filtering, depending on how long since URL filtering was last enabled, or if this is the first time you are enabling URL filtering, the Firepower Management Center retrieves URL data from Cisco CSI.

**Enable Automatic Updates**

Options for updating URL filtering threat data:

- If you enable the **Enable Automatic Updates** option on this page, the Firepower Management Center checks the cloud every 30 minutes for updates. This option is enabled by default when you add a URL filtering license.

- If you need strict control over when the system contacts external resources, disable automatic updates on this page and instead create a recurring task using the scheduler. See Automating URL Filtering Updates Using a Scheduled Task, on page 186.

- You can perform a one-time, on-demand update by clicking **Update Now**, but you should also either enable automatic updates or create a recurring task using the scheduler. You cannot start an on-demand update if an update is already in progress.

Although daily updates tend to be small, if it has been more than five days since your last update, new URL data may take up to 20 minutes to download, depending on your bandwidth. Then, it may take up to 30 minutes to perform the update itself.

**Query Cisco CSI for Unknown URLs**

Allowsthe system to submit URLsinfor threat intelligence evaluation when users browse to a website whose category and reputation are not in the local dataset. Disable this option if you do not want to submit your uncategorized URLs, for example, for privacy reasons.

Connections to uncategorized URLs do not match rules with category or reputation-based URL conditions. You cannot assign categories or reputations to URLs manually.

**AMP for Networks Options**

**Enable Automatic Local Malware Detection Updates**

The local malware detection engine statically analyzes and preclassifies files using signatures provided by Cisco. If you enable this option, the Firepower Management Center checks for signature updates once every 30 minutes.

**Share URI from Malware Events with Cisco**

The system can send information about the files detected in network traffic to the AMP cloud. This information includes URI information associated with detected files and their SHA-256 hash values. Although sharing is opt-in, transmitting this information to Cisco helps future efforts to identify and track malware.

**Use Legacy Port 32137 for AMP for Networks**

By default, AMP for Networks uses port 443/HTTPS to communicate with the AMP cloud (or AMPv). This option allows AMP for Networks to use port 32137. If you updated from a previous version of the system, this option may be enabled.
Configuring Communications with Collective Security Intelligence

### Before you begin

If you will use category and reputation-based URL filtering on an NGIPSv device, see the Firepower System Virtual Installation Guide for information on allocating the correct amount of memory.

### Procedure

**Step 1** Choose **System > Integration**.

**Step 2** Click the **Cisco CSI** tab.

**Step 3** Configure Cisco CSI communications as described in Collective Security Intelligence Communications Configuration Options, on page 1266.

**Step 4** Click **Save**.

File and Malware Inspection Performance and Storage Tuning

The following topics describe how to configure file and malware inspection performance and storage:

- File and Malware Inspection Performance and Storage Options, on page 1269
- Tuning File and Malware Inspection Performance and Storage, on page 1271

### File and Malware Inspection Performance and Storage Options

Increasing the file sizes can affect the performance of the system.

**Caution**

Configuring a non-default value under Files and Malware Settings restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Restrictions</th>
</tr>
</thead>
</table>
| Limit the number of bytes inspected when doing file type detection | Specifies the number of bytes inspected when performing file type detection. | 0 - 4294967295 (4GB)  
0 removes the restriction.  
The default value is the maximum segment size of a TCP packet. In most cases, the system can identify common file types using the first packet. |
| Allow file if cloud lookup for Block Malware takes longer than (seconds) | Specifies how long the system will hold the last byte of a file that matches a Block Malware rule and that does not have a cached disposition, while malware cloud lookup occurs. If the time elapses without the system obtaining a disposition, the file passes. Dispositions of Unavailable are not cached. | 0 - 30 seconds  
*Do not* set this option to 0 without contacting Support.  
Cisco recommends that you use the default value to avoid blocking traffic because of connection failures. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Restrictions</th>
</tr>
</thead>
</table>
| **Do not calculate SHA-256 hash values for files larger than (in bytes)** | Prevents the system from storing files larger than a certain size, performing a malware cloud lookup on the files, or blocking the files if added to the custom detection list. | 0 - 4294967295 (4GB)  
0 removes the restriction.  
This value must be greater than or equal to Maximum file size to store (bytes) and Maximum file size for dynamic analysis testing (bytes). |
| **Minimum file size to store (bytes)**                               | These settings specify:  
• The file size that the system can inspect using the following detectors:  
  • Spero analysis  
  • Sandboxing and preclassification  
  • Local malware analysis/ClamAV  
  • Archive inspection  
• The file size that the system can store using a file rule. | 0 - 10485760 (10MB)  
0 disables file storage.  
Must be less than or equal to Maximum file size to store (bytes) and Do not calculate SHA-256 hash values for files larger than (in bytes). |
| **Maximum file size to store (bytes)**                               | Specifies the minimum file size the system can submit to the AMP cloud for dynamic analysis. | 0 - 104857600 (100MB)  
Must be less than or equal to Maximum file size for dynamic analysis testing (bytes) and Do not calculate SHA-256 hash values for files larger than (in bytes).  
The file size for dynamic analysis must be within the limits defined by the minimum and maximum settings for file analysis.  
If you deploy to a device running Firepower Version 5.x, the system changes all values less than 15360, to 15360.  
The system checks the AMP cloud for updates to the minimum file size you can submit (no more than once a day). If the new minimum size is larger than your current value, your current value is updated to the new minimum, and your policy is marked out-of-date. |
| **Minimum file size for dynamic analysis testing (bytes)**            |                                                                                                                                            | 0 -104857600 (100MB)  
Must be less than or equal to Maximum file size for dynamic analysis testing (bytes) and Do not calculate SHA-256 hash values for files larger than (in bytes).  
The file size for dynamic analysis must be within the limits defined by the minimum and maximum settings for file analysis.  
If you deploy to a device running Firepower Version 5.x, the system changes all values less than 15360, to 15360.  
The system checks the AMP cloud for updates to the minimum file size you can submit (no more than once a day). If the new minimum size is larger than your current value, your current value is updated to the new minimum, and your policy is marked out-of-date. |
### Restrictions

<table>

<tbody>
<tr>
<td>Threat (file control) Malware (AMP)</td>
<td>Protection (file control) Malware (AMP)</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Caution**

Configuring a non-default value under Files and Malware Settings restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 282](#) for more information.

**Procedure**

1. **Step 1**
   In the access control policy editor, click the **Advanced** tab.

2. **Step 2**
   Click the edit icon (كرة) next to **Files and Malware Settings**.
   If a view icon (מזה) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

3. **Step 3**
   Set any of the options described in [File and Malware Inspection Performance and Storage Options, on page 1269](#).
Step 4  Click OK.
Step 5  Click Save to save the policy.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Network Analysis and Intrusion Policy Basics

Network analysis and intrusion policies work together as part of the Firepower System’s intrusion detection and prevention feature. The term intrusion detection generally refers to the process of passively analyzing network traffic for potential intrusions and storing attack data for security analysis. The term intrusion prevention includes the concept of intrusion detection, but adds the ability to block or alter malicious traffic as it travels across your network.

In an intrusion prevention deployment, when the system examines packets:

- A network analysis policy governs how traffic is decoded and preprocessed so it can be further evaluated, especially for anomalous traffic that might signal an intrusion attempt.
- An intrusion policy uses intrusion and preprocessor rules (sometimes referred to collectively as intrusion rules) to examine the decoded packets for attacks based on patterns. Intrusion policies are paired with variable sets, which allow you to use named values to accurately reflect your network environment.

Both network analysis and intrusion policies are invoked by a parent access control policy, but at different times. As the system analyzes traffic, the network analysis (decoding and preprocessing) phase occurs before and separately from the intrusion prevention (additional preprocessing and intrusion rules) phase. Together, network analysis and intrusion policies provide broad and deep packet inspection. They can help you detect, alert on, and protect against network traffic that could threaten the availability, integrity, and confidentiality of hosts and their data.

The Firepower System is delivered with several similarly named network analysis and intrusion policies (for example, Balanced Security and Connectivity) that complement and work with each other. By using system-provided policies, you can take advantage of the experience of the Cisco Talos Security Intelligence
and Research Group (Talos). For these policies, Talos sets intrusion and preprocessor rule states, as well as provides the initial configurations for preprocessors and other advanced settings.

You can also create custom network analysis and intrusion policies. You can tune settings in custom policies to inspect traffic in the way that matters most to you so that you can improve both the performance of your managed devices and your ability to respond effectively to the events they generate.

You create, edit, save, and manage network analysis and intrusion policies using similar policy editors in the web interface. When you are editing either type of policy, a navigation panel appears on the left side of the web interface; the right side displays various configuration pages.

**How Policies Examine Traffic For Intrusions**

When the system analyzes traffic as part of your access control deployment, the network analysis (decoding and preprocessing) phase occurs before and separately from the intrusion prevention (intrusion rules and advanced settings) phase.

The following diagram shows, in a simplified fashion, the order of traffic analysis in an inline, intrusion prevention and AMP for Networks deployment. It illustrates how the access control policy invokes other policies to examine traffic, and in which order those policies are invoked. The network analysis and intrusion policy selection phases are highlighted.

In an inline deployment (that is, where relevant configurations are deployed to devices using routed, switched, or transparent interfaces, or inline interface pairs), the system can block traffic without further inspection at almost any step in the illustrated process. Security Intelligence, the SSL policy, network analysis policies, file policies, and intrusion policies can all either drop or modify traffic. Only the network discovery policy, which passively inspects packets, cannot affect the flow of traffic.

Similarly, at each step of the process, a packet could cause the system to generate an event. Intrusion and preprocessor events (sometimes referred to collectively as *intrusion events*) are indications that a packet or its contents may represent a security risk.

---

**Tip**

The diagram does not reflect that access control rules handle encrypted traffic when your SSL inspection configuration allows it to pass, or if you do not configure SSL inspection. By default, the system disables intrusion and file inspection of encrypted payloads. This helps reduce false positives and improve performance when an encrypted connection matches an access control rule that has intrusion and file inspection configured.

Note that for a single connection, although the system selects a network analysis policy before an access control rule as shown in the diagram, some preprocessing (notably application layer preprocessing) occurs
after access control rule selection. This does **not** affect how you configure preprocessing in custom network analysis policies.

**Decoding, Normalizing, and Preprocessing: Network Analysis Policies**

Without decoding and preprocessing, the system could not appropriately evaluate traffic for intrusions because protocol differences would make pattern matching impossible. Network analysis policies govern these traffic-handling tasks:

- **after** traffic is filtered by Security Intelligence
- **after** encrypted traffic is decrypted by an optional SSL policy
- **before** traffic can be inspected by file or intrusion policies

A network analysis policy governs packet processing in phases. First the system decodes packets through the first three TCP/IP layers, then continues with normalizing, preprocessing, and detecting protocol anomalies:

- The packet decoder converts packet headers and payloads into a format that can be easily used by the preprocessors and later, intrusion rules. Each layer of the TCP/IP stack is decoded in turn, beginning with the data link layer and continuing through the network and transport layers. The packet decoder also detects various anomalous behaviors in packet headers.
- In inline deployments, the inline normalization preprocessor reformats (normalizes) traffic to minimize the chances of attackers evading detection. It prepares packets for examination by other preprocessors and intrusion rules, and helps ensure that the packets the system processes are the same as the packets received by the hosts on your network.

  **Note** In a passive deployment, Cisco recommends that you enable adaptive profile updates at the access control policy level, instead of inline normalization at the network analysis level.

- Various network and transport layers preprocessors detect attacks that exploit IP fragmentation, perform checksum validation, and perform TCP and UDP session preprocessing. Note that some advanced transport and network preprocessor settings apply globally to all traffic handled by the target devices of an access control policy. You configure these in the access control policy rather than in a network analysis policy.
- Various application-layer protocol decoders normalize specific types of packet data into formats that the intrusion rules engine can analyze. Normalizing application-layer protocol encodings allows the system to effectively apply the same content-related intrusion rules to packets whose data is represented differently, and to obtain meaningful results.
- The Modbus and DNP3 SCADA preprocessors detect traffic anomalies and provide data to intrusion rules. Supervisory Control and Data Acquisition (SCADA) protocols monitor, control, and acquire data from industrial, infrastructure, and facility processes such as manufacturing, production, water treatment, electric power distribution, airport and shipping systems, and so on.
- Several preprocessors allow you to detect specific threats, such as Back Orifice, portscans, SYN floods and other rate-based attacks.
Note that you configure the sensitive data preprocessor, which detects sensitive data such as credit card numbers and Social Security numbers in ASCII text, in intrusion policies.

In a newly created access control policy, one default network analysis policy governs preprocessing for all traffic for all intrusion policies invoked by the same parent access control policy. Initially, the system uses the Balanced Security and Connectivity network analysis policy as the default, but you can change it to another system-provided or custom network analysis policy. In a more complex deployment, advanced users can tailor traffic preprocessing options to specific security zones, networks, and VLANs by assigning different custom network analysis policies to preprocess matching traffic.

**Access Control Rules: Intrusion Policy Selection**

After initial preprocessing, access control rules (when present) evaluate traffic. In most cases, the first access control rule that a packet matches is the rule that handles that traffic; you can monitor, trust, block, or allow matching traffic.

When you allow traffic with an access control rule, the system can inspect the traffic for discovery data, malware, prohibited files, and intrusions, in that order. Traffic not matching any access control rule is handled by the access control policy’s default action, which can also inspect for discovery data and intrusions.

---

**Note**

All packets, regardless of which network analysis policy preprocesses them, are matched to configured access control rules—and thus are potentially subject to inspection by intrusion policies—in top-down order.

The diagram in *How Policies Examine Traffic For Intrusions*, on page 1276 shows the flow of traffic through a device in an inline, intrusion prevention and AMP for Networks deployment, as follows:

- Access Control Rule A allows matching traffic to proceed. The traffic is then inspected for discovery data by the network discovery policy, for prohibited files and malware by File Policy A, and then for intrusions by Intrusion Policy A.

- Access Control Rule B also allows matching traffic. However, in this scenario, the traffic is not inspected for intrusions (or files or malware), so there are no intrusion or file policies associated with the rule. Note that by default, traffic that you allow to proceed is inspected by the network discovery policy; you do not need to configure this.

- In this scenario, the access control policy’s default action allows matching traffic. The traffic is then inspected by the network discovery policy, and then by an intrusion policy. You can (but do not have to) use a different intrusion policy when you associate intrusion policies with access control rules or the default action.

The example in the diagram does not include any blocking or trusting rules because the system does not inspect blocked or trusted traffic.

**Intrusion Inspection: Intrusion Policies, Rules, and Variable Sets**

You can use intrusion prevention as the system’s last line of defense before traffic is allowed to proceed to its destination. Intrusion policies govern how the system inspects traffic for security violations and, in inline deployments, can block or alter malicious traffic. The main function of intrusion policies is to manage which intrusion and preprocessor rules are enabled and how they are configured.
Intrusion and Preprocessor Rules

An intrusion rule is a specified set of keywords and arguments that detects attempts to exploit vulnerabilities on your network; the system uses an intrusion rule to analyze network traffic to check if it matches the criteria in the rule. The system compares packets against the conditions specified in each rule and, if the packet data matches all the conditions specified in a rule, the rule triggers.

The system includes the following types of rules created by Cisco Talos Security Intelligence and Research Group (Talos):

- shared object intrusion rules, which are compiled and cannot be modified (except for rule header information such as source and destination ports and IP addresses)
- standard text intrusion rules, which can be saved and modified as new custom instances of the rule.
- preprocessor rules, which are rules associated with preprocessors and packet decoder detection options in the network analysis policy. You cannot copy or edit preprocessor rules. Most preprocessor rules are disabled by default; you must enable them to use preprocessors to generate events and, in an inline deployment, drop offending packets.

When the system processes packets according to an intrusion policy, first a rule optimizer classifies all activated rules in subsets based on criteria such as: transport layer, application protocol, direction to or from the protected network, and so on. Then, the intrusion rules engine selects the appropriate rule subsets to apply to each packet. Finally, a multi-rule search engine performs three different types of searches to determine if the traffic matches the rule:

- The protocol field search looks for matches in particular fields in an application protocol.
- The generic content search looks for ASCII or binary byte matches in the packet payload.
- The packet anomaly search looks for packet headers and payloads that, rather than containing specific content, violate well-established protocols.

In a custom intrusion policy, you can tune detection by enabling and disabling rules, as well as by writing and adding your own standard text rules. You can also use Firepower recommendations to associate the operating systems, servers, and client application protocols detected on your network with rules specifically written to protect those assets.

Variable Sets

Whenever the system uses an intrusion policy to evaluate traffic, it uses an associated variable set. Most variables in a set represent values commonly used in intrusion rules to identify source and destination IP addresses and ports. You can also use variables in intrusion policies to represent IP addresses in rule suppressions and dynamic rule states.

The system provides a single default variable set, which is comprised of predefined default variables. Most system-provided shared object rules and standard text rules use these predefined default variables to define networks and port numbers. For example, the majority of the rules use the variable $HOME_NET to specify the protected network and the variable $EXTERNAL_NET to specify the unprotected (or outside) network. In addition, specialized rules often use other predefined variables. For example, rules that detect exploits against web servers use the $HTTP_SERVERS and $HTTP_PORTS variables.
Even if you use system-provided intrusion policies, Cisco strongly recommends that you modify key default variables in the default set. When you use variables that accurately reflect your network environment, processing is optimized and the system can monitor relevant systems for suspicious activity. Advanced users can create and use custom variable sets for pairing with one or more custom intrusion policies.

**Tip**

**Related Topics**

Predefined Default Variables, on page 356

**Intrusion Event Generation**

When the system identifies a possible intrusion, it generates an *intrusion or preprocessor event* (sometimes collectively called *intrusion events*). Managed devices transmit their events to the Firepower Management Center, where you can view the aggregated data and gain a greater understanding of the attacks against your network assets. In an inline deployment, managed devices can also drop or replace packets that you know to be harmful.

Each intrusion event in the database includes an event header and contains information about the event name and classification; the source and destination IP addresses; ports; the process that generated the event; and the date and time of the event, as well as contextual information about the source of the attack and its target. For packet-based events, the system also logs a copy of the decoded packet header and payload for the packet or packets that triggered the event.

The packet decoder, the preprocessors, and the intrusion rules engine can all cause the system to generate an event. For example:

- If the packet decoder (configured in the network analysis policy) receives an IP packet that is less than 20 bytes, which is the size of an IP datagram without any options or payload, the decoder interprets this as anomalous traffic. If, later, the accompanying decoder rule in the intrusion policy that examines the packet is enabled, the system generates a preprocessor event.

- If the IP defragmentation preprocessor encounters a series of overlapping IP fragments, the preprocessor interprets this as a possible attack and, when the accompanying preprocessor rule is enabled, the system generates a preprocessor event.

- Within the intrusion rules engine, most standard text rules and shared object rules are written so that they generate intrusion events when triggered by packets.

As the database accumulates intrusion events, you can begin your analysis of potential attacks. The system provides you with the tools you need to review intrusion events and evaluate whether they are important in the context of your network environment and your security policies.

**System-Provided and Custom Network Analysis and Intrusion Policies**

Creating a new access control policy is one of the first steps in managing traffic flow using the Firepower System. By default, a newly created access control policy invokes system-provided network analysis and intrusion policies to examine traffic.
The following diagram shows how a newly created access control policy in an inline, intrusion-prevention deployment initially handles traffic. The preprocessing and intrusion prevention phases are highlighted.

![Diagram](image)

Note how:

- A default network analysis policy governs the preprocessing of all traffic handled by the access control policy. Initially, the system-provided *Balanced Security and Connectivity network analysis policy* is the default.

- The default action of the access control policy allows all non-malicious traffic, as determined by the *Balanced Security and Connectivity intrusion policy*. Because the default action allows traffic to pass, the discovery feature can examine it for host, application, and user data before the intrusion policy can examine and potentially block malicious traffic.

- The policy uses default Security Intelligence options (global whitelist and blacklist only), does not decrypt encrypted traffic with an SSL policy, and does not perform special handling and inspection of network traffic using access control rules.

A simple step you can take to tune your intrusion prevention deployment is to use a different set of system-provided network analysis and intrusion policies as your defaults. Cisco delivers several pairs of these policies with the Firepower System.

Or, you can tailor your intrusion prevention deployment by creating and using custom policies. You may find that the preprocessor options, intrusion rule, and other advanced settings configured in those policies do not address the security needs of your network. By tuning your network analysis and intrusion policies you can configure, at a very granular level, how the system processes and inspects the traffic on your network for intrusions.

### System-Provided Network Analysis and Intrusion Policies

Cisco delivers several pairs of network analysis and intrusion policies with the Firepower System. By using system-provided network analysis and intrusion policies, you can take advantage of the experience of the Cisco Talos Security Intelligence and Research Group (Talos). For these policies, Talos provides intrusion and preprocessor rule states as well as initial configurations for preprocessors and other advanced settings.

No system-provided policy covers every network profile, traffic mix, or defensive posture. Each covers common cases and network setups that provide a starting point for a well-tuned defensive policy. Although you can use system-provided policies as-is, Cisco strongly recommends that you use them as the base for custom policies that you tune to suit your network.

**Tip**

Even if you use system-provided network analysis and intrusion policies, you should configure the system’s intrusion variables to accurately reflect your network environment. At a minimum, modify key default variables in the default set.

As new vulnerabilities become known, Talos releases intrusion rule updates. These rule updates can modify any system-provided network analysis or intrusion policy, and can provide new and updated intrusion rules and preprocessor rules, modified states for existing rules, and modified default policy settings. Rule updates
may also delete rules from system-provided policies and provide new rule categories, as well as modify the default variable set.

If a rule update affects your deployment, the web interface marks affected intrusion and network analysis policies as out of date, as well as their parent access control policies. You must re-deploy an updated policy for its changes to take effect.

For your convenience, you can configure rule updates to automatically re-deploy affected intrusion policies, either alone or in combination with affected access control policies. This allows you to easily and automatically keep your deployment up-to-date to protect against recently discovered exploits and intrusions.

To ensure up-to-date preprocessing settings, you must re-deploy access control policies, which also deploys any associated SSL, network analysis, and file policies that are different from those currently running, and can also update default values for advanced preprocessing and performance options.

Cisco delivers the following network analysis and intrusion policies with the Firepower System:

**Balanced Security and Connectivity network analysis and intrusion policies**

These policies are built for both speed and detection. Used together, they serve as a good starting point for most organizations and deployment types. The system uses the Balanced Security and Connectivity policies and settings as defaults in most cases.

**Connectivity Over Security network analysis and intrusion policies**

These policies are built for organizations where connectivity (being able to get to all resources) takes precedence over network infrastructure security. The intrusion policy enables far fewer rules than those enabled in the Security over Connectivity policy. Only the most critical rules that block traffic are enabled.

**Security Over Connectivity network analysis and intrusion policies**

These policies are built for organizations where network infrastructure security takes precedence over user convenience. The intrusion policy enables numerous network anomaly intrusion rules that could alert on or drop legitimate traffic.

**Maximum Detection network analysis and intrusion policies**

These policies are built for organizations where network infrastructure security is given even more emphasis than is given by the Security Over Connectivity policies, with the potential for even greater operational impact. For example, the intrusion policy enables rules in a large number of threat categories including malware, exploit kit, old and common vulnerabilities, and known in-the-wild exploits.

**No Rules Active intrusion policy**

In the No Rules Active intrusion policy, all intrusion rules and advanced settings are disabled. This policy provides a starting point if you want to create your own intrusion policy instead of basing it on the enabled rules in one of the other system-provided policies.

---

**Note**

Depending on the system-provided base policy that is selected, the settings of the policy vary. To view the policy settings, click the **Edit** icon next to the policy and then click the **Manage Base Policy** link.
Benefits of Custom Network Analysis and Intrusion Policies

You may find that the preprocessor options, intrusion rules, and other advanced settings configured in the system-provided network analysis and intrusion policies do not fully address the security needs of your organization.

Building custom policies can improve the performance of the system in your environment and can provide a focused view of the malicious traffic and policy violations occurring on your network. By creating and tuning custom policies you can configure, at a very granular level, how the system processes and inspects the traffic on your network for intrusions.

All custom policies have a base policy, also called a base layer, which defines the default settings for all configurations in the policy. A layer is a building block that you can use to efficiently manage multiple network analysis or intrusion policies.

In most cases, you base custom policies on system-provided policies, but you can use another custom policy. However, all custom policies have a system-provided policy as the eventual base in a policy chain. Because rule updates can modify system-provided policies, importing a rule update may affect you even if you are using a custom policy as your base. If a rule update affects your deployment, the web interface marks affected policies as out of date.

In addition to custom policies that you create, the system provides two custom intrusion and two custom network analysis policies: Initial Inline Policy and Initial Passive Policy. These policies use the appropriate Balanced Security and Connectivity policy as their base. The only difference between them is their drop behavior, which enables traffic blocking and modification in the inline policies and disables it in the passive policies. You can edit and use these system-provided custom policies.

Benefits of Custom Network Analysis Policies

By default, one network analysis policy preprocesses all unencrypted traffic handled by the access control policy. That means that all packets are decoded and preprocessed according to the same settings, regardless of the intrusion policy (and therefore intrusion rule set) that later examines them.

Initially, the system-provided Balanced Security and Connectivity network analysis policy is the default. A simple way to tune preprocessing is to create and use a custom network analysis policy as the default.

Tuning options available vary by preprocessor, but some of the ways you can tune preprocessors and decoders include:

- You can disable preprocessors that do not apply to the traffic you are monitoring. For example, the HTTP Inspect preprocessor normalizes HTTP traffic. If you are confident that your network does not include any web servers using Microsoft Internet Information Services (IIS), you can disable the preprocessor option that looks for IIS-specific traffic and thereby reduce system processing overhead.

If you disable a preprocessor in a custom network analysis policy, but the system needs to use that preprocessor to later evaluate packets against an enabled intrusion or preprocessor rule, the system automatically enables and uses the preprocessor although the preprocessor remains disabled in the network analysis policy web interface.

- Specify ports, where appropriate, to focus the activity of certain preprocessors. For example, you can identify additional ports to monitor for DNS server responses or encrypted SSL sessions, or ports on which you decode telnet, HTTP, and RPC traffic.
For advanced users with complex deployments, you can create multiple network analysis policies, each tailored to pre-process traffic differently. Then, you can configure the system to use those policies to govern the pre-processing of traffic using different security zones, networks, or VLANs. (Note that ASA FirePOWER modules cannot restrict pre-processing by VLAN.)

**Note**

Tailoring pre-processing using custom network analysis policies—especially multiple network analysis policies—is an advanced task. Because pre-processing and intrusion inspection are so closely related, you **must** be careful to allow the network analysis and intrusion policies examining a single packet to complement each other.

### Benefits of Custom Intrusion Policies

In a newly created access control policy initially configured to perform intrusion prevention, the default action allows all traffic, but first inspects it with the system-provided Balanced Security and Connectivity intrusion policy. Unless you add access control rules or change the default action, all traffic is inspected by that intrusion policy.

To customize your intrusion prevention deployment, you can create multiple intrusion policies, each tailored to inspect traffic differently. Then, configure an access control policy with rules that specify which policy inspects which traffic. Access control rules can be simple or complex, matching and inspecting traffic using multiple criteria including security zone, network or geographical location, VLAN, port, application, requested URL, or user.

The main function of intrusion policies is to manage which intrusion and preprocessor rules are enabled and how they are configured, as follows:

- Within each intrusion policy, you should verify that all rules applicable to your environment are enabled, and improve performance by disabling rules that are not applicable to your environment. In an inline deployment, you can specify which rules should drop or modify malicious packets.
- Firepower recommendations allow you to associate the operating systems, servers, and client application protocols detected on your network with rules specifically written to protect those assets.
- You can modify existing rules and write new standard text rules as needed to catch new exploits or to enforce your security policies.

Other customizations you might make to an intrusion policy include:

- The sensitive data preprocessor detects sensitive data such as credit card numbers and Social Security numbers in ASCII text. Note that other preprocessors that detect specific threats (back orifice attacks, several portscan types, and rate-based attacks that attempt to overwhelm your network with excessive traffic) are configured in network analysis policies.
- Global thresholds cause the system to generate events based on how many times traffic matching an intrusion rule originates from or is targeted to a specific address or address range within a specified time period. This helps prevent the system from being overwhelmed with a large number of events.
- Suppressing intrusion event notifications and setting thresholds for individual rules or entire intrusion policies can also prevent the system from being overwhelmed with a large number of events.
- In addition to the various views of intrusion events within the web interface, you can enable logging to syslog facilities or send event data to an SNMP trap server. Per policy, you can specify intrusion event notification limits, set up intrusion event notification to external logging facilities, and configure external...
responses to intrusion events. Note that in addition to these per-policy alerting configurations, you can globally enable or disable email alerting on intrusion events for each rule or rule group. Your email alert settings are used regardless of which intrusion policy processes a packet.

**Limitations of Custom Policies**

Because preprocessing and intrusion inspection are so closely related, you **must** be careful that your configuration allows the network analysis and intrusion policies processing and examining a single packet to complement each other.

By default, the system uses one network analysis policy to preprocess all traffic handled by managed devices using a single access control policy. The following diagram shows how a newly created access control policy in an inline, intrusion-prevention deployment initially handles traffic. The preprocessing and intrusion prevention phases are highlighted.

![Diagram showing preprocessing and intrusion prevention phases](image)

Notice how a default network analysis policy governs the preprocessing of *all* traffic handled by the access control policy. Initially, the system-provided Balanced Security and Connectivity network analysis policy is the default.

A simple way to tune preprocessing is to create and use a custom network analysis policy as the default. However, if you disable a preprocessor in a custom network analysis policy but the system needs to evaluate preprocessed packets against an enabled intrusion or preprocessor rule, the system automatically enables and uses the preprocessor although it remains disabled in the network analysis policy web interface.

**Note**

In order to get the performance benefits of disabling a preprocessor, you **must** make sure that none of your intrusion policies have enabled rules that require that preprocessor.

An additional challenge arises if you use multiple custom network analysis policies. For advanced users with complex deployments, you can tailor preprocessing to specific security zones, networks, and VLANs by assigning custom network analysis policies to preprocess matching traffic. (Note that ASA FirePOWER cannot restrict preprocessing by VLAN.) To accomplish this, you add custom network analysis rules to your access control policy. Each rule has an associated network analysis policy that governs the preprocessing of traffic that matches the rule.

**Tip**

You configure network analysis rules as an advanced setting in an access control policy. Unlike other types of rules in the Firepower System, network analysis rules invoke—rather than being contained by—network analysis policies.

The system matches packets to any configured network analysis rules in top-down order by rule number. Traffic that does not match any network analysis rule is preprocessed by the default network analysis policy. While this allows you a great deal of flexibility in preprocessing traffic, keep in mind that all packets, regardless of which network analysis policy preprocessed them, are subsequently matched to access control rules—and thus to potential inspection by intrusion policies—in their own process. In other words, preprocessing a packet...
with a particular network analysis policy does **not** guarantee that the packet will be examined with any particular intrusion policy. You **must** carefully configure your access control policy so it invokes the correct network analysis and intrusion policies to evaluate a particular packet.

The following diagram shows in focused detail how the network analysis policy (preprocessing) selection phase occurs before and separately from the intrusion prevention (rules) phase. For simplicity, the diagram eliminates the discovery and file/malware inspection phases. It also highlights the default network analysis and default-action intrusion policies.

In this scenario, an access control policy is configured with two network analysis rules and a default network analysis policy:

- Network Analysis Rule A preprocesses matching traffic with Network Analysis Policy A. Later, you want this traffic to be inspected by Intrusion Policy A.
- Network Analysis Rule B preprocesses matching traffic with Network Analysis Policy B. Later, you want this traffic to be inspected by Intrusion Policy B.
- All remaining traffic is preprocessed with the default network analysis policy. Later, you want this traffic to be inspected by the intrusion policy associated with the access control policy’s default action.

After the system preprocesses traffic, it can examine the traffic for intrusions. The diagram shows an access control policy with two access control rules and a default action:

- Access Control Rule A allows matching traffic. The traffic is then inspected by Intrusion Policy A.
- Access Control Rule B allows matching traffic. The traffic is then inspected by Intrusion Policy B.
- The access control policy’s default action allows matching traffic. The traffic is then inspected by the default action’s intrusion policy.

Each packet’s handling is governed by a network analysis policy and intrusion policy pair, but the system does **not** coordinate the pair for you. Consider a scenario where you misconfigure your access control policy so that Network Analysis Rule A and Access Control Rule A do not process the same traffic. For example, you could intend the paired policies to govern the handling of traffic on a particular security zone, but you mistakenly use different zones in the two rules’ conditions. This could cause traffic to be incorrectly preprocessed. For this reason, tailoring preprocessing using network analysis rules and custom policies is an advanced task.
Note that for a single connection, although the system selects a network analysis policy before an access control rule, some preprocessing (notably application layer preprocessing) occurs after access control rule selection. This does not affect how you configure preprocessing in custom network analysis policies.

The Navigation Panel: Network Analysis and Intrusion Policies

Network analysis and intrusion policies use similar web interfaces to edit and save changes to their configurations.

A navigation panel appears on the left side of the web interface when you are editing either type of policy. The following graphic shows the navigation panel for the network analysis policy (left) and the intrusion policy (right).

A dividing line separates the navigation panel into links to policy settings you can configure with (below) or without (above) direct interaction with policy layers. To navigate to any settings page, click its name in the navigation panel. Dark shading of an item in the navigation panel highlights your current settings page. For example, in the illustration above the Policy Information page would be displayed to the right of the navigation panel.

Policy Information

The Policy Information page provides configuration options for commonly used settings. As shown in the illustration for the network analysis policy panel above, a policy change icon (▲) appears next to Policy Information in the navigation panel when the policy contains unsaved changes. The icon disappears when you save your changes.

Rules (intrusion policy only)

The Rules page in an intrusion policy allows you to configure rule states and other settings for shared object rules, standard text rules, and preprocessor rules.

Firepower Recommendations (intrusion policy only)

The Firepower Recommendations page in an intrusion policy allows you to associate the operating systems, servers, and client application protocols detected on your network with intrusion rules specifically written to
protect those assets. This allows you to tailor your intrusion policy to the specific needs of your monitored network.

**Settings (network analysis policy) and Advanced Settings (intrusion policy)**

The Settings page in a network analysis policy allows you to enable or disable preprocessors and access preprocessor configuration pages. Expanding the Settings link displays sublinks to individual configuration pages for all enabled preprocessors in the policy.

The Advanced Settings page in an intrusion policy allows you to enable or disable advanced settings and access configuration pages for those advanced settings. Expanding the Advanced Settings link displays sublinks to individual configuration pages for all enabled advanced settings in the policy.

**Policy Layers**

The Policy Layers page displays a summary of the layers that comprise your network analysis or intrusion policy. Expanding the Policy Layers link displays sublinks to summary pages for the layers in your policy. Expanding each layer sublink displays further sublinks to the configuration pages for all rules, preprocessors, or advanced settings that are enabled in the layer.

## Conflicts and Changes: Network Analysis and Intrusion Policies

When you edit a network analysis or intrusion policy, a policy change icon (⚠️) appears next to Policy Information in the navigation panel to indicate that the policy contains unsaved changes. You must save (or commit) your changes before the system recognizes them.

**Note**

After you save, you must deploy the network analysis or intrusion policy for your changes to take effect. If you deploy a policy without saving, the system uses the most recently saved configuration.

### Resolving Editing Conflicts

The Network Analysis Policy page (Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy) and Intrusion Policy page (Policies > Access Control > Intrusion) display whether each policy has unsaved changes, as well as information about who is currently editing the policy. Cisco recommends that only one person edit a policy at a time. If you are performing simultaneous editing, the consequences are as follows:

- If you are editing a network analysis or intrusion policy at the same time another user is editing the same policy, and the other user saves their changes to the policy, you are warned when you commit the policy that you will overwrite the other user’s changes.

- If you are editing the same network analysis or intrusion policy via multiple web interface instances as the same user, and you save your changes for one instance, you cannot save your changes for the other instance.

### Resolving Configuration Dependencies

To perform their particular analysis, many preprocessors and intrusion rules require that traffic first be decoded or preprocessed in a certain way, or have other dependencies. When you save a network analysis or intrusion policy...
policy, the system either automatically enables required settings, or warns you that disabled settings will have no effect on traffic, as follows:

- You cannot save an intrusion policy if you added an SNMP rule alert but did not configure SNMP alerting. You must either configure SNMP alerting or disable the rule alert, then save again.

- You cannot save an intrusion policy if it includes enabled sensitive data rules but you have not enabled the sensitive data preprocessor. You must either allow the system to enable the preprocessor and save the policy, or disable the rules and save again.

- If you disable a required preprocessor in a network analysis policy, you can still save the policy. However, the system automatically uses the disabled preprocessor with its current settings, even though the preprocessor remains disabled in the web interface.

- If you disable inline mode in a network analysis policy but enable the Inline Normalization preprocessor, you can still save the policy. However, the system warns you that normalization settings will be ignored. Disabling inline mode also causes the system to ignore other settings that allow preprocessors to modify or block traffic, including checksum verification and rate-based attack prevention.

**Committing, Discarding, and Caching Policy Changes**

While editing a network analysis or intrusion policy, if you exit the policy editor without saving your changes, the system caches those changes. Your changes are cached even when you log out of the system or experience a system crash. The system cache can store unsaved changes for one network analysis and one intrusion policy per user; you must commit or discard your changes before editing another policy of the same type. The system discards the cached changes when you edit another policy without saving your changes to the first policy, or when you import an intrusion rule update.

You can commit or discard policy changes on the Policy Information page of either the network analysis or intrusion policy editor.

In the Firepower Management Center configuration, you can control:

- whether you are prompted (or required) to comment on your network analysis or intrusion policy changes when you commit them
- whether changes and comments are recorded in the audit log

**Related Topics**

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

**Procedure**

If you want to exit the network analysis or intrusion policy advanced editor, you have the following choices:
• Cache — To exit the policy and cache changes, choose any menu or other path to another page. On exiting, click Leave page when prompted, or click Stay on page to remain in the advanced editor.
• Discard — To discard unsaved changes, click Discard Changes on the Policy Information page, then click OK.
• Save — To save changes to the policy, click Commit Changes on the Policy Information page. If prompted, enter a comment, and then click OK.
CHAPTER 69

Layers in Intrusion and Network Analysis Policies

The following topics explain how to use layers in intrusion and network analysis policies:

- Layer Basics, on page 1291
- The Layer Stack, on page 1291
- Layer Management, on page 1296

Layer Basics

Larger organizations with many managed devices may have many intrusion policies and network analysis policies to support the unique needs of different departments, business units or, in some instances, different companies. Configurations in both policy types are contained in building blocks called layers, which you can use to efficiently manage multiple policies.

Layers in intrusion and network analysis policies work in essentially the same way. You can create and edit either policy type without consciously using layers. You can modify your policy configurations and, if you have not added user layers to your policy, the system automatically includes your changes in a single configurable layer that is initially named My Changes. You can also add up to 200 layers where you can configure any combination of settings. You can copy, merge, move, and delete user layers and, most important, share individual user layers with other policies of the same type.

The Layer Stack

Layer stacks are composed of the following:

User Layers

User-configurable layers. You can copy, merge, move, or delete any user-configurable layer and set any user-configurable layer to be shared by other policies of the same type. This layer includes the automatically-generated layer initially named My Changes.

Built-in Layers

The read-only base policy layer. The policy in this layer can be either a system-provided policy or a custom policy you created.
By default, a network analysis or intrusion policy includes a base policy layer and a My Changes layer. You can add user layers as necessary.

Each policy layer contains complete configurations for either all preprocessors in a network analysis policy or all intrusion rules and advanced settings in an intrusion policy. The lowest, base policy layer includes all the settings from the base policy you selected when you created the policy. A setting in a higher layer takes precedence over the same setting in a lower layer. Features not explicitly set in a layer *inherit* their settings from the next highest layer where they are explicitly set. The system *flattens* the layers, that is, it applies only the cumulative effect of all settings, when it handles network traffic.

---

**Tip**

You can create an intrusion or network analysis policy based solely on the default settings in the base policy. In the case of an intrusion policy, you can also use Firepower rule state recommendations if you want to tailor your intrusion policy to the specific needs of your monitored network.

The following figure shows an example layer stack that, in addition to the base policy layer and the initial My Changes layer, also includes two additional user-configurable layers, *User Layer 1* and *User Layer 2*. Note in the figure that each user-configurable layer that you add is initially positioned as the highest layer in the stack; thus, *User Layer 2* in the figure was added last and is highest in the stack.

Regardless of whether you allow rule updates to modify your policy, changes in a rule update never override changes you make in a layer. This is because changes in a rule update are made in the base policy, which determines the default settings in your base policy layer; your changes are always made in a higher layer, so they override any changes that a rule update makes to your base policy.

## The Base Layer

The base layer, also referred to as the base policy, of an intrusion or network analysis policy defines the default settings for all configurations in the policy, and is the lowest layer in the policy. When you create a new policy and change a setting without adding new layers, the change is stored in the My Changes layer, and overrides—but does not change—the setting in the base policy.

### System-Provided Base Policies

The Firepower System provides several pairs of network analysis and intrusion policies. By using system-provided network analysis and intrusion policies, you can take advantage of the experience of the Cisco Talos Security Intelligence and Research Group (Talos). For these policies, Talos sets intrusion and preprocessor rule states, as well as provides the initial configurations for preprocessors and other advanced settings. You can use these system-provided policies as-is, or you can use them as the base for custom policies.

If you use a system-provided policy as your base, importing rule updates may modify settings in your base policy. However, you can configure a custom policy so that the system does not automatically make these changes to its system-provided base policy. This allows you to update system-provided base policies manually, on a schedule independent of rule updates. In either case, changes that a rule update makes to your base policy do not change or override settings in your My Changes or any other layer.
System-provided intrusion and network analysis policies are similarly named but contain different configurations. For example, the Balanced Security and Connectivity network analysis policy and the Balanced Security and Connectivity intrusion policy work together and can both be updated in intrusion rule updates.

**Custom Base Policies**

You can use a custom policy as your base. You can tune settings in custom policies to inspect traffic in ways that matter most to you so you can improve both the performance of your managed devices and your ability to respond effectively to the events they generate.

If you change the custom policy that you use as the base for another policy, those changes are automatically used as the default settings of the policy that uses the base.

In addition, a rule update may affect your policy even if you use a custom base policy, because all policies have a system-provided policy as the eventual base in a policy chain. If the first custom policy in a chain (the one that uses the system-provided policy as its base) allows rule updates to modify its base policy, your policy may be affected.

Regardless of how changes are made to your base policy—whether by a rule update or when you modify a custom policy that you use as a base policy—they do not change or override settings in your My Changes or any other layer.

**The Effect of Rule Updates on Base Policies**

When you import rule updates, the system modifies system-provided intrusion, access control, and network analysis policies. Rule updates can include:

- modified network analysis preprocessor settings
- modified advanced settings in intrusion and access control policies
- new and updated intrusion rules
- modified states for existing rules
- new rule categories and default variables

Rule updates can also delete existing rules from system-provided policies.

Changes to default variables and rule categories are handled at the system level.

When you use a system-provided policy as your intrusion or network analysis base policy, you can allow rule updates to modify your base policy which, in this case, is a copy of the system-provided policy. If you allow rule updates to update your base policy, a new rule update makes the same changes in your base policy that it makes to the system-provided policy that you use as your base policy. If you have not modified the corresponding setting, a setting in your base policy determines the setting in your policy. However, rule updates do not override changes you make in your policy.

If you do not allow rule updates to modify your base policy, you can manually update your base policy after importing one or more rule updates.

Rule updates always delete intrusion rules that Talos deletes, regardless of the rule state in your intrusion policy or whether you allow rule updates to modify your base intrusion policy.

Until you re-deploy your changes to network traffic, rules in your currently deployed intrusion policies behave as follows:

- Disabled intrusion rules remain disabled.
• Rules set to **Generate Events** continue to generate events when triggered.

• Rules set to **Drop and Generate Events** continue to generate events and drop offending packets when triggered.

Rule updates do not modify a custom base policy unless both of the following conditions are met:

• You allow rule updates to modify the system-provided base policy of the parent policy, that is, the policy that originated the custom base policy.

• You have not made changes in the parent policy that override the corresponding settings in the parent’s base policy.

When both conditions are met, changes in the rule update are passed to the child policy, that is, the policy using the custom base policy, when you save the parent policy.

For example, if a rule update enables a previously disabled intrusion rule, and you have not modified the rule’s state in the parent intrusion policy, the modified rule state is passed to the base policy when you save the parent policy.

Likewise, if a rule update modifies a default preprocessor setting and you have not modified the setting in the parent network analysis policy, the modified setting is passed to the base policy when you save the parent policy.

### Changing the Base Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You can choose a different system-provided or custom policy as your base policy.

You can chain up to five custom policies, with four of the five using one of the other four previously created policies as its base policy; the fifth must use a system-provided policy as its base.

### Procedure

**Step 1**
While editing your policy, click **Policy Information** in the navigation panel.

**Step 2**
You can configure the following choices:

• Choose a base policy — Choose from the **Base Policy** drop-down list.

• Allow rule updates to modify the base policy — Click **Manage Base Policy**, then check the **Update when a new Rule Update is installed** check box.

**Tip**
When you save your policy with the check box cleared and then import a rule update, an **Update Now** button appears on the Base Policy summary page and the status message on the page updates to inform you that the policy is out of date. If you want to update your base policy with the changes in the most recently imported rule update, click **Update Now**.

**Step 3**
To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.
If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics

Conflicts and Changes: Network Analysis and Intrusion Policies, on page 1288

The Firepower Recommendations Layer

When you generate rule state recommendations in an intrusion policy, you can choose whether to automatically modify rule states based on the recommendations.

As seen in the following figure, using recommended rule states inserts a read-only, built-in Firepower Recommendations layer immediately above the base layer.

Note that this layer is unique to intrusion policies.

If you subsequently choose not to use recommended rule states, the system removes the Firepower Recommendations layer. You cannot manually delete this layer, but you can add and remove it by choosing to use or not use recommended rule states.

Adding the Firepower Recommendations layer adds a Firepower Recommendations link under Policy Layers in the navigation panel. This link leads you to a read-only view of the Firepower Recommendations layer page where you can access a recommendation-filtered view of the Rules page in read-only mode.

Using recommended rule states also adds a Rules sublink beneath the Firepower Recommendations link in the navigation panel. The Rules sublink provides access to a read-only display of the Rules page in the Firepower Recommendations layer. Note the following in this view:

- When there is no rule state icon in the state column, the state is inherited from the base policy.
- When there is no rule state icon in the Firepower Recommendation column in this or other Rules page views, there is no recommendation for this rule.

Related Topics

Tailoring Intrusion Protection to Your Network Assets, on page 1343
Layer Management

The Policy Layers page provides a single-page summary of the complete layer stack for your network analysis or intrusion policy. On this page you can add shared and unshared layers, copy, merge, move, and delete layers, access the summary page for each layer, and access configuration pages for enabled, disabled, and overridden configurations within each layer.

For each layer, you can view the following information:

- whether the layer is a built-in, shared user, or unshared user layer
- which layers contain the highest, that is the effective, preprocessor or advanced setting configurations, by feature name
- in an intrusion policy, the number of intrusion rules whose states are set in the layer, and the number of rules set to each rule state.

The Policy Layers page also provides a summary of the net effect of all enabled preprocessors (network analysis) or advanced settings (intrusion) and, for intrusion policies, intrusion rules.

The feature name in the summary for each layer indicates which configurations are enabled, disabled, overridden, or inherited in the layer, as follows:

<table>
<thead>
<tr>
<th>When the feature is...</th>
<th>The feature name is...</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled in the layer</td>
<td>written in plain text</td>
</tr>
<tr>
<td>disabled in the layer</td>
<td>struck out</td>
</tr>
<tr>
<td>overridden by the...</td>
<td>written in italic text</td>
</tr>
<tr>
<td>inherited from a lower layer</td>
<td>not present</td>
</tr>
</tbody>
</table>

You can add up to 200 layers to a network analysis or intrusion policy. When you add a layer, it appears as the highest layer in your policy. The initial state is Inherit for all features and, in an intrusion policy, no event filtering, dynamic state, or alerting rule actions are set.

You give a user-configurable layer a unique name when you add the layer to your policy. Later, you can change the name and, optionally, add or modify a description that is visible when you edit the layer.

You can copy a layer, move a layer up or down within the User Layers page area, or delete a user layer, including the initial My Changes layer. Note the following considerations:

- When you copy a layer, the copy appears as the highest layer.
- Copying a shared layer creates a layer that is initially unshared and which you can then share if you choose.
- You cannot delete a shared layer; a layer with sharing enabled that you have not shared with another policy is not a shared layer.

You can merge a user-configurable layer with another user-configurable layer immediately beneath it. A merged layer retains all settings that were unique to either layer, and accepts the settings from the higher layer if both layers included settings for the same preprocessor, intrusion rule, or advanced setting. The merged layer retains the name of the lower layer. In the policy where you create a sharable layer that you can add to
other policies, you can merge an unshared layer immediately above the sharable layer with the sharable layer, but you cannot merge the sharable layer with an unshared layer beneath it. In a policy where you add a shared layer that you created in another policy, you can merge the shared layer into an unshared layer immediately beneath it and the resulting layer is no longer shared; you cannot merge an unshared layer into a shared layer beneath it.

## Shared Layers

A *shared layer* is a layer you add to your policy after creating the layer in another policy where you allow it to be shared. A *sharable layer* is a layer you allow to be shared.

The following figure shows an example master policy where you create the company-wide layer and site-specific layers for sites A and B, and allow these to be shared. You then add these as shared layers to the policies for sites A and B.

![Diagram of shared layers](image)

The company-wide layer in the master policy includes settings applicable to sites A and B. The site-specific layers include settings specific to each site. For example, in the case of a network analysis policy Site A might not have web servers on the monitored network and would not require the protection or processing overhead of the HTTP Inspect preprocessor, but both sites would likely require TCP stream preprocessing. You could enable TCP stream processing in the company-wide layer that you share with both sites, disable the HTTP Inspect preprocessor in the site-specific layer that you share with Site A, and enable the HTTP Inspect preprocessor in the site-specific layer that you share with Site B. By editing configurations in a higher layer in the site-specific policies, you could also further tune the policy for each site if necessary with any configuration adjustments.

It is unlikely that the flattened net settings in the example master policy would be useful for monitoring traffic, but the time saved in configuring and updating the site-specific policies makes this a useful application of policy layers.

Many other layer configurations are possible. For example, you could define policy layers by company, by department, by network, or even by user. In the case of an intrusion policy, you could also include advanced settings in one layer and rule settings in another.

You can allow a user-configurable layer to be shared with other policies of the same type (intrusion or network analysis). When you modify a configuration within a sharable layer and then commit your changes, the system updates all policies that share the layer and provides you with a list of all affected policies. You can only change feature configurations in the policy where you created the layer.

You cannot disable sharing for a layer that you have added to another policy; you must first delete the layer from the other policy or delete the other policy.

You cannot add a shared layer to a policy when your base policy is a custom policy where the layer you want to share was created. To do so would give the policy a circular dependency.

In a multidomain deployment, you can add shared layers from ancestor policies to policies in descendant domains.
Managing Layers

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

Procedure

Step 1
While editing your policy, click **Policy Layers** in the navigation panel.

Step 2
You can take any of the following management actions on the Policy Layers page:

- Add a shared layer from another policy — Click the add shared layer icon (✈️) next to User Layers, choose the layer from the **Add Shared Layer** drop-down list, then click **OK**.
- Add an unshared layer — Click the add layer icon (📍) next to User Layers, enter a **Name**, and click **OK**.
- Add or change the layer description — Click the edit icon (✍️) next to the layer, then add or change the **Description**.
- Allow a layer to be shared with another policy — Click the edit icon (✍️) next to the layer, then clear the **Sharing** check box.
- Change the layer name — Click the edit icon (✍️) next to the layer, then change the **Name**.
- Copy a layer — Click the copy icon (📢) for the layer.
- Delete a layer — Click the delete icon (🗑️) for the layer, then click **OK**.
- Merge two layers — Click the merge icon (🔚) for the upper of the two layers, then click **OK**.
- Move a layer — Click any open area in the layer summary and drag until the position arrow (➡️) points to a line above or below a layer where you want to move the layer.

Step 3
To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

### Navigating Layers

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

#### Procedure

**Step 1** While editing your policy, click **Policy Layers** in the navigation panel.

**Step 2** You can take any of the following actions to navigate through your layers:

- Access a preprocessor or advanced settings page — If you want to access a layer-level preprocessor or advanced setting configuration page, click the feature name in the row for the layer. Configuration pages are read-only in the base policy and in shared layers.
- Access a rule page — If you want to access a layer-level rule configuration page filtered by rule state type, click the icon for drop and generate events (❌), generate events (➡️), or disabled (➡️) in the summary for the layer. No rules are displayed if the layer contains no rules set to the selected rule state.
- Display the Policy Information page — If you want to display the Policy Information page, click **Policy Summary** in the navigation panel.
- Display a layer summary page — If you want to display the summary page for a layer, click the layer name in the row for the layer or, alternately, click the edit icon (✍️) next to a user layer. You can also click the view icon (👀) to access the read-only summary page for a shared layer.

**Step 3** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes, on page 279**.

**Related Topics**

- **Conflicts and Changes: Network Analysis and Intrusion Policies**, on page 1288

### Intrusion Rules in Layers

You can view individual layer settings on the Rules page for the layer, or view the net effect of all settings on the policy view of the Rules page. When you modify rule settings on the policy view of the Rules page, you are modifying the highest user-configurable layer in the policy. You can switch to another layer using the layer drop-down list on any Rules page.

The following table describes the effects of configuring the same type of setting in multiple layers.
### Table 101: Layer Rule Settings

<table>
<thead>
<tr>
<th>You can set...</th>
<th>Of this setting type...</th>
<th>To...</th>
</tr>
</thead>
<tbody>
<tr>
<td>one</td>
<td>rule state</td>
<td>override a rule state set for the rule in a lower layer, and ignore all thresholds, suppressions, rate-based rule states, and alerts for that rule configured in lower layers. If you want a rule to inherit its state from the base policy or a lower layer, set the rule state to Inherit. Note that when you are working on the intrusion policy Rules page, you cannot set a rule state to Inherit because the intrusion policy Rules page is a composite view of the net effect of all rule settings.</td>
</tr>
<tr>
<td>one</td>
<td>threshold SNMP alert</td>
<td>override a setting of the same type for the rule in a lower layer. Note that setting a threshold overwrites any existing threshold for the rule in the layer.</td>
</tr>
<tr>
<td>one or more</td>
<td>suppression rate-based rule state</td>
<td>cumulatively combine settings of the same type for each selected rule down to the first layer where a rule state is set for the rule. Settings below the layer where a rule state is set are ignored.</td>
</tr>
<tr>
<td>one or more</td>
<td>comment</td>
<td>add a comment to a rule. Comments are rule-specific, not policy- or layer-specific. You can add one or more comments to a rule in any layer.</td>
</tr>
</tbody>
</table>

For example, if you set a rule state to Drop and Generate Events in one layer and to Disabled in a higher layer, the intrusion policy Rules page shows that the rule is disabled.

In another example, if you set a source-based suppression for a rule to 192.168.1.1 in one layer, and you also set a destination-based suppression for the rule to 192.168.1.2 in another layer, the Rules page shows that the cumulative effect is to suppress events for the source address 192.168.1.1 and the destination address 192.168.1.2. Note that suppression and rate-based rule state settings cumulatively combine settings of the same type for each selected rule down to the first layer where a rule state is set for the rule. Settings below the layer where a rule state is set are ignored.

Color-coding on each Rules page for a specific layer indicates whether the effective state is in a higher, lower, or the current layer, as follows:

- red—the effective state is in a higher layer
- yellow—the effective state is in a lower layer
- unshaded—the effective state is in the current layer
Because the intrusion policy Rules page is a composite view of the net effect of all rule settings, rule states are not color-coded on this page.

**Configuring Intrusion Rules in Layers**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

In an intrusion policy, you can set the rule state, event filtering, dynamic state, alerting, and rule comments for a rule in any user-configurable layer. After accessing the layer where you want to make your changes, you add settings on the Rules page for the layer the same as you would on the intrusion policy Rules page.

**Procedure**

**Step 1**
While editing your intrusion policy, expand **Policy Layers** in the navigation panel.

**Step 2**
Expand the policy layer you want to modify.

**Step 3**
Click **Rules** immediately beneath the policy layer you want to modify.

**Step 4**
Modify any of the settings described in Tuning Intrusion Policies Using Rules, on page 1315.

**Tip**
To delete an individual setting from an editable layer, double-click the rule message on the Rules page for the layer to display rule details. Click **Delete** next to the setting you want to delete, then click **OK** twice.

**Step 5**
To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

**What to do next**
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Related Topics**
Conflicts and Changes: Network Analysis and Intrusion Policies, on page 1288

**Removing Rule Settings from Multiple Layers**

<table>
<thead>
<tr>
<th>Smart License</th>

You can simultaneously remove a specific type of event filter, dynamic state, or alerting from multiple layers in your intrusion policy. The system removes the selected setting and copies the remaining settings for the rule to the highest editable layer in the policy.
Removing Rule Settings from Multiple Layers

The system removes the setting type downward through each layer where it is set until it removes all the settings or encounters a layer where a rule state is set for the rule. In the latter case, it removes the setting from that layer and stops removing the setting type.

When the system encounters the setting type in a shared layer or in the base policy, and if the highest layer in the policy is editable, the system copies the remaining settings and rule state for the rule to that editable layer. Otherwise, if the highest layer in the policy is a shared layer, the system creates a new editable layer above the shared layer and copies the remaining settings and rule state for the rule to that editable layer.

Note
Removing rule settings derived from a shared layer or the base policy causes any changes to this rule from lower layers or the base policy to be ignored. To stop ignoring changes from lower layers or the base policy, set the rule state to **Inherit** on the summary page for the topmost layer.

Procedure

**Step 1**
While editing your intrusion policy, click **Rules** immediately beneath **Policy Information** in the navigation panel.

Tip
You can also choose **Policy** from the layer drop-down list on the Rules page for any layer, or click **Manage Rules** on the Policy Information page.

**Step 2**
Choose the rule or rules from which you want to remove multiple settings:

- **Choose specific** — If you want to choose specific rules, check the check box next to each rule.
- **Choose all** — If you want to choose all the rules in the current list, check the check box at the top of the column.

**Step 3**
Choose one of the following options:

- **Event Filtering > Remove Thresholds**
- **Event Filtering > RemoveSuppressions**
- **Dynamic State > Remove Rate-Based Rule States**
- **Alerting > Remove SNMP Alerts**

Note
Removing rule settings derived from a shared layer or the base policy causes any changes to this rule from lower layers or the base policy to be ignored. To stop ignoring changes from lower layers or the base policy, set the rule state to **Inherit** on the summary page for the topmost layer.

**Step 4**
Click **OK**.

**Step 5**
To save changes made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.
Accepting Rule Changes from a Custom Base Policy

<table>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

When a custom network analysis or intrusion policy where you have not added layers uses another custom policy as its base policy, you must set a rule to inherit its rule state if:

- you delete an event filter, dynamic state, or SNMP alert that is set for the rule in the base policy, and
- you want the rule to accept subsequent changes that you make to it in the other custom policy that you use as your base policy

**Procedure**

1. While editing your intrusion policy, expand **Policy Layers** in the navigation panel.
2. Expand **My Changes**.
3. Click the **Rules** link immediately beneath **My Changes**.
4. Choose the rule or rules whose settings you want to accept. You have the following choices:
   - Choose specific rules — If you want to choose specific rules, check the check box next to each rule.
   - Choose all rules — If you want to choose all the rules in the current list, check the check box at the top of the column.
5. Choose **Inherit** from the **Rule State** drop-down list.
6. To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

**Related Topics**

- **Conflicts and Changes: Network Analysis and Intrusion Policies**, on page 1288
Preprocessors and Advanced Settings in Layers

You use similar mechanisms to configure preprocessors in a network analysis policy and advanced settings in an intrusion policy. You can enable and disable preprocessors on the network analysis Settings page and intrusion policy advanced settings on the intrusion policy Advanced Settings page. These pages also provide summaries of the effective states for all relevant features. For example, if the network analysis SSL preprocessor is disabled in one layer and enabled in a higher layer, the Settings page shows it as enabled. Changes made on these pages appear in the top layer of the policy. Note that the Back Orifice preprocessor has no user-configurable options.

You can also enable or disable preprocessors or advanced settings and access their configuration pages on the summary page for a user-configurable layer. On this page you can modify the layer name and description and configure whether to share the layer with other policies of the same type. You can switch to the summary page for another layer by selecting the layer name beneath Policy Layers in the navigation panel.

When you enable a preprocessor or advanced setting, a sublink to the configuration page for that feature appears beneath the layer name in the navigation panel, and an edit icon (/edit) appears next to the feature on the summary page for the layer; these disappear when you disable the feature in the layer or set it to Inherit.

Setting the state (enabled or disabled) for a preprocessor or advanced setting overrides the state and configuration settings for that feature in lower layers. If you want a preprocessor or advanced setting to inherit its state and configuration from the base policy or a lower layer, set it to Inherit. Note that the Inherit selection is not available when you are working in the Settings or Advanced Settings page. Note also that if you inherit a feature that is currently enabled, the feature sublink in the navigation panel and the edit icon on the configuration page no longer appear.

The system uses the configuration in the highest layer where the feature is enabled. Unless you explicitly modify the configuration, the system uses the default configuration. For example, if you enable and modify the network analysis DCE/RPC preprocessor in one layer, and you also enable but do not modify it in a higher layer, the system uses the default configuration in the higher layer.

Color-coding on each layer summary page indicates whether the effective configuration is in a higher, lower, or the current layer, as follows:

- red—the effective configuration is in a higher layer
- yellow—the effective configuration is in a lower layer
- unshaded—the effective configuration is in the current layer

Because the Settings and Advanced Settings pages are composite views of all relevant settings, these page do not use color coding to indicate the positions of effective configurations.

Configuring Preprocessors and Advanced Settings in Layers

<table>
<thead>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>
Procedure

Step 1  While editing your policy, expand **Policy Layers** in the navigation panel, then click the name of the layer you want to modify.

Step 2  You have the following choices:

- Change the layer **Name**.
- Add or change the **Description**.
- Check or clear the **Sharing** check box to specify whether a layer can be shared with another policy.
- To access the configuration page for an enabled preprocessor/advanced setting, click the edit icon (✎) or the feature sublink.
- To disable a preprocessor/advanced setting in the current layer, click **Disabled** next to the feature.
- To enable a preprocessor/advanced setting in the current layer, click **Enabled** next to the feature.
- To inherit the preprocessor/advanced setting state and configuration from the settings in the highest layer below the current layer, click **Inherit**.

Step 3  To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Getting Started with Intrusion Policies

The following topics explain how to get started with intrusion policies:

- Intrusion Policy Basics, on page 1307
- Managing Intrusion Policies, on page 1308
- Custom Intrusion Policy Creation, on page 1309
- Editing Intrusion Policies, on page 1310
- Drop Behavior in an Inline Deployment, on page 1312
- Drop Behavior in a Dual System Deployment, on page 1313
- Intrusion Policy Advanced Settings, on page 1313
- Optimizing Performance for Intrusion Detection and Prevention, on page 1314

Intrusion Policy Basics

*Intrusion policies* are defined sets of intrusion detection and prevention configurations that inspect traffic for security violations and, in inline deployments, can block or alter malicious traffic. Intrusion policies are invoked by your access control policy and are the system’s last line of defense before traffic is allowed to its destination.

At the heart of each intrusion policy are the intrusion rules. An enabled rule causes the system to generate intrusion events for (and optionally block) traffic matching the rule. Disabling a rule stops processing of the rule.

The Firepower System delivers several base intrusion policies, which enable you to take advantage of the experience of the Cisco Talos Security Intelligence and Research Group (Talos). For these policies, Talos sets intrusion and preprocessor rule states (enabled or disabled), as well as provides the initial configurations for other advanced settings.

**Tip**

System-provided intrusion and network analysis policies are similarly named but contain different configurations. For example, the Balanced Security and Connectivity network analysis policy and the Balanced Security and Connectivity intrusion policy work together and can both be updated in intrusion rule updates. However, the network analysis policy governs mostly preprocessing options, whereas the intrusion policy governs mostly intrusion rules.

If you create a custom intrusion policy, you can:

- Tune detection by enabling and disabling rules, as well as by writing and adding your own rules.
• Use Firepower recommendations to associate the operating systems, servers, and client application protocols detected on your network with rules specifically written to protect those assets.

• Configure various advanced settings such as external alerting, sensitive data preprocessing, and global rule thresholding.

• Use layers as building blocks to efficiently manage multiple intrusion policies.

In an inline deployment, an intrusion policy can block and modify traffic:

• **Drop rules** can drop matching packets and generate intrusion events. To configure an intrusion or preprocessor drop rule, set its state to Drop and Generate Events.

• Intrusion rules can use the **replace** keyword to replace malicious content.

For intrusion rules to affect traffic, you must correctly configure drop rules and rules that replace content, as well as correctly deploy managed devices inline, that is, with inline interface sets. Finally, you must enable the intrusion policy’s **drop behavior**, or **Drop when Inline** setting.

When tailoring your intrusion policy, especially when enabling and adding rules, keep in mind that some intrusion rules require that traffic first be decoded or preprocessed in a certain way. Before an intrusion policy examines a packet, the packet is preprocessed according to configurations in a network analysis policy. If you disable a required preprocessor, the system automatically uses it with its current settings, although the preprocessor remains disabled in the network analysis policy web interface.

---

**Caution**

Because preprocessing and intrusion inspection are so closely related, the network analysis and intrusion policies examining a single packet **must** complement each other. Tailoring preprocessing, especially using multiple custom network analysis policies, is an **advanced** task.

After you configure a custom intrusion policy, you can use it as part of your access control configuration by associating the intrusion policy with one or more access control rules or an access control policy’s default action. This forces the system to use the intrusion policy to examine certain allowed traffic before the traffic passes to its final destination. A variable set that you pair with the intrusion policy allows you to accurately reflect your home and external networks and, as appropriate, the servers on your network.

Note that by default, the system disables intrusion inspection of encrypted payloads. This helps reduce false positives and improve performance when an encrypted connection matches an access control rule that has intrusion inspection configured.

---

## Managing Intrusion Policies

<table>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

On the Intrusion Policy page (**Policies > Access Control > Intrusion**), you can view your current custom intrusion policies, along with the following information:

• the time and date the policy was last modified (in local time) and the user who modified it
Intrusion Detection and Prevention

• whether the **Drop when Inline** setting is enabled, which allows you to drop and modify traffic in an inline deployment

• which access control policies and devices are using the intrusion policy to inspect traffic

• whether a policy has unsaved changes, as well as information about who (if anyone) is currently editing the policy

• in a multidomain deployment, the domain where the policy was created

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Step 2</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Choose Policies &gt; Access Control &gt; Intrusion.</strong></td>
<td>Manage your intrusion policy:</td>
</tr>
<tr>
<td><strong>Manage your intrusion policy:</strong></td>

</tr>
<tr>
<td></td>
<td>• Create — Click <strong>Create Policy</strong>; see Creating a Custom Intrusion Policy, on page 1310.</td>
</tr>
<tr>
<td></td>
<td>• Delete — Click the delete icon (✓) next to the policy you want to delete. The system prompts you to confirm and informs you if another user has unsaved changes in the policy. Click OK to confirm. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.</td>
</tr>
<tr>
<td></td>
<td>• Edit — Click the edit icon (&lt;textarea&gt;) next to the policy you want to edit; see Editing Intrusion Policies, on page 1310. If a view icon (('&lt;/textarea&gt;')) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.</td>
</tr>
<tr>
<td></td>
<td>• Export — If you want to export an intrusion policy to import on another Firepower Management Center, click the export icon (🛠); see Exporting Configurations, on page 167.</td>
</tr>
<tr>
<td></td>
<td>• Deploy—Click <strong>Deploy</strong>; see Deploy Configuration Changes, on page 279.</td>
</tr>
<tr>
<td></td>
<td>• Report—Click the report icon (📊); see Generating Current Policy Reports, on page 288.</td>
</tr>
</tbody>
</table>

**Custom Intrusion Policy Creation**

When you create a new intrusion policy you must give it a unique name, specify a base policy, and specify drop behavior.
The base policy defines the intrusion policy’s default settings. Modifying a setting in the new policy overrides—but does not change—the settings in the base policy. You can use either a system-provided or custom policy as your base policy.

The intrusion policy’s drop behavior, or **Drop when Inline** setting, determines how the system handles drop rules (intrusion or preprocessors rules whose rule state is set to Drop and Generate Events) and other intrusion policy configurations that affect traffic. You should enable drop behavior in inline deployments when you want to drop or replace malicious packets. Note that in passive deployments, the system cannot affect traffic flow regardless of the drop behavior.

---

**Creating a Custom Intrusion Policy**

<table>
<thead>
<tr>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose **Policies > Access Control > Intrusion**.

**Step 2** Click **Create Policy**. If you have unsaved changes in another policy, click **Cancel** when prompted to return to the Intrusion Policy page.

**Step 3** Enter a unique **Name** and, optionally, a **Description**.

**Step 4** Specify the initial **Base Policy**.

You can use either a system-provided or another custom policy as your base policy.

**Step 5** Set the system’s drop behavior in an inline deployment as described in **Setting Drop Behavior in an Inline Deployment**, on page 1312.

**Step 6** Create the policy:

- Click **Create Policy** to create the new policy and return to the Intrusion Policy page. The new policy has the same settings as its base policy.
- Click **Create and Edit Policy** to create the policy and open it for editing in the advanced intrusion policy editor; see **Intrusion Policy Changes**, on page 1311.

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>
Procedure

Step 1  Choose Policies > Access Control > Intrusion.

Step 2  Click the edit icon ( ) next to the intrusion policy you want to configure.

If a view icon ( ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3  Edit your policy:

• Change the base policy—Choose a base policy from the Base Policy drop-down list; see Changing the Base Policy, on page 1294.
• Configure advanced settings—Click Advanced Settings in the navigation panel; see Intrusion Policy Advanced Settings, on page 1313.
• Configure Firepower recommended intrusion rules—Click Firepower Recommendations in the navigation panel; see Generating and Applying Firepower Recommendations, on page 1346.
• Drop behavior in an inline deployment—Check or clear Drop when Inline; see Setting Drop Behavior in an Inline Deployment, on page 1312.
• Filter rules by recommended rule state—After you generate recommendations, click View next to each recommendation type. Click View Recommended Changes to view all recommendations.
• Filter rules by current rule state—Click View next to each rule state type (generate events, drop and generate events); see Intrusion Rule Filters in an Intrusion Policy, on page 1323.
• Manage policy layers—Click Policy Layers in the navigation panel; see Layer Management, on page 1296.
• Manage intrusion rules—Click Manage Rules; see Viewing Intrusion Rules in an Intrusion Policy, on page 1316.
• View settings in base policy—Click Manage Base Policy; see The Base Layer, on page 1292.

Step 4  To save changes you made in this policy since the last policy commit, choose Policy Information, then click Commit Changes.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics

Generating and Applying Firepower Recommendations, on page 1346

Conflicts and Changes: Network Analysis and Intrusion Policies, on page 1288

Intrusion Policy Changes

When you create a new intrusion policy, it has the same intrusion rule and advanced settings as its base policy.
The system caches one intrusion policy per user. While editing an intrusion policy, if you choose any menu or other path to another page, your changes stay in the system cache even if you leave the page.

**Drop Behavior in an Inline Deployment**

If you want to assess how your configuration would function in an inline deployment (that is, where relevant configurations are deployed to devices using routed, switched, or transparent interfaces, or inline interface pairs) without actually affecting traffic, you can disable drop behavior. In this case, the system generates intrusion events but does not drop packets that trigger drop rules. When you are satisfied with the results, you can enable drop behavior.

Note that in passive deployments or inline deployments in tap mode, the system cannot affect traffic regardless of the drop behavior. In other words, in a passive deployment, rules set to Drop and Generate Events behave identically to rules set to Generate Events—the system generates intrusion events but cannot drop packets.

---

**Note**

To block the transfer of malware over FTP, you must not only correctly configure AMP for Networks, but also enable **Drop when Inline** in your access control policy’s default intrusion policy.

When you view intrusion events, workflows can include the **inline result**, which indicates whether traffic was actually dropped, or whether it only would have dropped.

**Setting Drop Behavior in an Inline Deployment**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose **Policies > Access Control > Intrusion**.

**Step 2** Click the edit icon (-pencil) next to the policy you want to edit.

If a view icon (-eye) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Set the policy’s drop behavior:

- Check the **Drop when Inline** check box to allow intrusion rules to affect traffic and generate events.

- Clear the **Drop when Inline** check box to prevent intrusion rules from affecting traffic while still generating events.

**Step 4** Click **Commit Changes** to save changes you made in this policy since the last policy commit.
If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Drop Behavior in a Dual System Deployment

When there are two systems connected back to back in a network, it is normal to see the first system drop events and still record a drop or "would have dropped" event on the second system. The first system decides to drop the packets by the time it scans the last packet of the file, while the second system also investigates and identifies the traffic as "to be dropped".

For example, a 5 packet HTTP GET request whose first packet triggers a rule is blocked by the first system and only the last packet is dropped. The second system receives only 4 packets and the connection gets dropped, but when the second system finally flushes the partial GET request while it is pruning the session, it triggers the same rule with "would have dropped" as the inline result.

Intrusion Policy Advanced Settings

An intrusion policy’s advanced settings require specific expertise to configure. The base policy for your intrusion policy determines which advanced settings are enabled by default and the default configuration for each.

When you choose Advanced Settings in the navigation panel of an intrusion policy, the policy lists its advanced settings by type. On the Advanced Settings page, you can enable or disable advanced settings in your intrusion policy, as well as access advanced setting configuration pages. An advanced setting must be enabled for you to configure it.

When you disable an advanced setting, the sublink and Edit link no longer appear, but your configurations are retained. Note that some intrusion policy configurations (sensitive data rules, SNMP alerts for intrusion rules) require enabled and correctly configured advanced settings. You cannot save an intrusion policy misconfigured in this way.

Modifying the configuration of an advanced setting requires an understanding of the configuration you are modifying and its potential impact on your network.

Specific Threat Detection

The sensitive data preprocessor detects sensitive data such as credit card numbers and Social Security numbers in ASCII text.

Note that other preprocessors that detect specific threats (back orifice attacks, several portscan types, and rate-based attacks that attempt to overwhelm your network with excessive traffic) are configured in network analysis policies.
Intrusion Rule Thresholds

Global rule thresholding can prevent your system from being overwhelmed with a large number of events by allowing you to use thresholds to limit the number of times the system logs and displays intrusion events.

External Responses

In addition to the various views of intrusion events with in the web interface, you can enable logging to system log (syslog) facilities or send event data to an SNMP trap server. Per policy, you can specify intrusion event notification limits, set up intrusion event notification to external logging facilities, and configure external responses to intrusion events.

Note that in addition to these per-policy alerting configurations, you can globally enable or disable email alerting on intrusion events for each rule or rule group. Your email alert settings are used regardless of which intrusion policy processes a packet.

</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access, Admin/Network, Admin (access control), Admin/Discovery, Admin (network discovery)</td>
</tr>
</tbody>
</table>

If you want the Firepower System to perform intrusion detection and prevention but do not need to take advantage of discovery data, you can optimize performance by disabling new discovery as described below.

Procedure

**Step 1** Modify or delete rules associated with the access control policy deployed at the target device. None of the access control rules associated with that device can have user, application, or URL conditions; see Creating and Editing Access Control Rules, on page 1096.

**Step 2** Delete all rules from the network discovery policy for the target device; see Configuring Network Discovery Rules, on page 1748.

**Step 3** Deploy the changed configuration to the target device; see Deploy Configuration Changes, on page 279.
CHAPTER 71

Tuning Intrusion Policies Using Rules

The following topics explain how to use rules to tune intrusion policies:

- Intrusion Rule Tuning Basics, on page 1315
- Intrusion Rule Types, on page 1315
- Viewing Intrusion Rules in an Intrusion Policy, on page 1316
- Intrusion Rule Filters in an Intrusion Policy, on page 1323
- Intrusion Rule States, on page 1330
- Intrusion Event Notification Filters in an Intrusion Policy, on page 1332
- Dynamic Intrusion Rule States, on page 1339
- Adding Intrusion Rule Comments, on page 1342

Intrusion Rule Tuning Basics

You can use the Rules page in an intrusion policy to configure rule states and other settings for shared object rules, standard text rules, and preprocessors rules.

You enable a rule by setting its rule state to Generate Events or to Drop and Generate Events. Enabling a rule causes the system to generate events on traffic matching the rule. Disabling a rule stops processing of the rule. You can also set your intrusion policy so that a rule set to Drop and Generate Events in an inline deployment generates events on, and drops, matching traffic. In a passive deployment, a rule set to Drop and Generate Events just generates events on matching traffic.

You can filter rules to display a subset of rules, enabling you to select the exact set of rules where you want to change rule states or rule settings.

When an intrusion rule or rule argument requires a disabled preprocessor, the system automatically uses it with its current configuration even though it remains disabled in the network analysis policy’s web interface.

Intrusion Rule Types

An intrusion rule is a specified set of keywords and arguments that the system uses to detect attempts to exploit vulnerabilities in your network. As the system analyzes network traffic, it compares packets against the conditions specified in each rule, and triggers the rule if the data packet meets all the conditions specified in the rule.

An intrusion policy contains:
• *intrusion rules*, which are subdivided into *shared object rules* and *standard text rules*

• *preprocessor rules*, which are associated with a detection option of the packet decoder or with one of the preprocessors included with the Firepower System

The following table summarizes attributes of these rule types:

<table>
<thead>
<tr>
<th>Table 102: Intrusion Rule Types</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>---------</td>
</tr>
<tr>
<td>shared object rule</td>
</tr>
<tr>
<td>standard text rule</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>preprocessor rule</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

You cannot save changes to any rule created by Talos, but you can save a copy of a modified rule as a custom rule. You can modify either variables used in the rule or rule header information (such as source and destination ports and IP addresses). In a multidomain deployment, rules created by Talos belong to the Global domain. Administrators in descendant domains can save local copies of the rules, which they can then edit.

For the rules it creates, Talos assigns default rule states in each default intrusion policy. Most preprocessor rules are disabled by default and must be enabled if you want the system to generate events for preprocessor rules and, in an inline deployment, drop offending packets.

In a multidomain deployment, the system prepends a domain number to the SID of any custom rule created in or imported into a descendant domain. For example, a rule added in the Global domain would have a SID of 1000000 or greater, and rules added in descendant domains would have SIDs of [domain number]000000 or greater.

### Viewing Intrusion Rules in an Intrusion Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You can adjust how rules are displayed in the intrusion policy, and can sort rules by several criteria. You can also display the details for a specific rule to see rule settings, rule documentation, and other rule specifics.
Procedure

**Step 1** Choose Policies > Access Control > Intrusion.

**Step 2** Click the edit icon ((confirm you want to edit.  
If a view icon (conf) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click Rules under Policy Information in the navigation panel.

**Step 4** While viewing the rules, you can:
- Filter the rules as described in Setting a Rule Filter in an Intrusion Policy, on page 1329.
- Sort the rules by clicking the title or icon in the top of the column you want to sort by.
- View an intrusion rule’s details as described in Viewing Intrusion Rule Details, on page 1319.
- View rules in different policy layers by choosing a layer from the Policy drop-down list.

Intrusion Rules Page Columns

The Intrusion Rules page uses the same icons in its menu bar and column headers. For example, the Rule State menu uses the same icon (confirm you want to edit) as the Rule State column in the rule listing.

<table>
<thead>
<tr>
<th>Heading</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GID</td>
<td>Integer that indicates the Generator ID (GID) for the rule.</td>
</tr>
</tbody>
</table>
| SID       | Integer that indicates the Snort ID (SID), which acts as a unique identifier for the rule.  
For custom rules, the SID is 1000000 or higher.  
In a multidomain deployment, the system prepends a domain number to the SID of any custom rule created in or imported into a descendant domain. For example, a rule added in the Global domain would have a SID of 1000000 or greater, and rules added in descendant domains would have SIDs of [domain number]000000 or greater. |
| Message   | Message included in events generated by this rule, which also acts as the name of the rule. |

[confirm you want to edit] The rule state for the rule:
- Drop and generate events (confirm you want to edit)  
- Generate events (confirm you want to edit)  
- Disabled (confirm you want to edit)  

Note the icon for a disabled rule is a dimmed version of the icon for a rule that is set to generate events without dropping traffic. Also, clicking the rule state icon for a rule allows you to change the rule state.
**Intrusion Rule Details**

You can view rule documentation, Firepower recommendations, and rule overhead from the Rule Detail view. You can also view and add rule-specific features.

<table>
<thead>
<tr>
<th><strong>Item</strong></th>
<th><strong>Description</strong></th>

<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comments</td>
<td>Comments added to this rule, as well as the facility to add comments for the rule.</td>
</tr>
<tr>
<td>Documentation</td>
<td>The rule documentation for the current rule, supplied by the Cisco Talos Security Intelligence and Research Group (Talos).</td>
</tr>
</tbody>
</table>

#### Procedure

**Step 1** Choose Policies > Access Control > Intrusion.

**Step 2** Click the edit icon ( dục>) next to the policy you want to edit.

If a view icon (视力) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** On the navigation pane, click Rules.

**Step 4** Click the rule whose rule details you want to view, then click Show Details at the bottom of the page. Rule details appear, as described in Intrusion Rule Details, on page 1318.

**Step 5** From the rule details, you can configure:

- Alerts—See Setting an SNMP Alert for an Intrusion Rule, on page 1322.
- Comments—See Adding a Comment to an Intrusion Rule, on page 1322.
- Dynamic rule states—See Setting a Dynamic Rule State from the Rule Details Page, on page 1321.
- Thresholds—See Setting a Threshold for an Intrusion Rule, on page 1319.
- Suppressions—See Setting Suppression for an Intrusion Rule, on page 1320.

### Setting a Threshold for an Intrusion Rule

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You can set a single threshold for a rule from the Rule Detail page. Adding a threshold overwrites any existing threshold for the rule.

Note that a revert icon ( её) appears in a field when you enter an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.
**Setting Suppression for an Intrusion Rule**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

You can set one or more suppressions for a rule in your intrusion policy.

Note that a revert icon (⟈) appears in a field when you type an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

**Procedure**

**Step 1** From an intrusion rule’s details, click Add next to Suppressions.

**Step 2** From the Suppression Type drop-down list, choose one of the following options:

- Choose Rule to completely suppress events for a selected rule.
- Choose Source to suppress events generated by packets originating from a specified source IP address.
- Choose Destination to suppress events generated by packets going to a specified destination IP address.

**Step 3** If you chose Source or Destination for the suppression type, in the Network field enter the IP address, an address block, or a comma-separated list comprised of any combination of these.

If the intrusion policy is associated with the default action of an access control policy, you can also specify or list a network variable in the default action variable set.
The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

**Step 4**

Click **OK**.

**Tip**

The system displays an event filter icon (evento) next to the rule in the Event Filtering column next the suppressed rule. If you add multiple event filters to a rule, a number over the icon indicates the number of filters.

---

**Setting a Dynamic Rule State from the Rule Details Page**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can set one or more dynamic rule states for a rule. The first dynamic rule state listed has the highest priority. When two dynamic rule states conflict, the action of the first is carried out.

Dynamic rule states are policy-specific.

Note that a revert icon (evento) appears in a field when you enter an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

**Procedure**

**Step 1**

From an intrusion rule’s details, click **Add** next to **Dynamic State**.

**Step 2**

From the **Track By** drop-down list, choose an option to indicate how you want the rule matches tracked:

- Choose **Source** to track the number of hits for that rule from a specific source or set of sources.
- Choose **Destination** to track the number of hits for that rule to a specific destination or set of destinations.
- Choose **Rule** to track all matches for that rule.

**Step 3**

If you set **Track By** to **Source** or **Destination**, enter the IP address of each host you want to track in the **Network** field.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

**Step 4**

Next to **Rate**, specify the number of rule matches per time period to set the attack rate:

- In the **Count** field, specify the number of rule matches you want to use as your threshold.
- In the **Seconds** field, specify the number of seconds that make up the time period for which attacks are tracked.

**Step 5**

From the **New State** drop-down list, choose the new action to be taken when the conditions are met.

**Step 6**

Enter a value in the **Timeout** field.

After the timeout occurs, the rule reverts to its original state. Enter 0 to prevent the new action from timing out.
Step 7  
Click OK.  

Tip  
The system displays a dynamic state icon (jc) next to the rule in the Dynamic State column. If you add multiple dynamic rule state filters to a rule, a number over the icon indicates the number of filters.

---

### Setting an SNMP Alert for an Intrusion Rule

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can set an SNMP alert for a rule from the Rule Detail page.

**Procedure**

From an intrusion rule’s details, click **Add SNMP Alert** next to **Alerts**.

**Tip**  
The system displays an alert icon (ji) next to the rule in the Alerting column. If you add multiple alerts to a rule, the system includes an indication over the icon of the number of alerts.

---

### Adding a Comment to an Intrusion Rule

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**  
From an intrusion rule’s details, click **Add** next to **Comments**.

**Step 2**  
In the **Comment** field, enter the rule comment.

**Step 3**  
Click **OK**.  

**Tip**  
The system displays a comment icon (jx) next to the rule in the Comments column. If you add multiple comments to a rule, a number over the icon indicates the number of comments.

**Step 4**  
To delete a rule comment, click **Delete** in the rule comments section. You can only delete a comment if the comment is cached with uncommitted intrusion policy changes.
What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Intrusion Rule Filters in an Intrusion Policy

You can filter the rules you display on the Rules page by a single criteria, or a combination of one or more criteria.

Rule filter keywords help you find the rules for which you want to apply rule settings, such as rule states or event filters. You can filter by a keyword and simultaneously select the argument for the keyword by selecting the argument you want from the Rules page filter panel.

Intrusion Rule Filters Notes

The filter you construct is shown in the Filter text box. You can click keywords and keyword arguments in the filter panel to construct a filter. When you choose multiple keywords, the system combines them using AND logic to create a compound search filter. For example, if you choose preprocessor under Category and then choose Rule Content > GID and enter 116, you get a filter of Category: “preprocessor” GID:“116”, which retrieves all rules that are preprocessor rules and have a GID of 116.

The Category, Microsoft Vulnerabilities, Microsoft Worms, Platform Specific, Preprocessor, and Priority filter groups allow you to submit more than one argument for a keyword, separated by commas. For example, you can choose os-linux and os-windows from Category to produce the filter Category:”os-windows,os-linux”, which retrieves any rules in the os-linux category or in the os-windows category.

To show the filter panel, click the show icon ( ).

To hide the filter panel, click the hide icon ( ).

Intrusion Policy Rule Filters Construction Guidelines

In most cases, when you are building a filter, you can use the filter panel to the left of the Rules page in the intrusion policy to choose the keywords/arguments you want to use.

Rule filters are grouped into rule filter groups in the filter panel. Many rule filter groups contain sub-criteria so that you can more easily find the specific rules you are looking for. Some rule filters have multiple levels that you can expand to drill down to individual rules.

Items in the filter panel sometimes represent filter type groups, sometimes represent keywords, and sometimes represent the argument to a keyword. Note the following:

• When you choose a filter type group heading that is not a keyword (Rule Configuration, Rule Content, Platform Specific, and Priority), it expands to list the available keywords.

When you choose a keyword by clicking on a node in the criteria list, a pop-up window appears, where you supply the argument you want to filter by.

If that keyword is already used in the filter, the argument you supply replaces the existing argument for that keyword.
For example, if you click **Drop and Generate Events** under **Rule Configuration > Recommendation** in the filter panel, **Recommendation:** "Drop and Generate Events" is added to the filter text box. If you then click **Generate Events** under **Rule Configuration > Recommendation**, the filter changes to **Recommendation:** "Generate Events".

- When you choose a filter type heading that is a keyword (Category, Classifications, Microsoft Vulnerabilities, Microsoft Worms, Priority, and Rule Update), it lists the available arguments.

  When you choose an item from this type of group, the argument and the keyword it applies to are immediately added to the filter. If the keyword is already in the filter, it replaces the existing argument for the keyword that corresponds to that group.

  For example, if you click **os-linux** under **Category** in the filter panel, **Category:** "os-linux" is added to the filter text box. If you then click **os-windows** under **Category**, the filter changes to **Category:** "os-windows".

  - **Reference** under **Rule Content** is a keyword, and so are the specific reference ID types listed below it. When you choose any of the reference keywords, a pop-up window appears, where you supply an argument and the keyword is added to the existing filter. If the keyword is already in use in the filter, the new argument you supply replaces the existing argument.

    For example, if you click **Rule Content > Reference > CVE ID** in the filter panel, a pop-up window prompts you to supply the CVE ID. If you enter 2007, then **CVE:** "2007" is added to the filter text box. In another example, if you click **Rule Content > Reference** in the filter panel, a pop-up window prompts you to supply the reference. If you enter 2007, then **Reference:** "2007" is added to the filter text box.

  - When you choose rule filter keywords from different groups, each filter keyword is added to the filter and any existing keywords are maintained (unless overridden by a new value for the same keyword).

    For example, if you click **os-linux** under **Category** in the filter panel, **Category:** "os-linux" is added to the filter text box. If you then click **MS00-006** under **Microsoft Vulnerabilities**, the filter changes to **Category:** "os-linux" **MicrosoftVulnerabilities:** "MS00-006".

  - When you choose multiple keywords, the system combines them using AND logic to create a compound search filter. For example, if you choose **preprocessor** under **Category** and then choose **Rule Content > GID** and enter 116, you get a filter of **Category:** "preprocessor" **GID:** "116", which retrieves all rules that are preprocessor rules **and** have a GID of 116.

  - The **Category**, **Microsoft Vulnerabilities**, **Microsoft Worms**, **Platform Specific**, and **Priority** filter groups allow you to submit more than one argument for a keyword, separated by commas. For example, you can choose **os-linux** and **os-windows** from **Category** to produce the filter **Category:** "os-windows, app-detect", which retrieves any rules in the **os-linux** category or in the **os-windows** category.

The same rule may be retrieved by more than one filter keyword/argument pair. For example, the DOS Cisco attempt rule (SID 1545) appears if rules are filtered by the **dos** category, and also if you filter by the **High priority**.

---

**Note**

The Cisco Talos Security Intelligence and Research Group (Talos) may use the rule update mechanism to add and remove rule filters.

Note that the rules on the Rules page may be either shared object rules (generator ID 3) or standard text rules (generator ID 1). The following table describes the different rule filters.
**Table 105: Rule Filter Groups**

<table>
<thead>
<tr>

<td>No</td>
<td>A keyword</td>
<td>arguments</td>
</tr>
</tbody>
</table>

### Intrusion Rule Configuration Filters

You can filter the rules listed in the Rules page by several rule configuration settings. For example, if you want to view the set of rules whose rule state does not match the recommended rule state, you can filter on rule state by selecting **Does not match recommendation**.

When you choose a keyword by clicking on a node in the criteria list, you can supply the argument you want to filter by. If that keyword is already used in the filter, the argument you supply replaces the existing argument for that keyword.

For example, if you click **Drop and Generate Events** under **Rule Configuration > Recommendation** in the filter panel, **Recommendation:"Drop and Generate Events"** is added to the filter text box. If you then...
click **Generate Events** under **Rule Configuration** > **Recommendation**, the filter changes to **Recommendation:** "Generate Events".

### Intrusion Rule Content Filters

You can filter the rules listed in the Rules page by several rule content items. For example, you can quickly retrieve a rule by searching for the rule’s SID. You can also find all rules that inspect traffic going to a specific destination port.

When you select a keyword by clicking on a node in the criteria list, you can supply the argument you want to filter by. If that keyword is already used in the filter, the argument you supply replaces the existing argument for that keyword.

For example, if you click **SID** under **Rule Content** in the filter panel, a pop-up window appears, prompting you to supply a SID. If you type 1045, then **SID:** "1045" is added to the filter text box. If you then click **SID** again and change the SID filter to 1044, the filter changes to **SID:** "1044".

#### Table 106: Rule Content Filters

<td>have the selected rule overhead.</td>
</tr>
</tbody>
</table>
This filter... | Finds rules that...
---|---
Metadata | have metadata containing the matching *key value* pair. For example, type `metadata:“service http”` to locate rules with metadata relating to the HTTP application protocol.

**Intrusion Rule Categories**

The Firepower System places rules in categories based on the type of traffic the rule detects. On the Rules page, you can filter by rule category, so you can set a rule attribute for all rules in a category. For example, if you do not have Linux hosts on your network, you could filter by the `os-linux` category, then disable all the rules showing to disable the entire *os-linux* category.

You can hover your pointer over a category name to display the number of rules in that category.

**Note**
The Cisco Talos Security Intelligence and Research Group (Talos) may use the rule update mechanism to add and remove rule categories.

**Intrusion Rule Filter Components**

You can edit your filter to modify the special keywords and their arguments that are supplied when you click on a filter in the filter panel. Custom filters on the Rules page function like those used in the rule editor, but you can also use any of the keywords supplied in the Rules page filter, using the syntax displayed when you select the filter through the filter panel. To determine a keyword for future use, click on the appropriate argument in the filter panel on the right. The filter keyword and argument syntax appear in the filter text box.

Remember that comma-separated multiple arguments for a keyword are only supported for the Category and Priority filter types.

You can use keywords and arguments, character strings, and literal character strings in quotes, with spaces separating multiple filter conditions. A filter cannot include regular expressions, wild card characters, or any special operator such as a negation character (!), a greater than symbol (>), less than symbol (<), and so on. When you type in search terms without a keyword, without initial capitalization of the keyword, or without quotes around the argument, the search is treated as a string search and the category, message, and SID fields are searched for the specified terms.

Except for the `gid` and `sid` keywords, all arguments and strings are treated as partial strings. Arguments for `gid` and `sid` return only exact matches.

Each rule filter can include one or more keywords in the format:

```
keyword:“argument”
```

where keyword is one of the keywords in the intrusion rule filter groups and argument is enclosed in double quotes and is a single, case-insensitive, alphanumeric string to search for in the specific field or fields relevant to the keyword. Note that keywords should be typed with initial capitalization.

Arguments for all keywords except `gid` and `sid` are treated as partial strings. For example, the argument `123` returns "12345", "41235", "45123", and so on. The arguments for `gid` and `sid` return only exact matches; for example, `sid:3080` returns only SID 3080.

Each rule filter can also include one or more alphanumeric character strings. Character strings search the rule Message field, Snort ID (SID), and Generator ID (GID). For example, the string `123` returns the strings...
"lotus123", "123mania", and so on in the rule message, and also returns SID 6123, SID 12375, and so on. You can search for a partial SID by filtering with one or more character strings.

All character strings are case-insensitive and are treated as partial strings. For example, any of the strings ADMIN, admin, or Admin return "admin", "CFADMIN", "Administrator" and so on.

You can enclose character strings in quotes to return exact matches. For example, the literal string "overflow attempt" in quotes returns only that exact string, whereas a filter comprised of the two strings overflow and attempt without quotes returns "overflow attempt", "overflow multipacket attempt", "overflow with evasion attempt", and so on.

You can narrow filter results by entering any combination of keywords, character strings, or both, separated by spaces. The result includes any rule that matches all the filter conditions.

You can enter multiple filter conditions in any order. For example, each of the following filters returns the same rules:

- url:at login attempt cve:200
- login attempt cve:200 url:at
- login cve:200 attempt url:at

**Intrusion Rule Filter Usage**

You can select predefined filter keywords from the filter panel on the left side of the Rules page in the intrusion policy. When you select a filter, the page displays all matching rules, or indicates when no rules match.

You can add keywords to a filter to further constrain it. Any filter you enter searches the entire rules database and returns all matching rules. When you enter a filter while the page still displays the result of a previous filter, the page clears and returns the result of the new filter instead.

You can also type a filter using the same keyword and argument syntax supplied when you select a filter, or modify argument values in a filter after you select it. When you type in search terms without a keyword, without initial capitalization of the keyword, or without quotes around the argument, the search is treated as a string search and the category, message, and SID fields are searched for the specified terms.

**Setting a Rule Filter in an Intrusion Policy**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You can filter the rules on the Rules page to display a subset of rules. You can then use any of the page features, including choosing any of the features available in the context menu. This can be useful, for example, when you want to set a threshold for all the rules in a specific category. You can use the same features with rules in a filtered or unfiltered list. For example, you can apply new rule states to rules in a filtered or unfiltered list.

All filter keywords, keyword arguments, and character strings are case-insensitive. If you click an argument for a keyword already in the filter, it replaces the existing argument.
Procedure

Step 1  Choose Policies > Access Control > Intrusion.

Step 2  Click the edit icon (-Qaeda) next to the policy you want to edit.

If a view icon (-Qaeda) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3  Click Rules.

Step 4  Construct a filter using any of the following methods, separately or in combination:

- Enter a value in the Filter text box, and press Enter.
- Expand any of the predefined keywords. For example, click Rule Configuration.
- Click a keyword, and specify an argument value if prompted. For example:
  - Under Rule Configuration, you could click Rule State, choose Generate Events from the drop-down-list, and click OK.
  - Under Rule Configuration, you could click Comment, enter the string of comment text to filter by, and click OK.
  - Under Category, you could click app-detect, which the system uses as the argument value.
- Expand a keyword, and click an argument value. For example, expand Rule State and click Generate Events.

Intrusion Rule States

Intrusion rule states allow you to enable or disable the rule within an individual intrusion policy, as well as specify which action the system takes if monitored conditions trigger the rule.

The Cisco Talos Security Intelligence and Research Group (Talos) sets the default state of each intrusion and preprocessor rule in each default policy. For example, a rule may be enabled in the Security over Connectivity default policy and disabled in the Connectivity over Security default policy. Talos sometimes uses a rule update to change the default state of one or more rules in a default policy. If you allow rule updates to update your base policy, you also allow the rule update to change the default state of a rule in your policy when the default state changes in the default policy you used to create your policy (or in the default policy it is based on). Note, however, that if you have changed the rule state, the rule update does not override your change.

When you create an intrusion rule, it inherits the default states of the rules in the default policy you use to create your policy.

Intrusion Rule State Options

In an intrusion policy, you can set a rule’s state to the following values:
Generate Events

You want the system to detect a specific intrusion attempt and generate an intrusion event when it finds matching traffic. When a malicious packet crosses your network and triggers the rule, the packet is sent to its destination and the system generates an intrusion event. The malicious packet reaches its target, but you are notified via the event logging.

Drop and Generate Events

You want the system to detect a specific intrusion attempt, drop the packet containing the attack, and generate an intrusion event when it finds matching traffic. The malicious packet never reaches its target, and you are notified via the event logging.

Note that rules set to this rule state generate events but do not drop packets in a passive deployment, including deployments where a 7000 or 8000 Series device inline interface set is in tap mode. For the system to drop packets, you must also enable Drop when Inline in your intrusion policy and deploy your device inline.

Disable

You do not want the system to evaluate matching traffic.

Note

Choosing either the Generate Events or Drop and Generate Events options enables the rule. Choosing Disable disables the rule.

Cisco strongly recommends that you do not enable all the intrusion rules in an intrusion policy. The performance of your managed device is likely to degrade if all rules are enabled. Instead, tune your rule set to match your network environment as closely as possible.

Setting Intrusion Rule States

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

</tbody>
</table>

Intrusion rule states are policy-specific.

Procedure

Step 1 Choose Policies > Access Control > Intrusion.

Step 2 Click the edit icon (📝) next to the policy you want to edit.

If a view icon (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Tip This page indicates the total number of enabled rules, the total number of enabled rules set to Generate Events, and the total number set to Drop and Generate Events. Note also that in a passive deployment, rules set to Drop and Generate Events only generate events.
Step 3  
Click Rules immediately under Policy Information in the navigation panel.

Step 4  
Choose the rule or rules where you want to set the rule state.

Step 5  
Choose one of the following:
- Rule State > Generate Events
- Rule State > Drop and Generate Events
- Rule State > Disable

Step 6  
To save changes you made in this policy since the last policy commit, click Policy Information in the navigation panel, then click Commit Changes.
If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

What to do next
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Intrusion Event Notification Filters in an Intrusion Policy

The importance of an intrusion event can be based on frequency of occurrence, or on source or destination IP address. In some cases you may not care about an event until it has occurred a certain number of times. For example, you may not be concerned if someone attempts to log into a server until they fail a certain number of times. In other cases, you may only need to see a few occurrences to know there is a widespread problem. For example, if a DoS attack is launched against your web server, you may only need to see a few occurrences of an intrusion event to know that you need to address the situation. Seeing hundreds of the same event only overwhelms your system.

Intrusion Event Thresholds

You can set thresholds for individual rules, per intrusion policy, to limit the number of times the system logs and displays an intrusion event based on how many times the event is generated within a specified time period. This can prevent you from being overwhelmed with a large number of identical events. You can set thresholds per shared object rule, standard text rule, or preprocessor rule.

Intrusion Event Thresholds Configuration

To set a threshold, first specify the thresholding type.
### Table 107: Thresholding Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Limit</td>
<td>Logs and displays events for the specified number of packets (specified by the Count argument) that trigger the rule during the specified time period. For example, if you set the type to <strong>Limit</strong>, the <strong>Count</strong> to 10, and the <strong>Seconds</strong> to 60, and 14 packets trigger the rule, the system stops logging events for the rule after displaying the first 10 that occur within the same minute.</td>
</tr>
<tr>
<td>Threshold</td>
<td>Logs and displays a single event when the specified number of packets (specified by the Count argument) trigger the rule during the specified time period. Note that the counter for the time restarts after you hit the threshold count of events and the system logs that event. For example, you set the type to <strong>Threshold</strong>, <strong>Count</strong> to 10, and <strong>Seconds</strong> to 60, and the rule triggers 10 times by second 33. The system generates one event, then resets the Seconds and Count counters to 0. The rule then triggers another 10 times in the next 25 seconds. Because the counters reset to 0 at second 33, the system logs another event.</td>
</tr>
</tbody>
</table>
| Both     | Logs and displays an event once per specified time period, after the specified number (count) of packets trigger the rule. For example, if you set the type to **Both**, **Count** to two, and **Seconds** to 10, the following event counts result:  
  - If the rule is triggered once in 10 seconds, the system does not generate any events (the threshold is not met)  
  - If the rule is triggered twice in 10 seconds, the system generates one event (the threshold is met when the rule triggers the second time)  
  - If the rule is triggered four times in 10 seconds, the system generates one event (the threshold is met when the rule triggers the second time, and following events are ignored) |

Next, specify tracking, which determines whether the event threshold is calculated per source or destination IP address.

### Table 108: Thresholding IP Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>Calculates event instance count per source IP address.</td>
</tr>
<tr>
<td>Destination</td>
<td>Calculates event instance count per destination IP address.</td>
</tr>
</tbody>
</table>
Table 109: Thresholding Instance/Time Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>The number of event instances per specified time period per tracking IP address required to meet the threshold.</td>
</tr>
<tr>
<td>Seconds</td>
<td>The number of seconds that elapse before the count resets. If you set the threshold type to <strong>limit</strong>, the tracking to <strong>Source IP</strong>, the <strong>count</strong> to 10, and the <strong>seconds</strong> to 10, the system logs and displays the first 10 events that occur in 10 seconds from a given source port. If only 7 events occur in the first 10 seconds, the system logs and displays those; if 40 events occur in the first 10 seconds, the system logs and displays 10, then begins counting again when the 10-second time period elapses.</td>
</tr>
</tbody>
</table>

Note that you can use intrusion event thresholding alone or in any combination with rate-based attack prevention, the **detection_filter** keyword, and intrusion event suppression.

**Tip**
You can also add thresholds from within the packet view of an intrusion event.

**Related Topics**
- The **detection_filter** Keyword, on page 1465
- Setting Threshold Options within the Packet View, on page 2104

**Adding and Modifying Intrusion Event Thresholds**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Admin/Intrusion</td>
</tr>
</tbody>
</table>

You can set a threshold for one or more specific rules in an intrusion policy. You can also separately or simultaneously modify existing threshold settings. You can set a single threshold for each. Adding a threshold overwrites any existing threshold for the rule.

You can also modify the global threshold that applies by default to all rules and preprocessor-generated events associated with the intrusion policy.

A revert icon ( ZeroConstructor) appears in a field when you enter an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

**Tip**
A global or individual threshold on a managed device with multiple CPUs may result in a higher number of events than expected.
Procedure

Step 1  Choose Policies > Access Control > Intrusion.

Step 2  Click the edit icon (📝) next to the policy you want to edit.

If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3  Click Rules immediately under Policy Information in the navigation pane.

Step 4  Choose the rule or rules where you want to set a threshold.

Step 5  Choose Event Filtering > Threshold.

Step 6  Choose a threshold type from the Type drop-down list.

Step 7  From the Track By drop-down list, choose whether you want the event instances tracked by Source or Destination IP address.

Step 8  Enter a value in the Count field.

Step 9  Enter a value in the Seconds field.

Step 10  Click OK.

Tip  The system displays an event filter icon (🔍) next to the rule in the Event Filtering column. If you add multiple event filters to a rule, a number over the icon indicates the number of event filters.

Step 11  To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

</tr>
</tbody>
</table>

You may want to view or delete an existing threshold setting for a rule. You can use the Rules Details view to display the configured settings for a threshold to see if they are appropriate for your system. If they are not, you can add a new threshold to overwrite the existing values.

Note that you can also modify the global threshold that applies by default to all rules and preprocessor-generated events logged by the intrusion policy.
Procedure

Step 1  Choose Policies > Access Control > Intrusion.

Step 2  Click the edit icon (📝) next to the policy you want to edit.

If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3  Click Rules immediately under Policy Information in the navigation pane.

Step 4  Choose the rule or rules with a configured threshold you want to view or delete.

Step 5  To remove the threshold for each selected rule, choose Event Filtering > Remove Thresholds.

Step 6  Click OK.

Step 7  To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics

Global Rule Thresholding Basics, on page 1363

Intrusion Policy Suppression Configuration

You can suppress intrusion event notification when a specific IP address or range of IP addresses triggers a specific rule or preprocessor. This is useful for eliminating false positives. For example, if you have a mail server that transmits packets that look like a specific exploit, you might suppress event notification for that event when it is triggered by your mail server. The rule triggers for all packets, but you only see events for legitimate attacks.

Intrusion Policy Suppression Types

Note that you can use intrusion event suppression alone or in any combination with rate-based attack prevention, the detection_filter keyword, and intrusion event thresholding.

Tip

You can add suppressions from within the packet view of an intrusion event. You can also access suppression settings by using the right-click context menu on the intrusion rules editor page (Objects > Intrusion Rules) and on any intrusion event page (if the event was triggered by an intrusion rule).

Related Topics

The detection_filter Keyword, on page 1465
Setting Threshold Options within the Packet View, on page 2104
Suppressing Intrusion Events for a Specific Rule

<table>
<thead>
<tr>
<th>Smart License</th>

<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can suppress intrusion event notification for a rule or rules in your intrusion policy. When notification is suppressed for a rule, the rule triggers but events are not generated. You can set one or more suppressions for a rule. The first suppression listed has the highest priority. When two suppressions conflict, the action of the first is carried out.

Note that a revert icon (⟲) appears in a field when you enter an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

Procedure

**Step 1** Choose **Policies > Access Control > Intrusion**.

**Step 2** Click the edit icon (✎) next to the policy you want to edit.

If a view icon (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click **Rules** immediately under **Policy Information** in the navigation panel.

**Step 4** Choose the rule or rules for which you want to configure suppression conditions.

**Step 5** Choose **Event Filtering > Suppression**.

**Step 6** Choose a **Suppression Type**.

**Step 7** If you chose **Source** or **Destination** for the suppression type, in the **Network** field enter the IP address, address block, or variable you want to specify as the source or destination IP address, or a comma-separated list comprised of any combination of these.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

**Step 8** Click **OK**.

**Tip** The system displays an event filter icon (_runs) next to the rule in the Event Filtering column next the suppressed rule. If you add multiple event filters to a rule, a number over the icon indicates the number of event filters.

**Step 9** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.
What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Viewing and Deleting Suppression Conditions

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You may want to view or delete an existing suppression condition. For example, you can suppress event notification for packets originating from a mail server IP address because the mail server normally transmits packets that look like exploits. If you then decommission that mail server and reassign the IP address to another host, you should delete the suppression conditions for that source IP address.

Procedure

Step 1
Choose Policies > Access Control > Intrusion.

Step 2
Click the edit icon (✍️) next to the policy you want to edit.

If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3
Click Rules immediately under Policy Information in the navigation panel.

Step 4
Choose the rule or rules for which you want to view or delete suppressions.

Step 5
You have the following choices:

• To remove all suppression for a rule, choose Event Filtering > Remove Suppressions.
• To remove a specific suppression setting, click the rule, then click Show details. Expand the suppression settings and click Delete next to the suppression settings you want to remove.

Step 6
Click OK.

Step 7
To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.
Dynamic Intrusion Rule States

Rate-based attacks attempt to overwhelm a network or host by sending excessive traffic toward the network or host, causing it to slow down or deny legitimate requests. You can use rate-based prevention to change the action of a rule in response to excessive rule matches for specific rules.

You can configure your intrusion policies to include a rate-based filter that detects when too many matches for a rule occur in a given time period. You can use this feature on managed devices deployed inline to block rate-based attacks for a specified time, then revert to a rule state where rule matches only generate events and do not drop traffic.

Rate-based attack prevention identifies abnormal traffic patterns and attempts to minimize the impact of that traffic on legitimate requests. You can identify excessive rule matches in traffic going to a particular destination IP address or addresses or coming from a particular source IP address or addresses. You can also respond to excessive matches for a particular rule across all detected traffic.

In some cases, you may not want to set a rule to the Drop and Generate Events state because you do not want to drop every packet that matches the rule, but you do want to drop packets matching the rule if a particular rate of matches occurs in a specified time. Dynamic rule states let you configure the rate that should trigger a change in the action for a rule, what the action should change to when the rate is met, and how long the new action should persist.

The following diagram shows an example where an attacker is attempting to access a host. Repeated attempts to find a password trigger a rule which has rate-based attack prevention configured. The rate-based settings change the rule attribute to Drop and Generate Events after rule matches occur five times in a 10-second span. The new rule attribute times out after 15 seconds.

After the timeout, note that packets are still dropped in the rate-based sampling period that follows. If the sampled rate is above the threshold in the current or previous sampling period, the new action continues. The new action reverts to Generate Events only after a sampling period completes where the sampled rate was below the threshold rate.

Dynamic Intrusion Rule State Configuration

In the intrusion policy, you can configure a rate-based filter for any intrusion or preprocessor rule. The rate-based filter contains three components:
• the rule matching rate, which you configure as a count of rule matches within a specific number of
  seconds
• a new action to be taken when the rate is exceeded, with three available actions: Generate Events, Drop
  and Generate Events, and Disable
• the duration of the action, which you configure as a timeout value

Note that when started, the new action occurs until the timeout is reached, even if the rate falls below the
configured rate during that time period. When the timeout is reached, if the rate has fallen below the threshold,
the action for the rule reverts to the action initially configured for the rule.

You can configure rate-based attack prevention in an inline deployment to block attacks, either temporarily
or permanently. Without rate-based configuration, rules set to Generate Events do generate events, but the
system does not drop packets for those rules. However, if the attack traffic matches rules that have rate-based
criteria configured, the rate action may cause packet dropping to occur for the period of time that the rate
action is active, even if those rules are not initially set to Drop and Generate Events.

Note
Rate-based actions cannot enable disabled rules or drop traffic that matches disabled rules.

You can define multiple rate-based filters on the same rule. The first filter listed in the intrusion policy has
the highest priority. Note that when two rate-based filter actions conflict, the action of the first rate-based
filter is carried out.

Setting a Dynamic Rule State from the Rules Page

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You can set one or more dynamic rule states for a rule. The first dynamic rule state listed has the highest
priority. When two dynamic rule states conflict, the action of the first is carried out.

Dynamic rule states are policy-specific.

A revert icon (⟲) appears in a field when you enter an invalid value; click it to revert to the last valid value
for that field or to clear the field if there was no previous value.

Note
Dynamic rule states cannot enable disabled rules or drop traffic that matches disabled rules.

Procedure

Step 1  Choose Policies > Access Control > Intrusion.
Step 2  Click the edit icon ( Modiﬁ) next to the policy you want to edit.
If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3**
Click **Rules** immediately under **Policy Information** in the navigation pane.

**Step 4**
Choose the rule or rules where you want to add a dynamic rule state.

**Step 5**
Choose **Dynamic State** > **Add Rate-Based Rule State**.

**Step 6**
Choose a value from the **Track By** drop-down list.

**Step 7**
If you set **Track By** to **Source** or **Destination**, enter the address of each host you want to track in the **Network** field. You can specify a single IP address, address block, variable, or a comma-separated list comprised of any combination of these.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

**Step 8**
Next to **Rate**, specify the number of rule matches per time period to set the attack rate:

- Enter a value in the **Count** field.
- Enter a value in the **Seconds** field.

**Step 9**
From the **New State** drop-down list, specify the new action to be taken when the conditions are met.

**Step 10**
Enter a value in the **Timeout** field.

After the timeout occurs, the rule reverts to its original state. Specify 0 or leave the **Timeout** field blank to prevent the new action from timing out.

**Step 11**
Click **OK**.

**Tip**
The system displays a dynamic state icon (🔍) next to the rule in the Dynamic State column. If you add multiple dynamic rule state filters to a rule, a number over the icon indicates the number of filters.

**Tip**
To delete all dynamic rule settings for a set of rules, choose the rules on the **Rules** page, then choose **Dynamic State** > **Remove Rate-Based States**. You can also delete individual rate-based rule state filters from the rule details for the rule by choosing the rule, clicking **Show details**, then clicking **Delete** by the rate-based filter you want to remove.

**Step 12**
To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

### What to do next

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.
Adding Intrusion Rule Comments

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can add comments to rules in your intrusion policy. Comments added this way are policy-specific; that is, comments you add to a rule in one intrusion policy are not visible in other intrusion policies. Any comments you add can be seen in the Rule Details view on the Rules page for the intrusion policy.

After you commit the intrusion policy changes containing the comment, you can also view the comment by clicking **Rule Comment** on the rule Edit page.

**Procedure**

1. **Step 1** Choose **Policies > Access Control > Intrusion**.
2. **Step 2** Click the edit icon (፣) next to the policy you want to edit.

   If a view icon (��) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

3. **Step 3** Click **Rules** immediately under **Policy Information** in the navigation panel.
4. **Step 4** Choose the rule or rules where you want to add a comment.
5. **Step 5** Choose **Comments > Add Rule Comment**.
6. **Step 6** In the **Comment** field, enter the rule comment.
7. **Step 7** Click **OK**.

   **Tip** The system displays a comment icon (��) next to the rule in the Comments column. If you add multiple comments to a rule, a number over the icon indicates the number of comments.

8. **Step 8** Optionally, delete a rule comment by clicking **Delete** next to the comment.

   You can only delete a comment if the comment is cached with uncommitted intrusion policy changes. After intrusion policy changes are committed, the rule comment is permanent.

9. **Step 9** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

   If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.
Tailoring Intrusion Protection to Your Network Assets

The following topics describe how to use Firepower recommended rules:

- About Firepower Recommended Rules, on page 1343
- Default Settings for Firepower Recommendations, on page 1344
- Advanced Settings for Firepower Recommendations, on page 1345
- Generating and Applying Firepower Recommendations, on page 1346

About Firepower Recommended Rules

You can use Firepower intrusion rule recommendations to associate the operating systems, servers, and client application protocols detected on your network with rules specifically written to protect those assets. This allows you to tailor your intrusion policy to the specific needs of your monitored network.

The system makes an individual set of recommendations for each intrusion policy. It typically recommends rule state changes for standard text rules and shared object rules. However, it can also recommend changes for preprocessor and decoder rules.

When you generate rule state recommendations, you can use the default settings or configure advanced settings. Advanced settings allow you to:

- Redefine which hosts on your network the system monitors for vulnerabilities
- Influence which rules the system recommends based on rule overhead
- Specify whether to generate recommendations to disable rules

You can also choose either to use the recommendations immediately or to review the recommendations (and affected rules) before accepting them.

Choosing to use recommended rule states adds a read-only Firepower Recommendations layer to your intrusion policy, and subsequently choosing not to use recommended rule states removes the layer.

You can schedule a task to generate recommendations automatically based on the most recently saved configuration settings in your intrusion policy.

The system does not change rule states that you set manually:

• Manually setting the states of specified rules before you generate recommendations prevents the system from modifying the states of those rules in the future.

• Manually setting the states of specified rules after you generate recommendations overrides the recommended states of those rules.

Tip
The intrusion policy report can include a list of rules with rule states that differ from the recommended state.

While displaying the recommendation-filtered Rules page, or after accessing the Rules page directly from the navigation panel or the Policy Information page, you can manually set rule states, sort rules, and take any of the other actions available on the Rules page, such as suppressing rules, setting rule thresholds, and so on.

Note
The Cisco Talos Security Intelligence and Research Group (Talos) determines the appropriate state of each rule in the system-provided policies. If you use a system-provided policy as your base policy, and you allow the system to set your rules to the Firepower recommended rule state, the rules in your intrusion policy match the settings recommended by Cisco for your network assets.

Recommended Rules and Multitenancy
The system builds a separate network map for each leaf domain. In a multidomain deployment, if you enable this feature in an intrusion policy in an ancestor domain, the system generates recommendations using data from all descendant leaf domains. This can enable intrusion rules tailored to assets that may not exist in all leaf domains, which can affect performance.

Default Settings for Firepower Recommendations

When you generate Firepower recommendations, the system searches your base policy for rules that protect against vulnerabilities associated with your network assets, and identifies the current state of rules in your base policy. The system then recommends rule states and, if you choose to, sets the rules to the recommended states.

The system performs the following basic analysis to generate recommendations:

Table 110: Firepower Rule State Recommendations Based on Vulnerabilities

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate Events or Disable</td>
<td>yes</td>
<td>Generate Events</td>
</tr>
<tr>
<td>Drop and Generate Events</td>
<td>yes</td>
<td>Drop and Generate Events</td>
</tr>
<tr>
<td>any</td>
<td>no</td>
<td>Disable</td>
</tr>
</tbody>
</table>

When you generate recommendations without changing the advanced settings for Firepower recommended rules, the system recommends rule state changes for all hosts in your entire discovered network.
By default, the system generates recommendations only for rules with low or medium overhead, and generates recommendations to disable rules.

The system does not recommend a rule state for an intrusion rule that is based on a vulnerability that you disable using the Impact Qualification feature.

The system always recommends that you enable a local rule associated with a third-party vulnerability mapped to a host.

The system does not make state recommendations for unmapped local rules.

Related Topics
Deactivating Individual Vulnerabilities, on page 2180
Third-Party Product Mappings, on page 1668

Advanced Settings for Firepower Recommendations

Include all differences between recommendations and rule states in policy reports

By default, an intrusion policy report lists the policy's enabled rules, that is, rules set to either Generate Events or Drop and Generate Events. Enabling the Include all differences option also lists the rules whose recommended states differ from their saved states. For information on policy reports, see Policy Reports, on page 288.

Networks to Examine

Specifies the monitored networks or individual hosts to examine for recommendations. You can specify a single IP address or address block, or a comma-separated list comprised of either or both.

Lists of addresses within the hosts that you specify are linked with an OR operation except for negations, which are linked with an AND operation after all OR operations are calculated.

If you want to dynamically adapt active rule processing for specific packets based on host information, you can also enable adaptive profile updates.

Recommendation Threshold (By Rule Overhead)

Prevents the system from recommending or automatically enabling intrusion rules with a higher overhead than the threshold you choose.

Overhead is based on the rule’s potential impact on system performance and the likelihood that the rule may generate false positives. Permitting rules with higher overhead usually results in more recommendations, but can affect system performance. You can view the overhead rating for a rule in the rule detail view on the intrusion Rules page.

Note that the system does not factor rule overhead into recommendations to disable rules. Also, local rules are considered to have no overhead, unless they are mapped to a third-party vulnerability.

Generating recommendations for rules with the overhead rating at a particular setting does not preclude you from generating recommendations with different overhead, then generating recommendations again for the original overhead setting. You get the same rule state recommendations for each overhead setting each time you generate recommendations for the same rule set, regardless of the number of times you generate recommendations or how many different overhead settings you generate with. For example, you can generate recommendations with overhead set to medium, then to high, then finally to medium again; if the hosts and applications on your network have not changed, both sets of recommendations with overhead set to medium are then the same for that rule set.
Accept Recommendations to Disable Rules

Specifies whether the system disables intrusion rules based on Firepower recommendations.

Accepting recommendations to disable rules restricts your rule coverage. Omitting recommendations to disable rules augments your rule coverage.

Firepower System IP Address Conventions, on page 13
Adaptive Profile Updates and Firepower Recommended Rules, on page 1638

Generating and Applying Firepower Recommendations

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

Starting or stopping use of Firepower recommendations may take several minutes, depending on the size of your network and intrusion rule set.

The system builds a separate network map for each leaf domain. In a multidomain deployment, if you enable this feature in an intrusion policy in an ancestor domain, the system generates recommendations using data from all descendant leaf domains. This can enable intrusion rules tailored to assets that may not exist in all leaf domains, which can affect performance.

Procedure

**Step 1** In the intrusion policy editor's navigation pane, click Firepower Recommendations.

**Step 2** (Optional) Configure advanced settings; see Advanced Settings for Firepower Recommendations, on page 1345.

**Step 3** Generate and apply recommendations.

- Generate and Use Recommendations—Generates recommendations and changes rule states to match. Only available if you have never generated recommendations.
- Generate Recommendations—Regardless of whether you are using recommendations, generates new recommendations but does not change rule states to match.
- Update Recommendations—If you are using recommendations, generates recommendations and changes rule states to match. Otherwise, generates new recommendations without changing rule states.
- Use Recommendations—Changes rule states to match any unimplemented recommendations.
- Do Not Use Recommendations—Stops use of recommendations. If you manually changed a rule's state before you applied recommendations, the rule state returns to the value you gave it. Otherwise, the rule state returns to its default value.

When you generate recommendations, the system displays a summary of the recommended changes. To view a list of rules where the system recommends a state change, click View next to the newly proposed rule state.

**Step 4** Evaluate and adjust the recommendations you implemented.

Even if you accept most Firepower recommendations, you can override individual recommendations by setting rule states manually; see Setting Intrusion Rule States, on page 1331.
Step 5  

To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

Sensitive Data Detection Basics

Sensitive data such as Social Security numbers, credit card numbers, driver’s license numbers, and so on may be leaked onto the Internet, intentionally or accidentally. The system provides a sensitive data preprocessor that can detect and generate events on sensitive data in ASCII text, which can be particularly useful in detecting accidental data leaks.

Global sensitive data preprocessor options control how the preprocessor functions. You can modify global options that specify the following:

- whether the preprocessor replaces all but the last four credit card or Social Security numbers in triggering packets
- which destination hosts on your network to monitor for sensitive data
- how many total occurrences of all data types in a single session result in an event

Individual data types identify the sensitive data you can detect and generate events on in your specified destination network traffic. You can modify default settings for data type options that specify the following:

- a threshold that must be met for a detected data type to generate a single per-session event
- the destination ports to monitor for each data type
- the application protocols to monitor for each data type
You can create and modify custom data types to detect data patterns that you specify. For example, a hospital might create a data type to protect patient numbers, or a university might create a data type to detect student numbers that have a unique numbering pattern.

The system detects sensitive data per TCP session by matching individual data types against traffic. You can modify the default settings for each data type and for global options that apply to all data types in your intrusion policy. The Firepower System provides predefined, commonly used data types. You can also create custom data types.

A sensitive data preprocessor rule is associated with each data type. You enable sensitive data detection and event generation for each data type by enabling the corresponding preprocessor rule for the data type. A link on the configuration page takes you to a filtered view of sensitive data rules on the Rules page, where you can enable and disable rules and configure other rule attributes.

When you save changes to your intrusion policy, you are given the option to automatically enable the sensitive data preprocessor if the rule associated with a data type is enabled and sensitive data detection is disabled.

---

**Tip**
The sensitive data preprocessor can detect sensitive data in unencrypted Microsoft Word files that are uploaded and downloaded using FTP or HTTP; this is possible because of the way Word files group ASCII text and formatting commands separately.

The system does not detect encrypted or obfuscated sensitive data, or sensitive data in a compressed or encoded format such as a Base64-encoded email attachment. For example, the system would detect the phone number (555)123-4567, but not an obfuscated version where each number is separated by spaces, as in (5 5 5) 1 2 3 - 4 5 6 7, or by intervening HTML code, such as `<b>(555)</b>-<i>123-4567</i>`. However, the system would detect, for example, the HTML coded number `<b>(555)-123-4567</b>` where no intervening codes interrupt the numbering pattern.

---

**Global Sensitive Data Detection Options**

Global sensitive data options are policy-specific and apply to all data types.

**Mask**

Replaces with Xs all but the last four digits of credit card numbers and Social Security numbers in the triggering packet. The masked numbers appear in the intrusion event packet view in the web interface and in downloaded packets.

**Networks**

Specifies the destination host or hosts to monitor for sensitive data. You can specify a single IP address, address block, or a comma-separated list of either or both. The system interprets a blank field as any, meaning any destination IP address.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.
**Global Threshold**

Specifies the total number of all occurrences of all data types during a single session that the preprocessor must detect in any combination before generating a global threshold event. You can specify 1 through 65535. Cisco recommends that you set the value for this option higher than the highest threshold value for any individual data type that you enable in your policy.

Note the following points regarding global thresholds:

- You must enable preprocessor rule 139:1 to detect and generate events and, in an inline deployment, drop offending packets on combined data type occurrences.

- The preprocessor generates up to one global threshold event per session.

- Global threshold events are independent of individual data type events; that is, the preprocessor generates an event when the global threshold is reached, regardless of whether the event threshold for any individual data type has been reached, and vice versa.

**Related Topics**

[Firepower System IP Address Conventions](#), on page 13

---

**Individual Sensitive Data Type Options**

At a minimum, each custom data type must specify an event threshold and at least one port or application protocol to monitor.

Each system-provided data type uses an otherwise inaccessible \texttt{sd_pattern} keyword to define a built-in data pattern to detect in traffic. You can also create custom data types for which you use simple regular expressions to specify your own data patterns.

Sensitive data types display in all intrusion policies where Sensitive Data Detection is enabled. System-provided data types display as read-only. For custom data types, the name and pattern fields display as read-only, but you can set the other options to policy-specific values.

In a multidomain deployment, the system displays sensitive data types created in the current domain, which you can edit. It also displays data types created in ancestor domains, which you can edit in a limited way. For ancestor data types, the name and pattern fields display as read-only, but you can set the other options to policy-specific values.

**Table 111: Individual Data Type Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Type</td>
<td>Specifies the unique name for the data type.</td>
</tr>
<tr>
<td>Threshold</td>
<td>Specifies the number of occurrences of the data type when the system generates an event. You can specify 1 through 255. Note that the preprocessor generates one event for a detected data type per session. Note also that global threshold events are independent of individual data type events; that is, the preprocessor generates an event when the data type event threshold is reached, regardless of whether the global event threshold has been reached, and vice versa.</td>
</tr>
</tbody>
</table>
### System-Provided Sensitive Data Types

Each intrusion policy includes system-provided data types for detecting commonly used data patterns such as credit card numbers, email addresses, U.S. phone numbers, and U.S. Social Security numbers with and without dashes.

Each system-provided data type is associated with a single sensitive data preprocessor rule that has a generator ID (GID) of 138. You must enable the associated sensitive data rule in the intrusion policy to generate events and, in an inline deployment, drop offending packets for each data type that you want to use in your policy.

The following table describes each data type and lists the corresponding preprocessor rule.

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>
<th>Preprocessor Rule GID:SID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credit Card Numbers</td>
<td>Matches Visa®, MasterCard®, Discover® and American Express®, fifteen- and sixteen-digit credit card numbers, with or without their normal separating dashes or spaces; also uses the Luhn algorithm to verify credit card check digits.</td>
<td>138:2</td>
</tr>
<tr>
<td>Email Addresses</td>
<td>Matches email addresses.</td>
<td>138:5</td>
</tr>
<tr>
<td>U.S. Phone Numbers</td>
<td>Matches U.S. phone numbers adhering to the pattern <code>(\d{3}) ?\d{3}-\d{4}</code>.</td>
<td>138:6</td>
</tr>
<tr>
<td>Data Type</td>
<td>Description</td>
<td>Preprocessor Rule GID:SID</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>U.S. Social Security Numbers</td>
<td>Matches 9-digit U.S. Social Security numbers that have valid 3-digit area numbers, valid 2-digit group numbers, and do not have dashes.</td>
<td>138:4</td>
</tr>
<tr>
<td>Without Dashes</td>
<td></td>
<td></td>
</tr>
<tr>
<td>U.S. Social Security Numbers</td>
<td>Matches 9-digit U.S. Social Security numbers that have valid 3-digit area numbers, valid 2-digit group numbers, and dashes.</td>
<td>138:3</td>
</tr>
<tr>
<td>With Dashes</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To reduce false positives from 9-digit numbers other than Social Security numbers, the preprocessor uses an algorithm to validate the 3-digit area number and 2-digit group number that precede the 4-digit serial number in each Social Security number. The preprocessor validates Social Security group numbers through November 2009.

### Configuring Sensitive Data Detection

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection or Control</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion/Protection/Control</td>
</tr>
</tbody>
</table>

Because sensitive data detection can have a high impact on the performance of your Firepower System, Cisco recommends that you adhere to the following guidelines:

- Choose the No Rules Active default policy as your base intrusion policy.
- Ensure that the following settings are enabled in the corresponding network analysis policy:
  - **FTP and Telnet Configuration** under Application Layer Preprocessors
  - **IP Defragmentation** and **TCP Stream Configuration** under Transport/Network Layer Preprocessors.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

### Procedure

**Step 1**  
Choose **Policies > Access Control > Intrusion**

**Step 2**  
Click the edit icon (-pencil) next to the policy you want to edit.

If a view icon (-eye) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3**  
Click **Advanced Settings** in the navigation panel.
Step 4 If **Sensitive Data Detection** under **Specific Threat Detection** is disabled, click **Enabled**.

Step 5 Click the edit icon (📝) next to **Sensitive Data Detection**.

Step 6 You have the following choices:

- Modify the global settings as described in [Global Sensitive Data Detection Options, on page 1350](#).
- Choose a data type in the **Targets** section, and modify the data type configuration as described in [Individual Sensitive Data Type Options, on page 1351](#).
- If you want to inspect custom sensitive data, create a custom data type; see [Custom Sensitive Data Types, on page 1356](#).

Step 7 Add or remove application protocols to monitor for a data type; see [Monitored Application Protocols and Sensitive Data, on page 1354](#).

**Note** To detect sensitive data in FTP traffic, you must add the **Ftp data** application protocol.

Step 8 Optionally, to display sensitive data preprocessor rules, click **Configure Rules for Sensitive Data Detection**.

You can enable or disable any of the listed rules. You can also configure sensitive data rules for any of the other actions available on the Rules page, such as rule suppression, rate-based attack prevention, and so on; see [Intrusion Rule Types, on page 1315](#) for more information.

Step 9 To save changes you made in this policy since the last policy commit, click **Policy Information** in the navigation panel, then click **Commit Changes**.

If you enable sensitive data preprocessor rules in your policy without enabling sensitive data detection, you are prompted to enable sensitive data detection when you save changes to your policy.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

**What to do next**

- If you want to generate intrusion events, enable Sensitive Data Detection rules 138:2, 138:3, 138:4, 138:5, 138:6, 138:>=999999, or 139:1. For more information, see [Intrusion Rule States, on page 1330](#), [Global Sensitive Data Detection Options, on page 1350](#), [System-Provided Sensitive Data Types, on page 1352](#), and [Custom Sensitive Data Types, on page 1356](#).

- Deploy configuration changes; see [Deploy Configuration Changes, on page 279](#).

**Related Topics**

- [Special Case: Sensitive Data Detection in FTP Traffic, on page 1356](#)

---

**Monitored Application Protocols and Sensitive Data**

You can specify up to eight application protocols to monitor for each data type. At least one detector must be enabled for each application protocol you select. By default, all system-provided detectors are activated. If no detector is enabled for an application protocol, the system automatically enables all system-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application.
You must specify at least one application protocol or port to monitor for each data type. However, except in the case where you want to detect sensitive data in FTP traffic, Cisco recommends for the most complete coverage that you specify corresponding ports when you specify application protocols. For example, if you specify HTTP, you might also configure the well-known HTTP port 80. If a new host on your network implements HTTP, the system monitors port 80 during the interval when it is discovering the new HTTP application protocol.

In the case where you want to detect sensitive data in FTP traffic, you must specify the FTP data application protocol; there is no advantage in specifying a port number.

**Related Topics**
- Activating and Deactivating Detectors, on page 1717
- Special Case: Sensitive Data Detection in FTP Traffic, on page 1356

## Selecting Application Protocols to Monitor

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You can specify application protocols to monitor in both system-provided and custom sensitive data types. The application protocols you select are policy-specific.

**Procedure**

**Step 1** Choose Policies > Access Control > Intrusion.

**Step 2** Click the edit icon ( MODIFY ) next to the policy you want to edit.

If a view icon ( VIEW ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click Advanced Settings in the navigation panel.

**Step 4** If Sensitive Data Detection under Specific Threat Detection is disabled, click Enabled.

**Step 5** Click the edit icon ( MODIFY ) next to Sensitive Data Detection.

**Step 6** Click the name of a data type under DataTypes.

**Step 7** Click edit icon ( MODIFY ) next to the Application Protocols field.

**Step 8** You have the following choices:
- To add application protocols for monitoring, choose one or more application protocols from the Available list, then click the right arrow ( > ) button. You can add up to eight application protocols for monitoring.
- To remove an application protocol from monitoring, choose it from the Enabled list, then click the left arrow ( < ) button.

**Step 9** Click OK.

**Step 10** To save changes you made in this policy since the last policy commit, click Policy Information in the navigation pane, then click Commit Changes.
If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics

Special Case: Sensitive Data Detection in FTP Traffic, on page 1356

Special Case: Sensitive Data Detection in FTP Traffic

You usually determine which traffic to monitor for sensitive data by specifying the ports to monitor or specifying application protocols in deployments.

However, specifying ports or application protocols is not sufficient for detecting sensitive data in FTP traffic. Sensitive data in FTP traffic is found in traffic for the FTP application protocol, which occurs intermittently and uses a transient port number, making it difficult to detect. To detect sensitive data in FTP traffic, you must include the following in your configuration:

• Specify the FTP data application protocol to enable detection of sensitive data in FTP traffic.
  
  In the special case of detecting sensitive data in FTP traffic, specifying the FTP data application protocol does not invoke detection; instead, it invokes the rapid processing of the FTP/Telnet processor to detect sensitive data in FTP traffic.

• Ensure that the FTP Data detector, which is enabled by default, is enabled.

• Ensure that your configuration includes at least one port to monitor for sensitive data.

Note that it is not necessary to specify an FTP port except in the unlikely case where you only want to detect sensitive data in FTP traffic. Most sensitive data configurations will include other ports such as HTTP or email ports. In the case where you do want to specify only one FTP port and no other ports to monitor, Cisco recommends that you specify the FTP command port 23.

Custom Sensitive Data Types

Each custom data type you create also creates a single sensitive data preprocessor rule that has a Generator ID (GID) of 138 and a Snort ID (SID) of 1000000 or greater, that is, a SID for a local rule. In a multidomain deployment, the system prepends a domain number to the SID of any custom rule created in or imported into a descendant domain. For example, a rule added in the Global domain would have a SID of 1000000 or greater, and rules added in descendant domains would have SIDs of [domain number]000000 or greater.
You must enable the associated sensitive data rule to enable detection, generate events and, in an inline deployment, drop offending packets for each custom data type that you want to use in your policy.

To help you enable sensitive data rules, a link on the configuration page takes you to a filtered view of the intrusion policy Rules page that displays all system-provided and custom sensitive data rules. You can also display custom sensitive data rules along with any custom local rules by choosing the local filtering category on the intrusion policy Rules page. Note that custom sensitive data rules are not listed on the intrusion rules editor page (Objects > Intrusion Rules).

Once you create a custom data type, you can enable it in any intrusion policy in the system or, for multidomain deployments, in the current domain. To enable a custom data type, you must enable the associated sensitive data rule in any policy that you want to use to detect that custom data type.

### Data Patterns in Custom Sensitive Data Types

You define the data pattern for a custom data type using a simple set of regular expressions comprised of the following:

- three metacharacters
- escaped characters that allow you to use the metacharacters as literal characters
- six character classes

Metacharacters are literal characters that have special meaning within regular expressions.

<table>
<thead>
<tr>
<th>Metacharacter</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>?</td>
<td>Matches zero or one occurrence of the preceding character or escape sequence; that is, the preceding character or escape sequence is optional.</td>
<td>color?r matches color or colour</td>
</tr>
<tr>
<td>{n}</td>
<td>Matches the preceding character or escape sequence n times.</td>
<td>For example, \d(2) matches 55, 12, and so on; \l{3} matches AbC, www, and so on; \w{3} matches a1B, 25C, and so on; \x{5} matches xxxxx</td>
</tr>
<tr>
<td>\</td>
<td>Allows you to use metacharacters as actual characters and is also used to specify a predefined character class.</td>
<td>? matches a question mark, \ matches a backslash, \d matches numeric characters, and so on</td>
</tr>
</tbody>
</table>

You must use a backslash to escape certain characters for the sensitive data preprocessor to interpret them correctly as literal characters.

<table>
<thead>
<tr>
<th>Use this escaped character...</th>
<th>To represent this literal character...</th>
</tr>
</thead>
<tbody>
<tr>
<td>?</td>
<td>?</td>
</tr>
<tr>
<td>{</td>
<td>{</td>
</tr>
</tbody>
</table>
When defining a custom sensitive data pattern, you can use character classes.

**Table 115: Sensitive Data Pattern Character Classes**

<table>
<thead>
<tr>
<th>Character Class</th>
<th>Description</th>
<th>Character Class Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>\d</td>
<td>Matches any numeric ASCII character 0-9</td>
<td>0-9</td>
</tr>
<tr>
<td>\D</td>
<td>Matches any byte that is not a numeric ASCII character</td>
<td>not 0-9</td>
</tr>
<tr>
<td>\l (lowercase “ell”)</td>
<td>Matches any ASCII letter</td>
<td>a-zA-Z</td>
</tr>
<tr>
<td>\L</td>
<td>Matches any byte that is not an ASCII letter</td>
<td>not a-zA-Z</td>
</tr>
<tr>
<td>\w</td>
<td>Matches any ASCII alphanumeric character</td>
<td>a-zA-Z0-9</td>
</tr>
<tr>
<td>\W</td>
<td>Matches any byte that is not an ASCII alphanumeric character</td>
<td>not a-zA-Z0-9</td>
</tr>
</tbody>
</table>

The preprocessor treats characters entered directly, instead of as part of a regular expression, as literal characters. For example, the data pattern 1234 matches 1234.

The following data pattern example, which is used in system-provided sensitive data rule 138:4, uses the escaped digits character class, the multiplier and option-specifier metacharacters, and the literal dash (-) and left and right parentheses () characters to detect U.S. phone numbers:

```plaintext
(\d{3}) ?\d{3}-\d{4}
```

Exercise caution when creating custom data patterns. Consider the following alternative data pattern for detecting phone numbers which, although using valid syntax, could cause many false positives:

```plaintext
(?\d{3})? ?\d{3}-?\d{4}
```

Because the second example combines optional parentheses, optional spaces, and optional dashes, it would detect, among others, phone numbers in the following desirable patterns:

- (555) 123-4567
- 555123-4567
- 5551234567

However, the second example pattern would also detect, among others, the following potentially invalid patterns, resulting in false positives:
Consider finally, for illustration purposes only, an extreme example in which you create a data pattern that detects the lowercase letter a using a low event threshold in all destination traffic on a small company network. Such a data pattern could overwhelm your system with literally millions of events in only a few minutes.

**Configuring Custom Sensitive Data Types**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays sensitive data types created in the current domain, which you can edit. It also displays data types created in ancestor domains, which you can edit in a limited way. For ancestor data types, the name and pattern fields display as read-only, but you can set the other options to policy-specific values.

You cannot delete a data type if the sensitive data rule for that data type is enabled in any intrusion policy.

**Procedure**

**Step 1** Choose **Policies > Access Control > Intrusion**

**Step 2** Click the edit icon (-pencil) next to the policy you want to edit.

If a view icon (-eye) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click **Advanced Settings** in the navigation panel.

**Step 4** If **Sensitive Data Detection** under **Specific Threat Detection** is disabled, click **Enabled**.

**Step 5** Click the edit icon (-pencil) next to **Sensitive Data Detection**.

**Step 6** Click the add icon (-circle) next to **Data Types**.

**Step 7** Enter a name for the data type.

**Step 8** Enter the pattern you want to detect with this data type; see **Data Patterns in Custom Sensitive Data Types**, on page 1357.

**Step 9** Click **OK**.

**Step 10** Optionally, click the data type name, and modify the options described in **Individual Sensitive Data Type Options**, on page 1351.

**Step 11** Optionally, delete a custom data type by clicking the delete icon (-trash), then **OK** to confirm.

**Note** If the sensitive data rule for that data type is enabled in any intrusion policy, the system warns that you cannot delete the data type. You must disable the sensitive data rule in affected policies before attempting the deletion again; see **Setting Intrusion Rule States**, on page 1331.
To save changes you made in this policy since the last policy commit, click **Policy Information** in the navigation panel, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

**What to do next**

- Enable the associated custom sensitive data preprocessing rule in each policy where you want to use that data type; see Setting Intrusion Rule States, on page 1331.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You can edit all fields in custom sensitive data types. Note, however, that when you modify the name or pattern field, these settings change in all intrusion policies on the system. You can set the other options to policy-specific values.

In a multidomain deployment, the system displays sensitive data types created in the current domain, which you can edit. It also displays data types created in ancestor domains, which you can edit in a limited way. For ancestor data types, the name and pattern fields display as read-only, but you can set the other options to policy-specific values.

**Procedure**

- **Step 1**: Choose **Policies > Access Control > Intrusion**
- **Step 2**: Click the edit icon (✏️) next to the policy you want to edit.
  
  If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- **Step 3**: Click **Advanced Settings** in the navigation panel.
- **Step 4**: If **Sensitive Data Detection** under **Specific Threat Detection** is disabled, click **Enabled**.
- **Step 5**: Click **Edit** next to **Sensitive Data Detection**.
- **Step 6**: In the **Targets** section, click the name of the custom data type.
- **Step 7**: Click **Edit Data Type Name and Pattern**.
- **Step 8**: Modify the data type name and pattern; see Data Patterns in Custom Sensitive Data Types, on page 1357.
- **Step 9**: Click **OK**.
Step 10
Set the remaining options to policy-specific values; see Individual Sensitive Data Type Options, on page 1351.

Step 11
To save changes you made in this policy since the last policy commit, click Policy Information in the navigation panel, then click Commit Changes.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.
The following topics describe how to globally limit intrusion event logging:

- Global Rule Thresholding Basics, on page 1363
- Global Rule Thresholding Options, on page 1364
- Configuring Global Thresholds, on page 1366
- Disabling the Global Threshold, on page 1367

Global Rule Thresholding Basics

The global rule threshold sets limits for event logging by an intrusion policy. You can set a global rule threshold across all traffic to limit how often the policy logs events from a specific source or destination and displays those events per specified time period. You can also set thresholds per shared object rule, standard text rule, or preprocessor rule in the policy. When you set a global threshold, that threshold applies for each rule in the policy that does not have an overriding specific threshold. Thresholds can prevent you from being overwhelmed with a large number of events.

Every intrusion policy contains a default global rule threshold that applies by default to all intrusion rules and preprocessor rules. This default threshold limits the number of events on traffic going to a destination to one event per 60 seconds.

You can:

- Change the global threshold.
- Disable the global threshold.
- Override the global threshold by setting individual thresholds for specific rules.

For example, you might set a global limit threshold of five events every 60 seconds, but then set a specific threshold of ten events for every 60 seconds for SID 1315. All other rules generate no more than five events in each 60-second period, but the system generates up to ten events for each 60-second period for SID 1315.

Tip

A global or individual threshold on a managed device with multiple CPUs may result in a higher number of events than expected.
The following diagram demonstrates how the global rule thresholding works. In this example, an attack is in progress for a specific rule. The global limit threshold is set to limit event generation for each rule to two events every 20 seconds. Note that the period starts at one second and ends at 21 seconds. After the period ends, the cycle starts again and the next two rule matches generate events, then the system does not generate any more events during that period.

**Global Rule Thresholding Options**

The default threshold limits event generation for each rule to one event every 60 seconds on traffic going to the same destination. The default values for the global rule thresholding options are:

- **Type** — Limit
- **Track By** — Destination
- **Count** — 1
- **Seconds** — 60

You can modify these default values as follows:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Limit</strong></td>
<td>Logs and displays events for the specified number of packets (specified by the count argument) that trigger the rule during the specified time period. For example, if you set the type to <strong>Limit</strong>, the <strong>Count</strong> to 10, and the <strong>Seconds</strong> to 60, and 14 packets trigger the rule, the system stops logging events for the rule after displaying the first 10 that occur within the same minute.</td>
</tr>
</tbody>
</table>
Logs and displays a single event when the specified number of packets (specified by the count argument) trigger the rule during the specified time period. Note that the counter for the time restarts after you hit the threshold count of events and the system logs that event.

For example, you set the type to **Threshold, Count** to 10, and **Seconds** to 60, and the rule triggers 10 times by second 33. The system generates one event, then resets the Seconds and Count counters to 0. The rule then triggers another 10 times in the next 25 seconds. Because the counters reset to 0 at second 33, the system logs another event.

The **Track By** option determines whether the event instance count is calculated per source or destination IP address.

You can also specify the number of instances and time period that define the threshold, as follows:

The **Option** | **Description**
--- | ---
Threshold | Logs and displays a single event when the specified number of packets (specified by the count argument) trigger the rule during the specified time period. Note that the counter for the time restarts after you hit the threshold count of events and the system logs that event.

| Both | Logs and displays an event once per specified time period, after the specified number (count) of packets trigger the rule.

For example, if you set the type to **Both, Count** to 2, and **Seconds** to 10, the following event counts result:

- If the rule is triggered once in 10 seconds, the system does not generate any events (the threshold is not met)
- If the rule is triggered twice in 10 seconds, the system generates one event (the threshold is met when the rule triggers the second time)
- If the rule is triggered four times in 10 seconds, the system generates one event (the threshold is met when the rule triggered the second time and following events are ignored)

You can also specify the number of instances and time period that define the threshold, as follows:

The **Option** | **Description**
--- | ---
Count | For a **Limit** threshold, the number of event instances per specified time period per tracking IP address or address range required to meet the threshold.

For a **Threshold** threshold, the number of rule matches you want to use as your threshold.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Seconds</td>
<td>For a <strong>Limit</strong> threshold, the number of seconds that make up the time period when attacks are tracked. For a <strong>Threshold</strong> threshold, the number of seconds that elapse before the count resets. If you set the threshold type to <strong>Limit</strong>, the tracking to <strong>Source, Count</strong> to 10, and <strong>Seconds</strong> to 10, the system logs and displays the first 10 events that occur in 10 seconds from a given source port. If only seven events occur in the first 10 seconds, the system logs and displays those, if 40 events occur in the first 10 seconds, the system logs and displays 10, then begins counting again when the 10-second time period elapses.</td>
</tr>

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

**Procedure**

**Step 1** Choose **Policies > Access Control > Intrusion**.

**Step 2** Click the edit icon (📝) next to the policy you want to edit.

If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click **Advanced Settings** in the navigation panel.

**Step 4** If **Global Rule Thresholding** under **Intrusion Rule Thresholds** is disabled, click **Enabled**.

**Step 5** Click the edit icon (📝) next to **Global Rule Thresholding**.

**Step 6** Using the **Type** radio buttons, specify the type of threshold that will apply over the time you specify in the **Seconds** field.

**Step 7** Using the **Track By** radio buttons, specify the tracking method.

**Step 8** Enter a value in the **Count** field.

**Step 9** Enter a value in the **Seconds** field.
Step 10

To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

The Intrusion Rules Editor

The following topics describe how to use the intrusion rules editor:

- An Introduction to Intrusion Rule Editing, on page 1369
- Rule Anatomy, on page 1370
- Custom Rule Creation, on page 1382
- Searching for Rules, on page 1387
- Rule Filtering on the Intrusion Rules Editor Page, on page 1388
- Keywords and Arguments in Intrusion Rules, on page 1391

An Introduction to Intrusion Rule Editing

An intrusion rule is a set of keywords and arguments that the system uses to detect attempts to exploit vulnerabilities on your network. As the system analyzes network traffic, it compares packets against the conditions specified in each rule. If the packet data matches all the conditions specified in a rule, the rule triggers. If a rule is an alert rule, it generates an intrusion event. If it is a pass rule, it ignores the traffic. For a drop rule in an inline deployment, the system drops the packet and generates an event. You can view and evaluate intrusion events from the Firepower Management Center web interface.

The Firepower System provides two types of intrusion rules: shared object rules and standard text rules. The Cisco Talos Security Intelligence and Research Group (Talos) can use shared object rules to detect attacks against vulnerabilities in ways that traditional standard text rules cannot. You cannot create shared object rules. When you write your own intrusion rule, you create a standard text rule.

You can write custom standard text rules to tune the types of events you are likely to see. Note that while this documentation sometimes discusses rules targeted to detect specific exploits, the most successful rules target traffic that may attempt to exploit known vulnerabilities rather than specific known exploits. By writing rules and specifying the rule’s event message, you can more easily identify traffic that indicates attacks and policy evasions.

When you enable a custom standard text rule in a custom intrusion policy, keep in mind that some rule keywords and arguments require that traffic first be decoded or preprocessed in a certain way. This chapter explains the options you must configure in your network analysis policy, which governs preprocessing. Note that if you disable a required preprocessor, the system automatically uses it with its current settings, although the preprocessor remains disabled in the network analysis policy web interface.
**Rule Anatomy**

All standard text rules contain two logical sections: the rule header and the rule options. The rule header contains:

- the rule's action or type
- the protocol
- the source and destination IP addresses and netmasks
- direction indicators showing the flow of traffic from source to destination
- the source and destination ports

The rule options section contains:

- event messages
- keywords and their parameters and arguments
- patterns that a packet's payload must match to trigger the rule
- specifications of which parts of the packet the rules engine should inspect

The following diagram illustrates the parts of a rule:

```
alert tcp $EXTERNAL_NET any -> $HTTP_SERVERS $HTTP_PORTS
```

```
(MSG:WEB-IIS metsm.exe access
 flow:to_server.established; uri:content:"/scripts/tools/metsm.exe"; nocase; metadata:service http;
 reference:nessus,10360; classtype:web-application-activity; sid:1024; rev:10;
 )
```

Note that the options section of a rule is the section enclosed in parentheses. The intrusion rules editor provides an easy-to-use interface to help you build standard text rules.
The Intrusion Rule Header

Every standard text rule and shared object rule has a rule header containing parameters and arguments. The following illustrates parts of a rule header:

```
Type | Source IP | Operator | Destination Port
---- | --------- | -------- |------------------
alert tcp $EXTERNAL_NET any -> $HTTP_SERVERS $HTTP_PORTS
```

The following table describes each part of the rule header shown above.

<table>
<thead>
<tr>
<th>Rule Header Component</th>
<th>Example Value</th>
<th>This Value...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>alert</td>
<td>Generates an intrusion event when triggered.</td>
</tr>
<tr>
<td>Protocol</td>
<td>tcp</td>
<td>Tests TCP traffic only.</td>
</tr>
<tr>
<td>Source IP Address</td>
<td>$EXTERNAL_NET</td>
<td>Tests traffic coming from any host that is not on your internal network.</td>
</tr>
<tr>
<td>Source Ports</td>
<td>any</td>
<td>Tests traffic coming from any port on the originating host.</td>
</tr>
<tr>
<td>Operator</td>
<td>-&gt;</td>
<td>Tests external traffic (destined for the web servers on your network).</td>
</tr>
<tr>
<td>Destination IP Address</td>
<td>$HTTP_SERVERS</td>
<td>Tests traffic to be delivered to any host specified as a web server on your internal network.</td>
</tr>
<tr>
<td>Destination Ports</td>
<td>$HTTP_PORTS</td>
<td>Tests traffic delivered to an HTTP port on your internal network.</td>
</tr>
</tbody>
</table>

The previous example uses default variables, as do most intrusion rules.

**Related Topics**

Variable Sets, on page 354

**Intrusion Rule Header Action**

Each rule header includes a parameter that specifies the action the system takes when a packet triggers a rule. Rules with the action set to alert generate an intrusion event against the packet that triggered the rule and log the details of that packet. Rules with the action set to pass do not generate an event against, or log the details of, the packet that triggered the rule.
In an inline deployment, rules with the rule state set to *Drop and Generate Events* generate an intrusion event against the packet that triggered the rule. Also, if you apply a drop rule in a passive deployment, the rule acts as an alert rule.

By default, pass rules override alert rules. You can create pass rules to prevent packets that meet criteria defined in the pass rule from triggering the alert rule in specific situations, rather than disabling the alert rule. For example, you might want a rule that looks for attempts to log into an FTP server as the user “anonymous” to remain active. However, if your network has one or more legitimate anonymous FTP servers, you could write and activate a pass rule that specifies that, for those specific servers, anonymous users do not trigger the original rule.

Within the intrusion rules editor, you select the rule type from the *Action* list.

**Intrusion Rule Header Protocol**

In each rule header, you must specify the protocol of the traffic the rule inspects. You can specify the following network protocols for analysis:

- ICMP (Internet Control Message Protocol)
- IP (Internet Protocol)
- TCP (Transmission Control Protocol)
- UDP (User Datagram Protocol)

Use **IP** as the protocol type to examine all protocols assigned by IANA, including TCP, UDP, ICMP, IGMP, and many more.

**Note** The system ignores port definitions in an intrusion rule header when the protocol is set to **ip**.

You cannot currently write rules that match patterns in the next header (for example, the TCP header) in an IP payload. Instead, content matches begin with the last decoded protocol. As a workaround, you can match patterns in TCP headers by using rule options.

Within the Intrusion Rules editor, you select the protocol type from the *Protocol* list.

**Related Topics**

*Intrusion Rule Header Protocol*, on page 1372

**Intrusion Rule Header Direction**

Within the rule header, you can specify the direction that the packet must travel for the rule to inspect it. The following table describes these options.
Table 119: Directional Options in Rule Headers

<table>
<thead>
<tr>
<th>Use...</th>
<th>To Test...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directional</td>
<td>only traffic from the specified source IP address to the specified destination IP address</td>
</tr>
<tr>
<td>Bidirectional</td>
<td>all traffic traveling between the specified source and destination IP addresses</td>
</tr>
</tbody>
</table>

Intrusion Rule Header Source and Destination IP Addresses

Restricting packet inspection to the packets originating from specific IP addresses or destined to a specific IP address reduces the amount of packet inspection the system must perform. This also reduces false positives by making the rule more specific and removing the possibility of the rule triggering against packets whose source and destination IP addresses do not indicate suspicious behavior.

Tip

The system recognizes only IP addresses and does not accept host names for source or destination IP addresses.

Within the intrusion rules editor, you specify source and destination IP addresses in the **Source IPs** and **Destination IPs** fields.

When writing standard text rules, you can specify IPv4 and IPv6 addresses in a variety of ways, depending on your needs. You can specify a single IP address, any, IP address lists, CIDR notation, prefix lengths, or a network variable. Additionally, you can indicate that you want to exclude a specific IP address or set of IP addresses. When specifying IPv6 addresses, you can use any addressing convention defined in RFC 4291.

IP Address Syntax in Intrusion Rules

The following table summarizes the various ways you can specify source and destination IP addresses.

Table 120: Source/Destination IP Address Syntax

<table>
<thead>
<tr>
<th>To Specify...</th>
<th>Use...</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>any IP address</td>
<td>any</td>
<td>any</td>
</tr>
<tr>
<td>a specific IP address</td>
<td>the IP address</td>
<td>192.168.1.1</td>
</tr>
<tr>
<td></td>
<td>Note that you would not mix IPv4 and IPv6 source and destination addresses in the same rule.</td>
<td>2001:db8::abcd</td>
</tr>
<tr>
<td>a list of IP addresses</td>
<td>brackets ([ ]) to enclose the IP addresses and commas to separate them</td>
<td>[192.168.1.1, 192.168.1.15]</td>
</tr>
<tr>
<td></td>
<td></td>
<td>[2001:db8::b3ff, 2001:db8::0202]</td>
</tr>
<tr>
<td>a block of IP addresses</td>
<td>IPv4 CIDR block or IPv6 address prefix notation</td>
<td>192.168.1.0/24</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2001:db8::/32</td>
</tr>
<tr>
<td>anything except a</td>
<td>the : character before the IP address or addresses you want to negate</td>
<td>![192.168.1.15]</td>
</tr>
<tr>
<td>specific IP address or set of addresses</td>
<td></td>
<td>![2001:db8::0202:b3ff:fe1e]</td>
</tr>
</tbody>
</table>
### To Specify... | Use... | Example
--- | --- | ---
anything in a block of IP addresses except one or more specific IP addresses | a block of addresses followed by a list of negated addresses or blocks | [10.0.0/8, !10.2.3.4, !10.1.0.0/16]
IP addresses defined by a network variable | the variable name, in uppercase letters, preceded by $ | $HOME_NET
| | Note that preprocessor rules can trigger events regardless of the hosts defined by network variables used in intrusion rules. | |
all IP addresses except addresses defined by an IP address variable | the variable name, in uppercase letters, preceded by !$ | !$HOME_NET

The following descriptions provide additional information on some of the IP address entry methods.

**Any IP Address**

You can specify the word *any* as a rule source or destination IP address to indicate any IPv4 or IPv6 address. For example, the following rule uses the argument *any* in the **Source IPs** and **Destination IPs** fields and evaluates packets with any IPv4 or IPv6 source or destination address:

```
alert tcp any any -> any any
```

You can also specify :: to indicate any IPv6 address.

**Multiple IP Addresses**

You can list individual IP addresses by separating the IP addresses with commas and, optionally, by surrounding non-negated lists with brackets, as shown in the following example:

```
[192.168.1.100,192.168.1.103,192.168.1.105]
```

You can list IPv4 and IPv6 addresses alone or in any combination, as shown in the following example:

```
[192.168.1.100,2001:db8::1234,192.168.1.105]
```

Note that surrounding an IP address list with brackets, which was required in earlier software releases, is not required. Note also that, optionally, you can enter lists with a space before or after each comma.

---

**Note**

You must surround negated lists with brackets.

You can also use IPv4 Classless Inter-Domain Routing (CIDR) notation or IPv6 prefix lengths to specify address blocks. For example:

- 192.168.1.0/24 specifies the IPv4 addresses in the 192.168.1.0 network with a subnet mask of 255.255.255.0, that is, 192.168.1.0 through 192.168.1.255.

Tip

If you need to specify a block of IP addresses but cannot express it using CIDR or prefix length notation alone, you can use CIDR blocks and prefix lengths in an IP address list.

IP Addresses Negation

You can use an exclamation point (!) to negate a specified IP address. That is, you can match any IP address with the exception of the specified IP address or addresses. For example, !192.168.1.1 specifies any IP address other than 192.168.1.1, and !2001:db8:ca2e::fa4c specifies any IP address other than 2001:db8:ca2e::fa4c.

To negate a list of IP addresses, place ! before a bracketed list of IP addresses. For example, ![192.168.1.1,192.168.1.5] would define any IP address other than 192.168.1.1 or 192.168.1.5.

Note

You must use brackets to negate a list of IP addresses.

Be careful when using the negation character with IP address lists. For example, if you use ![192.168.1.1,192.168.1.5] to match any address that is not 192.168.1.1 or 192.168.1.5, the system interprets this syntax as “anything that is not 192.168.1.1, or anything that is not 192.168.1.5.”

Because 192.168.1.5 is not 192.168.1.1, and 192.168.1.1 is not 192.168.1.5, both IP addresses match the IP address value of ![192.168.1.1,192.168.1.5], and it is essentially the same as using “any.”

Instead, use ![192.168.1.1,192.168.1.5]. The system interprets this as “not 192.168.1.1 and not 192.168.1.5,” which matches any IP address other than those listed between brackets.

Note that you cannot logically use negation with any which, if negated, would indicate no address.

Related Topics

Variable Sets, on page 354

Intrusion Rule Header Source and Destination Ports

Within the intrusion rules editor, you specify source and destination ports in the Source Port and Destination Port fields.

Port Syntax in Intrusion Rules

The Firepower System uses a specific type of syntax to define the port numbers used in rule headers.

Note

The system ignores port definitions in an intrusion rule header when the protocol is set to ip.

You can list ports by separating the ports with commas, as shown in the following example:

80, 8080, 8138, 8600-9000, !8650-8675
Optionally, the following example shows how you can surround a port list with brackets, which was required in previous software versions but is no longer required:

```
[80, 8080, 8138, 8600-9000, !8650-8675]
```

Note that you must surround negated port lists in brackets, as shown in the following example:

```
!(20, 22, 23)
```

The following table summarizes the syntax you can use:

<table>
<thead>
<tr>
<th>To Specify...</th>
<th>Use</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>any port</td>
<td>any</td>
<td>any</td>
</tr>
<tr>
<td>a specific port</td>

<td>the ! character before the port, port list, or range of ports you want to negate</td>
<td>!20</td>
</tr>
<tr>
<td></td>
<td>Note that you can logically use negation with all port designations except any, which if negated would indicate no port.</td>
<td></td>
</tr>
<tr>
<td>all ports defined by a port variable</td>
<td>the variable name, in uppercase letter, preceded by $</td>
<td>$HTTP_PORTS</td>
</tr>
<tr>
<td>all ports except ports defined by a port variable</td>
<td>the variable name, in uppercase letter, preceded by !$</td>
<td>!$HTTP_PORTS</td>
</tr>
</tbody>
</table>

## Intrusion Event Details

As you construct a standard text rule, you can include contextual information that describes the vulnerability that the rule detects in exploit attempts. You can also include external references to vulnerability databases and define the priority that the event holds in your organization. When analysts see the event, they then have information about the priority, exploit, and known mitigation readily available.

### Message

You can specify meaningful text that appears as a message when the rule triggers. The message gives immediate insight into the nature of the vulnerability that the rule detects attempts to exploit. You can use any printable standard ASCII characters except curly braces ({ }). The system strips quotes that completely surround the message.
You must specify a rule message. Also, the message cannot consist of white space only, one or more quotation marks only, one or more apostrophes only, or any combination of just white space, quotation marks, or apostrophes.

To define the event message in the intrusion rules editor, you enter the event message in the **Message** field.

### Classification

For each rule, you can specify an attack classification that appears in the packet display of the event. The following table lists the name and number for each classification.

**Table 122: Rule Classifications**

<table>
<thead>
<tr>
<th>Number</th>
<th>Classification Name</th>
<th>Description</th>
</tr>

</tr>
<tr>
<td>19</td>
<td>system-call-detect</td>
<td>A System Call was Detected</td>
</tr>
</tbody>
</table>
### Custom Classification

If you want more customized content for the packet display description of the events generated by a rule you define, you can create a custom classification.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification Name</td>
<td>The name of the classification. The page is difficult to read if you use more than 40 characters. The following characters are not supported: &lt; &gt; ( ) &quot; ' &amp; $ ; and the space character.</td>
</tr>
<tr>
<td>Classification Description</td>
<td>A description of the classification. You can use alphanumeric characters and spaces. The following characters are not supported: &lt; &gt; ( ) &quot; ' &amp; $ ;</td>
</tr>
</tbody>
</table>
### Custom Priority

By default, the priority of a rule derives from the event classification for the rule. However, you can override the classification priority for a rule by adding the `priority` keyword to the rule and selecting a high, medium, or low priority. For example, to assign a high priority for a rule that detects web application attacks, add the `priority` keyword to the rule and select **high** as the priority.

### Custom Reference

You can use the `reference` keyword to add references to external web sites and additional information about the event. Adding a reference provides analysts with an immediately available resource to help them identify why the packet triggered a rule. The following table lists some of the external systems that can provide data on known exploits and attacks.

<table>
<thead>
<tr>
<th>System ID</th>
<th>Description</th>
<th>Example ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>bugtraq</td>
<td>Bugtraq page</td>
<td>8550</td>
</tr>
<tr>
<td>cve</td>
<td>Common Vulnerabilities and Exposure page</td>
<td>CAN-2003-0702</td>
</tr>
<tr>
<td>mcafee</td>
<td>McAfee page</td>
<td>98574</td>
</tr>
<tr>
<td>url</td>
<td>Website reference</td>
<td><a href="http://www.example.com?exploit=14">www.example.com?exploit=14</a></td>
</tr>
<tr>
<td>mab</td>
<td>Microsoft security bulletin</td>
<td>MS11-082</td>
</tr>
<tr>
<td>nessus</td>
<td>Nessus page</td>
<td>10039</td>
</tr>
<tr>
<td>secure-url</td>
<td>Secure Website Reference (https://...)</td>
<td>intranet/exploits/exploit=14</td>
</tr>
</tbody>
</table>

You specify a reference by entering a reference value, as follows:

```
id_system,id
```

where `id_system` is the system being used as a prefix, and `id` is the Bugtraq ID, CVE number, Arachnids ID, or URL (without `http://`).

For example, to specify the authentication bypass vulnerability on Microsoft Commerce Server 2002 servers documented in Bugtraq ID 17134, enter the value:

```
bugtraq,17134
```
Note the following when adding references to a rule:

- Do not use a space after the comma.
- Do not use uppercase letters in the system ID.

- Defining an Event Reference, on page 1381

### Adding a Custom Classification

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays custom classifications created in the current domain, and you can set the priorities for these classifications. It also displays custom classifications created in ancestor domains, but you cannot set the priorities for these classifications. To view and edit custom classifications created in a lower domain, switch to that domain.

**Procedure**

**Step 1**
While creating or editing a rule, choose **Edit Classifications** from the **Classification** drop-down list.

If **View Classifications** displays instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 2**
Enter a **Classification Name** and **Classification Description** as described in Intrusion Event Details, on page 1376.

**Step 3**
Choose a priority for the classification from the **Priority** drop-down list.

**Step 4**
Click **Add**.

**Step 5**
Click **Done**.

**What to do next**

- Continue with creating or editing the rule. See Writing New Rules, on page 1383 or Modifying Existing Rules, on page 1384 for more information.

Custom Rule Creation, on page 1382
Custom Rule Creation

You can create a custom intrusion rule by:

- creating your own standard text rules
- saving existing standard text rules as new
- saving system-provided shared object rules as new
- in a multidomain deployment, saving ancestor rules as new in a descendant domain
- importing a local rule file

The system saves the custom rule in the local rule category, regardless of the method you used to create it. When you create a custom intrusion rule, the system assigns it a unique rule number, which has the format `GID:SID:Rev`. The elements of this number are:

**GID**
Generator ID. For all standard text rules, this value is 1. For all shared object rules you save as new, this value is 3.

**SID**
Snort ID. Indicates whether the rule is a local rule of a system rule. When you create a new rule, the system assigns the next available SID for a local rule.

SID numbers for local rules start at 1000000, and the SID for each new local rule is incremented by one. In a multidomain deployment, the system prepends a domain number to the SID of any custom rule created in or imported into a descendant domain. For example, a rule added in the Global domain would have a SID of 1000000 or greater, and rules added in descendant domains would have SIDs of [domain number]000000 or greater.

**Rev**
The revision number. For a new rule, the revision number is one. Each time you modify a custom rule the revision number increments by one.

In a custom standard text rule, you set the rule header settings and the rule keywords and arguments. You can use the rule header settings to focus the rule to only match traffic using a specific protocol and traveling to or from specific IP addresses or ports.

In a custom system-provided standard text rule or shared object rule, you are limited to modifying rule header information such as the source and destination ports and IP addresses. You cannot modify the rule keywords or arguments.

Modifying header information for a shared object rule and saving your changes creates a new instance of the rule with a generator ID (GID) of 3 and the next available SID for a custom rule. The system links the new instance of the shared object rule to the reserved `soid` keyword, which maps the rule you create to the rule created by the Cisco Talos Security Intelligence and Research Group (Talos). You can delete instances of a shared object rule that you create, but you cannot delete shared object rules created by Talos.
Writing New Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1  
Access the intrusion rules using either of the following methods:

- Choose Policies > Access Control > Intrusion, and click Intrusion Rules.
- Choose Objects > Intrusion Rules.

Step 2  
Click Create Rule.

Step 3  
Enter a value in the Message field.

Step 4  
Choose a value from each of the following drop-down lists:

- Classification
- Action
- Protocol
- Direction

Step 5  
Enter values in the following fields:

- Source IPs
- Destination IPs
- Source Port
- Destination Port

The system uses the value any if you do not specify a value for these fields.

Note  
The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

Step 6  
Choose a value from the Detection Options drop-down list.

Step 7  
Click Add Option.

Step 8  
Enter any arguments for the keyword you added.

Step 9  
Optionally, repeat steps 6 to 8.

Step 10  
If you added multiple keywords, you can:

- Reorder keywords — Click the up or down arrow next to the keyword you want to move.
- Delete a keyword — Click the X next to that keyword.

Step 11  
Click Save As New.
What to do next

• Enable your new or changed rules within the appropriate intrusion policy; see Viewing Intrusion Rules in an Intrusion Policy, on page 1316.

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Modifying Existing Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

You can modify custom intrusion rules. In a multidomain deployment, you can modify custom intrusion rules that belong to the current domain only.

You can save system-provided rules and rules belonging to ancestor domains as new custom rules in the local rule category, which you can then modify.

Procedure

Step 1 Access the intrusion rules using either of the following methods:
  • Choose Policies > Access Control > Intrusion, and click Intrusion Rules.
  • Choose Objects > Intrusion Rules.

Step 2 Locate the rule you want to modify. You have the following choices:
  • Navigate through the folders to the rule.
  • Search for the rule; see Searching for Rules, on page 1387.
  • Filter for the group to which the rule belongs; see Filtering Rules, on page 1391.

Step 3 Click the edit icon (📝) next to the rule.
If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 4 Modify the rule as appropriate for the rule type.

Note Do not modify the protocol for a shared object rule; doing so would render the rule ineffective.

Step 5 You have the following choices:
  • Click Save if you are editing a custom rule and want to overwrite the current version of that rule.
  • Click Save As New if you are editing a system-provided rule or any rule belonging to an ancestor domain, or if you are editing a custom rule and want to save the changes as a new rule.
What to do next

• If you want to use the local modification of the rule instead of the system-provided rule, deactivate the system-provided rule by using the procedures at Intrusion Rule States, on page 1330 and activate the local rule.

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Adding Comments to Intrusion Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You can add comments to any intrusion rule. Such comments can be helpful to provide context and additional information about the rule and the exploit or policy violation it identifies.

In a multidomain deployment, the system displays comments created in the current domain, which you can delete. It also displays comments created in ancestor domains, which you cannot delete. To view comments created in a lower domain, switch to that domain.

Procedure

Step 1

Access the intrusion rules using either of the following methods:

• Choose Policies > Access Control > Intrusion, and click Intrusion Rules.
• Choose Objects > Intrusion Rules.

Step 2

Locate the rule you want to annotate. You have the following choices:

• Navigate through the folders to the rule.
• Search for the rule; see Searching for Rules, on page 1387.
• Filter for the group where the rule belongs; see Filtering Rules, on page 1391.

Step 3

Click the edit icon (-pencil) next to the rule.

If a view icon (-eye) appears next to a rule instead, the rule belongs to an ancestor policy, or you do not have permission to modify the rule.

Step 4

Click Rule Comment.

Step 5

Enter your comment in the text box.

Step 6

Click Add Comment.

Tip You can also add and view rule comments in an intrusion event’s packet view.
What to do next

• Continue with creating or editing the rule. See Writing New Rules, on page 1383 or Modifying Existing Rules, on page 1384 for more information.

Related Topics

<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can delete custom rules if the rules are not currently enabled in an intrusion policy. You cannot delete either standard text rules or shared object rules provided by the system. In a multidomain deployment, you can delete local rules created in the current domain only.

The system stores deleted rules in the deleted category, and you can use a deleted rule as the basis for a new rule. The Rules page in an intrusion policy does not display the deleted category, so you cannot enable deleted custom rules.

Tip

Custom rules include shared object rules that you save with modified header information. The system also saves these in the local rule category and lists them with a GID of 3. You can delete your modified version of a shared object rule, but you cannot delete the original shared object rule.

Procedure

Step 1

Access the intrusion rules using either of the following methods:

• Choose Policies > Access Control > Intrusion, and click Intrusion Rules.
• Choose Objects > Intrusion Rules.

Step 2

You have two choices:

• Delete all local rules — Click Delete Local Rules, then click OK.
• Delete a single rule — Choose Local Rules from the Group Rules By drop-down, click the delete icon ( ) next to a rule you want to delete, and click OK to confirm the deletion.

Related Topics

Intrusion Rule States, on page 1330
The Firepower System provides thousands of standard text rules, and the Cisco Talos Security Intelligence and Research Group (Talos) continues to add rules as new vulnerabilities and exploits are discovered. You can easily search for specific rules so that you can activate, deactivate, or edit them.

### Procedure

**Step 1**
Access the intrusion rules using either of the following methods:
- Choose Policies > Access Control > Intrusion, and click Intrusion Rules.
- Choose Objects > Intrusion Rules.

**Step 2**
Click Search on the toolbar.

**Step 3**
Add search criteria.

**Step 4**
Click Search.

### What to do next
- If you want to view or edit a located rule (or a copy of the rule, if it is a system rule), click the hyperlinked rule message. See Writing New Rules, on page 1383 or Modifying Existing Rules, on page 1384 for more information.

### Search Criteria for Intrusion Rules

The following table describes the available search options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signature ID</td>
<td>To search for a single rule based on Snort ID (SID), enter an SID number. To search for multiple rules, enter a comma-separated list of SID numbers. This field has an 80-character limit.</td>
</tr>
<tr>
<td>Generator ID</td>
<td>To search for standard text rules, select 1. To search for shared object rules, select 3.</td>
</tr>
<tr>
<td>Message</td>
<td>To search for a rule with a specific message, enter a single word from the rule message in the Message field. For example, to search for DNS exploits, you would enter DNS, or to search for buffer overflow exploits, enter overflow.</td>
</tr>
<tr>
<td>Protocol</td>
<td>To search rules that evaluate traffic of a specific protocol, select the protocol. If you do not select a protocol, search results contain rules for all protocols.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Source Port</td>
<td>To search for rules that inspect packets originating from a specified port, enter a source port number or a port-related variable.</td>
</tr>
<tr>
<td>Destination Port</td>
<td>To search for rules that inspect packets destined for a specific port, enter a destination port number or a port-related variable.</td>
</tr>
<tr>
<td>Source IP</td>
<td>To search for rules that inspect packets originating from a specified IP address, enter a source IP address or an IP address-related variable.</td>
</tr>
<tr>
<td>Destination IP</td>
<td>To search for rules that inspect packets destined for a specified IP address, enter a destination IP address or an IP address-related variable.</td>
</tr>
<tr>
<td>Keyword</td>
<td>To search for specific keywords, you can use the keyword search options. You select a keyword and enter a keyword value for which to search. You can also precede the keyword value with an exclamation point (!) to match any value other than the specified value.</td>
</tr>
<tr>
<td>Category</td>
<td>To search for rules in a specific category, select the category from the Category list.</td>
</tr>
<tr>
<td>Classification</td>
<td>To search for rules that have a specific classification, select the classification name from the Classification list.</td>
</tr>
<tr>
<td>Rule State</td>
<td>To search for rules within a specific policy and a specific rule state, select the policy from the first Rule State list, and choose a state from the second list to search for rules set to Generate Events, Drop and Generate Events, or Disabled.</td>
</tr>
</tbody>
</table>

**Rule Filtering on the Intrusion Rules Editor Page**

You can filter the rules on the intrusion rules editor page to display a subset of rules. This can be useful, for example, when you want to modify a rule or change its state but have difficulty finding it among the thousands of rules available.

When you enter a filter, the page displays any folder that includes at least one matching rule, or a message when no rule matches.

**Filtering Guidelines**

Your filter can include special keywords and their arguments, character strings, and literal character strings in quotes, with spaces separating multiple filter conditions. A filter cannot include regular expressions, wildcard characters, or any special operator such as a negation character (!), a greater than symbol (>), less than symbol (<), and so on.

All keywords, keyword arguments, and character strings are case-insensitive. Except for the `gid` and `sid` keywords, all arguments and strings are treated as partial strings. Arguments for `gid` and `sid` return only exact matches.

You can expand a folder on the original, unfiltered page and the folder remains expanded when the subsequent filter returns matches in that folder. This can be useful when the rule you want to find is in a folder that contains a large number of rules.
You cannot constrain a filter with a subsequent filter. Any filter you enter searches the entire rules database and returns all matching rules. When you enter a filter while the page still displays the result of a previous filter, the page clears and returns the result of the new filter instead.

You can use the same features with rules in a filtered or unfiltered list. For example, you can edit rules in a filtered or unfiltered list on the intrusion rules editor page. You can also use any of the options in the context menu for the page.

Tip Filtering may take significantly longer when the combined total of rules in all sub-groups is large because rules appear in multiple categories, even when the total number of unique rules is much smaller.

**Keyword Filtering**

Each rule filter can include one or more keywords in the format:

```
keyword:argument
```

where keyword is one of the keywords in the following table and argument is a single, case-insensitive, alphanumeric string to search for in the specific field or fields relevant to the keyword.

Arguments for all keywords except `gid` and `sid` are treated as partial strings. For example, the argument `123` returns "12345", "41235", "45123", and so on. The arguments for `gid` and `sid` return only exact matches; for example, `sid:3080` returns only SID 3080.

Tip You can search for a partial SID by filtering with one or more character strings.

The following table describes the specific filtering keywords and arguments you can use to filter rules.

**Table 125: Rule Filter Keywords**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>arachnids</td>
<td>Returns one or more rules based on all or part of the Arachnids ID in a rule reference.</td>
<td>arachnids:181</td>
</tr>
<tr>
<td>bugtraq</td>
<td>Returns one or more rules based on all or part of the Bugtraq ID in a rule reference.</td>
<td>bugtraq:2120</td>
</tr>
<tr>
<td>cve</td>
<td>Returns one or more rules based on all or part of the CVE number in a rule reference.</td>
<td>cve:2003-0109</td>
</tr>
<tr>
<td>gid</td>
<td>The argument 1 returns standard text rules. The argument 3 returns shared object rules.</td>
<td>gid:3</td>
</tr>
<tr>
<td>mcafee</td>
<td>Returns one or more rules based on all or part of the McAfee ID in a rule reference.</td>
<td>mcafee:10566</td>
</tr>
<tr>
<td>msg</td>
<td>Returns one or more rules based on all or part of the rule Message field, also known as the event message.</td>
<td>msg:chat</td>
</tr>
</tbody>
</table>
### Character String Filtering

Each rule filter can include one or more alphanumeric character strings. Character strings search the rule Message field, Snort ID (SID), and Generator ID (GID). For example, the string `123` returns the strings "Lotus123", "123mania", and so on in the rule message, and also returns SID 6123, SID 12375, and so on.

All character strings are case-insensitive and are treated as partial strings. For example, any of the strings `ADMIN`, `admin`, or `Admin` return "admin", "CFADMIN", "Administrator" and so on.

You can enclose character strings in quotes to return exact matches. For example, the literal string "overflow attempt" in quotes returns only that exact string, whereas a filter comprised of the two strings `overflow` and `attempt` without quotes returns "overflow attempt", "overflow multipacket attempt", "overflow with evasion attempt", and so on.

### Related Topics

- [Defining an Event Reference](#), on page 1381
- [Intrusion Event Details](#), on page 1376
- [Preprocessor Generator IDs](#), on page 2092

### Combination Keyword and Character String Filtering

You can narrow filter results by entering any combination of keywords, character strings, or both, separated by spaces. The result includes any rule that matches all the filter conditions.

You can enter multiple filter conditions in any order. For example, each of the following filters returns the same rules:

- `url:at login attempt cve:200`
- `login attempt cve:200 url:at`
- `login cve:200 attempt url:at`
Filtering Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>

<td>Admin/Intrusion</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

On the Intrusion Rules page, you can filter rules into subsets so you can more easily find specific rules. You can then use any of the page features, including choosing any of the features available in the context menu. Rule filtering can be particularly useful to locate a specific rule to edit.

Procedure

Step 1
Access the intrusion rules using either of the following methods:

- Choose Policies > Access Control > Intrusion, and click Intrusion Rules.
- Choose Objects > Intrusion Rules.

Step 2
Prior to filtering, you have the following choices:

- Expand any rule group you want to expand. Some rule groups also have sub-groups that you can expand.
  Expanding a group on the original, unfiltered page can be useful when you expect that a rule might be in that group. The group remains expanded when the subsequent filter results in a match in that folder, and when you return to the original, unfiltered page by clicking on the filter clearing icon (×).
- Choose a different grouping method from the Group Rules By drop-down list.

Step 3
Enter filter constraints in the text box next to the filter icon (☐) under the Group Rules By list.

Step 4
Press Enter.

Note
Clear the current filtered list by clicking the filter clearing icon (×).

Keywords and Arguments in Intrusion Rules

Using the rules language, you can specify the behavior of a rule by combining keywords. Keywords and their associated values (called arguments) dictate how the system evaluates packets and packet-related values that the rules engine tests. The Firepower System currently supports keywords that allow you to perform inspection functions, such as content matching, protocol-specific pattern matching, and state-specific matching. You can define up to 100 arguments per keyword, and combine any number of compatible keywords to create highly specific rules. This helps decrease the chance of false positives and false negatives and focus the intrusion information you receive.

Note that you can also use adaptive profile updates in passive deployments to dynamically adapt active rule processing for specific packets based on rule metadata and host information.

Keywords described in this section are listed under Detection Options in the rules editor.
The content and protected_content Keywords

Use the content keyword or the protected_content keyword to specify content that you want to detect in a packet.

You should almost always follow a content or protected_content keyword by modifiers that indicate where the content should be searched for, whether the search is case sensitive, and other options.

Note that all content matches must be true for the rule to trigger an event, that is, each content match has an AND relationship with the others.

Note also that, in an inline deployment, you can set up rules that match malicious content and then replace it with your own text string of equal length.

content

When you use the content keyword, the rules engine searches the packet payload or stream for that string. For example, if you enter /bin/sh as the value for one of the content keywords, the rules engine searches the packet payload for the string /bin/sh.

Match content using either an ASCII string, hexadecimal content (binary byte code), or a combination of both. Surround hexadecimal content with pipe characters (|) in the keyword value. For example, you can mix hexadecimal content and ASCII content using something that looks like |90C8 C0FF FFFF|/bin/sh.

You can specify multiple content matches in a single rule. To do this, use additional instances of the content keyword. For each content match, you can indicate that content matches must be found in the packet payload or stream for the rule to trigger.

⚠️ Caution

You may invalidate your intrusion policy if you create a rule that includes only one content keyword and that keyword has the Not option selected.

protected_content

The protected_content keyword allows you to encode your search content string before configuring the rule argument. The original rule author uses a hash function (SHA-512, SHA-256, or MD5) to encode the string before configuring the keyword.

When you use the protected_content keyword instead of the content keyword, there is no change to how the rules engine searches the packet payload or stream for that string and most of the keyword options function as expected. The following table summarizes the exceptions, where the protected_content keyword options differ from the content keyword options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hash Type</td>
<td>New option for the protected_content rule keyword.</td>
</tr>
<tr>
<td>Case Insensitive</td>
<td>Not supported</td>
</tr>
</tbody>
</table>
Cisco recommends that you include at least one `content` keyword in rules that include a `protected_content` keyword to ensure that the rules engine uses the fast pattern matcher, which increases processing speed and improves performance. Position the `content` keyword before the `protected_content` keyword in the rule. Note that the rules engine uses the fast pattern matcher when a rule includes at least one `content` keyword, regardless of whether you enable the `content` keyword `Use Fast Pattern Matcher` argument.

Caution
You may invalidate your intrusion policy if you create a rule that includes only one `protected_content` keyword and that keyword has the `Not` option selected.

Related Topics
- Custom Rule Creation, on page 1382
- Basic content and protected_content Keyword Arguments, on page 1393
- The replace Keyword, on page 1403

Basic content and protected_content Keyword Arguments

You can constrain the location and case-sensitivity of content searches with parameters that modify the `content` or `protected_content` keyword. Configure options that modify the `content` or `protected_content` keyword to specify the content for which you want to search.

Case Insensitive

Note
This option is not supported when configuring the `protected_content` keyword.

You can instruct the rules engine to ignore case when searching for content matches in ASCII strings. To make your search case-insensitive, check Case Insensitive when specifying a content search.

Hash Type

Note
This option is only configurable with the `protected_content` keyword.
Use the **Hash Type** drop-down to identify the hash function you used to encode your search string. The system supports SHA-512, SHA-256, and MD5 hashing for `protected_content` search strings. If the length of your hashed content does not match the selected hash type, the system does **not** save the rule.

The system automatically selects the Cisco-set default value. When **Default** is selected, no specific hash function is written into the rule and the system assumes SHA-512 for the hash function.

**Raw Data**

The **Raw Data** option instructs the rules engine to analyze the original packet payload before analyzing the normalized payload data (decoded by a network analysis policy) and does not use an argument value. You can use this keyword when analyzing telnet traffic to check the telnet negotiation options in the payload before normalization.

You cannot use the **Raw Data** option together in the **same** `content` or `protected_content` keyword with any HTTP content option.

---

**Tip**

You can configure the HTTP Inspect preprocessor **Client Flow Depth** and **Server Flow Depth** options to determine whether raw data is inspected in HTTP traffic, and how much raw data is inspected.

---

**Not**

Select the **Not** option to search for content that does not match the specified content. If you create a rule that includes a `content` or `protected_content` keyword with the **Not** option selected, you must also include in the rule at least one other `content` or `protected_content` keyword without the **Not** option selected.

---

**Caution**

Do not create a rule that includes only one `content` or `protected_content` keyword if that keyword has the **Not** option selected. You may invalidate your intrusion policy.

For example, SMTP rule 1:2541:9 includes three `content` keywords, one of which has the **Not** option selected. A custom rule based on this rule would be invalid if you removed all of the `content` keywords except the one with the **Not** option selected. Adding such a rule to your intrusion policy could invalidate the policy.

---

**Tip**

You cannot select the **Not** check box and the **Use Fast Pattern Matcher** check box with the **same** `content` keyword.

---

**content and protected_content Keyword Search Locations**

You can use search location options to specify where to begin searching for the specified content and how far to continue searching.

**Permitted Combinations: content Search Location Arguments**

You can use either of two `content` location pairs to specify where to begin searching for the specified content and how far to continue searching, as follows:

- Use **Offset** and **Depth** together to search relative to the beginning of the packet payload.
- Use **Distance** and **Within** together to search relative to the current search location.
When you specify only one of a pair, the default for the other option in the pair is assumed.

You cannot mix the Offset and Depth options with the Distance and Within options. For example, you cannot pair Offset and Within. You can use any number of location options in a rule.

When no location is specified, the defaults for Offset and Depth are assumed; that is, the content search starts at the beginning of the packet payload and continues to the end of the packet.

You can also use an existing byte_extract variable to specify the value for a location option.

Tip

You can use any number of location options in a rule.

Related Topics

The byte_extract Keyword, on page 1408

Permitted Combinations: protected_content Search Location Arguments

Use the required Length protected_content location option in combination with either the Offset or Distance location option to specify where to begin searching for the specified content and how far to continue searching, as follows:

- Use Length and Offset together to search for the protected string relative to the beginning of the packet payload.
- Use Length and Distance together to search for the protected string relative to the current search location.

Tip

You cannot mix the Offset and Distance options within a single keyword configuration, but you can use any number of location options in a rule.

When no location is specified, the defaults are assumed; that is, the content search starts at the beginning of the packet payload and continues to the end of the packet.

You can also use an existing byte_extract variable to specify the value for a location option.

Related Topics

The byte_extract Keyword, on page 1408

content and protected_content Search Location Arguments

Depth

Note

This option is only supported when configuring the content keyword.

Specifies the maximum content search depth, in bytes, from the beginning of the offset value, or if no offset is configured, from the beginning of the packet payload.

For example, in a rule with a content value of cgi-bin/phf, and offset value of 3, and a depth value of 22, the rule starts searching for a match to the cgi-bin/phf string at byte 3, and stops after processing 22 bytes (byte 25) in packets that meet the parameters specified by the rule header.
You must specify a value that is greater than or equal to the length of the specified content, up to a maximum of 65535 bytes. You cannot specify a value of 0.

The default depth is to search to the end of the packet.

**Distance**

Instructs the rules engine to identify subsequent content matches that occur a specified number of bytes after the previous successful content match.

Because the distance counter starts at byte 0, specify one less than the number of bytes you want to move forward from the last successful content match. For example, if you specify 4, the search begins at the fifth byte.

You can specify a value of -65535 to 65535 bytes. If you specify a **negative Distance** value, the byte you start searching on may fall outside the beginning of a packet. Any calculations will take into account the bytes outside the packet, even though the search actually starts on the first byte in the packet. For example, if the current location in the packet is the fifth byte, and the next content rule option specifies a **Distance** value of -10 and a **Within** value of 20, the search starts at the beginning of the payload and the **Within** option is adjusted to 15.

The default distance is 0, meaning the current location in the packet subsequent to the last content match.

**Length**

This option is only supported when configuring the `protected_content` keyword.

The **Length** `protected_content` keyword option indicates the length, in bytes, of the unhashed search string. For example, if you used the content `Sample1` to generate a secure hash, use 7 for the **Length** value. You must enter a value in this field.

**Offset**

Specifies in bytes where in the packet payload to start searching for content relative to the beginning of the packet payload. You can specify a value of 65535 to 65535 bytes.

Because the offset counter starts at byte 0, specify one less than the number of bytes you want to move forward from the beginning of the packet payload. For example, if you specify 7, the search begins at the eighth byte.

The default offset is 0, meaning the beginning of the packet.

**Within**

This option is only supported when configuring the `content` keyword.

The **Within** option indicates that, to trigger the rule, the next content match must occur within the specified number of bytes after the end of the last successful content match. For example, if you specify a **Within** value of 8, the next content match must occur within the next eight bytes of the packet payload or it does not meet the criteria that triggers the rule.
You can specify a value that is greater than or equal to the length of the specified content, up to a maximum of 65535 bytes.

The default for Within is to search to the end of the packet.

**Overview: HTTP content and protected_content Keyword Arguments**

HTTP `content` or `protected_content` keyword options let you specify where to search for content matches within an HTTP message decoded by the HTTP Inspect preprocessor.

Two options search status fields in HTTP responses:

- **HTTP Status Code**
- **HTTP Status Message**

Note that although the rules engine searches the raw, unnormalized status fields, these options are listed here separately to simplify explanation below of the restrictions to consider when combining other raw HTTP fields and normalized HTTP fields.

Five options search normalized fields in HTTP requests, responses, or both, as appropriate:

- **HTTP URI**
- **HTTP Method**
- **HTTPHeader**
- **HTTP Cookie**
- **HTTP Client Body**

Three options search raw (unnormalized) non-status fields in HTTP requests, responses, or both, as appropriate:

- **HTTP Raw URI**
- **HTTP Raw Header**
- **HTTP Raw Cookie**

Use the following guidelines when selecting HTTP content options:

- **HTTP content** options apply only to TCP traffic.

- To avoid a negative impact on performance, select only those parts of the message where the specified content might appear.
  
  For example, when traffic is likely to include large cookies such as those in shopping cart messages, you might search for the specified content in the HTTP header but not in HTTP cookies.

- To take advantage of HTTP Inspect preprocessor normalization, and to improve performance, any HTTP-related rule you create should at a minimum include at least one `content` or `protected_content` keyword with an `HTTP URI`, `HTTP Method`, `HTTPHeader`, or `HTTP Client Body` option selected.

- You cannot use the `replace` keyword in conjunction with `HTTP content` or `protected_content` keyword options.
You can specify a single normalized HTTP option or status field, or use normalized HTTP options and status fields in any combination to target a content area to match. However, note the following restrictions when using HTTP field options:

- You cannot use the Raw Data option together in the same content or protected_content keyword with any HTTP option.

- You cannot use a raw HTTP field option (HTTP Raw URI, HTTP Raw Header, or HTTP Raw Cookie) together in the same content or protected_content keyword with its normalized counterpart (HTTP URI, HTTP Header, or HTTP Cookie, respectively).

- You cannot select Use Fast Pattern Matcher in combination with one or more of the following HTTP field options:
  
  HTTP Raw URI, HTTP Raw Header, HTTP Raw Cookie, HTTP Cookie, HTTP Method, HTTP Status Message, or HTTP Status Code
  
  However, you can include the options above in a content or protected_content keyword that also uses the fast pattern matcher to search one of the following normalized fields:
  
  HTTP URI, HTTP Header, or HTTP Client Body
  
  For example, if you select HTTP Cookie, HTTP Header, and Use Fast Pattern Matcher, the rules engine searches for content in both the HTTP cookie and the HTTP header, but the fast pattern matcher is applied only to the HTTP header, not to the HTTP cookie.

- When you combine restricted and unrestricted options, the fast pattern matcher searches only the unrestricted fields you specify to test whether to pass the rule to the intrusion rules editor for complete evaluation, including evaluation of the restricted fields.

### HTTP content and protected_content Keyword Arguments

#### HTTP URI

Select this option to search for content matches in the normalized request URI field.

Note that you cannot use this option in combination with the pcre keyword HTTP URI (U) option to search the same content.

---

**Note**

A pipelined HTTP request packet contains multiple URIs. When HTTP URI is selected and the rules engine detects a pipelined HTTP request packet, the rules engine searches all URIs in the packet for a content match.

#### HTTP Raw URI

Select this option to search for content matches in the normalized request URI field.

Note that you cannot use this option in combination with the pcre keyword HTTP URI (U) option to search the same content.
A pipelined HTTP request packet contains multiple URIs. When HTTP URI is selected and the rules engine detects a pipelined HTTP request packet, the rules engine searches all URIs in the packet for a content match.

**HTTP Method**

Select this option to search for content matches in the request method field, which identifies the action such as GET and POST to take on the resource identified in the URI.

**HTTP Header**

Select this option to search for content matches in the normalized header field, except for cookies, in HTTP requests; also in responses when the HTTP Inspect preprocessor Inspect HTTP Responses option is enabled. Note that you cannot use this option in combination with the `pcre` keyword HTTP header (H) option to search the same content.

**HTTP Raw Header**

Select this option to search for content matches in the raw header field, except for cookies, in HTTP requests; also in responses when the HTTP Inspect preprocessor Inspect HTTP Responses option is enabled. Note that you cannot use this option in combination with the `pcre` keyword HTTP raw header (D) option to search the same content.

**HTTP Cookie**

Select this option to search for content matches in any cookie identified in a normalized HTTP client request header; also in response set-cookie data when the HTTP Inspect preprocessor Inspect HTTP Responses option is enabled. Note that the system treats cookies included in the message body as body content.

You must enable the HTTP Inspect preprocessor Inspect HTTP Cookies option to search only the cookie for a match; otherwise, the rules engine searches the entire header, including the cookie.

Note the following:

- You cannot use this option in combination with the `pcre` keyword HTTP cookie (C) option to search the same content.

- The `Cookie:` and `Set-Cookie:` header names, leading spaces on the header line, and the CRLF that terminates the header line are inspected as part of the header and not as part of the cookie.

**HTTP Raw Cookie**

Select this option to search for content matches in any cookie identified in a raw HTTP client request header; also in response set-cookie data when the HTTP Inspect preprocessor Inspect HTTP Responses option is enabled; note that the system treats cookies included in the message body as body content.

You must enable the HTTP Inspect preprocessor Inspect HTTP Cookies option to search only the cookie for a match; otherwise, the rules engine searches the entire header, including the cookie.

Note the following:

- You cannot use this option in combination with the `pcre` keyword HTTP raw cookie (K) option to search the same content.
• The Cookie: and Set-Cookie: header names, leading spaces on the header line, and the CRLF that terminates the header line are inspected as part of the header and not as part of the cookie.

HTTP Client Body
Select this option to search for content matches in the message body in an HTTP client request.
Note that for this option to function, you must specify a value of 0 to 65535 for the HTTP Inspect preprocessor HTTP Client Body Extraction Depth option.

HTTP Status Code
Select this option to search for content matches in the 3-digit status code in an HTTP response.
You must enable the HTTP Inspect preprocessor Inspect HTTP Responses option for this option to return a match.

HTTP Status Message
Select this option to search for content matches in the textual description that accompanies the status code in an HTTP response.
You must enable the HTTP Inspect preprocessor Inspect HTTP Responses option for this option to return a match.

Overview: content Keyword Fast Pattern Matcher

These options are not supported when configuring the protected_content keyword.

The fast pattern matcher quickly determines which rules to evaluate before passing a packet to the rules engine. This initial determination improves performance by significantly reducing the number of rules used in packet evaluation.

By default, the fast pattern matcher searches packets for the longest content specified in a rule; this is to eliminate as much as possible needless evaluation of a rule. Consider the following example rule fragment:

```plaintext
alert tcp any any -> any 80 (msg:"Exploit"; content:"GET"; http_method; nocase; content:"/exploit.cgi"; http_uri; nocase;)
```

Almost all HTTP client requests contain the content GET, but few will contain the content /exploit.cgi. Using GET as the fast pattern content would cause the rules engine to evaluate this rule in most cases and would rarely result in a match. However, most client GET requests would not be evaluated using /exploit.cgi, thus increasing performance.

The rules engine evaluates the packet against the rule only when the fast pattern matcher detects the specified content. For example, if one content keyword in a rule specifies the content short, another specifies longer, and a third specifies longest, the fast pattern matcher will use the content longest and the rule will be evaluated only if the rules engine finds longest in the payload.
**content Keyword Fast Pattern Matcher Arguments**

**Use Fast Pattern Matcher**

Use this option to specify a shorter search pattern for the fast pattern matcher to use. Ideally, the pattern you specify is less likely to be found in the packet than the longest pattern and, therefore, more specifically identifies the targeted exploit.

Note the following restrictions when selecting **Use Fast Pattern Matcher** and other options in the same content keyword:

- You can specify **Use Fast Pattern Matcher** only one time per rule.
- You cannot use **Distance**, **Within**, **Offset**, or **Depth** when you select **Use Fast Pattern Matcher** in combination with **Not**.
- You cannot select Use Fast Pattern Matcher in combination with any of the following HTTP field options:
  - HTTP Raw URI, HTTP Raw Header, HTTP Raw Cookie, HTTP Cookie, HTTP Method, HTTP Status Message, or HTTP Status Code

However, you can include the options above in a content keyword that also uses the fast pattern matcher to search one of the following normalized fields:

- **HTTP URI**, **HTTPHeader**, or **HTTP Client Body**

For example, if you select **HTTP Cookie**, **HTTPHeader**, and **Use Fast Pattern Matcher**, the rules engine searches for content in both the HTTP cookie and the HTTP header, but the fast pattern matcher is applied only to the HTTP header, not to the HTTP cookie.

Note that you cannot use a raw HTTP field option (HTTP Raw URI, HTTP Raw Header, or HTTP Raw Cookie) together in the same content keyword with its normalized counterpart (HTTP URI, HTTP Header, or HTTP Cookie, respectively).

When you combine restricted and unrestricted options, the fast pattern matcher searches only the unrestricted fields you specify to test whether to pass the packet to the rules engine for complete evaluation, including evaluation of the restricted fields.

- Optionally, when you select **Use Fast Pattern Matcher** you can also select **Fast Pattern Matcher Only** or **Fast Pattern Matcher Offset and Length**, but not both.
- You cannot use the fast pattern matcher when inspecting Base64 data.

**Fast Pattern Matcher Only**

This option allows you to use the content keyword only as a fast pattern matcher option and not as a rule option. You can use this option to conserve resources when rules engine evaluation of the specified content is not necessary. For example, consider a case where a rule requires only that the content 12345 be anywhere in the payload. When the fast pattern matcher detects the pattern, the packet can be evaluated against additional keywords in the rule. There is no need for the rules engine to reevaluate the packet to determine if it includes the pattern 12345.

You would not use this option when the rule contains other conditions relative to the specified content. For example, you would not use this option to search for the content 1234 if another rule condition sought to determine if abcd occurs before 1234. In this case, the rules engine could not determine the relative location because specifying **Fast Pattern Matcher Only** instructs the rules engine not to search for the specified content.
Note the following conditions when using this option:

- The specified content is location-independent; that is, it may occur anywhere in the payload; thus, you cannot use positional options (Distance, Within, Offset, Depth, or Fast Pattern Matcher Offset and Length).
- You cannot use this option in combination with Not.
- You cannot use this option in combination with Fast Pattern Matcher Offset and Length.
- The specified content will be treated as case-insensitive, because all patterns are inserted into the fast pattern matcher in a case-insensitive manner; this is handled automatically, so it is not necessary to select Case Insensitive when you select this option.
- You should not immediately follow a content keyword that uses the Fast Pattern Matcher Only option with the following keywords, which set the search location relative to the current search location:
  - isdataat
  - pcre
  - content when Distance or Within is selected
  - content when HTTP URI is selected
  - asn1
  - byte_jump
  - byte_test
  - byte_math
  - byte_extract
  - base64_decode

**Fast Pattern Matcher Offset and Length**

The Fast Pattern Matcher Offset and Length option allows you to specify a portion of the content to search. This can reduce memory consumption in cases where the pattern is very long and only a portion of the pattern is sufficient to identify the rule as a likely match. When a rule is selected by the fast pattern matcher, the entire pattern is evaluated against the rule.

You determine the portion for the fast pattern matcher to use by specifying in bytes where to begin the search (offset) and how far into the content (length) to search, using the syntax:

```
offset,length
```

For example, for the content:

```
1234567
```

if you specify the number of offset and length bytes as:

```
1,5
```

the fast pattern matcher searches only for the content 23456.
Note that you cannot use this option together with Fast Pattern Matcher Only.

The replace Keyword

You can use the replace keyword in an inline deployment to replace specified content or to replace content in SSL traffic detected by the Cisco SSL Appliance.

To use the replace keyword, construct a custom standard text rule that uses the content keyword to look for a specific string. Then use the replace keyword to specify a string to replace the content. The replace value and content value must be the same length.

- **Note**
  You cannot use the replace keyword to replace hashed content in a protected_content keyword.

Optionally, you can enclose the replacement string in quotation marks for backward compatibility with previous Firepower System software versions. If you do not include quotation marks, they are added to the rule automatically so the rule is syntactically correct. To include a leading or trailing quotation mark as part of the replacement text, you must use a backslash to escape it, as shown in the following example:

"replacement text plus "quotation" marks"

A rule can contain multiple replace keywords, but only one per content keyword. Only the first instance of the content found by the rule is replaced.

The following are example uses of the replace keyword:

- If the system detects an incoming packet that contains an exploit, you can replace the malicious string with a harmless one. Sometimes this technique is more successful than simply dropping the offending packet. In some attack scenarios, the attacker simply resends the dropped packet until it bypasses your network defenses or floods your network. By substituting one string for another rather than dropping the packet, you may trick the attacker into believing that the attack was launched against a target that was not vulnerable.

- If you are concerned about reconnaissance attacks that try to learn whether you are running a vulnerable version of, for example, a web server, then you can detect the outgoing packet and replace the banner with your own text.

- **Note**
  Make sure that you set the rule state to Generate Events in the inline intrusion policy where you want to use the replace rule; setting the rule to Drop and Generate events would cause the packet to drop, which would prevent replacing the content.

As part of the string replacement process, the system automatically updates the packet checksums so that the destination host can receive the packet without error.

Note that you cannot use the replace keyword in combination with HTTP request message content keyword options.
The byte_jump Keyword

The byte_jump keyword calculates the number of bytes defined in a specified byte segment, and then skips that number of bytes within the packet, either forward from the end of the specified byte segment, or from the beginning or end of the packet payload, or from a point relative to the last content match, depending on the options you specify. This is useful in packets where a specific segment of bytes describe the number of bytes included in variable data within the packet.

The following table describes the arguments required by the byte_jump keyword.

**Table 127: Required byte_jump Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bytes</td>
<td>The number of bytes to pick up from the packet. If used without DCE/RPC, the allowed values are 0 to 10, with the following restrictions: • If used with the From End argument, bytes can be 0. If Bytes is 0, the extracted value is 0. • If you specify a number of bytes other than 1, 2, or 4, you must specify a Number Type (hexadecimal, octal, or decimal.) If used with DCE/RPC, allowed values are 1, 2, and 4.</td>
</tr>
<tr>
<td>Offset</td>
<td>The number of bytes into the payload to start processing. The offset counter starts at byte 0, so calculate the offset value by subtracting 1 from the number of bytes you want to jump forward from the beginning of the packet payload or the last successful content match. You can specify -65535 to 65535 bytes. You can also use an existing byte_extract variable or byte_math result to specify the value for this argument.</td>
</tr>
</tbody>
</table>

The following table describes options you can use to define how the system interprets the values you specified for the required arguments.

**Table 128: Additional Optional byte_jump Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relative</td>
<td>Makes the offset relative to the last pattern found in the last successful content match.</td>
</tr>
<tr>
<td>Align</td>
<td>Rounds the number of converted bytes up to the next 32-bit boundary.</td>
</tr>
</tbody>
</table>
The byte_jump Keyword

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multiplier</td>
<td>Indicates the value by which the rules engine should multiply the byte_jump value obtained from the packet to get the final byte_jump value. That is, instead of skipping the number of bytes defined in a specified byte segment, the rules engine skips that number of bytes multiplied by an integer you specify with the Multiplier argument.</td>
</tr>
<tr>
<td>Post Jump Offset</td>
<td>The number of bytes -65535 through 65535 to skip forward or backward after applying other byte_jump arguments. A positive value skips forward and a negative value skips backward. Leave the field blank or enter 0 to disable. Note that some byte_jump arguments do not apply when you select the DCE/RPC argument.</td>
</tr>
<tr>
<td>From Beginning</td>
<td>Indicates that the rules engine should skip the specified number of bytes in the payload starting from the beginning of the packet payload, instead of from the current position in the packet.</td>
</tr>
<tr>
<td>From End</td>
<td>The jump will originate from the byte that follows the last byte of the buffer.</td>
</tr>
<tr>
<td>Bitmask</td>
<td>Applies the specified hexadecimal bitmask using the AND operator to the bytes extracted from the Bytes argument. A bitmask can be 1 to 4 bytes. The result will be right-shifted by the number of bits equal to the number of trailing zeros in the mask.</td>
</tr>
</tbody>
</table>

You can specify only one of DCE/RPC, Endian, or Number Type.

If you want to define how the byte_jump keyword calculates the bytes, you can choose from the arguments described in the following table. If you do not select a byte-ordering argument, the rules engine uses big endian byte order.

**Table 129: Byte-Ordering byte_jump Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Big Endian</td>
<td>Processes data in big endian byte order, which is the default network byte order.</td>
</tr>
<tr>
<td>Little Endian</td>
<td>Processes data in little endian byte order.</td>
</tr>
<tr>
<td>DCE/RPC</td>
<td>Specifies a byte_jump keyword for traffic processed by the DCE/RPC preprocessor. The DCE/RPC preprocessor determines big endian or little endian byte order, and the Number Type and Endian arguments do not apply. When you enable this argument, you can also use byte_jump in conjunction with other specific DCE/RPC keywords.</td>
</tr>
</tbody>
</table>

Define how the system views string data in a packet by using one of the arguments in the following table.
The byte_test Keyword

The byte_test keyword tests the specified byte segment against the Value argument and its operator. The following table describes the required arguments for the byte_test keyword.

### Table 130: Number Type Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hexadecimal String</td>
<td>Represents converted string data in hexadecimal format.</td>
</tr>
<tr>
<td>Decimal String</td>
<td>Represents converted string data in decimal format.</td>
</tr>
<tr>
<td>Octal String</td>
<td>Represents converted string data in octal format.</td>
</tr>
</tbody>
</table>

For example, if the values you set for byte_jump are as follows:

- Bytes = 4
- Offset = 12
- Relative enabled
- Align enabled

the rules engine calculates the number described in the four bytes that appear 13 bytes after the last successful content match, and skips ahead that number of bytes in the packet. For instance, if the four calculated bytes in a specific packet were 00 00 00 1F, the rules engine would convert this to 31. Because align is specified (which instructs the engine to move to the next 32-bit boundary), the rules engine skips ahead 32 bytes in the packet.

Alternately, if the values you set for byte_jump are as follows:

- Bytes = 4
- Offset = 12
- From Beginning enabled
- Multiplier = 2

the rules engine calculates the number described in the four bytes that appear 13 bytes after the beginning of the packet. Then, the engine multiplies that number by two to obtain the total number of bytes to skip. For instance, if the four calculated bytes in a specific packet were 00 00 00 1F, the rules engine would convert this to 31, then multiply it by two to get 62. Because From Beginning is enabled, the rules engine skips the first 63 bytes in the packet.

**Related Topics**
- The byte_extract Keyword, on page 1408
- DCE/RPC Keywords, on page 1440
<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bytes</td>
<td>The number of bytes to calculate from the packet. If used without DCE/RPC, the allowed values are 1 to 10. However, if you specify a number of bytes other than 1, 2, or 4, you must specify a Number Type (hexadecimal, octal, or decimal.). If used with DCE/RPC, allowed values are 1, 2, and 4.</td>
</tr>
<tr>
<td>Value</td>
<td>Value to test, including its operator. Supported operators: (&lt;), (\geq), (\leq), (\neq), (^\land), (^\lor), (!), (^\oplus), (!=), (!\land), or (!\lor). For example, if you specify (!1024), byte_test would convert the specified number, and if it did not equal 1024, it would generate an event (if all other keyword parameters matched). Note that (!) and (!=) are equivalent. You can also use an existing byte_extract variable or byte_math result to specify the value for this argument.</td>
</tr>
<tr>
<td>Offset</td>
<td>The number of bytes into the payload to start processing. The offset counter starts at byte 0, so calculate the offset value by subtracting 1 from the number of bytes you want to count forward from the beginning of the packet payload or the last successful content match. You can use an existing byte_extract variable or byte_math result to specify the value for this argument.</td>
</tr>
</tbody>
</table>

You can further define how the system uses byte_test arguments with the arguments described in the following table.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bitmask</td>
<td>Applies the specified hexadecimal bitmask using the AND operator to the bytes extracted from the Bytes argument. A bitmask can be 1 to 4 bytes. The result will be right-shifted by the number of bits equal to the number of trailing zeros in the mask.</td>
</tr>
<tr>
<td>Relative</td>
<td>Makes the offset relative to the last successful pattern match.</td>
</tr>
</tbody>
</table>

You can specify only one of DCE/RPC, Endian, or Number Type.

To define how the byte_test keyword calculates the bytes it tests, choose from the arguments in the following table. If you do not select a byte-ordering argument, the rules engine uses big endian byte order.
Table 133: Byte-Ordering byte_test Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Big Endian</td>
<td>Processes data in big endian byte order, which is the default network byte order.</td>
</tr>
<tr>
<td>Little Endian</td>
<td>Processes data in little endian byte order.</td>
</tr>
<tr>
<td>DCE/RPC</td>
<td>Specifies a byte_test keyword for traffic processed by the DCE/RPC preprocessor. The DCE/RPC preprocessor determines big endian or little endian byte order, and the Number Type and Endian arguments do not apply. When you enable this argument, you can also use byte_test in conjunction with other specific DCE/RPC keywords.</td>
</tr>
</tbody>
</table>

You can define how the system views string data in a packet by using one of the arguments in the following table.

Table 134: Number Type byte-test Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hexadecimal String</td>
<td>Represents converted string data in hexadecimal format.</td>
</tr>
<tr>
<td>Decimal String</td>
<td>Represents converted string data in decimal format.</td>
</tr>
<tr>
<td>Octal String</td>
<td>Represents converted string data in octal format.</td>
</tr>
</tbody>
</table>

For example, if the value for byte_test is specified as the following:

- Bytes = 4
- Operator and Value > 128
- Offset = 8
- Relative enabled

The rules engine calculates the number described in the four bytes that appear 9 bytes away from (relative to) the last successful content match, and, if the calculated number is larger than 128 bytes, the rule is triggered.

Related Topics

- The byte_extract Keyword, on page 1408
- DCE/RPC Keywords, on page 1440

The byte_extract Keyword

You can use the byte_extract keyword to read a specified number of bytes from a packet into a variable. You can then use the variable later in the same rule as the value for specific arguments in certain other detection keywords.

This is useful, for example, for extracting data size from packets where a specific segment of bytes describes the number of bytes included in data within the packet. For example, a specific segment of bytes might say that subsequent data is comprised of four bytes; you can extract the data size of four bytes to use as your variable value.
You can use `byte_extract` to create up to two separate variables in a rule concurrently. You can redefine a `byte_extract` variable any number of times; entering a new `byte_extract` keyword with the same variable name and a different variable definition overwrites the previous definition of that variable.

The following table describes the arguments required by the `byte_extract` keyword.

**Table 135: Required byte_extract Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bytes to Extract</td>
<td>The number of bytes to pick up from the packet. If you specify a number of bytes other than 1, 2, or 4, you must specify a Number Type (hexadecimal, octal, or decimal.)</td>
</tr>
<tr>
<td>Offset</td>
<td>The number of bytes into the payload to begin extracting data. You can specify -65535 to 65535 bytes. The offset counter starts at byte 0, so calculate the offset value by subtracting 1 from the number of bytes you want to count forward. For example, specify 7 to count forward 8 bytes. The rules engine counts forward from the beginning of the packet payload or, if you also specify <code>Relative</code>, after the last successful content match. Note that you can specify negative numbers only when you also specify <code>Relative</code>. You can use an existing <code>byte_math</code> result to specify the value for this argument.</td>
</tr>
<tr>
<td>Variable Name</td>
<td>The variable name to use in arguments for other detection keywords. You can specify an alphanumeric string that must begin with a letter.</td>
</tr>
</tbody>
</table>

To further define how the system locates the data to extract, you can use the arguments described in the following table.

**Table 136: Additional Optional byte_extract Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multiplier</td>
<td>A multiplier for the value extracted from the packet. You can specify 0 to 65535. If you do not specify a multiplier, the default value is 1.</td>
</tr>
<tr>
<td>Align</td>
<td>Rounds the extracted value to the nearest 2-byte or 4-byte boundary. When you also select <code>Multipler</code>, the system applies the multiplier before the alignment.</td>
</tr>
<tr>
<td>Relative</td>
<td>Makes <code>Offset</code> relative to the end of the last successful content match instead of the beginning of the payload.</td>
</tr>
<tr>
<td>Bitmask</td>
<td>Applies the specified hexadecimal bitmask using the AND operator to the bytes extracted from the Bytes to Extract argument. A bitmask can be 1 to 4 bytes. The result will be right-shifted by the number of bits equal to the number of trailing zeros in the mask.</td>
</tr>
</tbody>
</table>

You can specify only one of `DCE/RPC`, `Endian`, or `Number Type`.

To define how the `byte_extract` keyword calculates the bytes it tests, you can choose from the arguments in the following table. If you do not select a byte-ordering argument, the rules engine uses big endian byte order.
The **byte_extract Keyword**

</tr>
<tr>
<td>DCE/RPC</td>
<td>Specifies a <code>byte_extract</code> keyword for traffic processed by the DCE/RPC preprocessor. The DCE/RPC preprocessor determines big endian or little endian byte order, and the <strong>Number Type</strong> and <strong>Endian</strong> arguments do not apply. When you enable this argument, you can also use <code>byte_extract</code> in conjunction with other specific DCE/RPC keywords.</td>
</tr>
</tbody>
</table>

You can specify a number type to read data as an ASCII string. To define how the system views string data in a packet, you can select one of the arguments in the following table.

### Table 138: Number Type byte_extract arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hexadecimal String</td>
<td>Reads extracted string data in hexadecimal format.</td>
</tr>
<tr>
<td>Decimal String</td>
<td>Reads extracted string data in decimal format.</td>
</tr>
<tr>
<td>Octal String</td>
<td>Reads extracted string data in octal format.</td>
</tr>
</tbody>
</table>

For example, if the value for `byte_extract` is specified as the following:

- Bytes to Extract = 4
- Variable Name = `var`
- Offset = 8
- Relative = enabled

the rules engine reads the number described in the four bytes that appear 9 bytes away from (relative to) the last successful content match into a variable named `var`, which you can specify later in the rule as the value for certain keyword arguments.

The following table lists the keyword arguments where you can specify a variable defined in the `byte_extract` keyword.

### Table 139: Arguments Accepting a byte_extract Variable

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Argument</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>Depth, Offset, Distance, Within</td>
</tr>
<tr>
<td>byte_jump</td>
<td>Offset</td>
</tr>
<tr>
<td>byte_test</td>
<td>Offset, Value</td>
</tr>
<tr>
<td>byte_math</td>
<td>RValue, Offset</td>
</tr>
</tbody>
</table>
The byte_math Keyword

The byte_math keyword performs a mathematical operation on an extracted value and a specified value or existing variable, and stores the outcome in a new resulting variable. You can then use the resulting variable as an argument in other keywords.

You can use multiple byte_math keywords in a rule to perform multiple byte_math operations.

The following table describes the arguments required by the byte_math keyword.

**Table 140: Required byte_math Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
</table>
| Bytes    | The number of bytes to calculate from the packet. If used without DCE/RPC, the allowed values are 1 to 10:  
  - Bytes can be 1 to 10 when the operator is +, -, *, or /.  
  - Bytes can be 1 to 4 when the operator is << or >>.  
  - If you specify a number of bytes other than 1, 2, or 4, you must specify a Number Type (hexadecimal, octal, or decimal.)  
  If used with DCE/RPC, allowed values are 1, 2, and 4. |
| Offset   | The number of bytes into the payload to start processing. The offset counter starts at byte 0, so calculate the offset value by subtracting 1 from the number of bytes you want to jump forward from the beginning of the packet payload or (if you specified Relative) from the last successful content match.  
  You can specify -65535 to 65535 bytes.  
  You can also specify the byte_extract variable here. |
| Operator | +, -, *, /, <<, or >> |
| RValue   | The value following the operator. This can be an unsigned integer or a variable passed from byte_extract. |
The name of the variable into which the result of the `byte_math` calculation will be stored. You can use this variable as an argument in other keywords. This value is stored as an unsigned integer.

This variable name:
- Must use alphanumeric characters
- Must not begin with a number
- May include special characters supported by the Microsoft filename/variable name convention
- Cannot consist entirely of special characters

You can specify only one of **DCE/RPC**, **Endian**, or **Number Type**.

If you want to define how the `byte_math` keyword calculates the bytes, you can choose from the arguments described in the following table. If you do not select a byte-ordering argument, the rules engine uses big endian byte order.

### Table 141: Additional Optional byte_math Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relative</td>
<td>Makes the offset relative to the last pattern found in the last successful</td>
</tr>
<tr>
<td></td>
<td>content match instead of the beginning of the payload.</td>
</tr>
<tr>
<td>Bitmask</td>
<td>Applies the specified hexadecimal bitmask using the AND operator to the</td>
</tr>
<tr>
<td></td>
<td>bytes extracted from the Bytes argument. A bitmask can be 1 to 4 bytes.</td>
</tr>
<tr>
<td></td>
<td>The result will be right-shifted by the number of bits equal to the number</td>
</tr>
<tr>
<td></td>
<td>of trailing zeros in the mask.</td>
</tr>
</tbody>
</table>

### Table 142: Byte-Ordering byte_math Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Big Endian</td>
<td>Processes data in big endian byte order, which is the default network byte</td>
</tr>
<tr>
<td></td>
<td>order.</td>
</tr>
<tr>
<td>Little Endian</td>
<td>Processes data in little endian byte order.</td>
</tr>
</tbody>
</table>

DCE/RPC specifies a `byte_math` keyword for traffic processed by the DCE/RPC preprocessor. The DCE/RPC preprocessor determines big endian or little endian byte order, and the **Number Type** and **Endian** arguments do not apply.

When you enable this argument, you can also use `byte_math` in conjunction with other specific DCE/RPC keywords.
Define how the system views string data in a packet by using one of the arguments in the following table.

**Table 143: Number Type Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hexadecimal String</td>
<td>Represents string data in hexadecimal format.</td>
</tr>
<tr>
<td>Decimal String</td>
<td>Represents string data in decimal format.</td>
</tr>
<tr>
<td>Octal String</td>
<td>Represents string data in octal format.</td>
</tr>
</tbody>
</table>

For example, if the values you set for `byte_math` are as follows:

- Bytes = 2
- Offset = 0
- Operator = *
- RValue = height
- Result Variable = area

the rules engine extracts the number described in the first two bytes in the packet and multiplies it by the RValue (which uses the existing variable, height) to create the new variable, area.

**Table 144: Arguments Accepting a byte_math Variable**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Argument</th>
</tr>
</thead>
<tbody>
<tr>
<td>byte_jump</td>
<td>Offset</td>
</tr>
<tr>
<td>byte_test</td>
<td>Offset, Value</td>
</tr>
<tr>
<td>byte_extract</td>
<td>Offset</td>
</tr>
<tr>
<td>isdataat</td>
<td>Offset</td>
</tr>
</tbody>
</table>

**Overview: The pcre Keyword**

The `pcre` keyword allows you to use Perl-compatible regular expressions (PCRE) to inspect packet payloads for specified content. You can use PCRE to avoid writing multiple rules to match slight variations of the same content.

Regular expressions are useful when searching for content that could be displayed in a variety of ways. The content may have different attributes that you want to account for in your attempt to locate it within a packet’s payload.

Note that the regular expression syntax used in intrusion rules is a subset of the full regular expression library and varies in some ways from the syntax used in commands in the full library. When adding a `pcre` keyword using the intrusion rules editor, enter the full value in the following format:

`!/pcre/ ismxAEGRBUIPHDCKSY`

where:
• ! is an optional negation (use this if you want to match patterns that do not match the regular expression).

• /pcre/ is a Perl-compatible regular expression.

• ismxAEGRBUIPHDMCKSY is any combination of modifier options.

Also note that you must escape the characters listed in the following table for the rules engine to interpret them correctly when you use them in a PCRE to search for specific content in a packet payload.

### Table 145: Escaped PCRE Characters

<table>
<thead>
<tr>
<th>You must escape...</th>
<th>with a backslash...</th>
<th>or Hex code...</th>
</tr>
</thead>
<tbody>
<tr>
<td># (hash mark)</td>
<td>\#</td>
<td>\x23</td>
</tr>
<tr>
<td>; (semicolon)</td>
<td>\;</td>
<td>\x3B</td>
</tr>
<tr>
<td></td>
<td>(vertical bar)</td>
<td>\</td>
</tr>
<tr>
<td>: (colon)</td>
<td>\:</td>
<td>\x3A</td>
</tr>
</tbody>
</table>

You can also use m?regex?, where ? is a delimiter other than /. You may want to use this in situations where you need to match a forward slash within a regular expression and do not want to escape it with a backslash. For example, you might use m?regex? ismxAEGRBUIPHDMCKSY where regex is your Perl-compatible regular expression and ismxAEGRBUIPHDMCKSY is any combination of modifier options.

---

**Tip**

Optionally, you can surround your Perl-compatible regular expression with quote characters, for example, pcre_expression or “pcre_expression”. The option of using quotes accommodates experienced users accustomed to previous versions when quotes were required instead of optional. The intrusion rules editor does not display quotation marks when you display a rule after saving it.

---

### pc re Syntax

The pc re keyword accepts standard Perl-compatible regular expression (PCRE) syntax. The following sections describe that syntax.

---

**Tip**

While this section describes the basic syntax you may use for PCRE, you may want to consult an online reference or book dedicated to Perl and PCRE for more advanced information.

---

#### Metacharacters

Metacharacters are literal characters that have special meaning within regular expressions. When you use them within a regular expression, you must “escape” them by preceding them with a backslash.

The following table describes the metacharacters you can use with PCRE and gives examples of each.
Table 146: PCRE Metacharacters

<table>
<thead>
<tr>
<th>Metacharacter</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>.</td>
<td>Matches any character except newline characters.</td>
<td>abc. matches abcd, abc1, abc#, and so on.</td>
</tr>
<tr>
<td>*</td>
<td>Matches zero or more occurrences of a character or expression.</td>
<td>abc* matches abc, abcc, abccc, abccccc, and so on.</td>
</tr>
<tr>
<td>?</td>
<td>Matches zero or one occurrence of a character or expression.</td>
<td>abc? matches abc.</td>
</tr>
<tr>
<td>+</td>
<td>Matches one or more occurrences of a character or expression.</td>
<td>abc+ matches abc, abcc, abccc, abccccc, and so on.</td>
</tr>
<tr>
<td>()</td>
<td>Groups expressions.</td>
<td>(abc) + matches abc, abcabc, abcabcabc and so on.</td>
</tr>
<tr>
<td>{}</td>
<td>Specifies a limit for the number of matches for a character or expression. If you want to set a lower and upper limit, separate the lower limit and upper limit with a comma.</td>
<td>a{4,6} matches aaaa, aaaaa, or aaaaaa. (ab){2} matches abab.</td>
</tr>
<tr>
<td>[]</td>
<td>Allows you to define character classes, and matches any character or combination of characters described in the set.</td>
<td>[abc123] matches a or b or c, and so on.</td>
</tr>
<tr>
<td>^</td>
<td>Matches content at the beginning of a string. Also used for negation, if used within a character class.</td>
<td>^in matches the “in” in info, but not in bin. [^a] matches anything that does not contain a.</td>
</tr>
<tr>
<td>$</td>
<td>Matches content at the end of a string.</td>
<td>ce$ matches the “ce” in announce, but not cent.</td>
</tr>
<tr>
<td></td>
<td>Indicates an OR expression.</td>
<td>(MAILTO</td>
</tr>
<tr>
<td>\</td>
<td>Allows you to use metacharacters as actual characters and is also used to specify a predefined character class.</td>
<td>. matches a period, * matches an asterisk, \ matches a backslash and so on. \d matches the numeric characters, \w matches alphanumeric characters, and so on.</td>
</tr>
</tbody>
</table>

Character Classes

Character classes include alphabetic characters, numeric characters, alphanumeric characters, and whitespace characters. While you can create your own character classes within brackets, you can use the predefined classes as shortcuts for different types of character types. When used without additional qualifiers, a character class matches a single digit or character.

The following table describes and provides examples of the predefined character classes accepted by PCRE.

Table 147: PCRE Character Classes

<table>
<thead>
<tr>
<th>Character Class</th>
<th>Description</th>
<th>Character Class Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>\d</td>
<td>Matches a numeric character (“digit”).</td>
<td>[0-9]</td>
</tr>
<tr>
<td>\D</td>
<td>Matches anything that is not an numeric character.</td>
<td>[^0-9]</td>
</tr>
</tbody>
</table>
Character Class | Description | Character Class Definition
--- | --- | ---
\w | Matches an alphanumeric character (“word”). | [a-zA-Z0-9_] 
\W | Matches anything that is not an alphanumeric character. | [^a-zA-Z0-9_] 
\s | Matches white space characters, including spaces, carriage returns, tabs, newlines, and form feeds. | [\r\t\n\f] 
\S | Matches anything that is not a white space character. | [^\r\t\n\f]

**pcre Modifier Options**

You can use modifying options after you specify regular expression syntax in the `pcre` keyword’s value. These modifiers perform Perl, PCRE, and Snort-specific processing functions. Modifiers always appear at the end of the PCRE value, and appear in the following format:

```
/pcre/ismxAEGRBUIPHDMCKSY
```

where `ismxAEGRBUIPHMC` can include any of the modifying options that appear in the following tables.

---

Tip

Optionally, you can surround the regular expression and any modifying options with quotes, for example, “/pcre/ismxAEGRBUIPHDMCKSY”. The option of using quotes accommodates experienced users accustomed to previous versions when quotes were required instead of optional. The intrusion rules editor does not display quotation marks when you display a rule after saving it.

The following table describes options you can use to perform Perl processing functions.

### Table 148: Perl-Related Post Regular Expression Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>Makes the regular expression case-insensitive.</td>
</tr>
<tr>
<td>s</td>
<td>The dot character (.) describes all characters except the newline or \n character. You can use “s” as an option to override this and have the dot character match all characters, including the newline character.</td>
</tr>
<tr>
<td>m</td>
<td>By default, a string is treated as a single line of characters, and ^ and $ match the beginning and ending of a specific string. When you use “m” as an option, ^ and $ match content immediately before or after any newline character in the buffer, as well as at the beginning or end of the buffer.</td>
</tr>
<tr>
<td>x</td>
<td>Ignores white space data characters that may appear within the pattern, except when escaped (preceded by a backslash) or included inside a character class.</td>
</tr>
</tbody>
</table>

The following table describes the PCRE modifiers you can use after the regular expression.
### Table 149: PCRE-Related Post Regular Expression Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>The pattern must match at the beginning of the string (same as using <code>^</code> in a regular expression).</td>
</tr>
<tr>
<td>E</td>
<td>Sets <code>$</code> to match only at the end of the subject string. (Without <code>e</code>, <code>$</code> also matches immediately before the final character if it is a newline, but not before any other newline characters).</td>
</tr>
<tr>
<td>G</td>
<td>By default, <code>*</code>, <code>+</code>, and <code>?</code> are “greedy,” which means that if two or more matches are found, they will choose the longest match. Use the <code>G</code> character to change this so that these characters always choose the first match unless followed by a question mark character (<code>?</code>). For example, <code>*?</code> <code>+?</code> and <code>??</code> would be greedy in a construct using the <code>G</code> modifier, and any incidences of <code>*</code>, <code>+</code>, or <code>?</code> without the additional question mark will not be greedy.</td>
</tr>
</tbody>
</table>

The following table describes the Snort-specific modifiers that you can use after the regular expression.

### Table 150: Snort-Specific Post Regular Expression Modifiers

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R</td>
<td>Searches for matching content relative to the end of the last match found by the rules engine.</td>
</tr>
<tr>
<td>B</td>
<td>Searches for the content within data before it is decoded by a preprocessor (this option is similar to using the <code>Raw Data</code> argument with the <code>content</code> or <code>protected_content</code> keyword).</td>
</tr>
<tr>
<td>U</td>
<td>Searches for the content within the URI of a normalized HTTP request message decoded by the HTTP Inspect preprocessor. Note that you cannot use this option in combination with the <code>content</code> or <code>protected_content</code> keyword <code>HTTP URI</code> option to search the same content. Note that a pipelined HTTP request packet contains multiple URIs. A PCRE expression that includes the U option causes the rules engine to search for a content match only in the first URI in a pipelined HTTP request packet. To search all URIs in the packet, use the <code>content</code> or <code>protected_content</code> keyword with <code>HTTP URI</code> selected, either with or without an accompanying PCRE expression that uses the U option.</td>
</tr>
<tr>
<td>I</td>
<td>Searches for the content within the URI of a raw HTTP request message decoded by the HTTP Inspect preprocessor. Note that you cannot use this option in combination with the <code>content</code> or <code>protected_content</code> keyword <code>HTTP Raw URI</code> option to search the same content.</td>
</tr>
<tr>
<td>P</td>
<td>Searches for the content within the body of a normalized HTTP request message decoded by the HTTP Inspect preprocessor.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>H</td>
<td>Searches for the content within the header, excluding cookies, of an HTTP request or response message decoded by the HTTP Inspect preprocessor. Note that you cannot use this option in combination with the <code>content</code> or <code>protected_content</code> keyword. <strong>HTTP Header</strong> option to search the same content.</td>
</tr>
<tr>
<td>D</td>
<td>Searches for the content within the header, excluding cookies, of a raw HTTP request or response message decoded by the HTTP Inspect preprocessor. Note that you cannot use this option in combination with the <code>content</code> or <code>protected_content</code> keyword. <strong>HTTP Raw Header</strong> option to search the same content.</td>
</tr>
<tr>
<td>M</td>
<td>Searches for the content within the method field of a normalized HTTP request message decoded by the HTTP Inspect preprocessor; the method field identifies the action such as GET, PUT, CONNECT, and so on to take on the resource identified in the URI.</td>
</tr>
</tbody>
</table>
| C      | When the HTTP Inspect preprocessor **Inspect HTTP Cookies** option is enabled, searches for the normalized content within any cookie in an HTTP request header, and also within any set-cookie in an HTTP response header when the preprocessor **Inspect HTTP Responses** option is enabled. When **Inspect HTTP Cookies** is not enabled, searches the entire header, including the cookie or set-cookie data.  
Note the following:  
• Cookies included in the message body are treated as body content.  
• You cannot use this option in combination with the `content` or `protected_content` keyword. **HTTP Cookie** option to search the same content.  
• The Cookie: and Set-Cookie: header names, leading spaces on the header line, and the CRLF that terminates the header line are inspected as part of the header and not as part of the cookie. |
| K      | When the HTTP Inspect preprocessor **Inspect HTTP Cookies** option is enabled, searches for the raw content within any cookie in an HTTP request header, and also within any set-cookie in an HTTP response header when the preprocessor **Inspect HTTP Responses** option is enabled. When **Inspect HTTP Cookies** is not enabled, searches the entire header, including the cookie or set-cookie data.  
Note the following:  
• Cookies included in the message body are treated as body content.  
• You cannot use this option in combination with the `content` or `protected_content` keyword. **HTTP Raw Cookie** option to search the same content.  
• The Cookie: and Set-Cookie: header names, leading spaces on the header line, and the CRLF that terminates the header line are inspected as part of the header and not as part of the cookie. |
| S      | Searches the 3-digit status code in an HTTP response. |
| Y      | Searches the textual description that accompanies the status code in an HTTP response. |
Do not use the U option in combination with the R option. This could cause performance problems. Also, do not use the U option in combination with any other HTTP content option (I, P, H, D, M, C, K, S, or Y).

**Note**

**Related Topics**

*Overview: HTTP content and protected_content Keyword Arguments*, on page 1397

**pcre Example Keyword Values**

The following examples show values that you could enter for pcre, with descriptions of what each example would match.

- `/feedback[^\d{0,1}]?\.cgi/U`

  This example searches packet payload for `feedback`, followed by zero or one numeric character, followed by `.cgi`, and located only in URI data.

  This example would match:
  - `feedback.cgi`
  - `feedback1.cgi`
  - `feedback2.cgi`
  - `feedback3.cgi`

  This example would **not** match:
  - `feedbacka.cgi`
  - `feedback11.cgi`
  - `feedback21.cgi`
  - `feedbackzb.cgi`

- `/^ez\w{3,5}\.cgi/iU`

  This example searches packet payload for `ez` at the beginning of a string, followed by a word of 3 to 5 letters, followed by `.cgi`. The search is case-insensitive and only searches URI data.

  This example would match:
  - `EZBoard.cgi`
  - `ezman.cgi`
  - `ezadmin.cgi`
  - `EZAdmin.cgi`

  This example would **not** match:
  - `ezez.cgi`
  - `fez.cgi`
This example searches packet payload for `mail`, followed by either `file` or `seek`, in URI data.

This example would match:
- `mailfile.cgi`
- `mailseek.cgi`

This example would **not** match:
- `MailFile.cgi`
- `mailfilefile.cgi`

This example searches packet payload for URI content for a tab or newline character in an HTTP request, after any number of characters. This example uses `m?regex?` to avoid using `http:\/\/` in the expression. Note that the colon is preceded by a backslash.

This example would match:
- `http://www.example.com?scriptvar=x&othervar=\n\n..\..
- `http://www.example.com?scriptvar=\t`

This example would **not** match:
- `ftp://ftp.example.com?scriptvar=&othervar=\n\n..\..
- `http://www.example.com?scriptvar=/bin/sh -i`

This example searches packet payload for a URL with any number of characters, including newlines, followed by an equal sign, and pipe characters that contain any number of characters or white space. This example uses `m?regex?` to avoid using `http:\/\/` in the expression.

This example would match:
- `http://www.example.com?value=/bin/sh/ -i`
- `http://www.example.com?input=cat /etc/passwd`

This example would **not** match:
- `http://www.example.com?value=x&input=?cat /etc/passwd`
- `/\[0-9a-f\]{2}\:\[0-9a-f\]{2}\:\[0-9a-f\]{2}\:\[0-9a-f\]{2}\:\[0-9a-f\]{2}\:\[0-9a-f\]{2}/i`
This example searches packet payload for any MAC address. Note that it escapes the colon characters with backslashes.

The metadata Keyword

You can use the `metadata` keyword to add your own descriptive information to a rule. You can also use the `metadata` keyword with `service` arguments to identify applications and ports in network traffic. You can use the information you add to organize or identify rules in ways that suit your needs, and you can search rules for information you add and for `service` arguments.

The system validates metadata based on the argument format:

```
key value
```

where `key` and `value` provide a combined description separated by a space. This is the format used by the Cisco Talos Security Intelligence and Research Group (Talos) for adding metadata to rules provided by Cisco.

Alternatively, you can also use the format:

```
key = value
```

For example, you could use the `key value` format to identify rules by author and date, using a category and sub-category as follows:

```
author SnortGuru_20050406
```

You can use multiple `metadata` keywords in a rule. You can also use commas to separate multiple `key value` arguments in a single `metadata` keyword, as seen in the following example:

```
author SnortGuru_20050406, revised_by SnortUser1_20050707,
revised_by SnortUser2_20061003,
revised_by SnortUser1_20070123
```

You are not limited to using a `key value` or `key=value` format; however, you should be aware of limitations resulting from validation based on these formats.

Restricted Characters to Avoid

Note the following character restrictions:

- Do not use a semicolon (;) or colon (:).
- The system interprets a comma as a separator for multiple `key value` or `key=value` arguments. For example:
  ```
  key value, key value, key value
  ```
- The system interprets the equal to (=) character or space character as separators between `key` and `value`. For example:
  ```
  key value
  key=value
  ```

All other characters are permitted.
Reserved Metadata to Avoid

Avoid using the following words in a metadata keyword, either as a single argument or as the key in a key value argument; these are reserved for use by Talos:

application
eengine
impact_flag
os
policy
rule-type
rule-flushing
soid

Note

Contact Support for assistance in adding restricted metadata to local rules that might not otherwise function as expected.

Impact Level 1

You can use the following reserved key value argument in a metadata keyword:

impact_flag red

This key value argument sets the impact flag to red (level 1) for a local rule you import or a custom rule you create using the intrusion rules editor.

Note that when Talos includes the impact_flag red argument in a rule provided by Cisco, Talos has determined that a packet triggering the rule indicates that the source or destination host is potentially compromised by a virus, trojan, or other piece of malicious software.

Guidelines for Importing Local Intrusion Rules, on page 147
The Intrusion Events Clipboard, on page 2113

Service Metadata

The system detects applications running on the hosts in your network and inserts application protocol information into your network traffic; it does this regardless of the configuration of your discovery policy. You can use metadata keyword service arguments in a TCP or UDP rule to match application protocols and ports in your network traffic. You can combine one or more service application arguments in a rule with a single port argument.

Service Applications

You can use the metadata keyword with service as the key and an application as the value to match packets with the identified application protocol. For example, the following key value argument in a metadata keyword associates the rule with HTTP traffic:

service http

You can identify multiple applications separated by commas. For example:

service http, service smtp, service ftp
Adaptive profiling must be enabled (its default state) as described in Configuring Adaptive Profiles, on page 1639 for intrusion rules to use service metadata.

The following table describes the most common application values used with the service keyword.

Contact Support for assistance if you have difficulty identifying applications not in the table.

**Table 151: service Values**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvs</td>
<td>Concurrent Versions System</td>
</tr>

Note the following:

- You must include a service application argument with the service and-ports argument.
- If a rule specifies more than one of the values in the table above, the system applies the last one that appears in the rule.
- Port and application arguments can be in any order.
Except for the `and-ports` value, you can include a `service` port argument with or without one or more `service` application arguments. For example:

```
service or-ports, service http, service smtp
```

### Applications and Ports in Traffic

The diagrams below illustrate the application and port combinations that intrusion rules support, and the results of applying these rule constraints to packet data.

#### Host application protocol else source/destination ports:

```
<table>
<thead>
<tr>
<th>Application metadata in rule?</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
</tr>
<tr>
<td>Yes</td>
</tr>
</tbody>
</table>

```

#### Host application protocol and source/destination ports:

```
<table>
<thead>
<tr>
<th>Application in packet?</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
</tr>
<tr>
<td>Yes</td>
</tr>
</tbody>
</table>

```

Apply rule if it matches application in traffic

Apply rule if it matches port in traffic

Do not apply rule
Host application protocol or source/destination ports:

Example Matches

The following sample rules using the `metadata` keyword with `service` arguments are shown with examples of data they match and do not match:

- `alert tcp any any -> any [80,8080] (metadata:service and-ports, service http, service smtp;)

<table>
<thead>
<tr>
<th>Example Matches</th>
<th>Example Non-Matches</th>
</tr>
</thead>
<tbody>
<tr>
<td>• HTTP traffic over TCP port 80</td>
<td>• POP3 traffic on ports 80 or 8080</td>
</tr>
<tr>
<td>• HTTP traffic over TCP port 8080</td>
<td>• Traffic of unknown application on ports 80 or 8080</td>
</tr>
<tr>
<td>• SMTP traffic over TCP port 80</td>
<td>• HTTP traffic on port 9999</td>
</tr>
<tr>
<td>• SMTP traffic over TCP port 8080</td>
<td></td>
</tr>
</tbody>
</table>

- `alert tcp any any -> any [80,8080] (metadata:service or-ports, service http;)

<table>
<thead>
<tr>
<th>Example Matches</th>
<th>Example Non-Matches</th>
</tr>
</thead>
<tbody>
<tr>
<td>• HTTP traffic on any port</td>
<td>• Non-HTTP and non-SMTP traffic on ports other than 80 or 8080</td>
</tr>
<tr>
<td>• SMTP traffic on port 80</td>
<td></td>
</tr>
<tr>
<td>• SMTP traffic on port 8080</td>
<td></td>
</tr>
<tr>
<td>• Traffic of unknown application on port 80 and 8080</td>
<td></td>
</tr>
</tbody>
</table>
• Any of the following rules:
  
  * alert tcp any any -> any [80,8080] metadata:service else-ports, service http;
  * alert tcp any any -> any [80,8080] metadata:service unknown, service http;
  * alert tcp any any -> any [80,8080] metadata:service http;

<table>
<thead>
<tr>
<th>Example Matches</th>
<th>Example Non-Matches</th>
</tr>
</thead>
<tbody>
<tr>
<td>• HTTP traffic on any port</td>
<td>• SMTP traffic on ports 80 or 8080</td>
</tr>
<tr>
<td>• port 80 if packet application is unknown</td>
<td>• POP3 traffic on ports 80 or 8080</td>
</tr>
<tr>
<td>• port 8080 if packet application is unknown</td>
<td></td>
</tr>
</tbody>
</table>

**Metadata Search Guidelines**

To search for rules that use the `metadata` keyword, select the `metadata` keyword on the rules Search page and, optionally, type any portion of the metadata. For example, you can type:

- **search** to display all rules where you have used **search** for **key**.
- **search http** to display all rules where you have used **search** for **key** and **http** for **value**.
- **author snortguru** to display all rules where you have used **author** for **key** and SnortGuru for **value**.
- **author s** to display all rules where you have used **author** for **key** and any terms such as SnortGuru or SnortUser1 or SnortUser2 for **value**.

**Tip**

When you search for both **key** and **value**, use the same connecting operator (equal to [-] or a space character) in searches that is used in the **key value** argument in the rule; searches return different results depending on whether you follow **key** with equal to (-) or a space character.

Note that regardless of the format you use to add metadata, the system interprets your metadata search term as all or part of a **key value** or **key-value** argument. For example, the following would be valid metadata that does not follow a **key value** or **key-value** format:

```
ab cd ef gh
```

However, the system would interpret each space in the example as a separator between a **key** and **value**. Thus, you could successfully locate a rule containing the example metadata using any of the following searches for juxtaposed and single terms:

```
  cd ef
  ef gh
  ef
  but you would not locate the rule using the following search, which the system would interpret as a single **key value** argument:
  
  ab ef

Searching for Rules, on page 1387

IP Header Values

You can use keywords to identify possible attacks or security policy violations in the IP headers of packets.

fragbits

The `fragbits` keyword inspects the fragment and reserved bits in the IP header. You can check each packet for the Reserved Bit, the More Fragments bit, and the Don't Fragment bit in any combination.

Table 153: Fragbits Argument Values

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R</td>
<td>Reserved bit</td>
</tr>
<tr>
<td>M</td>
<td>More Fragments bit</td>
</tr>
<tr>
<td>D</td>
<td>Don’t Fragment bit</td>
</tr>
</tbody>
</table>

To further refine a rule using the `fragbits` keyword, you can specify any operator described in the following table after the argument value in the rule.

Table 154: Fragbit Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plus sign (+)</td>
<td>The packet must match against all specified bits.</td>
</tr>
<tr>
<td>asterisk (*)</td>
<td>The packet can match against any of the specified bits.</td>
</tr>
<tr>
<td>exclamation point (!)</td>
<td>The packet meets the criteria if none of the specified bits are set.</td>
</tr>
</tbody>
</table>

For example, to generate an event against packets that have the Reserved Bit set (and possibly any other bits), use `R+` as the `fragbits` value.

id

The `id` keyword tests the IP header fragment identification field against the value you specify in the keyword’s argument. Some denial-of-service tools and scanners set this field to a specific number that is easy to detect. For example, in SID 630, which detects a Synscan portscan, the `id` value is set to 39426, the static value used as the ID number in packets transmitted by the scanner.

Note

id argument values must be numeric.

ipopts

The `IPopts` keyword allows you to search packets for specified IP header options. The following table lists the available argument values.
Table 15: IP option Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rr</td>
<td>record route</td>
</tr>
<tr>
<td>eol</td>
<td>end of list</td>
</tr>
<tr>
<td>nop</td>
<td>no operation</td>
</tr>
<tr>
<td>ts</td>
<td>time stamp</td>
</tr>
<tr>
<td>sec</td>
<td>IP security option</td>
</tr>
<tr>
<td>lsrr</td>
<td>loose source routing</td>
</tr>
<tr>
<td>ssrr</td>
<td>strict source routing</td>
</tr>
<tr>
<td>satid</td>
<td>stream identifier</td>
</tr>
</tbody>
</table>

Analysts most frequently watch for strict and loose source routing because these options may be an indication of a spoofed source IP address.

**ip_proto**

The `ip_proto` keyword allows you to identify packets with the IP protocol specified as the keyword’s value. You can specify the IP protocols as a number, 0 through 255. You can combine these numbers with the following operators: `<`, `>`, or `!`. For example, to inspect traffic with any protocol that is not ICMP, use `!1` as a value to the `ip_proto` keyword. You can also use the `ip_proto` keyword multiple times in a single rule; note, however, that the rules engine interprets multiple instances of the keyword as having a Boolean AND relationship. For example, if you create a rule containing `ip_proto:!3; ip_proto:!6`, the rule ignores traffic using the GGP protocol AND the TCP protocol.

**tos**

Some networks use the type of service (ToS) value to set precedence for packets traveling on that network. The `tos` keyword allows you to test the packet’s IP header ToS value against the value you specify as the keyword’s argument. Rules using the `tos` keyword will trigger on packets whose ToS is set to the specified value and that meet the rest of the criteria set forth in the rule.

---

**Note**

Argument values for `tos` must be numeric.

The ToS field has been deprecated in the IP header protocol and replaced with the Differentiated Services Code Point (DSCP) field.

**ttl**

A packet’s time-to-live (ttl) value indicates how many hops it can make before it is dropped. You can use the `ttl` keyword to test the packet’s IP header ttl value against the value, or range of values, you specify as the keyword’s argument. It may be helpful to set the `ttl` keyword parameter to a low value such as 0 or 1, as low time-to-live values are sometimes indicative of a traceroute or intrusion evasion attempt. (Note, though, that
the appropriate value for this keyword depends on your managed device placement and network topology.)

Use syntax as follows:

• Use an integer from 0 to 255 to set a specific value for the TTL value. You can also precede the value
  with an equal (=) sign (for example, you can specify 5 or =5).

• Use a hyphen (-) to specify a range of TTL values (for example, 0-2 specifies all values 0 through 2,
  -5 specifies all values 0 through 5, and 5- specifies all values 5 through 255).

• Use the greater than (>) sign to specify TTL values greater than a specific value (for example, >3 specifies
  all values greater than 3).

• Use the greater than and equal to signs (>=) to specify TTL values greater than or equal to a specific
  value (for example, >=3 specifies all values greater than or equal to 3).

• Use the less than (<) sign to specify TTL values less than a specific value (for example, <3 specifies all
  values less than 3).

• Use the less than and equal to signs (<=) to specify TTL values less than or equal to a specific value (for
  example, <=3 specifies all values less than or equal to 3).

ICMP Header Values

The Firepower System supports keywords that you can use to identify attacks and security policy violations
in the headers of ICMP packets. Note, however, that predefined rules exist that detect most ICMP types and
codes. Consider enabling an existing rule or creating a local rule based on an existing rule; you may be able
to find a rule that meets your needs more quickly than if you build an ICMP rule from scratch.

icm_id and icmp_seq

The ICMP identification and sequence numbers help associate ICMP replies with ICMP requests. In normal
traffic, these values are dynamically assigned to packets. Some covert channel and Distributed Denial of
Server (DDoS) programs use static ICMP ID and sequence values. The following keywords allow you to
identify ICMP packets with static values.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Definition</th>
</tr>
</thead>
</table>
| icmp_id  | Inspects an ICMP echo request or reply packet's ICMP ID number. Use a numeric
           value that corresponds with the ICMP ID number as the argument for the icmp_id
           keyword.                                                   |
| icmp_seq | The icmp_seq keyword inspects an ICMP echo request or reply packet's ICMP
           sequence. Use a numeric value that corresponds with the ICMP sequence number as
           the argument for the icmp_seq keyword.                     |

itype

Use the itype keyword to look for packets with specific ICMP message type values. You can specify either
a valid ICMP type value or an invalid ICMP type value to test for different types of traffic. For example,
attackers may set ICMP type values out of range to cause denial of service and flooding attacks.

You can specify a range for the itype argument value using less than (<) and greater than (>).

For example:
TCP Header Values and Stream Size

The Firepower System supports keywords that are designed to identify attacks attempted using TCP headers of packets and TCP stream size.

ack

You can use the `ack` keyword to compare a value against a packet’s TCP acknowledgment number. The rule triggers if a packet’s TCP acknowledgment number matches the value specified for the `ack` keyword.

Argument values for `ack` must be numeric.

flags

You can use the `flags` keyword to specify any combination of TCP flags that, when set in an inspected packet, cause the rule to trigger.

Note

In situations where you would traditionally use `A+` as the value for `flags`, you should instead use the `flow` keyword with a value of `established`. Generally, you should use the `flow` keyword with a value of `stateless` when using flags to ensure that all combinations of flags are detected.

You can either check for or ignore the values described in the following table for the `flag` keyword.
Table 156: flag Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>TCP Flag</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ack</td>
<td>Acknowledges data.</td>
</tr>
<tr>
<td>Psh</td>
<td>Data should be sent in this packet.</td>
</tr>
<tr>
<td>Syn</td>
<td>A new connection.</td>
</tr>
<tr>
<td>Urg</td>
<td>Packet contains urgent data.</td>
</tr>
<tr>
<td>Fin</td>
<td>A closed connection.</td>
</tr>
<tr>
<td>Rst</td>
<td>An aborted connection.</td>
</tr>
<tr>
<td>CWR</td>
<td>An ECN congestion window has been reduced. This was formerly the R1 argument, which is still supported for backward compatibility.</td>
</tr>
<tr>
<td>ECE</td>
<td>ECN echo. This was formerly the R2 argument, which is still supported for backward compatibility.</td>
</tr>
</tbody>
</table>

When using the flags keyword, you can use an operator to indicate how the system performs matches against multiple flags. The following table describes these operators.

Table 157: Operators Used with flags

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>The packet must contain all specified flags.</td>
<td>Select Urg and all to specify that a packet must contain the Urgent flag and may contain any other flags.</td>
</tr>
<tr>
<td>any</td>
<td>The packet can contain any of the specified flags.</td>
<td>Select Ack, Psh, and any to specify that either or both the Ack and Psh flags must be set to trigger the rule, and that other flags may also be set on a packet.</td>
</tr>
<tr>
<td>not</td>
<td>The packet must not contain the specified flag set.</td>
<td>Select Urg and not to specify that the Urgent flag is not set on packets that trigger this rule.</td>
</tr>
</tbody>
</table>

flow

You can use the flow keyword to select packets for inspection by a rule based on session characteristics. The flow keyword allows you to specify the direction of the traffic flow to which a rule applies, applying rules to either the client flow or server flow. To specify how the flow keyword inspects your packets, you can set the direction of traffic you want analyzed, the state of packets inspected, and whether the packets are part of a rebuilt stream.

Stateful inspection of packets occurs when rules are processed. If you want a TCP rule to ignore stateless traffic (traffic without an established session context), you must add the flow keyword to the rule and select the Established argument for the keyword. If you want a UDP rule to ignore stateless traffic, you must add the flow keyword to the rule and select either the Established argument or a directional argument, or both. This causes the TCP or UDP rule to perform stateful inspection of a packet.
When you add a directional argument, the rules engine inspects only those packets that have an established state with a flow that matches the direction specified. For example, if you add the `flow` keyword with the `established` argument and the `From Client` argument to a rule that triggers when a TCP or UDP connection is detected, the rules engine only inspects packets that are sent from the client.

---

**Tip**

For maximum performance, always include a `flow` keyword in a TCP rule or a UDP session rule.

The following table describes the stream-related arguments you can specify for the `flow` keyword:

**Table 158: State-Related flow Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Established</td>
<td>Triggers on established connections.</td>
</tr>
<tr>
<td>Stateless</td>
<td>Triggers regardless of the state of the stream processor.</td>
</tr>
</tbody>
</table>

The following table describes the directional options you can specify for the `flow` keyword:

**Table 159: flow Directional Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To Client</td>
<td>Triggers on server responses.</td>
</tr>
<tr>
<td>To Server</td>
<td>Triggers on client responses.</td>
</tr>
<tr>
<td>From Client</td>
<td>Triggers on client responses.</td>
</tr>
<tr>
<td>From Server</td>
<td>Triggers on server responses.</td>
</tr>
</tbody>
</table>

Notice that `From Server` and `To Client` perform the same function, as do `To Server` and `From Client`. These options exist to add context and readability to the rule. For example, if you create a rule designed to detect an attack from a server to a client, use `From Server`. But, if you create a rule designed to detect an attack from the client to the server, use `From Client`.

The following table describes the stream-related arguments you can specify for the `flow` keyword:

**Table 160: Stream-Related flow Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore Stream Traffic</td>
<td>Does not trigger on rebuilt stream packets.</td>
</tr>
<tr>
<td>Only Stream Traffic</td>
<td>Triggers only on rebuilt stream packets.</td>
</tr>
</tbody>
</table>

For example, you can use `To Server, Established, Only Stream Traffic` as the value for the `flow` keyword to detect traffic, traveling from a client to the server in an established session, that has been reassembled by the stream preprocessor.
**seq**

The seq keyword allows you to specify a static sequence number value. Packets whose sequence number matches the specified argument trigger the rule containing the keyword. While this keyword is used rarely, it is helpful in identifying attacks and network scans that use generated packets with static sequence numbers.

**window**

You can use the window keyword to specify the TCP window size you are interested in. A rule containing this keyword triggers whenever it encounters a packet with the specified TCP window size. While this keyword is used rarely, it is helpful in identifying attacks and network scans that use generated packets with static TCP window sizes.

**stream_size**

You can use the stream_size keyword in conjunction with the stream preprocessor to determine the size in bytes of a TCP stream, using the format:

```
direction, operator, bytes
```

where bytes is number of bytes. You must separate each option in the argument with a comma (,).

The following table describes the case-insensitive directional options you can specify for the stream_size keyword:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client</td>
<td>triggers on a stream from the client matching the specified stream size.</td>
</tr>
<tr>
<td>server</td>
<td>triggers on a stream from the server matching the specified stream size.</td>
</tr>
</tbody>
</table>
| both     | triggers on traffic from the client and traffic from the server both matching the specified stream size. 

For example, the argument `both, >, 200` would trigger when traffic from the client is greater than 200 bytes AND traffic from the server is greater than 200 bytes.

| either     | triggers on traffic from either the client or the server matching the specified stream size, whichever occurs first. 

For example, the argument `either, >, 200` would trigger when traffic from the client is greater than 200 bytes OR traffic from the server is greater than 200 bytes.

The following table describes the operators you can use with the stream_size keyword:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>=</td>
<td>equal to</td>
</tr>
<tr>
<td>!=</td>
<td>not equal to</td>
</tr>
<tr>
<td>&gt;</td>
<td>greater than</td>
</tr>
<tr>
<td>Operator</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>----------------------</td>
</tr>
<tr>
<td>&lt;</td>
<td>less than</td>
</tr>
<tr>
<td>&gt;=</td>
<td>greater than or equal to</td>
</tr>
<tr>
<td>&lt;=</td>
<td>less than or equal to</td>
</tr>
</tbody>
</table>

For example, you could use `client, >=, 5001216` as the argument for the `stream_size` keyword to detect a TCP stream traveling from a client to a server and greater than or equal to 5001216 bytes.

### The stream_reassembly Keyword

You can use the `stream_reassemble` keyword to enable or disable TCP stream reassembly for a single connection when inspected traffic on the connection matches the conditions of the rule. Optionally, you can use this keyword multiple times in a rule.

Use the following syntax to enable or disable stream reassembly:

```
enable|disable, server|client|both, option, option
```

The following table describes the optional arguments you can use with the `stream_reassemble` keyword.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>noalert</td>
<td>Generate no events regardless of any other detection options specified in the rule.</td>
</tr>
<tr>
<td>fastpath</td>
<td>Ignore the rest of the connection traffic when there is a match.</td>
</tr>
</tbody>
</table>

For example, the following rule disables TCP client-side stream reassembly without generating an event on the connection where a 200 OK status code is detected in an HTTP response:

```
alert tcp any 80 -> any any (flow:to_client, established; content: "200 OK"; stream_reassemble:disable, client, noalert)
```

### SSL Keywords

You can use SSL rule keywords to invoke the Secure Sockets Layer (SSL) preprocessor and extract information about SSL version and session state from packets in an encrypted session.

When a client and server communicate to establish an encrypted session using SSL or Transport Layer Security (TLS), they exchange handshake messages. Although the data transmitted in the session is encrypted, the handshake messages are not.

The SSL preprocessor extracts state and version information from specific handshake fields. Two fields within the handshake indicate the version of SSL or TLS used to encrypt the session and the stage of the handshake.

#### ssl_state

The `ssl_state` keyword can be used to match against state information for an encrypted session. To check for two or more SSL versions used simultaneously, use multiple `ssl_version` keywords in a rule.
When a rule uses the `ssl_state` keyword, the rules engine invokes the SSL preprocessor to check traffic for SSL state information.

For example, to detect an attacker’s attempt to cause a buffer overflow on a server by sending a `ClientHello` message with an overly long challenge length and too much data, you could use the `ssl_state` keyword with `client_hello` as an argument then check for abnormally large packets.

Use a comma-separated list to specify multiple arguments for the SSL state. When you list multiple arguments, the system evaluates them using the OR operator. For example, if you specify `client_hello` and `server_hello` as arguments, the system evaluates the rule against traffic that has a `client_hello` OR a `server_hello`.

You can also negate any argument; for example:

```plaintext
!client_hello, !unknown
```

To ensure the connection has reached each of a set of states, multiple rules using the `ssl_state` rule option should be used. The `ssl_state` keyword takes the following identifiers as arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_hello</td>
<td>Matches against a handshake message with <code>ClientHello</code> as the message type, where the client requests an encrypted session.</td>
</tr>
<tr>
<td>server_hello</td>
<td>Matches against a handshake message with <code>ServerHello</code> as the message type, where the server responds to the client’s request for an encrypted session.</td>
</tr>
<tr>
<td>client_keyx</td>
<td>Matches against a handshake message with <code>ClientKeyExchange</code> as the message type, where the client transmits a key to the server to confirm receipt of a key from the server.</td>
</tr>
<tr>
<td>server_keyx</td>
<td>Matches against a handshake message with <code>ServerKeyExchange</code> as the message type, where the client transmits a key to the server to confirm receipt of a key from the server.</td>
</tr>
<tr>
<td>unknown</td>
<td>Matches against any handshake message type.</td>
</tr>
</tbody>
</table>

**ssl_version**

The `ssl_version` keyword can be used to match against version information for an encrypted session. When a rule uses the `ssl_version` keyword, the rules engine invokes the SSL preprocessor to check traffic for SSL version information.

For example, if you know there is a buffer overflow vulnerability in SSL version 2, you could use the `ssl_version` keyword with the `sslv2` argument to identify traffic using that version of SSL.

Use a comma-separated list to specify multiple arguments for the SSL version. When you list multiple arguments, the system evaluates them using the OR operator. For example, if you wanted to identify any encrypted traffic that was not using SSLv2, you could add `ssl_version:sslv3,tlsv1.0,tlsv1.1,tlsv1.2` to a rule. The rule would evaluate any traffic using SSL Version 3, TLS Version 1.0, TLS Version 1.1, or TLS Version 1.2.

The `ssl_version` keyword takes the following SSL/TLS version identifiers as arguments:
### Table 165: ssl_version Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>sslv2</td>
<td>Matches against traffic encoded using Secure Sockets Layer (SSL) Version 2.</td>
</tr>
<tr>
<td>sslv3</td>
<td>Matches against traffic encoded using Secure Sockets Layer (SSL) Version 3.</td>
</tr>
<tr>
<td>tls1.0</td>
<td>Matches against traffic encoded using Transport Layer Security (TLS) Version 1.0.</td>
</tr>
<tr>
<td>tls1.2</td>
<td>Matches against traffic encoded using Transport Layer Security (TLS) Version 1.2.</td>
</tr>
</tbody>
</table>

### The appid Keyword

You can use the `appid` keyword to identify the application protocol, client application, or web application in a packet. For example, you could target a specific application that you know is susceptible to a specific vulnerability.

Within the `appid` keyword of an intrusion rule, click `Configure AppID` to select one or more applications that you want to detect.

#### Browsing the Available Applications

When you first start to build the condition, the `Available Applications` list is unconstrained and displays every application the system detects, 100 per page:

- To page through the applications, click the arrows underneath the list.
- To display a pop-up window with summary information about the application’s characteristics, as well as Internet search links that you can follow, click the information icon (ℹ️) next to an application.

#### Using Application Filters

To help you find the applications you want to match, you can constrain the `Available Applications` list in the following ways:

- To search for applications, click the `Search by name` prompt above the list, then type a name. The list updates as you type to display matching applications.
- To constrain the applications by applying a filter, use the `Application Filters` list. The `Available Applications` list updates as you apply filters. For your convenience, the system uses an unlock icon (🔓) to mark applications that the system can identify only in decrypted traffic—not encrypted or unencrypted.

---

**Note**

If you select one or more filters in the Application Filters list and also search the `Available Applications` list, your selections and the search-filtered `Available Applications` list are combined using an AND operation.
Selecting Applications

To select a single application, select it and click **Add to Rule**. To select all applications in the current constrained view, right-click and select **Select All**.

Application Layer Protocol Values

Although preprocessors perform most of the normalization and inspection of application layer protocol values, you can continue to inspect application layer values using various preprocessor options.

The RPC Keyword

The `rpc` keyword identifies Open Network Computing Remote Procedure Call (ONC RPC) services in TCP or UDP packets. This allows you to detect attempts to identify the RPC programs on a host. Intruders can use an RPC portmapper to determine if any of the RPC services running on your network can be exploited. They can also attempt to access other ports running RPC without using portmapper. The following table lists the arguments that the `rpc` keyword accepts.

**Table 166: rpc Keyword Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application</td>
<td>The RPC application number</td>
</tr>
<tr>
<td>procedure</td>
<td>The RPC procedure invoked</td>
</tr>
<tr>
<td>version</td>
<td>The RPC version</td>
</tr>
</tbody>
</table>

To specify the arguments for the `rpc` keyword, use the following syntax:

```
application,procedure,version
```

where application is the RPC application number, procedure is the RPC procedure number, and version is the RPC version number. You must specify all arguments for the `rpc` keyword — if you are not able to specify one of the arguments, replace it with an asterisk (`*`).

For example, to search for RPC portmapper (which is the RPC application indicated by the number 100000), with any procedure or version, use `100000,*,*` as the arguments.

The ASN.1 Keyword

The `asn1` keyword allows you to decode a packet or a portion of a packet, looking for various malicious encodings.

The following table describes the arguments for the `asn1` keyword.

**Table 167: asn.1 Keyword Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bitstring Overflow</td>
<td>Detects invalid, remotely exploitable bitstring encodings.</td>
</tr>
<tr>
<td>Double Overflow</td>
<td>Detects a double ASCII encoding that is larger than a standard buffer. This is known to be an exploitable function in Microsoft Windows, but it is unknown at this time which services may be exploitable.</td>
</tr>
</tbody>
</table>
### Argument | Description
--- | ---
Oversize Length | Detects ASN.1 type lengths greater than the supplied argument. For example, if you set the Oversize Length to 500, any ASN.1 type greater than 500 triggers the rule.
Absolute Offset | Sets an absolute offset from the beginning of the packet payload. (Remember that the offset counter starts at byte 0.) For example, if you want to decode SNMP packets, set Absolute Offset to 0 and do not set a Relative Offset. Absolute Offset may be positive or negative.
Relative Offset | This is the relative offset from the last successful content match, `pcre`, or `byte_jump`. To decode an ASN.1 sequence right after the content "foo", set Relative Offset to 0, and do not set an Absolute Offset. Relative Offset may be positive or negative. (Remember that the offset counter starts at 0.)

For example, there is a known vulnerability in the Microsoft ASN.1 Library that creates a buffer overflow, allowing an attacker to exploit the condition with a specially crafted authentication packet. When the system decodes the asn.1 data, exploit code in the packet could execute on the host with system-level privileges or could cause a DoS condition. The following rule uses the `asn1` keyword to detect attempts to exploit this vulnerability:

```
alert tcp $EXTERNAL_NET any -> $HOME_NET 445
(flow:to_server, established; content:"|FF|SMB|73|"; nocase; offset:4; depth:5;
asn1:bitstring_overflow,double_overflow,oversize_length 100,
relative_offset 54;)
```

The above rule generates an event against TCP traffic traveling from any IP address defined in the $EXTERNAL_NET variable, from any port, to any IP address defined in the $HOME_NET variable using port 445. In addition, it only executes the rule on established TCP connections to servers. The rule then tests for specific content in specific locations. Finally, the rule uses the `asn1` keyword to detect bitstring encodings and double ASCII encodings and to identify asn.1 type lengths over 100 bytes in length starting 55 bytes from the end of the last successful content match. (Remember that the offset counter starts at byte 0.)

### The `urilen` Keyword

You can use the `urilen` keyword in conjunction with the HTTP Inspect preprocessor to inspect HTTP traffic for URIs of a specific length, less than a maximum length, greater than a minimum length, or within a specified range.

After the HTTP Inspect preprocessor normalizes and inspects the packet, the rules engine evaluates the packet against the rule and determines whether the URI matches the length condition specified by the `urilen` keyword. You can use this keyword to detect exploits that attempt to take advantage of URI length vulnerabilities, for example, by creating a buffer overflow that allows the attacker to cause a DoS condition or execute code on the host with system-level privileges.

Note the following when using the `urilen` keyword in a rule:

- In practice, you always use the `urilen` keyword in combination with the `flow:established` keyword and one or more other keywords.
- The rule protocol is always TCP.
- Target ports are always HTTP ports.

You specify the URI length using a decimal number of bytes, less than (<) and greater than (>).
For example:

- specify 5 to detect a URI 5 bytes long.
- specify < 5 (separated by one space character) to detect a URI less than 5 bytes long.
- specify > 5 (separated by one space character) to detect a URI greater than 5 bytes long.
- specify 3 < 5 (with one space character before and after <>) to detect a URI between 3 and 5 bytes long inclusive.

For example, there is a known vulnerability in Novell’s server monitoring and diagnostics utility iMonitor version 2.4, which comes with eDirectory version 8.8. A packet containing an excessively long URI creates a buffer overflow, allowing an attacker to exploit the condition with a specially crafted packet that could execute on the host with system-level privileges or could cause a DoS condition. The following rule uses the urilen keyword to detect attempts to exploit this vulnerability:

```
alert tcp $EXTERNAL_NET any -> $HOME_NET $HTTP_PORTS
(msg:"EXPLOIT eDirectory 8.8 Long URI iMonitor buffer
overflow attempt"; flow:to_server,established;
urilen:> 8192; uricontent:"/nds/"; nocase;
class:attempted-admin; sid:x; rev:1;)
```

The above rule generates an event against TCP traffic traveling from any IP address defined in the $EXTERNAL_NET variable, from any port, to any IP address defined in the $HOME_NET variable using the ports defined in the $HTTP_PORTS variable. In addition, packets are evaluated against the rule only on established TCP connections to servers. The rule uses the urilen keyword to detect any URI over 8192 bytes in length. Finally, the rule searches the URI for the specific case-insensitive content `/nds/`.

### DCE/RPC Keywords

The three DCE/RPC keywords described in the following table allow you to monitor DCE/RPC session traffic for exploits. When the system processes rules with these keywords, it invokes the DCE/RPC preprocessor.

#### Table 168: DCE/RPC Keywords

<table>
<thead>
<tr>
<th>Use...</th>
<th>In this way...</th>
<th>To detect...</th>
</tr>
</thead>
<tbody>
<tr>
<td>dce_iface</td>
<td>alone</td>
<td>packets identifying a specific DCE/RPC service</td>
</tr>
<tr>
<td>dce_opnum</td>
<td>preceded by dce_iface</td>
<td>packets identifying specific DCE/RPC service</td>
</tr>
<tr>
<td></td>
<td></td>
<td>operations</td>
</tr>
<tr>
<td>dce_stub_data</td>
<td>preceded by dce_iface + dce_opnum</td>
<td>stub data defining a specific operation request or response</td>
</tr>
</tbody>
</table>

Note in the table that you should always precede `dce_opnum` with `dce_iface`, and you should always precede `dce_stub_data` with `dce_iface + dce_opnum`. 
You can also use these DCE/RPC keywords in combination with other rule keywords. Note that for DCE/RPC rules, you use the byte_jump, byte_test, and byte_extract keywords with their DCE/RPC arguments selected.

Cisco recommends that you include at least one content keyword in rules that include DCE/RPC keywords to ensure that the rules engine uses the fast pattern matcher, which increases processing speed and improves performance. Note that the rules engine uses the fast pattern matcher when a rule includes at least one content keyword, regardless of whether you enable the content keyword Use Fast Pattern Matcher argument.

You can use the DCE/RPC version and adjoining header information as the matching content in the following cases:

- the rule does not include another content keyword
- the rule contains another content keyword, but the DCE/RPC version and adjoining information represent a more unique pattern than the other content

For example, the DCE/RPC version and adjoining information are more likely to be unique than a single byte of content.

You should end qualifying rules with one of the following version and adjoining information content matches:

- For connection-oriented DCE/RPC rules, use the content |05 00 00| (for major version 05, minor version 00, and the request PDU (protocol data unit) type 00).
- For connectionless DCE/RPC rules, use the content |04 00| (for version 04, and the request PDU type 00).

In either case, position the content keyword for version and adjoining information as the last keyword in the rule to invoke the fast pattern matcher without repeating processing already completed by the DCE/RPC preprocessor. Note that placing the content keyword at the end of the rule applies to version content used as a device to invoke the fast pattern matcher, and not necessarily to other content matches in the rule.

**dce_iface**

You can use the dce_iface keyword to identify a specific DCE/RPC service.

Optionally, you can also use dce_iface in combination with the dce_opnum and dce_stub_data keywords to further limit the DCE/RPC traffic to inspect.

A fixed, sixteen-byte Universally Unique Identifier (UUID) identifies the application interface assigned to each DCE/RPC service. For example, the UUID 4b324fc8-670-01d3-1278-5a47bf6ee188 identifies the DCE/RPC lanmanserver service, also known as the srvsvc service, which provides numerous management functions for sharing peer-to-peer printers, files, and SMB named pipes. The DCE/RPC preprocessor uses the UUID and associated header values to track DCE/RPC sessions.

The interface UUID is comprised of five hexadecimal strings separated by hyphens:

<4hexbytes>-<2hexbytes>-<2hexbytes>-<2hexbytes>-<6hexbytes>
You specify the interface by entering the entire UUID including hyphens, as seen in the following UUID for the netlogon interface:

\[12345678-1234-abcd-ef00-01234567cffb\]

Note that you must specify the first three strings in the UUID in big endian byte order. Although published interface listings and protocol analyzers typically display UUIDs in the correct byte order, you might encounter a need to rearrange the UUID byte order before entering it. Consider the following messenger service UUID shown as it might sometimes be displayed in raw ASCII text with the first three strings in little endian byte order:

\[f8\ 91\ 7b\ 5a\ 00\ ff\ d0\ 11\ a9\ b2\ 00\ c0\ 4f\ b6\ e6\ fc\]

You would specify the same UUID for the `dce iface` keyword by inserting hyphens and putting the first three strings in big endian byte order as follows:

\[5a7b91f8-ff00-11d0-a9b2-00c04fb6e6fc\]

Although a DCE/RPC session can include requests to multiple interfaces, you should include only one `dce iface` keyword in a rule. Create additional rules to detect additional interfaces.

DCE/RPC application interfaces also have interface version numbers. You can optionally specify an interface version with an operator indicating that the version equals, does not equal, is less than, or greater than the specified value.

Both connection-oriented and connectionless DCE/RPC can be fragmented in addition to any TCP segmentation or IP fragmentation. Typically, it is not useful to associate any DCE/RPC fragment other than the first with the specified interface, and doing so may result in a large number of false positives. However, for flexibility you can optionally evaluate all fragments against the specified interface.

The following table summarizes the `dce iface` keyword arguments.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface UUID</td>
<td>The UUID, including hyphens, that identifies the application interface of the specific service that you want to detect in DCE/RPC traffic. Any request associated with the specified interface would match the interface UUID.</td>
</tr>
<tr>
<td>Version</td>
<td>Optionally, the application interface version number 0 to 65535 and an operator indicating whether to detect a version greater than (&gt;), less than (&lt;), equal to (=), or not equal to (!) the specified value.</td>
</tr>
<tr>
<td>All Fragments</td>
<td>Optionally, enable to match against the interface in all associated DCE/RPC fragments and, if specified, on the interface version. This argument is disabled by default, indicating that the keyword matches only if the first fragment or the entire unfragmented packet is associated with the specified interface. Note that enabling this argument may result in false positives.</td>
</tr>
</tbody>
</table>

The `dce_opnum` Keyword

You can use the `dce_opnum` keyword in conjunction with the DCE/RPC preprocessor to detect packets that identify one or more specific operations that a DCE/RPC service provides.
Client function calls request specific service functions, which are referred to in DCE/RPC specifications as operations. An operation number (opnum) identifies a specific operation in the DCE/RPC header. It is likely that an exploit would target a specific operation.

For example, the UUID 12345678-1234-abcd-ef00-01234567cffb identifies the interface for the netlogon service, which provides several dozen different operations. One of these is operation 6, the NetrServerPasswordSet operation.

You should precede a dce_opnum keyword with a dce_iface keyword to identify the service for the operation. You can specify a single decimal value 0 to 65535 for a specific operation, a range of operations separated by a hyphen, or a comma-separated list of operations and ranges in any order.

Any of the following examples would specify valid netlogon operation numbers:

15
15-18
15, 18-20
15, 20-22, 17
15, 18-20, 22, 24-26

The dce_stub_data Keyword

You can use the dce_stub_data keyword in conjunction with the DCE/RPC preprocessor to specify that the rules engine should start inspection at the beginning of the stub data, regardless of any other rule options. Packet payload rule options that follow the dce_stub_data keyword are applied relative to the stub data buffer.

DCE/RPC stub data provides the interface between a client procedure call and the DCE/RPC run-time system, the mechanism that provides the routines and services central to DCE/RPC. DCE/RPC exploits are identified in the stub data portion of the DCE/RPC packet. Because stub data is associated with a specific operation or function call, you should always precede dce_stub_data with dce_iface and dce_opnum to identify the related service and operation.

The dce_stub_data keyword has no arguments.

SIP Keywords

Four SIP keywords allow you to monitor SIP session traffic for exploits. Note that the SIP protocol is vulnerable to denial of service (DoS) attacks. Rules addressing these attacks can benefit from rate-based attack prevention.

The sip_header Keyword

You can use the sip_header keyword to start inspection at the beginning of the extracted SIP request or response header and restrict inspection to header fields.

The sip_header keyword has no arguments.

The following example rule fragment points to the SIP header and matches the CSeq header field:

alert udp any any -> any 5060 ( sip_header; content:"CSeq"; )

Related Topics

- Dynamic Intrusion Rule States, on page 1339
- Rate-Based Attack Prevention, on page 1626
The *sip_body* Keyword

You can use the `sip_body` keyword to start inspection at the beginning of the extracted SIP request or response message body and restrict inspection to the message body.

The `sip_body` keyword has no arguments.

The following example rule fragment points to the SIP message body and matches a specific IP address in the `c` (connection information) field in extracted SDP data:

```plaintext
alert udp any any -> any 5060 { sip_body; content:"c=IN 192.168.12.14"; }
```

Note that rules are not limited to searching for SDP content. The SIP preprocessor extracts the entire message body and makes it available to the rules engine.

The *sip_method* Keyword

A *method* field in each SIP request identifies the purpose of the request. You can use the `sip_method` keyword to test SIP requests for specific methods. Separate multiple methods with commas.

You can specify any of the following currently defined SIP methods:

- `ack`
- `bnotify`
- `bye`
- `cancel`
- `do`
- `info`
- `invite`
- `join`
- `message`
- `notify`
- `options`
- `prack`
- `publish`
- `quath`
- `refer`
- `register`
- `service`
- `sprack`
- `subscribe`
- `unsubscribe`
- `update`

Methods are case-insensitive. You can separate multiple methods with commas.

Because new SIP methods might be defined in the future, you can also specify a custom method, that is, a method that is not a currently defined SIP method. Accepted field values are defined in RFC 2616, which allows all characters except control characters and separators such as `-`, `{`, and `}`. See RFC 2616 for the complete list of excluded separators. When the system encounters a specified custom method in traffic, it will inspect the packet header but not the message.

The system supports up to 32 methods, including the 21 currently defined methods and an additional 11 methods. The system ignores any undefined methods that you might configure. Note that the 32 total methods includes methods specified using the **Methods to Check** SIP preprocessor option.

You can specify only one method when you use negation. For example:

```plaintext
!invite
```

Note, however, that multiple `sip_method` keywords in a rule are linked with an **AND** operation. For example, to test for all extracted methods except `invite` and `cancel`, you would use two negated `sip_method` keywords:

```plaintext
sip_method: !invite
sip_method: !cancel
```

Cisco recommends that you include at least one `content` keyword in rules that include the `sip_method` keyword to ensure that the rules engine uses the fast pattern matcher, which increases processing speed and improves performance. Note that the rules engine uses the fast pattern matcher when a rule includes at least one `content` keyword, regardless of whether you enable the `content` keyword **Use Fast Pattern Matcher** argument.

**Related Topics**

The **sip_stat_code Keyword**

A three-digit status code in each SIP response indicates the outcome of the requested action. You can use the `sip_stat_code` keyword to test SIP responses for specific status codes.

You can specify a one-digit response-type number 1-9, a specific three-digit number 100-999, or a comma-separated list of any combination of either. A list matches if any single number in the list matches the code in the SIP response.

The following table describes the SIP status code values you can specify.

**Table 170: sip_stat_code Values**

<table>
<thead>
<tr>
<th>To detect...</th>
<th>Specify...</th>
<th>For example...</th>
<th>Detects...</th>
</tr>
</thead>
<tbody>
<tr>
<td>a specific status code</td>
<td>the three-digit status code</td>
<td>189</td>
<td>189</td>
</tr>
<tr>
<td>any three-digit code that begins with a</td>
<td>the single digit</td>
<td>1</td>
<td>1xx; that is, 100, 101, 102, and so on</td>
</tr>
<tr>
<td>specified single digit</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>a list of values</td>
<td>any comma-separated</td>
<td>222, 3</td>
<td>222 plus 300, 301, 302, and so on</td>
</tr>
<tr>
<td></td>
<td>combination of specific codes</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>and single digits</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note also that the rules engine does not use the fast pattern matcher to search for the value specify using the `sip_stat_code` keyword, regardless of whether your rule includes a `content` keyword.

**GTP Keywords**

Three GSRP Tunneling Protocol (GTP) keywords allow you to inspect the GTP command channel for GTP version, message type, and information elements. You cannot use GTP keywords in combination with other intrusion rule keywords such as `content` or `byte_jump`. You **must** use the `gtp_version` keyword in each rule that uses the `gtp_info` or `gtp_type` keyword.

**The gtp_version Keyword**

You can use the `gtp_version` keyword to inspect GTP control messages for GTP version 0, 1, or 2.

Because different GTP versions define different message types and information elements, you must use `gtp_version` when you use the `gtp_type` or `gtp_info` keyword. You can specify the value 0, 1, or 2.

**The gtp_type Keyword**

Each GTP message is identified by a message type, which is comprised of both a numeric value and a string. You can use the `gtp_type` keyword to inspect traffic for specific GTP message types. Because different GTP versions define different message types and information elements, you must also use `gtp_version` when you use the `gtp_type` or `gtp_info` keyword.

You can specify a defined decimal value for a message type, a defined string, or a comma-separated list of either or both in any combination, as seen in the following example:

```
10, 11, echo_request
```

The system uses an OR operation to match each value or string that you list. The order in which you list values and strings does not matter. Any single value or string in the list matches the keyword. You receive an error if you attempt to save a rule that includes an unrecognized string or an out-of-range value.
Note in the table that different GTP versions sometimes use different values for the same message type. For example, the `sgsn_context_request` message type has a value of 50 in GTPv0 and GTPv1, but a value of 130 in GTPv2.

The `gtp_type` keyword matches different values depending on the version number in the packet. In the example above, the keyword matches the message type value 50 in a GTPv0 or GTPv1 packet and the value 130 in a GTPv2 packet. The keyword does not match a packet when the message type value in the packet is not a known value for the version specified in the packet.

If you specify an integer for the message type, the keyword matches if the message type in the keyword matches the value in the GTP packet, regardless of the version specified in the packet.

The following table lists the defined values and strings recognized by the system for each GTP message type.

**Table 171: GTP Message Types**

The `gtp_info` Keyword

A GTP message can include multiple information elements, each of which is identified by both a defined numeric value and a defined string. You can use the `gtp_info` keyword to start inspection at the beginning of a specified information element, and restrict inspection to the specified information element. Because different GTP versions define different message types and information elements, you must also use `gtp_version` when you use this keyword.
You can specify either the defined decimal value or the defined string for an information element. You can specify a single value or string, and you can use multiple `gtp_info` keywords in a rule to inspect multiple information elements.

When a message includes multiple information elements of the same type, all are inspected for a match. When information elements occur in an invalid order, only the last instance is inspected.

Note that different GTP versions sometimes use different values for the same information element. For example, the `cause` information element has a value of 1 in GTPv0 and GTPv1, but a value of 2 in GTPv2.

The `gtp_info` keyword matches different values depending on the version number in the packet. In the example above, the keyword matches the information element value 1 in a GTPv0 or GTPv1 packet and the value 2 in a GTPv2 packet. The keyword does not match a packet when the information element value in the packet is not a known value for the version specified in the packet.

If you specify an integer for the information element, the keyword matches if the message type in the keyword matches the value in the GTP packet, regardless of the version specified in the packet.

The following table lists the values and strings recognized by the system for each GTP information element.

### Table 172: GTP Information Elements

### SCADA Keywords

The rules engine uses Modbus and DNP3 rules to access certain protocol fields.

### Modbus Keywords

You can use Modbus keywords alone or in combination with other keywords such as `content` and `byte_jump`.

**modbus_data**

You can use the `modbus_data` keyword to point to the beginning of the Data field in a Modbus request or response.

**modbus_func**

You can use the `modbus_func` keyword to match against the Function Code field in a Modbus application layer request or response header. You can specify either a single defined decimal value or a single defined string for a Modbus function code.

The following table lists the defined values and strings recognized by the system for Modbus function codes.

#### Table 173: Modbus Function Codes

<table>
<thead>
<tr>
<th>Value</th>
<th>String</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>read_coils</code></td>
</tr>
<tr>
<td>2</td>
<td><code>read_discrete_inputs</code></td>

<td><code>write_multiple_coils</code></td>
</tr>
</tbody>
</table>
modbus_unit
You can use the `modbus_unit` keyword to match a single decimal value against the Unit ID field in a Modbus request or response header.

DNP3 Keywords
You can use DNP3 keywords alone or in combination with other keywords such as `content` and `byte_jump`.

dnp3_data
You can use the `dnp3_data` keyword to point to the beginning of reassembled DNP3 application layer fragments. The DNP3 preprocessor reassembles link layer frames into application layer fragments. The `dnp3_data` keyword points to the beginning of each application layer fragment; other rule options can match against the reassembled data within fragments without separating the data and adding checksums every 16 bytes.

dnp3_func
You can use the `dnp3_func` keyword to match against the Function Code field in a DNP3 application layer request or response header. You can specify either a single defined decimal value or a single defined string for a DNP3 function code.

The following table lists the defined values and strings recognized by the system for DNP3 function codes.

<table>
<thead>
<tr>
<th>Value</th>

</tbody>
</table>
You can use the `dnp3_ind` keyword to match against flags in the Internal Indications field in a DNP3 application layer response header.

You can specify the string for a single known flag or a comma-separated list of flags, as seen in the following example:

```
class_1_events, class_2_events
```

When you specify multiple flags, the keyword matches against any flag in the list. To detect a combination of flags, use the `dnp3_ind` keyword multiple times in a rule.

The following list provides the string syntax recognized by the system for defined DNP3 internal indications flags.

```
class_1_events
class_2_events
class_3_events
need_time
local_control
device_trouble
device_restart
no_func_code_support
object_unknown
parameter_error
event_buffer_overflow
already_executing
config_corrupt
reserved_2
reserved_1
```

You can use the `dnp3_obj` keyword to match against DNP3 object headers in a request or response.

DNP3 data is comprised of a series of DNP3 objects of different types such as analog input, binary input, and so on. Each type is identified with a `group` such as analog input group, binary input group, and so on, each of which can be identified by a decimal value. The objects in each group are further identified by an `object variation` such as 16-bit integers, 32-bit integers, short floating point, and so on, each of which specifies the data format of the object. Each type of object variation can also be identified by a decimal value.

You identify object headers by specifying the decimal number for the type of object header group and the decimal number for the type of object variation. The combination of the two defines a specific type of DNP3 object.
Packet Characteristics

You can write rules that only generate events against packets with specific packet characteristics.

**dsize**

The `dsize` keyword tests the packet payload size. With it, you can use the greater than and less than operators (`>` and `<`) to specify a range of values. You can use the following syntax to specify ranges:

```
>number_of_bytes
<number_of_bytes
number_of_bytes<>number_of_bytes
```

For example, to indicate a packet size greater than 400 bytes, use `>400` as the `dtype` value. To indicate a packet size of less than 500 bytes, use `<500`. To specify that the rule trigger against any packet between 400 and 500 bytes inclusive, use `400<>500`.

**Caution**

The `dsize` keyword tests packets before they are decoded by any preprocessors.

**isdataat**

The `isdataat` keyword instructs the rules engine to verify that data resides at a specific location in the payload.

The following table lists the arguments you can use with the `isdataat` keyword.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Offset</td>
<td>Required</td>
<td>The specific location in the payload. For example, to test that data appears at byte 50 in the packet payload, you would specify <code>50</code> as the offset value. A <code>!</code> modifier negates the results of the <code>isdataat</code> test; it alerts if a certain amount of data is not present within the payload. You can also use an existing <code>byte_extract</code> variable or <code>byte_math</code> result to specify the value for this argument.</td>
</tr>
<tr>
<td>Relative</td>
<td>Optional</td>
<td>Makes the location relative to the last successful content match. If you specify a relative location, note that the counter starts at byte 0, so calculate the location by subtracting 1 from the number of bytes you want to move forward from the last successful content match. For example, to specify that the data must appear at the ninth byte after the last successful content match, you would specify a relative offset of 8.</td>
</tr>
<tr>
<td>Raw Data</td>
<td>Optional</td>
<td>Specifies that the data is located in the original packet payload before decoding or application layer normalization by any Firepower System preprocessor. You can use this argument with <code>Relative</code> if the previous content match was in the raw packet data.</td>
</tr>
</tbody>
</table>

For example, in a rule searching for the content `foo`, if the value for `isdataat` is specified as the following:

- Offset = `!10`
- Relative = `enabled`

The system alerts if the rules engine does not detect 10 bytes after `foo` before the payload ends.
**sameip**

The `sameip` keyword tests that a packet’s source and destination IP addresses are the same. It does not take an argument.

**fragoffset**

The `fragoffset` keyword tests the offset of a fragmented packet. This is useful because some exploits (such as WinNuke denial-of-service attacks) use hand-generated packet fragments that have specific offsets.

For example, to test whether the offset of a fragmented packet is 31337 bytes, specify 31337 as the `fragoffset` value.

You can use the following operators when specifying arguments for the `fragoffset` keyword.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>!</code></td>
<td>not</td>
</tr>
<tr>
<td><code>&gt;</code></td>
<td>greater than</td>
</tr>
<tr>
<td><code>&lt;</code></td>
<td>less than</td>
</tr>
</tbody>
</table>

Note that you cannot use the `not (!)` operator in combination with `<` or `>`.  

**cvs**

The `cvs` keyword tests Concurrent Versions System (CVS) traffic for malformed CVS entries. An attacker can use a malformed entry to force a heap overflow and execute malicious code on the CVS server. This keyword can be used to identify attacks against two known CVS vulnerabilities: CVE-2004-0396 (CVS 1.11.x up to 1.11.15, and 1.12.x up to 1.12.7) and CVE-2004-0414 (CVS 1.12.x through 1.12.8, and 1.11.x through 1.11.16). The `cvs` keyword checks for a well-formed entry, and generates alerts when a malformed entry is detected.

Your rule should include the ports where CVS runs. In addition, any ports where traffic may occur should be added to the list of ports for stream reassembly in your TCP policies so state can be maintained for CVS sessions. The TCP ports 2401 (`pserver`) and 514 (`rsh`) are included in the list of client ports where stream reassembly occurs. However, note that if your server runs as an `xinetd` server (i.e., `pserver`), it can run on any TCP port. Add any non-standard ports to the stream reassembly **Client Ports** list.

**Related Topics**

- TCP Stream Preprocessing Options, on page 1606

---

**Active Response Keywords**

The system can initiate active responses to close TCP connections in response to triggered TCP rules or UDP sessions in response to triggered UDP rules. Two keywords provide you with separate approaches to initiating active responses. When a packet triggers a rule containing either of the keywords, the system initiates a single active response. You can also use the `config response` command to configure an active response interface and the number of TCP resets to attempt in a passive deployment.
Active responses are most effective in inline deployments because resets are more likely to arrive in time to affect the connection or session. For example, in response to the `react` keyword in an inline deployment, the system inserts a TCP reset (RST) packet directly into the traffic for each end of the connection, which normally should close the connection.

Active responses are not intended to take the place of a firewall for a number of reasons, including that the system cannot insert packets in passive deployments and an attacker may have chosen to ignore or circumvent active responses.

Because active responses can be routed back, the system does not allow TCP resets to initiate TCP resets; this prevents an unending sequence of active responses. The system also does not allow ICMP unreachable packets to initiate ICMP unreachable packets in keeping with standard practice.

You can configure the TCP stream preprocessor to detect additional traffic on a connection or session after an intrusion rule has triggered an active response. When the preprocessor detects additional traffic, it sends additional active responses up to a specified maximum to both ends of the connection or session.

**Related Topics**

*Active Responses with Intrusion Drop Rules*, on page 1584

---

### The `resp` Keyword

You can use the `resp` keyword to actively respond to TCP connections or UDP sessions, depending on whether you specify the TCP or UDP protocol in the rule header.

Keyword arguments allow you to specify the packet direction and whether to use TCP reset (RST) packets or ICMP unreachable packets as active responses.

You can use any of the TCP reset or ICMP unreachable arguments to close TCP connections. You should use only ICMP unreachable arguments to close UDP sessions.

Different TCP reset arguments also allow you to target active responses to the packet source, destination, or both. All ICMP unreachable arguments target the packet source and allow you to specify whether to use an ICMP network, host, or port unreachable packet, or all three.

The following table lists the arguments you can use with the `resp` keyword to specify exactly what you want the Firepower System to do when the rule triggers.

---

**Table 177: `resp` Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>reset_source</code></td>
<td>Directs a TCP reset packet to the endpoint that sent the packet that triggered the rule. Alternatively, you can specify <code>rst_snd</code>, which is supported for backward compatibility.</td>
</tr>
<tr>
<td><code>reset_dest</code></td>
<td>Directs a TCP reset packet to the intended destination endpoint of the packet that triggered the rule. Alternatively, you can specify <code>rst_rcv</code>, which is supported for backward compatibility.</td>
</tr>
<tr>
<td><code>reset_both</code></td>
<td>Directs a TCP reset packet to both the sending and receiving endpoints. Alternatively, you can specify <code>rst_all</code>, which is supported for backward compatibility.</td>
</tr>
<tr>
<td><code>icmp_net</code></td>
<td>Directs an ICMP network unreachable message to the sender.</td>
</tr>
<tr>
<td><code>icmp_host</code></td>
<td>Directs an ICMP host unreachable message to the sender.</td>
</tr>
<tr>
<td><code>icmp_port</code></td>
<td>Directs an ICMP port unreachable message to the sender. This argument is used to terminate UDP traffic.</td>
</tr>
<tr>
<td>Argument</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>icmp_all</td>
<td>Directs the following ICMP messages to the sender:</td>
</tr>
<tr>
<td></td>
<td>• network unreachable</td>
</tr>
<tr>
<td></td>
<td>• host unreachable</td>
</tr>
<tr>
<td></td>
<td>• port unreachable</td>
</tr>
</tbody>
</table>

For example, to configure a rule to reset both sides of a connection when a rule is triggered, use `reset_both` as the value for the `resp` keyword.

You can use a comma-separated list to specify multiple arguments as follows:

```
argument,argument,argument
```

You can use the `config response` command to configure the active response interface to use and the number of TCP resets to attempt in a passive deployment.

**Related Topics**

- [The config response Command](#), on page 1465

## The react Keyword

You can use the `react` keyword to send a default HTML page to the TCP connection client when a packet triggers the rule; after sending the HTML page, the system uses TCP reset packets to initiate active responses to both ends of the connection. The `react` keyword does not trigger active responses for UDP traffic.

Optionally, you can specify the following argument:

```
msg
```

When a packet triggers a `react` rule that uses the `msg` argument, the HTML page includes the rule event message.

If you do not specify the `msg` argument, the HTML page includes the following message:

```
You are attempting to access a forbidden site.
Consult your system administrator for details.
```

**Note**

Because active responses can be routed back, ensure that the HTML response page does not trigger a `react` rule; this could result in an unending sequence of active responses. Cisco recommends that you test `react` rules extensively before activating them in a production environment.

You can use the `config response` command to configure the active response interface to use and the number of TCP resets to attempt in a passive deployment.

**Related Topics**

- [Rule Anatomy](#), on page 1370
- [The config response Command](#), on page 1465
The config response Command

You can use the **config response** command to further configure the behavior of TCP resets initiated by `resp` and `react` rules. This command also affects the behavior of active responses initiated by drop rules.

You use the **config response** command by inserting it on a separate line in the USER_CONF advanced variable.

Insert a form of the **config response** command on a separate line in the USER_CONF advanced variable as follows:

- To specify only the number of active response attempts, insert the command:
  
  ```
  config response: attempts att
  ```
  
  For example: `config response: attempts 10`

- To specify only the active response interface, insert the command:
  
  ```
  config response: device dev
  ```
  
  For example: `config response: device eth0`

- To specify both the number of active response attempts and the active response interface, insert the command:

  ```
  config response: attempts att, device dev
  ```

  where:

  - `att` is the number 1 to 20 of attempts to land each TCP reset packet within the current connection window so the receiving host accepts the packet. This sequence *strafing* is useful only in passive deployments; in inline deployments, the system inserts reset packets directly into the stream in place of triggering packets. The system sends only 1 ICMP reachable active response.

  - `dev` is an alternate interface where you want the system to send active responses in a passive deployment or insert active responses in an inline deployment.

  For example: `config response: attempts 10, device eth0`

---

**Caution**

Do not use the **USER_CONF** advanced variable to configure an intrusion policy feature unless you are instructed to do so in the feature description or by Support. Conflicting or duplicate configurations will halt the system.

---

**Related Topics**

- [Active Responses with Intrusion Drop Rules](#), on page 1584
- [Advanced Variables](#), on page 361

---

The detection_filter Keyword

You can use the **detection_filter** keyword to prevent a rule from generating events unless a specified number of packets trigger the rule within a specified time. This can stop the rule from prematurely generating events. For example, two or three failed login attempts within a few seconds could be expected behavior, but a large number of attempts within the same time could indicate a brute force attack.
The `detection_filter` keyword requires arguments that define whether the system tracks the source or destination IP address, the number of times the detection criteria must be met before triggering an event, and how long to continue the count.

Use the following syntax to delay the triggering of events:

```
track by_src/by_dst, count count, seconds number_of_seconds
```

The `track` argument specifies whether to use the packet’s source or destination IP address when counting the number of packets that meet the rule’s detection criteria. Select from the argument values described in the following table to specify how the system tracks event instances.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>by_src</td>
<td>Detection criteria count by source IP address.</td>
</tr>
<tr>
<td>by_dst</td>
<td>Detection criteria count by destination IP address.</td>
</tr>
</tbody>
</table>

The `count` argument specifies the number of packets that must trigger the rule for the specified IP address within the specified time before the rule generates an event.

The `seconds` argument specifies the number of seconds within which the specified number of packets must trigger the rule before the rule generates an event.

Consider the case of a rule that searches packets for the content `foo` and uses the `detection_filter` keyword with the following arguments:

```
track by_src, count 10, seconds 20
```

In the example, the rule will not generate an event until it has detected `foo` in 10 packets within 20 seconds from a given source IP address. If the system detects only 7 packets containing `foo` within the first 20 seconds, no event is generated. However, if `foo` occurs 40 times in the first 20 seconds, the rule generates 30 events and the count begins again when 20 seconds have elapsed.

### Comparing the threshold and detection_filter Keywords

The `detection_filter` keyword replaces the deprecated `threshold` keyword. The `threshold` keyword is still supported for backward compatibility and operates the same as thresholds that you set within an intrusion policy.

The `detection_filter` keyword is a detection feature that is applied before a packet triggers a rule. The rule does not generate an event for triggering packets detected before the specified packet count and, in an inline deployment, does not drop those packets if the rule is set to drop packets. Conversely, the rule does generate events for packets that trigger the rule and occur after the specified packet count and, in an inline deployment, drops those packets if the rule is set to drop packets.

Thresholding is an event notification feature that does not result in a detection action. It is applied after a packet triggers an event. In an inline deployment, a rule that is set to drop packets drops all packets that trigger the rule, independent of the rule threshold.

Note that you can use the `detection_filter` keyword in any combination with the intrusion event thresholding, intrusion event suppression, and rate-based attack prevention features in an intrusion policy. Note also that policy validation fails if you enable an imported local rule that uses the deprecated `threshold` keyword in combination with the intrusion event thresholding feature in an intrusion policy.
The tag Keyword

Use the tag keyword to tell the system to log additional traffic for the host or session. Use the following syntax when specifying the type and amount of traffic you want to capture using the tag keyword:

```
tagging_type, count, metric, optional_direction
```

The next three tables describe the other available arguments.

You can choose from two types of tagging. The following table describes the two types of tagging. Note that the session tag argument type causes the system to log packets from the same session as if they came from different sessions if you configure only rule header options in the intrusion rule. To group packets from the same session together, configure one or more rule options (such as a flag keyword or content keyword) within the same intrusion rule.

**Table 179: Tag Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>Logs packets in the session that triggered the rule.</td>
</tr>
<tr>
<td>host</td>
<td>Logs packets from the host that sent the packet that triggered the rule. You can add a directional modifier to log only the traffic coming from the host (src) or going to the host (dst).</td>
</tr>
</tbody>
</table>

To indicate how much traffic you want to log, use the following argument:

**Table 180: Count Argument**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>The number of packets or seconds you want to log after the rule triggers. This unit of measure is specified with the metric argument, which follows the count argument.</td>
</tr>
</tbody>
</table>

Select the metric you want to use to log by time or volume of traffic from those described in the following table.

---

**Caution**

High-bandwidth networks can see thousands of packets per second, and tagging a large number of packets may seriously affect performance, so make sure you tune this setting for your network environment.
### Table 181: Logging Metrics Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>packets</td>
<td>Logs the number of packets specified by the count after the rule triggers.</td>
</tr>
<tr>
<td>seconds</td>
<td>Logs traffic for the number of seconds specified by the count after the rule triggers.</td>
</tr>
</tbody>
</table>

For example, when a rule with the following `tag` keyword value triggers:

```
host, 30, seconds, dst
```

all packets that are transmitted from the client to the host for the next 30 seconds are logged.

## The `flowbits` Keyword

Use the `flowbits` keyword to assign state names to sessions. By analyzing subsequent packets in a session according to the previously named state, the system can detect and alert on exploits that span multiple packets in a single session.

The `flowbits` state name is a user-defined label assigned to packets in a specific part of a session. You can label packets with state names based on packet content to help distinguish malicious packets from those you do not want to alert on. You can define up to 1024 state names per managed device. For example, if you want to alert on malicious packets that you know only occur after a successful login, you can use the `flowbits` keyword to filter out the packets that constitute an initial login attempt so you can focus only on the malicious packets.

You can do this by first creating a rule that labels all packets in the session that have an established login with a `logged_in` state, then creating a second rule where `flowbits` checks for packets with the state you set in the first rule and acts only on those packets.

An optional `group name` allows you to include a state name in a group of states. A state name can belong to several groups. States not associated with a group are not mutually exclusive, so a rule that triggers and sets a state that is not associated with a group does not affect other currently set states.

### flowbits Keyword Options

The following table describes the various combinations of operators, states, and groups available to the `flowbits` keyword. Note that state names can contain alphanumeric characters, periods (.), underscores (_), and dashes (-).

### Table 182: flowbits Options

<table>
<thead>
<tr>
<th>Operator</th>
<th>State Option</th>
<th>Group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>set</td>
<td>state_name</td>
<td>optional</td>
<td>Sets the specified state for a packet. Sets the state in the specified group if a group is defined.</td>
</tr>
<tr>
<td>set</td>
<td>state_name&amp;state_name</td>
<td>optional</td>
<td>Sets the specified states for a packet. Sets the states in the specified group if a group is defined.</td>
</tr>
<tr>
<td>setx</td>
<td>state_name</td>
<td>mandatory</td>
<td>Sets the specified state in the specified group for a packet, and unsets all other states in the group.</td>
</tr>
<tr>
<td>setx</td>
<td>state_name&amp;state_name</td>
<td>mandatory</td>
<td>Sets the specified states in the specified group for a packet, and unsets all other states in the group.</td>
</tr>
<tr>
<td>Operator</td>
<td>State Option</td>

**Guidelines for Using the flowbits Keyword**

Note the following when using the `flowbits` keyword:
• When using the `setx` operator, the specified state can only belong to the specified group, and not to any other group.

• You can define the `setx` operator multiple times, specifying different states and the same group with each instance.

• When you use the `setx` operator and specify a group, you cannot use the `set`, `toggle`, or `unset` operators on that specified group.

• The `isset` and `isnotset` operators evaluate for the specified state regardless of whether the state is in a group.

• During intrusion policy saves, intrusion policy reappplies, and access control policy applies (regardless of whether the access control policy references one intrusion policy or multiple intrusion policies), if you enable a rule that contains the `isset` or `isnotset` operator without a specified group, and you do not enable at least one rule that affects `flowbits assignment` (`set`, `setx`, `unset`, `toggle`) for the corresponding state name and protocol, all rules that affect `flowbits assignment` for the corresponding state name are enabled.

• During intrusion policy saves, intrusion policy reappplies, and access control policy applies (regardless of whether the access control policy references one intrusion policy or multiple intrusion policies), if you enable a rule that contains the `isset` or `isnotset` operator with a specified group, all rules that affect `flowbits assignment` (`set`, `setx`, `unset`, `toggle`) and define a corresponding group name are also enabled.

flowbits Keyword Examples

This section provides three examples that use the `flowbits` keyword.

flowbits Keyword Example: A Configuration Using `state_name`

This is an example of a flowbits configuration using `state_name`.

Consider the IMAP vulnerability described in Bugtraq ID #1110. This vulnerability exists in an implementation of IMAP, specifically in the LIST, LSUB, RENAME, FIND, and COPY commands. However, to take advantage of the vulnerability, the attacker must be logged into the IMAP server. Because the LOGIN confirmation from the IMAP server and the exploit that follows are necessarily in different packets, it is difficult to construct non-flow-based rules that catch this exploit. Using the `flowbits` keyword, you can cflowbitonstruct a series of rules that track whether the user is logged into the IMAP server and, if so, generate an event if one of the attacks is detected. If the user is not logged in, the attack cannot exploit the vulnerability and no event is generated.

The two rule fragments that follow illustrate this example. The first rule fragment looks for an IMAP login confirmation from the IMAP server:

```plaintext
alert tcp any 143 -> any any (msg:"IMAP login"; content:"OK LOGIN"; flowbits:set,logged_in; flowbits:noalert;)
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:
Note that `flowbits:set` sets a state of `logged_in`, while `flowbits:noalert` suppresses the alert because you are likely to see many innocuous login sessions on an IMAP server.

The next rule fragment looks for a `LIST` string, but does not generate an event unless the `logged_in` state has been set as a result of some previous packet in the session:

```plaintext
alert tcp any any -> any 143 (msg:"IMAP LIST";
content:"LIST"; flowbits:isset,logged_in;)
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:
In this case, if a previous packet has caused a rule containing the first fragment to trigger, then a rule containing the second fragment triggers and generates an event.

**Flowbits Keyword Example: A Configuration Resulting in False Positive Events**

Including different state names that are set in different rules in a group can prevent false positive events that might otherwise occur when content in a subsequent packet matches a rule whose state is no longer valid. The following example illustrates how you can get false positives when you do not include multiple state names in a group.

Consider the case where the following three rule fragments trigger in the order shown during a single session:

```plaintext
{msg:"JPEG transfer";
 content:"image/"pcre:="/^Content-Type\x3a\s*|\s*\r?\n\s+image\x2fp?jpe?g/smi";
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:
The `content` and `pcre` keywords in the first rule fragment match a JPEG file download, `flowbits:set,http.jpeg` sets the `http.jpeg` flowbits state, and `flowbits:noalert` stops the rule from generating events. No event is generated because the rule’s purpose is to detect the file download and set the `flowbits` state so one or more companion rules can test for the state name in combination with malicious content and generate events when malicious content is detected.

The next rule fragment detects a GIF file download subsequent to the JPEG file download above:

```
(msg:"GIF transfer"; content:"image/";
pcre:="/\Content-\?Type\x3a\"image\x2fgif\";/s?flowbits: set,http.jpg , image_downloads; flowbits: noalert;)
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:

The `content` and `pcre` keywords in the second rule fragment match the GIF file download, `flowbits:set,http.jpg` sets the `http.jpg` flowbit state, and `flowbits:noalert` stops the rule from generating an event. Note that the `http.jpeg` state set by the first rule fragment is still set even though it is no longer needed; this is because the JPEG download must have ended if a subsequent GIF download has been detected.

The third rule fragment is a companion to the first rule fragment:

```
(msg:"JPEG exploit"; ?flowbits:isset,http.jpeg;content:value; pcre:="/\xFF\x{E1}\x{E2}\x{ED}\x{FE}\x{00}\x{00}\x{00}\x{01}\"/;
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:

In the third rule fragment, `flowbits:isset,http.jpeg` determines that the now-irrelevant `http.jpeg` state is set, and `content` and `pcre` match content that would be malicious in a JPEG file but not in a GIF file. The third rule fragment results in a false positive event for a nonexistent exploit in a JPEG file.
flowbits Keyword Example: A Configuration for Preventing False Positive Events

The following example illustrates how including state names in a group and using the `setx` operator can prevent false positives.

Consider the same case as the previous example, except that the first two rules now include their two different state names in the same state group.

```plaintext
(msg: "JPEG transfer";
 content: "image/";
pcre: "/^Content-\s*\s*\r\n\s*image\x2fp?jpe?g/smi";
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:

When the first rule fragment detects a JPEG file download, the `flowbits: setx, http.jpeg, image_downloads` keyword sets the `flowbits` state to `http.jpeg` and includes the state in the `image_downloads` group.

The next rule then detects a subsequent GIF file download:

```plaintext
(msg: "GIF transfer"; content: "image/";
pcre: "/^Content-\s*\s*\r\n\s*image\x2fgif/smi";
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:

When the second rule fragment matches the GIF download, the `flowbits: setx, http.gif, image_downloads` keyword sets the `http.gif` `flowbits` state and unsets `http.jpeg`, the other state in the group.

The third rule fragment does not result in a false positive:

```plaintext
(msg: "JPEG exploit"; ?flowbits: isset, http.jpeg; content: "|FF|";
pcre: "/\x00{\x00|\x01}/";)
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:
Because `flowbits:isset, http.jpeg` is false, the rules engine stops processing the rule and no event is generated, thus avoiding a false positive even in a case where content in the GIF file matches exploit content for a JPEG file.

## The `http_encode` Keyword

You can use the `http_encode` keyword to generate events on the type of encoding in an HTTP request or response before normalization, either in the HTTP URI, in non-cookie data in an HTTP header, in cookies in HTTP requests headers, or set-cookie data in HTTP responses.

You must configure the HTTP Inspect preprocessor to inspect HTTP responses and HTTP cookies to return matches for rules using the `http_encode` keyword.

Also, you must enable both the decoding and alerting option for each specific encoding type in your HTTP Inspect preprocessor configuration so the `http_encode` keyword in an intrusion rule can trigger events on that encoding type.

The following table describes the encoding types this option can generate events for in HTTP URIs, headers, cookies, and set-cookies:

<table>
<thead>
<tr>
<th>Encoding Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>utf8</td>
<td>Detects UTF-8 encoding in the specified location when this encoding type is enabled for decoding by the HTTP Inspect preprocessor.</td>
</tr>
<tr>
<td>double_encode</td>
<td>Detects double encoding in the specified location when this encoding type is enabled for decoding by the HTTP Inspect preprocessor.</td>
</tr>
<tr>
<td>non_ascii</td>
<td>Detects non-ASCII characters in the specified location when non-ASCII characters are detected but the detected encoding type is not enabled.</td>
</tr>
<tr>
<td>uencode</td>
<td>Detects Microsoft %u encoding in the specified location when this encoding type is enabled for decoding by the HTTP Inspect preprocessor.</td>
</tr>
<tr>
<td>bare_byte</td>
<td>Detects bare byte encoding in the specified location when this encoding type is enabled for decoding by the HTTP Inspect preprocessor.</td>
</tr>
</tbody>
</table>

http_encode Keyword Syntax

Encoding Location
Specifies whether to search for the specified encoding type in an HTTP URI, header, or cookie, including a set-cookie.

Encoding Type
Specifies one or more encoding types using one of the following formats:

```
encode_type
encode_type|encode_type|encode_type...
```

where `encode_type` is one of the following:

- utf8
- double_encode
- non_ascii
- uencode
- bare_byte.

Note that you cannot use the negation (!) and OR (|) operators together.

http_encode Keyword example: Using Two http_encode Keywords to Search for Two Encodings

The following example uses two `http_encode` keywords in the same rule to search the HTTP URI for UTF-8 AND Microsoft IIS %u encoding:

First, the `http_encode` keyword:

- **Encoding Location**: HTTP URI
- **Encoding Type**: utf8

Then, the additional `http_encode` keyword:

- **Encoding Location**: HTTP URI
- **Encoding Type**: uencode

Overview: The file_type and file_group Keywords

The `file_type` and `file_group` keywords allow you to detect files transmitted via FTP, HTTP, SMTP, IMAP, POP3, and NetBIOS-ssn (SMB) based on their type and version. Do not use more than one `file_type` or `file_group` keyword in a single intrusion rule.

Tip

Updating your vulnerability database (VDB) populates the intrusion rules editor with the most up-to-date file types, versions, and groups.
The system does not automatically enable preprocessors to accommodate the `file_type` and `file_group` keywords.

You **must** enable specific preprocessors if you want to generate events and, in an inline deployment, drop offending packets for traffic matching your `file_type` or `file_group` keywords.

### The `file_type` and `file_group` Keywords

**file_type**

The `file_type` keyword allows you to specify the file type and version of a file detected in traffic. File type arguments (for example, **JPEG** and **PDF**) identify the format of the file you want to find in traffic.

**Note**

*Do not* use the `file_type` keyword with another `file_type` or `file_group` keyword in the same intrusion rule.

The system selects **Any Version** by default, but some file types allow you to select version options (for example, **PDF** version **1.7**) to identify specific file type versions you want to find in traffic.
**The file_group Keyword**

The `file_group` keyword allows you to select a Cisco-defined group of similar file types to find in traffic (for example, multimedia or audio). File groups also include Cisco-defined versions for each file type in the group.

---

**Note**

Do not use the `file_group` keyword with another `file_group` or `file_type` keyword in the same intrusion rule.

---

**The file_data Keyword**

The `file_data` keyword provides a pointer that serves as a reference for the positional arguments available for other keywords such as `content`, `byte_jump`, `byte_test`, and `pcre`. The detected traffic determines the type of data the `file_data` keyword points to. You can use the `file_data` keyword to point to the beginning of the following payload types:

- **HTTP response body**
  
  To inspect HTTP response packets, the HTTP Inspect preprocessor must be enabled and you must configure the preprocessor to inspect HTTP responses. The `file_data` keyword matches if the HTTP Inspect preprocessor detects HTTP response body data.

- **Uncompressed gzip file data**
  
  To inspect uncompressed gzip files in the HTTP response body, the HTTP Inspect preprocessor must be enabled and you must configure the preprocessor to inspect HTTP responses and to decompress gzip-compressed files in the HTTP response body. For more information, see the Inspect HTTP Responses and Inspect Compressed Data Server-Level HTTP Normalization options. The `file_data` keyword matches if the HTTP Inspect preprocessor detects uncompressed gzip data in the HTTP response body.

- **Normalized JavaScript**
  
  To inspect normalized JavaScript data, the HTTP Inspect preprocessor must be enabled and you must configure the preprocessor to inspect HTTP responses. The `file_data` keyword matches if the HTTP Inspect preprocessor detects JavaScript in response body data.

- **SMTP payload**
  
  To inspect the SMTP payload, the SMTP preprocessor must be enabled. The `file_data` keyword matches if the SMTP preprocessor detects SMTP data.

- **Encoded email attachments in SMTP, POP, or IMAP traffic**
  
  To inspect email attachments in SMTP, POP, or IMAP traffic, the SMTP, POP, or IMAP preprocessor, respectively, must be enabled, alone or in any combination. Then, for each enabled preprocessor, you must ensure that the preprocessor is configured to decode each attachment encoding type that you want decoded. The attachment decoding options that you can configure for each preprocessor are: Base64 Decoding Depth, 7-Bit/8-Bit/Binary Decoding Depth, Quoted-Printable Decoding Depth, and Unix-to-Unix Decoding Depth.

  You can use multiple `file_data` keywords in a rule.
The pkt_data Keyword

The pkt_data keyword provides a pointer that serves as a reference for the positional arguments available for other keywords such as content, byte_jump, byte_test, and pcre.

When normalized FTP, telnet, or SMTP traffic is detected, the pkt_data keyword points to the beginning of the normalized packet payload. When other traffic is detected, the pkt_data keyword points to the beginning of the raw TCP or UDP payload.

The following normalization options must be enabled for the system to normalize the corresponding traffic for inspection by intrusion rules:

- Enable the FTP & Telnet preprocessor Detect Telnet Escape codes within FTP commands option to normalize FTP traffic for inspection.
- Enable the FTP & Telnet preprocessor Normalize telnet option to normalize telnet traffic for inspection.
- Enable the SMTP preprocessor Normalize option to normalize SMTP traffic for inspection.

You can use multiple pkt_data keywords in a rule.

- Telnet Options, on page 1527
- SMTP Preprocessor Options, on page 1562

The base64_decode and base64_data Keywords

You can use the base64_decode and base64_data keywords in combination to instruct the rules engine to decode and inspect specified data as Base64 data. This can be useful, for example, for inspecting Base64-encoded HTTP Authentication request headers and Base64-encoded data in HTTP PUT and POST requests.

These keywords are particularly useful for decoding and inspecting Base64 data in HTTP requests. However, you can also use them with any protocol such as SMTP that uses the space and tab characters the same way HTTP uses these characters to extend a lengthy header line over multiple lines. When this line extension, which is known as folding, is not present in a protocol that uses it, inspection ends at any carriage return or line feed that is not followed with a space or tab.

base64_decode

The base64_decode keyword instructs the rules engine to decode packet data as Base64 data. Optional arguments let you specify the number of bytes to decode and where in the data to begin decoding.

You can use the base64_decode keyword once in a rule; it must precede at least one instance of the base64_data keyword.
Before decoding Base64 data, the rules engine unfolds lengthy headers that are folded across multiple lines. Decoding ends when the rules engine encounters any of the following:

- the end of a header line
- the specified number of bytes to decode
- the end of the packet

The following table describes the arguments you can use with the `base64_decode` keyword.

**Table 185: Optional base64_decode Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bytes</td>
<td>Specifies the number of bytes to decode. When not specified, decoding continues to the end of a header line or the end of the packet payload, whichever comes first. You can specify a positive, non-zero value.</td>
</tr>
<tr>
<td>Offset</td>
<td>Determines the offset relative to the start of the packet payload or, when you also specify Relative, relative to the current inspection location. You can specify a positive, non-zero value.</td>
</tr>
<tr>
<td>Relative</td>
<td>Specifies inspection relative to the current inspection location.</td>
</tr>
</tbody>
</table>

**base64_data**

The `base64_data` keyword provides a reference for inspecting Base64 data decoded using the `base64_decode` keyword. The `base64_data` keyword sets inspection to begin at the start of the decoded Base64 data. Optionally, you can then use the positional arguments available for other keywords such as `content` or `byte_test` to further specify the location to inspect.

You must use the `base64_data` keyword at least once after using the `base64_decode` keyword; optionally, you can use `base64_data` multiple times to return to the beginning of the decoded Base64 data.

Note the following when inspecting Base64 data:

- You cannot use the fast pattern matcher.

- If you interrupt Base64 inspection in a rule with an intervening HTTP content argument, you must insert another `base64_data` keyword in the rule before further inspecting Base64 data.

Intrusion Prevention Performance Tuning

The following topics describe how to refine intrusion prevention performance:

- About Intrusion Prevention Performance Tuning, on page 1481
- Limiting Pattern Matching for Intrusions, on page 1482
- Regular Expression Limits Overrides for Intrusion Rules, on page 1482
- Overriding Regular Expression Limits for Intrusion Rules, on page 1483
- Per Packet Intrusion Event Generation Limits, on page 1484
- Limiting Intrusion Events Generated Per Packet, on page 1485
- Packet and Intrusion Rule Latency Threshold Configuration, on page 1485
- Intrusion Performance Statistic Logging Configuration, on page 1490
- Configuring Intrusion Performance Statistic Logging, on page 1491

About Intrusion Prevention Performance Tuning

Cisco provides several features for improving the performance of your system as it analyzes traffic for attempted intrusions. You can:

- specify the number of packets to allow in the event queue. You can also, before and after stream reassembly, enable or disable inspection of packets that will be rebuilt into larger streams.

- override default match and recursion limits on PCRE that are used in intrusion rules to examine packet payload content.

- elect to have the rules engine log more than one event per packet or packet stream when multiple events are generated, allowing you to collect information beyond the reported event.

- balance security with the need to maintain device latency at an acceptable level with packet and rule latency thresholding.

- configure the basic parameters of how devices monitor and report their own performance. This allows you to specify the intervals at which the system updates performance statistics on your devices.

You configure these performance settings on a per-access-control-policy basis, and they apply to all intrusion policies invoked by that parent access control policy.
Limiting Pattern Matching for Intrusions

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>

<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1  In the access control policy editor, click the Advanced tab.
Step 2  Click the edit icon (📝) next to Performance Settings.
        If a view icon (🔍) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck Inherit from base policy to enable editing.
Step 3  Click the Pattern Matching Limits tab in the Performance Settings pop-up window.
Step 4  Enter a value for the maximum number of events to queue in the Maximum Pattern States to Analyze Per Packet field.
Step 5  To disable the inspection of packets that will be rebuilt into larger streams of data before and after stream reassembly, check the Disable Content Checks on Traffic Subject to Future Reassembly check box.
        Inspection before and after reassembly requires more processing overhead and may decrease performance.
Step 6  Click OK.
Step 7  Click Save to save the policy.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Regular Expression Limits Overrides for Intrusion Rules

The default regular expression limits ensure a minimum level of performance. Overriding these limits could increase security, but could also significantly impact performance by permitting packet evaluation against inefficient regular expressions.

Caution

Do not override default PCRE limits unless you are an experienced intrusion rule writer with knowledge of the impact of degenerative patterns.
### Table 186: Regular Expression Constraint Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Match Limit State             | Specifies whether to override **Match Limit**. You have the following options:  
  • select **Default** to use the value configured for **Match Limit**  
  • select **Unlimited** to permit an unlimited number of attempts  
  • select **Custom** to specify either a limit of 1 or greater for **Match Limit**, or to specify 0 to completely disable PCRE match evaluations  
| Match Limit                   | Specifies the number of times to attempt to match a pattern defined in a PCRE regular expression.                                                                                                         |
| Match Recursion Limit State   | Specifies whether to override **Match Recursion Limit**. You have the following options:  
  • select **Default** to use the value configured for **Match Recursion Limit**  
  • select **Unlimited** to permit an unlimited number of recursions  
  • select **Custom** to specify either a limit of 1 or greater for **Match Recursion Limit**, or to specify 0 to completely disable PCRE recursions  
  Note that for **Match Recursion Limit** to be meaningful, it must be smaller than **Match Limit**.  
| Match Recursion Limit          | Specifies the number of recursions when evaluating a PCRE regular expression against the packet payload.                                                                                                 |

|               |                 |                   |                   | Admin/Network/Admin           |
Procedure

Step 1 In the access control policy editor, click the **Advanced** tab.

Step 2 Click the edit icon (📝) next to **Performance Settings**.

If a view icon (🔍) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

Step 3 Click the **RegularExpression Limits** tab in the **Performance Settings** pop-up window.

Step 4 You can modify any of the options in **RegularExpression Limits Overrides for Intrusion Rules**, on page 1482.

Step 5 Click **OK**.

Step 6 Click **Save** to save the policy.

What to do next

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

Per Packet Intrusion Event Generation Limits

When the intrusion rules engine evaluates traffic against rules, it places the events generated for a given packet or packet stream in an event queue, then reports the top events in the queue to the user interface. When configuring the intrusion event logging limits, you can specify how many events can be placed in the queue and how many are logged, and select the criteria for determining event order within the queue.

**Table 187: Intrusion Event Logging Limits Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum Events Stored Per Packet</td>
<td>The maximum number of events that can be stored for a given packet or packet stream.</td>
</tr>
<tr>
<td>Maximum Events Logged Per Packet</td>
<td>The number of events logged for a given packet or packet stream. This cannot exceed the <strong>Maximum Events Stored Per Packet</strong> value.</td>
</tr>
<tr>
<td>Prioritize Event Logging By</td>
<td>The value used to determine event ordering within the event queue. The highest ordered event is reported through the user interface. You can select from:</td>
</tr>
<tr>
<td></td>
<td>- <strong>priority</strong>, which orders events in the queue by the event priority.</td>
</tr>
<tr>
<td></td>

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

---

## Packet and Intrusion Rule Latency Threshold Configuration

Each access control policy has latency-based settings that use thresholding to manage packet and rule processing performance.

Packet latency thresholding measures the total elapsed time taken to process a packet by applicable decoders, preprocessors, and rules, and ceases inspection of the packet if the processing time exceeds a configurable threshold.

Rule latency thresholding measures the elapsed time each rule takes to process an individual packet, suspends the violating rule along with a group of related rules for a specified time if the processing time exceeds the rule latency threshold a configurable consecutive number of times, and restores the rules when the suspension expires.

### Packet Latency Thresholding

Packet latency thresholding measures elapsed time, not just processing time, in order to more accurately reflect the actual time required for the rule to process a packet. However, latency thresholding is a software-based latency implementation that does not enforce strict timing.
The trade-off for the performance and latency benefits derived from latency thresholding is that uninspected packets could contain attacks. A timer starts for each packet when decoder processing begins. Timing continues either until all processing ends for the packet or until the processing time exceeds the threshold at a timing test point.

As illustrated in the above figure, packet latency timing is tested at the following test points:

• after the completion of all decoder and preprocessor processing and before rule processing begins
• after processing by each rule

If the processing time exceeds the threshold at any test point, packet inspection ceases.

Tip
Total packet processing time does not include routine TCP stream or IP fragment reassembly times.

Packet latency thresholding has no effect on events triggered by a decoder, preprocessor, or rule processing the packet. Any applicable decoder, preprocessor, or rule triggers normally until a packet is fully processed, or until packet processing ends because the latency threshold is exceeded, whichever comes first. If a drop rule detects an intrusion in an inline deployment, the drop rule triggers an event and the packet is dropped.

Note
No packets are evaluated against rules after processing for that packet ceases because of a packet latency threshold violation. A rule that would have triggered an event cannot trigger that event, and for drop rules, cannot drop the packet.

Packet latency thresholding can improve system performance in both passive and inline deployments, and can reduce latency in inline deployments, by stopping inspection of packets that require excessive processing time. These performance benefits might occur when, for example:

• for both passive and inline deployments, sequential inspection of a packet by multiple rules requires an excessive amount of time
• for inline deployments, a period of poor network performance, such as when someone downloads an extremely large file, slows packet processing

In a passive deployment, stopping the processing of packets might not contribute to restoring network performance because processing simply moves to the next packet.
Packet Latency Thresholding Notes

**Table 188: Packet Latency Thresholding Option**

**Procedure**

**Step 1** In the access control policy editor, click the **Advanced** tab.
**Step 2** Click the edit icon (🔒) next to **Latency-Based Performance Settings**.

If a view icon (👁️) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 3** Click the **Packet Handling** tab in the **Latency-Based Performance Settings** pop-up window.
**Step 4** See Packet Latency Thresholding Notes, on page 1487 for recommended minimum **Threshold** settings.
**Step 5** Click **OK**.
**Step 6** Click **Save** to save the policy.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Rule Latency Thresholding

Rule latency thresholding measures elapsed time, not just processing time, in order to more accurately reflect the actual time required for the rule to process a packet. However, latency thresholding is a software-based latency implementation that does not enforce strict timing.

The trade-off for the performance and latency benefits derived from latency thresholding is that uninspected packets could contain attacks. A timer measures the processing time each time a packet is processed against a group of rules. Any time the rule processing time exceeds a specified rule latency threshold, the system
increments a counter. If the number of consecutive threshold violations reaches a specified number, the system takes the following actions:

- suspends the rules for the specified period
- triggers an event indicating the rules have been suspended
- re-enables the rules when the suspension expires
- triggers an event indicating the rules have been re-enabled

The system zeroes the counter when the group of rules has been suspended, or when rule violations are not consecutive. Permitting some consecutive violations before suspending rules lets you ignore occasional rule violations that might have negligible impact on performance and focus instead on the more significant impact of rules that repeatedly exceed the rule latency threshold.

The following example shows five consecutive rule processing times that do not result in rule suspension.

![Diagram showing five consecutive rule processing times](image)

In the above example, the time required to process each of the first three packets violates the rule latency threshold of 1000 microseconds, and the violations counter increments with each violation. Processing of the fourth packet does not violate the threshold, and the violations counter resets to zero. The fifth packet violates the threshold and the violations counter restarts at one.

The following example shows five consecutive rule processing times that do result in rule suspension.

![Diagram showing five consecutive rule processing times](image)

In the second example, the time required to process each of the five packets violates the rule latency threshold of 1000 microseconds. The group of rules is suspended because the rule processing time of 1100 microseconds for each packet violates the threshold of 1000 microseconds for the specified five consecutive violations. Any subsequent packets, represented in the figure as packets 6 through n, are not examined against suspended rules until the suspension expires. If more packets occur after the rules are re-enabled, the violations counter begins again at zero.

Rule latency thresholding has no effect on intrusion events triggered by the rules processing the packet. A rule triggers an event for any intrusion detected in the packet, regardless of whether the rule processing time exceeds the threshold. If the rule detecting the intrusion is a drop rule in an inline deployment, the packet is
dropped. When a drop rule detects an intrusion in a packet that results in the rule being suspended, the drop rule triggers an intrusion event, the packet is dropped, and that rule and all related rules are suspended.

---

**Note**

Packets are not evaluated against suspended rules. A suspended rule that would have triggered an event cannot trigger that event and, for drop rules, cannot drop the packet.

Rule latency thresholding can improve system performance in both passive and inline deployments, and can reduce latency in inline deployments, by suspending rules that take the most time to process packets. Packets are not evaluated again against suspended rules until a configurable time expires, giving the overloaded device time to recover. These performance benefits might occur when, for example:

- hastily written, largely untested rules require an excessive amount of processing time
- a period of poor network performance, such as when someone downloads an extremely large file, causes slow packet inspection

---

**Rule Latency Thresholding Notes**

Rule latency thresholding suspends rules for the time specified by **Suspension Time** when the time rules take to process a packet exceeds **Threshold** for the consecutive number of times specified by **Consecutive Threshold Violations Before Suspending Rule**.

You can enable rule 134:1 to generate an event when rules are suspended, and rule 134:2 to generate an event when suspended rules are enabled. See Intrusion Rule State Options, on page 1330.

**Table 189: Rule Latency Thresholding Options**

Procedure

**Step 1**  
In the access control policy editor, click the **Advanced** tab.

**Step 2**  
Click the edit icon (✏️️) next to **Latency-Based Performance Settings**.

If a view icon (🔍️️) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 3**  
Click the **Rule Handling** tab in the **Latency-Based Performance Settings** pop-up window.

**Step 4**  
You can configure any of the options in [Rule Latency Thresholding Notes](#), on page 1489.

**Step 5**  
Click **OK**.

**Step 6**  
Click **Save** to save the policy.

**What to do next**

- If you want to generate events, enable latency rules 134:1 and 134:2. For more information, see [Intrusion Rule State Options](#), on page 1330.

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 279.

---

**Intrusion Performance Statistic Logging Configuration**

**Sample time (seconds) and Minimum number of packets**

When the number of seconds specified elapses between performance statistics updates, the system verifies it has analyzed the specified number of packets. If it has, the system updates performance statistics. Otherwise, the system waits until it analyzes the specified number of packets.

**Troubleshooting Options: Log Session/Protocol Distribution**

Support might ask you during a troubleshooting call to log protocol distribution, packet length, and port statistics.

⚠️ **Caution**

Do not enable **Log Session/Protocol Distribution** unless instructed to by Support. Note that enabling or disabling **Log Session/Protocol Distribution** restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior](#), on page 282 for more information.

**Troubleshooting Options: Summary**

Support might ask you during a troubleshooting call to configure the system to calculate the performance statistics only when the Snort process is shut down or restarted. To enable this option, you must also enable the **Log Session/Protocol Distribution** troubleshooting option.

- The Default Intrusion Policy, on page 1495
- Advanced Settings for Network Analysis Policies, on page 1497

About Advanced Access Control Settings for Network Analysis and Intrusion Policies

Many of the advanced settings in an access control policy govern intrusion detection and prevention configurations that require specific expertise to configure. Advanced settings typically require little or no modification and are not common to every deployment.

The Default Intrusion Policy

Each access control policy uses its default intrusion policy to initially inspect traffic before the system can determine exactly how to inspect that traffic. This is needed because sometimes the system must process the first few packets in a connection, allowing them to pass, before it can decide which access control rule (if any) will handle the traffic. However, so that these packets do not reach their destination uninspected, you can use an intrusion policy—called the default intrusion policy—to inspect them and generate intrusion events. By default, the default intrusion policy uses the default variable set.

A default intrusion policy is especially useful when performing application control and URL filtering, because the system cannot identify applications or filter URLs before a connection is fully established between the client and the server. For example, if a packet matches all the other conditions in an access control rule with an application or URL condition, it and subsequent packets are allowed to pass until the connection is established and application or URL identification is complete, usually 3 to 5 packets.

The system inspects these allowed packets with the default intrusion policy, which can generate events and, if placed inline, block malicious traffic. After the system identifies the access control rule or default action that should handle the connection, the remaining packets in the connection are handled and inspected accordingly.
When you create an access control policy, its default intrusion policy depends on the default action you first chose. Initial default intrusion policies for access control are as follows:

- Balanced Security and Connectivity (a system-provided policy) is the default intrusion policy for an access control policy where you first chose the **Intrusion Prevention** default action.

- No Rules Active is the default intrusion policy for an access control policy where you first chose the **Block all traffic** or **Network Discovery** default action. Although choosing this option disables intrusion inspection on the allowed packets described above, it can improve performance if you are not interested in intrusion data.

> Note
If you are not performing intrusion inspection (for example, in a discovery-only deployment), keep the No Rules Active policy as your default intrusion policy.

If you change your default action after you create the access control policy, the default intrusion policy does not automatically change. To change it manually, use the access control policy’s advanced options.

You can choose a system- or user-created policy.

> Note
The network analysis policy associated with the first matching network analysis rule preprocesses traffic for the default intrusion policy. If there are no network analysis rules, or none match, the default network analysis policy is used.

### Setting the Default Intrusion Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access admin/admin/network admin</td>
</tr>
</tbody>
</table>

> Caution
Changing the total number of intrusion policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See **Snort® Restart Traffic Behavior, on page 282** for more information. You change the total number of intrusion policies by adding an intrusion policy that is not currently used, or by removing the last instance of an intrusion policy. You can use an intrusion policy in an access control rule, as the default action, or as the default intrusion policy.

**Procedure**

**Step 1**
In the access control policy editor, click the **Advanced** tab, then click the edit icon (edit) next to the Network Analysis and Intrusion Policies section.
If a view icon appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck Inherit from base policy to enable editing.

**Step 2**  Select an intrusion policy from the **Intrusion Policy used before Access Control rule is determined** drop-down list.

If you choose a user-created policy, you can click an edit icon to edit the policy in a new window. You cannot edit system-provided policies.

**Step 3**  Optionally, select a different variable set from the **Intrusion Policy Variable Set** drop-down list. You can also select the edit icon next to the variable set to create and edit variable sets. If you do not change the variable set, the system uses a default set.

**Step 4**  Click **OK**.

**Step 5**  Click **Save** to save the policy.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Related Topics**

Variable Sets, on page 354

---

**Advanced Settings for Network Analysis Policies**

*Network analysis policies* govern how traffic is decoded and preprocessed so that it can be further evaluated, especially for anomalous traffic that might signal an intrusion attempt. This traffic preprocessing occurs after Security Intelligence blacklisting and traffic decryption, but before intrusion policies inspect packets in detail. By default, the system-provided Balanced Security and Connectivity network analysis policy is the default network analysis policy.

---

**Tip**

The system-provided Balanced Security and Connectivity network analysis policy and the Balanced Security and Connectivity intrusion policy work together and can both be updated in intrusion rule updates. However, the network analysis policy governs mostly preprocessing options, whereas the intrusion policy governs mostly intrusion rules.

---

A simple way to tune preprocessing is to create and use a custom network analysis policy as the default. For advanced users with complex deployments, you can create multiple network analysis policies, each tailored to preprocess traffic differently. Then, you can configure the system to use those policies to govern the preprocessing of traffic using different security zones, networks, or VLANs.

To accomplish this, you add custom *network analysis rules* to your access control policy. A network analysis rule is simply a set of configurations and conditions that specifies how you preprocess traffic that matches those qualifications. You create and edit network analysis rules in the advanced options in an existing access control policy. Each rule belongs to only one policy.

Each rule has:

- a set of rule conditions that identifies the specific traffic you want to preprocess
• an associated network analysis policy that you want to use to preprocess traffic that meets all the rules’ conditions

When it is time for the system to preprocess traffic, it matches packets to network analysis rules in top-down order by rule number. Traffic that does not match any network analysis rules is preprocessed by the default network analysis policy.

### Setting the Default Network Analysis Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network/Audit</td>
</tr>
</tbody>
</table>

You can choose a system- or user-created policy.

---

**Note**

If you disable a preprocessor but the system needs to evaluate preprocessed packets against an enabled intrusion or preprocessor rule, the system automatically enables and uses the preprocessor although it remains disabled in the network analysis policy web interface. Tailoring preprocessing, especially using multiple custom network analysis policies, is an **advanced** task. Because preprocessing and intrusion inspection are so closely related, you must be careful that you allow the network analysis and intrusion policies examining a single packet to complement each other.

### Procedure

**Step 1**

In the access control policy editor, click the **Advanced** tab, then click the edit icon (📝) next to the Network Analysis and Intrusion Policies section.

If a view icon (🔍) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 2**

From the **Default Network Analysis Policy** drop-down list, select a default network analysis policy.

If you choose a user-created policy, you can click an edit icon (📝) to edit the policy in a new window. You cannot edit system-provided policies.

**Caution** Changing the total number of network analysis policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See **Snort® Restart Traffic Behavior**, on page 282 for more information. You change the total number of network analysis policies by adding a policy that is not currently used, or by removing the last instance of a network analysis policy. You can use a network analysis policy with network analysis rules or as the default network analysis policy.

**Step 3**

Click **OK**.
Step 4  Click **Save** to save the policy.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Related Topics**

- Limitations of Custom Policies, on page 1285

---

**Network Analysis Rules**

Within your access control policy’s advanced settings, you can use network analysis rules to tailor preprocessing configurations to network traffic.

Network analysis rules are numbered, starting at 1. When it is time for the system to preprocess traffic, it matches packets to network analysis rules in top-down order by ascending rule number, and preprocesses traffic according to the first rule where all the rule’s conditions match.

You can add zone, network, and VLAN tag conditions to a rule. If you do not configure a particular condition for a rule, the system does not match traffic based on that criterion. For example, a rule with a network condition but no zone condition evaluates traffic based on its source or destination IP address, regardless of its ingress or egress interface. Traffic that does not match any network analysis rules is preprocessed by the default network analysis policy.

**Configuring Network Analysis Rules**

<table>

</tr>
</tbody>
</table>

**Procedure**

**Step 1**  In the access control policy editor, click the **Advanced** tab, then click the edit icon (.edit) next to the Network Analysis and Intrusion Policies section.

If a view icon (view) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Tip**  Click **Network Analysis Policy List** to view and edit existing custom network analysis policies.

**Step 2**  Next to **Network Analysis Rules**, click the statement that indicates how many custom rules you have.

**Step 3**  Click **Add Rule**.

**Step 4**  Configure the rule's conditions by clicking the tabs corresponding to the conditions you want to add; see Rule Condition Types, on page 294.

**Step 5**  Click the **Network Analysis** tab and choose the **Network Analysis Policy** you want to use to preprocess the traffic matching this rule.
Click the edit icon (📝) to edit a custom policy in a new window. You cannot edit system-provided policies.

**Caution** Changing the total number of network analysis policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information. You change the total number of network analysis policies by adding a policy that is not currently used, or by removing the last instance of a network analysis policy. You can use a network analysis policy with network analysis rules or as the default network analysis policy.

**Step 6** Click **Add**.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

---

**Managing Network Analysis Rules**

</tbody>
</table>

A network analysis rule is simply a set of configurations and conditions that specifies how you preprocess traffic that matches those qualifications. You create and edit network analysis rules in the advanced options in an existing access control policy. Each rule belongs to only one policy.

**Procedure**

**Step 1** In the access control policy editor, click the **Advanced** tab, then click the edit icon (📝) next to the Intrusion and Network Analysis Policies section.

If a view icon (🔍) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 2** Next to **Network Analysis Rules**, click the statement that indicates how many custom rules you have.

**Step 3** Edit your custom rules. You have the following options:

- To edit a rule’s conditions, or change the network analysis policy invoked by the rule, click the edit icon (📝) next to the rule.

- To change a rule’s order of evaluation, click and drag the rule to the correct location. To select multiple rules, use the Shift and Ctrl keys.

- To delete a rule, click the delete icon (🗑️) next to the rule.
Tip  
Right-clicking a rule displays a context menu that allows you to cut, copy, paste, edit, delete, and add new network analysis rules.

**Step 4**  
Click **OK**.

**Step 5**  
Click **Save** to save the policy.

---

**What to do next**

- Deploy configuration changes; see *Deploy Configuration Changes, on page 279.*
The following topics describe how to get started with network analysis policies:

- Network Analysis Policy Basics, on page 1503
- Managing Network Analysis Policies, on page 1503

**Network Analysis Policy Basics**

Network analysis policies govern many traffic preprocessing options, and are invoked by advanced settings in your access control policy. Network analysis-related preprocessing occurs after Security Intelligence blacklisting and SSL decryption, but before intrusion or file inspection begins.

By default, the system uses the Balanced Security and Connectivity network analysis policy to preprocess all traffic handled by an access control policy. However, you can choose a different default network analysis policy to perform this preprocessing. For your convenience, the system provides a choice of several non-modifiable network analysis policies, which are tuned for a specific balance of security and connectivity by the Cisco Talos Security Intelligence and Research Group (Talos). You can also create a custom network analysis policy with custom preprocessing settings.

**Tip**

System-provided intrusion and network analysis policies are similarly named but contain different configurations. For example, the Balanced Security and Connectivity network analysis policy and the Balanced Security and Connectivity intrusion policy work together and can both be updated in intrusion rule updates. However, the network analysis policy governs mostly preprocessing options, whereas the intrusion policy governs mostly intrusion rules. Network analysis and intrusion policies work together to examine your traffic.

You can also tailor traffic preprocessing options to specific security zones, networks, and VLANs by creating multiple custom network analysis policies, then assigning them to preprocess different traffic. (Note that ASA FirePOWER cannot restrict preprocessing by VLAN.)

**Managing Network Analysis Policies**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>
In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

**Procedure**

**Step 1** Choose **Policies > Access Control**, then click **Network Analysis Policy** or **Policies > Access Control > Intrusion**, then click **Network Analysis Policy**.

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2** Manage your network analysis policy:

- **Compare**—Click **Compare Policies**; see *Comparing Policies*, on page 287.
- **Create** — If you want to create a new network analysis policy, click **Create Policy** and proceed as described in *Custom Network Analysis Policy Creation*, on page 1504.
- **Delete** — If you want to delete a network analysis policy, click the delete icon (🗑️), then confirm that you want to delete the policy. You cannot delete a network analysis policy if an access control policy references it.
  
  If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- **Deploy**—Click **Deploy**; see *Deploy Configuration Changes*, on page 279.
- **Edit** — If you want edit an existing network analysis policy, click the edit icon (📝) and proceed as described in *Network Analysis Policy Settings and Cached Changes*, on page 1506.
  
  If a view icon (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- **Report**—Click the report icon (📊); see *Generating Current Policy Reports*, on page 288.

---

**Custom Network Analysis Policy Creation**

When you create a new network analysis policy you must give it a unique name, specify a base policy, and choose an **inline mode**.

The base policy defines the network analysis policy’s default settings. Modifying a setting in the new policy overrides—but does not change—the settings in the base policy. You can use either a system-provided or custom policy as your base policy.

The network analysis policy’s inline mode allows preprocessors to modify (normalize) and drop traffic to minimize the chances of attackers evading detection. Note that in passive deployments, the system cannot affect traffic flow regardless of the inline mode.
Creating a Custom Network Analysis Policy

<table>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion/Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Procedure

**Step 1** Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2** Click Create Policy. If you have unsaved changes in another policy, click Cancel when prompted to return to the Network Analysis Policy page.

**Step 3** Enter a unique Name.

In a multidomain deployment, policy names must be unique within the domain hierarchy. The system may identify a conflict with the name of a policy you cannot view in your current domain.

**Step 4** Optionally, enter a Description.

**Step 5** Choose the initial Base Policy. You can use either a system-provided or custom policy as your base policy.

**Step 6** If you want to allow preprocessors to affect traffic in an inline deployment, enable Inline Mode.

**Step 7** Create the policy:

- Click Create Policy to create the new policy and return to the Network Analysis Policy page. The new policy has the same settings as its base policy.
- Click Create and Edit Policy to create the policy and open it for editing in the advanced network analysis policy editor.

Related Topics

- Creating Custom User Roles, on page 61
Network Analysis Policy Management

On the Network Analysis Policy page (or Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy) you can view your current custom network analysis policies, along with the following information:

• the time and date the policy was last modified (in local time) and the user who modified it
• whether the Inline Mode setting is enabled, which allows preprocessors to affect traffic
• which access control policies and devices are using the network analysis policy to preprocess traffic
• whether a policy has unsaved changes, as well as information about who (if anyone) is currently editing the policy

In addition to custom policies that you create, the system provides two custom policies: Initial Inline Policy and Initial Passive Policy. These two network analysis policies use the Balanced Security and Connectivity network analysis policy as their base. The only difference between them is their inline mode, which allows preprocessors to affect traffic in the inline policy and disables it in the passive policy. You can edit and use these system-provided custom policies.

Note that you can create and edit network analysis as well as intrusion policies if your Firepower System user account’s role is restricted to Intrusion Policy or Modify Intrusion Policy.

Network Analysis Policy Settings and Cached Changes

When you create a new network analysis policy, it has the same settings as its base policy.

When tailoring a network analysis policy, especially when disabling preprocessors, keep in mind that some preprocessors and intrusion rules require that traffic first be decoded or preprocessed in a certain way. If you disable a required preprocessor, the system automatically uses it with its current settings, although the preprocessor remains disabled in the network analysis policy web interface.

Note

Because preprocessing and intrusion inspection are so closely related, the network analysis and intrusion policies examining a single packet must complement each other. Tailoring preprocessing, especially using multiple custom network analysis policies, is an advanced task.

The system caches one network analysis policy per user. While editing a network analysis policy, if you select any menu or other path to another page, your changes stay in the system cache even if you leave the page.

</tr>
</tbody>
</table>

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Procedure

**Step 1**
Choose **Policies > Access Control**, then click **Network Analysis Policy** or **Policies > Access Control > Intrusion**, then click **Network Analysis Policy**.

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2**
Click the edit icon (🔧) next to the network analysis policy you want to configure.

If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3**
Edit your network analysis policy:

- Change the base policy — If you want to change the base policy, choose a base policy from the **Base Policy** drop-down list on the Policy Information page.
- Manage policy layers — If you want to manage policy layers, click **Policy Layers** in the navigation panel.
- Modify a preprocessor — If you want to enable, disable, or edit the settings for a preprocessor, click **Settings** in the navigation panel.
- Modify traffic — If you want to allow preprocessors to modify or drop traffic, check the **Inline Mode** check box on the Policy Information page.
- View settings — If you want to view the settings in the base policy, click **Manage Base Policy** on the Policy Information page.

**Step 4**
To save changes you made in this policy since the last policy commit, choose **Policy Information**, then click **Commit Changes**. If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

**What to do next**

- If you want a preprocessor to generate events and, in an inline deployment, drop offending packets, enable rules for the preprocessor. For more information, see **Setting Intrusion Rule States**, on page 1331.
- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.
Preprocessor Configuration in a Network Analysis Policy

Preprocessors prepare traffic to be further inspected by normalizing traffic and identifying protocol anomalies. Preprocessors can generate preprocessorevents when packets trigger preprocessor options that you configure. The base policy for your network analysis policy determines which preprocessors are enabled by default and the default configuration for each.

Note

In most cases, preprocessors require specific expertise to configure and typically require little or no modification. Tailoring preprocessing, especially using multiple custom network analysis policies, is an advanced task. Because preprocessing and intrusion inspection are so closely related, the network analysis and intrusion policies examining a single packet must complement each other.

Modifying a preprocessor configuration requires an understanding of the configuration and its potential impact on your network.

Note that some advanced transport and network preprocessor settings apply globally to all networks, zones, and VLANs where you deploy your access control policy. You configure these advanced settings in an access control policy rather than in a network analysis policy.

Note also that you configure the sensitive data preprocessor, which detects sensitive data such as credit card numbers and Social Security numbers in ASCII text, in intrusion policies.

Preprocessor Traffic Modification in Inline Deployments

In an inline deployment (that is, where relevant configurations are deployed to devices using routed, switched, or transparent interfaces, or inline interface pairs), some preprocessors can modify and block traffic. For example:

- The inline normalization preprocessor normalizes packets to prepare them for analysis by other preprocessors and the intrusion rules engine. You can also use the preprocessor’s **Allow These TCP Options** and **Block Unresolvable TCP Header Anomalies** options to block certain packets.
- The system can drop packets with invalid checksums.
- The system can drop packets matching rate-based attack prevention settings.

For a preprocessor configured in the network analysis policy to affect traffic, you must enable and correctly configure the preprocessor, as well as correctly deploy managed devices inline. Finally, you must enable the network analysis policy’s **Inline Mode** setting.

Preprocessor Configuration in a Network Analysis Policy Notes

When you select **Settings** in the navigation panel of a network analysis policy, the policy lists its preprocessors by type. On the Settings page, you can enable or disable preprocessors in your network analysis policy, as well as access preprocessor configuration pages.

A preprocessor must be enabled for you to configure it. When you enable a preprocessor, a sublink to the configuration page for the preprocessor appears beneath the **Settings** link in the navigation panel, and an **Edit** link to the configuration page appears next to the preprocessor on the Settings page.

---

**Tip**

To revert a preprocessor’s configuration to the settings in the base policy, click **Revert to Defaults** on a preprocessor configuration page. When prompted, confirm that you want to revert.

When you disable a preprocessor, the sublink and **Edit** link no longer appear, but your configurations are retained. Note that to perform their particular analysis, many preprocessors and intrusion rules require that traffic first be decoded or preprocessed in a certain way. If you disable a required preprocessor, the system automatically uses it with its current settings, although the preprocessor remains disabled in the network analysis policy web interface.

If you want to assess how your configuration would function in an inline deployment without actually modifying traffic, you can disable inline mode. In passive deployments or inline deployments in tap mode, the system cannot affect traffic regardless of the inline mode setting.
Disabling inline mode can affect intrusion event performance statistics graphs. With inline mode enabled in an inline deployment, the Intrusion Event Performance page (Overview > Summary > Intrusion Event Performance) displays graphs that represent normalized and blocked packets. If you disable inline mode, or in a passive deployment, many of the graphs display data about the traffic the system would have normalized or dropped.

Note
In an inline deployment, Cisco recommends that you enable inline mode and configure the inline normalization preprocessor with the Normalize TCP Payload option enabled. In a passive deployment, Cisco recommends that you use adaptive profile updates.

Application Layer Preprocessors

The following topics explain application layer preprocessors and how to configure them:

- Introduction to Application Layer Preprocessors, on page 1511
- The DCE/RPC Preprocessor, on page 1511
- The DNS Preprocessor, on page 1522

- The SSL Preprocessor, on page 1572

Introduction to Application Layer Preprocessors

Application layer protocols can represent the same data in a variety of ways. The Firepower System provides application layer protocol decoders that normalize specific types of packet data into formats that the intrusion rules engine can analyze. Normalizing application-layer protocol encodings allows the rules engine to effectively apply the same content-related rules to packets whose data is represented differently and obtain meaningful results.

When an intrusion rule or rule argument requires a disabled preprocessor, the system automatically uses it with its current configuration even though it remains disabled in the network analysis policy’s web interface.

Note that preprocessors do not generate events in most cases unless you enable the accompanying preprocessor rules in an intrusion policy.

The DCE/RPC Preprocessor

The DCE/RPC protocol allows processes on separate network hosts to communicate as if the processes were on the same host. These inter-process communications are commonly transported between hosts over TCP and UDP. Within the TCP transport, DCE/RPC might also be further encapsulated in the Windows Server...
Message Block (SMB) protocol or in Samba, an open-source SMB implementation used for inter-process communication in a mixed environment comprised of Windows and UNIX- or Linux-like operating systems. In addition, Windows IIS web servers on your network might use IIS RPC over HTTP, which provides distributed communication through a firewall, to proxy TCP-transported DCE/RPC traffic.

Note that descriptions of DCE/RPC preprocessor options and functionality include the Microsoft implementation of DCE/RPC known as MSRPC; descriptions of SMB options and functionality refer to both SMB and Samba.

Although most DCE/RPC exploits occur in DCE/RPC client requests targeted for DCE/RPC servers, which could be practically any host on your network that is running Windows or Samba, exploits can also occur in server responses. The DCE/RPC preprocessor detects DCE/RPC requests and responses encapsulated in TCP, UDP, and SMB transports, including TCP-transported DCE/RPC using version 1 RPC over HTTP. The preprocessor analyzes DCE/RPC data streams and detects anomalous behavior and evasion techniques in DCE/RPC traffic. It also analyzes SMB data streams and detects anomalous SMB behavior and evasion techniques.

The DCE/RPC preprocessor also desegments SMB and defragments DCE/RPC in addition to the IP defragmentation provided by the IP defragmentation preprocessor and the TCP stream reassembly provided by the TCP stream preprocessor.

Finally, the DCE/RPC preprocessor normalizes DCE/RPC traffic for processing by the rules engine.

Connectionless and Connection-Oriented DCE/RPC Traffic

DCE/RPC messages comply with one of two distinct DCE/RPC Protocol Data Unit (PDU) protocols:

- connection-oriented DCE/RPC PDU protocol
  The DCE/RPC preprocessor detects connection-oriented DCE/RPC in the TCP, SMB, and RPC over HTTP transports.

- connectionless DCE/RPC PDU protocol
  The DCE/RPC preprocessor detects connectionless DCE/RPC in the UDP transport.

The two DCE/RPC PDU protocols have their own unique headers and data characteristics. For example, the connection-oriented DCE/RPC header length is typically 24 bytes and the connectionless DCE/RPC header length is fixed at 80 bytes. Also, correct fragment order of fragmented connectionless DCE/RPC cannot be handled by a connectionless transport and, instead, must be ensured by connectionless DCE/RPC header values; in contrast, the transport protocol ensures correct fragment order for connection-oriented DCE/RPC. The DCE/RPC preprocessor uses these and other protocol-specific characteristics to monitor both protocols for anomalies and other evasion techniques, and to decode and defragment traffic before passing it to the rules engine.

The following diagram illustrates the point at which the DCE/RPC preprocessor begins processing DCE/RPC traffic for the different transports.
DCE/RPC Target-Based Policies

Windows and Samba DCE/RPC implementations differ significantly. For example, all versions of Windows use the DCE/RPC context ID in the first fragment when defragmenting DCE/RPC traffic, and all versions of Samba use the context ID in the last fragment. As another example, Windows Vista uses the opnum (operation number) header field in the first fragment to identify a specific function call, and Samba and all other Windows versions use the opnum field in the last fragment.

There are also significant differences in Windows and Samba SMB implementations. For example, Windows recognizes the SMB OPEN and READ commands when working with named pipes, but Samba does not recognize these commands.

When you enable the DCE/RPC preprocessor, you automatically enable a default target-based policy. Optionally, you can add target-based policies that target other hosts running different Windows or Samba versions. The default target-based policy applies to any host not included in another target-based policy.

In each target-based policy, you can:

- enable one or more transports and specify detection ports for each

Note the following in the figure:

- The well-known TCP or UDP port 135 identifies DCE/RPC traffic in the TCP and UDP transports.
- The figure does not include RPC over HTTP.
  
  For RPC over HTTP, connection-oriented DCE/RPC is transported directly over TCP as shown in the figure after an initial setup sequence over HTTP.
- The DCE/RPC preprocessor typically receives SMB traffic on the well-known TCP port 139 for the NetBIOS Session Service or the similarly implemented well-known Windows port 445.
  
  Because SMB has many functions other than transporting DCE/RPC, the preprocessor first tests whether the SMB traffic is carrying DCE/RPC traffic and stops processing if it is not or continues processing if it is.
- IP encapsulates all DCE/RPC transports.
- TCP transports all connection-oriented DCE/RPC.
- UDP transports connectionless DCE/RPC.
• enable and specify *auto-detection ports*
• set the preprocessor to detect when there is an attempt to connect to one or more shared SMB resources that you identify
• configure the preprocessor to detect files in SMB traffic and to inspect a specified number of bytes in a detected file
• modify an advanced option that should be modified only by a user with SMB protocol expertise; this option lets you set the preprocessor to detect when a number of chained SMB AndX commands exceed a specified maximum number

In addition to enabling SMB traffic file detection in the DCE/RPC preprocessor, you can configure a file policy to optionally capture and block these files, or submit them to the Cisco AMP cloud for dynamic analysis. Within that policy, you must create a file rule with an **Action** of **Detect Files** or **Block Files** and a selected **Application Protocol** of **Any** or **NetBIOS-ssn (SMB)**.

### RPC over HTTP Transport

Microsoft RPC over HTTP allows you to tunnel DCE/RPC traffic through a firewall as shown in the following diagram. The DCE/RPC preprocessor detects version 1 of Microsoft RPC over HTTP.

![Diagram of RPC over HTTP Transport](image)

The Microsoft IIS proxy server and the DCE/RPC server can be on the same host or on different hosts. Separate proxy and server options provide for both cases. Note the following in the figure:

• The DCE/RPC server monitors port 593 for DCE/RPC client traffic, but the firewall blocks port 593. Firewalls typically block port 593 by default.

• RPC over HTTP transports DCE/RPC over HTTP using well-known HTTP port 80, which firewalls are likely to permit.

• Example 1 shows that you would choose the **RPC over HTTP proxy** option to monitor traffic between the DCE/RPC client and the Microsoft IIS RPC proxy server.

• Example 2 shows that you would choose the **RPC over HTTP server** option when the Microsoft IIS RPC proxy server and the DCE/RPC server are located on different hosts and the device monitors traffic between the two servers.
• Traffic is comprised solely of connection-oriented DCE/RPC over TCP after RPC over HTTP completes the proxied setup between the DCE/RPC client and server.

DCE/RPC Global Options

Global DCE/RPC preprocessor options control how the preprocessor functions. Note that, except for the Memory Cap Reached and Auto-Detect Policy on SMB Session options, modifying these options could have a negative impact on performance or detection capability. You should not modify them unless you have a thorough understanding of the preprocessor and the interaction between the preprocessor and enabled DCE/RPC rules.

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

Maximum Fragment Size

When Enable Defragmentation is selected, specifies the maximum DCE/RPC fragment length allowed. The preprocessor truncates larger fragments for processing purposes to the specified size before defragmenting but does not alter the actual packet. A blank field disables this option.

Make sure that the Maximum Fragment Size option is greater than or equal to the depth to which the rules need to detect.

Reassembly Threshold

When Enable Defragmentation is selected, 0 disables this option, or specifies a minimum number of fragmented DCE/RPC bytes and, if applicable, segmented SMB bytes to queue before sending a reassembled packet to the rules engine. A low value increases the likelihood of early detection but could have a negative impact on performance. You should test for performance impact if you enable this option.

Make sure that the Reassembly Threshold option is greater than or equal to the depth to which the rules need to detect.

Enable Defragmentation

Specifies whether to defragment fragmented DCE/RPC traffic. When disabled, the preprocessor still detects anomalies and sends DCE/RPC data to the rules engine, but at the risk of missing exploits in fragmented DCE/RPC data.

Although this option provides the flexibility of not defragmenting DCE/RPC traffic, most DCE/RPC exploits attempt to take advantage of fragmentation to hide the exploit. Disabling this option would bypass most known exploits, resulting in a large number of false negatives.

Memory Cap Reached

Detects when the maximum memory limit allocated to the preprocessor is reached or exceeded. When the maximum memory cap is reached or exceeded, the preprocessor frees all pending data associated with the session that caused the memory cap event and ignores the rest of that session.

You can enable rule 133:1 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.
Auto-Detect Policy on SMB Session

Detects the Windows or Samba version that is identified in SMB Session Setup AndX requests and responses. When the detected version is different from the Windows or Samba version configured for the Policy configuration option, the detected version overrides the configured version for that session only.

For example, if you set Policy to Windows XP and the preprocessor detects Windows Vista, the preprocessor uses a Windows Vista policy for that session. Other settings remain in effect.

When the DCE/RPC transport is not SMB (that is, when the transport is TCP or UDP), the version cannot be detected and the policy cannot be automatically configured.

To enable this option, choose one of the following from the drop-down list:

- Choose Client to inspect server-to-client traffic for the policy type.
- Choose Server to inspect client-to-server traffic for the policy type.
- Choose Both to inspect server-to-client and client-to-server traffic for the policy type.

Legacy SMB Inspection Mode

Specifies which SMB versions to inspect. When Legacy SMB Inspection Mode is enabled, the DCE/RPC preprocessor inspects only SMB Version 1 traffic. When this option is disabled, the DCE/RPC preprocessor inspects traffic that uses SMB Versions 1, 2, and 3.

Related Topics

- Basic content and protected_content Keyword Arguments, on page 1393
- Overview: The byte_jump and byte_test Keywords

DCE/RPC Target-Based Policy Options

In each target-based policy, you can enable one or more of the TCP, UDP, SMB, and RPC over HTTP transports. When you enable a transport, you must also specify one or more detection ports, that is, ports that are known to carry DCE/RPC traffic.

Cisco recommends that you use the default detection ports, which are either well-known ports or otherwise commonly-used ports for each protocol. You would add detection ports only if you detected DCE/RPC traffic on a non-default port.

You can specify ports for one or more transports in any combination in a Windows target-based policy to match the traffic on your network, but you can only specify ports for the SMB transport in a Samba target-based policy.

Note

You must enable at least one DCE/RPC transport in the default target-based policy except when you have added a DCE/RPC target-based policy that has at least one transport enabled. For example, you might want to specify the hosts for all DCE/RPC implementations and not have the default target-based policy deploy to unspecified hosts, in which case you would not enable a transport for the default target-based policy.

Optionally, you can also enable and specify auto-detection ports, that is, ports that the preprocessor tests first to determine if they carry DCE/RPC traffic and continues processing only when it detects DCE/RPC traffic.

When you enable auto-detection ports, ensure that they are set to the port range from 1025 to 65535 to cover the entire ephemeral port range.
Note that auto-detection occurs only for ports not already identified by transport detection ports.

It is unlikely that you would enable or specify auto-detection ports for the RPC over HTTP Proxy Auto-Detect Ports option or the SMB Auto-Detect Ports option because there is little likelihood that traffic for either would occur or even be possible except on the specified default detection ports.

Each target-based policy allows you to specify the various options below. If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

**Networks**

The host IP addresses where you want to deploy the DCE/RPC target-based server policy. Also named the Server Address field in the Add Target pop-up window when you add a target-based policy.

You can specify a single IP address or address block, or a comma-separated list of either or both. You can configure up to 255 total profiles including the default policy.

---

**Note**

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Note that the default setting in the default policy specifies all IP addresses on your monitored network segment that are not covered by another target-based policy. Therefore, you cannot and do not need to specify an IP address or CIDR block/prefix length for the default policy, and you cannot leave this setting blank in another policy or use address notation to represent any (for example, 0.0.0.0/0 or ::/0).

**Policy**

The Windows or Samba DCE/RPC implementation used by the targeted host or hosts on your monitored network segment.

Note that you can enable the Auto-Detect Policy on SMB Session global option to automatically override the setting for this option on a per session basis when SMB is the DCE/RPC transport.

**SMB Invalid Shares**

Identifies one or more SMB shared resources the preprocessor will detect when there is an attempt to connect to a shared resource that you specify. You can specify multiple shares in a comma-separated list and, optionally, you can enclose shares in quotes, which was required in previous software versions but is no longer required; for example:

```
"C$", D$, "admin", private
```

The preprocessor detects invalid shares in SMB traffic when you have enabled SMB Ports.

Note that in most cases you should append a dollar sign to a drive named by Windows that you identify as an invalid share. For example, identify drive C as C$ or "C$".

Note also that to detect SMB invalid shares, you must also enable SMB Ports or SMB Auto-Detect Ports.

You can enable rule 133:26 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.
**SMB Maximum AndX Chain**

The maximum number of chained SMB AndX commands to permit. Typically, more than a few chained AndX commands represent anomalous behavior and could indicate an evasion attempt. Specify 1 to permit no chained commands or 0 to disable detecting the number of chained commands.

Note that the preprocessor first counts the number of chained commands and generates an event if accompanying SMB preprocessor rules are enabled and the number of chained commands equals or exceeds the configured value. It then continues processing.

⚠️ **Caution**

Only someone who is expert in the SMB protocol should modify the setting for the **SMB Maximum AndX Chains** option.

You can enable rule 133:20 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

**RPC proxy traffic only**

Enabling **RPC over HTTP Proxy Ports** indicates whether detected client-side RPC over HTTP traffic is proxy traffic only or might include other web server traffic. For example, port 80 could carry both proxy and other web server traffic.

When this option is disabled, both proxy and other web server traffic are expected. Enable this option, for example, if the server is a dedicated proxy server. When enabled, the preprocessor tests traffic to determine if it carries DCE/RPC, ignores the traffic if it does not, and continues processing if it does. Note that enabling this option adds functionality only if the **RPC over HTTP Proxy Ports** check box is also enabled.

**RPC over HTTP Proxy Ports**

Enables detection of DCE/RPC traffic tunneled by RPC over HTTP over each specified port when your managed device is positioned between the DCE/RPC client and the Microsoft IIS RPC proxy server.

When enabled, you can add any ports where you see DCE/RPC traffic, although this is unlikely to be necessary because web servers typically use the default port for both DCE/RPC and other traffic. When enabled, you would not enable **RPC over HTTP Proxy Auto-Detect Ports**, but you would enable the **RPC Proxy Traffic Only** when detected client-side RPC over HTTP traffic is proxy traffic only and does not include other web server traffic.

⚠️ **Note**

You would rarely, if ever, select this option.

**RPC over HTTP Server Ports**

Enables detection of DCE/RPC traffic tunneled by RPC over HTTP on each specified port when the Microsoft IIS RPC proxy server and the DCE/RPC server are located on different hosts and the device monitors traffic between the two servers.

Typically, when you enable this option you should also enable **RPC over HTTP Server Auto-Detect Ports** with a port range from 1025 to 65535 for that option even if you are not aware of any proxy web servers on your network. Note that the RPC over HTTP server port is sometimes reconfigured, in which case you should add the reconfigured server port to port list for this option.
TCP Ports

Enables detection of DCE/RPC traffic in TCP on each specified port.

Legitimate DCE/RPC traffic and exploits might use a wide variety of ports, and other ports above port 1024 are common. Typically, when this option is enabled you should also enable TCP Auto-Detect Ports with a port range from 1025 to 65535 for that option.

UDP Ports

Enables detection of DCE/RPC traffic in UDP on each specified port.

Legitimate DCE/RPC traffic and exploits might use a wide variety of ports, and other ports above port 1024 are common. Typically, when this option is enabled you should also enable UDP Auto-Detect Ports with a port range from 1025 to 65535 for that option.

SMB Ports

Enables detection of DCE/RPC traffic in SMB on each specified port.

You could encounter SMB traffic using the default detection ports. Other ports are rare. Typically, use the default settings.

Note that you can enable the Auto-Detect Policy on SMB Session global option to automatically override the policy type configured for a targeted policy on a per session basis when SMB is the DCE/RPC transport.

RPC over HTTP Proxy Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic tunneled by RPC over HTTP on the specified ports when your managed device is positioned between the DCE/RPC client and the Microsoft IIS RPC proxy server.

When enabled, you would typically specify a port range from 1025 to 65535 to cover the entire range of ephemeral ports.

RPC over HTTP Server Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic tunneled by RPC over HTTP on the specified ports when the Microsoft IIS RPC proxy server and the DCE/RPC server are located on different hosts and the device monitors traffic between the two servers.

TCP Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic in TCP on the specified ports.

UDP Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic in UDP on each specified port.

SMB Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic in SMB.

---

Note

You would rarely, if ever, select this option.
SMB File Inspection

Enables inspection of SMB traffic for file detection. You have the following options:

- Select Off to disable file inspection.
- Select Only to inspect file data without inspecting the DCE/RPC traffic in SMB. Selecting this option can improve performance over inspecting both files and DCE/RPC traffic.
- Select On to inspect both files and the DCE/RPC traffic in SMB. Selecting this option can impact performance.

Inspection of SMB traffic for the following is not supported:

- files transferred in an established TCP or SMB session before this option is enabled and the policy applied
- files transferred concurrently in a single TCP or SMB session
- files transferred across multiple TCP or SMB sessions
- files transferred with non-contiguous data, such as when message signing is negotiated
- files transferred with different data at the same offset, overlapping the data
- files opened on a remote client for editing that the client saves to the file server

SMB File Inspection Depth

If SMB File Inspection is set to Only or On, the number of bytes inspected when a file is detected in SMB traffic. Specify one of the following:

- a positive value
- 0 to inspect the entire file
- -1 to disable file inspection

Enter a value in this field equal to or smaller than the one defined in the File and Malware Settings section of the Advanced tab in your access control policy. If you set a value for this option larger than the one defined for Limit the number of bytes inspected when doing file type detection, the system uses the access control policy setting as the functional maximum.

If SMB File Inspection is set to Off, this field is disabled.

Traffic-Associated DCE/RPC Rules

Most DCE/RPC preprocessor rules trigger against anomalies and evasion techniques detected in SMB, connection-oriented DCE/RPC, or connectionless DCE/RPC traffic. The following table identifies the rules that you can enable for each type of traffic.
Table 190: Traffic-Associated DCE/RPC Rules

<table>
<thead>
<tr>
<th>Traffic</th>
<th>Preprocessor Rule GID:SID</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMB</td>
<td>133:2 through 133:26, and 133:48 through 133:57</td>
</tr>
<tr>
<td>Connection-Oriented DCE/RPC</td>
<td>133:27 through 133:39</td>
</tr>
<tr>
<td>Detect Connectionless DCE/RPC</td>
<td>133:40 through 133:43</td>
</tr>
</tbody>
</table>

Configuring the DCE/RPC Preprocessor

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You configure the DCE/RPC preprocessor by modifying any of the global options that control how the preprocessor functions, and by specifying one or more target-based server policies that identify the DCE/RPC servers on your network by IP address and by either the Windows or Samba version running on them. Target-based policy configuration also includes enabling transport protocols, specifying the ports carrying DCE/RPC traffic to those hosts, and setting other server-specific options.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Before you begin

- Confirm that networks you want to identify in a custom target-based policy match or are a subset of the networks, zones, and VLANs handled by its parent network analysis policy. See Advanced Settings for Network Analysis Policies, on page 1497 for more information.

Procedure

**Step 1** Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2** Click the edit icon (🛠️) next to the policy you want to edit.

If a view icon (📖) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click Settings in the navigation panel on the left.

**Step 4** If DCE/RPC Configuration under Application Layer Preprocessors is disabled, click Enabled.

**Step 5** Click the edit icon (🛠️) next to DCE/RPC Configuration.
Step 6 Modify the options in the **Global Settings** section; see DCE/RPC Global Options, on page 1515.

Step 7 You have the following choices:

- Add a server profile — Click the add icon ( ) next to **Servers**. Specify one or more IP addresses in the **Server Address** field, then click **OK**.
- Delete a server profile — Click the delete icon ( ) next to the policy.
- Edit a server profile — Click the configured address for the profile under **Servers**, or click **default**. You can modify any of the settings in the **Configuration** section; see DCE/RPC Target-Based Policy Options, on page 1516.

Step 8 To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

---

**What to do next**

- If you want to generate intrusion events, enable DCE/RPC preprocessor rules (GID 132 or 133). For more information, see Setting Intrusion Rule States, on page 1331, DCE/RPC Global Options, on page 1515, DCE/RPC Target-Based Policy Options, on page 1516, and Traffic-Associated DCE/RPC Rules, on page 1520.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**The DNS Preprocessor**

The DNS preprocessor inspects DNS name server responses for the following specific exploits:

- Overflow attempts on RData text fields
- Obsolete DNS resource record types
- Experimental DNS resource record types

The most common type of DNS name server response provides one or more IP addresses that correspond to domain names in the query that prompted the response. Other types of server responses provide, for example, the destination of an email message or the location of a name server that can provide information not available from the server originally queried.

A DNS response is comprised of:

- a message header
• a Question section that contains one or more requests
• three sections that respond to requests in the Question section
  • Answer
  • Authority
  • Additional Information.

Responses in these three sections reflect the information in resource records (RR) maintained on the name server. The following table describes these three sections.

Table 19: DNS Name Server RR Responses

<table>
<thead>
<tr>
<th>This section...</th>
<th>Includes...</th>
<th>For example...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answer</td>
<td>Optionally, one or more resource records that provide a specific answer to a query</td>
<td>The IP address corresponding to a domain name</td>
</tr>
<tr>
<td>Authority</td>
<td>Optionally, one or more resource records that point to an authoritative name server</td>
<td>The name of an authoritative name server for the response</td>
</tr>
<tr>
<td>Additional Information</td>
<td>Optionally, one or more resource records that provided additional information related to the Answer sections</td>
<td>The IP address of another server to query</td>
</tr>
</tbody>
</table>

There are many types of resource records, all adhering to the following structure:

```
| Name | Type | Class | TTL | RData Length | RData |
```

Theoretically, any type of resource record can be used in the Answer, Authority, or Additional Information section of a name server response message. The DNS preprocessor inspects any resource record in each of the three response sections for the exploits it detects.

The Type and RData resource record fields are of particular importance to the DNS preprocessor. The Type field identifies the type of resource record. The RData (resource data) field provides the response content. The size and content of the RData field differ depending on the type of resource record.

DNS messages typically use the UDP transport protocol but also use TCP when the message type requires reliable delivery or the message size exceeds UDP capabilities. The DNS preprocessor inspects DNS server responses in both UDP and TCP traffic.

The DNS preprocessor does not inspect TCP sessions picked up in midstream, and ceases inspection if a session loses state because of dropped packets.
DNS Preprocessor Options

**Ports**
This field specifies the source port or ports the DNS preprocessor should monitor for DNS server responses. Separate multiple ports with commas.

The typical port to configure for the DNS preprocessor is well-known port 53, which DNS name servers use for DNS messages in both UDP and TCP.

**Detect Overflow attempts on RData Text fields**
When the resource record type is TXT (text), the RData field is a variable-length ASCII text field.

When selected, this option detects a specific vulnerability identified by entry CVE-2006-3441 in MITRE’s Current Vulnerabilities and Exposures database. This is a known vulnerability in Microsoft Windows 2000 Service Pack 4, Windows XP Service Pack 1 and Service Pack 2, and Windows Server 2003 Service Pack 1. An attacker can exploit this vulnerability and take complete control of a host by sending or otherwise causing the host to receive a maliciously crafted name server response that causes a miscalculation in the length of an RData text field, resulting in a buffer overflow.

You should enable this option when your network might include hosts running operating systems that have not been upgraded to correct this vulnerability.

You can enable rule 131:3 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

**Detect Obsolete DNS RR Types**
RFC 1035 identifies several resource record types as obsolete. Because these are obsolete record types, some systems do not account for them and may be open to exploits. You would not expect to encounter these record types in normal DNS responses unless you have purposely configured your network to include them.

You can configure the system to detect known obsolete resource record types. The following table lists and describes these record types.

<table>
<thead>
<tr>
<th>RR Type</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>MD</td>
<td>a mail destination</td>
</tr>
<tr>
<td>4</td>
<td>MF</td>
<td>a mail forwarder</td>
</tr>
</tbody>
</table>

You can enable rule 131:1 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

**Detecting Experimental DNS RR Types**
RFC 1035 identifies several resource record types as experimental. Because these are experimental record types, some systems do not account for them and may be open to exploits. You would not expect to encounter these record types in normal DNS responses unless you have purposely configured your network to include them.
You can configure the system to detect known experimental resource record types. The following table lists and describes these record types.

<table>
<thead>
<tr>
<th>RR Type</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>MB</td>
<td>a mailbox domain name</td>
</tr>
<tr>
<td>8</td>
<td>MG</td>
<td>a mail group member</td>
</tr>
<tr>
<td>9</td>
<td>MR</td>
<td>a mail rename domain name</td>
</tr>
<tr>
<td>10</td>
<td>NUL</td>
<td>a null resource record</td>
</tr>
</tbody>
</table>

You can enable rule 131:2 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Configuring the DNS Preprocessor

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Procedure

**Step 1**  
Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

**Note**  
If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2**  
Click the edit icon (-pencil) next to the policy you want to edit.

If a view icon (-eye) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3**  
Click Settings in the navigation panel.

**Step 4**  
If DNS Configuration under Application Layer Preprocessors is disabled, click Enabled.

**Step 5**  
Click the edit icon (-pencil) next to DNS Configuration.

**Step 6**  
Modify the settings described in DNS Preprocessor Options, on page 1524.

**Step 7**  
To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.
If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

What to do next

- If you want to generate intrusion events, enable DNS preprocessor rules (GID 131). For more information, see Setting Intrusion Rule States, on page 1331 and DNS Preprocessor Options, on page 1524.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics
- Layers in Intrusion and Network Analysis Policies, on page 1291

The FTP/Telnet Decoder

The FTP/Telnet decoder analyzes FTP and telnet data streams, normalizing FTP and telnet commands before processing by the rules engine.

Global FTP and Telnet Options

You can set global options to determine whether the FTP/Telnet decoder performs stateful or stateless inspection of packets, whether the decoder detects encrypted FTP or telnet sessions, and whether the decoder continues to check a data stream after it encounters encrypted data.

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

Stateful Inspection

When selected, causes the FTP/Telnet decoder to save state and provide session context for individual packets and only inspect reassembled sessions. When cleared, analyzes each individual packet without session context.

To check for FTP data transfers, this option must be selected.

Detect Encrypted Traffic

Detects encrypted telnet and FTP sessions.

You can enable rules 125:7 and 126:2 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Continue to Inspect Encrypted Data

Instructs the preprocessor to continue checking a data stream after it is encrypted, looking for eventual decrypted data that can be processed.
Telnet Options

You can enable or disable normalization of telnet commands by the FTP/Telnet decoder, enable or disable a specific anomaly case, and set the threshold number of Are You There (AYT) attacks to permit.

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

Ports

Indicates the ports whose telnet traffic you want to normalize. Telnet typically connects to TCP port 23. In the interface, list multiple ports separated by commas.

Caution

Because encrypted traffic (SSL) cannot be decoded, adding port 22 (SSH) could yield unexpected results.

Normalize

Normalizes telnet traffic to the specified ports.

Detect Anomalies

Enables detection of Telnet SB (subnegotiation begin) without the corresponding SE (subnegotiation end).

Telnet supports subnegotiation, which begins with SB (subnegotiation begin) and must end with an SE (subnegotiation end). However, certain implementations of Telnet servers will ignore the SB without a corresponding SE. This is anomalous behavior that could be an evasion case. Because FTP uses the Telnet protocol on the control connection, it is also susceptible to this behavior.

You can enable rule 126:3 to generate an event and, in an inline deployment, drop offending packets when this anomaly is detected in Telnet traffic, and rule 125:9 when it is detected on the FTP command channel. See Setting Intrusion Rule States, on page 1331.

Are You There Attack Threshold Number

Detects when the number of consecutive AYT commands exceeds the specified threshold. Cisco recommends that you set the AYT threshold to a value no higher than the default value.

You can enable rule 126:1 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Server-Level FTP Options

You can set options for decoding on multiple FTP servers. Each server profile you create contains the server IP address and the ports on the server where traffic should be monitored. You can specify which FTP commands to validate and which to ignore for a particular server, and set maximum parameter lengths for commands. You can also set the specific command syntax the decoder should validate against for particular commands and set alternate maximum command parameter lengths.

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.
**Networks**

Use this option to specify one or more IP addresses of FTP servers.

You can specify a single IP address or address block, or a comma-separated list comprised of either or both. You can configure up to 1024 characters, and you can specify up to 255 profiles including the default profile.

---

**Note**

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Note that the `default` setting in the default policy specifies all IP addresses on your monitored network segment that are not covered by another target-based policy. Therefore, you cannot and do not need to specify an IP address or address block for the default policy, and you cannot leave this setting blank in another policy or use address notation to represent any (for example, 0.0.0.0/0 or ::/0).

**Ports**

Use this option to specify the ports on the FTP server where the managed device should monitor traffic. In the interface, list multiple ports separated by commas. Port 21 is the well-known port for FTP traffic.

**File Get Commands**

Use this option to define the FTP commands used to transfer files from server to client. Do not change these values unless directed to do so by Support.

---

**Caution**

Do not modify the `File Get Commands` field unless directed to by Support.

**File Put Commands**

Use this option to define the FTP commands used to transfer files from client to server. Do not change these values unless directed to do so by Support.

---

**Caution**

Do not modify the `File Put Commands` field unless directed to by Support.

**Additional FTP Commands**

Use this line to specify the additional commands that the decoder should detect. Separate additional commands by spaces.

Additional commands you may want to add include `XPWD`, `XCWD`, `XCUF`, `XMKD`, and `XRMD`. For more information on these commands, see RFC 775, the Directory oriented FTP commands specification by the Network Working Group.

**Default Max Parameter Length**

Use this option to detect the maximum parameter length for commands where an alternate maximum parameter length has not been set. You can add as many alternative maximum parameter lengths as needed.
You can enable rule 125:3 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

**Alternate Max Parameter Length**

Use this option to specify commands where you want to detect a different maximum parameter length, and to specify the maximum parameter length for those commands. Click Add to add lines where you can specify a different maximum parameter length to detect for particular commands.

**Check Commands for String Format Attacks**

Use this option to check the specified commands for string format attacks.

You can enable rule 125:5 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

**Command Validity**

Use this option to enter a valid format for a specific command. Click Add to add a command validation line.

You can enable rules 125:2 and 125:4 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

**Ignore FTP Transfers**

Use this option to improve performance on FTP data transfers by disabling all inspection other than state inspection on the data transfer channel.

To inspect data transfers, the global FTP/Telnet Stateful Inspection option must be selected.

**Detect Telnet Escape Codes within FTP Commands**

Use this option to detect when telnet commands are used over the FTP command channel.

You can enable rule 125:1 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

**Ignore Erase Commands during Normalization**

When Detect Telnet Escape Codes within FTP Commands is selected, use this option to ignore telnet character and line erase commands when normalizing FTP traffic. The setting should match how the FTP server handles telnet erase commands. Note that newer FTP servers typically ignore telnet erase commands, while older servers typically process them.

**Troubleshooting Option: Log FTP Command Validation Configuration**

Support might ask you during a troubleshooting call to configure your system to print the configuration information for each FTP command listed for the server.

Do not enable Log FTP Command Validation Configuration unless instructed to do so by Support.
FTP Command Validation Statements

When setting up a validation statement for an FTP command, you can specify a group of alternative parameters by separating the parameters with spaces. You can also create a binary OR relationship between two parameters by separating them with a pipe character (|) in the validation statement. Surrounding parameters by square brackets ([ ]) indicates that those parameters are optional. Surrounding parameters with curly brackets ({} ) indicates that those parameters are required.

You can create FTP command parameter validation statements to validate the syntax of a parameter received as part of an FTP communication.

Any of the parameters listed in the following table can be used in FTP command parameter validation statements.

Table 194: FTP Command Parameters

<table>
<thead>
<tr>
<th>If you use...</th>
<th>The following validation occurs...</th>
</tr>
</thead>
<tbody>
<tr>
<td>int</td>
<td>The represented parameter must be an integer.</td>
</tr>
<tr>
<td>number</td>
<td>The represented parameter must be an integer between 1 and 255.</td>
</tr>
<tr>
<td>char _chars</td>
<td>The represented parameter must be a single character and a member of the characters specified in the _chars argument. For example, defining the command validity for MODE with the validation statement char SBC checks that the parameter for the MODE command comprises the character S (representing Stream mode), the character B (representing Block mode), or the character C (representing Compressed mode).</td>
</tr>
</tbody>
</table>
| date _datefmt | If _datefmt contains #, the represented parameter must be a number.  
If _datefmt contains C, the represented parameter must be a character.  
If _datefmt contains literal strings, the represented parameter must match the literal string. |
| string        | The represented parameter must be a string. |
| host_port     | The represented parameter must be a valid host port specifier as defined by RFC 959, the File Transfer Protocol specification by the Network Working Group. |

You can combine the syntax in the table above as needed to create parameter validation statements that correctly validate each FTP command where you need to validate traffic.

Note

When you include a complex expression in a TYPE command, surround it by spaces. Also, surround each operand within the expression by spaces. For example, type char A | B , not char A|B.
Client-Level FTP Options

Use these options to configure custom FTP client profiles. If an option description does not include a preprocessor rule, the option is not associated with a preprocessor rule.

Networks

Use this option to specify one or more IP addresses of FTP clients.

You can specify a single IP address or address block, or a comma-separated list comprised of either or both. You can specify up to 1024 characters, and you can specify up to 255 profiles including the default profile.

Note

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Note that the default setting in the default policy specifies all IP addresses on your monitored network segment that are not covered by another target-based policy. Therefore, you cannot and do not need to specify an IP address or address block for the default policy, and you cannot leave this setting blank in another policy or use address notation to represent any (for example, 0.0.0.0/0 or ::/0).

Max Response Length

Use this option to specify the maximum allowed response length to an FTP command accepted by the client. This can detect basic buffer overflows.

You can enable rule 125:6 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Detect FTP Bounce Attempts

Use this option to detect FTP bounce attacks.

You can enable rule 125:8 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Allow FTP Bounce to

Use this option to configure a list of additional hosts and ports on those hosts on which FTP PORT commands should not be treated as FTP bounce attacks.

Detect Telnet Escape Codes within FTP Commands

Use this option to detect when telnet commands are used over the FTP command channel.

You can enable rule 125:1 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.
Ignore Erase Commands During Normalization

When Detect Telnet Escape Codes within FTP Commands is selected, use this option to ignore telnet character and line erase commands when normalizing FTP traffic. The setting should match how the FTP client handles telnet erase commands. Note that newer FTP clients typically ignore telnet erase commands, while older clients typically process them.

Configuring the FTP/Telnet Decoder

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

You can configure client profiles for FTP clients to monitor FTP traffic from clients.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Before you begin

- Confirm that any networks you want to identify in a custom target-based policy match or are a subset of the networks, zones, and VLANs handled by its parent network analysis policy. See Advanced Settings for Network Analysis Policies, on page 1497 for more information.

Procedure

**Step 1**
Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

**Note**
If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2**
Click the edit icon (📝) next to the policy you want to edit.

If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3**
Click Settings in the navigation panel.

**Step 4**
If FTP and Telnet Configuration under Application Layer Preprocessors is disabled, click Enabled.

**Step 5**
Click the edit icon (📝) next to FTP and Telnet Configuration.

**Step 6**
Set options in the Global Settings section as described in Global FTP and Telnet Options, on page 1526.

**Step 7**
Set options in the Telnet Settings section as described in Telnet Options, on page 1527.

**Step 8**
Manage FTP server profiles:
The HTTP Inspect Preprocessor

The HTTP Inspect preprocessor is responsible for:

- decoding and normalizing HTTP requests sent to and HTTP responses received from web servers on your network
- separating messages sent to web servers into URI, non-cookie header, cookie header, method, and message body components to improve performance of HTTP-related intrusion rules
• separating messages received from web servers into status code, status message, non-set-cookie header, cookie header, and response body components to improve performance of HTTP-related intrusion rules
• detecting possible URI-encoding attacks
• making the normalized data available for additional rule processing

HTTP traffic can be encoded in a variety of formats, making it difficult for rules to appropriately inspect. HTTP Inspect decodes 14 types of encoding, ensuring that your HTTP traffic gets the best inspection possible.

You can configure HTTP Inspect options globally, on a single server, or for a list of servers.

Note that the preprocessor engine performs HTTP normalization statelessly. That is, it normalizes HTTP strings on a packet-by-packet basis, and can only process HTTP strings that have been reassembled by the TCP stream preprocessor.

Global HTTP Normalization Options

The global HTTP options provided for the HTTP Inspect preprocessor control how the preprocessor functions. Use these options to enable or disable HTTP normalization when ports not specified as web server ports receive HTTP traffic.

Note the following:

• If you enable Unlimited Decompression, the Maximum Compressed Data Depth and Maximum Decompressed Data Depth options are automatically set to 65535 when you commit your changes.

• The highest value is used when the values for Maximum Compressed Data Depth or Maximum Decompressed Data Depth are different in:
  • the default network analysis policy
  • any other custom network analysis policy invoked by network analysis rules in the same access control policy

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

Detect Anomalous HTTP Servers

Detects HTTP traffic sent to or received by ports not specified as web server ports.

Note

If you turn this option on, be sure to list all ports that do receive HTTP traffic in a server profile on the HTTP Configuration page. If you do not, and you enable this option and the accompanying preprocessor rule, normal traffic to and from the server will generate events. The default server profile contains all ports normally used for HTTP traffic, but if you modified that profile, you may need to add those ports to another profile to prevent events from being generated.

You can enable rule 120:1 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.
Detect HTTP Proxy Servers
 Detects HTTP traffic using proxy servers not defined by the Allow HTTP Proxy Use option.
 You can enable rule 119:17 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Maximum Compressed Data Depth
 Sets the maximum size of compressed data to decompress when Inspect Compressed Data (and, optionally, Decompress SWF File (LZMA), Decompress SWF File (Deflate), or Decompress PDF File (Deflate)) is enabled.

Maximum Decompressed Data Depth
 Sets the maximum size of the normalized decompressed data when Inspect Compressed Data (and, optionally, Decompress SWF File (LZMA), Decompress SWF File (Deflate), or Decompress PDF File (Deflate)) is enabled.

Server-Level HTTP Normalization Options

You can set server-level options for each server you monitor, globally for all servers, or for a list of servers. Additionally, you can use a predefined server profile to set these options, or you can set them individually to meet the needs of your environment. Use these options, or one of the default profiles that set these options, to specify the HTTP server ports whose traffic you want to normalize, the amount of server response payload you want to normalize, and the types of encoding you want to normalize.

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

Networks
 Use this option to specify the IP address of one or more servers. You can specify a single IP address or address block, or a comma-separated list comprised of either or both.

In addition to a limit of up to 255 total profiles, including the default profile, you can include up to 496 characters, or approximately 26 entries, in an HTTP server list, and specify a total of 256 address entries for all server profiles.

Note
The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Note that the default setting in the default policy specifies all IP addresses on your monitored network segment that are not covered by another target-based policy. Therefore, you cannot and do not need to specify an IP address or CIDR block/prefix length for the default policy, and you cannot leave this setting blank in another policy or use address notation to represent any (for example, 0.0.0.0/0 or ::/0).

Ports
 The ports whose HTTP traffic the preprocessor engine normalizes. Separate multiple port numbers with commas.
**Oversize Dir Length**

Detects URL directories longer than the specified value.

You can enable rule 119:15 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

**Client Flow Depth**

Specifies the number of bytes for rules to inspect in raw HTTP packets, including header and payload data, in client-side HTTP traffic defined in Ports. Client flow depth does not apply when HTTP content rule options within a rule inspect specific parts of a request message.

Specify any of the following:

- A positive value inspects the specified number of bytes in the first packet. If the first packet contains fewer bytes than specified, inspect the entire packet. Note that the specified value applies to both segmented and reassembled packets.
  - Note also that a value of 300 typically eliminates inspection of large HTTP Cookies that appear at the end of many client request headers.

- 0 inspects all client-side traffic, including multiple packets in a session and exceeding the upper byte limit if necessary. Note that this value is likely to affect performance.

- -1 ignores all client-side traffic.

**Server Flow Depth**

Specifies the number of bytes for rules to inspect in raw HTTP packets in server-side HTTP traffic specified by Ports. Inspection includes the raw header and payload when Inspect HTTP Responses disabled and only the raw response body when Inspect HTTP Response is enabled.

Server flow depth specifies the number of bytes of raw server response data in a session for rules to inspect in server-side HTTP traffic defined in Ports. You can use this option to balance performance and the level of inspection of HTTP server response data. Server flow depth does not apply when HTTP content options within a rule inspect specific parts of a response message.

Unlike client flow depth, server flow depth specifies the number of bytes per HTTP response, not per HTTP request packet, for rules to inspect.

You can specify any of the following:

- A positive value:
  - When Inspect HTTP Responses is enabled, inspects only the raw HTTP response body, and not raw HTTP headers; also inspects decompressed data when Inspect Compressed Data is enabled.
  - When Inspect HTTP Responses is disabled, inspects the raw packet header and payload.

  If the session includes fewer response bytes than specified, rules fully inspect all response packets in a given session, across multiple packets as needed. If the session includes more response bytes than specified, rules inspect only the specified number of bytes for that session, across multiple packets as needed.

  Note that a small flow depth value may cause false negatives from rules that target server-side traffic defined in Ports. Most of these rules target either the HTTP header or content that is likely to be in the first hundred or so bytes of non-header data. Headers are usually under 300 bytes long, but header size may vary.
Note also that the specified value applies to both segmented and reassembled packets.

- 0 inspects the entire packet for all HTTP server-side traffic defined in **Ports**, including response data in a session that exceeds 65535 bytes.

  Note that this value is likely to affect performance.

- -1:
  
  When **Inspect HTTP Responses** is enabled, inspects only raw HTTP headers and not the raw HTTP response body.

  When **Inspect HTTP Responses** is disabled, ignores all server-side traffic defined in **Ports**.

**Maximum Header Length**

Detects a header field longer than the specified maximum number of bytes in an HTTP request; also in HTTP responses when **Inspect HTTP Responses** is enabled. A value of 0 disables this option. Specify a positive value to enable it.

You can enable rule 119:19 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331..

**Maximum Number of Headers**

Detects when the number of headers exceeds this setting in an HTTP request. A value of 0 disables this option. Specify a positive value to enable it.

You can enable rule 119:20 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331..

**Maximum Number of Spaces**

Detects when the number of white spaces in a folded line equals or exceeds this setting in an HTTP request. A value of 0 disables this option. Specify a positive value to enable it.

You can enable rule 119:26 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331..

**HTTP Client Body Extraction Depth**

Specifies the number of bytes to extract from the message body of an HTTP client request. You can use an intrusion rule to inspect the extracted data by selecting the **content** or **protected_content** keyword **HTTP Client Body** option.

Specify -1 to ignore the client body. Specify 0 to extract the entire client body. Note that identifying specific bytes to extract can improve system performance. Note also that you must specify a value greater than or equal to 0 for the **HTTP Client Body** option to function in an intrusion rule.

**Small Chunk Size**

Specifies the maximum number of bytes at which a chunk is considered small. Specify a positive value. A value of 0 disables detection of anomalous consecutive small segments. See the **Consecutive Small Chunks** option for more information.
**Consecutive Small Chunks**

Specifies how many consecutive small chunks represent an abnormally large number in client or server traffic that uses chunked transfer encoding. The Small Chunk Size option specifies the maximum size of a small chunk.

For example, set Small Chunk Size to 10 and Consecutive Small Chunks to 5 to detect 5 consecutive chunks of 10 bytes or less.

You can enable preprocessor rule 119:27 to generate events and, in an inline deployment, drop offending packets on excessive small chunks in client traffic, and rule 120:7 in server traffic. When Small Chunk Size is enabled and this option is set to 0 or 1, enabling these rules would trigger an event on every chunk of the specified size or less.

**HTTP Methods**

Specifies HTTP request methods in addition to GET and POST that you expect the system to encounter in traffic. Use a comma to separate multiple values.

Intrusion rules use the content or protected_content keyword with the HTTP Method argument to search for content in HTTP methods. You can enable rule 119:31 to generate events and, in an inline deployment, drop offending packets when a method other than GET, POST, or a method configured for this option is encountered in traffic. See Setting Intrusion Rule States, on page 1331.

**No Alerts**

Disables intrusion events when accompanying preprocessor rules are enabled.

---

**Note**

This option does not disable HTTP standard text rules and shared object rules.

---

**Normalize HTTP Headers**

When Inspect HTTP Responses is enabled, enables normalization of non-cookie data in request and response headers. When Inspect HTTP Responses is not enabled, enables normalization of the entire HTTP header, including cookies, in request and response headers.

**Inspect HTTP Cookies**

Enables extraction of cookies from HTTP request headers. Also enables extraction of set-cookie data from response headers when Inspect HTTP Responses is enabled. Disabling this option when cookie extraction is not required can improve performance.

Note that the Cookie: and Set-Cookie: header names, leading spaces on the header line, and the CRLF that terminates the header line are inspected as part of the header and not as part of the cookie.

**Normalize Cookies in HTTP headers**

Enables normalization of cookies in HTTP request headers. When Inspect HTTP Responses is enabled, also enables normalization of set-cookie data in response headers. You must select Inspect HTTP Cookies before selecting this options.
Allow HTTP Proxy Use

Allows the monitored web server to be used as an HTTP proxy. This option is used only in the inspection of HTTP requests.

Inspect URI Only

Inspects only the URI portion of the normalized HTTP request packet.

Inspect HTTP Responses

Enables extended inspection of HTTP responses so, in addition to decoding and normalizing HTTP request messages, the preprocessor extracts response fields for inspection by the rules engine. Enabling this option causes the system to extract the response header, body, status code, and so on, and also extracts set-cookie data when Inspect HTTP Cookies is enabled.

You can enable rules 120:2 and 120:3 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331..

Normalize UTF Encodings to UTF-8

When Inspect HTTP Responses is enabled, detects UTF-16LE, UTF-16BE, UTF-32LE, and UTF32-BE encodings in HTTP responses and normalizes them to UTF-8.

You can enable rule 120:4 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331..

Inspect Compressed Data

When Inspect HTTP Responses is enabled, enables decompression of gzip and deflate-compatible compressed data in the HTTP response body, and inspection of the normalized decompressed data. The system inspects chunked and non-chunked HTTP response data. The system inspects decompressed data packet by packet across multiple packets as needed; that is, the system does not combine the decompressed data from different packets for inspection. Decompression ends when Maximum Compressed Data Depth, Maximum Decompressed Data Depth, or the end of the compressed data is reached. Inspection of decompressed data ends when Server Flow Depth is reached unless you also select Unlimited Decompression. You can use the file_data rule keyword to inspect decompressed data.

You can enable rule 120:6 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331..

Unlimited Decompression

When Inspect Compressed Data (and, optionally, Decompress SWF File (LZMA), Decompress SWF File (Deflate), or Decompress PDF File (Deflate)) is enabled, overrides Maximum Decompressed Data Depth across multiple packets; that is, this option enables unlimited decompression across multiple packets. Note that enabling this option does not affect Maximum Compressed Data Depth or Maximum Decompressed Data Depth within a single packet. Note also that enabling this option sets Maximum Compressed Data Depth and Maximum Decompressed Data Depth to 65535 when you commit your changes.

Normalize Javascript

When Inspect HTTP Responses is enabled, enables detection and normalization of Javascript within the HTTP response body. The preprocessor normalizes obfuscated Javascript data such as the unescape and
decodeURI functions and the String.fromCharCode method. The preprocessor normalizes the following encodings within the unescape, decodeURI, and decodeURIComponent functions:

- %XX
- %uXXXX
- 0xXX
- \xXX
- \uXXXX

The preprocessor detects consecutive white spaces and normalizes them into a single space. When this option is enabled, a configuration field allows you to specify the maximum number of consecutive white spaces to permit in obfuscated Javascript data. You can enter a value from 1 to 65535. The value 0 disables event generation, regardless of whether the preprocessor rule (120:10) associated with this field is enabled.

The preprocessor also normalizes the Javascript plus (+) operator and concatenates strings using the operator. You can use the file_data intrusion rule keyword to point intrusion rules to the normalized Javascript data. You can enable rules 120:9, 120:10, and 120:11 to generate events and, in an inline deployment, drop offending packets, as follows:

**Table 195: Normalize Javascript Option Rules**

<table>
<thead>
<tr>
<th>This rule...</th>
<th>Triggers when...</th>
</tr>
</thead>
<tbody>
<tr>
<td>120:9</td>
<td>the obfuscation level within the preprocessor is greater than or equal to 2.</td>
</tr>
<tr>
<td>120:10</td>
<td>the number of consecutive white spaces in the Javascript obfuscated data is greater than or equal to the value configured for the maximum number of consecutive white spaces allowed.</td>
</tr>
<tr>
<td>120:11</td>
<td>escaped or encoded data includes more than one type of encoding.</td>
</tr>
</tbody>
</table>

**Decompress SWF File (LZMA) and Decompress SWF File (Deflate)**

When HTTP Inspect Responses is enabled, these options decompress the compressed portions of files located within the HTTP response body of HTTP requests.

**Note**

You can only decompress the compressed portions of files found in HTTP GET responses.

- **Decompress SWF File (LZMA)** decompresses the LZMA-compatible compressed portions of Adobe ShockWave Flash (.swf) files

- **Decompress SWF File (Deflate)** decompresses the deflate-compatible compressed portions of Adobe ShockWave Flash (.swf) files

Decompression ends when Maximum Compressed Data Depth, Maximum Decompressed Data Depth, or the end of the compressed data is reached. Inspection of decompressed data ends when Server Flow Depth
is reached unless you also select **Unlimited Decompression**. You can use the `file_data` intrusion rule keyword to inspect decompressed data.

You can enable rules 120:12 and 120:13 to generate events and, in an inline deployment, drop offending packets, as follows:

**Table 196: Decompress SWF File Option Rules**

<table>
<thead>
<tr>
<th>This rule...</th>
<th>Triggers when...</th>
</tr>
</thead>
<tbody>
<tr>
<td>120:12</td>
<td>deflate file decompression fails.</td>
</tr>
<tr>
<td>120:13</td>
<td>LZMA file decompression fails.</td>
</tr>
</tbody>
</table>

### Decompress PDF File (Deflate)

When **HTTP Inspect Responses** is enabled, **Decompress PDF File (Deflate)** decompresses the deflate-compatible compressed portions of Portable Document Format (.pdf) files located within the HTTP response body of HTTP requests. The system can only decompress PDF files with the `/FlateDecode` stream filter. Other stream filters (including `/FlateDecode /FlateDecode`) are unsupported.

**Note**

You can only decompress the compressed portions of files found in HTTP GET responses.

Decompression ends when **Maximum Compressed Data Depth**, **Maximum Decompressed Data Depth**, or the end of the compressed data is reached. Inspection of decompressed data ends when **Server Flow Depth** is reached unless you also select **Unlimited Decompression**. You can use the `file_data` intrusion rule keyword to inspect decompressed data.

You can enable rules 120:14, 120:15, 120:16, and 120:17 to generate events and, in an inline deployment, drop offending packets, as follows:

**Table 197: Decompress PDF File (Deflate) Option Rules**

<table>
<thead>
<tr>
<th>This rule...</th>
<th>Triggers when...</th>
</tr>
</thead>
<tbody>
<tr>
<td>120:14</td>
<td>file decompression fails.</td>
</tr>
<tr>
<td>120:15</td>
<td>file decompression fails due to an unsupported compression type.</td>
</tr>
<tr>
<td>120:16</td>
<td>file decompression fails due to an unsupported PDF stream filter.</td>
</tr>
<tr>
<td>120:17</td>
<td>file parsing fails.</td>
</tr>
</tbody>
</table>

### Extract Original Client IP Address

Enables the examination of original client IP addresses during intrusion inspection. The system extracts the original client IP address from the X-Forwarded-For (XFF), True-Client-IP, or custom HTTP headers you define in the **XFF Header Priority** option. You can view the extracted original client IP address in the intrusion events table.
You can enable rules 119:23, 119:29 and 119:30 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

**XFF Header Priority**

Specifies the order in which the system processes original client IP headers when multiple headers are present in an HTTP request. By default, the system examines X-Forwarded-For (XFF) headers, then True-Client-IP headers. Use the up and down arrow icons beside each header type to adjust its priority.

This option also allows you to specify original client IP headers other than XFF or True-Client-IP for extraction and evaluation. Click Add to add custom header names to the priority list. The system only supports custom headers that use the same syntax as an XFF or True-Client-IP header.

Keep in mind the following when configuring this option:

- The system uses this priority order when evaluating original client IP address headers for both access control and intrusion inspection.

- If multiple original client IP headers are present, the system processes only the header with the highest priority.

- The XFF header contains a list of IP addresses, which represent the proxy servers through which the request has passed. To prevent spoofing, the system uses the last IP address in the list (that is, the address appended by the trusted proxy) as the original client IP address.

**Log URI**

Enables extraction of the raw URI, if present, from HTTP request packets and associates the URI with all intrusion events generated for the session.

When this option is enabled, you can display the first fifty characters of the extracted URI in the HTTP URI column of the intrusion events table view. You can display the complete URI, up to 2048 bytes, in the packet view.

**Log Hostname**

Enables extraction of the host name, if present, from the HTTP request Host header and associates the host name with all intrusion events generated for the session. When multiple Host headers are present, extracts the host name from the first header.

When this option is enabled, you can display the first fifty characters of the extracted host name in the HTTP Hostname column of the intrusion events table view. You can display the complete host name, up to 256 bytes, in the packet view.

You can enable rule 119:25 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Note that, when enabled, rule 119:24 triggers if it detects multiple Host headers in an HTTP request, regardless of the setting for this option.

**Profile**

Specifies the types of encoding that are normalized for HTTP traffic. The system provides a default profile appropriate for most servers, default profiles for Apache servers and IIS servers, and custom default settings that you can tailor to meet the needs of your monitored traffic:

- Select All to use the standard default profile, appropriate for all servers.
• Select **IIS** to use the system-provided IIS profile.
• Select **Apache** to use the system-provided Apache profile.
• Select **Custom** to create your own server profile.

**Server-Level HTTP Normalization Encoding Options**

When you set the HTTP server-level **Profile** option to **Custom**, you can specify the types of encoding that are normalized for HTTP traffic, and enable HTTP preprocessor rules to generate events against traffic containing the different encoding types.

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

**ASCII Encoding**

Decodes encoded ASCII characters and specifies whether the rules engine generates an event on ASCII-encoded URIs.

You can enable rule 119:1 to generate events and, in an inline deployment, drop offending packets for this option. See **Setting Intrusion Rule States**, on page 1331.

**UTF-8 Encoding**

Decodes standard UTF-8 Unicode sequences in the URI.

You can enable rule 119:6 to generate events and, in an inline deployment, drop offending packets for this option. See **Setting Intrusion Rule States**, on page 1331.

**Microsoft %U Encoding**

Decodes the IIS %u encoding scheme that uses %u followed by four characters where the 4 characters are a hex encoded value that correlates to an IIS Unicode codepoint.

---

**Tip**

Legitimate clients rarely use %u encodings, so Cisco recommends decoding HTTP traffic encoded with %u encodings.

You can enable rule 119:3 to generate events and, in an inline deployment, drop offending packets for this option. See **Setting Intrusion Rule States**, on page 1331.

**Bare Byte UTF-8 Encoding**

Decodes bare byte encoding, which uses non-ASCII characters as valid values in decoding UTF-8 values.

---

**Tip**

Bare byte encoding allows the user to emulate an IIS server and interpret non-standard encodings correctly. Cisco recommends enabling this option because no legitimate clients encode UTF-8 this way.

You can enable rule 119:4 to generate events and, in an inline deployment, drop offending packets for this option. See **Setting Intrusion Rule States**, on page 1331.
Microsoft IIS Encoding

Decodes using Unicode codepoint mapping.

Tip

Cisco recommends enabling this option, because it is seen mainly in attacks and evasion attempts.

You can enable rule 119:7 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Double Encoding

Decodes IIS double encoded traffic by making two passes through the request URI performing decodes in each one. Cisco recommends enabling this option because it is usually found only in attack scenarios.

You can enable rule 119:2 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Multi-Slash Obfuscation

Normalizes multiple slashes in a row into a single slash.

You can enable rule 119:8 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

IIS Backslash Obfuscation

Normalizes backslashes to forward slashes.

You can enable rule 119:9 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Directory Traversal

Normalizes directory traversals and self-referential directories. If you enable the accompanying preprocessor rules to generate events against this type of traffic, it may generate false positives because some web sites refer to files using directory traversals.

You can enable rules 119:10 and 119:11 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Tab Obfuscation

Normalizes the non-RFC standard of using a tab for a space delimiter. Apache and other non-IIS web servers use the tab character (0x09) as a delimiter in URLs.

Note

Regardless of the configuration for this option, the HTTP Inspect preprocessor treats a tab as white space if a space character (0x20) precedes it.

You can enable rule 119:12 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.
Invalid RFC Delimiter

Normalizes line breaks (\n) in URI data.

You can enable rule 119:13 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Webroot Directory Traversal

Detects directory traversals that traverse past the initial directory in the URL.

You can enable rule 119:18 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Tab URI Delimiter

Turns on the use of the tab character (0x09) as a delimiter for a URI. Apache, newer versions of IIS, and some other web servers use the tab character as a delimiter in URLs.

Note

Regardless of the configuration for this option, the HTTP Inspect preprocessor treats a tab as white space if a space character (0x20) precedes it.

Non-RFC characters

Detects the non-RFC character list you add in the corresponding field when it appears within incoming or outgoing URI data. When modifying this field, use the hexadecimal format that represents the byte character. If and when you configure this option, set the value with care. Using a character that is very common may overwhelm you with events.

You can enable rule 119:14 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Max Chunk Encoding Size

Detects abnormally large chunk sizes in URI data.

You can enable rules 119:16 and 119:22 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Disable Pipeline Decoding

Disables HTTP decoding for pipelined requests. When this option is disabled, performance is enhanced because HTTP requests waiting in the pipeline are not decoded or analyzed, and are only inspected using generic pattern matching.

Non-Strict URI Parsing

Enables non-strict URI parsing. Use this option only on servers that will accept non-standard URIs in the format "GET /index.html abc xo qr \n". Using this option, the decoder assumes that the URI is between the first and second space, even if there is no valid HTTP identifier after the second space.
Extended ASCII Encoding

Enables parsing of extended ASCII characters in an HTTP request URI. Note that this option is available in custom server profiles only, and not in the default profiles provided for Apache, IIS, or all servers.

</tr>
</tbody>
</table>

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Before you begin

- Confirm that any networks you want to identify in a custom target-based policy match or are a subset of the networks, zones, and VLANs handled by its parent network analysis policy. See Advanced Settings for Network Analysis Policies, on page 1497 for more information.

Procedure

Step 1
Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

Note If your custom user role limits access to the first path listed here, use the second path to access the policy.

Step 2
Click the edit icon (✏️) next to the policy you want to edit.

If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3
Click Settings in the navigation panel.

Step 4
If HTTP Configuration under Application Layer Preprocessors is disabled, click Enabled.

Step 5
Click the edit icon (✏️) next to HTTP Configuration.

Step 6
Modify the options in the Global Settings page area; see Global HTTP Normalization Options, on page 1534.

Step 7
You have three choices:

- Add a server profile — Click the add icon (➕) in the Servers section. Specify one or more IP addresses for the client in the Server Address field, and click OK. You can specify a single IP address or address block, or a comma-separated list of either or both. You can include up to 496 characters in a list, specify
a total of 256 address entries for all server profiles, and create a total of 255 profiles including the default profile.

- Edit a server profile — Click the configured address for a profile you have added under Servers, or click default. You can modify any of the settings in the Configuration section; see Server-Level HTTP Normalization Options, on page 1535. If you choose Custom for the Profile value, you can also modify the encoding options described in Server-Level HTTP Normalization Encoding Options, on page 1543.

- Delete a server profile — Click the delete icon (.GONE) next to a custom profile.

**Step 8**

To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

---

**What to do next**

- If you want generate events and, in an inline deployment, drop offending packets, enable HTTP preprocessors rules (GID 119). For more information, see Setting Intrusion Rule States, on page 1331.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Additional HTTP Inspect Preprocessor Rules**

You can enable the rules in the Preprocessor Rule GID:SID column of the following table to generate events for HTTP Inspect preprocessor rules that are not associated with specific configuration options.

**Table 198: Additional HTTP Inspect Preprocessor Rules**

<table>
<thead>
<tr>
<th>Preprocessor Rule GID:SID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>120:5</td>
<td>Generates an event when UTF-7 encoding is encountered in HTTP response traffic; UTF-7 should only appear where 7-bit parity is required, such as in SMTP traffic.</td>
</tr>
<tr>
<td>119:21</td>
<td>Generates an event when an HTTP request header has more than one content-length field.</td>
</tr>
<tr>
<td>119:24</td>
<td>Generates an event when an HTTP request has more than one Host header.</td>
</tr>
<tr>
<td>119:28 120:8</td>
<td>When enabled, these rules do not generate events.</td>
</tr>
<tr>
<td>119:32</td>
<td>Generates an event when HTTP version 0.9 is encountered in traffic. Note that the TCP stream configuration must also be enabled.</td>
</tr>
</tbody>
</table>
The Sun RPC Preprocessor

Remote Procedure Call (RPC) normalization takes fragmented RPC records and normalizes them to a single record so the rules engine can inspect the complete record. For example, an attacker may attempt to discover the port where RPC admind runs. Some UNIX hosts use RPC admind to perform remote distributed system tasks. If the host performs weak authentication, a malicious user could take control of remote administration. The standard text rule (GID: 1) with the Snort ID (SID) 575 detects this attack by searching for content in specific locations to identify inappropriate portmap GETPORT requests.

Sun RPC Preprocessor Options

**Ports**

Specify the ports whose traffic you want to normalize. In the interface, list multiple ports separated by commas. Typical RPC ports are 111 and 32771. If your network sends RPC traffic to other ports, consider adding them.

**Detect fragmented RPC records**

Detects RPC fragmented records.

You can enable rules 106:1 and 106:5 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

**Detect multiple records in one packet**

Detects more than one RPC request per packet (or reassembled packet).

You can enable rule 106:2 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

**Detect fragmented record sums which exceed one fragment**

Detects reassembled fragment record lengths that exceed the current packet length.

You can enable rule 106:3 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

**Detect single fragment records which exceed the size of one packet**

Detects partial records

You can enable rule 106:4 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

**The SIP Preprocessor**

The Session Initiation Protocol (SIP) provides call setup, modification, and teardown of one or more sessions for one or more users of client applications such as Internet telephony, multimedia conferencing, instant messaging, online gaming, and file transfer. A *method* field in each SIP request identifies the purpose of the
request, and a Request-URI specifies where to send the request. A status code in each SIP response indicates the outcome of the requested action.

After calls are set up using SIP, the Real-time Transport Protocol (RTP) is responsible for subsequent audio and video communication; this part of the session is sometimes referred to as the call channel, the data channel, or the audio/video data channel. RTP uses the Session Description Protocol (SDP) within the SIP message body for data-channel parameter negotiation, session announcement, and session invitation.

The SIP preprocessor is responsible for:

* decoding and analyzing SIP 2.0 traffic
* extracting the SIP header and message body, including SDP data when present, and passing the extracted data to the rules engine for further inspection
* generating events when the following conditions are detected and the corresponding preprocessor rules are enabled:
  * anomalies and known vulnerabilities in SIP packets
  * out-of-order and invalid call sequences
* optionally, ignoring the call channel

The preprocessor identifies the RTP channel based on the port identified in the SDP message, which is embedded in the SIP message body, but the preprocessor does not provide RTP protocol inspection.

Note the following when using the SIP preprocessor:

* UDP typically carries media sessions supported by SIP. UDP stream preprocessing provides SIP session tracking for the SIP preprocessor.
* SIP rule keywords allow you to point to the SIP packet header or message body and to limit detection to packets for specific SIP methods or status codes.

### SIP Preprocessor Options

For the following options, you can specify a positive value from 1 to 65535 bytes, or 0 to disable event generation for the option regardless of whether the associated rule is enabled.

* Maximum Request URI Length
* Maximum Call ID Length
* Maximum Request Name Length
* Maximum From Length
* Maximum To Length
* Maximum Via Length
* Maximum Contact Length
* Maximum Content Length

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.
Ports

Specifies the ports to inspect for SIP traffic. You can specify an integer from 0 to 65535. Separate multiple port numbers with commas.

Methods to Check

Specifies SIP methods to detect. You can specify any of the following currently defined SIP methods:

ack, benotify, bye, cancel, do, info, invite, join, message, notify, options, prack, publish, quath, refer, register, service, sprack, subscribe, unsubscribe, update

Methods are case-insensitive. The method name can include alphabetic characters, numbers, and the underscore character. No other special characters are permitted. Separate multiple methods with commas.

Because new SIP methods might be defined in the future, your configuration can include an alphabetic string that is not currently defined. The system supports up to 32 methods, including the 21 currently defined methods and an additional 11 methods. The system ignores any undefined methods that you might configure.

Note that, in addition to any methods you specify for this option, the 32 total methods includes methods specified using the sip_method keyword in intrusion rules.

Maximum Dialogs within a Session

Specifies the maximum number of dialogs allowed within a stream session. If more dialogs than this number are created, the oldest dialogs are dropped until the number of dialogs does not exceed the maximum number specified. You can specify an integer from 1 to 4194303.

You can enable rule 140:27 to generate events and, in an inline deployment, drop offending packets for this option. See Setting Intrusion Rule States, on page 1331.

Maximum Request URI Length

Specifies the maximum number of bytes to allow in the Request-URI header field. A longer URI generates an event and, in an inline deployment, drops offending packets when rule 140:3 is enabled. The request URI field indicates the destination path or page for the request.

Maximum Call ID Length

Specifies the maximum number of bytes to allow in the request or response Call-ID header field. A longer Call-ID generates an event and, in an inline deployment, drops offending packets when rule 140:5 is enabled. The Call-ID field uniquely identifies the SIP session in requests and responses.

Maximum Request Name Length

Specifies the maximum number of bytes to allow in the request name, which is the name of the method specified in the CSeq transaction identifier. A longer request name generates an event and, in an inline deployment, drops offending packets when rule 140:7 is enabled.

Maximum From Length

Specifies the maximum number of bytes to allow in the request or response From header field. A longer From generates an event and, in an inline deployment, drops offending packets when rule 140:9 is enabled. The From field identifies the message initiator.
Maximum To Length
Specifies the maximum number of bytes to allow in the request or response To header field. A longer To generates an event and, in an inline deployment, drops offending packets when rule 140:11 is enabled. The To field identifies the message recipient.

Maximum Via Length
Specifies the maximum number of bytes to allow in the request or response Via header field. A longer Via generates an event and, in an inline deployment, drops offending packets when rule 140:13 is enabled. The Via field provides the path followed by the request and, in a response, receipt information.

Maximum Contact Length
Specifies the maximum number of bytes to allow in the request or response Contact header field. A longer Contact generates an event and, in an inline deployment, drops offending packets when rule 140:15 is enabled. The Contact field provides a URI that specifies the location to contact with subsequent messages.

Maximum Content Length
Specifies the maximum number of bytes to allow in the content of the request or response message body. Longer content generates an event and, in an inline deployment, drops offending packets when rule 140:16 is enabled.

Ignore Audio/Video Data Channel
Enables and disables inspection of data channel traffic. Note that the preprocessor continues inspection of other non-data-channel SIP traffic when you enable this option.

Configuring the SIP Preprocessor

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2** Click the edit icon (📝) next to the policy you want to edit.

If a view icon (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
Step 3  Click **Settings** in the navigation panel.

Step 4  If **SIP Configuration** under **Application Layer Preprocessors** is disabled, click **Enabled**.

Step 5  Click the edit icon (عائل) next to **SIP Configuration**.

Step 6  Modify the options described in **SIP Preprocessor Options, on page 1550**.

Step 7  To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

---

**What to do next**

- If you want to generate events and, in an inline deployment, drop offending packets, enable SIP preprocessor rules (GID 140). For more information, see **Setting Intrusion Rule States, on page 1331**.
- Deploy configuration changes; see **Deploy Configuration Changes, on page 279**.

---

**Additional SIP Preprocessor Rules**

The SIP preprocessor rules in the following table are not associated with specific configuration options. As with other SIP preprocessor rules, you must enable these rules if you want them to generate events and, in an inline deployment, drop offending packets.

<table>
<thead>
<tr>
<th>Preprocessor Rule GID:SID</th>
<th>Triggers when...</th>
</tr>
</thead>
<tbody>
<tr>
<td>140:1</td>
<td>the preprocessor is monitoring the maximum number of SIP sessions allowed by the system.</td>
</tr>
<tr>
<td>140:2</td>
<td>the required Request_URI field is empty in a SIP request.</td>
</tr>
<tr>
<td>140:4</td>
<td>the Call-ID header field is empty in a SIP request or response.</td>
</tr>
<tr>
<td>140:6</td>
<td>the value for the sequence number in the SIP request or response CSeq field is not a 32-bit unsigned integer less than 231.</td>
</tr>
<tr>
<td>140:8</td>
<td>the From header field is empty in a SIP request or response.</td>
</tr>
<tr>
<td>140:10</td>
<td>the To header field is empty in a SIP request or response.</td>
</tr>
<tr>
<td>140:12</td>
<td>the Via header field is empty in a SIP request or response</td>
</tr>
<tr>
<td>140:14</td>
<td>the required Contact header field is empty in a SIP request or response.</td>
</tr>
</tbody>
</table>
The GTP Preprocessor

The General Service Packet Radio (GPRS) Tunneling Protocol (GTP) provides communication over a GTP core network. The GTP preprocessor detects anomalies in GTP traffic and forwards command channel signaling messages to the rules engine for inspection. You can use the `gtp_version`, `gtp_type`, and `gtp_info` rule keywords to inspect GTP command channel traffic for exploits.

A single configuration option allows you to modify the default setting for the ports that the preprocessor inspects for GTP command channel messages.

### GTP Preprocessor Rules

You must enable the GTP preprocessor rules in the following table if you want them to generate events and, in an inline deployment, drop offending packets.

<table>
<thead>
<tr>
<th>Preprocessor Rule GID:SID</th>
<th>Triggers when...</th>
</tr>
</thead>
<tbody>
<tr>
<td>140:17</td>
<td>a single SIP request or response packet in UDP traffic contains multiple messages. Note that older SIP versions supported multiple messages, but SIP 2.0 supports only one message per packet.</td>
</tr>
<tr>
<td>140:18</td>
<td>the actual length of the message body in a SIP request or response in UDP traffic does not match the value specified in the Content-Length header field in a SIP request or response.</td>
</tr>
<tr>
<td>140:19</td>
<td>the preprocessor does not recognize a method name in the CSeq field of a SIP response.</td>
</tr>
<tr>
<td>140:20</td>
<td>the SIP server does not challenge an authenticated invite message. Note that this occurs in the case of the InviteReplay billing attack.</td>
</tr>
<tr>
<td>140:21</td>
<td>session information changes before the call is set up. Note that this occurs in the case of the FakeBusy billing attack.</td>
</tr>
<tr>
<td>140:22</td>
<td>the response status code is not a three-digit number.</td>
</tr>
<tr>
<td>140:23</td>
<td>the Content-Type header field does not specify a content type and the message body contains data.</td>
</tr>
<tr>
<td>140:24</td>
<td>the SIP version is not 1, 1.1, or 2.0.</td>
</tr>
<tr>
<td>140:25</td>
<td>the method specified in the CSeq header and the method field do not match in a SIP request.</td>
</tr>
<tr>
<td>140:26</td>
<td>the preprocessor does not recognize the method named in the SIP request method field.</td>
</tr>
</tbody>
</table>
### Configuring the GTP Preprocessor

You can use this procedure to modify the ports the GTP preprocessor monitors for GTP command messages.

**Procedure**

**Step 1** Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2** Click the edit icon (✏️) next to the policy you want to edit.

If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click Settings in the navigation panel on the left.

**Step 4** If GTP Command Channel Configuration under Application Layer Preprocessors is disabled, click Enabled.

**Step 5** Click the edit icon (✏️) next to GTP Command Channel Configuration.

**Step 6** Enter a Ports value.

Separate multiple ports with commas.

**Step 7** To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

**Table 200: GTP Preprocessor Rules**

<table>
<thead>
<tr>
<th>Preprocessor Rule GID:SID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>143:1</td>
<td>Generates an event when the preprocessor detects an invalid message length.</td>
</tr>
<tr>
<td>143:2</td>
<td>Generates an event when the preprocessor detects an invalid information element length.</td>
</tr>
<tr>
<td>143:3</td>
<td>Generates an event when the preprocessor detects information elements that are out of order.</td>
</tr>
</tbody>
</table>
What to do next

- If you want to enable intrusion events, enable GTP preprocessor rules (GID 143). For more information, see Setting Intrusion Rule States, on page 1331.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

The IMAP Preprocessor

The Internet Message Application Protocol (IMAP) is used to retrieve email from a remote IMAP server. The IMAP preprocessor inspects server-to-client IMAP4 traffic and, when associated preprocessor rules are enabled, generates events on anomalous traffic. The preprocessor can also extract and decode email attachments in client-to-server IMAP4 traffic and send the attachment data to the rules engine. You can use the `file_data` keyword in an intrusion rule to point to the attachment data.

Extraction and decoding include multiple attachments, when present, and large attachments that span multiple packets.

IMAP Preprocessor Options

Note that decoding, or extraction when the MIME email attachment does not require decoding, includes multiple attachments when present, and large attachments that span multiple packets.

Note also that the highest value is used when the values for the Base64 Decoding Depth, 7-Bit/8-Bit/Binary Decoding Depth, Quoted-Printable Decoding Depth, or Unix-to-Unix Decoding Depth options are different in:

- the default network analysis policy
- any other custom network analysis policy invoked by network analysis rules in the same access control policy

⚠️ Caution

Changing the value for Base64 Decoding Depth, 7-Bit/8-Bit/Binary Decoding Depth, Quoted-Printable Decoding Depth, or Unix-to-Unix Decoding Depth restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

Ports

Specifies the ports to inspect for IMAP traffic. You can specify an integer from 0 to 65535. Separate multiple port numbers with commas.
**Base64 Decoding Depth**

Specifies the maximum number of bytes to extract and decode from each Base64 encoded MIME email attachment. You can specify a positive value, or specify 0 to decode all the Base64 data. Specify -1 to ignore Base64 data.

Note that positive values not divisible by 4 are rounded up to the next multiple of 4 except for the values 65533, 65534, and 65535, which are rounded down to 65532.

When this option is enabled, you can enable rule 141:4 generate events and, in an inline deployment, drop offending packets when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data.

**7-Bit/8-Bit/Binary Decoding Depth**

Specifies the maximum bytes of data to extract from each MIME email attachment that does not require decoding. These attachment types include 7-bit, 8-bit, binary, and various multipart content types such as plain text, jpeg images, mp3 files, and so on. You can specify a positive value, or specify 0 to extract all data in the packet. Specify -1 to ignore non-decoded data.

When this option is enabled, you can enable rule 141:6 to generate events and, in an inline deployment, drop offending packets when extraction fails; extraction could fail, for example, because of corrupted data.

**Quoted-Printable Decoding Depth**

Specifies the maximum number of bytes to extract and decode from each quoted-printable (QP) encoded MIME email attachment. You can specify a positive value, or specify 0 to decode all QP encoded data in the packet. Specify -1 to ignore QP encoded data.

When this option is enabled, you can enable rule 141:5 to generate events and, in an inline deployment, drop offending packets when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data.

**Unix-to-Unix Decoding Depth**

Specifies the maximum number of bytes to extract and decode from each Unix-to-Unix encoded (uuencoded) email attachment. You can specify a positive value, or specify 0 to decode all uuencoded data in the packet. Specify -1 to ignore uuencoded data.

When this option is enabled, you can enable rule 141:7 to generate events and, in an inline deployment, drop offending packets when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data.

</tr>
</tbody>
</table>
Caution

Changing the value for Base64 Decoding Depth, 7-Bit/8-Bit/Binary Decoding Depth, Quoted-Printable Decoding Depth, or Unix-to-Unix Decoding Depth restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

Procedure

Step 1

Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

Note If your custom user role limits access to the first path listed here, use the second path to access the policy.

Step 2

Click the edit icon (ปากี) next to the policy you want to edit.

If a view icon (ปากี) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3

Click Settings in the navigation panel.

Step 4

If IMAP Configuration under Application Layer Preprocessors is disabled, click Enabled.

Step 5

Click the edit icon (ปากี) next to IMAP Configuration.

Step 6

Modify the settings described in IMAP Preprocessor Options, on page 1556.

Step 7

To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

What to do next

• If you want to enable intrusion events, enable IMAP preprocessor rules (GID 141); see Setting Intrusion Rule States, on page 1331.

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics

Layers in Intrusion and Network Analysis Policies, on page 1291

Additional IMAP Preprocessor Rules

The IMAP preprocessor rules in the following table are not associated with specific configuration options. As with other IMAP preprocessor rules, you must enable these rules if you want them to generate events and, in an inline deployment, drop offending packets.
Table 201: Additional IMAP Preprocessor Rules

<table>
<thead>
<tr>
<th>Preprocessor Rule GID:SID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>141:1</td>
<td>Generates an event when the preprocessor detects a client command that is not defined in RFC 3501.</td>
</tr>
<tr>
<td>141:2</td>
<td>Generates an event when the preprocessor detects a server response that is not defined in RFC 3501.</td>
</tr>
<tr>
<td>141:3</td>
<td>Generates an event when the preprocessor is using the maximum amount of memory allowed by the system. At this point, the preprocessor stops decoding until memory becomes available.</td>
</tr>
</tbody>
</table>

The POP Preprocessor

The Post Office Protocol (POP) is used to retrieve email from a remote POP mail server. The POP preprocessor inspects server-to-client POP3 traffic and, when associated preprocessor rules are enabled, generates events on anomalous traffic. The preprocessor can also extract and decode email attachments in client-to-server POP3 traffic and send the attachment data to the rules engine. You can use the `file_data` keyword in an intrusion rule to point to attachment data.

Extraction and decoding include multiple attachments, when present, and large attachments that span multiple packets.

POPreprocessor Options

Note that decoding, or extraction when the MIME email attachment does not require decoding, includes multiple attachments when present, and large attachments that span multiple packets.

Note also that the highest value is used when the values for the `Base64 Decoding Depth`, `7-Bit/8-Bit/Binary Decoding Depth`, `Quoted-Printable Decoding Depth`, or `Unix-to-Uni Decoding Depth` options are different in:

- the default network analysis policy
- any other custom network analysis policy invoked by network analysis rules in the same access control policy

Caution

Changing the value for `Base64 Decoding Depth`, `7-Bit/8-Bit/Binary Decoding Depth`, `Quoted-Printable Decoding Depth`, or `Unix-to-Uni Decoding Depth` restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.
Ports
Specifies the ports to inspect for POP traffic. You can specify an integer from 0 to 65535. Separate multiple port numbers with commas.

Base64 Decoding Depth
Specifies the maximum number of bytes to extract and decode from each Base64 encoded MIME email attachment. You can specify a positive value, or specify 0 to decode all the Base64 data. Specify -1 to ignore Base64 data.

Note that positive values not divisible by 4 are rounded up to the next multiple of 4 except for the values 65533, 65534, and 65535, which are rounded down to 65532.

When this option is enabled, you can enable rule 142:4 to generate an event and, in an inline deployment, drop offending packets when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data.

7-Bit/8-Bit/Binary Decoding Depth
Specifies the maximum bytes of data to extract from each MIME email attachment that does not require decoding. These attachment types include 7-bit, 8-bit, binary, and various multipart content types such as plain text, jpeg images, mp3 files, and so on. You can specify a positive value, or specify 0 to extract all data in the packet. Specify -1 to ignore non-decoded data.

When this option is enabled, you can enable rule 142:6 to generate an event and, in an inline deployment, drop offending packets when extraction fails; extraction could fail, for example, because of corrupted data.

Quoted-Printable Decoding Depth
Specifies the maximum number of bytes to extract and decode from each quoted-printable (QP) encoded MIME email attachment. You can specify a positive value, or specify 0 to decode all QP encoded data in the packet. Specify -1 to ignore QP encoded data.

When this option is enabled, you can enable rule 142:5 to generate an event and, in an inline deployment, drop offending packets when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data.

Unix-to-Unix Decoding Depth
Specifies the maximum number of bytes to extract and decode from each Unix-to-Unix encoded (uuencoded) email attachment. You can specify a positive value, or specify 0 to decode all uuencoded data in the packet. Specify -1 to ignore uuencoded data.

When this option is enabled, you can enable rule 142:7 to generate an event and, in an inline deployment, drop offending packets when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data.

Additional POP Preprocessor Rules

The POP preprocessor rules in the following table are not associated with specific configuration options. As with other POP preprocessor rules, you must enable these rules if you want them to generate events and, in an inline deployment, drop offending packets.

Table 202: Additional POP Preprocessor Rules

<table>
<thead>
<tr>
<th>Preprocessor Rule GID:SID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>142:1</td>
<td>Generates an event when the preprocessor detects a client command that is not defined in RFC 1939.</td>
</tr>
<tr>
<td>142:2</td>
<td>Generates an event when the preprocessor detects a server response that is not defined in RFC 1939.</td>
</tr>
<tr>
<td>142:3</td>
<td>Generates an event when the preprocessor is using the maximum amount of memory allowed by the system. At this point, the preprocessor stops decoding until memory becomes available.</td>
</tr>
</tbody>
</table>

The SMTP Preprocessor

The SMTP preprocessor instructs the rules engine to normalize SMTP commands. The preprocessor can also extract and decode email attachments in client-to-server traffic and, depending on the software version, extract email file names, addresses, and header data to provide context when displaying intrusion events triggered by SMTP traffic.

SMTP Preprocessor Options

You can enable or disable normalization, and you can configure options to control the types of anomalous traffic the SMTP decoder detects.

Note that decoding, or extraction when the MIME email attachment does not require decoding, includes multiple attachments when present, and large attachments that span multiple packets.

Note also that the highest value is used when the values for the **Base64 Decoding Depth**, **7-Bit/8-Bit/Binary Decoding Depth**, **Quoted-Printable Decoding Depth**, or **Unix-to-Unix Decoding Depth** options are different in:

- the default network analysis policy
- any other custom network analysis policy invoked by network analysis rules in the same access control policy
Changing the value for **Base64 Decoding Depth**, **7-Bit/8-Bit/Binary Decoding Depth**, **Quoted-Printable Decoding Depth**, or **Unix-to-Uni Decoding Depth** restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

**Ports**

Specifies the ports whose SMTP traffic you want to normalize. You can specify a value greater than or equal to 0. Separate multiple ports with commas.

**Stateful Inspection**

When selected, causes SMTP decoder to save state and provide session context for individual packets and only inspectes reassembled sessions. When cleared, analyzes each individual packet without session context.

**Normalize**

When set to **All**, normalizes all commands. Checks for more than one space character after a command.

When set to **None**, normalizes no commands.

When set to **Cmds**, normalizes the commands listed in **Custom Commands**.

**Custom Commands**

When **Normalize** is set to **Cmds**, normalizes the listed commands.

Specify commands which should be normalized in the text box. Checks for more than one space character after a command.

The space (ASCII 0x20) and tab (ASCII 0x09) characters count as space characters for normalization purposes.

**Ignore Data**

Does not process mail data; processes only MIME mail header data.

**Ignore TLS Data**

Does not process data encrypted under the Transport Layer Security protocol.

**No Alerts**

Disables intrusion events when accompanying preprocessor rules are enabled.

**Detect Unknown Commands**

Detects unknown commands in SMTP traffic.

You can enable rule 124:5 to generate events and, in an inline deployment, drop offending packets for this option.
Max Command Line Len
Detects when an SMTP command line is longer than this value. Specify 0 to never detect command line length. RFC 2821, the Network Working Group specification on the Simple Mail Transfer Protocol, recommends 512 as a maximum command line length.
You can enable rule 124:1 to generate events and, in an inline deployment, drop offending packets for this option.

Max Header Line Len
Detects when an SMTP data header line is longer than this value. Specify 0 to never detect data header line length.
You can enable rules 124:2 and 124:7 to generate events and, in an inline deployment, drop offending packets for this option.

Max Response Line Len
Detects when an SMTP response line is longer than this value. Specify 0 to never detect response line length. RFC 2821 recommends 512 as a maximum response line length.
You can enable rule 124:3 to generate events and, in an inline deployment, drop offending packets for this option and also for Alt Mac Command Line Len, when that option is enabled.

Alt Max Command Line Len
Detects when the SMTP command line for any of the specified commands is longer than this value. Specify 0 to never detect command line length for the specified commands. Different default line lengths are set for numerous commands.
This setting overrides the Max Command Line Len setting for the specified commands.
You can enable rule 124:3 to generate events and, in an inline deployment, drop offending packets for this option and also for Max Response Line Len when that option is enabled.

Invalid Commands
Detects if these commands are sent from the client side.
You can enable rule 124:6 to generate events and, in an inline deployment, drop offending packets for this option and also for Invalid Commands.

Valid Commands
Permits commands in this list.
Even if this list is empty, the preprocessor permits the following valid commands: ATRN AUTH BDAT DATA DEBUG EHLO EMAL ESAM ESND ESMTP ETEN EVFY EXPN HELO HELP IDENT MAIL NOOP ONEX QUEU QUIT RCPT RSET SAML SEND SIZE SOML STARTTLS TICK TIME TURN TURMME VERB VRFY XADR XAUTH XCI XEXCH50 X-EXPS XGEN XLICENSE X-LINK2STATE XQUE XSTA XTRN XUSR
RCPT TO and MAIL FROM are SMTP commands. The preprocessor configuration uses command names of RCPT and MAIL, respectively. Within the code, the preprocessor maps RCPT and MAIL to the correct command name.

You can enable rule 124:4 to generate events and, in an inline deployment, drop offending packets for this option and also for **Invalid Commands** when that option is configured.

**Data Commands**

Lists commands that initiate sending data in the same way the SMTP DATA command sends data per RFC 5321. Separate multiple commands with spaces.

**Binary Data Commands**

Lists commands that initiate sending data in a way that is similar to how the BDAT command sends data per RFC 3030. Separate multiple commands with spaces.

**Authentication Commands**

Lists commands that initiate an authentication exchange between client and server. Separate multiple commands with spaces.

**Detect xlink2state**

Detects packets that are part of X-Link2State Microsoft Exchange buffer data overflow attacks. In inline deployments, the system can also drop those packets.

You can enable rule 124:8 to generate events and, in an inline deployment, drop offending packets for this option.

**Base64 Decoding Depth**

When **Ignore Data** is disabled, specifies the maximum number of bytes to extract and decode from each Base64 encoded MIME email attachment. You can specify from a positive value, or specify 0 to decode all the Base64 data. Specify -1 to ignore Base64 data. The preprocessor will not decode data when **Ignore Data** is selected.

Note that positive values not divisible by 4 are rounded up to the next multiple of 4 except for the values 65533, 65534, and 65535, which are rounded down to 65532.

When this option is enabled, you can enable rule 124:10 to generate events and, in an inline deployment, drop offending packets when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data.

Note that this option replaces the deprecated options **Enable MIME Decoding** and **Maximum MIME Decoding Depth**, which are still supported in existing intrusion policies for backward compatibility.

**7-Bit/8-Bit/Binary Decoding Depth**

When **Ignore Data** is disabled, specifies the maximum bytes of data to extract from each MIME email attachment that does not require decoding. These attachment types include 7-bit, 8-bit, binary, and various multipart content types such as plain text, jpeg images, mp3 files, and so on. You can specify a positive value,
or specify 0 to extract all data in the packet. Specify -1 to ignore non-decoded data. The preprocessor will not extract data when **Ignore Data** is selected.

**Quoted-Printable Decoding Depth**

When **Ignore Data** is disabled, specifies the maximum number of bytes to extract and decode from each quoted-printable (QP) encoded MIME email attachment.

You can specify from 1 to 65535 bytes, or specify 0 to decode all QP encoded data in the packet. Specify -1 to ignore QP encoded data. The preprocessor will not decode data when **Ignore Data** is selected.

When this option is enabled, you can enable rule 124:11 to generate events and, in an inline deployment, drop offending packets when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data.

**Unix-to-Unix Decoding Depth**

When **Ignore Data** is disabled, specifies the maximum number of bytes to extract and decode from each Unix-to-Unix encoded (uuencoded) email attachment. You can specify from 1 to 65535 bytes, or specify 0 to decode all uuencoded data in the packet. Specify -1 to ignore uuencoded data. The preprocessor will not decode data when **Ignore Data** is selected.

When this option is enabled, you can enable rule 124:13 to generate events and, in an inline deployment, drop offending packets when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data.

**Log MIME Attachment Names**

Enables extraction of MIME attachment file names from the MIME Content-Disposition header and associates the file names with all intrusion events generated for the session. Multiple file names are supported.

When this option is enabled, you can view file names associated with events in the Email Attachment column of the intrusion events table view.

**Log To Addresses**

Enables extraction of recipient email addresses from the SMTP RCPT TO command and associates the recipient addresses with all intrusion events generated for the session. Multiple recipients are supported.

When this option is enabled, you can view recipients associated with events in the Email Recipient column of the intrusion events table view.

**Log From Addresses**

Enables extraction of sender email addresses from the SMTP MAIL FROM command and associates the sender addresses with all intrusion events generated for the session. Multiple sender addresses are supported.

When this option is enabled, you can view senders associated with events in the Email Sender column of the intrusion events table view.

**Log Headers**

Enables extraction of email headers. The number of bytes to extract is determined by the value specified for **Header Log Depth**.
You can use the `content` or `protected_content` keyword to write intrusion rules that use email header data as a pattern. You can also view the extracted email header in the intrusion event packet view.

**Header Log Depth**

Specifies the number of bytes of the email header to extract when Log Headers is enabled. You can specify 0 to 20480 bytes. A value of 0 disables Log Headers.

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

---

**Caution**

Changing the value for **Base64 Decoding Depth**, **7-Bit/8-Bit/Binary Decoding Depth**, **Quoted-Printable Decoding Depth**, or **Unix-to-Uni Decoding Depth** restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See **Snort® Restart Traffic Behavior**, on page 282 for more information.

---

**Procedure**

1. **Step 1** Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

   **Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

2. **Step 2** Click the edit icon (-pencil) next to the policy you want to edit.

   If a view icon (-eye) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

3. **Step 3** Click Settings in the navigation pane.

4. **Step 4** If SMTP Configuration under Application Layer Preprocessors is disabled, click Enabled.

5. **Step 5** Click the edit icon (-pencil) next to SMTP Configuration.

6. **Step 6** Modify the options described in SMTP Preprocessor Options, on page 1562.

7. **Step 7** To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.
If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

What to do next

- If you want to generate events and, in an inline deployment, drop offending packets, enable SMTP preprocessors rules (GID 124). For more information, see Setting Intrusion Rule States, on page 1331.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

The SSH Preprocessor

The SSH preprocessor detects:

- The Challenge-Response Buffer Overflow exploit
- The CRC-32 exploit
- The SecureCRT SSH Client Buffer Overflow exploit
- Protocol mismatches
- Incorrect SSH message direction
- Any version string other than version 1 or 2

Challenge-Response Buffer Overflow and CRC-32 attacks occur after the key exchange and are, therefore, encrypted. Both attacks send an uncharacteristically large payload of more than 20 KBytes to the server immediately after the authentication challenge. CRC-32 attacks apply only to SSH Version 1; Challenge-Response Buffer Overflow exploits apply only to SSH Version 2. The version string is read at the beginning of the session. Except for the difference in the version string, both attacks are handled in the same way.

The SecureCRT SSH exploit and protocol mismatch attacks occur when attempting to secure a connection, before the key exchange. The SecureCRT exploit sends an overly long protocol identifier string to the client that causes a buffer overflow. A protocol mismatch occurs when either a non-SSH client application attempts to connect to a secure SSH server or the server and client version numbers do not match.

You can configure the SSH preprocessor to inspect traffic on a specified port or list of ports, or to automatically detect SSH traffic. It will continue to inspect SSH traffic until either a specified number of encrypted packets has passed within a specified number of bytes, or until a specified maximum number of bytes is exceeded within the specified number of packets. If the maximum number of bytes is exceeded, it is assumed that a CRC-32 (SSH Version 1) or a Challenge-Response Buffer Overflow (SSH Version 2) attack has occurred. Note that without configuration the preprocessor detects any version string value other than version 1 or 2. Also note that the that the SSH preprocessor does not handle brute force attacks.
SSH Preprocessor Options

The preprocessor stops inspecting traffic for a session when either of the following occurs:

- a valid exchange between the server and the client has occurred for this number of encrypted packets; the connection continues.
- the **Number of Bytes Sent Without Server Response** is reached before the number of encrypted packets to inspect is reached; the assumption is made that there is an attack.

Each valid server response during **Number of Encrypted Packets to Inspect** resets the **Number of Bytes Sent Without Server Response** and the packet count continues.

Consider the following example SSH preprocessor configuration:

- **Server Ports**: 22
- **Autodetect Ports**: off
- **Maximum Length of Protocol Version String**: 80
- **Number of Encrypted Packets to Inspect**: 25
- **Number of Bytes Sent Without Server Response**: 19,600
- All detect options are enabled.

In the example, the preprocessor inspects traffic only on port 22. That is, auto-detection is disabled, so it inspects only on the specified port.

Additionally, the preprocessor in the example stops inspecting traffic when either of the following occurs:

- The client sends 25 encrypted packets which contain no more than 19,600 bytes, cumulative. The assumption is there is no attack.
- The client sends more than 19,600 bytes within 25 encrypted packets. In this case, the preprocessor considers the attack to be the Challenge-Response Buffer Overflow exploit because the session in the example is an SSH Version 2 session.

The preprocessor in the example will also detect any of the following that occur while it is processing traffic:

- a server overflow, triggered by a version string greater than 80 bytes and indicating a SecureCRT exploit
- a protocol mismatch
- a packet flowing in the wrong direction

Finally, the preprocessor will automatically detect any version string other than version 1 or version 2.

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

**Server Ports**

Specifies on which ports the SSH preprocessor should inspect traffic.

You can configure a single port or a comma-separated list of ports.
**Autodetect Ports**

Sets the preprocessor to automatically detect SSH traffic.

When this option is selected, the preprocessor inspects all traffic for an SSH version number. It stops processing when neither the client nor the server packet contains a version number. When disabled, the preprocessor inspects only the traffic identified by the Server Ports option.

**Number of Encrypted Packets to Inspect**

Specifies the number of encrypted packets to examine per session.

Setting this option to zero will allow all traffic to pass.

Reducing the number of encrypted packets to inspect may result in some attacks escaping detection. Raising the number of encrypted packets to inspect may negatively affect performance.

**Number of Bytes Sent Without Server Response**

Specifies the maximum number of bytes an SSH client may send to a server without getting a response before assuming there is a Challenge-Response Buffer Overflow or CRC-32 attack.

Increase the value for this option if the preprocessor generates false positives on the Challenge-Response Buffer Overflow or CRC-32 exploit.

**Maximum Length of Protocol Version String**

Specifies the maximum number of bytes allowed in the server’s version string before considering it to be a SecureCRT exploit.

**Detect Challenge-Response Buffer Overflow Attack**

Enables or disables detecting the Challenge-Response Buffer Overflow exploit.

You can enable rule 128:1 to generate events and, in an inline deployment, drop offending packets for this option.

**Detect SSH1 CRC-32 Attack**

Enables or disables detecting the CRC-32 exploit.

You can enable rule 128:2 to generate events and, in an inline deployment, drop offending packets for this option.

**Detect Server Overflow**

Enables or disables detecting the SecureCRT SSH Client Buffer Overflow exploit.

You can enable rule 128:3 to generate events and, in an inline deployment, drop offending packets for this option.

**Detect Protocol Mismatch**

Enables or disables detecting protocol mismatches.

You can enable rule 128:4 to generate events and, in an inline deployment, drop offending packets for this option.
Detect Bad Message Direction

Enables or disables detecting when traffic flows in the wrong direction (that is, if the presumed server generates client traffic, or if a client generates server traffic).

You can enable rule 128:5 to generate events and, in an inline deployment, drop offending packets for this option.

Detect Payload Size Incorrect for the Given Payload

Enables or disables detecting packets with an incorrect payload size such as when the length specified in the SSH packet is not consistent with the total length specified in the IP header or the message is truncated, that is, there is not enough data for a full SSH header.

You can enable rule 128:6 to generate events and, in an inline deployment, drop offending packets for this option.

Detect Bad Version String

Note that, when enabled, the preprocessor detects without configuration any version string other than version 1 or 2.

You can enable rule 128:7 to generate events and, in an inline deployment, drop offending packets for this option.

Configuring the SSH Preprocessor

The SSL Preprocessor

The SSL preprocessor allows you to configure SSL inspection, which can block encrypted traffic, decrypt it, or inspect the traffic with access control. Whether or not you configure SSL inspection, the SSL preprocessor also analyzes SSL handshake messages when detected in traffic and determines when a session becomes encrypted. Identifying encrypted traffic allows the system to stop intrusion and file inspection of encrypted payloads, which helps reduce false positives and improve performance.

The SSL preprocessor can also examine encrypted traffic to detect attempts to exploit the Heartbleed bug, and generate events when it detects such exploits.

You can suspend inspecting traffic for intrusions and malware once the session is encrypted. If you configure SSL inspection, the SSL preprocessor also identifies encrypted traffic you can block, decrypt, or inspect with access control.

Using the SSL preprocessor to decrypt encrypted traffic does not require a license. All other SSL preprocessor functionality, including halting inspection of encrypted payloads for malware and intrusions, and detecting Heartbleed bug exploits, requires a Protection license.

How SSL Preprocessing Works

The SSL preprocessor stops intrusion and file inspection of encrypted data, and inspects encrypted traffic with an SSL policy if you configure SSL inspection. This can help to eliminate false positives. The SSL preprocessor maintains state information as it inspects the SSL handshake, tracking both the state and SSL version for that session. When the preprocessor detects that a session state is encrypted, the system marks the traffic in that session as encrypted. You can configure the system to stop processing on all packets in an encrypted session when encryption is established, as well as generate an event when it detects an attempt to exploit the Heartbleed bug.

For each packet, the SSL preprocessor verifies that the traffic contains an IP header, a TCP header, and a TCP payload, and that it occurs on the ports specified for SSL preprocessing. For qualifying traffic, the following scenarios determine whether the traffic is encrypted:

• The system observes all packets in a session, Server side data is trusted is not enabled, and the session includes a Finished message from both the server and the client and at least one packet from each side with an Application record and without an Alert record.
• The system misses some of the traffic, **Server side data is trusted** is not enabled, and the session includes at least one packet from each side with an Application record that is not answered with an Alert record.

• The system observes all packets in a session, **Server side data is trusted** is enabled, and the session includes a Finished message from the client and at least one packet from the client with an Application record and without an Alert record.

• The system misses some of the traffic, **Server side data is trusted** is enabled, and the session includes at least one packet from the client with an Application record that is not answered with an Alert record.

If you choose to stop processing on encrypted traffic, the system ignores future packets in a session after it marks the session as encrypted.

In addition, during the SSL handshake, the preprocessor monitors heartbeat requests and responses. The preprocessor generates an event if it detects:

• a heartbeat request containing a payload length value greater than the payload itself

• a heartbeat response that is larger than the value stored in the Max Heartbeat Length field

---

**Note**

You can add the `ssl_state` and `ssl_version` keywords to a rule to use SSL state or version information within the rule.

---

## SSL Preprocessor Options

**Note**

The system-provided network analysis policies enable the SSL preprocessor by default. Cisco recommends that you do not disable the SSL preprocessor in custom deployments if you expect encrypted traffic to cross your network.

Without SSL inspection configured, the system attempts to inspect encrypted traffic for malware and intrusions without decrypting it. When you enable the SSL preprocessor, it detects when a session becomes encrypted. After the SSL preprocessor is enabled, the rules engine can invoke the preprocessor to obtain SSL state and version information. If you enable rules using the `ssl_state` and `ssl_version` keywords in an intrusion policy, you should also enable the SSL preprocessor in that policy.

### Ports

Specifies the ports, separated by commas, where the SSL preprocessor should monitor traffic for encrypted sessions. Only ports specified in this field will be checked for encrypted traffic.

**Note**

If the SSL preprocessor detects non-SSL traffic over the ports specified for SSL monitoring, it tries to decode the traffic as SSL traffic, and then flags it as corrupt.
Stop inspecting encrypted traffic

Enables or disables inspection of traffic in a session after the session is marked as encrypted.

Enable this option to disable inspection and reassembly for encrypted sessions. The SSL preprocessor maintains state for the session so it can disable inspection of all traffic in the session. The system only stops inspecting traffic in encrypted sessions if both:

- SSL preprocessing is enabled
- this option is selected

If you clear this option, you cannot modify the Server side data is trusted option.

Server side data is trusted

When Stop inspecting encrypted traffic is enabled, enables identification of encrypted traffic based only on the client-side traffic,

Max Heartbeat Length

By specifying a number of bytes, enables inspection of heartbeat requests and responses within the SSL handshake for Heartbleed bug exploit attempts. You can specify an integer from 1 to 65535, or 0 to disable the option.

If the preprocessor detects a heartbeat request whose payload length is greater than the actual payload length and rule 137:3 is enabled, or a heartbeat response greater in size than the value configured for this option when rule 137:4 is enabled, the preprocessor generates an event and, in an inline deployment, drops offending packets.

Configuring the SSL Preprocessor

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>

</tbody>
</table>

Procedure

Step 1 Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

Note If your custom user role limits access to the first path listed here, use the second path to access the policy.

Step 2 Click the edit icon (📝) next to the policy you want to edit.

If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3 Click Settings in the navigation panel.

Step 4 If SSL Configuration under Application Layer Preprocessors is disabled, click Enabled.
Step 5  Click the edit icon (📝) next to SSL Configuration.

Step 6  Modify any of the settings described in SSL Preprocessor Options, on page 1573.

- Enter a value in the Ports field. Separate multiple values with commas.
- Check or clear the Stop inspecting encrypted traffic check box.
- If you checked Stop inspecting encrypted traffic, check or clear Server side data is trusted.
- Enter a value in the Max Heartbeat Length field.

Tip  A value of 0 disables this option.

Step 7  To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

What to do next

- If you want to enable intrusion events, enable SSL preprocessor rules (GID 137). For more information, see Setting Intrusion Rule States, on page 1331.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

</table>
SCADA Preprocessors

The following topics explain preprocessors for Supervisory Control and Data Acquisition (SCADA) protocols, and how to configure them:

- Introduction to SCADA Preprocessors, on page 1577
- The Modbus Preprocessor, on page 1577
- The DNP3 Preprocessor, on page 1579

Introduction to SCADA Preprocessors

Supervisory Control and Data Acquisition (SCADA) protocols monitor, control, and acquire data from industrial, infrastructure, and facility processes such as manufacturing, production, water treatment, electric power distribution, airport and shipping systems, and so on. The Firepower System provides preprocessors for the Modbus and DNP3 SCADA protocols that you can configure as part of your network analysis policy.

If you enable a rule containing Modbus or DNP3 keywords in the corresponding intrusion policy, the system automatically uses the Modbus or DNP3 processor, respectively, with its current settings, although the preprocessor remains disabled in the network analysis policy web interface.

The Modbus Preprocessor

The Modbus protocol, which was first published in 1979 by Modicon, is a widely used SCADA protocol. The Modbus preprocessor detects anomalies in Modbus traffic and decodes the Modbus protocol for processing by the rules engine, which uses Modbus keywords to access certain protocol fields.

A single configuration option allows you to modify the default setting for the port that the preprocessor inspects for Modbus traffic.

Related Topics

SCADA Keywords, on page 1457

Modbus Preprocessor Ports Option

Ports

Specifies the ports that the preprocessor inspects for Modbus traffic. Separate multiple ports with commas.
Configuring the Modbus Preprocessor

<table>

<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

You should not enable this preprocessor in a network analysis policy that you apply to traffic if your network does not contain any Modbus-enabled devices.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Procedure

**Step 1**
Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2**
Click the edit icon (-pencil) next to the policy you want to edit.

If a view icon (-eye) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3**
Click Settings in the navigation panel.

**Step 4**
If Modbus Configuration under SCADA Preprocessors is disabled, click Enabled.

**Step 5**
Click the edit icon (-pencil) next to Modbus Configuration.

**Step 6**
Enter a value in the Ports field.

Separate multiple values with commas.

**Step 7**
To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

What to do next

- If you want to generate events and, in an inline deployment, drop offending packets, enable Modbus preprocessor rules (GID 144). For more information, see Setting Intrusion Rule States, on page 1331 and Modbus Preprocessor Rules, on page 1579.

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Related Topics

Managing Layers, on page 1298
Modbus Preprocessor Rules

You must enable the Modbus preprocessor rules in the following table if you want these rules to generate events and, in an inline deployment, drop offending packets.

Table 204: Modbus Preprocessor Rules

<table>
<thead>
<tr>
<th>Preprocessor Rule GID:SID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>144:1</td>
<td>Generates an event when the length in the Modbus header does not match the length required by the Modbus function code. Each Modbus function has an expected format for requests and responses. If the length of the message does not match the expected format, this event is generated.</td>
</tr>
<tr>
<td>144:2</td>
<td>Generates an event when the Modbus protocol ID is non-zero. The protocol ID field is used for multiplexing other protocols with Modbus. Because the preprocessor does not process these other protocols, this event is generated instead.</td>
</tr>
<tr>
<td>144:3</td>
<td>Generates an event when the preprocessor detects a reserved Modbus function code.</td>
</tr>
</tbody>
</table>

The DNP3 Preprocessor

The Distributed Network Protocol (DNP3) is a SCADA protocol that was originally developed to provide consistent communication between electrical stations. DNP3 has also become widely used in the water, waste, transportation, and many other industries.

The DNP3 preprocessor detects anomalies in DNP3 traffic and decodes the DNP3 protocol for processing by the rules engine, which uses DNP3 keywords to access certain protocol fields.

Related Topics

DNP3 Keywords, on page 1458

DNP3 Preprocessor Options

Ports

Enables inspection of DNP3 traffic on each specified port. You can specify a single port or a comma-separated list of ports.

Log bad CRCs

Validates the checksums contained in DNP3 link layer frames. Frames with invalid checksums are ignored.
You can enable rule 145:1 to generate events and, in an inline deployment, drop offending packets when invalid checksums are detected.

**Configuring the DNP3 Preprocessor**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

You should not enable this preprocessor in a network analysis policy that you apply to traffic if your network does not contain any DNP3-enabled devices.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

**Procedure**

**Step 1** Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

*Note* If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2** Click the edit icon (edit) next to the policy you want to edit.

If a view icon (view) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click Settings in the navigation panel.

**Step 4** If DNP3 Configuration under SCADA Preprocessors is disabled, click Enabled.

**Step 5** Click the edit icon (edit) next to DNP3 Configuration.

**Step 6** Enter a value for Ports.

Separate multiple values with commas.

**Step 7** Check or clear the Log bad CRCs check box.

**Step 8** To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

---

**What to do next**

- If you want to generate events and, in an inline deployment, drop offending packets, enable DNP3 preprocessor rules (GID 145). For more information, see Setting Intrusion Rule States, on page 1331, DNP3 Preprocessor Options, on page 1579, and DNP3 Preprocessor Rules, on page 1581.
• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

DNP3 Preprocessor Rules
You must enable the DNP3 preprocessor rules in the following table if you want these rules to generate events and, in an inline deployment, drop offending packets.

Table 205: DNP3 Preprocessor Rules

<table>
<thead>
<tr>
<th>Preprocessor Rule GID:SID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>145:1</td>
<td>When <strong>Log bad CRC</strong> is enabled, generates an event when the preprocessor detects a link layer frame with an invalid checksum.</td>
</tr>
<tr>
<td>145:2</td>
<td>Generates an event and blocks the packet when the preprocessor detects a DNP3 link layer frame with an invalid length.</td>
</tr>
<tr>
<td>145:3</td>
<td>Generates an event and blocks the packet during reassembly when the preprocessor detects a transport layer segment with an invalid sequence number.</td>
</tr>
<tr>
<td>145:4</td>
<td>Generates an event when the DNP3 reassembly buffer is cleared before a complete fragment can be reassembled. This happens when a segment carrying the FIR flag appears after other segments have been queued.</td>
</tr>
<tr>
<td>145:5</td>
<td>Generates an event when the preprocessor detects a DNP3 link layer frame that uses a reserved address.</td>
</tr>
<tr>
<td>145:6</td>
<td>Generates an event when the preprocessor detects a DNP3 request or response that uses a reserved function code.</td>
</tr>
</tbody>
</table>
Transport & Network Layer Preprocessors

The following topics explain transport and network layer preprocessors and how to configure them:

- Introduction to Transport and Network Layer Preprocessors, on page 1583
- Advanced Transport/Network Preprocessor Settings, on page 1583
- Checksum Verification, on page 1586
- The Inline Normalization Preprocessor, on page 1588
- The IP Defragmentation Preprocessor, on page 1594
- The Packet Decoder, on page 1599
- TCP Stream Preprocessing, on page 1604
- UDP Stream Preprocessing, on page 1614

Introduction to Transport and Network Layer Preprocessors

Transport and network layer preprocessors detect attacks that exploit IP fragmentation, checksum validation, and TCP and UDP session preprocessing. Before packets are sent to preprocessors, the packet decoder converts packet headers and payloads into a format that can be easily used by the preprocessors and the intrusion rules engine and detects various anomalous behaviors in packet headers. After packet decoding and before sending packets to other preprocessors, the inline normalization preprocessor normalizes traffic for inline deployments.

When an intrusion rule or rule argument requires a disabled preprocessor, the system automatically uses it with its current configuration even though it remains disabled in the network analysis policy’s web interface.

Advanced Transport/Network Preprocessor Settings

Advanced transport and network preprocessor settings apply globally to all networks, zones, and VLANs where you deploy your access control policy. You configure these advanced settings in an access control policy rather than in a network analysis policy.

Ignored VLAN Headers

Different VLAN tags in traffic traveling in different directions for the same connection can affect traffic reassembly and rule processing. For example, in the following graphic traffic for the same connection could be transmitted over VLAN A and received over VLAN B.
You can configure the system to ignore the VLAN header so packets can be correctly processed for your deployment.

**Note**

This option is not supported on ASA FirePOWER.

### Active Responses with Intrusion Drop Rules

A drop rule is an intrusion rule or preprocessor rule whose rule state is set to Drop and Generate Events. In an inline deployment, the system responds to TCP or UDP drop rules by dropping the triggering packet and blocking the session where the packet originated. In a passive deployment, the system cannot drop the packet and does not block the session except with the use of active responses.

Because UDP data streams are not typically thought of in terms of sessions, the stream preprocessor uses the source and destination IP address fields in the encapsulating IP datagram header and the port fields in the UDP header to determine the direction of flow and identify a UDP session.

You can configure the system to initiate one or more **active responses** to more precisely and specifically close a TCP connection or UDP session when an offending packet triggers a TCP or UDP drop rule.

When active responses are enabled in an inline deployment, the system responds to TCP drop rules by dropping the triggering packet and inserting a TCP Reset (RST) packet in both the client and server traffic. The system cannot drop the packet in a passive deployment; when active responses are enabled in a passive deployment, the system responds to TCP drop rules by sending a TCP reset to both the client and server ends of a TCP connection. When active responses are enabled in inline or passive deployments, the system closes a UDP session by sending an ICMP unreachable packet to each end of the session. Active responses are most effective in inline deployments because resets are more likely to arrive in time to affect the connection or session.

Depending on your configuration, the system can also initiate additional active responses if it sees additional traffic from either end of the connection or session. The system initiates each additional active response, up to a specified maximum, after a specified number of seconds have elapsed since the previous response.

### Advanced Transport/Network Preprocessor Options

**Ignore the VLAN header when tracking connections**

Specifies whether to ignore or include VLAN headers when identifying traffic, as follows:

- When this option is selected, the system ignores VLAN headers. Use this setting for deployed devices that might detect different VLAN tags for the same connection in traffic traveling in different directions.
• When this option is disabled, the system includes VLAN headers. Use this setting for deployed devices that will not detect different VLAN tags for the same connection traffic traveling in different directions.

This option is not supported on ASA FirePOWER.

**Maximum Active Responses**

Specifies a maximum number of active responses per TCP connection. When additional traffic occurs on a connection where an active response has been initiated, and the traffic occurs more than **Minimum Response Seconds** after a previous active response, the system sends another active response unless the specified maximum has been reached. A setting of 0 disables active responses triggered by drop rules and disables additional active responses triggered by `resp` or `react` rules.

Note that a triggered `resp` or `react` rule also initiates an active response regardless of the configuration of this option; however, this option controls whether the system initiates additional active responses for `resp` and `react` rules in the same way it controls the maximum number of active responses for drop rules.

You can also use the `config response` command to configure the active response interface to use and the number of TCP resets to attempt in a passive deployment.

**Minimum Response Seconds**

Until **Maximum Active Responses** occur, specifies the number of seconds to wait before any additional traffic on a connection where the system has initiated an active response results in a subsequent active response.

**Troubleshooting Options: Session Termination Logging Threshold**

**Caution**

Do not modify Session Termination Logging Threshold unless instructed to do so by Support.

Support might ask you during a troubleshooting call to configure your system to log a message when an individual connection exceeds the specified threshold. Changing the setting for this option will affect performance and should be done only with Support guidance.

This option specifies for the number of bytes that result in a logged message when the session terminates and the specified number was exceeded.

**Note**

The upper limit of 1GB is also restricted by the amount of memory on the managed device allocated for stream processing.

<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Procedure

**Step 1**  
In the access control policy editor, click the Advanced tab.

**Step 2**  
Click the edit icon (edit) next to the Transport/Network Layer Settings section.

**Step 3**  
Except for the troubleshooting option **Session Termination Logging Threshold**, modify the options described in Advanced Transport/Network Preprocessor Options, on page 1584.

**Note**  
The Ignore the VLAN header when tracking connections option is not available on the ASA FirePOWER module.

**Caution**  
Do not modify **Session Termination Logging Threshold** unless instructed to do so by Support.

**Step 4**  
Click OK.

What to do next

- Optionally, further configure the policy as described in Editing an Access Control Policy, on page 1081.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Checksum Verification

The system can verify all protocol-level checksums to ensure that complete IP, TCP, UDP, and ICMP transmissions are received and that, at a basic level, packets have not been tampered with or accidentally altered in transit. A checksum uses an algorithm to verify the integrity of a protocol in the packet. The packet is considered to be unchanged if the system computes the same value that is written in the packet by the end host.

Disabling checksum verification may leave your network susceptible to insertion attacks. Note that the system does not generate checksum verification events. In an inline deployment, you can configure the system to drop packets with invalid checksums.

Checksum Verification Options

You can set any of the following options to **Enabled** or **Disabled** in a passive or inline deployment, or to **Drop** in an inline deployment:

- ICMP Checksums
To drop offending packets, in addition to setting an option to Drop you must also enable Inline Mode in the associated network analysis policy and ensure that the device is deployed inline.

Setting these options to Drop in a passive deployment, or in an inline deployment in tap mode, is the same as setting them to Enabled.

The default for all checksum verification options is Enabled. However, Firepower Threat Defense routed and transparent interfaces always drop packets that fail IP checksum verification. Note that the Firepower Threat Defense routed and transparent interfaces fix UDP packets with a bad checksum before passing the packets to the Snort process.

</tbody>
</table>

**Procedure**

**Step 1**
Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

*Note* If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2**
Click the edit icon (🖌) next to the policy you want to edit.

If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3**
Click Settings in the navigation panel.

**Step 4**
If Checksum Verification under Transport/Network Layer Preprocessors is disabled, click Enabled.

**Step 5**
Click the edit icon (🖌) next to Checksum Verification.

**Step 6**
Modify the options described in Checksum Verification, on page 1586.

**Step 7**
To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.
The Inline Normalization Preprocessor

The inline normalization preprocessor normalizes traffic to minimize the chances of attackers evading detection in inline deployments.

Note

For the system to affect traffic, you must deploy relevant configurations to managed devices using routed, switched, or transparent interfaces, or inline interface pairs.

You can specify normalization of any combination of IPv4, IPv6, ICMPv4, ICMPv6, and TCP traffic. Most normalizations are on a per-packet basis and are conducted by the inline normalization preprocessor. However, the TCP stream preprocessor handles most state-related packet and stream normalizations, including TCP payload normalization.

Inline normalization takes place immediately after decoding by the packet decoder and before processing by other preprocessors. Normalization proceeds from the inner to outer packet layers.

The inline normalization preprocessor does not generate events; it prepares packets for use by other preprocessors and the rules engine in inline deployments. The preprocessor also helps ensure that the packets the system processes are the same as the packets received by the hosts on your network.

Note

In an inline deployment, Cisco recommends that you enable inline mode and configure the inline normalization preprocessor with the Normalize TCP Payload option enabled. In a passive deployment, Cisco recommends that you use adaptive profile updates.

Inline Normalization Options

Minimum TTL

When Reset TTL is greater than or equal to the value set for this option, specifies the following:

- the minimum value the system will permit in the IPv4 Time to Live (TTL) field when Normalize IPv4 is enabled; a lower value results in normalizing the packet value for TTL to the value set for Reset TTL
- the minimum value the system will permit in the IPv6 Hop Limit field when Normalize IPv6 is enabled; a lower value results in normalizing the packet value for Hop Limit to the value set for Reset TTL
The system assumes a value of 1 when the field is empty.

**Note**

For Firepower Threat Defense routed and transparent interfaces, the Minimum TTL and Reset TTL options are ignored. The maximum TTL for a connection is determined by the TTL in the initial packet. The TTL for subsequent packets can decrease, but it cannot increase. The system will reset the TTL to the lowest previously-seen TTL for that connection. This prevents TTL evasion attacks.

When the packet decoding **Detect Protocol Header Anomalies** option is enabled, you can enable the following rules in the decoder rule category to generate events and, in an inline deployment, drop offending packets for this option:

- You can enable rule 116:428 to trigger when the system detects an IPv4 packet with a TTL less than the specified minimum.
- You can enable rule 116:270 to trigger when the system detects an IPv6 packet with a hop limit that is less than the specified minimum.

**Reset TTL**

When set to a value greater than or equal to Minimum TTL, normalizes the following:

- the IPv4 TTL field when Normalize IPv4 is enabled
- the IPv6 Hop Limit field when Normalize IPv6 is enabled

The system normalizes the packet by changing its TTL or Hop Limit value to the value set for this option when the packet value is less than Minimum TTL. Leaving this field blank, or setting it to 0, or to any value less than Minimum TTL, disables the option.

**Normalize IPv4**

Enables normalization of IPv4 traffic. The system also normalizes the TTL field as needed when:

- this option is enabled, and
- the value set for Reset TTL enables TTL normalization.

You can also enable additional IPv4 options when this option is enabled.

When you enable this option, the system performs the following base IPv4 normalizations:

- truncates packets with excess payload to the datagram length specified in the IP header
- clears the Differentiated Services (DS) field, formerly known as the Type of Service (TOS) field
- sets all option octets to 1 (No Operation)

This option is ignored for Firepower Threat Defense routed and transparent interfaces. Firepower Threat Defense devices will drop any RSVP packet that contains IP options other than the router alert, end of options list (EOOL), and no operation (NOP) options on any routed or transparent interface.
**Normalize Don’t Fragment Bit**
Clears the single-bit Don’t Fragment subfield of the IPv4 Flags header field. Enabling this option allows a downstream router to fragment packets if necessary instead of dropping them; enabling this option can also prevent evasions based on crafting packets to be dropped. You must enable Normalize IPv4 to select this option.

**Normalize Reserved Bit**
Clears the single-bit Reserved subfield of the IPv4 Flags header field. You would typically enable this option. You must enable Normalize IPv4 to select this option.

**Normalize TOS Bit**
Clears the one byte Differentiated Services field, formerly known as Type of Service. You must enable Normalize IPv4 to select this option.

**Normalize Excess Payload**
Truncates packets with excess payload to the datagram length specified in the IP header plus the Layer 2 (for example, Ethernet) header, but does not truncate below the minimum frame length. You must enable Normalize IPv4 to select this option.

This option is ignored for Firepower Threat Defense routed and transparent interfaces. Packets with excess payload are always dropped on these interfaces.

**Normalize IPv6**
Sets all Option Type fields in the Hop-by-Hop Options and Destination Options extension headers to 00 (Skip and continue processing). The system also normalizes the Hop Limit field as needed when this option is enabled and the value set for Reset TTL enables hop limit normalization.

**Normalize ICMPv4**
Clears the 8-bit Code field in Echo (Request) and Echo Reply messages in ICMPv4 traffic.

**Normalize ICMPv6**
Clears the 8-bit Code field in Echo (Request) and Echo Reply messages in ICMPv6 traffic.

**Normalize/Clear Reserved Bits**
Clears the Reserved bits in the TCP header.

**Normalize/Clear Option Padding Bytes**
Clears any TCP option padding bytes.

**Clear Urgent Pointer if URG=0**
Clears the 16-bit TCP header Urgent Pointer field if the urgent (URG) control bit is not set.

**Clear Urgent Pointer/URG on Empty Payload**
Clears the TCP header Urgent Pointer field and the URG control bit if there is no payload.
Clear URG if Urgent Pointer is Not Set
Clears the TCP header URG control bit if the urgent pointer is not set.

Normalize Urgent Pointer
Sets the two-byte TCP header Urgent Pointer field to the payload length if the pointer is greater than the payload length.

Normalize TCP Payload
Enables normalization of the TCP Data field to ensure consistency in retransmitted data. Any segment that cannot be properly reassembled is dropped.

Remove Data on SYN
Removes data in synchronization (SYN) packets if your TCP operating system policy is not Mac OS.
This option also disables rule 129:2, which can otherwise trigger when the TCP stream preprocessor Policy option is not set to Mac OS.

Remove Data on RST
Removes any data from a TCP reset (RST) packet.

Trim Data to Window
Trims the TCP Data field to the size specified in the Window field.

Trim Data to MSS
Trims the TCP Data field to the Maximum Segment Size (MSS) if the payload is longer than MSS.

Block Unresolvable TCP Header Anomalies
When you enable this option, the system blocks anomalous TCP packets that, if normalized, would be invalid and likely would be blocked by the receiving host. For example, the system blocks any SYN packet transmitted subsequent to an established session.
The system also drops any packet that matches any of the following TCP stream preprocessor rules, regardless of whether the rules are enabled:

- 129:1
- 129:3
- 129:4
- 129:6
- 129:8
- 129:11
- 129:14 through 129:19
The Total Blocked Packets performance graph tracks the number of packets blocked in inline deployments and, in passive deployments and inline deployments in tap mode, the number that would have been blocked in an inline deployment.

**Explicit Congestion Notification**

Enables per-packet or per-stream normalization of Explicit Congestion Notification (ECN) flags as follows:

- select **Packet** to clear ECN flags on a per-packet basis regardless of negotiation
- select **Stream** to clear ECN flags on a per-stream basis if ECN use was not negotiated

If you select **Stream**, you must also ensure that the TCP stream preprocessor **Require TCP 3-Way Handshake** option is enabled for this normalization to take place.

**Clear Existing TCP Options**

Enables **Allow These TCP Options**.

**Allow These TCP Options**

Disables normalization of specific TCP options you allow in traffic.

The system does not normalize options that you explicitly allow. It normalizes options that you do not explicitly allow by setting the options to No Operation (TCP Option 1).

The system always allows the following options regardless of the configuration of **Allow These TCP Options** because they are commonly used for optimal TCP performance:

- Maximum Segment Size (MSS)
- Window Scale
- Time Stamp TCP

The system does not automatically allow other less commonly used options.

You can allow specific options by configuring a comma-separated list of option keywords, option numbers, or both as shown in the following example:

`sack, echo, 19`

Specifying an option keyword is the same as specifying the number for one or more TCP options associated with the keyword. For example, specifying `sack` is the same as specifying TCP options 4 (Selective Acknowledgment Permitted) and 5 (Selective Acknowledgment). Option keywords are not case sensitive.

You can also specify `any`, which allows all TCP options and effectively disables normalization of all TCP options.

The following table summarizes how you can specify TCP options to allow. If you leave the field empty, the system allows only the MSS, Window Scale, and Time Stamp options.

<table>
<thead>
<tr>
<th>Specify...</th>
<th>To allow...</th>
</tr>
</thead>
<tbody>
<tr>
<td>sack</td>
<td>TCP options 4 (Selective Acknowledgment Permitted) and 5 (Selective Acknowledgment)</td>
</tr>
</tbody>
</table>
### Specify...  |  To allow...
--- | ---
echo  | TCP options 6 (Echo Request) and 7 (Echo Reply)
partial_order  | TCP options 9 (Partial Order Connection Permitted) and 10 (Partial Order Service Profile)
conn_count  | TCP Connection Count options 11 (CC), 12 (CC.New), and 13 (CC.Echo)
alt_checksum  | TCP options 14 (Alternate Checksum Request) and 15 (Alternate Checksum)
md5  | TCP option 19 (MD5 Signature)
the option number, 2 to 255  | a specific option, including options for which there is no keyword
any  | all TCP options; this setting effectively disables TCP option normalization

When you do not specify *any* for this option, normalizations include the following:

- except MSS, Window Scale, Time Stamp, and any explicitly allowed options, sets all option bytes to No Operation (TCP Option 1)
- sets the Time Stamp octets to No Operation if Time Stamp is present but invalid, or valid but not negotiated
- blocks the packet if Time Stamp is negotiated but not present
- clears the Time Stamp Echo Reply (TSecr) option field if the Acknowledgment (ACK) control bit is not set
- sets the MSS and Window Scale options to No Operation (TCP Option 1) if the SYN control bit is not set

**Before you begin**

- If you want to normalize or drop offending packets, enable **Inline Mode** as described in *Preprocessor Traffic Modification in Inline Deployments*, on page 1509. The managed device must also be deployed inline.
Procedure

**Step 1**  Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

**Note**  If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2**  Click the edit icon (📝) next to the policy you want to edit.

If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3**  Click Settings in the navigation panel.

**Step 4**  If Inline Normalization under Transport/Network Layer Preprocessors is disabled, click Enabled.

**Step 5**  Click the edit icon (📝) next to Inline Normalization.

**Step 6**  Set the options described in The Inline Normalization Preprocessor, on page 1588.

**Step 7**  To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

What to do next

- If you want the inline normalization Minimum TTL option to generate intrusion events, enable either or both packet decoder rules 116:429 (IPv4) and 116:270 (IPv6). For more information, see Setting Intrusion Rule States, on page 1331, and Inline Normalization Options, on page 1588.

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

The IP Defragmentation Preprocessor

When an IP datagram is broken into two or more smaller IP datagrams because it is larger than the maximum transmission unit (MTU), it is fragmented. A single IP datagram fragment may not contain enough information to identify a hidden attack. Attackers may attempt to evade detection by transmitting attack data in fragmented packets. The IP defragmentation preprocessor reassembles fragmented IP datagrams before the rules engine executes rules against them so the rules can more appropriately identify attacks in those packets. If fragmented datagrams cannot be reassembled, rules do not execute against them.
IP Fragmentation Exploits

Enabling IP defragmentation helps you detect attacks against hosts on your network, like the teardrop attack, and resource consumption attacks against the system itself, like the Jolt2 attack.

The Teardrop attack exploits a bug in certain operating systems that causes them to crash when trying to reassemble overlapping IP fragments. When enabled and configured to do so, the IP defragmentation preprocessor identifies the overlapping fragments. The IP defragmentation preprocessor detects the first packets in an overlapping fragment attack such as Teardrop, but does not detect subsequent packets for the same attack.

The Jolt2 attack sends a large number of copies of the same fragmented IP packet in an attempt to overuse IP defragmentors and cause a denial of service attack. A memory usage cap disrupts this and similar attacks in the IP defragmentation preprocessor, and places the system self-preservation above exhaustive inspection. The system is not overwhelmed by the attack, remains operational, and continues to inspect network traffic.

Different operating systems reassemble fragmented packets in different ways. Attackers who can determine which operating systems your hosts are running can also fragment malicious packets so that a target host reassembles them in a specific manner. Because the system does not know which operating systems the hosts on your monitored network are running, the preprocessor may reassemble and inspect the packets incorrectly, thus allowing an exploit to pass through undetected. To mitigate this kind of attack, you can configure the defragmentation preprocessor to use the appropriate method of defragmenting packets for each host on your network.

Note that you can also use adaptive profile updates in a passive deployment to dynamically select target-based policies for the IP defragmentation preprocessor using host operating system information for the target host in a packet.

Target-Based Defragmentation Policies

A host's operating system uses three criteria to determine which packet fragments to favor when reassembling the packet:

- the order in which the fragment was received by the operating system
- its offset (the fragment's distance, in bytes, from the beginning of the packet)
- its beginning and ending position compared to overlap fragments.

Although every operating system uses these criteria, different operating systems favor different fragments when reassembling fragmented packets. Therefore, two hosts with different operating systems on your network could reassemble the same overlapping fragments in entirely different ways.

An attacker, aware of the operating system of one of your hosts, could attempt to evade detection and exploit that host by sending malicious content hidden in overlapping packet fragments. This packet, when reassembled and inspected, seems innocuous, but when reassembled by the target host, contains a malicious exploit. However, if you configure the IP defragmentation preprocessor to be aware of the operating systems running on your monitored network segment, it will reassemble the fragments the same way that the target host does, allowing it to identify the attack.

IP Defragmentation Options

You can choose to simply enable or disable IP defragmentation; however, Cisco recommends that you specify the behavior of the enabled IP defragmentation preprocessor at a more granular level.
If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

You can configure the following global option:

**Preallocated Fragments**

The maximum number of individual fragments that the preprocessor can process at once. Specifying the number of fragment nodes to preallocate enables static memory allocation.

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing an individual fragment uses approximately 1550 bytes of memory. If the preprocessor requires more memory to process the individual fragments than the predetermined allowable memory limit for the managed device, the memory limit for the device takes precedence.</td>
</tr>
</tbody>
</table>

You can configure the following options for each IP defragmentation policy:

**Networks**

The IP address of the host or hosts to which you want to apply the defragmentation policy.

You can specify a single IP address or address block, or a comma-separated list of either or both. You can specify up to 255 total profiles, including the default policy.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.</td>
</tr>
</tbody>
</table>

Note that the default setting in the default policy specifies all IP addresses on your monitored network segment that are not covered by another target-based policy. Therefore, you cannot and do not need to specify an IP address or CIDR block/prefix length for the default policy, and you cannot leave this setting blank in another policy or use address notation to represent any (for example, 0.0.0.0/0 or ::/0).

**Policy**

The defragmentation policy you want to use for a set of hosts on your monitored network segment.

You can select one of seven defragmentation policies, depending on the operating system of the target host. The following table lists the seven policies and the operating systems that use each one. The First and Last policy names reflect whether those policies favor original or subsequent overlapping packets.

This option is ignored for Firepower Threat Defense routed and transparent interfaces.

**Timeout**

Specifies the maximum amount of time, in seconds, that the preprocessor engine can use when reassembling a fragmented packet. If the packet cannot be reassembled within the specified time period, the preprocessor engine stops attempting to reassemble the packet and discards received fragments.

**Min TTL**

Specifies the minimum acceptable TTL value a packet may have. This option detects TTL-based insertion attacks.

You can enable rule 123:11 to generate events and, in an inline deployment, drop offending packets for this option.

**Detect Anomalies**

Identifies fragmentation problems such as overlapping fragments.

This option is ignored for Firepower Threat Defense routed and transparent interfaces.

You can enable the following rules to generate events and, in an inline deployment, drop offending packets for this option:

- 123:1 through 123:4
- 123:5 (BSD policy)
- 123:6 through 123:8

**Overlap Limit**

Specifies that when the configured number of overlapping segments in a session has been detected, defragmentation stops for that session.

You must enable **Detect Anomalies** to configure this option. A blank value disables this option. A value of 0 specifies an unlimited number overlapping segments.

This option is ignored for Firepower Threat Defense routed and transparent interfaces. Overlapping fragments are always dropped on those interfaces.
You can enable rule 123:12 to generate events and, in an inline deployment, drop offending packets for this option.

**Minimum Fragment Size**

Specifies that when a non-last fragment smaller than the configured number of bytes has been detected, the packet is considered malicious.

You must enable **Detect Anomalies** to configure this option. A blank value disables this option. A value of 0 specifies an unlimited number of bytes.

You can enable rule 123:13 to generate events and, in an inline deployment, drop offending packets for this option.

### Configuring IP Defragmentation

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

### Before you begin

- Confirm that any networks you want to identify in a custom target-based policy match or are a subset of the networks, zones, and VLANs handled by its parent network analysis policy. See Advanced Settings for Network Analysis Policies, on page 1497 for more information.

### Procedure

**Step 1** Choose **Policies > Access Control**, then click **Network Analysis Policy** or **Policies > Access Control > Intrusion**, then click **Network Analysis Policy**.

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2** Click the edit icon (✏️) next to the policy you want to edit.

If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click **Settings** in the navigation panel.

**Step 4** If **IP Defragmentation** under **Transport/Network Layer Preprocessors** is disabled, click **Enabled**.

**Step 5** Click the edit icon (✏️) next to **IP Defragmentation**.
Step 6 Optionally, enter a value in the **Preallocated Fragments** field.

Step 7 You have the following choices:

- Add a server profile — Click the add icon ( ) next to **Servers** on the left side of the page, then enter a value in the **Host Address** field and click **OK**. You can specify a single IP address or address block, or a comma-separated list of either or both. You can create a total of 255 target-based policies including the default policy.
- Edit a server profile — Click the configured address for under **Servers** on the left side of the page, or click **default**.
- Delete a profile — Click the delete icon ( ) next to the policy.

Step 8 Modify the options described in **IP Defragmentation Options**, on page 1595.

Step 9 To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

---

What to do next

- If you want to generate events and, in an inline deployment, drop offending packets, enable IP defragmentation rules (GID 123). For more information, see **Setting Intrusion Rule States**, on page 1331 and **IP Defragmentation Options**, on page 1595.
- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

---

**The Packet Decoder**

Before sending captured packets to a preprocessor, the system first sends the packets to the packet decoder. The packet decoder converts packet headers and payloads into a format that preprocessors and the rules engine can easily use. Each stack layer is decoded in turn, beginning with the data link layer and continuing through the network and transport layers.

**Packet Decoder Options**

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.
Decode GTP Data Channel

Decodes the encapsulated GTP (General Packet Radio Service [GPRS] Tunneling Protocol) data channel. By default, the decoder decodes version 0 data on port 3386 and version 1 data on port 2152. You can use the GTP_PORTS default variable to modify the ports that identify encapsulated GTP traffic.

You can enable rules 116:297 and 116:298 to generate events and, in an inline deployment, drop offending packets for this option.

Detect Teredo on Non-Standard Ports

Inspects Teredo tunneling of IPv6 traffic that is identified on a UDP port other than port 3544.

The system always inspects IPv6 traffic when it is present. By default, IPv6 inspection includes the 4in6, 6in4, 6to4, and 6in6 tunneling schemes, and also includes Teredo tunneling when the UDP header specifies port 3544.

In an IPv4 network, IPv4 hosts can use the Teredo protocol to tunnel IPv6 traffic through an IPv4 Network Address Translation (NAT) device. Teredo encapsulates IPv6 packets within IPv4 UDP datagrams to permit IPv6 connectivity behind an IPv4 NAT device. The system normally uses UDP port 3544 to identify Teredo traffic. However, an attacker could use a non-standard port in an attempt to avoid detection. You can enable Detect Teredo on Non-Standard Ports to cause the system to inspect all UDP payloads for Teredo tunneling.

Teredo decoding occurs only on the first UDP header, and only when IPv4 is used for the outer network layer. When a second UDP layer is present after the Teredo IPv6 layer because of UDP data encapsulated in the IPv6 data, the rules engine uses UDP intrusion rules to analyze both the inner and outer UDP layers.

Note that intrusion rules 12065, 12066, 12067, and 12068 in the policy-other rule category detect, but do not decode, Teredo traffic. Optionally, you can use these rules to drop Teredo traffic in an inline deployment; however, you should ensure that these rules are disabled or set to generate events without dropping traffic when you enable Detect Teredo on Non-Standard Ports.

Detect Excessive Length Value

Detects when the packet header specifies a packet length that is greater than the actual packet length.

This option is ignored for Firepower Threat Defense routed, transparent, and inline interfaces. Packets that have excessive header length are always dropped. However, this option does apply to Firepower Threat Defense inline tap and passive interfaces.

You can enable rules 116:6, 116:47, 116:97, and 116:275 to generate events and, in an inline deployment, drop offending packets for this option.

Detect Invalid IP Options

Detects invalid IP header options to identify exploits that use invalid IP options. For example, there is a denial of service attack against a firewall which causes the system to freeze. The firewall attempts to parse invalid Timestamp and Security IP options and fails to check for a zero length, which causes an irrecoverable infinite loop. The rules engine identifies the zero length option, and provides information you can use to mitigate the attack at the firewall.

Firepower Threat Defense devices will drop any RSVP packet that contains IP options other than the router alert, end of options list (EOOL), and no operation (NOP) options on any routed or transparent interface. For inline, inline tap, or passive interfaces, IP options will be handled as described above.

You can enable rules 116:4 and 116:5 to generate events and, in an inline deployment, drop offending packets for this option.
Detect Experimental TCP Options

Detects TCP headers with experimental TCP options. The following table describes these options.

<table>
<thead>
<tr>
<th>TCP Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>Partial Order Connection Permitted</td>
</tr>
<tr>
<td>10</td>
<td>Partial Order Service Profile</td>
</tr>
<tr>
<td>14</td>
<td>Alternate Checksum Request</td>
</tr>
<tr>
<td>15</td>
<td>Alternate Checksum Data</td>
</tr>
<tr>
<td>18</td>
<td>Trailer Checksum</td>
</tr>
<tr>
<td>20</td>
<td>Space Communications Protocol Standards (SCPS)</td>
</tr>
<tr>
<td>21</td>
<td>Selective Negative Acknowledgements (SCPS)</td>
</tr>
<tr>
<td>22</td>
<td>Record Boundaries (SCPS)</td>
</tr>
<tr>
<td>23</td>
<td>Corruption (SPCS)</td>
</tr>
<tr>
<td>24</td>
<td>SNAP</td>
</tr>
<tr>
<td>26</td>
<td>TCP Compression Filter</td>
</tr>
</tbody>
</table>

Because these are experimental options, some systems do not account for them and may be open to exploits.

In addition to the experimental options listed in the above table, the system considers any TCP option with an option number greater than 26 to be experimental.

You can enable rule 116:58 to generate events and, in an inline deployment, drop offending packets for this option.

Detect Obsolete TCP Options

Detects TCP headers with obsolete TCP options. Because these are obsolete options, some systems do not account for them and may be open to exploits. The following table describes these options.

<table>
<thead>
<tr>
<th>TCP Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>Echo</td>
</tr>
<tr>
<td>7</td>
<td>Echo Reply</td>
</tr>
<tr>
<td>16</td>
<td>Skeeter</td>
</tr>
<tr>
<td>17</td>
<td>Bubba</td>
</tr>
<tr>
<td>19</td>
<td>MD5 Signature</td>
</tr>
<tr>
<td>25</td>
<td>Unassigned</td>
</tr>
</tbody>
</table>
You can enable rule 116:57 to generate events and, in an inline deployment, drop offending packets for this option.

**Detect T/TCP**

Detects TCP headers with the CC.ECHO option. The CC.ECHO option confirms that TCP for Transactions (T/TCP) is being used. Because T/TCP header options are not in widespread use, some systems do not account for them and may be open to exploits.

You can enable rule 116:56 to generate events and, in an inline deployment, drop offending packets for this option.

**Detect Other TCP Options**

Detects TCP headers with invalid TCP options not detected by other TCP decoding event options. For example, this option detects TCP options with the incorrect length or with a length that places the option data outside the TCP header.

This option is ignored for Firepower Threat Defense routed and transparent interfaces. Packets that have invalid TCP options are always dropped.

You can enable rules 116:54, 116:55, and 116:59 to generate events and, in an inline deployment, drop offending packets for this option.

**Detect Protocol Header Anomalies**

Detects other decoding errors not detected by the more specific IP and TCP decoder options. For example, the decoder might detect a malformed data-link protocol header.

This option is ignored for Firepower Threat Defense routed, transparent, and inline interfaces. Packets that have header anomalies are always dropped. However, this option does apply to Threat Defense inline tap and passive interfaces.

To generate events and, in an inline deployment, drop offending packets for this option, you can enable any of the following rules:

<table>
<thead>
<tr>
<th>GID:SID</th>
<th>Generates an event if:</th>
</tr>
</thead>
<tbody>
<tr>
<td>116:467</td>
<td>The packet is smaller than the minimum size of a packet encapsulated with a Cisco FabricPath header.</td>
</tr>
<tr>
<td>116:468</td>
<td>The Cisco Meta Data (CMD) field in the header contains a header length smaller than the minimum size of a valid CMD header. The CMD field is associated with the Cisco Trustsec protocol.</td>
</tr>
<tr>
<td>116:469</td>
<td>The CMD field in the header contains an invalid field length.</td>
</tr>
<tr>
<td>116:470</td>
<td>The CMD field in the header contains an invalid Security Group Tag (SGT) option type.</td>
</tr>
<tr>
<td>116:471</td>
<td>The CMD field in the header contains an SGT with a reserved value.</td>
</tr>
</tbody>
</table>

You can also enable any packet decoder rule not associated with other packet decoder options.
Configuring Packet Decoding

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1
Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.  
**Note**  If your custom user role limits access to the first path listed here, use the second path to access the policy.

Step 2
Click the edit icon ( ) next to the policy you want to edit.  
If a view icon ( ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3
Click Settings in the navigation panel.

Step 4
If Packet Decoding under Transport/Network Layer Preprocessors is disabled, click Enabled.

Step 5
Click the edit icon ( ) next to Packet Decoding.

Step 6
Enable or disable the options described in Packet Decoder Options, on page 1599.

Step 7
To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

What to do next

• If you want to generate events and, in an inline deployment, drop offending packets, enable packet decoder rules (GID 116). For more information, see Setting Intrusion Rule States, on page 1331 and Packet Decoder Options, on page 1599.

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

TCP Stream Preprocessing

The TCP protocol defines various states in which connections can exist. Each TCP connection is identified by the source and destination IP addresses and source and destination ports. TCP permits only one connection with the same connection parameter values to exist at a time.

State-Related TCP Exploits

If you add the flow keyword with the established argument to an intrusion rule, the intrusion rules engine inspects packets matching the rule and the flow directive in stateful mode. Stateful mode evaluates only the traffic that is part of a TCP session established with a legitimate three-way handshake between a client and server.

You can configure the system so that the preprocessor detects any TCP traffic that cannot be identified as part of an established TCP session, although this is not recommended for typical use because the events would quickly overload the system and not provide meaningful data.

Attacks like stick and snot use the system’s extensive rule sets and packet inspection against itself. These tools generate packets based on the patterns in Snort-based intrusion rules, and send them across the network. If your rules do not include the flow or flowbits keyword to configure them for stateful inspection, each packet will trigger the rule, overwhelming the system. Stateful inspection allows you to ignore these packets because they are not part of an established TCP session and do not provide meaningful information. When performing stateful inspection, the rules engine detects only those attacks that are part of an established TCP session, allowing analysts to focus on these rather than the volume of events caused by stick or snot.

Target-Based TCP Policies

Different operating systems implement TCP in different ways. For example, Windows and some other operating systems require a TCP reset segment to have a precise TCP sequence number to reset a session, while Linux and other operating systems permit a range of sequence numbers. In this example, the stream preprocessor must understand exactly how the destination host will respond to the reset based on the sequence number. The stream preprocessor stops tracking the session only when the destination host considers the reset to be valid, so an attack cannot evade detection by sending packets after the preprocessor stops inspecting the stream. Other variations in TCP implementations include such things as whether an operating system employs a TCP timestamp option and, if so, how it handles the timestamp, and whether an operating system accepts or ignores data in a SYN packet.

Different operating systems also reassemble overlapping TCP segments in different ways. Overlapping TCP segments could reflect normal retransmissions of unacknowledged TCP traffic. They could also represent an attempt by an attacker, aware of the operating system of one of your hosts, to evade detection and exploit that host by sending malicious content hidden in overlapping segments. However, you can configure the stream preprocessor to be aware of the operating systems running on your monitored network segment so it reassembles segments the same way the target host does, allowing it to identify the attack.

You can create one or more TCP policies to tailor TCP stream inspection and reassembly to the different operating systems on your monitored network segment. For each policy, you identify one of thirteen operating system policies. You bind each TCP policy to a specific IP address or address block using as many TCP policies as you need to identify any or all of the hosts using a different operating system. The default TCP policy applies to any hosts on the monitored network that you do not identify in any other TCP policy, so there is no need to specify an IP address or address block for the default TCP policy.
Note that you can also use adaptive profile updates in a passive deployment to dynamically select target-based policies for the TCP stream preprocessor using host operating system information for the target host in a packet.

**TCP Stream Reassembly**

The stream preprocessor collects and reassembles all the packets that are part of a TCP session’s server-to-client communication stream, client-to-server communication stream, or both. This allows the rules engine to inspect the stream as a single, reassembled entity rather than inspecting only the individual packets that are part of a given stream.

Stream reassembly allows the rules engine to identify stream-based attacks, which it may not detect when inspecting individual packets. You can specify which communication streams the rules engine reassembles based on your network needs. For example, when monitoring traffic on your web servers, you may only want to inspect client traffic because you are much less likely to receive malicious traffic from your own web server.

In each TCP policy, you can specify a comma-separated list of ports to identify the traffic for the stream preprocessor to reassemble. If adaptive profile updates are enabled, you can also list services that identify traffic to reassemble, either as an alternative to ports or in combination with ports.

You can specify ports, services, or both. You can specify separate lists of ports for any combination of client ports, server ports, and both. You can also specify separate lists of services for any combination of client services, server services, and both. For example, assume that you wanted to reassemble the following:

- SMTP (port 25) traffic from the client
- FTP server responses (port 21)
- telnet (port 23) traffic in both directions

You could configure the following:

- For client ports, specify 23, 25
- For server ports, specify 21, 23

Or, instead, you could configure the following:

- For client ports, specify 25
- For server ports, specify 21
- For both ports, specify 23

Additionally, consider the following example which combines ports and services and would be valid when adaptive profile updates are enabled:

- For client ports, specify 23
- For client services, specify smtp
- For server ports, specify 21
- For server services, specify telnet

Negating a port (for example, !80) can improve performance by preventing the TCP stream preprocessor from processing traffic for that port.
Although you can also specify all as the argument to provide reassembly for all ports, Cisco does not recommend setting ports to all because it may increase the amount of traffic inspected by this preprocessor and slow performance unnecessarily.

TCP reassembly automatically and transparently includes ports that you add to other preprocessors. However, if you do explicitly add ports to TCP reassembly lists that you have added to other preprocessor configurations, these additional ports are handled normally. This includes port lists for the following preprocessors:

- FTP/Telnet (server-level FTP)
- DCE/RPC
- HTTP Inspect
- SMTP
- Session Initiation Protocol
- POP
- IMAP
- SSL

Note that reassembling additional traffic types (client, server, both) increases resource demands.

**TCP Stream Preprocessing Options**

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

You can configure the following global TCP option:

**Packet Type Performance Boost**

Enables ignoring TCP traffic for all ports and application protocols that are not specified in enabled intrusion rules, except when a TCP rule with both the source and destination ports set to any has a flow or flowbits option. This performance improvement could result in missed attacks.

You can configure the following options for each TCP policy.

**Network**

Specifies the host IP addresses to which you want to apply the TCP stream reassembly policy.

You can specify a single IP address or address block. You can specify up to 255 total profiles including the default policy.

---

**Note**

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Note that the default setting in the default policy specifies all IP addresses on your monitored network segment that are not covered by another target-based policy. Therefore, you cannot and do not need to specify
an IP address or CIDR block/prefix length for the default policy, and you cannot leave this setting blank in another policy or use address notation to represent any (for example, 0.0.0.0/0 or ::/0).

**Policy**

Identifies the TCP policy operating system of the target host or hosts. If you select a policy other than **Mac OS**, the system removes the data from the synchronization (SYN) packets and disables event generation for rule 129:2. Note that enabling the inline normalization preprocessor **Remove Data on SYN** option also disables rule 129:2.

The following table identifies the operating system policies and the host operating systems that use each.

**Table 207: TCP Operating System Policies**

<table>
<thead>
<tr>
<th>Policy</th>

<td>Mac OS 10 (Mac OS X)</td>
</tr>
</tbody>
</table>
The First operating system policy could offer some protection when you do not know the host operating system. However, it may result in missed attacks. You should edit the policy to specify the correct operating system if you know it.

**Timeout**

The number of seconds between 1 and 86400 the intrusion rules engine keeps an inactive stream in the state table. If the stream is not reassembled in the specified time, the intrusion rules engine deletes it from the state table.

**Note**

If your managed device is deployed on a segment where the network traffic is likely to reach the device’s bandwidth limits, you should consider setting this value higher (for example, to 600 seconds) to lower the amount of processing overhead.

This option is ignored for Firepower Threat Defense routed and transparent interfaces.

**Maximum TCP Window**

Specifies the maximum TCP window size between 1 and 1073725440 bytes allowed as specified by a receiving host. Setting the value to 0 disables checking for the TCP window size.

The upper limit is the maximum window size permitted by RFC, and is intended to prevent an attacker from evading detection, but setting a significantly large maximum window size could result in a self-imposed denial of service.

When Stateful Inspection Anomalies is enabled, you can enable rule 129:6 to generate events and, in an inline deployment, drop offending packets for this option.

**Overlap Limit**

Specifies that when the configured number between 0 (unlimited) and 255 of overlapping segments in a session has been detected, segment reassembly stops for that session and, if Stateful Inspection Anomalies is enabled and the accompanying preprocessor rule is enabled, an event is generated.

You can enable rule 129:7 to generate events and, in an inline deployment, drop offending packets for this option.

**Flush Factor**

In an inline deployment, specifies that when a segment of decreased size has been detected subsequent to the configured number between 1 and 2048 of segments of non-decreasing size, the system flushes segment data accumulated for detection. Setting the value to 0 disables detection of this segment pattern, which can indicate the end of a request or response. Note that the Inline Normalization Normalize TCP Payload option must be enabled for this option the be effective.
Stateful Inspection Anomalies

Detects anomalous behavior in the TCP stack. When accompanying preprocessor rules are enabled, this may generate many events if TCP/IP stacks are poorly written.

This option is ignored for Firepower Threat Defense routed and transparent interfaces.

You can enable the following rules to generate events and, in an inline deployment, drop offending packets for this option:

- 129:1 through 129:5
- 129:6 (Mac OS only)
- 129:8 through 129:11
- 129:13 through 129:19

Note the following:

- for rule 129:6 to trigger you must also configure a value greater than 0 for Maximum TCP Window.
- for rules 129:9 and 129:10 to trigger you must also enable TCP Session Hijacking.

TCP Session Hijacking

Detects TCP session hijacking by validating the hardware (MAC) addresses detected from both sides of a TCP connection during the 3-way handshake against subsequent packets received on the session. When the MAC address for one side or the other does not match, if Stateful Inspection Anomalies is enabled and one of the two corresponding preprocessor rules are enabled, the system generates events.

This option is ignored for Firepower Threat Defense routed and transparent interfaces.

You can enable rules 129:9 and 129:10 to generate events and, in an inline deployment, drop offending packets for this option. Note that for either of these rules to generate events you must also enable Stateful Inspection Anomalies.

Consecutive Small Segments

When Stateful Inspection Anomalies is enabled, specifies a maximum number of 1 to 2048 consecutive small TCP segments allowed. Setting the value to 0 disables checking for consecutive small segments.

You must set this option together with the Small Segment Size option, either disabling both or setting a non-zero value for both. Note that receiving as many as 2000 consecutive segments, even if each segment was 1 byte in length, without an intervening ACK would be far more consecutive segments than you would normally expect.

This option is ignored for Firepower Threat Defense routed and transparent interfaces.

You can enable rule 129:12 to generate events and, in an inline deployment, drop offending packets for this option.

Small Segment Size

When Stateful Inspection Anomalies is enabled, specifies the 1 to 2048 byte TCP segment size that is considered small. Setting the value to 0 disables specifying the size of a small segment.

This option is ignored for Firepower Threat Defense routed and transparent interfaces.
You must set this option together with the **Consecutive Small Segments** option, either disabling both or setting a non-zero value for both. Note that a 2048 byte TCP segment is larger than a normal 1500 byte Ethernet frame.

### Ports Ignoring Small Segments

When **Stateful Inspection Anomalies**, **Consecutive Small Segments**, and **Small Segment Size** are enabled, specifies a comma-separated list of one or more ports that ignore small TCP segment detection. Leaving this option blank specifies that no ports are ignored.

This option is ignored for Firepower Threat Defense routed and transparent interfaces.

You can add any port to the list, but the list only affects ports specified in one of the **Perform Stream Reassembly on** port lists in the TCP policy.

### Require TCP 3-Way Handshake

Specifies that sessions are treated as established only upon completion of a TCP three-way handshake. Disable this option to increase performance, protect from SYN flood attacks, and permit operation in a partially asynchronous environment. Enable it to avoid attacks that attempt to generate false positives by sending information that is not part of an established TCP session.

You can enable rule 129:20 to generate events and, in an inline deployment, drop offending packets for this option.

### 3-Way Handshake Timeout

Specifies the number of seconds between 0 (unlimited) and 86400 (twenty-four hours) by which a handshake must be completed when **Require TCP 3-Way Handshake** is enabled. You must enable **Require TCP 3-Way Handshake** to modify the value for this option.

For Firepower Software devices and Firepower Threat Defense inline, inline tap, and passive interfaces, the default is 0. For Firepower Threat Defense routed and transparent interfaces, the timeout is always 30 seconds; the value configured here is ignored.

### Packet Size Performance Boost

Sets the preprocessor to not queue large packets in the reassembly buffer. This performance improvement could result in missed attacks. Disable this option to protect against evasion attempts using small packets of one to twenty bytes. Enable it when you are assured of no such attacks because all traffic is comprised of very large packets.

### Legacy Reassembly

Sets the stream preprocessor to emulate the deprecated Stream 4 preprocessor when reassembling packets, which lets you compare events reassembled by the stream preprocessor to events based on the same data stream reassembled by the Stream 4 preprocessor.

### Asynchronous Network

Specifies whether the monitored network is an asynchronous network, that is, a network where the system sees only half the traffic. When this option is enabled, the system does not reassemble TCP streams to increase performance.

This option is ignored for Firepower Threat Defense routed and transparent interfaces.
Perform Stream Reassembly on Client Ports

Enables stream reassembly based on ports for the client side of the connection. In other words, it reassembles streams destined for web servers, mail servers, or other IP addresses typically defined by the IP addresses specified in $HOME_NET. Use this option when you expect malicious traffic to originate from clients.

This option is ignored for Firepower Threat Defense routed and transparent interfaces.

Perform Stream Reassembly on Client Services

Enables stream reassembly based on services for the client side of the connection. Use this option when you expect malicious traffic to originate from clients.

At least one client detector must be enabled for each client service you select. By default, all Cisco-provided detectors are activated. If no detector is enabled for an associated client application, the system automatically enables all Cisco-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application.

This feature requires Protection and Control licenses.

This option is ignored for Firepower Threat Defense routed and transparent interfaces.

Perform Stream Reassembly on Server Ports

Enables stream reassembly based on ports for the server side of the connection only. In other words, it reassembles streams originating from web servers, mail servers, or other IP addresses typically defined by the IP addresses specified in $EXTERNAL_NET. Use this option when you want to watch for server side attacks. You can disable this option by not specifying ports.

This option is ignored for Firepower Threat Defense routed and transparent interfaces.

Note

For a thorough inspection of a service, add the service name in the Perform Stream Reassembly on Server Services field in addition to adding the port number in the Perform Stream Reassembly on Server Ports field. For example, add ‘HTTP’ service in the Perform Stream Reassembly on Server Services field to inspect HTTP service in addition to adding port number 80 in the Perform Stream Reassembly on Server Ports field.

Perform Stream Reassembly on Server Services

Enables stream reassembly based on services for the server side of the connection only. Use this option when you want to watch for server side attacks. You can disable this option by not specifying services.

At least one detector must be enabled. By default, all Cisco-provided detectors are activated. If no detector is enabled for a service, the system automatically enables all Cisco-provided detectors for the associated application protocol; if none exist, the system enables the most recently modified user-defined detector for the application protocol.

This feature requires Protection and Control licenses.

This option is ignored for Firepower Threat Defense routed and transparent interfaces.
**Perform Stream Reassembly on Both Ports**

 Enables stream reassembly based on ports for both the client and server side of the connection. Use this option when you expect that malicious traffic for the same ports may travel in either direction between clients and servers. You can disable this option by not specifying ports.

 This option is ignored for Firepower Threat Defense routed and transparent interfaces.

**Perform Stream Reassembly on Both Services**

 Enables stream reassembly based on services for both the client and server side of the connection. Use this option when you expect that malicious traffic for the same services may travel in either direction between clients and servers. You can disable this option by not specifying services.

 At least one detector must be enabled. By default, all Cisco-provided detectors are activated. If no detector is enabled for an associated client application or application protocol, the system automatically enables all Cisco-provided detectors for the application or application protocol; if none exist, the system enables the most recently modified user-defined detector for the application or application protocol.

 This feature requires Protection and Control licenses.

 This option is ignored for Firepower Threat Defense routed and transparent interfaces.

**Troubleshooting Options: Maximum Queued Bytes**

 Support might ask you during a troubleshooting call to specify the amount of data that can be queued on one side of a TCP connection. A value of 0 specifies an unlimited number of bytes.

 [Caution]

 Changing the setting for this troubleshooting option will affect performance and should be done only with Support guidance.

**Troubleshooting Options: Maximum Queued Segments**

 Support might ask you during a troubleshooting call to specify the maximum number of bytes of data segments that can be queued on one side of a TCP connection. A value of 0 specifies an unlimited number of data segment bytes.

 [Caution]

 Changing the setting for this troubleshooting option will affect performance and should be done only with Support guidance.

</tr>
</tbody>
</table>

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Before you begin

- Confirm that networks you want to identify in a custom target-based policy match or are a subset of the networks, zones, and VLANs handled by its parent network analysis policy. See Advanced Settings for Network Analysis Policies, on page 1497 for more information.

Procedure

Step 1 Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

Note If your custom user role limits access to the first path listed here, use the second path to access the policy.

Step 2 Click the edit icon ( ) next to the policy you want to modify.

If a view icon ( ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3 Click Settings in the navigation panel on the left.

Step 4 If the TCP Stream Configuration setting is disabled under Transport/Network Layer Preprocessors, enable it by clicking Enabled.

Step 5 Click the edit icon ( ) next to TCP Stream Configuration.

Step 6 Check or clear the Packet Type Performance Boost check box in the Global Settings section.

Step 7 You can:

- Add a target-based policy — Click the add icon ( ) next to Hosts in the Targets section. Specify one or more IP addresses in the Host Address field. You can specify a single IP address or address block. You can create a total of 255 target-based policies including the default policy. When done, click OK.
- Edit an exist target-based policy — Under Hosts, click on the address for the policy you want to edit, or click default to edit the default configuration values.
- Modify the TCP Stream Preprocessing options — See TCP Stream Preprocessing Options, on page 1606.

Caution Do not modify Maximum Queued Bytes or Maximum Queued Segments unless instructed to do so by Support.
Tip

To modify stream reassembly settings based on client, server, or both services, click inside the field you want to modify or click Edit next to the field. Use the arrow buttons to move services between the Available and Enabled lists in the pop-up window, then click OK.

- Delete an existing target-based policy — Click the delete icon (🗑️) next to the policy you want to remove.

Step 8

To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

What to do next

- If you want to generate events and, in an inline deployment, drop offending packets, enable TCP Stream preprocessor rules (GID 129). For more information, see Setting Intrusion Rule States, on page 1331 and TCP Stream Preprocessing Options, on page 1606.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

UDP Stream Preprocessing

UDP stream preprocessing occurs when the rules engine processes packets against a UDP rule that includes the flow keyword using any of the following arguments:

- Established
- To Client
- From Client
- To Server
- From Server

UDP data streams are not typically thought of in terms of sessions. UDP is a connectionless protocol that does not provide a means for two endpoints to establish a communication channel, exchange data, and close the channel. However, the stream preprocessor uses the source and destination IP address fields in the encapsulating IP datagram header and the port fields in the UDP header to determine the direction of flow and identify a session. A session ends when a configurable timer is exceeded, or when either endpoint receives an ICMP message that the other endpoint is unreachable or the requested service is unavailable.

Note that the system does not generate events related to UDP stream preprocessing; however, you can enable related packet decoder rules to detect UDP protocol header anomalies.
UDP Stream Preprocessing Options

**Timeout**

Specifies the number of seconds the preprocessor keeps an inactive stream in the state table. If additional datagrams are not seen in the specified time, the preprocessor deletes the stream from the state table.

For Firepower Threat Defense routed and transparent interfaces, this value is ignored. Instead, the UDP Timeout defined in the Platform Settings policy applied to the device determines the timeout. The default in the Platform Settings policy is 2 minutes.

**Packet Type Performance Boost**

Sets to preprocessor to ignore UDP traffic for all ports and application protocols that are not specified in enabled rules, except when a UDP rule with both the source and destination ports set to any has a flow or flowbits option. This performance improvement could result in missed attacks.

### Configuring UDP Stream Preprocessing

</table>

#### Procedure

**Step 1**
Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2**
Click the edit icon (✏️) next to the policy you want to edit.

If a view icon (_eye) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3**
Click Settings in the navigation panel.

**Step 4**
If UDP Stream Configuration under Transport/Network Layer Preprocessors is disabled, click Enabled.

**Step 5**
Click the edit icon (✏️) next to UDP Stream Configuration.

**Step 6**
Set the options described in UDP Stream Preprocessing Options, on page 1615.

**Step 7**
To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.
If you leave the policy without committing changes, cached changes since the last commit are discarded if you edit a different policy.

What to do next

• If you want to generate events and, in an inline deployment, drop offending packets, enable related packet decoder rules (GID 116). For more information, see Setting Intrusion Rule States, on page 1331 and The Packet Decoder, on page 1599.

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Detecting Specific Threats

The following topics explain how to use preprocessors in a network analysis policy to detect specific threats:

- Introduction to Specific Threat Detection, on page 1617
- Back Orifice Detection, on page 1617
- Portscan Detection, on page 1619
- Rate-Based Attack Prevention, on page 1626

Introduction to Specific Threat Detection

You can use several preprocessors in a network analysis policy to detect specific threats to your monitored network, such as Back Orifice attacks, several portscan types, and rate-based attacks that attempt to overwhelm your network with excessive traffic. Note that when an intrusion rule or rule argument requires a disabled preprocessor, the system automatically uses it with its current configuration even though it remains disabled in the network analysis policy’s web interface.

You can also use sensitive data detection, which you configure in an intrusion policy, to detect unsecured transmission of sensitive numerical data.

Back Orifice Detection

The Firepower System provides a preprocessor that detects the existence of the Back Orifice program. This program can be used to gain admin access to your Windows hosts.

Back Orifice Detection Preprocessor

The Back Orifice preprocessor analyzes UDP traffic for the Back Orifice magic cookie, "*!QWTY?", which is located in the first eight bytes of the packet and is XOR-encrypted.

The Back Orifice preprocessor has a configuration page, but no configuration options. When it is enabled, you must also enable preprocessor rules for the preprocessor to generate events and, in an inline deployment, drop offending packets.

### Procedure

**Step 1** Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

*Note* If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2** Click the edit icon (📝) next to the policy you want to edit.

If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click Settings in the navigation panel.

**Step 4** If Back Orifice Detection under Specific Threat Detection is disabled, click Enabled.

*Note* There are no user-configurable options for Back Orifice.

**Step 5** To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

### What to do next

- If you want to generate events and, in an inline deployment, drop offending packets, enable Back Orifice Detection rules 105:1, 105:2, 105:3, or 105:4. For more information, see Intrusion Rule States, on page 1330 and Back Orifice Detection Preprocessor, on page 1617.
Portscan Detection

A portscan is a form of network reconnaissance that is often used by attackers as a prelude to an attack. In a portscan, an attacker sends specially crafted packets to a targeted host. By examining the packets that the host responds with, the attacker can often determine which ports are open on the host and, either directly or by inference, which application protocols are running on these ports.

By itself, a portscan is not evidence of an attack. In fact, some of the portscanning techniques used by attackers can also be employed by legitimate users on your network. Cisco’s portscan detector is designed to help you determine which portscans might be malicious by detecting patterns of activity.

Portscan Types, Protocols, and Filtered Sensitivity Levels

Attackers are likely to use several methods to probe your network. Often they use different protocols to draw out different responses from a target host, hoping that if one type of protocol is blocked, another may be available.

Table 209: Protocol Types

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>Detects TCP probes such as SYN scans, ACK scans, TCP connect() scans, and scans with unusual flag combinations such as Xmas tree, FIN, and NULL</td>
</tr>
<tr>
<td>UDP</td>
<td>Detects UDP probes such as zero-byte UDP packets</td>
</tr>
<tr>
<td>ICMP</td>
<td>Detects ICMP echo requests (pings)</td>
</tr>
<tr>
<td>IP</td>
<td>Detects IP protocol scans. These scans differ from TCP and UDP scans because the attacker, instead of looking for open ports, is trying to discover which IP protocols are supported on a target host.</td>
</tr>
</tbody>
</table>

Portscans are generally divided into four types based on the number of targeted hosts, the number of scanning hosts, and the number of ports that are scanned.
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Portscan Detection  | A one-to-one portscan in which an attacker uses one or a few hosts to scan multiple ports on a single target host. One-to-one portscans are characterized by:  
  • a low number of scanning hosts  
  • a single host that is scanned  
  • a high number of ports scanned  
  This option detects TCP, UDP, and IP portscans. |
| Port Sweep          | A one-to-many port sweeps in which an attacker uses one or a few hosts to scan a single port on multiple target hosts. Portsweeps are characterized by:  
  • a low number of scanning hosts  
  • a high number of scanned hosts  
  • a low number of unique ports scanned  
  This option detects TCP, UDP, ICMP, and IP portsweeps. |
| Decoy Portscan      | A one-to-one portscan in which the attacker mixes spoofed source IP addresses with the actual scanning IP address. Decoy portscans are characterized by:  
  • a high number of scanning hosts  
  • a low number of ports that are scanned only once  
  • a single (or a low number of) scanned hosts  
  The decoy portscan option detects TCP, UDP, and IP protocol portscans. |
| Distributed Portscan| A many-to-one portscan in which multiple hosts query a single host for open ports. Distributed portscans are characterized by:  
  • a high number of scanning hosts  
  • a high number of ports that are scanned only once  
  • a single (or a low number of) scanned hosts  
  The distributed portscan option detects TCP, UDP, and IP protocol portscans. |
The information that the portscan detector learns about a probe is largely based on seeing negative responses from the probed hosts. For example, when a web client tries to connect to a web server, the client uses port 80/tcp and the server can be counted on to have that port open. However, when an attacker probes a server, the attacker does not know in advance if it offers web services. When the portscan detector sees a negative response (that is, an ICMP unreachable or TCP RST packet), it records the response as a potential portscan. The process is more difficult when the targeted host is on the other side of a device such as a firewall or router that filters negative responses. In this case, the portscan detector can generate filtered portscan events based on the sensitivity level that you select.

<table>
<thead>
<tr>
<th>Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low</td>
<td>Detects only negative responses from targeted hosts. Select this sensitivity level to suppress false positives, but keep in mind that some types of portscans (slow scans, filtered scans) might be missed. This level uses the shortest time window for portscan detection.</td>
</tr>
<tr>
<td>Medium</td>
<td>Detects portscans based on the number of connections to a host, which means that you can detect filtered portscans. However, very active hosts such as network address translators and proxies may generate false positives. Note that you can add the IP addresses of these active hosts to the Ignore Scanned field to mitigate this type of false positive. This level uses a longer time window for portscan detection.</td>
</tr>
<tr>
<td>High</td>
<td>Detects portscans based on a time window, which means that you can detect time-based portscans. However, if you use this option, you should be careful to tune the detector over time by specifying IP addresses in the Ignore Scanned and Ignore Scanner fields. This level uses a much longer time window for portscan detection.</td>
</tr>
</tbody>
</table>

**Portscan Event Generation**

When portscan detection is enabled, you must enable rules with Generator ID (GID) 122 and a Snort ID (SID) from among SIDs 1 through 27 to generate events and, in an inline deployment, drop offending packets for each enabled portscan type.

**Note**

For events generated by the portscan connection detector, the protocol number is set to 255. Because portscan does not have a specific protocol associated with it by default, the Internet Assigned Numbers Authority (IANA) does not have a protocol number assigned to it. IANA designates 255 as a reserved number, so that number is used in portscan events to indicate that there is not an associated protocol for the event.

</tbody>
</table>
When you enable the accompanying preprocessor rules, the portscan detector generates intrusion events that you can view just as you would any other intrusion event. However, the information presented on the packet view is different from the other types of intrusion events.

Begin by using the intrusion event views to drill down to the packet view for a portscan event. Note that you cannot download a portscan packet because single portscan events are based on multiple packets; however, the portscan packet view provides all usable packet information.

For any IP address, you can click the address to view the context menu and select whois to perform a lookup on the IP address or View Host Profile to view the host profile for that host.

**Configuring Portscan Detection**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

The portscan detection configuration options allow you to finely tune how the portscan detector reports scan activity.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.
Procedure

Step 1  Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

Note  If your custom user role limits access to the first path listed here, use the second path to access the policy.

Step 2  Click the edit icon (>Edit) next to the policy you want to edit.

If a view icon (>View) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3  Click Settings.

Step 4  If Portscan Detection under Specific Threat Detection is disabled, click Enabled.

Step 5  Click the edit icon (>Edit) next to Portscan Detection.

Step 6  In the Protocol field, specify protocols to enable.

Note  You must ensure TCP stream processing is enabled to detect scans over TCP, and that UDP stream processing is enabled to detect scans over UDP.

Step 7  In the Scan Type field, specify portscan types you want to detect.

Step 8  Choose a level from the Sensitivity Level list; see Portscan Types, Protocols, and Filtered Sensitivity Levels, on page 1619.

Step 9  If you want to monitor specific hosts for signs of portscan activity, enter the host IP address in the Watch IP field.

You can specify a single IP address or address block, or a comma-separated lists of either or both. Leave the field blank to watch all network traffic.

Step 10  If you want to ignore hosts as scanners, enter the host IP address in the Ignore Scanners field.

You can specify a single IP address or address block, or a comma-separated lists of either or both.

Step 11  If you want to ignore hosts as targets of a scan, enter the host IP address in the Ignore Scanned field.

You can specify a single IP address or address block, or a comma-separated lists of either or both.

Tip  Use the Ignore Scanners and Ignore Scanned fields to indicate hosts on your network that are especially active. You may need to modify this list of hosts over time.

Step 12  If you want to discontinue monitoring of sessions picked up in mid-stream, clear the Detect Ack Scans check box.

Note  Detection of mid-stream sessions helps to identify ACK scans, but may cause false events, particularly on networks with heavy traffic and dropped packets.

Step 13  To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.
If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

### What to do next

- If you want portscan detection to generate events and, in an inline deployment, drop offending packets, enable rules 122:1 through 122:27. For more information, see Intrusion Rule States, on page 1330 and Portscan Event Generation, on page 1621.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

---

## Rate-Based Attack Prevention

Rate-based attacks are attacks that depend on frequency of connection or repeated attempts to perpetrate the attack. You can use rate-based detection criteria to detect a rate-based attack as it occurs and respond to it when it happens, then return to normal detection settings after it stops.

You can configure your network analysis policy to include rate-based filters that detect excessive activity directed at hosts on your network. You can use this feature on managed devices deployed in inline mode to block rate-based attacks for a specified time, then revert to only generating events and not drop traffic.

The SYN attack prevention option helps you protect your network hosts against SYN floods. You can protect individual hosts or whole networks based on the number of packets seen over a period of time. If your device is deployed passively, you can generate events. If your device is placed inline, you can also drop the malicious packets. After the timeout period elapses, if the rate condition has stopped, the event generation and packet dropping stops.

For example, you could configure a setting to allow a maximum number of SYN packets from any one IP address, and block further connections from that IP address for 60 seconds.

You can also limit TCP/IP connections to or from hosts on your network to prevent denial of service (DoS) attacks or excessive activity by users. When the system detects the configured number of successful connections to or from a specified IP address or range of addresses, it generates events on additional connections. The rate-based event generation continues until the timeout period elapses without the rate condition occurring. In an inline deployment you can choose to drop packets until the rate condition times out.

For example, you could configure a setting to allow a maximum of 10 successful simultaneous connections from any one IP address, and block further connections from that IP address for 60 seconds.

---

**Note**

Devices load-balance inspection across internal resources. When you configure rate-based attack prevention, you configure the triggering rate per resource, not per device. If rate-based attack prevention is not working as expected, you may need to lower the triggering rate. For help determining the correct rate, contact Support.

The following diagram shows an example where an attacker is attempting to access a host. Repeated attempts to find a password trigger a rule which has rate-based attack prevention configured. The rate-based settings...
change the rule attribute to Drop and Generate Events after rule matches occur five times in a 10-second span. The new rule attribute times out after 15 seconds.

After the timeout, note that packets are still dropped in the rate-based sampling period that follows. If the sampled rate is above the threshold in the current or previous sampling period, the new action continues. The new action reverts to generating events only after a sampling period completes where the sampled rate is below the threshold rate.

**Rate-Based Attack Prevention Examples**

The detection_filter keyword and the thresholding and suppression features provide other ways to filter either the traffic itself or the events that the system generates. You can use rate-based attack prevention alone or in any combination with thresholding, suppression, or the detection_filter keyword.

The detection_filter keyword, thresholding or suppression, and rate-based criteria may all apply to the same traffic. When you enable suppression for a rule, events are suppressed for the specified IP addresses even if a rate-based change occurs.

**detection_filter Keyword Example**

The following example shows an attacker attempting a brute-force login. Repeated attempts to find a password trigger a rule that also includes the detection_filter keyword, with a count set to 5. This rule has rate-based attack prevention configured. The rate-based settings change the rule attribute to Drop and Generate Events for 20 seconds when there are five hits on the rule in a 10-second span.

As shown in the diagram, the first five packets matching the rule do not generate events because the rule does not trigger until the rate exceeds the rate indicated by the detection_filter keyword. After the rule triggers, event notification begins, but the rate-based criteria do not trigger the new action of Drop and Generate Events until five more packets pass.
After the rate-based criteria are met, events are generated and the packets are dropped until the rate-based timeout period expires and the rate falls below the threshold. After twenty seconds elapse, the rate-based action times out. After the timeout, note that packets are still dropped in the rate-based sampling period that follows. Because the sampled rate is above the threshold rate in the previous sampling period when the timeout happens, the rate-based action continues.

Notethatalthoughtheexampledoesnotdepictthis,youcanusetheDropandGenerateEventsrulestatein combinationwiththedetection_filterkeywordtostartdroppingtrafficwhenhitstherulereachthespecifiedrate. When deciding whether to configure rate-based settings for a rule, consider whether setting the rule to Drop and Generate Events and including the detection_filterkeyword would achievethesame result, or whether you want to manage the rate and timeout settings in the intrusion policy.

Intrusion Rule States, on page 1330

**Dynamic Rule State Thresholding or Suppression Example**

The following example shows an attacker attempting a brute-force login. Repeated attempts to find a password trigger a rule that has rate-based attack prevention configured. The rate-based settings change the rule attribute to Drop and Generate Events for 15 seconds when there are five hits on the rule in 10 seconds. In addition, a limit threshold limits the number of events the rule can generate to 10 events in 23 seconds.

As shown in the diagram, the rule generates events for the first five matching packets. After five packets, the rate-based criteria trigger the new action of Drop and Generate Events, and for the next five packets the rule
generates events and the system drops the packet. After the tenth packet, the limit threshold has been reached, so for the remaining packets the system does not generate events but does drop the packets.

After the timeout, note that packets are still dropped in the rate-based sampling period that follows. If the sampled rate is above the threshold rate in the current or previous sampling period, the new action continues. The new action reverts to Generate Events only after a sampling period completes where the sampled rate is below the threshold rate.

![Diagram](image.png)

Note that although it is not shown in this example, if a new action triggers because of rate-based criteria after a threshold has been reached, the system generates a single event to indicate the change in action. So, for example, when the limit threshold of 10 is reached and the system stops generating events and the action changes from Generate Events to Drop and Generate Events on the 14th packet, the system generates an eleventh event to indicate the change in action.

**Policy-Wide Rate-Based Detection and Thresholding or Suppression Example**

The following example shows an attacker attempting denial of service (DoS) attacks on hosts in your network. Many simultaneous connections to hosts from the same sources trigger a policy-wide Control Simultaneous Connections setting. The setting generates events and drops malicious traffic when there are five connections from one source in 10 seconds. In addition, a global limit threshold limits the number of events any rule or setting can generate to 10 events in 20 seconds.

As shown in the diagram, the policy-wide setting generates events for the first ten matching packets and drops the traffic. After the tenth packet, the limit threshold is reached, so for the remaining packets no events are generated but the packets are dropped.

After the timeout, note that packets are still dropped in the rate-based sampling period that follows. If the sampled rate is above the threshold rate in the current or previous sampling period, the rate-based action of generating events and dropping traffic continues. The rate-based action stops only after a sampling period completes where the sampled rate is below the threshold rate.
Note that although it is not shown in this example, if a new action triggers because of rate-based criteria after a threshold has been reached, the system generates a single event to indicate the change in action. So, for example, if the limit threshold of 10 has been reached and the system stops generating events and the action changes to Drop and Generate events on the 14th packet, the system generates an eleventh event to indicate the change in action.

Rate-Based Detection with Multiple Filtering Methods Example

The following example shows an attacker attempting a brute force login, and describes a case where a detection_filter keyword, rate-based filtering, and thresholding interact. Repeated attempts to find a password trigger a rule which includes the detection_filter keyword, with a count set to 5. This rule also has rate-based attack prevention settings that change the rule attribute to Drop and Generate Events for 30 seconds when there are five rule hits in 15 seconds. In addition, a limit threshold limits the rule to 10 events in 30 seconds.

As shown in the diagram, the first five packets matching the rule do not cause event notification because the rule does not trigger until the rate indicated in the detection_filter keyword is exceeded. After the rule triggers, event notification begins, but the rate-based criteria do not trigger the new action of Drop and Generate Events until five more packets pass. After the rate-based criteria are met, the system generates events for packets 11-15 and drops the packets. After the fifteenth packet, the limit threshold has been reached, so for the remaining packets the system does not generate events but does drop the packets.

After the rate-based timeout, note that packets are still dropped in the rate-based sampling period that follows. Because the sampled rate is above the threshold rate in the previous sampling period, the new action continues.
Rate-Based Attack Prevention Options and Configuration

Rate-based attack prevention identifies abnormal traffic patterns and attempts to minimize the impact of that traffic on legitimate requests. Rate-based attacks usually have one of the following characteristics:

- Any traffic containing excessive incomplete connections to hosts on the network, indicating a SYN flood attack
- Any traffic containing excessive complete connections to hosts on the network, indicating a TCP/IP connection flood attack
- Excessive rule matches in traffic going to a particular destination IP address or addresses or coming from a particular source IP address or addresses
- Excessive matches for a particular rule across all traffic

In a network analysis policy, you can either configure SYN flood or TCP/IP connection flood detection for the entire policy; in an intrusion policy, you can set rate-based filters for individual intrusion or preprocessor rules. Note that you cannot manually add a rate-based filter to GID 135 rules or modify their rule state. Rules with GID 135 use the client as the source value and the server as the destination value.
Devices load-balance inspection across internal resources. When you configure rate-based attack prevention, you configure the triggering rate per resource, not per device. If rate-based attack prevention is not working as expected, you may need to lower the triggering rate. For help determining the correct rate, contact Support.

Enabling the **SYN Attack Prevention** option also activates rule 135:1. Manually activating this rule has no effect. The rule state is always displayed as Disabled, and never changes. The rule generates events when this option is enabled and a defined rate condition is exceeded.

Enabling the **Control Simultaneous Connections** option also activates rules 135:2 and 135:3. Manually activating these rule has no effect. The rule state is always displayed as Disabled, and never changes. Rule 135:2 rule generates events when a defined rate condition is exceeded. Rule 135:3 generates events when a session closes or times out.

Each rate-based filter contains several components:

- For policy-wide or rule-based source or destination settings, the network address designation
- The rule matching rate, which you configure as a count of rule matches within a specific number of seconds
- A new action to be taken when the rate is exceeded
  
  When you set a rate-based setting for the entire policy, the system generates events when it detects a rate-based attack, and can drop the traffic in an inline deployment. When setting rate-based actions for individual rules, you have three available actions: Generate Events, Drop and Generate Events, and Disable.
  
  - The duration of the action, which you configure as a timeout value

Note that when started, the new action occurs until the timeout is reached, even if the rate falls below the configured rate during that time period. When the timeout period expires, if the rate has fallen below the threshold, the action for the rule reverts to the action initially configured for the rule. For policy-wide settings, the action reverts to the action of each rule the traffic matches or stops if it does not match any rules.

You can configure rate-based attack prevention in an inline deployment to block attacks, either temporarily or permanently. Without rate-based configuration, rules set to Generate Events create events, but the system does not drop packets for those rules. However, if the attack traffic matches rules that have rate-based criteria configured, the rate action may cause packet dropping to occur for the period of time that the rate action is active, even if those rules are not initially set to Drop and Generate Events.

Rate-based actions cannot enable disabled rules or drop traffic that matches disabled rules. However, if you set a rate-based filter at the policy level, you can generate events on or generate events on and drop traffic that contains an excessive number of SYN packets or SYN/ACK interactions within a designated time period.

You can define multiple rate-based filters on the same rule. The first filter listed in the intrusion policy has the highest priority. Note that when two rate-based filter actions conflict, the system implements the action of the first rate-based filter. Similarly, policy-wide rate-based filters override rate-based filters set on individual rules if the filters conflict.

**Related Topics**

- [Setting a Dynamic Rule State from the Rules Page](#), on page 1340
Rate-Based Attack Prevention, Detection Filtering, and Thresholding or Suppression

The `detection_filter` keyword prevents a rule from triggering until a threshold number of rule matches occur within a specified time. When a rule includes the `detection_filter` keyword, the system tracks the number of incoming packets matching the pattern in the rule per timeout period. The system can count hits for that rule from particular source or destination IP addresses. After the rate exceeds the rate in the rule, event notification for that rule begins.

You can use thresholding and suppression to reduce excessive events by limiting the number of event notifications for a rule, a source, or destination, or by suppressing notifications altogether for that rule. You can also configure a global rule threshold that applies to each rule that does not have an overriding specific threshold.

If you apply suppression to a rule, the system suppresses event notifications for that rule for all applicable IP addresses even if a rate-based action change occurs because of a policy-wide or rule-specific rate-based setting.

</tbody>
</table>

You can configure rate-based attack prevention at the policy level to stop SYN flood attacks. You can also stop excessive connections from a specific source or to a specific destination.

Procedure

Step 1 Choose Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy.

Note If your custom user role limits access to the first path listed here, use the second path to access the policy.

Step 2 Click the edit icon (✏️) next to the policy you want to edit.

If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3 Click Settings.

Step 4 If Rate-Based Attack Prevention under Specific Threat Detection is disabled, click Enabled.

Step 5 Click the edit icon (✏️) next to Rate-Based Attack Prevention.

Step 6 You have two choices:

• To prevent incomplete connections intended to flood a host, click Add under SYN Attack Prevention.
• To prevent excessive numbers of connections, click Add under Control Simultaneous Connections.

Step 7

Specify how you want to track traffic:

• To track all traffic from a specific source or range of sources, choose Source from the Track By drop-down list, and enter a single IP address or address block in the Network field.

• To track all traffic to a specific destination or range of destinations, choose Destination from the Track By drop-down list, and enter an IP address or address block in the Network field.

**Note** The system tracks traffic separately for each IP address included in the Network field. Traffic from an IP address that exceeds the configured rate results in generated events only for that IP address. As an example, you might set a source CIDR block of 10.1.0.0/16 for the network setting and configure the system to generate events when there are ten simultaneous connections open. If eight connections are open from 10.1.4.21 and six from 10.1.5.10, the system does not generate events, because neither source has the triggering number of connections open. However, if eleven simultaneous connections are open from 10.1.4.21, the system generates events only for the connections from 10.1.4.21.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Step 8

Specify the triggering rate for the rate tracking setting:

• For SYN attack configuration, enter the number of SYN packets per number of seconds in the Rate fields.

• For simultaneous connection configuration, enter the number of connections in the Count field.

Devices load-balance inspection across internal resources. When you configure rate-based attack prevention, you configure the triggering rate per resource, not per device. If rate-based attack prevention is not working as expected, you may need to lower the triggering rate. For help determining the correct rate, contact Support.

Step 9

To drop packets matching the rate-based attack prevention settings, check the Drop check box.

Step 10

In the Timeout field, enter the time period after which to stop generating events (and if applicable, dropping) for traffic with the matching pattern of SYNs or simultaneous connections.

**Caution** Setting a high timeout value may entirely block connection to a host in an inline deployment.

Step 11

Click OK.

Step 12

To save changes you made in this policy since the last policy commit, click Policy Information, then click Commit Changes.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Adaptive Profiles

The following topics describe how to configure adaptive profiles:

- About Adaptive Profiles, on page 1637
- Adaptive Profile Updates, on page 1637
- Adaptive Profile Updates and Firepower Recommended Rules, on page 1638
- Adaptive Profile Options, on page 1638
- Configuring Adaptive Profiles, on page 1639

About Adaptive Profiles

With adaptive profiles you can:

- Enable access control rules to perform application and file control, including AMP, and intrusion rules to use service metadata.

⚠️ Caution

Adaptive profiling must be enabled (its default state) as described in Configuring Adaptive Profiles, on page 1639 for access control rules to perform application and file control, including AMP, and for intrusion rules to use service metadata.

- For passive deployments, enable adaptive profile updates to defragment and reassemble IP traffic according to the destination hosts' operating systems.

Note

For inline deployments Cisco recommends that, instead of enabling adaptive profile updates, you configure the inline normalization preprocessor with the Normalize TCP Payload option enabled.

Adaptive Profile Updates

Typically, the system uses the static settings in your network analysis policy to preprocess and analyze traffic. With adaptive profile updates, the system can adapt processing behavior using host information either detected by network discovery or imported from a third party.
Profile updates, like the target-based profiles you can configure manually in a network analysis policy, help to defragment IP packets and reassemble streams in the same way as the operating system on the target host. The intrusion rules engine then analyzes the data in the same format as that used by the destination host.

Manually configured target-based profiles apply either the default operating system profile you select, or profiles you bind to specific hosts. Profile updates, however, switch to the appropriate operating system profile based on the operating system in the host profile for the target host.

Consider a scenario where you configure profile updates for the 10.6.0.0/16 subnet and set the default IP Defragmentation target-based policy to Linux. The Firepower Management Center where you configure the settings has a network map that includes the 10.6.0.0/16 subnet.

- When the system detects traffic from Host A, which is not in the 10.6.0.0/16 subnet, it uses the Linux target-based policy to reassemble IP fragments.
- When the system detects traffic from Host B, which is in the 10.6.0.0/16 subnet, it retrieves Host B’s operating system data from the network map. The system uses a profile based on that operating system to defragment the traffic destined for Host B.

Adaptive Profile Updates and Firepower Recommended Rules

The adaptive profile updates feature is an advanced setting in an access control policy that applies globally to all intrusion policies invoked by that access control policy. The Firepower recommended rules feature applies to the individual intrusion policy where you configure it.

Like Firepower recommended rules, profile updates compare metadata in a rule to host information to determine whether a rule should apply for a particular host. However, while Firepower recommended rules provide recommendations for enabling or disabling rules using that information, profile updates use the information to apply specific rules to specific traffic.

Firepower recommended rules require your interaction to implement suggested changes to rule states. Profile updates, on the other hand, do not modify intrusion policies. Treatment of rules based on profile updates happens on a packet-by-packet basis.

Additionally, Firepower recommended rules can result in enabling disabled rules. Profile updates, in contrast, only affect the application of rules that are already enabled in intrusion policies. Profile updates never change the rule state.

You can use profile updates and Firepower recommended rules in combination. Profile updates use the rule state for a rule when your intrusion policy is deployed to determine whether to include it as a candidate for applying, and your choices to accept or decline recommendations are reflected in that rule state. You can use both features to ensure that you have enabled or disabled the most appropriate rules for each network you monitor, and then to apply enabled rules most efficiently for specific traffic.

- About Firepower Recommended Rules, on page 1343

Adaptive Profile Options

Enable

Enables:
• access control rules to perform application and file control, including AMP

• intrusion rules to use service metadata

Enable Profile Updates

In passive deployments, enable profile updates to defragment and reassemble IP traffic according to a profile of the operating system used by the hosts in your network map.

Adaptive Profiles - Attribute Update Interval

When profile updates are enabled, you can control how frequently in minutes network map data is synced from the Firepower Management Center to its managed devices. The system uses the data to determine what profiles should be used when processing traffic. Increasing the value for this option can improve performance in a large network.

Adaptive Profiles - Networks

Optionally, when profile updates are enabled, you can improve performance by constraining profile updates to a comma-separated list of IP addresses, address blocks, and network variables. If you use a network variable, the system uses the variable's value in the variable set linked to the default intrusion policy for your access control policy. For example, you could enter: 192.168.1.101, 192.168.4.0/24, $HOME_NET.

Note

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. If you enable and enforce profile updates in an ancestor policy, Cisco recommends you keep the default network constraint of 0.0.0.0/0, or use a network variable with a value of any. This setting applies profile updates to all monitored hosts in all subdomains.

In a passive deployment, Cisco recommends that you configure adaptive profile updates. In an inline deployment, configure the inline normalization preprocessor with the Normalize TCP Payload option enabled.
**Caution**

Adaptive profiling **must** be enabled (its default state) as described in this procedure for access control rules to perform application or file control, including AMP, and for intrusion rules to use service metadata. Enabling or disabling adaptive profiles restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

---

**Procedure**

**Step 1**
In the access control policy editor, click the **Advanced** tab, then click the edit icon (-pencil) next to the Detection Enhancement Settings section.

If a view icon (-eye) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 2**
Set adaptive profile options as described in Adaptive Profile Options, on page 1638.

**Step 3**
Click **OK**.

**Step 4**
Click **Save** to save the policy.

---

**What to do next**

Introduction to Network Discovery and Identity

The following topics provide an introduction to network discovery and identity policies and data:

- Host, Application, and User Detection, on page 1643
- Uses for Host, Application, and User Discovery and Identity Data, on page 1644
- Host and Application Detection Fundamentals, on page 1644
- About User Identity, on page 1651
- Firepower System Host and User Limits, on page 1654

Host, Application, and User Detection

The Firepower System uses network discovery and identity policies to collect host, application, and user data for traffic on your network. You can use certain types of discovery and identity data to build a comprehensive map of your network assets, perform forensic analysis, behavioral profiling, access control, and mitigate and respond to the vulnerabilities and exploits to which your organization is susceptible.

Host and Application Data

Host and application data is collected by host identity sources and application detectors according to the settings in your network discovery policy. Managed devices observe traffic on the network segments you specify.

For more information, see Host and Application Detection Fundamentals, on page 1644.

User Data

User data is collected by user identity sources according to the settings in your network discovery and identity policies. You can use the data for user awareness and user control.

For more information, see About User Identity, on page 1651.

Related Topics

- Host Identity Sources, on page 1657
- Application Detection, on page 1701
- User Identity Sources, on page 1721
Uses for Host, Application, and User Discovery and Identity Data

Logging discovery and identity data allows you to take advantage of many features in the Firepower System, including:

- Viewing the network map, which is a detailed representation of your network assets and topology that you can view by grouping hosts and network devices, host attributes, application protocols, or vulnerabilities.
- Performing application and user control; that is, writing access control rules using application, realm, user, user group, and ISE attribute conditions.
- Viewing host profiles, which are complete views of all the information available for your detected hosts.
- Viewing dashboards, which (among other capabilities) can provide you with an at-a-glance view of your network assets and user activity.
- Viewing detailed information on the discovery events and user activity logged by the system.
- Associating hosts and any servers or clients they are running with the exploits to which they are susceptible.

This enables you to identify and mitigate vulnerabilities, evaluate the impact that intrusion events have on your network, and tune intrusion rule states so that they provide maximum protection for your network assets.

- Alerting you by email, SNMP trap, or syslog when the system generates either an intrusion event with a specific impact flag, or a specific type of discovery event.
- Monitoring your organization’s compliance with a white list of allowed operating systems, clients, application protocols, and protocols.
- Creating correlation policies with rules that trigger and generate correlation events when the system generates discovery events or detects user activity.
- Logging and using NetFlow connections, if applicable.

Host and Application Detection Fundamentals

You can configure your network discovery policy to perform host and application detection.

For more information, see Overview: Host Data Collection, on page 1657 and Overview: Application Detection, on page 1701.

Passive Detection of Operating System and Host Data

*Passive detection* is the system's default method of populating the network map by analyzing network traffic (and any exported NetFlow data). Passive detection provides contextual information about your network assets, such as operating systems and running applications.
If traffic from a monitored host does not offer conclusive evidence of the host's operating system, the network map displays the most likely operating system. For example, a NAT device may appear to be running several operating systems because of the hosts "behind" the NAT device. To make this most-likely determination, the system uses a confidence value it assigns to each detected operating system, and the amount of corroborating data among detected operating systems.

**Note**

The system does not consider reported "unknown" applications and operating systems in its determination.

If passive detection inaccurately identifies your network assets, consider the placement of your managed devices. You can also augment the system's passive detection capabilities with custom operating-system fingerprints and custom application detectors. Or, you can use *active detection*, which is not based on traffic analysis, but instead allows you to directly update the network map using scan results or other information sources.

### Active Detection of Operating System and Host Data

*Active detection* adds host information collected by active sources to network maps. For example, you can use the Nmap scanner to actively scan the hosts that you target on your network. Nmap discovers operating systems and applications on hosts.

In addition, the host input feature allows you to actively add *host input data* to network maps. There are two different categories of host input data:

- **user input data**—Data added through the Firepower System user interface. You can modify a host’s operating system or application identity through this interface.
- **host import input data**—Data imported using a command line utility.

The system retains one identity for each active source. When you run an Nmap scan instance, for example, the results of the previous scan are replaced with the new scan results. However, if you run an Nmap scan and then replace those results with data from a client whose results are imported through the command line, the system retains both the identities from the Nmap results and the identities from the import client. The system then uses the priorities set in the network discovery policy to determine which active identity to use as the current identity.

Note that user input is considered one source, even if it comes from different users. As an example, if UserA sets the operating system through the host profile, and then UserB changes that definition through the host profile, the definition set by UserB is retained, and the definition set by UserA is discarded. In addition, note that user input overrides all other active sources and is used as the current identity if it exists.

### Current Identities for Applications and Operating Systems

The *current identity* for an application or an operating system on a host is the identity that the system finds most likely to be correct.

The system uses the current identity for an operating system or application for the following purposes:

- to assign vulnerabilities to a host
- for impact assessment
- when evaluating correlation rules written against operating system identifications, host profile qualifications, and compliance white lists
- for display in the Hosts and Servers table views in workflows
- for display in the host profile
- to calculate the operating system and application statistics on the Discovery Statistics page

The system uses source priorities to determine which active identity should be used as the current identity for an application or operating system.

For example, if a user sets the operating system to Windows 2003 Server on a host, Windows 2003 Server is the current identity. Attacks which target Windows 2003 Server vulnerabilities on that host are given a higher impact, and the vulnerabilities listed for that host in the host profile include Windows 2003 Server vulnerabilities.

The database may retain information from several sources for the operating system or for a particular application on a host.

The system treats an operating system or application identity as the current identity when the source for the data has the highest source priority. Possible sources have the following priority order:

1. user
2. scanner and application (set in the network discovery policy)
3. managed devices
4. NetFlow records

A new higher priority application identity will not override a current application identity if it has less detail than the current identity.

In addition, when an identity conflict occurs, the resolution of the conflict depends on settings in the network discovery policy or on your manual resolution.

**Current User Identities**

When the system detects multiple logins to the same host by different users, the system assumes that only one user is logged into any given host at a time, and that the current user of a host is the last authoritative user login. If only non-authoritative user logins have been logged into the host, the last non-authoritative user login
is considered the current user. If multiple users are logged in through remote sessions, the last user reported by the server is the user reported to the Firepower Management Center.

When the system detects multiple logins to the same host by the same user, the system records the first time that a user logs into a specific host and disregards subsequent logins. If an individual user is the only person who logs into a specific host, the only login that the system records is the original login.

If another user logs into that host, however, the system records the new login. Then, if the original user logs in again, his or her new login is recorded.

**Application and Operating System Identity Conflicts**

An *identity conflict* occurs when the system reports a new passive identity that conflicts with the current active identity and previously reported passive identities. For example, the previous passive identity for an operating system is reported as Windows 2000, then an active identity of Windows XP becomes current. Next, the system detects a new passive identity of Ubuntu Linux 8.04.1. The Windows XP and the Ubuntu Linux identities are in conflict.

When an identity conflict exists for the identity of the host’s operating system or one of the applications on the host, the system lists both conflicting identities as current and uses both for impact assessment until the conflict is resolved.

A user with Administrator privileges can resolve identity conflicts automatically by choosing to always use the passive identity or always use the active identity. Unless you disable automatic resolution of identity conflicts, identity conflicts are always automatically resolved.

A user with Administrator privileges can also configure the system to generate an event when an identity conflict occurs. That user can then set up a correlation policy with a correlation rule that uses an Nmap scan as a correlation response. When an event occurs, Nmap scans the host to obtain updated host operating system and application data.

**Netflow Data in the Firepower System**

NetFlow is a Cisco IOS application that provides statistics on packets flowing through a router. It is available on Cisco networking devices and can also be embedded in Juniper, FreeBSD, and OpenBSD devices.
When NetFlow is enabled on a network device, a database on the device (the NetFlow cache) stores records of the flows that pass through the router. A flow, called a `connection` in the Firepower System, is a sequence of packets that represents a session between a source and destination host, using specific ports, protocol, and application protocol. The network device can be configured to export this NetFlow data. In this documentation, network devices configured in this way are called `NetFlow exporters`.

Firepower System managed devices can be configured to collect records from NetFlow exporters, generate unidirectional end-of-connection events based on the data in those records, and finally send those events to the Firepower Management Center to be logged in the connection event database. You can also configure the network discovery policy to add host and application protocol information to the database based on the information in NetFlow connections.

You can use this discovery and connection data to supplement the data gathered directly by your managed devices. This is especially useful if you have NetFlow exporters monitoring networks that your managed devices cannot monitor.

**Requirements for Using NetFlow Data**

Before you configure the Firepower System to analyze NetFlow data, you must enable the NetFlow feature on the routers or other NetFlow-enabled network devices you plan to use, and configure the devices to broadcast NetFlow data to a destination network where the sensing interface of a managed device is connected.

The Firepower System can parse both NetFlow version 5 and NetFlow version 9 records. NetFlow exporters must use one of those versions if you want to export the data to the Firepower System. In addition, the system requires that specific fields be present in the exported NetFlow templates and records. If your NetFlow exporters are using version 9, which you can customize, you must make sure that the exported templates and records contain the following fields, in any order:

- IN_BYTES (1)
- IN_PKTS (2)
- PROTOCOL (4)
- TCP_FLAGS (6)
- L4_SRC_PORT (7)
- IPV4_SRC_ADDR (8)
- L4_DST_PORT (11)
- IPV4_DST_ADDR (12)
- LAST_SWITCHED (21)
- FIRST_SWITCHED (22)
- IPV6_SRC_ADDR (27)
- IPV6_DST_ADDR (28)

Because the Firepower System uses managed devices to analyze NetFlow data, your deployment must include at least one managed device that can monitor NetFlow exporters. At least one sensing interface on that managed device must be connected to a network where it can collect the exported NetFlow data. Because the sensing interfaces on managed devices do not usually have IP addresses, the system does not support the direct collection of NetFlow records.
Note that the Sampled NetFlow feature available on some network devices collects NetFlow statistics on only a subset of packets that pass through the devices. Although enabling this feature can improve CPU utilization on the network device, it may affect the NetFlow data you are collecting for analysis by the Firepower System.

**Differences between NetFlow and Managed Device Data**

The Firepower System does not directly analyze the traffic represented by NetFlow data. Instead, it converts exported NetFlow records into connection logs and host and application protocol data.

As a result, there are several differences between converted NetFlow data and the discovery and connection data gathered directly by your managed devices. You should keep these differences in mind when performing analysis that requires:

- statistics on the number of detected connections
- operating system and other host-related information (including vulnerabilities)
- application data, including client information, web application information, and vendor and version server information
- knowing which host in a connection is the initiator and which is the responder

**Network Discovery Policy v. Access Control Policy**

You configure NetFlow data collection, including connection logging, using rules in the network discovery policy. Contrast this with connection logging for connections detected by Firepower System managed devices, which you configure per access control rule.

**Types of Connection Events**

Because NetFlow data collection is linked to networks rather than access control rules, you do not have granular control over which NetFlow connections the system logs.

NetFlow data cannot generate Security Intelligence events.

NetFlow-based connection events can be stored in the connection event database only; you cannot send them to the system log or an SNMP trap server.

**Number of Connection Events Generated Per Monitored Session**

For connections detected directly by managed devices, you can configure the access control rule to log a bidirectional connection event at the beginning or end of a connection, or both.

In contrast, because exported NetFlow records contain unidirectional connection data, the system generates at least two connection events for each NetFlow record it processes. This also means that a summary's connection count is incremented by two for every connection based on NetFlow data, providing an inflated count of the number of connections that are actually occurring on your network.

Because the NetFlow exporter outputs records at a fixed interval even if a connection is still ongoing, long-running sessions can result in multiple exported records, each of which generates a connection event. For example, if the NetFlow exporter exports every five minutes, and a particular connection lasts twelve minutes, the system generates six connection events for that session:

- one pair of events for the first five minutes
- one pair for the second five minutes
Host and Operating System Data

Hosts added to the network map from NetFlow data do not have operating system, NetBIOS, or host type (host vs network device) information. You can, however, manually set a host’s operating system identity using the host input feature.

Application Data

For connections detected directly by managed devices, the system can identify application protocols, clients, and web applications by examining the packets in the connection.

When the system processes NetFlow records, the system uses a port correlation in /etc/sf/services to extrapolate application protocol identity. However, there is no vendor or version information for those application protocols, nor do connection logs contain information on client or web applications used in the session. You can, however, manually provide this information using the host input feature.

Note that a simple port correlation means that application protocols running on non-standard ports may be unidentified or misidentified. Additionally, if no correlation exists, the system marks the application protocol as unknown in connection logs.

Vulnerability Mappings

The system cannot map vulnerabilities to hosts monitored by NetFlow exporters, unless you use the host input feature to manually set either a host’s operating system identity or an application protocol identity. Note that because there is no client information in NetFlow connections, you cannot associate client vulnerabilities with hosts created from NetFlow data.

Initiator and Responder Information in Connections

For connections detected directly by managed devices, the system can identify which host is the initiator, or source, and which is the responder, or destination. However, NetFlow data does not contain initiator or responder information.

When the Firepower System processes NetFlow records, it uses an algorithm to determine this information based on the ports each host is using, and whether those ports are well-known:

- If both or neither port being used is a well-known port, the system considers the host using the lower-number port to be the responder.
- If only one of the hosts is using a well-known port, the system considers that host to be the responder.

For this purpose, a well-known port is any port that is either numbered from 1 to 1023, or that contains application protocol information in /etc/sf/services on the managed device.

In addition, for connections detected directly by managed devices, the system records two byte counts in the corresponding connection event:

- The Initiator Bytes field records bytes sent.
- The Responder Bytes field records bytes received.

Connection events based on unidirectional NetFlow records contain only one byte count, which the system assigns to either Initiator Bytes or Responder Bytes, depending on the port-based algorithm. The system
sets the other field to 0. Note that if you are viewing connection summaries (aggregated connection data) of NetFlow records, both fields may be populated.

**NetFlow-only Connection Event Fields**

A small number of fields are present only in connection events generated from NetFlow records; see Information Available in Connection Event Fields, on page 2067.

**Related Topics**

Information Available in Connection Event Fields, on page 2067

---

### About User Identity

User identity information can help you to identify the source of policy breaches, attacks, or network vulnerabilities, and trace them to specific users. For example, you could determine:

- Who owns the host targeted by an intrusion event that has a Vulnerable (level 1: red) impact level.
- Who initiated an internal attack or portscan.
- Who is attempting unauthorized access to a specified host.
- Who is consuming an unreasonable amount of bandwidth.
- Who has not applied critical operating system updates.
- Who is using instant messaging software or peer-to-peer file-sharing applications in violation of company policy.

Armed with this information, you can use other features of the Firepower System to mitigate risk, perform access control, and take action to protect others from disruption. These capabilities also significantly improve audit controls and enhance regulatory compliance.

After you configure user identity sources to gather user data, you can perform user awareness and user control.

**Related Topics**

Identity Terminology, on page 1651
Identity Deployments, on page 1652

---

### Identity Terminology

This topic discusses common terminology for user identity and user control.

**User awareness**

Identifying users on your network using *identity sources* (such as User Agent or TS Agent). User awareness enables you to identify users from both *authoritative* (such as Active Directory) and *non-authoritative* (application-based) sources. To use Active Directory as an identity source, you must configure a realm and directory. For more information, see About User Identity Sources, on page 1721.

**User control**

Configuring an *identity policy* that you associate with an *access control policy*. (The identity policy is then referred to as an access control *subpolicy*.) The identity policy specifies the identity source and, optionally, users and groups belonging to that source.
By associating the identity policy with an access control policy, you determine whether to monitor, trust, block, or allow users or user activity in traffic on your network. For more information, see *Getting Started with Access Control Policies, on page 1073.*

**Authoritative identity sources**

A trusted server validated the user login (for example, Active Directory). You can use the data obtained from authoritative logins to perform user awareness and user control. Authoritative user logins are obtained from passive and active authentications:

- *Passive authentications* occur when a user authenticates through an external server. The User Agent, ISE, and the TS Agent are the passive authentication methods supported by the Firepower System.

- *Active authentications* occur when a user authenticates through preconfigured managed devices. Captive portal is the only active authentication method supported by the Firepower System.

**Non-authoritative identity sources**

An unknown or untrusted server validated the user login. Traffic-based detection is the only non-authoritative identity source supported by the Firepower System. You can use the data obtained from non-authoritative logins to perform user awareness.

**Identity Deployments**

When the system detects user data from a user login, from any identity source, the user from the login is checked against the list of users in the Firepower Management Center user database. If the login user matches an existing user, the data from the login is assigned to the user. Logins that do not match existing users cause a new user to be created, unless the login is in SMTP traffic. Non-matching logins in SMTP traffic are discarded.

The following diagram illustrates how the Firepower System collects and stores user data:
The User Activity Database

The user activity database on the Firepower Management Center contains records of user activity on your network detected or reported by all of your configured identity sources. The system logs events in the following circumstances:

- When it detects individual logins or logoffs.
- When it detects a new user.
- When a system administrator manually delete a user.
- When the system detects a user that is not in the database, but cannot add the user because you have reached your user limit.

If the TS Agent monitors the same users as another passive authentication identity source (such as the User Agent or ISE), the Firepower Management Center prioritizes the TS Agent data. If the TS Agent and another passive source report identical activity from the same IP address, only the TS Agent data is logged to the Firepower Management Center.

You can view user activity detected by the system using the Firepower Management Center web interface. (Analysis > Users > User Activity).

The Users Database

The users database on the Firepower Management Center contains a record for each user detected or reported by all of your configured identity sources. You can use data obtained from an authoritative source for user control.

See About User Identity Sources, on page 1721 for more information about the supported non-authoritative and authoritative identity sources.

The total number of users the Firepower Management Center can store depends on the Firepower Management Center model, as described in Firepower System User Limit, on page 1655. After the user limit is reached, the system prioritizes previously-undetected user data based on its identity source, as follows:

- If the new user is from a non-authoritative identity source, the system does not add the user to the database. To allow new users to be added, you must delete users manually or with a database purge.
- If the new user is from an authoritative identity source, the system deletes the non-authoritative user who has remained inactive for the longest period and adds the new user to the database.

If an identity source is configured to exclude specific user names, user activity data for those user names are not reported to the Firepower Management Center. These excluded user names remain in the database, but are not associated with IP addresses. For more information about the type of data stored by the system, see User Data, on page 2228.

If you have Firepower Management Center high availability configured and the primary fails, no logins reported by a User Agent, ISE, or captive portal device can be identified during failover downtime, even if the users were previously seen and downloaded to the Firepower Management Center. The unidentified users are logged as Unknown users on the Firepower Management Center. After the downtime, the Unknown users are reidentified and processed according to the rules in your identity policy.
If the TS Agent monitors the same users as another passive authentication identity source (the User Agent or ISE), the Firepower Management Center prioritizes the TS Agent data. If the TS Agent and another passive source report identical activity from the same IP address, only the TS Agent data is logged to the Firepower Management Center.

When the system detects a new user session, the user session data remains in the users database until one of the following occurs:

- A user on the Firepower Management Center manually deletes the user session.
- An identity source reports the logoff of that user session.
- A realm ends the user session as specified by the realm's **User Session Timeout: Authenticated Users**, **User Session Timeout: Failed Authentication Users**, or **User Session Timeout: Guest Users** setting.

## Firepower System Host and User Limits

Your Firepower Management Center model determines how many individual hosts you can monitor with your deployment, as well as how many users you can monitor and use to perform user control.

**Related Topics**

- [Purging Data from the Management Center Database](#), on page 191

## Firepower System Host Limit

The system adds a host to the network map when it detects activity associated with an IP address in your monitored network (as defined in your network discovery policy). The number of hosts a Firepower Management Center can monitor, and therefore store in the network map, depends on its model.

### Table 214: Host Limits by Firepower Management Center Model

<table>
<thead>
<tr>
<th>Management Center Model</th>
<th>Hosts</th>
</tr>
</thead>
<tbody>
<tr>
<td>MC750</td>
<td>2,000</td>
</tr>
<tr>
<td>MC1500</td>
<td>50,000</td>
</tr>
<tr>
<td>FS2000</td>
<td>150,000</td>
</tr>
<tr>
<td>MC3500</td>
<td>300,000</td>
</tr>
<tr>
<td>MC4000</td>
<td>600,000</td>
</tr>
<tr>
<td>virtual</td>
<td>50,000</td>
</tr>
</tbody>
</table>

You cannot view contextual data for hosts not in the network map. However, you can perform access control. For example, you can perform application control on traffic to and from a host not in the network map, even though you cannot use a compliance white list to monitor the host's network compliance.
The system counts MAC-only hosts separately from hosts identified by both IP addresses and MAC addresses. All IP addresses associated with a host are counted together as one host.

**Reaching the Host Limit and Deleting Hosts**

The network discovery policy controls what happens when you detect a new host after you reach the host limit; you can drop the new host, or replace the host that has been inactive for the longest time. You can also set the period after which the system removes a host from the network map due to inactivity. Although you can manually delete a host, an entire subnet, or all of your hosts from the network map, if the system detects activity associated with a deleted host, it re-adds the host.

In a multidomain deployment, each leaf domain has its own network discovery policy. Therefore, each leaf domain governs its own behavior when the system discovers a new host.

**Related Topics**

- Domain Properties, on page 271
- Network Discovery Data Storage Settings, on page 1763

**Firepower System User Limit**

Your Firepower Management Center model determines how many individual users you can monitor. When the system detects activity from a new user, that user is added to the Users database on the Firepower Management Center. You can detect users using any identity source.

There are two types of user limits to consider:

- The authoritative user limit, which is the number of access-controlled users you can store in the database and use for access control. Authoritative user data is gathered by the User Agent, ISE, the TSAgent, and captive portal.

- The total user limit, which is the number of authoritative and non-authoritative users you can store in the database. This limit includes all authoritative user data as well as non-authoritative user data gathered using traffic-based detection.

<table>
<thead>
<tr>
<th>Management Center Model</th>
<th>Authoritative Users</th>
<th>Total Users</th>
</tr>
</thead>
<tbody>
<tr>
<td>MC750</td>
<td>2,000</td>
<td>2,000</td>
</tr>
<tr>
<td>MC1500</td>
<td>50,000</td>
<td>50,000</td>
</tr>
<tr>
<td>FS2000</td>
<td>64,000</td>
<td>150,000</td>
</tr>
<tr>
<td>MC3500</td>
<td>64,000</td>
<td>300,000</td>
</tr>
<tr>
<td>MC4000</td>
<td>64,000</td>
<td>600,000</td>
</tr>
<tr>
<td>virtual</td>
<td>50,000</td>
<td>50,000</td>
</tr>
</tbody>
</table>
When the system detects a new, previously-undetected user after the limit has been reached, it prioritizes user data based on their identity source:

- If the new user is from a non-authoritative identity source, the system does not add the user to the database. To allow new users to be added, you must delete users manually or with a database purge.
- If the new user is from an authoritative identity source, the system deletes the non-authoritative user who has remained inactive for the longest period and adds the new user to the database.

---

**Note**

If your deployment includes an ASA FirePOWER module managed via ASDM, you can store a maximum of 2,000 authoritative users, regardless of your Firepower Management Center model.

---

**Tip**

Note that if you are using traffic-based detection, you can restrict user logging by protocol to help minimize username clutter and preserve space in the database. For example, you could prevent the system from adding users discovered in AIM, POP3, and IMAP traffic because you know it is traffic from specific contractors or visitors you do not want to monitor.
Host Identity Sources

The following topics provide information on host identity sources:

• Overview: Host Data Collection, on page 1657
• Determining Which Host Operating Systems the System Can Detect, on page 1658
• Identifying Host Operating Systems, on page 1658
• Custom Fingerprinting, on page 1658
• Host Input Data, on page 1667
• Nmap Scanning, on page 1678

Overview: Host Data Collection

As the Firepower System passively monitors the traffic that travels through your network, it compares specific packet header values and other unique data from network traffic against established definitions (called fingerprints) to determine information about the hosts on your network, including:

• the number and types of hosts (including network devices such as bridges, routers, load balancers, and NAT devices)

• basic network topology data, including the number of hops from the discovery point on the network to the hosts

• the operating systems running on the hosts

• applications on the hosts and users associated with these applications

If the system cannot identify a host’s operating system, you can create custom client or server fingerprints. The system uses these fingerprints to identify new hosts. You can map fingerprints to systems in the vulnerability database (VDB) to allow the appropriate vulnerability information to be displayed whenever a host is identified using the custom fingerprint.

Note

In addition to collecting host data from monitored network traffic, the system can collect host data from exported NetFlow records, and you can actively add host data using Nmap scans and the host input feature.
Determining Which Host Operating Systems the System Can Detect

To learn which exact operating systems the system can fingerprint, view the list of available fingerprints that is shown during the process of creating a custom OS fingerprint.

**Procedure**

1. Choose **Policies > Network Discovery**.
2. Click **Custom Operating Systems**.
3. Click **Create Custom Fingerprint**.
4. View the lists of options in the drop-down lists in the **OS Vulnerability Mappings** section. These options are the operating systems that the system can fingerprint.

**What to do next**

As needed, see *Identifying Host Operating Systems, on page 1658*.

Identifying Host Operating Systems

If the system does not correctly identify a host’s operating system (for example, it shows in the Host Profile as Unknown or is incorrectly identified), try the strategies below.

**Procedure**

Try one of the following strategies:

- Check the Network Discovery Identity Conflict Settings.
- Create a custom fingerprint for the host.
- Run an Nmap scan against the host.
- Import data into the network map, using the host input feature.
- Manually enter operating system information.

Custom Fingerprinting

The Firepower System includes operating system fingerprints that the system uses to identify the operating system on each host it detects. However, sometimes the system cannot identify a host operating system or
misidentifies it because no fingerprints exist that match the operating system. To correct this problem, you can create a custom fingerprint, which provides a pattern of operating system characteristics unique to the unknown or misidentified operating system, to supply the name of the operating system for identification purposes.

If the system cannot match a host’s operating system, it cannot identify the vulnerabilities for the host, because the system derives the list of vulnerabilities for each host from its operating system fingerprint. For example, if the system detects a host running Microsoft Windows, the system has a stored Microsoft Windows vulnerability list that it adds to the host profile for that host based on the detected Windows operating system.

As an example, if you have several devices on your network running a new beta version of Microsoft Windows, the system cannot identify that operating system or map vulnerabilities to the hosts. However, knowing that the system has a list of vulnerabilities for Microsoft Windows, you may want to create a custom fingerprint for one of the hosts to help identify the other hosts running the same operating system. You can include a mapping of the vulnerability list for Microsoft Windows in the fingerprint to associate that list with each host that matches the fingerprint.

When you create a custom fingerprint, the Firepower Management Center lists the set of vulnerabilities associated with that fingerprint for any hosts running the same operating system. If the custom fingerprint you create does not have any vulnerabilities mappings in it, the system uses the fingerprint to assign the custom operating system information you provide in the fingerprint. When the system sees new traffic from a previously detected host, the system updates the host with the new fingerprint information. The system also uses the new fingerprint to identify any new hosts with that operating system the first time they are detected.

Before creating a custom fingerprint, you should determine why the host is not being identified correctly to decide whether custom fingerprinting is a viable solution.

You can create two types of fingerprints with the system:

- Client fingerprints, which identify operating systems based on the SYN packet that the host sends when it connects to a TCP application running on another host on the network.

- Server fingerprints, which identify operating systems based on the SYN-ACK packet that the host uses to respond to an incoming connection to a running TCP application.

If both a client and server fingerprint match the same host, the client fingerprint is used.

After creating fingerprints, you must activate them before the system can associate them with hosts.

Managing Fingerprints

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

After a fingerprint is created and activated, you can edit a fingerprint to make changes or add vulnerability mappings.
Procedure

Step 1  Choose Policies > Network Discovery.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 2  Click Custom Operating Systems.  If the system is awaiting data to create a fingerprint, it automatically refreshes the page every 10 seconds until the fingerprint is created.

Step 3  Manage your custom fingerprints:

• Activate/Deactivate — Activate or deactivate a fingerprint as described in Activating and Deactivating Fingerprints, on page 1660.
• Create — Create fingerprints as described in Creating a Custom Fingerprint for Clients, on page 1662 and Creating a Custom Fingerprint for Servers, on page 1664.
• Edit — Edit a fingerprint as described in Editing an Active Fingerprint, on page 1661 and Editing an Inactive Fingerprint, on page 1661.
• Delete — Click the delete icon ( ) next to the fingerprint you want to delete, and click OK to confirm. You can only delete deactivated fingerprints.

Activating and Deactivating Fingerprints

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You must activate a custom fingerprint before the system can use it to identify hosts. After the new fingerprint is activated, the system uses it to re-identify previously discovered hosts and discover new hosts.

If you want to stop using a fingerprint, you can deactivate it. Deactivating a fingerprint causes a fingerprint to no longer be used, but allows it to remain on the system. When you deactivate a fingerprint, the operating system is marked as unknown for hosts that use the fingerprint. If the hosts are detected again and match a different active fingerprint, they are then identified by that active fingerprint.

Deleting a fingerprint removes it from the system completely. After deactivating a fingerprint, you can delete it.

Procedure

Step 1  Choose Policies > Network Discovery.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 2  Click Custom Operating Systems.

Step 3  Click the slider next to the fingerprint you want to activate or deactivate.
The activate option is only available if the fingerprint you created is valid. If the slider is not available, try creating the fingerprint again.

**Note**

**Editing an Active Fingerprint**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

If a fingerprint is active, you can modify the fingerprint name, description, custom operating system display, and map additional vulnerabilities to it.

You can modify the fingerprint name, description, custom operating system display, and map additional vulnerabilities to it.

**Procedure**

**Step 1** Choose Policies > Network Discovery.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2** Click Custom Operating Systems

**Step 3** Click the edit icon (🖌️) next to the fingerprint you want to edit.

**Step 4** Modify the fingerprint name, description, and custom OS display, if necessary.

**Step 5** If you want to delete a vulnerability mapping, click Delete next to the mapping in the Pre-Defined OS Product Maps section of the page.

**Step 6** If you want to add additional operating systems for vulnerability mapping, choose the Product and, if applicable, Major Version, Minor Version, Revision Version, Build, Patch, and Extension and then click Add OS Definition.

The vulnerability mapping is added to the Pre-Defined OS Product Maps list.

**Step 7** Click Save.

**Editing an Inactive Fingerprint**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

If a fingerprint is inactive, you can modify all elements of the fingerprint and resubmit it to the Firepower Management Center. This includes all properties you specified when creating the fingerprint, such as fingerprint type, target IP addresses and ports, vulnerability mappings, and so on. When you edit an inactive fingerprint and submit it, it is resubmitted to the system and, if it is a client fingerprint, you must resend traffic to the appliance before activating it. Note that you can choose only a single vulnerability mapping for an inactive
fingerprint. After you activate the fingerprint, you can map additional operating systems and versions to its vulnerabilities list.

**Procedure**

**Step 1**  
Choose Policies > Network Discovery.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2**  
Click Custom Operating Systems.

**Step 3**  
Click the edit icon (pen) next to the fingerprint you want to edit.

**Step 4**  
Make changes to the fingerprint as necessary:

- If you are modifying a client fingerprint, see Creating a Custom Fingerprint for Clients, on page 1662.
- If you are modifying a server fingerprint, see Creating a Custom Fingerprint for Servers, on page 1664.

**Step 5**  
Click Save.

**What to do next**

- If you modified a client fingerprint, remember to send traffic from the host to the appliance gathering the fingerprint.

**Creating a Custom Fingerprint for Clients**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery ADMIN</td>
</tr>
</tbody>
</table>

Client fingerprints identify operating systems based on the SYN packet a host sends when it connects to a TCP application running on another host on the network.

If the Firepower Management Center does not have direct contact with monitored hosts, you can specify a device that is managed by the Management Center and is closest to the host you intend to fingerprint when specifying client fingerprint properties.

Before you begin the fingerprinting process, obtain the following information about the host you want to fingerprint:

- The number of network hops between the host and the Firepower Management Center or the device you use to obtain the fingerprint. (Cisco strongly recommends that you directly connect the Firepower Management Center or the device to the same subnet that the host is connected to.)

- The network interface (on the Firepower Management Center or the device) that is connected to the network where the host resides.

- The actual operating system vendor, product, and version of the host.

- Access to the host in order to generate client traffic.
Procedure

Step 1
Choose Policies > Network Discovery.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 2
Click Custom Operating Systems.

Step 3
Click Create Custom Fingerprint.

Step 4
From the Device drop-down list, choose the Firepower Management Center or the device that you want to use to collect the fingerprint.

Step 5
Enter a Fingerprint Name.

Step 6
Enter a Fingerprint Description.

Step 7
From the Fingerprint Type list, choose Client.

Step 8
In the Target IP Address field, enter an IP address of the host you want to fingerprint.
Note that the fingerprint will only be based on traffic to and from the host IP address you specify, not any of the host’s other IP addresses (if it has any).

Step 9
In the Target Distance field, enter the number of network hops between the host and the device that you chose earlier to collect the fingerprint.
Caution This must be the actual number of physical network hops to the host, which may or may not be the same as the number of hops detected by the system.

Step 10
From the Interface list, choose the network interface that is connected to the network segment where the host resides.
Caution Cisco recommends that you do not use the sensing interface on a managed device for fingerprinting for several reasons. First, fingerprinting does not work if the sensing interface is on a span port. Also, if you use the sensing interface on a device, the device stops monitoring the network for the amount of time it takes to collect the fingerprint. You can, however, use the management interface or any other available network interfaces to perform fingerprint collection. If you do not know which interface is the sensing interface on your device, refer to the Installation Guide for the specific model you are using to fingerprint.

Step 11
If you want to display custom information in the host profile for fingerprinted hosts (or if the host you want to fingerprint does not reside in the OS Vulnerability Mappings section), choose Use Custom OS Display and provide the values you want to display for the following:

- In the Vendor String field, enter the operating system’s vendor name. For example, the vendor for Microsoft Windows would be Microsoft.
- In the Product String field, enter the operating system’s product name. For example, the product name for Microsoft Windows 2000 would be Windows.
- In the Version String field, enter the operating system’s version number. For example, the version number for Microsoft Windows 2000 would be 2000.

Step 12
In the OS Vulnerability Mappings section, choose the operating system, product, and versions you want to use for vulnerability mapping.
You must specify **Vendor** and **Product** values in this section if you want to use the fingerprint to identify vulnerabilities for matching hosts or if you do not assign custom operating system display information.

To map vulnerabilities for all versions of an operating system, specify only the **Vendor** and **Product** values.

**Note** Not all options in the **Major Version**, **Minor Version**, **Revision Version**, **Build**, **Patch**, and **Extension** drop-down lists may apply to the operating system you choose. In addition, if no definition appears in a list that matches the operating system you want to fingerprint, you can leave these values empty. Be aware that if you do not create any OS vulnerability mappings in a fingerprint, the system cannot use the fingerprint to assign a vulnerabilities list with hosts identified by the fingerprint.

**Example:**
If you want your custom fingerprint to assign the list of vulnerabilities from Redhat Linux 9 to matching hosts, choose **Redhat, Inc.** as the vendor, **Redhat Linux** as the product, and 9 as the major version.

**Example:**
To add all versions of the Palm OS, you would choose **PalmSource, Inc.** from the **Vendor** list, **Palm OS** from the **Product** list, and leave all other lists at their default settings.

**Step 13** Click **Create**.

The status briefly shows **New**, then switches to **Pending**, where it remains until traffic is seen for the fingerprint. Once traffic is seen, it switches to **Ready**.

The Custom Fingerprint status page refreshes every ten seconds until it receives data from the host in question.

**Step 14** Using the IP address you specified as the target IP address, access the host you are trying to fingerprint and initiate a TCP connection to the appliance.

To create an accurate fingerprint, traffic must be seen by the appliance collecting the fingerprint. If you are connected through a switch, traffic to a system other than the appliance may not be seen by the system.

**Example:**
Access the web interface of the Firepower Management Center from the host you want to fingerprint or SSH into the Management Center from the host. If you are using SSH, use the command below, where `localIPv6address` is the IPv6 address specified in step 7 that is currently assigned to the host and `DCmanagementIPv6address` is the management IPv6 address of the Management Center. The Custom Fingerprint page should then reload with a “Ready” status.

```bash
ssh -b localIPv6address DCmanagementIPv6address
```

**What to do next**
- Activate the fingerprint as described in Activating and Deactivating Fingerprints, on page 1660.

---

### Creating a Custom Fingerprint for Servers

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>
Server fingerprints identify operating systems based on the SYN-ACK packet that the host uses to respond to an incoming connection to a running TCP application. Before you begin, you should obtain the following information about the host you want to fingerprint:

- The number of network hops between the host and the appliance you use to obtain the fingerprint. Cisco strongly recommends that you directly connect an unused interface on the appliance to the same subnet that the host is connected to.
- The network interface (on the appliance) that is connected to the network where the host resides.
- The actual operating system vendor, product, and version of the host.
- An IP address that is not currently in use and is authorized on the network where the host is located.

**Tip**

If the Firepower Management Center does not have direct contact with monitored hosts, you can specify a managed device that is closest to the host you intend to fingerprint when specifying server fingerprint properties.

**Procedure**

**Step 1**
Choose **Policies > Network Discovery**.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2**
Click **Custom Operating Systems**.

**Step 3**
Click **Create Custom Fingerprint**.

**Step 4**
From the **Device** list, choose the Firepower Management Center or the managed device that you want to use to collect the fingerprint.

**Step 5**
Enter a **Fingerprint Name**.

**Step 6**
Enter a **Fingerprint Description**.

**Step 7**
From the **Fingerprint Type** list, choose **Server** to display the server fingerprinting options.

**Step 8**
In the **Target IP Address** field, enter an IP address of the host you want to fingerprint.

Note that the fingerprint will only be based on traffic to and from the host IP address you specify, not any of the host’s other IP addresses (if it has any).

**Caution**
You can capture IPv6 fingerprints only with appliances running Version 5.2 and later of the Firepower System.

**Step 9**
In the **Target Distance** field, enter the number of network hops between the host and the device that you chose earlier to collect the fingerprint.

**Caution**
This must be the actual number of physical network hops to the host, which may or may not be the same as the number of hops detected by the system.

**Step 10**
From the **Interface** list, choose the network interface that is connected to the network segment where the host resides.
Caution  Cisco recommends that you do not use the sensing interface on a managed device for fingerprinting for several reasons. First, fingerprinting does not work if the sensing interface is on a span port. Also, if you use the sensing interface on a device, the device stops monitoring the network for the amount of time it takes to collect the fingerprint. You can, however, use the management interface or any other available network interfaces to perform fingerprint collection. If you do not know which interface is the sensing interface on your device, refer to the Installation Guide for the specific model you are using to fingerprint.

Step 11  Click Get Active Ports.

Step 12  In the Server Port field, enter the port that you want the device chose to collect the fingerprint to initiate contact with, or choose a port from the Get Active Ports drop-down list.

You can use any server port that you know is open on the host (for instance, 80 if the host is running a web server).

Step 13  In the Source IP Address field, enter an IP address that should be used to attempt to communicate with the host.

You should use a source IP address that is authorized for use on the network but is not currently being used, for example, a DHCP pool address that is currently not in use. This prevents you from temporarily knocking another host offline while you create the fingerprint.

You should exclude that IP address from monitoring in your network discovery policy while you create the fingerprint. Otherwise, the network map and discovery event views will be cluttered with inaccurate information about the host represented by that IP address.

Step 14  In the Source Subnet Mask field, enter the subnet mask for the IP address you are using.

Step 15  If the Source Gateway field appears, enter the default gateway IP address that should be used to establish a route to the host.

Step 16  If you want to display custom information in the host profile for fingerprinted hosts or if the fingerprint name you want to use does not exist in the OS Definition section, choose Use Custom OS Display in the Custom OS Display section.

Provide the values you want to appear in host profiles for the following:

- In the Vendor String field, enter the operating system’s vendor name. For example, the vendor for Microsoft Windows would be Microsoft.

- In the Product String field, enter the operating system’s product name. For example, the product name for Microsoft Windows 2000 would be Windows.

- In the Version String field, enter the operating system’s version number. For example, the version number for Microsoft Windows 2000 would be 2000.

Step 17  In the OS Vulnerability Mappings section, choose the operating system, product, and versions you want to use for vulnerability mapping.

You must specify a Vendor and Product name in this section if you want to use the fingerprint to identify vulnerabilities for matching hosts or if you do not assign custom operating system display information.

To map vulnerabilities for all versions of an operating system, specify only the vendor and product name.
Note Not all options in the Major Version, Minor Version, Revision Version, Build, Patch, and Extension drop-down lists may apply to the operating system you choose. In addition, if no definition appears in a list that matches the operating system you want to fingerprint, you can leave these values empty. Be aware that if you do not create any OS vulnerability mappings in a fingerprint, the system cannot use the fingerprint to assign a vulnerabilities list with hosts identified by the fingerprint.

Example:
If you want your custom fingerprint to assign the list of vulnerabilities from Redhat Linux 9 to matching hosts, choose Redhat, Inc. as the vendor, Redhat Linux as the product, and 9 as the version.

Example:
To add all versions of the Palm OS, you would choose PalmSource, Inc. from the Vendor list, Palm OS from the Product list, and leave all other lists at their default settings.

Step 18
Click Create.
The Custom Fingerprint status page refreshes every ten seconds and should reload with a “Ready” status.

Note If the target system stops responding during the fingerprinting process, the status shows an ERROR: No Response message. If you see this message, submit the fingerprint again. Wait three to five minutes (the time period may vary depending on the target system), click the edit icon (✏️) to access the Custom Fingerprint page, and then click Create.

What to do next
• Activate the fingerprint as described in Activating and Deactivating Fingerprints, on page 1660.

Host Input Data
You can augment the network map by importing network map data from third parties. You can also use the host input feature by modifying operating system or application identities or deleting application protocols, protocols, host attributes, or clients using the web interface.
The system may reconcile data from multiple sources to determine the current identity of an operating system or application.
All data except third-party vulnerabilities is discarded when the affected host is removed from the network map. For more information on setting up scripts or import files, see the Firepower System Host Input API Guide.
To include imported data in impact correlations, you must map the data to the operating system and application definitions in the database.

Requirements for Using Third-Party Data
You can import discovery data from third-party systems on your network. However, to enable features where intrusion and discovery data are used together, such as Firepower recommendations, adaptive profile updates, or impact assessment, you should map as many elements of it as possible to corresponding definitions. Consider the following requirements for using third-party data:
• If you have a third-party system that has specific data on your network assets, you can import that data using the host input feature. However, because third parties may name the products differently, you must map the third-party vendor, product, and versions to the corresponding Cisco product definition. After you map the products, you must enable vulnerability mappings for impact assessment in the Firepower Management Center configuration to allow impact correlation. For versionless or vendorless application protocols, you need to map vulnerabilities for the application protocols in the Firepower Management Center configuration.

• If you import patch information from a third party and you want to mark all vulnerabilities fixed by that patch as invalid, you must map the third-party fix name to a fix definition in the database. All vulnerabilities addressed by the fix will then be removed from hosts where you add that fix.

• If you import operating system and application protocol vulnerabilities from a third party and you want to use them for impact correlation, you must map the third-party vulnerability identification string to vulnerabilities in the database. Note that although many clients have associated vulnerabilities, and clients are used for impact assessment, you cannot import and map third-party client vulnerabilities. After the vulnerabilities are mapped, you must enable third-party vulnerability mappings for impact assessment in the Firepower Management Center configuration. To cause application protocols without vendor or version information to map to vulnerabilities, an administrative user must also map vulnerabilities for the applications in the Firepower Management Center configuration.

• If you import application data and you want to use that data for impact correlation, you must map the vendor string for each application protocol to the corresponding Cisco application protocol definition.

- Mapping Third-Party Product Fixes, on page 1670
- Mapping Third-Party Vulnerabilities, on page 1671
- Mapping Vulnerabilities for Servers, on page 798
- Creating Custom Product Mappings, on page 1672

Third-Party Product Mappings

When you add data from third parties to the network map through the user input feature, you must map the vendor, product, and version names used by the third party to the Cisco product definitions. Mapping the products to Cisco definitions assigns vulnerabilities based on those definitions.

Similarly, if you are importing patch information from a third party, such as a patch management product, you must map the name for the fix to the appropriate vendor and product and the corresponding fix in the database.

Mapping Third-Party Products

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If you import data from a third party, you must map the Cisco product to the third-party name to assign vulnerabilities and perform impact correlation using that data. Mapping the product associates Cisco vulnerability information with the third-party product name, which allows the system to perform impact correlation using that data.
If you import data using the host input import feature, you can also use the AddScanResult function to map third-party products to operating system and application vulnerabilities during the import.

For example, if you import data from a third party that lists Apache Tomcat as an application and you know it is version 6 of that product, you could add a third-party map where:

- **Vendor Name** is set to Apache.
- **Product Name** is set to Tomcat.
- Apache is chosen from the **Vendor** drop-down list.
- Tomcat is chosen from the **Product** drop-down list.
- 6 is chosen from the **Version** drop-down list

This mapping would cause any vulnerabilities for Apache Tomcat 6 to be assigned to hosts with an application listing for Apache Tomcat.

Note that for versionless or vendorless applications, you must map vulnerabilities for the application types in the Firepower Management Center configuration. Although many clients have associated vulnerabilities, and clients are used for impact assessment, you cannot import and map third-party client vulnerabilities.

---

**Tip**

If you have already created a third-party mapping on another Firepower Management Center, you can export it and then import it onto this Management Center. You can then edit the imported mapping to suit your needs.

---

**Procedure**

**Step 1** Choose **Policies > Application Detectors**.

**Step 2** Click **User Third-Party Mappings**.

**Step 3** You have two choices:

- **Create** — To create a new map set, click **Create Product Map Set**.
- **Edit** — To edit an existing map set, click the edit icon (-pencil) next to the map set you want to modify. If a view icon (-eye) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4** Enter a **Mapping Set Name**.

**Step 5** Enter a **Description**.

**Step 6** You have two choices:

- **Create** — To map a third-party product, click **Add Product Map**.
- **Edit** — To edit an existing third-party product map, click the edit icon (-pencil) next to the map set you want to modify. If a view icon (-eye) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 7** Enter the **Vendor String** used by the third-party product.

**Step 8** Enter the **Product String** used by the third-party product.

**Step 9** Enter the **Version String** used by the third-party product.
Step 10 In the Product Mappings section, choose the operating system, product, and versions you want to use for vulnerability mapping from the **Vendor**, **Product**, **Major Version**, **Minor Version**, **Revision Version**, **Build**, **Patch**, and **Extension** fields.

**Example:**
If you want a host running a product whose name consists of third-party strings to use the vulnerabilities from Red Hat Linux 9, choose **Redhat, Inc.** as the vendor, **Redhat Linux** as the product, and **9** as the version.

Step 11 Click **Save**.

## Mapping Third-Party Product Fixes

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If you map a fix name to a particular set of fixes in the database, you can then import data from a third-party patch management application and apply the fix to a set of hosts. When the fix name is imported to a host, the system marks all vulnerabilities addressed by the fix as invalid for that host.

**Procedure**

Step 1 Choose **Policies > Application Detectors**.

Step 2 Click **User Third-Party Mappings**.

Step 3 You have two choices:
- Create — To create a new map set, click **Create Product Map Set**.
- Edit — To edit an existing map set, click the edit icon (✏️) next to the map set you want to modify. If a view icon (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 4 Enter a **Mapping Set Name**.

Step 5 Enter a **Description**.

Step 6 You have two choices:
- Create — To map a third-party product, click **Add Fix Map**.
- Edit — To edit an existing third-party product map, click the edit icon (✏️) next to it. If a view icon (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 7 Enter the name of the fix you want to map in the **Third-Party Fix Name** field.

Step 8 In the **Product Mappings** section, choose the operating system, product, and versions you want to use for fix mapping from the following fields:
- **Vendor**
- **Product**
• Major Version
• Minor Version
• Revision Version
• Build
• Patch
• Extension

Example:
If you want your mapping to assign the fixes from Red Hat Linux 9 to hosts where the patch is applied, choose Redhat, Inc. as the vendor, Redhat Linux as the product, and 9 as the version.

Step 9
Click Save to save the fix map.

---

Mapping Third-Party Vulnerabilities

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

To add vulnerability information from a third party to the VDB, you must map the third-party identification string for each imported vulnerability to any existing SVID, Bugtraq, or SID. After you create a mapping for the vulnerability, the mapping works for all vulnerabilities imported to hosts in the network map and allows impact correlation for those vulnerabilities.

You must enable impact correlation for third-party vulnerabilities to allow correlation to occur. For versionless or vendorless applications, you must also map vulnerabilities for the application types in the Firepower Management Center configuration.

Although many clients have associated vulnerabilities, and clients are used for impact assessment, you cannot use third-party client vulnerabilities for impact assessment.

Tip
If you have already created a third-party mapping on another Firepower Management Center, you can export it and then import it onto this Management Center. You can then edit the imported mapping to suit your needs.

Procedure

Step 1
Choose Policies > Application Detectors.

Step 2
Click User Third-Party Mappings.

Step 3
You have two choices:

• Create — To create a new vulnerability set, click Create Vulnerability Map Set.

• Edit — To edit an existing vulnerability set, click the edit icon ( MODIFY ) next to the vulnerability set. If a view icon ( VIEW ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 4
Click Add Vulnerability Map.
Step 5 Enter the third-party identification for the vulnerability in the Vulnerability ID field.

Step 6 Enter a Vulnerability Description.

Step 7 Optionally:
- Enter a Snort ID in the Snort Vulnerability ID Mappings field.
- Enter a legacy vulnerability ID in the SVID Mappings field.
- Enter a Bugtraq identification number in the Bugtraq Vulnerability ID Mappings field.

Step 8 Click Add.

Related Topics
- Enabling Network Discovery Vulnerability Impact Assessment, on page 1761
- Mapping Vulnerabilities for Servers, on page 798

Custom Product Mappings

You can use product mappings to ensure that servers input by a third party are associated with the appropriate Cisco definitions. After you define and activate the product mapping, all servers or clients on monitored hosts that have the mapped vendor strings use the custom product mappings. For this reason, you may want to map vulnerabilities for all servers in the network map with a particular vendor string instead of explicitly setting the vendor, product, and version for the server.

Creating Custom Product Mappings

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If the system cannot map a server to a vendor and product in the VDB, you can manually create the mapping. When you activate a custom product mapping, the system maps vulnerabilities for the specified vendor and product to all servers in the network map where that vendor string occurs.

Note

Custom product mappings apply to all occurrences of an application protocol, regardless of the source of the application data (such as Nmap, the host input feature, or the Firepower System itself). However, if third-party vulnerability mappings for data imported using the host input feature conflicts with the mappings you set through a custom product mapping, the third-party vulnerability mapping overrides the custom product mapping and uses the third-party vulnerability mapping settings when the input occurs.

You create lists of product mappings and then enable or disable use of several mappings at once by activating or deactivating each list. When you specify a vendor to map to, the system updates the list of products to include only those made by that vendor.

After you create a custom product mapping, you must activate the custom product mapping list. After you activate a list of custom product mappings, the system updates all servers with occurrences of the specified vendor strings. For data imported through the host input feature, vulnerabilities update unless you have already explicitly set the product mappings for this server.

If, for example, your company modifies the banner for your Apache Tomcat web servers to read Internal Web Server, you can map the vendor string Internal Web Server to the vendor Apache and the product
Tomcat, then activate the list containing that mapping, all hosts where a server labeled Internal Web Server occurs have the vulnerabilities for Apache Tomcat in the database.

Tip
You can use this feature to map vulnerabilities to local intrusion rules by mapping the SID for the rule to another vulnerability.

Procedure

Step 1 Choose Policies > Application Detectors.
Step 2 Click Custom Product Mappings.
Step 3 Click Create Custom Product Mapping List.
Step 4 Enter a Custom Product Mapping List Name.
Step 5 Click Add Vendor String.
Step 6 In the Vendor String field, enter the vendor string that identifies the applications that should map to the chosen vendor and product values.
Step 7 Choose the vendor you want to map to from the Vendor drop-down list.
Step 8 Choose the product you want to map to from the Product drop-down list.
Step 9 Click Add to add the mapped vendor string to the list.
Step 10 Optionally, repeat steps 4 to 8 as needed to add additional vendor string mappings to the list.
Step 11 Click Save.

What to do next
• Activate the custom product mapping list. For more information, see Activating and Deactivating Custom Product Mappings, on page 1674.

Editing Custom Product Mapping Lists

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can modify existing custom product mapping lists by adding or removing vendor strings or changing the list name.

Procedure

Step 1 Choose Policies > Application Detectors.
Step 2 Click Custom Product Mappings.
Step 3 Click the edit icon (✏️) next to the product mapping list you want to edit.
Activating and Deactivating Custom Product Mappings

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can enable or disable use of an entire list of custom product mappings at once. After you activate a custom product mapping list, each mapping on that list applies to all applications with the specified vendor string, whether detected by managed devices or imported through the host input feature.

**Procedure**

**Step 1** Choose **Policies > Application Detectors**.

**Step 2** Click **Custom Product Mappings**.

**Step 3** Click the slider next to the custom product mapping list to activate or deactivate it.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

---

**eStreamer Server Streaming**

The Event Streamer (eStreamer) allows you to stream several kinds of event data from a Firepower Management Center or 7000 or 8000 Series device to a custom-developed client application. For more information, see Firepower eStreamer Integration Guide.

Before the appliance you want to use as an eStreamer server can begin streaming eStreamer events to an external client, you must configure the eStreamer server to send events to clients, provide information about the client, and generate a set of authentication credentials to use when establishing communication. You can perform all of these tasks from the appliance’s user interface. Once your settings are saved, the events you selected will be forwarded to eStreamer clients when requested.

You can control which types of events the eStreamer server is able to transmit to clients that request them.

**Table 216: Event Types Transmittable by the eStreamer Server**

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>

</tbody>
</table>

**Choosing eStreamer Event Types**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Management Center 7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

The eStreamer Event Configuration check boxes control which events the eStreamer server can transmit. Your client must still specifically request the types of events you want it to receive in the request message it sends to the eStreamer server. For more information, see the *Firepower eStreamer Integration Guide*.

In a multidomain deployment, you can configure eStreamer Event Configuration at any domain level. However, if an ancestor domain has enabled a particular event type, you cannot disable that event type in the descendant domains.

**Procedure**

**Step 1** Choose System > Integration.
**Step 2** Click the eStream tab.
Step 3 Under eStreamer Event Configuration, check or clear the checkboxes next to the types of events you want eStreamer to forward to requesting clients, described in eStreamer Server Streaming, on page 1674.

Step 4 Click Save.

Configuring eStreamer Client Communications

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Management Center</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>7000 &amp; 8000 Series</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Before eStreamer can send eStreamer events to a client, you must add the client to the eStreamer server’s peers database from the eStreamer page. You must also copy the authentication certificate generated by the eStreamer server to the client. After completing these steps you do not need to restart the eStream service to enable the client to connect to the eStreamer server.

In a multidomain deployment, you can create an eStreamer client in any domain. The authentication certificate allows the client to request events only from the client certificate's domain and any descendant domains. The eStreamer configuration page shows only clients associated with the current domain, so if you want to download or revoke a certificate, switch to the domain where the client was created.

Procedure

Step 1 Choose System > Integration.

Step 2 Click the eStreamer tab.

Step 3 Click Create Client.

Step 4 In the Hostname field, enter the host name or IP address of the host running the eStreamer client.

Note If you have not configured DNS resolution, use an IP address.

Step 5 If you want to encrypt the certificate file, enter a password in the Password field.

Step 6 Click Save.

The eStreamer server now allows the host to access port 8302 on the eStreamer server and creates an authentication certificate to use during client-server authentication.

Step 7 Click the download file icon ( ) next to the client hostname to download the certificate file.

Step 8 Save the certificate file to the appropriate directory used by your client for SSL authentication.

Step 9 To revoke access for a client, click the delete icon ( ) next to the host you want to remove.

Note that you do not need to restart the eStreamer service; access is revoked immediately.
Configuring the Host Input Client

The host input feature allows you to update the Firepower Management Center's network map from a client program running on another appliance. For example, you can add or delete hosts from the network map, or update the host OS and service information. For more information, see Firepower System Host Input API Guide.

Before you can run a remote client, you must add the client to the Firepower Management Center’s peers database from the Host Input Client page. You must also copy the authentication certificate generated by the Management Center to the client. After completing these steps the client can connect to the Management Center.

In a multidomain deployment, you can create a client in any domain. The authentication certificate allows the client to submit network map updates for any leaf domains associated with the client certificate's domain. If you create a certificate for an ancestor domain (or if your certificate domain later becomes an ancestor domain after adding descendant domains), any clients using that certificate must specify a target leaf domain with every transaction, as described in the Firepower System Host Input API Guide.

The Host Input Client tab shows only clients associated the current domain, so if you want to download or revoke a certificate, switch to the domain where the client was created.

Procedure

**Step 1** Choose System > Integration.
**Step 2** Click the Host Input Client tab.
**Step 3** Click Create Client.
**Step 4** In the Hostname field, enter the host name or IP address of the host running the host input client.

*Note* If you have not configured DNS resolution, use an IP address.

**Step 5** If you want to encrypt the certificate file, enter a password in the Password field.
**Step 6** Click Save. The host input service allows the host to access port 8307 on the Firepower Management Center and creates an authentication certificate to use during client-server authentication.

**Step 7** Click the download file icon (📄) next to the certificate file.
**Step 8** Save the certificate file to the directory used by your client for SSL authentication.
**Step 9** To revoke access for a client, click the delete icon (Trash) next to the host you want to remove.
Nmap Scanning

The Firepower System builds network maps through passive analysis of traffic on your network. Information obtained through this passive analysis can occasionally be incomplete, depending on system conditions. However, you can actively scan a host to obtain complete information. For example, if a host has a server running on an open port but the server has not received or sent traffic during the time that the system has been monitoring your network, the system does not add information about that server to the network map. If you directly scan that host using an active scanner, however, you can detect the presence of the server.

The Firepower System integrates with Nmap™, an open source active scanner for network exploration and security auditing.

When you scan a host using Nmap, the system:

- Adds servers on previously undetected open ports to the Servers list in the host profile for that host. The host profile lists any servers detected on filtered or closed TCP ports or on UDP ports in the Scan Results section. By default, Nmap scans more than 1660 TCP ports.

  If the system recognizes a server identified in an Nmap scan and has a corresponding server definition, the system maps the names Nmap uses for servers to the corresponding Cisco server definitions.

- Compares the results of the scan to over 1500 known operating system fingerprints to determine the operating system and assigns scores to each. The operating system assigned to the host is the operating system fingerprint with the highest score.

  The system maps Nmap operating system names to Cisco operating system definitions.

- Assigns vulnerabilities to the host for the added servers and operating systems.

Note:

- A host must exist in the network map before Nmap can append its results to the host profile.

- If the host is deleted from the network map, any Nmap scan results for that host are discarded.

Tip

Some scanning options (such as portscans) may place a significant load on networks with low bandwidths. Schedule scans like these to run during periods of low network use.

For more information on the underlying Nmap technology used to scan, refer to the Nmap documentation at http://insecure.org/.

Nmap Remediation Options

You define the settings for an Nmap scan by creating an Nmap remediation. An Nmap remediation can be used as a response in a correlation policy, run on demand, or scheduled to run at a specific time.

Note that Nmap-supplied server and operating system data remain static until you run another Nmap scan. If you plan to scan a host for operating system and server data using Nmap, you may want to set up regularly scheduled scans to keep any Nmap-supplied operating system and server data up-to-date.
The following table explains the options configurable in Nmap remediations on a Firepower System.

**Table 217: Nmap Remediation Options**

**Nmap Scanning Guidelines**

While active scanning can obtain valuable information, overuse of a tool such as Nmap may overload your network resources or even crash important hosts. When using any active scanner, you should create a scanning strategy following these guidelines to make sure that you are scanning only the hosts and ports that you need to scan.

**Selecting Appropriate Scan Targets**

When you configure Nmap, you can create scan targets that identify which hosts you want to scan. A scan target includes a single IP address, a CIDR block or octet range of IP addresses, an IP address range, or a list of IP addresses or ranges to scan, as well as the ports on the host or hosts.

You can specify targets in the following ways:

- For IPv6 hosts:
  
  - an exact IP address (for example, `192.168.1.101`)

- For IPv4 hosts:
  
  - an exact IP address (for example, `192.168.1.101`) or a list of IP addresses separated by commas or spaces
  
  - an IP address block using CIDR notation (for example, `192.168.1.0/24` scans the 254 hosts between 192.168.1.1 and 192.168.1.254, inclusive).
  
  - an IP address range using octet range addressing (for example, `192.168.0-255.1-254` scans all addresses in the 192.168.x.x range, except those that end in .0 and or .255)
**Example: Using Nmap to Resolve Unknown Operating Systems**

For each scan target you configure, you can select the ports you want to scan. You can designate individual port numbers, port ranges, or a series of port numbers and port ranges to identify the exact set of ports that should be scanned on each target.

By default, Nmap scans TCP ports 1 through 1024. If you plan to use the remediation as a response in a correlation policy, you can cause the remediation to scan only the port specified in the event that triggers the correlation response. If you run the remediation on demand or as a scheduled task, or if you do not use the port from the event, you can use other port options to determine which ports are scanned. You can choose to scan only the TCP ports listed in the `nmap-services` file, ignoring other port settings. You can also scan UDP ports in addition to TCP ports. Note that scanning for UDP ports may be time-consuming, so avoid using that option if you want to scan quickly. To select the specific ports or range of ports to scan, use Nmap port specification syntax to identify ports.

**Setting Host Discovery Options**

You can decide whether to perform host discovery before starting a port scan for a host, or you can assume that all the hosts you plan to scan are online. If you choose not to treat all hosts as online, you can choose what method of host discovery to use and, if needed, customize the list of ports scanned during host discovery. Host discovery does not probe the ports listed for operating system or server information; it uses the response over a particular port only to determine whether a host is active and available. If you perform host discovery and a host is not available, Nmap does not scan ports on that host.

**Example: Using Nmap to Resolve Unknown Operating Systems**

This example walks through an Nmap configuration designed to resolve unknown operating systems. For a complete look at Nmap configuration, see [Managing Nmap Scanning](#).
If the system cannot determine the operating system on a host on your network, you can use Nmap to actively scan the host. Nmap uses the information it obtains from the scan to rate the possible operating systems. It then uses the operating system that has the highest rating as the host operating system identification.

Using Nmap to challenge new hosts for operating system and server information deactivates the system’s monitoring of that data for scanned hosts. If you use Nmap to discover host and server operating system for hosts the system marks as having unknown operating systems, you may be able to identify groups of hosts that are similar. You can then create a custom fingerprint based on one of them to cause the system to associate the fingerprint with the operating system you know is running on the host based on the Nmap scan. Whenever possible, create a custom fingerprint rather than inputting static data through a third-party source like Nmap because the custom fingerprint allows the system to continue to monitor the host operating system and update it as needed.

In this example, you would:

1. Configure a scan instance as described in Adding an Nmap Scan Instance, on page 1689.

2. Create an Nmap remediation using the following settings:
   - Enable Use Port From Event to scan the port associated with the new server.
   - Enable Detect Operating System to detect operating system information for the host.
   - Enable Probe open ports for vendor and version information to detect server vendor and version information.
   - Enable Treat All Hosts as Online, because you know the host exists.

3. Create a correlation rule that triggers when the system detects a host with an unknown operating system. The rule should trigger when a discovery event occurs and the OS information for a host has changed and it meets the following conditions: OS Name is unknown.

4. Create a correlation policy that contains the correlation rule.

5. In the correlation policy, add the Nmap remediation you created in step 2 as a response to the rule you created in step 3.

6. Activate the correlation policy.

7. Purge the hosts on the network map to force network discovery to restart and rebuild the network map.

8. After a day or two, search for events generated by the correlation policy. Analyze the Nmap results for the operating systems detected on the hosts to see if there is a particular host configuration on your network that the system does not recognize.

9. If you find hosts with unknown operating systems whose Nmap results are identical, create a custom fingerprint for one of those hosts and use it to identify similar hosts in the future.

**Example: Using Nmap to Respond to New Hosts**

This example walks through an Nmap configuration designed to respond to new hosts. For a complete look at Nmap configuration, see **Managing Nmap Scanning, on page 1689**.

When the system detects a new host in a subnet where intrusions may be likely, you may want to scan that host to make sure you have accurate vulnerability information for it.

You can accomplish this by creating and activating a correlation policy that detects when a new host appears in this subnet, and that launches a remediation that performs an Nmap scan on the host.

To do this, you would:

1. Configure a scan instance as described in **Adding an Nmap Scan Instance, on page 1689**.

2. Create an Nmap remediation using the following settings:
   - Enable **Use Port From Event** to scan the port associated with the new server.
   - Enable **Detect Operating System** to detect operating system information for the host.
   - Enable **Probe open ports for vendor and version information** to detect server vendor and version information.
   - Enable **Treat All Hosts as Online**, because you know the host exists.

3. Create a correlation rule that triggers when the system detects a new host on a specific subnet. The rule should trigger when a **discovery event occurs** and a **new host is detected**.

4. Create a correlation policy that contains the correlation rule.

5. In the correlation policy, add the Nmap remediation you created in step 2 as a response to the rule you created in step 3.

6. Activate the correlation policy.

7. When you are notified of a new host, check the host profile to see the results of the Nmap scan and address any vulnerabilities that apply to the host.

After you activate the policy, you can periodically check the remediation status view (**Analysis > Correlation > Status**) to see when the remediation launched. The remediation’s dynamic scan target should include the IP addresses of the hosts it scanned as a result of the server detection. Check the host profile for those hosts to see if there are vulnerabilities that need to be addressed for the host, based on the operating system and servers detected by Nmap.

**Caution**

If you have a large or dynamic network, detection of a new host may be too frequent an occurrence to respond to using a scan. To prevent resource overload, avoid using Nmap scans as a response to events that occur frequently. In addition, note that using Nmap to challenge new hosts for operating system and server information deactivates Cisco monitoring of that data for scanned hosts.

To use Nmap scanning, you must, at minimum, configure an Nmap scan instance and an Nmap remediation. Configuring an Nmap scan target is optional.

Procedure

**Step 1**
Configure the Nmap scan:
- Add an Nmap scan instance as described in Adding an Nmap Scan Instance, on page 1689.
- Create an Nmap remediation as described in Creating an Nmap Remediation, on page 1693.
- Optionally, add an Nmap scan target as described in Adding an Nmap Scan Target, on page 1691.

**Step 2**
Run the Nmap scan:
- Run an on-demand Nmap scan as described in Running an On-Demand Nmap Scan, on page 1696.
- Configure automatic Nmap scans as described in Nmap Scan Automation, on page 176.
- Schedule automatic Nmap scans as described in Scheduling an Nmap Scan, on page 177.

What to do next
- Monitor the Nmap scan in progress by viewing the related task; see Viewing Task Messages, on page 260.
- Optionally, refine the scan:
  - Edit an Nmap scan instance as described in Editing an Nmap Scan Instance, on page 1691.
  - Edit an Nmap scan target as described in Editing an Nmap Scan Target, on page 1693.
  - Edit an Nmap remediation as described in Editing an Nmap Remediation, on page 1695.

Adding an Nmap Scan Instance

</tbody>
</table>

You can set up a separate scan instance for each Nmap module that you want to use to scan your network for vulnerabilities. You can set up scan instances for the local Nmap module on the Firepower Management Center and for any devices you want to use to run scans remotely. The results of each scan are always stored on the Firepower Management Center where you configure the scan, even if you run the scan from a remote...
device. To prevent accidental or malicious scanning of mission-critical hosts, you can create a blacklist for the instance to indicate the hosts that should never be scanned with the instance.

You cannot add a scan instance with the same name as any existing scan instance.

In a multidomain deployment, the system displays scan instances created in the current domain, which you can edit. It also displays scan instances created in ancestor domains, which you cannot edit. To view and edit scan instances in a lower domain, switch to that domain.

**Procedure**

**Step 1** Access the list of Nmap scan instances using either of the following methods:
- Choose Policies > Actions > Instances.
- Choose Policies > Actions > Scanners.

**Step 2** Add the remediation:
- If you accessed the list via the first method above, locate the Add a New Instance section, choose the Nmap Remediation module from the drop-down list, and click Add.
- If you accessed the list via the second method above, click Add Nmap Instance.

**Step 3** Enter an **Instance Name**.

**Step 4** Enter a **Description**.

**Step 5** Optionally, in the **Black Listed Scan hosts** field, specify any hosts or networks that should *never* be scanned with this scan instance, using the following syntax:
- For IPv6 hosts, an exact IP address (for example, 2001:DB8::fedd:eeff)
- For IPv4 hosts, an exact IP address (for example, 192.168.1.101) or an IP address block using CIDR notation (for example, 192.168.1.0/24 scans the 254 hosts between 192.168.1.1 and 192.168.1.254, inclusive)
- Note that you cannot use an exclamation mark (!) to negate an address value.

**Note** If you specifically target a scan to a host that is in a blacklisted network, that scan will not run.

**Step 6** Optionally, to run the scan from a remote device instead of the Firepower Management Center, specify the IP address or name of the device as it appears in the Information page for the device in the Management Center web interface, in the **Remote Device Name** field.

**Step 7** Click **Create**. When the system is done creating the instance, it displays it in edit mode.

**Step 8** Optionally, add an Nmap remediation to the instance. To do so, locate the Configured Remediations section of the instance, click **Add**, and create a remediation as described in Creating an Nmap Remediation, on page 1693.

**Step 9** Click **Cancel** to return to the list of instances.

**Note** If you accessed the list of Nmap scan instances via the **Scanners** option, the system does not display the instance you added unless you also added a remediation to the instance. To view any instances to which you have not yet added remediations, use the **Instances** menu option to access the list.
Editing an Nmap Scan Instance

<table>
<thead>
<tr>

When you edit a scan instance, you can view, add, and delete remediations associated with the instance. Delete an Nmap scan instance when you no longer want to use the Nmap module profiled in the instance. Note that when you delete the scan instance, you also delete any remediations that use that instance.

In a multidomain deployment, the system displays scan instances created in the current domain, which you can edit. It also displays scan instances created in ancestor domains, which you cannot edit. To view and edit scan instances in a lower domain, switch to that domain.

**Procedure**

**Step 1**
Access the list of Nmap scan instances using either of the following methods:
- Choose Policies > Actions > Instances.
- Choose Policies > Actions > Scanners.

**Step 2**
Click the view icon ( ) next to the instance you want to edit.

**Step 3**
Make changes to the scan instance settings as described in Adding an Nmap Scan Instance, on page 1689.

**Step 4**
Click Save.

**Step 5**
Click Done.

**What to do next**
- Optionally, add a new remediation to the scan instance; see Creating an Nmap Remediation, on page 1693.
- Optionally, edit a remediation associated with the instance; see Editing an Nmap Remediation, on page 1695.
- Optionally, delete a remediation associated with the instance; see Running an On-Demand Nmap Scan, on page 1696.
- Optionally, delete the scan instance by clicking the delete icon ( ) next to it.

When you configure an Nmap module, you can create and save scan targets that identify the hosts and ports you want to target when you perform an on-demand or a scheduled scan, so that you do not have to construct
a new scan target every time. A scan target includes a single IP address or a block of IP addresses to scan, as well as the ports on the host or hosts. For Nmap targets, you can also use Nmap octet range addressing or IP address ranges. For more information on Nmap octet range addressing, refer to the Nmap documentation at http://insecure.org.

Note:

• Scans for scan targets containing a large number of hosts can take an extended period of time. As a workaround, scan fewer hosts at a time.

• Nmap-supplied server and operating system data remains static until you run another Nmap scan. If you plan to scan a host using Nmap, regularly schedule scans. If a host is deleted from the network map, any Nmap scan results are discarded.

• In a multidomain deployment, the system displays scan targets created in the current domain, which you can edit. It also displays scan targets created in ancestor domains, which you cannot edit. To view and edit scan targets in a lower domain, switch to that domain.

Procedure

Step 1 Choose Policies > Actions > Scanners.
Step 2 On the toolbar, click Targets.
Step 3 Click Create Scan Target.
Step 4 In the Name field, enter the name you want to use for this scan target.
Step 5 In the IP Range text box, specify the host or hosts you want to scan using the syntax described in Nmap Scanning Guidelines, on page 1685.
Note If you use a comma in a list of IP addresses or ranges in a scan target, the comma converts to a space when you save the target.

Step 6 In the Ports field, specify the ports you want to scan.
You can enter any of the following, using values from 1 to 65535:

• a port number

• a list of ports separated by commas

• a range of port numbers separated by a dash

• ranges of port numbers separated by dashes, separated by commas

Step 7 Click Save.

Nmap Scan Automation, on page 176
Editing an Nmap Scan Target

You might want to edit a remediation’s dynamic scan target if you do not want to use the remediation to scan a specific IP address, but the IP address was added to the target because the host was involved in a correlation policy violation that launched the remediation.

Delete a scan target if you no longer want to scan the hosts listed in it.

In a multidomain deployment, the system displays scan targets created in the current domain, which you can edit. It also displays scan targets created in ancestor domains, which you cannot edit. To view and edit scan targets in a lower domain, switch to that domain.

Procedure

Step 1 Choose Policies > Actions > Scanners.
Step 2 On the toolbar, click Targets.
Step 3 Click the edit icon (📝) next to the scan target you want to edit.
If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
Step 4 Make modifications as necessary. For more information, see Adding an Nmap Scan Target, on page 1691.
Step 5 Click Save.
Step 6 Optionally, delete the scan target by clicking the delete icon (🗑️) next to it.

Creating an Nmap Remediation

An Nmap remediation can only be created by adding it to an existing Nmap scan instance. The remediation defines the settings for the scan. It can be used as a response in a correlation policy, run on demand, or run as a scheduled task at a specific time.

Nmap-supplied server and operating system data remains static until you run another Nmap scan. If you plan to scan a host using Nmap, regularly schedule scans. If a host is deleted from the network map, any Nmap scan results are discarded.

For general information about Nmap functionality, refer to the Nmap documentation at http://insecure.org.
In a multidomain deployment, the system displays Nmap remediations created in the current domain, which you can edit. It also displays Nmap remediations created in ancestor domains, which you cannot edit. To view and edit Nmap remediations in a lower domain, switch to that domain.

**Before you begin**
- Add an Nmap scan instance as described in Adding an Nmap Scan Instance, on page 1689.

**Procedure**

**Step 1** Choose **Policies > Actions > Instances**.

**Step 2** Click the view icon (🔍) next to the instance to which you want to add the remediation.

**Step 3** In the Configured Remediations section, click **Add**.

**Step 4** Enter a Remediation Name.

**Step 5** Enter a Description.

**Step 6** If you plan to use this remediation in response to a correlation rule that triggers on an intrusion event, a connection event, or a user event, configure the **Scan Which Address(es) From Event?** option.

**Tip** If you plan to use this remediation in response to a correlation rule that triggers on a discovery event or a host input event, by default the remediation scans the IP address of the host involved in the event; you do not need to configure this option.

**Note** Do not assign an Nmap remediation as a response to a correlation rule that triggers on a traffic profile change.

**Step 7** Configure the **Scan Type** option.

**Step 8** Optionally, to scan UDP ports in addition to TCP ports, choose **On** for the **Scan for UDP ports** option.

**Tip** A UDP portscan takes more time than a TCP portscan. To speed up your scans, leave this option disabled.

**Step 9** If you plan to use this remediation in response to correlation policy violations, configure the **Use Port From Event** option.

**Step 10** If you plan to use this remediation in response to correlation policy violations and want to run the scan using the appliance running the detection engine that detected the event, configure the **Scan from reporting detection engine** option.

**Step 11** Configure the **Fast Port Scan** option.

**Step 12** In the **Port Ranges and Scan Order** field, enter the ports you want to scan by default, using Nmap port specification syntax, in the order you want to scan those ports.

Use the following format:
- Specify values from 1 to 65535.
- Separate ports using commas or spaces.
- Use a hyphen to indicate a port range.
- When scanning for both TCP and UDP ports, preface the list of TCP ports you want to scan with a T and the list of UDP ports with a U.
The **Use Port From Event** option overrides this setting when the remediation is launched in response to a correlation policy violation, as described in step 8.

**Example:**
To scan ports 53 and 111 for UDP traffic, then scan ports 21-25 for TCP traffic, enter `U:53,111,T:21-25`.

**Step 13**
To probe open ports for server vendor and version information, configure **Probe open ports for vendor and version information**.

**Step 14**
If you choose to probe open ports, set the number of probes used by choosing a number from the **Service Version Intensity** drop-down list.

**Step 15**
To scan for operating system information, configure **Detect Operating System** settings.

**Step 16**
To determine whether host discovery occurs and whether port scans are only run against available hosts, configure **Treat All Hosts As Online**.

**Step 17**
To set the method you want Nmap to use when it tests for host availability, choose a method from the **Host Discovery Method** drop-down list.

**Step 18**
If you want to scan a custom list of ports during host discovery, enter a list of ports appropriate for the host discovery method you chose, separated by commas, in the **Host Discovery Port List** field.

**Step 19**
Configure the **Default NSE Scripts** option to control whether to use the default set of Nmap scripts for host discovery and server, operating system, and vulnerability discovery.

**Tip**
See [http://nmap.org/nsedoc/categories/default.html](http://nmap.org/nsedoc/categories/default.html) for the list of default scripts.

**Step 20**
To set the timing of the scan process, choose a timing template number from the **Timing Template** drop-down list.

Choose a higher number for a faster, less comprehensive scan and a lower number for a slower, more comprehensive scan.

**Step 21**
Click **Create**.
When the system is done creating the remediation, it displays it in edit mode.

**Step 22**
Click **Done** to return to the related instance.

**Step 23**
Click **Cancel** to return to the instance list.

**Related Topics**

</table>

Modifications you make to Nmap remediations do not affect scans in progress. The new settings take effect when the next scan starts. Delete an Nmap remediation if you no longer need it.

In a multidomain deployment, the system displays Nmap remediations created in the current domain, which you can edit. It also displays Nmap remediations created in ancestor domains, which you cannot edit. To view and edit Nmap remediations in a lower domain, switch to that domain.
Procedure

**Step 1** Access the list of Nmap scan instances using either of the following methods:

- Choose Policies > Actions > Instances.
- Choose Policies > Actions > Scanners.

**Step 2** Access the remediation you want to edit:

- If you accessed the list via the first method above, click the view icon (%) next to the relevant instance, and then click it again next to the remediation you want to edit in the Configured Remediations section.
- If you accessed the list via the second method above, click the view icon (%) next to the remediation you want to edit.

**Step 3** Make modifications as necessary as described in Creating an Nmap Remediation, on page 1693.

**Step 4** Click Save if you want to save your changes, or Done if you want to exit without saving.

**Step 5** Optionally, delete the remediation by clicking the delete icon (%) next to it.

### Running an On-Demand Nmap Scan

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>

</tr>
</tbody>
</table>

You can launch on-demand Nmap scans whenever needed. You can specify the target for an on-demand scan by entering the IP addresses and ports you want to scan or by choosing an existing scan target.

Nmap-supplied server and operating system data remains static until you run another Nmap scan. If you plan to scan a host using Nmap, regularly schedule scans. If a host is deleted from the network map, any Nmap scan results are discarded.

**Before you begin**

- Optionally, add an Nmap scan target; see Adding an Nmap Scan Target, on page 1691.

**Procedure**

**Step 1** Choose Policies > Actions > Scanners.

**Step 2** Next to the Nmap remediation you want to use to perform the scan, click the scan icon ( ).

**Step 3** Optionally, to scan using a saved scan target, choose a target from the Saved Targets drop-down list, and click Load.

**Note** To add a scan target, you can click the edit icon ( ) at the top of the dialog.

**Step 4** In the IP Range(s) field, specify the IP address for hosts you want to scan or modify the loaded list.
Note:

- For hosts with IPv4 addresses, you can specify multiple IP addresses separated by commas or use CIDR notation. You can also negate IP addresses by preceding them with an exclamation point (!).
- For hosts with IPv6 addresses, use an exact IP address. Ranges are not supported.

**Step 5**

In the **Ports** field, specify the ports you want to scan or modify the loaded list.

You can enter a port number, a list of ports separated by commas, or a range of port numbers separated by a dash.

**Step 6**

In a multidomain deployment, use the **Domain** field to specify the leaf domain where you want to perform the scan.

**Step 7**

Click **Scan Now**.

**What to do next**

- Optionally, monitor the task status; see Viewing Task Messages, on page 260.

**Related Topics**

Nmap Scan Automation, on page 176

**Nmap Scan Results**

You can monitor Nmap scans in progress, import results from scans previously performed through the Firepower System or results performed outside the Firepower System, and view and analyze scan results.

You can view scan results that you create using the local Nmap module as a rendered page in a pop-up window. You can also download the Nmap results file in raw XML format.

You can also view operating system and server information detected by Nmap in host profiles and in the network map. If a scan of a host produces server information for servers on filtered or closed ports, or if a scan collects information that cannot be included in the operating system information or the servers section, the host profile includes those results in an Nmap Scan Results section.

**Viewing Nmap Scan Results**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

When an Nmap scan is complete, you can view a table of scan results.

You can manipulate the results view depending on the information you are looking for. The page you see when you access scan results differs depending on the workflow you use. You can use the predefined workflow, which includes a table view of scan results. You can also create a custom workflow that displays only the information that matches your specific needs.
In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

You can download and view the Nmap results using the Nmap Version 1.01 DTD, available at http://insecure.org.

You can also clear scan results.

**Procedure**

**Step 1** Choose Policies > Actions > Scanners.

**Step 2** On the toolbar, click Scan Results.

**Step 3** You have the following choices:

- Adjust the time range as described in Event Time Constraints, on page 1994.
- To use a different workflow, including a custom workflow, click (switch workflows) by the workflow title.
- To view the scan results as a rendered page in a pop-up window, click View next to the scan job.
- To save a copy of the scan results file so that you can view the raw XML code in any text editor, click Download next to the scan job.
- To sort scan results, click the column title. Click the column title again to reverse the sort order.
- To constrain the columns that appear, click the close icon (X) in the column heading that you want to hide. In the pop-up window that appears, click Apply.

**Tip** To hide or show other columns, check or clear the appropriate check boxes before you click Apply. To add a disabled column back to the view, click the expand arrow to expand the search constraints, then click the column name under Disabled Columns.

- To drill down to the next page in the workflow, see Using Drill-Down Pages, on page 1985.
- To configure scan instances and remediations, click Scanners in the toolbar and see Managing Nmap Scanning, on page 1689.
- To navigate within and between workflow pages, see Workflow Page Navigation Tools, on page 1982.
- To navigate to other event views to view associated events, choose the name of the event view you want to see from the Jump to drop-down list.
- To search for scan results, enter your search criteria in the appropriate fields.

You can import XML results files created by an Nmap scan performed outside of the Firepower System. You can also import XML results files that you previously downloaded from the Firepower System. To import Nmap scan results, the results file must be in XML format and adhere to the Nmap Version 1.01 DTD. For more information on creating Nmap results and on the Nmap DTD, refer to the Nmap documentation at [http://insecure.org](http://insecure.org).

A host must already exist in the network map before Nmap can append its results to the host profile.

**Procedure**

**Step 1** Choose **Policies > Actions > Scanners**.

**Step 2** On the toolbar, click **Import Results**.

**Step 3** In a multidomain deployment, choose a leaf domain from the Domain drop-down list to specify where you want to store the imported results.

**Step 4** Click **Browse** to navigate to the results file.

**Step 5** After you return to the Import Results page, click **Import** to import the results.
Importing Nmap Scan Results
The following topics describe Firepower System application detection:

- Overview: Application Detection, on page 1701
- Custom Application Detectors, on page 1706
- Viewing or Downloading Detector Details, on page 1714
- Sorting the Detector List, on page 1715
- Filtering the Detector List, on page 1715
- Navigating to Other Detector Pages, on page 1716
- Activating and Deactivating Detectors, on page 1717
- Editing Custom Application Detectors, on page 1718
- Deleting Detectors, on page 1718

Overview: Application Detection

When the Firepower System analyzes IP traffic, it attempts to identify the commonly used applications on your network. Application awareness is crucial to application control.

There are three types of applications that the system detects:

- application protocols such as HTTP and SSH, which represent communications between hosts
- clients such as web browsers and email clients, which represent software running on the host
- web applications such as MPEG video and Facebook, which represent the content or requested URL for HTTP traffic

The system identifies applications in your network traffic according to the characteristics specified in the detector. For example, the system can identify an application by an ASCII pattern in the packet header. In addition, Secure Socket Layers (SSL) protocol detectors use information from the secured session to identify the application from the session.

There are two sources of application detectors in the Firepower System:

- System-provided detectors detect web applications, clients, and application protocols.

The availability of system-provided detectors for applications (and operating systems) depends on the version of the Firepower System and the version of the VDB you have installed. Release notes and advisories contain information on new and updated detectors. You can also import individual detectors authored by Professional Services.
• Custom application protocol detectors are user-created and detect web applications, clients, and application protocols.

You can also detect application protocols through implied application protocol detection, which infers the existence of an application protocol based on the detection of a client.

The system identifies only those application protocols running on hosts in your monitored networks, as defined in the network discovery policy. For example, if an internal host accesses an FTP server on a remote site that you are not monitoring, the system does not identify the application protocol as FTP. On the other hand, if a remote or internal host accesses an FTP server on a host you are monitoring, the system can positively identify the application protocol.

If the system can identify the client used by a monitored host to connect to a non-monitored server, the system identifies the client's corresponding application protocol, but does not add the protocol to the network map. Note that client sessions must include a response from the server for application detection to occur.

The system characterizes each application that it detects; see Application Characteristics, on page 309. The system uses these characteristics to create groups of applications, called application filters. Application filters are used to perform access control and to constrain search results and data used in reports and dashboard widgets.

You can also supplement application detector data using exported NetFlow records, Nmap active scans, and the host input feature.

Related Topics

Application Detector Fundamentals, on page 1702

Application Detector Fundamentals

The Firepower System uses application detectors to identify the commonly used applications on your network. Use the Detectors page (Policies > Application Detectors) to view the detector list and customize detection capability.

Whether you can modify a detector or change its state (active or inactive) depends on its type. The system uses only active detectors to analyze application traffic.

Note

Cisco-provided detectors may change with Firepower System and VDB updates. See the release notes and advisories for information on updated detectors.

Cisco-Provided Internal Detectors

Internal detectors are a special category of detectors for client, web application, and application protocol traffic. Internal detectors are delivered with system updates and are always on.

Cisco-Provided Client Detectors

Client detectors detect client traffic and are delivered via VDB or system update, or are provided for import by Cisco Professional Services. You can activate and deactivate client detectors. You can export a client detector only if you import it.
Cisco-Provided Web Application Detectors

Web application detectors detect web applications in HTTP traffic payloads and are delivered via VDB or system update. Web application detectors are always on.

Cisco-Provided Application Protocol (Port) Detectors

Port-based application protocol detectors use well-known ports to identify network traffic. They are delivered via VDB or system update, or are provided for import by Cisco Professional Services. You can activate and deactivate application protocol detectors, and view a detector definition to use it as the basis for a custom detector.

Cisco-Provided Application Protocol (Firepower) Detectors

Firepower-based application protocol detectors analyze network traffic using Firepower application fingerprints and are delivered via VDB or system update. You can activate and deactivate application protocol detectors.

Custom Application Detectors

Custom application detectors are pattern-based. They detect patterns in packets from client, web application, or application protocol traffic. You have full control over imported and custom detectors.

Identification of Application Protocols in the Web Interface

The following table outlines how the Firepower System identifies detected application protocols:

### Table 219: Firepower System Identification of Application Protocols

<table>
<thead>
<tr>
<th>Identification</th>
<th>Description</th>
</tr>
</thead>
</table>
| application protocol name | The Firepower Management Center identifies an application protocol with its name if the application protocol was:  
• positively identified by the system  
• identified using NetFlow data and there is a port-application protocol correlation in `/etc/sf/services`  
• manually identified using the host input feature  
• identified by Nmap or another active source |
| pending | The Firepower Management Center identifies an application protocol as pending if the system can neither positively nor negatively identify the application.  
Most often, the system needs to collect and analyze more connection data before it can identify a pending application.  
In the Application Details and Servers tables and in the host profile, the pending status appears only for application protocols where specific application protocol traffic was detected (rather than inferred from detected client or web application traffic). |
The Firepower Management Center identifies an application protocol as **unknown** if:

- the application does not match any of the system’s detectors
- the application protocol was identified using NetFlow data, but there is no port-application protocol correlation in `/etc/sf/services`

All available detected data has been examined, but no application protocol was identified. In the Application Details and Servers tables and in the host profile, the application protocol is left blank for non-HTTP generic client traffic with no detected application protocol.

### Implied Application Protocol Detection from Client Detection

If the system can identify the client used by a monitored host to access a non-monitored server, the Firepower Management Center infers that the connection is using the application protocol that corresponds with the client. (Because the system tracks applications only on monitored networks, connection logs usually do not include application protocol information for connections where a monitored host is accessing a non-monitored server.)

This process, or **implied application protocol detection**, has the following consequences:

- Because the system does not generate a New TCP Port or New UDP Port event for these servers, the server does not appear in the Servers table. In addition, you cannot trigger either discovery event alerts or correlation rules using the detection of these application protocol as a criterion.

- Because the application protocol is not associated with a host, you cannot view its details in host profiles, set its server identity, or use its information in host profile qualifications for traffic profiles or correlation rules. In addition, the system does not associate vulnerabilities with hosts based on this type of detection.

You can, however, trigger correlation events on whether the application protocol information is present in a connection. You can also use the application protocol information in connection logs to create connection trackers and traffic profiles.

### Host Limits and Discovery Event Logging

When the system detects a client, server, or web application, it generates a discovery event unless the associated host has already reached its maximum number of clients, servers, or web applications.

Host profiles display up to 16 clients, 100 servers, and 100 web applications per host.

Note that actions dependent on the detection of clients, servers, or web applications are unaffected by this limit. For example, access control rules configured to trigger on a server will still log connection events.

<table>
<thead>
<tr>
<th>Identification</th>
<th>Description</th>
</tr>
</thead>
</table>
| unknown        | The Firepower Management Center identifies an application protocol as unknown if:  
• the application does not match any of the system’s detectors  
• the application protocol was identified using NetFlow data, but there is no port-application protocol correlation in `/etc/sf/services` |
| blank          | All available detected data has been examined, but no application protocol was identified. In the Application Details and Servers tables and in the host profile, the application protocol is left blank for non-HTTP generic client traffic with no detected application protocol. |
Special Considerations for Application Detection

**Squid**

The system positively identifies Squid server traffic when either:

- the system detects a connection from a host on your monitored network to a Squid server where proxy authentication is enabled, or
- the system detects a connection from a Squid proxy server on your monitored network to a target system (that is, the destination server where the client is requesting information or another resource).

However, the system cannot identify Squid service traffic if:

- a host on your monitored network connects to a Squid server where proxy authentication is disabled, or
- the Squid proxy server is configured to strip Via: header fields from its HTTP responses

**SSL Application Detection**

The system provides application detectors that can use session information from a Secure Socket Layers (SSL) session to identify the application protocol, client application, or web application in the session.

When the system detects an encrypted connection, it marks that connection as either a generic HTTPS connection or as a more specific secure protocol, such as SMTPS, when applicable. When the system detects an SSL session, it adds `SSL client` to the `Client` field in connection events for the session. If it identifies a web application for the session, the system generates discovery events for the traffic.

For SSL application traffic, managed devices can also detect the common name from the server certificate and match that against a client or web application from an SSL host pattern. When the system identifies a specific client, it replaces `SSL client` with the name of the client.

Because the SSL application traffic is encrypted, the system can use only information in the certificate for identification, not application data within the encrypted stream. For this reason, SSL host patterns can sometimes only identify the company that authored the application, so SSL applications produced by the same company may have the same identification.

In some instances, such as when an HTTPS session is launched from within an HTTP session, managed devices detect the server name from the client certificate in a client-side packet.

To enable SSL application identification, you must create access control rules that monitor responder traffic. Those rules must have either an application condition for the SSL application or URL conditions using the URL from the SSL certificate. For network discovery, the responder IP address does not have to be in the networks to monitor in the network discovery policy; the access control policy configuration determines whether the traffic is identified. To identify detections for SSL applications, you can filter by the `SSL protocol` tag, in the application detectors list or when adding application conditions in access control rules.

**Referred Web Applications**

Web servers sometimes refer traffic to other websites, which are often advertisement servers. To help you better understand the context for referred traffic occurring on your network, the system lists the web application that referred the traffic in the **Web Application** field in events for the referred session. The VDB contains a list of known referred sites. When the system detects traffic from one of those sites, the referring site is stored with the event for that traffic. For example, if an advertisement accessed via Facebook is actually hosted on Advertising.com, the detected Advertising.com traffic is associated with the Facebook web application. The
system can also detect referring URLs in HTTP traffic, such as when a website provides a simple link to another site; in this case, the referring URL appears in the HTTP Referrer event field.

In events, if a referring application exists, it is listed as the web application for the traffic, while the URL is that for the referred site. In the example above, the web application for the connection event for that traffic would be Facebook, but the URL would be Advertising.com. A referred application may appear as the web application if no referring web application is detected, if the host refers to itself, or if there is a chain of referrals. In the dashboard, connection and byte counts for web applications include sessions where the web application is associated with traffic referred by that application.

Note that if you create a rule to act specifically on referred traffic, you should add a condition for the referred application, rather than the referring application. To block Advertising.com traffic referred from Facebook, for example, add an application condition to your access control rule for the Advertising.com application.

**Custom Application Detectors**

If you use a custom application on your network, you can create a custom web application, client, or application protocol detector that provides the system with the information it needs to identify the application. The type of application detector is determined by your selections in the Protocol, Type, and Direction fields.

Client sessions must include a responder packet from the server for the system to begin detecting and identifying application protocols in server traffic. Note that, for UDP traffic, the system designates the source of the responder packet as the server.

If you have already created a detector on another Firepower Management Center, you can export it and then import it onto this Firepower Management Center. You can then edit the imported detector to suit your needs. You can export and import custom detectors as well as detectors provided by Cisco Professional Services. However, you cannot export or import any other type of Cisco-provided detectors.

**Custom Application Detector and User-Defined Application Fields**

You can use the following fields to configure custom application detectors and user-defined applications.

**Custom Application Detector Fields: General**

Use the following fields to configure basic and advanced custom application detectors.

**Application Protocol**

The application protocol you want to detect. This can be a system-provided application or a user-defined application.

If you want the application to be available for exemption from active authentication (configured in your identity rules), you must select or create an application protocol with the **User-Agent Exclusion** tag.

**Description**

A description for the application detector.

**Name**

A name for the application detector.
Detector Type

The type of detector, Basic or Advanced. Basic application detectors are created in the web interface as a series of fields. Advanced application detectors are created externally and uploaded as custom .lua files.

Custom Application Detector Fields: Detection Patterns

Use the following fields to configure the detection patterns for basic custom application detectors.

Direction

The source of the traffic the detector should inspect, Client or Server.

Offset

The location in a packet, in bytes from the beginning of the packet payload, where the system should begin searching for the pattern.

Because packet payloads start at byte 0, calculate the offset by subtracting 1 from the number of bytes you want to move forward from the beginning of the packet payload. For example, to look for the pattern in the fifth bit of the packet, type 4 in the Offset field.

Pattern

The pattern string associated with the Type you selected.

Ports

The port of the traffic the detector should inspect.

Protocol

The protocol you want to detect. Your protocol selection determines whether the Type or the URL field displays.

The protocol (and, in some cases, your subsequent selections in the Type and Direction fields) determine the type of application detector you create: web application, client, or application protocol.

<table>
<thead>
<tr>
<th>Detector Type</th>
<th>Protocol</th>
<th>Type or Direction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Application</td>
<td>HTTP</td>
<td>Type is Content Type or URL</td>
</tr>
<tr>
<td></td>
<td>RTMP</td>
<td>Any</td>
</tr>
<tr>
<td></td>
<td>SSL</td>
<td>Any</td>
</tr>
<tr>
<td>Client</td>
<td>HTTP</td>
<td>Type is User Agent</td>
</tr>
<tr>
<td></td>
<td>SIP</td>
<td>Any</td>
</tr>
<tr>
<td></td>
<td>TCP or UDP</td>
<td>Direction is Client</td>
</tr>
<tr>
<td>Application Protocol</td>
<td>TCP or UDP</td>
<td>Direction is Server</td>
</tr>
</tbody>
</table>

Type

The type of pattern string you entered. The options you see are determined by the Protocol you selected. If you selected RTMP as the protocol, the URL field displays instead of the Type field.
If you select **User Agent** as the **Type**, the system automatically sets the **Tag** for the application to **User-Agent Exclusion**.

<table>
<thead>
<tr>
<th>Type Selection</th>
<th>String Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ascii</td>
<td>The string is ASCII encoded.</td>
</tr>
<tr>
<td>Common Name</td>
<td>The string is the value in the commonName field within the server response message.</td>
</tr>
<tr>
<td>Content Type</td>
<td>The string is the value in the content-type field within the server response header.</td>
</tr>
<tr>
<td>Hex</td>
<td>The string is in hexadecimal notation.</td>
</tr>
<tr>
<td>Organizational Unit</td>
<td>The string is the value in the organizationName field within the server response message.</td>
</tr>
<tr>
<td>SIP Server</td>
<td>The string is the value in the From field within the message header.</td>
</tr>
<tr>
<td>SSL Host</td>
<td>The string is the value in the server_name field within the ClientHello message.</td>
</tr>
<tr>
<td><strong>URL</strong></td>
<td>The string is a URL.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The detector assumes that the string you enter is a complete section of the URL. For example, entering <code>cisco.com</code> would match <code>www.cisco.com/support</code> and <code>www.cisco.com</code>, but not <code>www.wearecisco.com</code>.</td>
</tr>
<tr>
<td>User Agent</td>
<td>The string is the value in the user-agent field within the GET request header. It is also available for the SIP protocol and indicates that the string is the value in the User-Agent field within the SIP message header.</td>
</tr>
</tbody>
</table>

**URL**

Either a full URL or a section of a URL from the swfURL field within the C2 message of a RTMP packet. This field displays instead of the **Type** field when you select **RTMP** as the **Protocol**.

**Note**

The detector assumes that the string you enter is a complete section of the URL. For example, entering `cisco.com` would match `www.cisco.com/support` and `www.cisco.com`, but not `www.wearecisco.com`.

**User-Defined Application Fields**

Use the following fields to configure user-defined applications within basic and advanced custom application detectors.
Business Relevance

The likelihood that the application is used within the context of your organization’s business operations, as opposed to recreationally: Very High, High, Medium, Low, or Very Low. Select the option that best describes the application.

Categories

A general classification for the application that describes its most essential function.

Description

A description for the application.

Name

A name for the application.

Risk

The likelihood that the application is used for purposes that might be against your organization’s security policy: Very High, High, Medium, Low, or Very Low. Select the option that best describes the application.

Tags

One or more predefined tags that provide additional information about the application. If you want an application to be available for exemption from active authentication (configured in your identity rules), you must add the User-Agent Exclusion tag to your application.

Configuring Custom Application Detectors

You can configure basic or advanced custom application detectors.

### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Select Policies &gt; Application Detectors.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Click Create Custom Detector.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter a Name and a Description.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Select an Application Protocol. You have the following options:</td>
</tr>
<tr>
<td></td>
<td>• If you are creating a detector for an existing application protocol (for example, if you want to detect a particular application protocol on a non-standard port), select the application protocol from the drop-down list.</td>
</tr>
<tr>
<td></td>
<td>• If you are creating a detector for a user-defined application, follow the procedure outlined in Creating a User-Defined Application, on page 1710.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Select a Detector Type.</td>
</tr>
</tbody>
</table>
Step 6  Click OK.

Step 7  Configure Detection Patterns or Detection Criteria:

• If you are configuring a basic detector, specify preset Detection Patterns as described in Specifying Detection Patterns in Basic Detectors, on page 1711.

• If you are configuring an advanced detector, specify custom Detection Criteria as described in Specifying Detection Criteria in Advanced Detectors, on page 1712.

Caution  Advanced custom detectors are complex and require outside knowledge to construct valid .lua files. Incorrectly configured detectors could have a negative impact on performance or detection capability.

Step 8  Optionally, use Packet Captures to test the new detector as described in Testing a Custom Application Protocol Detector, on page 1713.

Step 9  Click Save.

Note  If you include the application in an access control rule, the detector is automatically activated and cannot be deactivated while in use.

What to do next

• Activate the detector as described in Activating and Deactivating Detectors, on page 1717.

Creating a User-Defined Application

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

Applications, categories, and tags created here are available in access control rules and in the application filter object manager as well.

Caution

Creating a user-defined application immediately restarts the Snort process without going through the deploy process. Restarting the Snort process temporarily interrupts traffic inspection on all managed devices. Whether traffic drops during this interruption or passes without further inspection depends on the model of the managed device and how it handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

Before you begin

• Begin configuring your custom application protocol detector as described in Configuring Custom Application Detectors, on page 1709.
## Procedure

**Step 1**
On the Create Detector page, click Add.

**Step 2**
Type a Name.

**Step 3**
Type a Description.

**Step 4**
Select a Business Relevance.

**Step 5**
Select a Risk.

**Step 6**
Click Add next to Categories to add a category and type a new category name, or select an existing category from the Categories drop-down list.

**Step 7**
Optionally, click Add next to Tags to add a tag and type a new tag name, or select an existing tag from the Tags drop-down list.

**Step 8**
Click OK.

## What to do next

- Continue configuring your custom application protocol detector as described in Configuring Custom Application Detectors, on page 1709. You must save and activate the detector before the system can use it to analyze traffic.

## Related Topics

- Custom Application Detector and User-Defined Application Fields, on page 1706

### Specifying Detection Patterns in Basic Detectors

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

You can configure a custom application protocol detector to search application protocol packet headers for a particular pattern string. You can also configure detectors to search for multiple patterns; in that case the application protocol traffic must match all of the patterns for the detector to positively identify the application protocol.

Application protocol detectors can search for ASCII or hexadecimal patterns, using any offset.

### Before you begin

- Begin configuring your custom application protocol detector as described in Configuring Custom Application Detectors, on page 1709.

### Procedure

**Step 1**
On the Create Detector page, in the Detection Patterns section, click Add.

**Step 2**
Select a Protocol for traffic the detector should inspect.

**Step 3**
Specify the pattern Type you want to detect.
Step 4 Type a **Pattern String** that matches the **Type** you specified.
Step 5 Optionally, type the **Offset** (in bytes).
Step 6 Optionally, to identify application protocol traffic based on the port it uses, type a port from 1 to 65535 in the **Port(s)** field. To use multiple ports, separate them by commas.
Step 7 Optionally, select a **Direction**: **Client** or **Server**.
Step 8 Click **OK**.

**Tip** If you want to delete a pattern, click the delete icon (🗑️) next to the pattern you want to delete.

---

**What to do next**

- Continue configuring your custom application protocol detector as described in Configuring Custom Application Detectors, on page 1709. You must save and activate the detector before the system can use it to analyze traffic.

**Related Topics**

- Specifying Detection Criteria in Advanced Detectors, on page 1712

</tr>
</tbody>
</table>

---

**Caution**

Advanced custom detectors are complex and require outside knowledge to construct valid .lua files. Incorrectly configured detectors could have a negative impact on performance or detection capability.

---

**Caution**

Do not upload .lua files from untrusted sources.

Custom .lua files contain your custom application detector settings. Creating custom .lua files requires advanced knowledge of the lua programming language and experience with Cisco's C-lua API. Cisco strongly recommends you follow the following to prepare .lua files:

- third-party instruction and reference material for the lua programming language
- The Open Source Detectors Developers Guide: https://www.snort.org/downloads
- OpenAppID Snort community resources: http://blog.snort.org/search/label/openappid

---

**Note**

The system does not support .lua files that reference system calls or file I/O.
Before you begin

- Begin configuring your custom application protocol detector as described in Configuring Custom Application Detectors, on page 1709.
- Prepare to create a valid .lua file by downloading and studying the .lua files for comparable detectors. For more information about downloading detector files, see Viewing or Downloading Detector Details, on page 1714.
- Create a valid .lua file that contains your custom application detector settings.

Procedure

**Step 1**
On the Create Detector page for an advanced custom application detector, in the Detection Criteria section, click **Add**.

**Step 2**
Click **Browse...** to navigate to the .lua file and upload it.

**Step 3**
Click **OK**.

What to do next

- Continue configuring your custom application protocol detector as described in Configuring Custom Application Detectors, on page 1709. You must save and activate the detector before the system can use it to analyze traffic.

- Specifying Detection Patterns in Basic Detectors, on page 1711

Testing a Custom Application Protocol Detector

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

If you have a packet capture (pcap) file that contains packets with traffic from the application protocol you want to detect, you can test a custom application protocol detector against that pcap file. Cisco recommends using a simple, clean pcap file without unnecessary traffic.

Pcap files must be 256 KB or smaller; if you try to test your detector against a larger pcap file, the Firepower Management Center automatically truncates it and tests the incomplete file. You must fix the unresolved checksums in a pcap before using the file to test a detector.

Before you begin

- Configure your custom application protocol detector as described in Configuring Custom Application Detectors, on page 1709.
Procedure

Step 1  On the Create Detector page, in the Packet Captures section, click Add.

Step 2  Browse to the pcap file in the pop-up window and click OK.

Step 3  To test your detector against the contents of the pcap file, click the evaluate icon next to the pcap file. A message indicates whether the test succeeded.

Step 4  Optionally, repeat steps 1 to 3 to test the detector against additional pcap files.

Tip  To delete a pcap file, click the delete icon (🗑️) next to the file you want to delete.

What to do next

- Continue configuring your custom application protocol detector as described in Configuring Custom Application Detectors, on page 1709. You must save and activate the detector before the system can use it to analyze traffic.

Viewing or Downloading Detector Details

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can use the detectors list to view application detector details (all detectors) and download detector details (custom application detectors only).

Procedure

Step 1  Select Policies > Application Detectors.

Step 2  To view detector details, click the information icon (🔗) to view the risk, business relevance, tags, and categories described in Overview: Application Detection, on page 1701.

Step 3  To download detector details for a custom application detector, click the download icon (⬇️). If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
## Sorting the Detector List

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

By default, the Detectors page lists detectors alphabetically by name. An up or down arrow next to a column heading indicates that the page is sorted by that column in that direction.

**Procedure**

**Step 1** Select *Policies > Application Detectors*.

**Step 2** Click the appropriate column heading.

## Filtering the Detector List

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Select *Policies > Application Detectors*.

**Step 2** Expand one of the filter groups described in *Filter Groups for the Detector List, on page 1715* and select the check box next to a filter. To select all filters in a group, right-click the group name and select *Check All*.

**Step 3** If you want to remove a filter, click the remove icon (🗑️) in the name of the filter in the *Filters* field or disable the filter in the filter list. To remove all filters in a group, right-click the group name and select *Uncheck All*.

**Step 4** If you want to remove all filters, click *Clear all* next to the list of filters applied to the detectors.

## Filter Groups for the Detector List

You can use several filter groups, separately or in combination, to filter the list of detectors.

### Name

Finds detectors with names or descriptions containing the string you type. Strings can contain any alphanumeric or special character.
**Custom Filter**

Finds detectors matching a custom application filter created on the object management page.

**Author**

Finds detectors according to who created the detector. You can filter detectors by:

- any individual user who has created or imported a custom detector
- Cisco, which represents all Cisco-provided detectors except individually imported add-on detectors (you are the author for any detector that you import)
- **Any User**, which represents all detectors not provided by Cisco

**State**

Finds detectors according to their state, that is, **Active** or **Inactive**.

**Type**

Finds detectors according to the detector type, as described in Application Detector Fundamentals, on page 1702.

**Protocol**

Finds detectors according to which traffic protocol the detector inspects.

**Category**

Finds detectors according to the categories assigned to the application they detect.

**Tag**

Finds detectors according to the tags assigned to the application they detect.

**Risk**

Finds detectors according to the risks assigned to the application they detect: **Very High**, **High**, **Medium**, **Low**, and **Very Low**.

**Business Relevance**

Finds detectors according to the business relevance assigned to the application they detect: **Very High**, **High**, **Medium**, **Low**, and **Very Low**.

---

**Navigating to Other Detector Pages**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>
**Activating and Deactivating Detectors**

You must activate a detector before you can use it to analyze network traffic. By default, all Cisco-provided detectors are activated.

You can activate multiple application detectors for each port to supplement the system’s detection capability.

When you include an application in an access control rule in a policy and that policy is deployed, if there is no active detector for that application, one or more detectors automatically activate. Similarly, while an application is in use in a deployed policy, you cannot deactivate a detector if deactivating leaves no active detectors for that application.

---

### Procedure

**Step 1** Select Policies > Application Detectors.

**Step 2** If you want to view the next page, click the right arrow icon (▶).

**Step 3** If you want to view the previous page, click the left arrow icon (◀).

**Step 4** If you want to view a different page, type the page number and press Enter.

**Step 5** If you want to jump to the last page, click the right end arrow icon (▶️).

**Step 6** If you want to jump to the first page, click the left end arrow icon (◀️).

---

For improved performance, deactivate any application protocol, client, or web application detectors you do not intend to use.

---

Activating or deactivating a system or custom application detector immediately restarts the Snort process without going through the deploy process. Restarting the Snort process temporarily interrupts traffic inspection on all managed devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

---

### Procedure

**Step 1** Select Policies > Application Detectors.

**Step 2** Click the slider next to the detector you want to activate or deactivate. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
Some application detectors are required by other detectors. If you deactivate one of these detectors, a warning appears to indicate that the detectors that depend on it are also disabled.

### Editing Custom Application Detectors

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Use the following procedure to modify custom application detectors.

**Procedure**

1. **Step 1** Select **Policies > Application Detectors**.
2. **Step 2** Click the edit icon (📝) next to the detector you want to modify. If a view icon (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
3. **Step 3** Make changes to the detector as described in Configuring Custom Application Detectors, on page 1709.
4. **Step 4** You have the following saving options, depending on the state of the detector:
   - To save an inactive detector, click **Save**.
   - To save an inactive detector as a new, inactive detector, click **Save as New**.
   - To save an active detector and immediately start using it, click **Save and Reactivate**.

**Caution** Saving and reactivating a custom application detector immediately restarts the Snort process without going through the deploy process. Restarting the Snort process temporarily interrupts traffic inspection on all managed devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

- To save an active detector as a new, inactive detector, click **Save as New**.

### Deleting Detectors

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>
You can delete custom detectors as well as individually imported add-on detectors provided by Cisco Professional Services. You cannot delete any of the other Cisco-provided detectors, though you can deactivate many of them.

**Note**
While a detector is in use in a deployed policy, you cannot delete the detector.

**Caution**
Deleting an activated custom application detector immediately restarts the Snort process without going through the deploy process. Restarting the Snort process temporarily interrupts traffic inspection on all managed devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

**Procedure**

**Step 1** Select **Policies > Application Detectors**.

**Step 2** Click the delete icon (🗑️) next to the detector you want to delete. If a view icon (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click **OK**.
User Identity Sources

The following topics describe Firepower System user identity sources, which are sources for user awareness. These users can be controlled with identity and access control policies:

- About User Identity Sources, on page 1721
- The User Agent Identity Source, on page 1722
- The ISE Identity Source, on page 1725
- The Terminal Services (TS) Agent Identity Source, on page 1730
- The Captive Portal Identity Source, on page 1731
- The Traffic-Based Detection Identity Source, on page 1742

About User Identity Sources

The following table provides a brief overview of the user identity sources supported by the Firepower System. Each identity source provides a store of users for user awareness. These users can then be controlled with identity and access control policies.

<table>
<thead>
<tr>
<th>User Identity Source</th>
<th>Policy</th>
<th>Server Requirements</th>
<th>Type</th>
<th>Authentication Type</th>
<th>User Awareness?</th>
<th>User Control?</th>
<th>For more information, see...</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Agent</td>
<td>Identity</td>
<td>Microsoft Active Directory</td>
<td>Authoritative logins</td>
<td>Passive</td>
<td>Yes</td>
<td>Yes</td>
<td>The User Agent Identity Source, on page 1722</td>
</tr>
<tr>
<td>ISE</td>
<td>Identity</td>
<td>Microsoft Active Directory</td>
<td>Authoritative logins</td>
<td>Passive</td>
<td>Yes</td>
<td>Yes</td>
<td>The ISE Identity Source, on page 1725</td>
</tr>
</tbody>
</table>
Consider the following when selecting identity sources to deploy:

- You must use traffic-based detection for non-LDAP user logins. For example, if you are using only User Agents to detect user activity, restricting non-LDAP logins has no effect.
- You must use traffic-based detection or captive portal to record failed login or authentication activity. A failed login or authentication attempt does not add a new user to the list of users in the database.
- The captive portal identity source requires a managed device with a routed interface. You cannot use an inline (also referred to as tap mode) interface with captive portal.

Data from those identity sources is stored in the Firepower Management Center's users database and the user activity database. You can configure Firepower Management Center-server user downloads to automatically and regularly download new user data to your databases.

After you configure identity rules using the desired identity source, you must associate each rule with an access control policy and deploy the policy to managed devices for the policy to have any effect. For more information about access control policies and deployment, see User, Realm, and ISE Attribute Conditions (User Control), on page 319.

For general information about user identity in the Firepower System, see About User Identity, on page 1651.

### The User Agent Identity Source

The User Agent is a passive authentication method; it is an authoritative identity source, meaning user information is supplied by a trusted Active Directory server. When integrated with the Firepower System, the

<table>
<thead>
<tr>
<th>User Identity Source</th>
<th>Policy</th>
<th>Server Requirements</th>
<th>Type</th>
<th>Authentication Type</th>
<th>User Awareness?</th>
<th>User Control?</th>
<th>For more information, see...</th>
</tr>
</thead>
<tbody>
<tr>
<td>TS Agent</td>
<td>Identity</td>
<td>Microsoft Windows Terminal Server</td>
<td>Authoritative logins</td>
<td>Passive</td>
<td>Yes</td>
<td>Yes</td>
<td>The Terminal Services (TS) Agent Identity Source, on page 1730</td>
</tr>
<tr>
<td>Captive portal</td>
<td>Identity</td>
<td>LDAP or Microsoft Active Directory</td>
<td>Authoritative logins</td>
<td>Active</td>
<td>Yes</td>
<td>Yes</td>
<td>The Captive Portal Identity Source, on page 1731</td>
</tr>
<tr>
<td>Traffic-based detection</td>
<td>Network discovery</td>
<td>n/a</td>
<td>Non-authoritative logins</td>
<td>n/a</td>
<td>Yes</td>
<td>No</td>
<td>The Traffic-Based Detection Identity Source, on page 1742</td>
</tr>
</tbody>
</table>
user agent monitors users when they log in and out of hosts with Active Directory credentials. The data gained from the User Agent can be used for user awareness and user control.

The user agent associates each user with an IP address, which allows access control rules with user conditions to trigger. You can use one user agent to monitor user activity on up to five Active Directory servers and send encrypted data to up to five Firepower Management Centers.

The User Agent does not report failed login attempts.

### User Agent Guidelines

The User Agent requires a multi-step configuration that includes the following:

- At least one computer with the user agent installed.
- Connections between a Firepower Management Center and the computers or Active Directory servers with the user agent installed.
- An identity realm configured in each Firepower Management Center that receives user data from a user agent.

For detailed information about the multi-step User Agent configuration and a complete discussion of the server requirements, see the Firepower User Agent Configuration Guide.

---

**Note**

Make sure the time on your computer or Active Directory server is synchronized with the time on the Firepower Management Center. If the appliances are not synchronized, the system might perform user timeouts at unexpected intervals.

The Firepower Management Center connection not only allows you to retrieve metadata for the users whose logins and logoffs were detected by User Agents, but also is used to specify the users and groups you want to use in access control rules. If the user agent is configured to exclude specific user names, login data for those user names are not reported to the Firepower Management Center. User agent data is stored in the user database and user activity database on the Firepower Management Center.

---

**Note**

User Agents cannot transmit Active Directory user names ending with the `$` character to the Firepower Management Center. You must remove the final `$` character if you want to monitor these users.

If multiple users are logged into a host using remote sessions, the agent might not detect logins from that host properly. For information about how to prevent this, see the Firepower User Agent Configuration Guide.

### Configure the User Agent for User Control

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Global only</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

For more information about the User Agent, see The User Agent Identity Source, on page 1722.
Before you begin

• Configure and enable an Active Directory realm for your User Agent connection as described in Create a Realm, on page 1776.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Log in to the Firepower Management Center.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Click <strong>System &gt; Integration</strong>.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click the <strong>Identity Sources</strong> tab.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click <strong>User Agent</strong> for the <strong>Service Type</strong> to enable the User Agent connection.</td>
</tr>
</tbody>
</table>

**Note**
To disable the connection, click **None**.

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Click <strong>New Agent</strong> to add a new agent.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 6</td>
<td>Enter the <strong>Hostname</strong> or <strong>Address</strong> of the computer where you plan to install the agent. You must use an IPv4 address; you cannot configure the Firepower Management Center to connect to a User Agent using an IPv6 address.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Click <strong>Add</strong>.</td>
</tr>
<tr>
<td>Step 8</td>
<td>To delete a connection, click the delete icon ( 🗑️ ) and confirm that you want to delete it.</td>
</tr>
</tbody>
</table>

What to do next

• Continue User Agent setup as described in the Firepower User Agent Configuration Guide.

• Configure an identity rule as described in Create an Identity Rule, on page 1783.

• Associate the identity policy with an access control policy as discussed in Associating Other Policies with Access Control, on page 1088.

• Deploy your identity and access control policies to managed devices as discussed in Deploy Configuration Changes, on page 279.

Related Topics

Troubleshoot the User Agent Identity Source

If you experience issues with the User Agent connection, see the Firepower User Agent Configuration Guide.

For related troubleshooting information in this guide, see Troubleshoot Realms and User Downloads, on page 1773 and Troubleshooting User Control, on page 322.

If you experience issues with user data reported by the User Agent, note:

• After the system detects activity from a User Agent user whose data is not yet in the database, the system retrieves information about them from the server. That user's activity is not handled by rules, and is not...
displayed in the web interface until the system successfully retrieves information about them in a user download.

- If you have Firepower Management Center high availability configured and the primary fails, all logins reported by a User Agent cannot be identified during failover downtime, even if the users were previously seen and downloaded to the Firepower Management Center. The unidentified users are logged as Unknown users on the Firepower Management Center. After the downtime, the Unknown users are reidentified and processed according to the rules in your identity policy.

### The ISE Identity Source

You can integrate your Cisco Identity Services Engine (ISE) deployment with the Firepower System to use ISE for passive authentication.

ISE is an authoritative identity source, and provides user awareness data for users who authenticate using Active Directory (AD), LDAP, RADIUS, or RSA. Additionally, you can perform user control on Active Directory users. ISE does not report failed login attempts or the activity of ISE Guest Services users.

#### Note

The Firepower System does not support 802.1x machine authentication alongside Active Directory authentication because the system does not associate machine authentication with users. If you use 802.1x active logins, configure ISE to report only 802.1x active logins (both machine and user). That way, a machine login is reported only once to the system.

For more information on Cisco ISE, see the *Cisco Identity Services Engine Administrator Guide*.

### ISE Guidelines and Limitations

Use the guidelines discussed in this section when configuring ISE with the Firepower System.

#### ISE Version and Configuration Compatibility

Your ISE version and configuration affects its integration and interaction with Firepower, as follows:

- Synchronize the time on the ISE server and the Firepower Management Center. Otherwise, the system might perform user timeouts at unexpected intervals.

- To implement user control using ISE data, configure and enable a realm for the ISE server assuming the pxGrid persona as described in *Create a Realm, on page 1776*.

- If you configure ISE to monitor a large number of user groups, the system might drop user mappings based on groups due to memory limitations. As a result, rules with realm or user conditions might not perform as expected.

- Version 1.3 of ISE does not include support for IPv6-enabled endpoints. With this version of ISE, you cannot gather user identity data or perform remediations on IPv6-enabled endpoints.

- Version 2.0 (patch 4) and later of ISE includes support for IPv6-enabled endpoints.

- If ISE Endpoint Protection Service (EPS) is enabled and configured in your ISE deployment, you can use your ISE connection to run ISE EPS remediations on the source or destination host involved in a correlation policy violation.
If you configured your ISE deployment to update a user's SGT after the user's EPSStatus changes, your ISE EPS remediations also update the SGT on the Firepower Management Center.

For the specific versions of ISE that are compatible with this version of the system, see the Cisco Firepower Compatibility Guide.

Approve clients in ISE

Before a connection between the ISE server and the Firepower Management Center succeeds, you must manually approve the clients in ISE. (Typically, there are two clients: one for the connection test and another for ISE agent.)

You can also enable **Automatically approve new accounts** in ISE as discussed in the chapter on Managing users and external identity sources in the Cisco Identity Services Engine Administrator Guide.

Security Group Tags (SGT)

A Security Group Tag (SGT) specifies the privileges of a traffic source within a trusted network. Cisco ISE and Cisco TrustSec use a feature called Security Group Access (SGA) to apply SGT attributes to packets as they enter the network. These SGTs correspond to a user's assigned security group within ISE or TrustSec. If you configure ISE as an identity source, the Firepower System can use these SGTs to filter traffic.

In some rules, custom SGT conditions can match traffic tagged with SGT attributes that were **not** assigned by ISE. This is not considered user control, and works only if you are not using ISE as an identity source; see Custom SGT Conditions, on page 323.

Endpoint Location (or Location IP)

An Endpoint Location attribute is the IP address of the network device that used ISE to authenticate the user, as identified by ISE.

Endpoint Profile (or Device Type)

An Endpoint Profile attribute is the user's endpoint device type, as identified by ISE.

ISE Attributes

Configuring an ISE connection populates the Firepower Management Center database with ISE attribute data. You can use the following ISE attributes for user awareness and user control.

### Configure ISE for User Control

<table>

<td>If the test fails, click Additional Logs for more information about the connection failure.</td>
</tr>
</tbody>
</table>

**What to do next**

• Specify users to control and other options using an identity policy as described in Create an Identity Policy, on page 1783.

• Associate the identity rule with an access control policy, which filters and optionally inspects traffic, as discussed in Associating Other Policies with Access Control, on page 1088.

• Deploy your identity and access control policies to managed devices as discussed in Deploy Configuration Changes, on page 279.

• Monitor user activity as discussed in Using Workflows, on page 1977.

**Related Topics**

- Troubleshoot the Captive Portal Identity Source, on page 1741
- Trusted Certificate Authority Objects, on page 393
- Internal Certificate Objects, on page 396

**ISE Configuration Fields**

The following fields are used to configure a connection to ISE.
Primary and Secondary Host Name/IP Address

The hostname or IP address for the primary and, optionally, the secondary pxGrid ISE servers. The ports used by the host names you specify must be reachable by both ISE and the Firepower Management Center.

pxGrid Server CA

The certificate authority for the pxGrid framework. If your deployment includes a primary and a secondary pxGrid node, the certificates for both nodes must be signed by the same certificate authority.

MNT Server CA

The certificate authority for the ISE certificate when performing bulk downloads. If your deployment includes a primary and a secondary MNT node, the certificates for both nodes must be signed by the same certificate authority.

FMC Server Certificate

The certificate and key that the Firepower Management Center must provide to ISE when connecting to ISE or performing bulk downloads.

Note

The FMC Server Certificate must include the clientAuth extended key usage value, or it must not include any extended key usage values.

ISE Network Filter

An optional filter you can set to restrict the data that ISE reports to the Firepower Management Center. If you provide a network filter, ISE reports data from the networks within that filter. You can specify a filter in the following ways:

- Leave the field blank to specify any.
- Enter a single IPv4 address block using CIDR notation.
- Enter a list of IPv4 address blocks using CIDR notation, separated by commas.

Note

This version of the Firepower System does not support filtering using IPv6 addresses, regardless of your ISE version.

Related Topics

- Trusted Certificate Authority Objects, on page 393
- Internal Certificate Objects, on page 396

Troubleshoot the ISE Identity Source

For other related troubleshooting information, see Troubleshoot Realms and User Downloads, on page 1773 and Troubleshooting User Control, on page 322.

If you experience issues with the ISE connection, check the following:
• The pxGrid Identity Mapping feature in ISE must be enabled before you can successfully integrate ISE with the Firepower System.

• Before a connection between the ISE server and the Firepower Management Center succeeds, you must manually approve the clients in ISE. (Typically, there are two clients: one for the connection test and another for ISE agent.)

You can also enable **Automatically approve new accounts** in ISE as discussed in the chapter on Managing users and external identity sources in the *Cisco Identity Services Engine Administrator Guide*.

• The **FMC Server Certificate** must include the **clientAuth** extended key usage value, or it must not include any extended key usage values.

• The time on your ISE server must be synchronized with the time on the Firepower Management Center. If the appliances are not synchronized, the system may perform user timeouts at unexpected intervals.

• If your deployment includes a primary and a secondary pxGrid node,
  • The certificates for both nodes must be signed by the same certificate authority.
  • The ports used by the host name must be reachable by both the ISE server and by the Firepower Management Center.

• If your deployment includes a primary and a secondary MNT node, the certificates for both nodes must be signed by the same certificate authority.

• If you updated to Version 6.1.x from Version 6.0.x and you are experiencing issues with your ISE connection, check your pxGrid server certificate. Version 6.1 is compliant with RFC6125-6.4.4, which states that certificate CNs should be ignored if there are SAN values specified. If the pxGrid server certificate in your ISE deployment is configured with a CN value and one or more SAN values, remove the CN value and add it as an additional SAN.

If you experience issues with user data reported by ISE, note the following:

• After the system detects activity from an ISE user whose data is not yet in the database, the system retrieves information about them from the server. Activity seen by the ISE user is **not** handled by access control rules, and is **not** displayed in the web interface until the system successfully retrieves information about them in a user download.

• You cannot perform user control on ISE users who were authenticated by an LDAP, RADIUS, or RSA domain controller.

• The Firepower Management Center does not receive user data for ISE Guest Services users.

• If ISE monitors the same users as TS Agent, the Firepower Management Center prioritizes the TS Agent data. If the TS Agent and ISE report identical activity from the same IP address, only the TS Agent data is logged to the Firepower Management Center.

• Your ISE version and configuration impact how you can use ISE in the Firepower System. For more information, see **The ISE Identity Source, on page 1725**.

If you experience issues with supported functionality, see **The ISE Identity Source, on page 1725** for more information about version compatibility.
The Terminal Services (TS) Agent Identity Source

The TS Agent is a passive authentication method and one of the authoritative identity sources supported by the Firepower System. A Windows Terminal Server performs the authentication, and the TS Agent reports it to a standalone or high availability Firepower Management Center.

When installed on Windows Terminal Servers, the TS Agent assigns a unique port range to individual users as they log in or log out of a monitored network. The Firepower Management Center uses the unique port to identify individual users in the Firepower System. You can use one TS Agent to monitor user activity on one Windows Terminal Server and send encrypted data to a Firepower Management Center.

The TS Agent does not report failed login attempts. The data gained from the TS Agent can be used for user awareness and user control.

TS Agent Guidelines

The TS Agent requires a multi-step configuration, and includes the following:

1. A Windows Terminal Server with the TS Agent installed and configured.
2. One or more identity realms targeting the users your server is monitoring.

You install the TS Agent on a Microsoft Windows Terminal Server. For detailed information about the multi-step TS Agent installation and configuration and a complete discussion of the server and Firepower System requirements, see the Cisco Terminal Services (TS) Agent Guide.

TS Agent data is visible in the Users, User Activity, and Connection Event tables and can be used for user awareness and user control.

Note

If the TS Agent monitors the same users as another passive authentication identity source (the User Agent or ISE), the Firepower Management Center prioritizes the TS Agent data. If the TS Agent and another passive identity source report activity by the same IP address, only the TS Agent data is logged to the Firepower Management Center.

Configure the TS Agent for User Control

To use the TS Agent as an identity source for user awareness and user control, install and configure the TS Agent software as discussed in the Cisco Terminal Services (TS) Agent Guide.

What to do next:

• Specify users to control and other options using an identity policy as described in Create an Identity Policy, on page 1783.

• Associate the identity rule with an access control policy, which filters and optionally inspects traffic, as discussed in Associating Other Policies with Access Control, on page 1088.

• Deploy your identity and access control policies to managed devices as discussed in Deploy Configuration Changes, on page 279.

• Monitor user activity as discussed in Using Workflows, on page 1977.
**Troubleshoot the TS Agent Identity Source**

For other related troubleshooting information, see Troubleshoot Realms and User Downloads, on page 1773 and Troubleshooting User Control, on page 322.

If you experience issues with the TS Agent-Firepower System integration, check the following:

- You must synchronize the time on your TS Agent server with the time on the Firepower Management Center.

- If the TS Agent monitors the same users as another passive authentication identity source (the User Agent or ISE), the Firepower Management Center prioritizes the TS Agent data. If the TS Agent and a passive identity source report activity by the same IP address, only the TS Agent data is logged to the Firepower Management Center.

For complete troubleshooting information, see the *Cisco Terminal Services (TS) Agent Configuration Guide*.

**The Captive Portal Identity Source**

Captive portal is one of the authoritative identity sources supported by the Firepower System. It is the only active authentication method supported by the Firepower System, where users can authenticate onto the network using a managed device.

You typically use captive portal to require authentication to access the internet or to access restricted internal resources; you can optionally configure guest access to resources. After the system authenticates captive portal users, it handles their user traffic according to access control rules. Captive portal performs authentication on HTTP and HTTPS traffic only.

---

**Note**

HTTPS traffic must be decrypted before captive portal can perform authentication.

Captive portal also records failed authentication attempts. A failed attempt does not add a new user to the list of users in the database. The user activity type for failed authentication activity reported by captive portal is *Failed Auth User*.

The authentication data gained from captive portal can be used for user awareness and user control.

**Related Topics**

- How to Configure the Captive Portal for User Control, on page 1733

**Captive Portal Guidelines and Limitations**

When you configure and deploy captive portal in an identity policy, users from specified realms authenticate through the following device to access your network:

- Virtual routers on 7000 and 8000 Series devices
- ASA FirePOWER devices in routed mode running Version 9.5(2) or later
- Firepower Threat Defense devices in routed mode
Routed Interface Required

Captive portal active authentication can be performed only by a device with a routed interface configured. If you are configuring the rule for captive portal and your captive portal device contains inline and routed interfaces, you must configure an Interface Conditions to target only the routed interfaces on the device.

If the identity policy referenced by your access control policy contains one or more captive portal identity rules and you deploy the policy on a Firepower Management Center that manages:

- One or more devices with routed interfaces configured, the policy deployment succeeds and the routed interfaces perform active authentication.

  The system does not validate the type of interface in ASA with FirePOWER devices. If you apply a captive portal policy to an inline (tap mode) interface on an ASA with FirePOWER device, the policy deployment succeeds but users in traffic matching those rules are identified as Unknown.

- One or more NGIPSv devices, the policy deployment fails.

Captive Portal and Policies

You configure captive portal in your identity policy and invoke active authentication in your identity rules. Identity policies are associated with access control policies.

You configure some captive portal identity policy settings on the access control policy's Active Authentication tab page and configure the rest in an identity rule associated with the access control policy.

An active authentication rule has either an Active Authentication rule action, or a Passive Authentication rule action with Use active authentication if passive authentication cannot identify user selected. In each case the system transparently enables or disables SSL decryption, which restarts the Snort process.

Adding the first or removing the last active authentication rule when SSL decryption is disabled (that is, when the access control policy does not include an SSL policy) restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

Caution

Captive Portal Requirements and Limitations

Note the following requirements and limitations:

- The system supports up to 20 captive portal logins per second.

- To use an ASA FirePOWER device (in routed mode and running ASA version 9.5(2) or later) for captive portal, use the captive-portal ASA CLI command to enable captive portal for active authentication and define the port as described in the ASA Firewall Configuration Guide (Version 9.5(2) or later):

- You must allow traffic destined for the IP address and port of the device you plan to use for captive portal.

- To perform captive portal active authentication on HTTPS traffic, you must use an SSL policy to decrypt the traffic from the users you want to authenticate. You cannot decrypt the traffic in the connection
between a captive portal user’s web browser and the captive portal daemon on the managed device; this connection is used to authenticate the captive portal user.

**How to Configure the Captive Portal for User Control**

**Before you begin**

To use the captive portal for active authentication, you must set up an access control policy, an identity policy, an SSL policy, and associate the identity and SSL policies with the access control policy. Finally, you must deploy the policies to managed devices. This topic provides a high-level summary of those tasks.

An example of the entire procedure begins in *Configure the Captive Portal Part 1: Create an Identity Policy*, on page 1734.

Perform the following tasks first:

- Confirm that your Firepower Management Center manages one or more devices with a routed interface configured.
  
  In particular, if your Firepower Management Center manages ASA with FirePOWER devices, see *Captive Portal Guidelines and Limitations*, on page 1731.

- To use encrypted authentication with the captive portal, either create a PKI object or have your certificate data and key available on the machine from which you’re accessing the Firepower Management Center. To create a PKI object, see *PKI Objects*, on page 387.

<table>

</table>

High-level overview of how to control user activity with captive portal:

**Procedure**

**Step 1** Create and enable a realm as discussed in the following topics:

- Create a Realm, on page 1776
- Configure a Realm Directory, on page 1780
- Download Users and Groups, on page 1781

**Step 2** Create an active authentication identity policy for captive portal.

The identity policy enables selected users in your realm access resources after authenticating with the captive portal.

For more information, see *Configure the Captive Portal Part 1: Create an Identity Policy*, on page 1734.

**Step 3** Configure an access control rule for the captive portal that allows traffic on the captive portal port (by default, TCP 885).

You can choose any available TCP port for the captive portal to use. Whatever your choice, you must create a rule that allows traffic on that port.
Step 4  Add another access control rule to allow users in the selected realms to access resources using the captive portal. This enables users to authenticate with captive portal. For more information, see Configure the Captive Portal Part 3: Create a User Access Control Rule, on page 1737.

Step 5  Configure an SSL decrypt - resign policy for the Unknown user so captive portal users can access web pages using the HTTPS protocol. The captive portal can authenticate users only if the HTTPS traffic is decrypted before the traffic is sent to the captive portal. Captive portal is seen by the system as the Unknown user.

For more information, see Configure Captive Portal Part 4: Create an SSL Decrypt-Resign Policy, on page 1737.

Step 6  Associate the identity and SSL policies with the access control policy from step 2. This final step enables the system to authenticate users with the captive portal.

For more information, see Configure Captive Portal Part 5: Associate Identity and SSL Policies with the Access Control Policy, on page 1738.

What to do next

See Configure the Captive Portal Part 1: Create an Identity Policy, on page 1734.

Related Topics

Exclude Applications from Captive Portal, on page 1740
Internal Certificate Objects, on page 396
Troubleshoot the Captive Portal Identity Source, on page 1741
Snort® Restart Scenarios, on page 281

Configure the Captive Portal Part 1: Create an Identity Policy

Before you begin

This five-part procedure shows how to set up the captive portal using the default TCP port 885 and using a Firepower Management Center server certificate for both the captive portal and for SSL decryption. Each part of this example explains one task required to enable the captive portal to perform active authentication.

If you follow all the steps in this procedure, you can configure captive portal to work for users in your domains. You can optionally perform additional tasks, which are discussed in each part of the procedure.

For an overview of the entire procedure, see How to Configure the Captive Portal for User Control, on page 1733.

Procedure

Step 1  Log in to the Firepower Management Center if you have not already done so.

Step 2  Click Policies > Access Control > Identity and create or edit an identity policy.
Step 3  (Optional.) Click Add Category to add a category for the captive portal identity rules and enter a Name for the category.

Step 4  Click the Active Authentication tab.

Step 5  Choose the appropriate Server Certificate from the list or click the add icon ( 🔻 ) to add a certificate.

Step 6  Enter 885 in the Port field and specify the Maximum login attempts.

Step 7  (Optional.) Choose an Active Authentication Response Page as described in Captive Portal Fields, on page 1739.

The following figure shows an example.

![Captive portal](image)

Step 8  Click Save.

Step 9  Click the Rules tab.

Step 10  Click Add Rule to add a new captive portal identity policy rule, or click the edit icon ( 🔻 ) to edit an existing rule.

Step 11  Enter a Name for the rule.

Step 12  From the Action list, choose Active Authentication.

The system can enforce captive portal active authentication on TCP traffic only. If an identity rule Action is Active Authentication (you are using captive portal) or if you are using passive authentication and you check the option on the Realms & Settings tab page to Use active authentication if passive authentication cannot identify user, use TCP ports constraints only.

Step 13  Click the Realm & Settings tab.

Step 14  From the Realms list, choose a realm to use for user authentication.

Step 15  (Optional.) Check Identify as Guest if authentication cannot identify user. For more information, see Captive Portal Fields, on page 1739.

Step 16  Choose an Authentication Type from the list.

Step 17  (Optional.) To exempt specific application traffic from captive portal, see Exclude Applications from Captive Portal, on page 1740.

Step 18  Add conditions to the rule (port, network, and so on) as discussed in Rule Condition Types, on page 294.

Step 19  Click Add.

Step 20  At the top of the page, click Save.
Configure the Captive Portal Part 2: Create a TCP Port Access Control Rule

This part of the procedure shows how to create an access control rule that allows the captive portal to communicate with clients using TCP port 885, which is the captive portal's default port. You can choose another port if you wish, but the port must match the one you chose in Configure the Captive Portal Part 1: Create an Identity Policy, on page 1734.

Before you begin

For an overview of the entire captive portal configuration, see How to Configure the Captive Portal for User Control, on page 1733.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>In the access control policy editor, click Add Rule.</td>

</tr>
<tr>
<td>Step 7</td>
<td>In the Available Users list, choose the users to add to the rule and click Add to Rule.</td>
</tr>
<tr>
<td>Step 8</td>
<td>(Optional.) Add conditions to the access control policy as discussed in Rule Condition Types, on page 294.</td>
</tr>
<tr>
<td>Step 9</td>
<td>Click Add.</td>
</tr>
<tr>
<td>Step 10</td>
<td>On the access control rule page, click Save.</td>
</tr>
<tr>
<td>Step 11</td>
<td>In the policy editor, set the rule position. Click and drag or use the right-click menu to cut and paste. Rules are numbered starting at 1. The system matches traffic to rules in top-down order by ascending rule number. The first rule that traffic matches is the rule that handles that traffic. Proper rule order reduces the resources required to process network traffic and prevents rule preemption.</td>
</tr>
</tbody>
</table>

What to do next

Continue with Configure Captive Portal Part 4: Create an SSL Decrypt-Resign Policy, on page 1737.

Configure Captive Portal Part 4: Create an SSL Decrypt-Resign Policy

This part of the procedure discusses how to create an SSL access policy to decrypt and resign traffic before the traffic reaches the captive portal. The captive portal can authenticate traffic only after it has been decrypted.

Before you begin

For an overview of the entire captive portal configuration, see How to Configure the Captive Portal for User Control, on page 1733.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>If you haven't done so already, create a certificate object to decrypt SSL traffic as discussed in PKI Objects, on page 387.</td>
</tr>
</tbody>
</table>
Step 2  Click Policies > Access Control > SSL.
Step 3  Click New Policy.
Step 4  Enter a Name and choose a Default Action for the policy. Default actions are discussed in SSL Policy Default Actions, on page 1186.
Step 5  Click Save.
Step 6  Click Add Rule.
Step 7  Enter a Name for the rule.
Step 8  From the Action list, choose Decrypt - Resign.
Step 9  From the with list, choose your PKI object.
Step 10 Click the Users tab.
Step 11 Above the Available Realms list, click (refresh).
Step 12 In the Available Realms list, click Special Identities.
Step 13 In the Available Users list, click Unknown.
Step 14 Click Add to Rule.
The following figure shows an example.
Step 15 (Optional.) Set other options as discussed in SSL Rule Conditions, on page 1199.
Step 16 Click Add.
Step 17 At the top of the page, click Save.

What to do next
Continue with Configure Captive Portal Part 5: Associate Identity and SSL Policies with the Access Control Policy, on page 1738.

Configure Captive Portal Part 5: Associate Identity and SSL Policies with the Access Control Policy

This part of the procedure discusses how to associate the identity policy and SSL Decrypt - Resign rule with the access control policy you created earlier. After this, users can authenticate using the captive portal.

Before you begin
For an overview of the entire captive portal configuration, see How to Configure the Captive Portal for User Control, on page 1733.
Procedure

Step 1  Click Policies > Access Control > Access Control and edit the access control policy you created as discussed in Configure the Captive Portal Part 2: Create a TCP Port Access Control Rule, on page 1736. If a view icon ( ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 2  Either create a new access control policy or edit an existing policy.

Step 3  At the top of the page, click the link next to Identity Policy.

Step 4  From the list, choose the name of your identity policy and, at the top of the page, click Save.

Step 5  Repeat the preceding steps to associate your captive portal SSL policy with the access control policy.

Step 6  If you haven't done so already, target the policy at managed devices as discussed in Setting Target Devices for an Access Control Policy, on page 1086.

What to do next

- Deploy your identity and access control policies to managed devices as discussed in Deploy Configuration Changes, on page 279.

- Monitor user activity as discussed in Using Workflows, on page 1977.

Captive Portal Fields

Use the following fields to configure captive portal on the Active Authentication tab of your identity policy. See also Identity Rule Fields, on page 1784.

Server Certificate

The server certificate presented by the captive portal daemon.

Port

The port number to use for the captive portal connection. If you plan to use an ASA FirePOWER device for captive portal, the port number in this field must match the port number you configured on the ASA FirePOWER device using the captive-portal CLI command.

Maximum login attempts

The maximum allowed number of failed login attempts before the system denies a user's login request.

Active Authentication Response Page

The system-provided or custom HTTP response page you want to display to captive portal users. After you select an Active Authentication Response Page in your identity policy active authentication settings, you also must configure one or more identity rules with HTTP Response Page as the Authentication Type.

The system-provided HTTP response page includes Username and Password fields, as well as a Login as guest button to allow users to access the network as guests. To display a single login method, configure a custom HTTP response page.

Choose the following options:
Exclude Applications from Captive Portal

- To use a generic response, click **System-provided**. You can click the view icon (اظهار) to view the HTML code for this page.

- To create a custom response, click **Custom**. A window with system-provided code is displayed that you can replace or modify. When you are done, save your changes. You can edit a custom page by clicking the edit icon (لاصق).

**Related Topics**

### Exclude Applications from Captive Portal

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any, except NGIPSv</td>
<td>Any</td>
<td>Administrator, Access Admin, Network Admin</td>
</tr>
</tbody>
</table>

You can select applications (identified by their HTTP User-Agent strings) and exempt them from captive portal active authentication. This allows traffic from the selected applications to pass through the identity policy without authenticating.

**Note**

Only applications with the **User-Agent Exclusion Tag** are displayed in this list.

**Procedure**

**Step 1**

On the **Realm & Settings** tab of the identity rule editor page, use Cisco-provided filters in the **Application Filters** list to narrow the list of applications you want to add to the filter:

- Click the arrow next to each filter type to expand and collapse the list.

- Right-click a filter type and click **Check All** or **Uncheck All**. Note that the list indicates how many filters you have selected of each type.

- To narrow the filters that appear, type a search string in the **Search by name** field; this is especially useful for categories and tags. To clear the search, click the clear icon (حذف).

- To refresh the filters list and clear any selected filters, click the reload icon (إعادة).

- To clear all filters and search fields, click **Clear All Filters**.

**Note**

The list displays 100 applications at a time.

**Step 2**

Choose the applications that you want to add to the filter from the **Available Applications** list:

- To narrow the individual applications that appear, enter a search string in the **Search by name** field. To clear the search, click the clear icon (حذف).

- Use the paging icons at the bottom of the list to browse the list of individual available applications.
To refresh the applications list and clear any selected applications, click the reload icon ( ).

**Step 3**

Add the selected applications to exclude from external authentication. You can click and drag, or you can click **Add to Rule**. The result is the combination of the application filters you selected.

---

**What to do next**

- Continue configuring the identity rule as described in Create an Identity Rule, on page 1783.

---

**Troubleshoot the Captive Portal Identity Source**

For other related troubleshooting information, see Troubleshoot Realms and User Downloads, on page 1773 and Troubleshooting User Control, on page 322.

If you experience issues with captive portal, check the following:

- The time on your captive portal server must be synchronized with the time on the Firepower Management Center.

- If you have DNS resolution configured and you create an identity rule to perform **Kerberos** (or **HTTP Negotiate**, if you want Kerberos as an option) captive portal, you must configure your DNS server to resolve the fully qualified domain name (FQDN) of the captive portal device. The FQDN must match the hostname you provided when configuring DNS.

For ASA with FirePOWER Services and Firepower Threat Defense devices, the FQDN must resolve to the IP address of the routed interface used for captive portal.

- If you select **Kerberos** (or **HTTP Negotiate**, if you want Kerberos as an option) as the **Authentication Type** in an identity rule, the **Realm** you select must be configured with an **AD Join Username** and **AD Join Password** in order to perform Kerberos captive portal active authentication.

- If you select **HTTP Basic** as the **Authentication Type** in an identity rule, users on your network may not notice their sessions time out. Most web browsers cache the credentials from **HTTP Basic** logins and use the credentials to seamlessly begin a new session after an old session times out.

- If the connection between your Firepower Management Center and a managed device fails, no captive portal logins reported by the device can be identified during the downtime unless the users were previously seen and downloaded to the Firepower Management Center. The unidentified users are logged as Unknown users on the Firepower Management Center. After the downtime, the Unknown users are reidentified and processed according to the rules in your identity policy.

- If the device you want to use for captive portal contains both inline and routed interfaces, you must configure a zone condition in your captive portal identity rules to target only the routed interfaces on the captive portal device.

- The system does not validate the type of interface in ASA with FirePOWER devices. If you apply a captive portal policy to an inline (tap mode) interface on an ASA with FirePOWER device, the policy deployment succeeds but users in traffic matching those rules are identified as Unknown.
The Traffic-Based Detection Identity Source

Traffic-based detection is the only non-authoritative identity source supported by the Firepower System. When configured, managed devices detect LDAP, AIM, POP3, IMAP, Oracle, SIP (VoIP), FTP, HTTP, MDNS, and SMTP logins on the networks you specify. The data gained from traffic-based detection can be used only for user awareness. Unlike authoritative identity sources, you configure traffic-based detection in your network discovery policy as described in Configuring Traffic-Based User Detection, on page 1756.

Note the following limitations:

- Traffic-based detection interprets only Kerberos logins for LDAP connections as LDAP authentications. Managed devices cannot detect encrypted LDAP authentications using protocols such as SSL or TLS.
- Traffic-based detection detects AIM logins using the OSCAR protocol only. They cannot detect AIM logins using TOC2.
- Traffic-based detection cannot restrict SMTP logging. This is because users are not added to the database based on SMTP logins; although the system detects SMTP logins, the logins are not recorded unless there is already a user with a matching email address in the database.

Traffic-based detection also records failed login attempts. A failed login attempt does not add a new user to the list of users in the database. The user activity type for detected failed login activity detected by traffic-based detection is Failed User Login.

**Note**

The system cannot distinguish between failed and successful HTTP logins. To see HTTP user information, you must enable Capture Failed Login Attempts in the traffic-based detection configuration.

**Caution**

Enabling or disabling non-authoritative, traffic-based user detection over the HTTP, FTP, or MDNS protocols, using the network discovery policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

**Traffic-Based Detection Data**

When a device detects a login using traffic-based detection, it sends the following information to the Firepower Management Center to be logged as user activity:

- the user name identified in the login
- the time of the login
- the IP address involved in the login, which can be the IP address of the user’s host (for LDAP, POP3, IMAP, and AIM logins), the server (for HTTP, MDNS, FTP, SMTP and Oracle logins), or the session originator (for SIP logins)
- the user’s email address (for POP3, IMAP, and SMTP logins)
- the name of the device that detected the login
If the user was previously detected, the Firepower Management Center updates that user’s login history. Note that the Firepower Management Center can use the email addresses in POP3 and IMAP logins to correlate with LDAP users. This means that, for example, if the Firepower Management Center detects a new IMAP login, and the email address in the IMAP login matches that for an existing LDAP user, the IMAP login does not create a new user; rather, it updates the LDAP user’s history.

If the user was previously undetected, the Firepower Management Center adds the user to the users database. Unique AIM, SIP, and Oracle logins always create new user records, because there is no data in those login events that the Firepower Management Center can correlate with other login types.

The Firepower Management Center does not log user activity or user identities in the following cases:

- if you configured the network discovery policy to ignore that login type
- if a managed device detects an SMTP login, but the users database does not contain a previously detected LDAP, POP3, or IMAP user with a matching email address

The user data is added to the users table.

**Traffic-Based Detection Strategies**

You can restrict the protocols where user activity is discovered to reduce the total number of detected users so you can focus on users likely to provide the most complete user information. Limiting protocol detection helps minimize user name clutter and preserve storage space on your Firepower Management Center.

Consider the following when selecting traffic-based detection protocols:

- Obtaining user names through protocols such as AIM, POP3, and IMAP may introduce user names not relevant to your organization due to network access from contractors, visitors, and other guests.

- AIM, Oracle, and SIP logins may create extraneous user records. This occurs because these login types are not associated with any of the user metadata that the system obtains from an LDAP server, nor are they associated with any of the information contained in the other types of login that your managed devices detect. Therefore, the Firepower Management Center cannot correlate these users with other types of users.

The Traffic-Based Detection Identity Source
Network Discovery Policies

The following topics describe how to create, configure, and manage network discovery policies:

- Overview: Network Discovery Policies, on page 1745
- Network Discovery Customization, on page 1746
- Network Discovery Rules, on page 1747
- Configuring Advanced Network Discovery Options, on page 1757
- Troubleshooting Your Network Discovery Strategy, on page 1767

Overview: Network Discovery Policies

The network discovery policy on the Firepower Management Center controls how the system collects data on your organization’s network assets and which network segments and ports are monitored.

In a multidomain deployment, each leaf domain has an independent network discovery policy. Network discovery policy rules and other settings cannot be shared, inherited, or copied between domains. Whenever you create a new domain, the system creates a network discovery policy for the new domain, using default settings. You must explicitly apply any desired customizations to the new policy.

Discovery rules within the policy specify which networks and ports the Firepower System monitors to generate discovery data based on network data in traffic, and the zones to which the policy is deployed. Within a rule, you can configure whether hosts, applications, and non-authoritative users are discovered. You can create rules to exclude networks and zones from discovery. You can configure discovery of data from NetFlow exporters and restrict the protocols for traffic where user data is discovered on your network.

The network discovery policy has a single default rule in place, configured to discover applications from all observed traffic. The rule does not exclude any networks, zones, or ports, host and user discovery is not configured, and the rule is not configured to monitor a NetFlow exporter. This policy is deployed by default to any managed devices when they are registered to the Firepower Management Center. To begin collecting host or user data, you must add or modify discovery rules and re-deploy the policy to a device.

If you want to adjust the scope of network discovery, you can create additional discovery rules and modify or remove the default rule.

Remember that the access control policy for each managed device defines the traffic that you permit for that device and, therefore, the traffic you can monitor with network discovery. If you block certain traffic using access control, the system cannot examine that traffic for host, user, or application activity. For example, if an access control policy blocks access to social networking applications, the system cannot provide any discovery data on those applications.
If you enable traffic-based user detection in your discovery rules, you can detect non-authoritative users through user login activity in traffic over a set of application protocols. You can disable discovery in particular protocols across all rules if needed. Disabling some protocols can help avoid reaching the user limit associated with your Firepower Management Center model, reserving available user count for users from the other protocols.

Advanced network discovery settings allow you to manage what data is logged, how discovery data is stored, what indications of compromise (IOC) rules are active, what vulnerability mappings are used for impact assessment, and what happens when sources offer conflicting discovery data. You can also add sources for host input and NetFlow exporters to monitor.

**Network Discovery Customization**

The information about your network traffic collected by the Firepower System is most valuable to you when the system can correlate this information to identify the hosts on your network that are most vulnerable and most important.

As an example, if you have several devices on your network running a customized version of SuSE Linux, the system cannot identify that operating system and so cannot map vulnerabilities to the hosts. However, knowing that the system has a list of vulnerabilities for SuSE Linux, you may want to create a custom fingerprint for one of the hosts that can then be used to identify the other hosts running the same operating system. You can include a mapping of the vulnerability list for SuSE Linux in the fingerprint to associate that list with each host that matches the fingerprint.

The system also allows you to input host data from third-party systems directly into the network map, using the host input feature. However, third-party operating system or application data does not automatically map to vulnerability information. If you want to see vulnerabilities and perform impact correlation for hosts using third-party operating system, server, and application protocol data, you must map the vendor and version information from the third-party system to the vendor and version listed in the vulnerability database (VDB). You also may want to maintain the host input data on an ongoing basis. Note that even if you map application data to Firepower System vendor and version definitions, imported third-party vulnerabilities are not used for impact assessment for clients or web applications.

If the system cannot identify application protocols running on hosts on your network, you can create user-defined application protocol detectors that allow the system to identify the applications based on a port or a pattern. You can also import, activate, and deactivate certain application detectors to further customize the application detection capability of the Firepower System.

You can also replace detection of operating system and application data using scan results from the Nmap active scanner or augment the vulnerability lists with third-party vulnerabilities. The system may reconcile data from multiple sources to determine the identity for an application.

**Configuring the Network Discovery Policy**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, each domain has a separate network discovery policy. If your user account can manage multiple domains, switch to the leaf domain where you want to configure the policy.
**Procedure**

**Step 1**

Choose Policies > Network Discovery.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2**

Configure the following components of your policy:

- Discovery rules — See Configuring Network Discovery Rules, on page 1748.
- Traffic-based detection for users — See Configuring Traffic-Based User Detection, on page 1756.
- Advanced network discovery options — See Configuring Advanced Network Discovery Options, on page 1757.
- Custom operating system definitions (fingerprints) — See Creating a Custom Fingerprint for Clients, on page 1662 and Creating a Custom Fingerprint for Servers, on page 1664.

---

**Network Discovery Rules**

Network discovery rules allow you to tailor the information discovered for your network map to include only the specific data you want. Rules in your network discovery policy are evaluated sequentially. You can create rules with overlapping monitoring criteria, but doing so may affect your system performance.

When you exclude a host or a network from monitoring, the host or network does not appear in the network map and no events are reported for it. Cisco recommends that you exclude load balancers (or specific ports on load balancers) and NAT devices from monitoring. These devices may create excessive and misleading events, filling the database and overloading the Firepower Management Center. For example, a monitored NAT device might exhibit multiple updates of its operating system in a short period of time. If you know the IP addresses of your load balancers and NAT devices, you can exclude them from monitoring.

Tip

The system can identify many load balancers and NAT devices by examining your network traffic.

In addition, if you need to create a custom server fingerprint, you should temporarily exclude from monitoring the IP address that you are using to communicate with the host you are fingerprinting. Otherwise, the network map and discovery event views will be cluttered with inaccurate information about the host represented by that IP address. After you create the fingerprint, you can configure your policy to monitor that IP address again.

Cisco also recommends that you **not** monitor the same network segment with NetFlow exporters and Firepower System managed devices. Although ideally you should configure your network discovery policy with non-overlapping rules, the system does drop duplicate connection logs generated by managed devices. However, you **cannot** drop duplicate connection logs for connections detected by both a managed device and a NetFlow exporter.
Configuring Network Discovery Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery/Leafonly</td>
</tr>
</tbody>
</table>

You can configure discovery rules to tailor the discovery of host and application data to your needs.

**Before you begin**

- Make sure you are logging connections for the traffic where you want to discover network data; see [Connection Logging Strategies](#), on page 2038.
- If you want to collect exported NetFlow records, add a NetFlow Exporter as described in [Adding NetFlow Exporters to a Network Discovery Policy](#), on page 1763.

**Procedure**

**Step 1** Choose Policies > Network Discovery.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2** Click Add Rule.

**Step 3** Set the Action for the rule as described in Actions and Discovered Assets, on page 1748.

**Step 4** Set optional discovery parameters:

- Restrict the rule action to specific networks; see Restricting the Monitored Network, on page 1750.
- Restrict the rule action to traffic in specific zones; see Configuring Zones in Network Discovery Rules, on page 1754.
- Exclude ports from monitoring; see Excluding Ports in Network Discovery Rules, on page 1752.
- Configure the rule for NetFlow data discovery; see Configuring Rules for NetFlow Data Discovery, on page 1750.

**Step 5** Click Save.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Actions and Discovered Assets**

When you configure a discovery rule, you must select an action for the rule. The effect of that action depends on whether you are using the rule to discover data from a managed device or from a NetFlow exporter.

The following table describes what assets are discovered by rules with the specified action settings in those two scenarios.
### Table 220: Discovery Rule Actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Managed Device</th>
<th>NetFlow Exporter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exclude</td>
<td>Excludes the specified network from monitoring. If the source or destination host for a connection is excluded from discovery, the connection is recorded but discovery events are not created for excluded hosts.</td>
<td>Excludes the specified network from monitoring. If the source or destination host for a connection is excluded from discovery, the connection is recorded but discovery events are not created for excluded hosts.</td>
</tr>
<tr>
<td>Discover: Hosts</td>
<td>Adds hosts to the network map based on discovery events. (Optional, unless user discovery is enabled, then required.)</td>
<td>Adds hosts to the network map and logs connections based on NetFlow records. (Required)</td>
</tr>
<tr>
<td>Discover: Applications</td>
<td>Adds applications to the network map based on application detectors. Note that you cannot discover hosts or users in a rule without also discovering applications. (Required)</td>
<td>Adds application protocols to the network map based on NetFlow records and the port-application protocol correlation in /etc/sf/services. (Optional)</td>
</tr>
<tr>
<td>Discover: Users</td>
<td>Adds users to the users table and logs user activity based on traffic-based detection on the user protocols configured in the network discovery policy. (Optional)</td>
<td>n/a</td>
</tr>
<tr>
<td>Log NetFlow Connections</td>
<td>n/a</td>
<td>Logs NetFlow connections only. Does not discover hosts or applications.</td>
</tr>
</tbody>
</table>

If you want the rule to monitor managed device traffic, application logging is required. If you want the rule to monitor users, host logging is required. If you want the rule to monitor exported NetFlow records, you cannot configure it to log users, and logging applications is optional.

**Note**

The system detects connections in exported NetFlow records based on the **Action** settings in the network discovery policy. The system detects connections in managed device traffic based on access control policy settings.

### Monitored Networks

A discovery rule causes discovery of monitored assets only in traffic to and from hosts in the specified networks. For a discovery rule, discovery occurs for connections that have at least one IP address within the networks specified, with events generated only for IP addresses within the networks to monitor. The default discovery rule discovers applications from all observed traffic (0.0.0.0/0 for all IPv4 traffic, and ::/0 for all IPv6 traffic).

If you configure a rule to handle NetFlow discovery and log only connections data, the system also logs connections to and from IP addresses in the specified networks. Note that network discovery rules provide the only way to log NetFlow network connections.

You can also use network object or object groups to specify the networks to monitor.
Restricting the Monitored Network

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

Every discovery rule must include at least one network.

**Procedure**

**Step 1** Choose **Policies > Network Discovery**.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2** Click **Add Rule**.

**Step 3** Click the **Networks** tab, if it is not already open.

**Step 4** Optionally, add network objects to the Available Networks list as described in **Creating Network Objects During Discovery Rule Configuration**, on page 1751.

**Note** If you modify a network object used in the network discovery policy, the changes do not take effect for discovery until you deploy the configuration changes.

**Step 5** Specify a network:

- Choose a network from the **Available Networks** list.

  **Tip** If the network does not immediately appear on the list, click the reload icon (ıld).

- Enter the IP address into the text box below the Available Networks label.

**Step 6** Click **Add**.

**Step 7** Optionally, repeat the previous two steps to add additional networks.

**Step 8** Click **Save** to save the changes you made.

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

**Configuring Rules for NetFlow Data Discovery**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

The Firepower System can use data from NetFlow exporters to generate connection and discovery events, and to add host and application data to the network map.
If you choose a NetFlow exporter in a discovery rule, the rule is limited to discovery of NetFlow data for the specified networks. Choose the NetFlow device to monitor before you configure other aspects of rule behavior, as the available rule actions change when you choose a NetFlow device. You cannot configure port exclusions for monitoring NetFlow exporters.

**Before you begin**

- Add NetFlow-enabled devices to the network discovery policy; see Adding NetFlow Exporters to a Network Discovery Policy, on page 1763.

**Procedure**

**Step 1** Choose **Policies > Network Discovery**.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2** Click **Add Rule**.

**Step 3** Choose the **NetFlow Device** tab.

**Step 4** From the **Netflow Device** drop-down list, choose the IP address of the NetFlow exporter to be monitored.

**Step 5** Specify the type of NetFlow data you want the Firepower System managed device to collect:

- Connection only — Choose **Log NetFlow Connections** from the **Action** drop-down list.
- Host, Application, and Connection — Choose **Discover** from the **Action** drop-down list. The system automatically checks the **Hosts** check box and enables collection of connection data. Optionally, you can check the **Application** check box to collect application data.

**Step 6** Click **Save**.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Creating Network Objects During Discovery Rule Configuration**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

You can add new network objects to the list of available networks that appears in a discovery rule by adding them to the list of reusable network objects and groups.

**Procedure**

**Step 1** Choose **Policies > Network Discovery**.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2** In the **Networks** tab, click **Add Rule**.
Step 3 Click the add icon (➕) next to Available Networks.
Step 4 Create a network object as described in Creating Network Objects, on page 346.
Step 5 Finish adding the network discovery rule as described in Configuring Network Discovery Rules, on page 1748.

Port Exclusions

Just as you can exclude hosts from monitoring, you can exclude specific ports from monitoring. For example:

• Load balancers can report multiple applications on the same port in a short period of time. You can configure your network discovery rules so that they exclude that port from monitoring, such as excluding port 80 on a load balancer that handles a web farm.

• Your organization may use a custom client that uses a specific range of ports. If the traffic from this client generates excessive and misleading events, you can exclude those ports from monitoring. Similarly, you may decide that you do not want to monitor DNS traffic. In that case, you could configure your rules so that your discovery policy does not monitor port 53.

When adding ports to exclude, you can decide whether to use a reusable port object from the Available Ports list, add ports directly to the source or destination exclusion lists, or create a new reusable port and then move it into the exclusion lists.

Note You cannot exclude ports in rules handling NetFlow data discovery.

Excluding Ports in Network Discovery Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

You cannot exclude ports in rules handling NetFlow data discovery.

Procedure

Step 1 Choose Policies > Network Discovery.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 2 Click Add Rule.

Step 3 Click the Port Exclusions tab.

Step 4 Optionally, add port objects to the Available Ports list as described in Creating Port Objects During Discovery Rule Configuration, on page 1753.

Step 5 Exclude specific source ports from monitoring, using either of the following methods:

• Choose a port or ports from the Available Ports list and click Add to Source.

• To exclude traffic from a specific source port without adding a port object, under the Selected Source Ports list, choose a Protocol, enter a Port number (a value from 1 to 65535), and click Add.
Step 6 Excludes specific destination ports from monitoring, using either of the following methods:

- Choose a port or ports from the Available Ports list and click Add to Destination.
- To exclude traffic from a specific destination port without adding a port object, under the Selected Destination Ports list, choose a Protocol, enter a Port number, and click Add.

Step 7 Click Save to save the changes you made.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Creating Port Objects During Discovery Rule Configuration

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

You can add new port objects to the list of available ports that appears in a discovery rule by adding them to the list of reusable port objects and groups that can be used anywhere in the Firepower System.

Procedure

Step 1 Choose Policies > Network Discovery.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 2 In the Networks tab, click Add Rule.

Step 3 Click Port Exclusions.

Step 4 To add a port to the Available Ports list, click the add object icon ( ).

Step 5 Supply a Name.

Step 6 In the Protocol field, specify the protocol of the traffic you want to exclude.

Step 7 In the Port field, enter the ports you want to exclude from monitoring.

You can specify a single port, a range of ports using the dash (-), or a comma-separated list of ports and port ranges. Allowed port values are from 1 to 65535.

Step 8 Click Save.

Step 9 If the port does not immediately appear on the list, click the refresh icon ( ).

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.
Zones in Network Discovery Rules

To improve performance, discovery rules can be configured so that the zones in the rule include the sensing interfaces on your managed devices that are physically connected to the networks-to-monitor in the rule.

Unfortunately, you may not always be kept informed of network configuration changes. A network administrator may modify a network configuration through routing or host changes without informing you, which may make it challenging to stay on top of proper network discovery policy configurations. If you do not know how the sensing interfaces on your managed devices are physically connected to your network, leave the zone configuration as the default. This default causes the system to deploy the discovery rule to all zones in your deployment. (If no zones are excluded, the system deploy the discovery policy to all zones.)

Configuring Zones in Network Discovery Rules

<table>
<thead>

</table>

Procedure

Step 1 Choose Policies > Network Discovery.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 2 Click Add Rule.

Step 3 Click the Zones tab.

Step 4 Choose a zone or zones from the Available Zones list.

Step 5 Click Save to save the changes you made.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

The Traffic-Based Detection Identity Source

Traffic-based detection is the only non-authoritative identity source supported by the Firepower System. When configured, managed devices detect LDAP, AIM, POP3, IMAP, Oracle, SIP (VoIP), FTP, HTTP, MDNS, and SMTP logins on the networks you specify. The data gained from traffic-based detection can be used only for user awareness. Unlike authoritative identity sources, you configure traffic-based detection in your network discovery policy as described in Configuring Traffic-Based User Detection, on page 1756.

Note the following limitations:

- Traffic-based detection interprets only Kerberos logins for LDAP connections as LDAP authentications. Managed devices cannot detect encrypted LDAP authentications using protocols such as SSL or TLS.

- Traffic-based detection detects AIM logins using the OSCAR protocol only. They cannot detect AIM logins using TOC2.
• Traffic-based detection cannot restrict SMTP logging. This is because users are not added to the database based on SMTP logins; although the system detects SMTP logins, the logins are not recorded unless there is already a user with a matching email address in the database.

Traffic-based detection also records failed login attempts. A failed login attempt does not add a new user to the list of users in the database. The user activity type for detected failed login activity detected by traffic-based detection is **Failed User Login**.

---

**Note**

The system cannot distinguish between failed and successful HTTP logins. To see HTTP user information, you must enable **Capture Failed Login Attempts** in the traffic-based detection configuration.

---

**Caution**

Enabling or disabling non-authoritative, traffic-based user detection over the HTTP, FTP, or MDNS protocols, using the network discovery policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See **Snort® Restart Traffic Behavior, on page 282** for more information.

---

**Traffic-Based Detection Data**

When a device detects a login using traffic-based detection, it sends the following information to the Firepower Management Center to be logged as user activity:

• the username identified in the login
• the time of the login
• the IP address involved in the login, which can be the IP address of the user’s host (for LDAP, POP3, IMAP, and AIM logins), the server (for HTTP, MDNS, FTP, SMTP and Oracle logins), or the session originator (for SIP logins)
• the user’s email address (for POP3, IMAP, and SMTP logins)
• the name of the device that detected the login

If the user was previously detected, the Firepower Management Center updates that user’s login history. Note that the Firepower Management Center can use the email addresses in POP3 and IMAP logins to correlate with LDAP users. This means that, for example, if the Firepower Management Center detects a new IMAP login, and the email address in the IMAP login matches that for an existing LDAP user, the IMAP login does not create a new user; rather, it updates the LDAP user’s history.

If the user was previously undetected, the Firepower Management Center adds the user to the users database. Unique AIM, SIP, and Oracle logins always create new user records, because there is no data in those login events that the Firepower Management Center can correlate with other login types.

The Firepower Management Center does **not** log user activity or user identities in the following cases:

• if you configured the network discovery policy to ignore that login type
• if a managed device detects an SMTP login, but the users database does not contain a previously detected LDAP, POP3, or IMAP user with a matching email address
The user data is added to the users table.

**Traffic-Based Detection Strategies**

You can restrict the protocols where user activity is discovered to reduce the total number of detected users so you can focus on users likely to provide the most complete user information. Limiting protocol detection helps minimize user name clutter and preserve storage space on your Firepower Management Center.

Consider the following when selecting traffic-based detection protocols:

- Obtaining user names through protocols such as AIM, POP3, and IMAP may introduce user names not relevant to your organization due to network access from contractors, visitors, and other guests.

- AIM, Oracle, and SIP logins may create extraneous user records. This occurs because these login types are not associated with any of the user metadata that the system obtains from an LDAP server, nor are they associated with any of the information contained in the other types of login that your managed devices detect. Therefore, the Firepower Management Center cannot correlate these users with other types of users.

</tbody>
</table>

When you enable traffic-based user detection in a network discovery rule, host discovery is automatically enabled. For more information about traffic-based detection, see [The Traffic-Based Detection Identity Source](#), on page 1742.

**Procedure**

---

**Step 1** Choose Policies > Network Discovery.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2** Click Users.

**Step 3** Click the edit icon (-pencil).

**Step 4** Check the check boxes for protocols where you want to detect logins or clear check boxes for protocols where you do not want to detect logins.

**Step 5** Optionally, to record failed login attempts detected in LDAP, POP3, FTP, or IMAP traffic, or to capture user information for HTTP logins, enable Capture Failed Login Attempts.

**Step 6** Click Save.
What to do next

**Caution**
Enabling or disabling non-authoritative, traffic-based user detection over the HTTP, FTP, or MDNS protocols, using the network discovery policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

- Configure network discovery rules to discover users as described in Configuring Network Discovery Rules, on page 1748.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

### Configuring Advanced Network Discovery Options

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

The Advanced tab of the network discovery policy allows you to configure policy-wide settings for what events are detected, how long discovery data is retained and how often it is updated, what vulnerability mappings are used for impact correlation, and how operating system and server identity conflicts are resolved. In addition, you can add host input sources and NetFlow exporters to allow import of data from other sources.

**Note**
Database event limits for discovery and user activity events are set in system configuration.

**Procedure**

**Step 1**
Choose Policies > Network Discovery.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2**
Click Advanced.

**Step 3**
Click the edit icon (📝) or add icon (➕) next to the setting you want to modify:

- **Data Storage Settings** — Update the settings as described in Configuring Network Discovery Data Storage, on page 1765.
- **Event Logging Settings** — Update the settings as described in Configuring Network Discovery Event Logging, on page 1765.
- **General Settings** — Update the settings as described in Configuring Network Discovery General Settings, on page 1758.
- **Identity Conflict Settings** — Update the settings as described in Configuring Network Discovery Identity Conflict Resolution, on page 1760.
• Indications of Compromise Settings — Update the settings as described in Enabling Indications of Compromise Rules, on page 1762.
• NetFlow Exporters — Update the settings as described in Adding NetFlow Exporters to a Network Discovery Policy, on page 1763.
• OS and Server Identity Sources — Update the settings as described in Adding Network Discovery OS and Server Identity Sources, on page 1766.
• Vulnerabilities to use for Impact Assessment — Update the settings as described in Enabling Network Discovery Vulnerability Impact Assessment, on page 1761.

Step 4  Click Save.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Network Discovery General Settings

The general settings control how often the system updates network maps and whether server banners are captured during discovery.

Capture Banners

Select this check box if you want the system to store header information from network traffic that advertises server vendors and versions (“banners”). This information can provide additional context to the information gathered. You can access server banners collected for hosts by accessing server details.

Update Interval

The interval at which the system updates information (such as when any of a host’s IP addresses was last seen, when an application was used, or the number of hits for an application). The default setting is 3600 seconds (1 hour).

Note that setting a lower interval for update timeouts provides more accurate information in the host display, but generates more network events.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2**  
Click Advanced.

**Step 3**  
Click the edit icon (⋮) next to General Settings.

**Step 4**  
Update the settings as described in Network Discovery General Settings, on page 1758.

**Step 5**  
Click Save to save the general settings.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

---

**Network Discovery Identity Conflict Settings**

The system determines which operating system and applications are running on a host by matching fingerprints for operating systems and servers against patterns in traffic. To provide the most reliable operating system and server identity information, the system collates fingerprint information from several sources.

The system uses all passive data to derive operating system identities and assign a confidence value.

By default, unless there is an identity conflict, identity data added by a scanner or third-party application overrides identity data detected by the Firepower System. You can use the Identity Sources settings to rank scanner and third-party application fingerprint sources by priority. The system retains one identity for each source, but only data from the highest priority third-party application or scanner source is used as the current identity. Note, however, that user input data overrides scanner and third-party application data regardless of priority.

An identity conflict occurs when the system detects an identity that conflicts with an existing identity that came from either the active scanner or third-party application sources listed in the Identity Sources settings or from a Firepower System user. By default, identity conflicts are not automatically resolved and you must resolve them through the host profile or by rescanning the host or re-adding new identity data to override the passive identity. However, you can set your system to automatically resolve the conflict by keeping either the passive identity or the active identity.

**Generate Identity Conflict Event**

Specifies whether the system generates an event when an identity conflict occurs.

**Automatically Resolve Conflicts**

From the Automatically Resolve Conflicts drop-down list, choose one of the following:

- **Disabled** if you want to force manual conflict resolution of identity conflicts
- **Identity** if you want the system to use the passive fingerprint when an identity conflict occurs
- **Keep Active** if you want the system to use the current identity from the highest priority active source when an identity conflict occurs

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2** Click Advanced.

**Step 3** Click the edit icon (📝) next to Identity Conflict Settings.

**Step 4** Update the settings in the Edit Identity Conflict Settings pop-up window as described in Network Discovery Identity Conflict Settings, on page 1759.

**Step 5** Click Save to save the identity conflict settings.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Network Discovery Vulnerability Impact Assessment Options

You can configure how the Firepower System performs impact correlation with intrusion events. Your choices are as follows:

- Check the Use Network Discovery Vulnerability Mappings check box if you want to use system-based vulnerability information to perform impact correlation.

- Check the Use Third-Party Vulnerability Mappings check box if you want to use third-party vulnerability references to perform impact correlation. For more information, see the Firepower System Host Input API Guide.

You can check either or both of the check boxes. If the system generates an intrusion event and the host involved in the event has servers or an operating system with vulnerabilities in the selected vulnerability mapping sets, the intrusion event is marked with the Vulnerable (level 1: red) impact icon. For any servers which do not have vendor or version information, note that you need to enable vulnerability mapping in the Firepower Management Center configuration.

If you clear both check boxes, intrusion events will **never** be marked with the Vulnerable (level 1: red) impact icon.

</tbody>
</table>

**Procedure**

**Step 1** Choose Policies > Network Discovery.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2** Click Advanced.

**Step 3** Click the edit icon ( pena) next to Vulnerabilities to use for Impact Assessment.

**Step 4** Update the settings in the Edit Vulnerability Settings pop-up window as described in Network Discovery Vulnerability Impact Assessment Options, on page 1760.

**Step 5** Click Save to save the vulnerability settings.

**What to do next**
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

**Indications of Compromise**

The Firepower System uses IOC rules in the network discovery policy to identify a host as likely to be compromised by malicious means. When a host meets the conditions specified in these system-provided rules, the system tags it with an indication of compromise (IOC). The related rules are known as IOC rules. Each IOC rule corresponds to one type of IOC tag. The IOC tags specify the nature of the likely compromise.

The Firepower Management Center can tag the host involved when one of the following things occurs:

- The system correlates data gathered about your monitored network and its traffic, using intrusion, connection, Security Intelligence, and file or malware events, and determines that a potential IOC has occurred.

- The Firepower Management Center can import IOC data from your AMP for Endpoints deployments via the AMP cloud. Because this data examines activity on a host itself—such as actions taken by or on individual programs—it can provide insights into possible threats that network-only data cannot. For your convenience, the Firepower Management Center automatically obtains any new IOC tags that Cisco develops from the AMP cloud.

To configure this feature, see Enabling Indications of Compromise Rules, on page 1762.

You can also write correlation rules against host IOC data and compliance white lists that account for IOC-tagged hosts.

To investigate and work with tagged IOCs, see Indications of Compromise Data, on page 2205 and its subtopics.
Enabling Indications of Compromise Rules

### Smart License

<table>
<thead>
<tr>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery/Admin</td>
</tr>
</tbody>
</table>

For your system to detect and tag indications of compromise (IOC), you must first activate at least one IOC rule in your network discovery policy. Each IOC rule corresponds to one type of IOC tag, and all IOC rules are predefined by Cisco; you cannot create original rules. You can enable any or all rules, depending on the needs of your network and organization. For example, if hosts using software such as Microsoft Excel never appear on your monitored network, you may decide not to enable the IOC tags that pertain to Excel-based threats.

**Tip**

To disable IOC rules for individual hosts, see Editing Indication of Compromise Rule States for a Single Host, on page 2208.

**Before you begin**

Because IOC rules trigger based on data provided by other components of the Firepower System and by AMP for Endpoints, those components must be correctly licensed and configured for IOC rules to set IOC tags. Enable the Firepower System features associated with the IOC rules you will enable, such as intrusion detection and prevention (IPS) and Advanced Malware Protection (AMP). If an IOC rule’s associated feature is not enabled, no relevant data is collected and the rule cannot trigger.

**Procedure**

**Step 1**

Choose **Policies > Network Discovery**.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2**

Click **Advanced**.

**Step 3**

Click the edit icon ( ✎) next to **Indications of Compromise Settings**.

**Step 4**

To toggle the entire IOC feature off or on, click the slider next to **Enable IOC**.

**Step 5**

To globally enable or disable individual IOC rules, click the slider in the rule’s **Enabled** column.

**Step 6**

Click **Save** to save your IOC rule settings.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.
Adding NetFlow Exporters to a Network Discovery Policy

Before you begin

- Configure the NetFlow exporters you plan to use as described in Netflow Data in the Firepower System, on page 1647.
- Review the other NetFlow prerequisites described in Requirements for Using NetFlow Data, on page 1648.

Procedure

Step 1
Choose Policies > Network Discovery.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 2
Click Advanced.

Step 3
Click the add icon (.addButton) next to NetFlow Devices.

Step 4
In the IP Address field, enter the IP address of the network device from which you want the managed device to collect NetFlow data.

Step 5
Optionally:
- Repeat the previous two steps to add additional NetFlow exporters.
- Remove a NetFlow exporter by clicking the delete icon (deleteButton). Keep in mind that if you use a NetFlow exporter in a discovery rule, you must delete the rule before you can delete the device from the Advanced page.

Step 6
Click Save.

What to do next

- Configure a network discovery rule to monitor NetFlow traffic as described in Configuring Network Discovery Rules, on page 1748.
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Network Discovery Data Storage Settings

Discovery data storage settings include the host limit and timeout settings.
When Host Limit Reached

The number of hosts a Firepower Management Center can monitor, and therefore store in the network map, depends on its model. The **When Host Limit Reached** option controls what happens when you detect a new host after you reach the host limit. You can:

**Drop hosts**

The system drops the host that has remained inactive for the longest time, then adds the new host. This is the default setting.

**Don't insert new hosts**

The system does not track any newly discovered hosts. The system only tracks new hosts after the host count drops below the limit, such as after an administrator increases the domain's host limit or manually deletes hosts from the network map, or if the system identifies hosts as timed-out due to inactivity.

In a multidomain deployment, leaf domains share the available pool of monitored hosts. To ensure that each leaf domain can populate its network map, you can set host limits at any subdomain level in the domain's properties. Because each leaf domain has its own network discovery policy, each leaf domain governs its own behavior when the system discovers a new host, as described in the following table.

**Table 221: Reaching the Host Limit with Multitenancy**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Domain Host Limit Set?</th>
<th>Domain Host Limit Reached</th>
<th>Ancestor Domain Host Limit Reached</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drop hosts</td>
<td>yes</td>
<td>Drops oldest host in the constrained domain.</td>
<td>Drops the oldest host among all descendant leaf domains configured to drop hosts. If no host can be dropped, does not add the host.</td>
</tr>
<tr>
<td></td>
<td>no</td>
<td>n/a</td>
<td>Drops the oldest host among all descendant leaf domains configured to drop hosts and that share the general pool.</td>
</tr>
<tr>
<td>Don't insert new hosts</td>
<td>yes or no</td>
<td>Does not add the host.</td>
<td>Does not add the host.</td>
</tr>
</tbody>
</table>

**Host Timeout**

The amount of time that passes, in minutes, before the system drops a host from the network map due to inactivity. The default setting is 10080 minutes (one week). Individual host IP and MAC addresses can time out individually, but a host does not disappear from the network map unless all its associated addresses time out.

To avoid premature timeout of hosts, make sure that the host timeout value is longer than the update interval in the network discovery policy general settings.

**Server Timeout**

The amount of time that passes, in minutes, before the system drops a server from the network map due to inactivity. The default setting is 10080 minutes (one week).

To avoid premature timeout of servers, make sure that the service timeout value is longer than the update interval in the network discovery policy general settings.
**Client Application Timeout**

The amount of time that passes, in minutes, before the system drops a client from the network map due to inactivity. The default setting is 10080 minutes (one week).

Make sure that the client timeout value is longer than the update interval in the network discovery policy general settings.

<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose **Policies > Network Discovery**.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2** Click **Advanced**.

**Step 3** Click the edit icon (🚀) next to **Data Storage Settings**.

**Step 4** Update the settings in the Data Storage Settings dialog as described in [Network Discovery Data Storage Settings](#), on page 1763.

**Step 5** Click **Save** to save the data storage settings.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 279.

## Configuring Network Discovery Event Logging

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

The Event Logging Settings control whether discovery and host input events are logged. If you do not log an event, you cannot retrieve it in event views or use it to trigger correlation rules.
Adding Network Discovery OS and Server Identity Sources

**Procedure**

**Step 1** Choose **Policies** > **Network Discovery**.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2** Click **Advanced**.

**Step 3** Click the edit icon (📝) next to **Event Logging Settings**.

**Step 4** Check or clear the check boxes next to the discovery and host input event types you want to log in the database, described in **Discovery Event Types**, on page 2190 and **Host Input Event Types**, on page 2194.

**Step 5** Click **Save** to save the event logging settings.

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

**Adding Network Discovery OS and Server Identity Sources**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

In the Advanced tab of the network discovery policy, you can add new active sources or change the priority or timeout settings for existing sources.

Adding a scanner to this page does not add the full integration capabilities that exist for the Nmap scanners, but does allow integration of imported third-party application or scan results.

If you import data from a third-party application or scanner, make sure that you map vulnerabilities from the source to the vulnerabilities detected in your network.

**Procedure**

**Step 1** Choose **Policies** > **Network Discovery**.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2** Click **Advanced**.

**Step 3** Click the edit icon (📝) next to **OS and Server Identity Sources**.

**Step 4** To add a new source, click **Add Source**.

**Step 5** Enter a **Name**.

**Step 6** Choose the input source **Type** from the drop-down list:

- Choose **Scanner** if you plan to import scan results using the AddScanResult function.
- Choose **Application** if you do not plan to import scan results.
Step 7 To indicate the duration of time that should elapse between the addition of an identity to the network map by this source and the deletion of that identity, choose **Hours**, **Days**, or **Weeks** from the **Timeout** drop-down list and enter the appropriate duration.

Step 8 Optionally:
- To promote a source and cause the operating system and application identities to be used in favor of sources below it in the list, choose the source and click the up arrow.
- To demote a source and cause the operating system and application identities to be used only if there are no identities provided by sources above it in the list, choose the source and click the down arrow.
- To delete a source, click the delete icon (●) next to the source.

Step 9 Click **Save** to save the identity source settings.

---

**What to do next**
- Deploy configuration changes; see **Deploy Configuration Changes**, on page 279.

**Related Topics**
- **Mapping Third-Party Vulnerabilities**, on page 1671

---

**Troubleshooting Your Network Discovery Strategy**

Before you make any changes to the system’s default detection capabilities, you should analyze what hosts are not being identified correctly and why, so you can decide what solution to implement.

**Are Your Managed Devices Correctly Placed?**

If network devices such as load balancers, proxy servers, or NAT devices reside between the managed device and the unidentified or misidentified host, place a managed device closer to the misidentified host rather than using custom fingerprinting. Cisco does not recommend using custom fingerprinting in this scenario.

**Do Unidentified Operating Systems Have a Unique TCP Stack?**

If the system misidentifies a host, you should investigate why the host is misidentified to help you decide between creating and activating a custom fingerprint or substituting Nmap or host input data for discovery data.

---

**Caution**

If you encounter misidentified hosts, contact your support representative before creating custom fingerprints.

---

If a host is running an operating system that is not detected by the system by default and does not share identifying TCP stack characteristics with existing detected operating systems, you should create a custom fingerprint.

For example, if you have a customized version of Linux with a unique TCP stack that the system cannot identify, you would benefit from creating a custom fingerprint, which allows the system to identify the host and continue monitoring it, rather than using scan results or third-party data, which require you to actively update the data yourself on an ongoing basis.
Note that many open source Linux distributions use the same kernel, and as such, the system identifies them using the Linux kernel name. If you create a custom fingerprint for a Red Hat Linux system, you may see other operating systems (such as Debian Linux, Mandrake Linux, Knoppix, and so on) identified as Red Hat Linux, because the same fingerprint matches multiple Linux distributions.

You should not use a fingerprint in every situation. For example, a modification may have been made to a host’s TCP stack so that it resembles or is identical to another operating system. For example, an Apple Mac OS X host is altered, making its fingerprint identical to a Linux 2.4 host, causing the system to identify it as Linux 2.4 instead of Mac OS X. If you create a custom fingerprint for the Mac OS X host, it may cause all legitimate Linux 2.4 hosts to be erroneously identified as Mac OS X hosts. In this case, if Nmap correctly identifies the host, you could schedule regular Nmap scans for that host.

If you import data from a third-party system using host input, you must map the vendor, product, and version strings that the third party uses to describe servers and application protocols to the Cisco definitions for those products. Note that even if you map application data to Firepower System vendor and version definitions, imported third-party vulnerabilities are not used for impact assessment for clients or web applications.

The system may reconcile data from multiple sources to determine the current identity for an operating system or application.

For Nmap data, you can schedule regular Nmap scans. For host input data, you can regularly run the Perl script for the import or the command line utility. However, note that active scan data and host input data may not be updated with the frequency of discovery data.

**Can the Firepower System Identify All Applications?**

If a host is correctly identified by the system but has unidentified applications, you can create a user-defined detector to provide the system with port and pattern matching information to help identify the application.

**Have You Applied Patches that Fix Vulnerabilities?**

If the system correctly identifies a host but does not reflect applied fixes, you can use the host input feature to import patch information. When you import patch information, you must map the fix name to a fix in the database.

**Do You Want to Track Third-Party Vulnerabilities?**

If you have vulnerability information from a third-party system that you want to use for impact correlation, you can map the third-party vulnerability identifiers for servers and application protocols to vulnerability identifiers in the Cisco database and then import the vulnerabilities using the host input feature. For more information on using the host input feature, see the *Firepower System Host Input API Guide*. Note that even if you map application data to Firepower System vendor and version definitions, imported third-party vulnerabilities are not used for impact assessment for clients or web applications.
Realms and Identity Policies

The following topics describe realms and identity policies:

- About Realms and Identity Policies, on page 1769
- Create a Realm, on page 1776
- Create an Identity Policy, on page 1783
- Create an Identity Rule, on page 1783
- Manage a Realm, on page 1787
- Manage an Identity Policy, on page 1788
- Manage an Identity Rule, on page 1789

About Realms and Identity Policies

A realm consists of one or more LDAP or Microsoft Active Directory servers that share the same directory credentials. You must configure a realm to perform user and user group queries, user control, or to configure an authoritative identity source. After configuring one or more realms, you can configure an identity policy.

An identity policy associates traffic on your network with an authoritative identity source and a realm. After configuring one or more identity policies, you can associate one with an access control policy and deploy the access control policy to a managed device.

About Realms

Realms are connections between the Firepower Management Center and the user accounts on the servers you monitor. They specify the connection settings and authentication filter settings for the server. Realms can:

- Specify the users and user groups whose activity you want to monitor.

- Query the user repository for user metadata on authoritative users, as well as some non-authoritative users: POP3 and IMAP users detected by traffic-based detection and users detected by traffic-based detection, a User Agent, a TS Agent, or ISE.

You can add multiple domain controllers as directories in a realm, but they must share the same basic realm information. The directories in a realm must be exclusively LDAP or exclusively Active Directory (AD) servers. After you enable a realm, your saved changes take effect next time the Firepower Management Center queries the server.
To perform user awareness, you must configure a realm for any of the Supported Servers for Realms. The system uses these connections to query the servers for data associated with POP3 and IMAP users, and to collect data about LDAP users discovered through traffic-based detection.

The system uses the email addresses in POP3 and IMAP logins to correlate with LDAP users on an Active Directory, OpenLDAP, or Oracle Directory Server Enterprise Edition server. For example, if a managed device detects a POP3 login for a user with the same email address as an LDAP user, the system associates the LDAP user’s metadata with that user.

To perform user control, you can configure any of the following:

- A realm for an AD server for either the User Agent or ISE
- A realm for an AD server for the TS Agent
- A realm for an AD, Oracle Directory, or OpenLDAP server for captive portal

About User Download

You can configure a realm to establish a connection between the Firepower Management Center and an LDAP or AD server to retrieve user and user group metadata for certain detected users:

- LDAP and AD users authenticated by captive portal or reported by a User Agent or ISE. This metadata can be used for user awareness and user control.
- POP3 and IMAP user logins detected by traffic-based detection, if those users have the same email address as an LDAP or AD user. This metadata can be used for user awareness.

You configure LDAP server or Active Directory domain controller connections as a directory in a realm. You must check Download users and user groups for access control to download a realm's user and user group data for user awareness and user control.

The Firepower Management Center obtains the following information and metadata about each user:

- LDAP user name
- First and last names
- Email address
- Department
- Telephone number

About User Activity Data

User activity data is stored in the user activity database and user identity data is stored in the users database. The maximum number of users you can store and use in access control depends on your Firepower Management Center model. When choosing which users and groups to include, make sure the total number of users is less than your model limit. If your access control parameters are too broad, the Firepower Management Center obtains information on as many users as it can and reports the number of users it failed to retrieve in the Tasks tab page of the Message Center.
If you remove a user that has been detected by the system from your user repository, the Firepower Management Center does not remove that user from its users database; you must manually delete it. However, your LDAP changes are reflected in access control rules when the Firepower Management Center next updates its list of authoritative users.

### Realms and Trusted Domains

When you configure a realm in the Firepower Management Center, it is associated with an Active Directory or LDAP domain.

A grouping of Microsoft Active Directory (AD) domains that trust each other is commonly referred to as a forest. This trust relationship can enable domains to access each other's resources in different ways. For example, a user account defined in domain A can be marked as a member of a group defined in domain B.

The Firepower System does not support trusted AD domains. This means that the Firepower System does not track which configured domains trust each other, and does not know which domains are parent or child domains of each other. The Firepower System also has not been tested to assure support for environments that use cross-domain trust, even when the trust relationship is exercised outside of the Firepower System.

For more information, see Troubleshoot Realms and User Downloads, on page 1773.

### Supported Servers for Realms

You can configure realms to connect to the following types of servers, providing they have TCP/IP access from the Firepower Management Center:

<table>
<thead>
<tr>
<th>Server Type</th>
<th>Supported for user awareness data retrieval?</th>
<th>Supported for User Agent data retrieval?</th>
<th>Supported for ISE data retrieval?</th>
<th>Supported for TS Agent data retrieval?</th>
<th>Supported for captive portal data retrieval?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft Active Directory on Windows Server 2008 and Windows Server 2012</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Oracle Directory Server Enterprise Edition 7.0 on Windows Server 2008</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>OpenLDAP on Linux</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>
If the TS Agent is installed on a Microsoft Active Directory Windows Server shared with another passive authentication identity source (the User Agent or ISE), the Firepower Management Center prioritizes the TS Agent data. If the TS Agent and a passive identity source report activity by the same IP address, only the TS Agent data is logged to the Firepower Management Center.

Note

Note the following about your server group configurations:

- To perform user control on user groups or on users in groups, you must configure user groups on the LDAP or Active Directory server. The Firepower Management Center cannot perform user group control if the server organizes the users in basic object hierarchy.

- Group names cannot start with S- because it is used internally by LDAP.

  Neither group names nor organizational unit names can contain special characters like asterisk (*), equals (=), or backslash (\); otherwise, users in those groups or organizational units are not downloaded and are not available for identity policies.

- To configure an Active Directory realm that includes or excludes users who are members of a sub-group on your server, note that Microsoft recommends that Active Directory has no more than 5000 users per group in Windows Server 2008 or 2012. For more information, see Active Directory Maximum Limits—Scalability on MSDN.

  If necessary, you can modify your Active Directory server configuration to increase this default limit and accommodate more users.

- To uniquely identify the users reported by a server in your terminal services environment, you must configure the Cisco Terminal Services (TS) Agent. When installed and configured, the TS Agent assigns unique ports to individual users so the Firepower System can uniquely identify those users.

  For more information about the TS Agent, see the Cisco Terminal Services (TS) Agent Guide.

**Supported Server Object Class and Attribute Names**

The servers in your realms must use the attribute names listed in the following table for the Firepower Management Center to retrieve user metadata from the servers. If the attribute names are incorrect on your server, the Firepower Management Center cannot populate its database with the information in that attribute.
Table 222: Map of attribute names to Firepower Management Center fields

<table>
<thead>
<tr>

</tbody>
</table>

The LDAP ObjectClass for groups is group, groupOfNames, (group-of-names for Active Directory) or groupOfUniqueNames.

For more information about ObjectClasses and attributes, see the following references:

- Microsoft Active Directory:
  - ObjectClasses: All Classes on MSDN
  - Attributes: All Attributes on MSDN

- Oracle:
  - ObjectClasses: LDAP Object Class Reference on docs.oracle.com
  - Attributes: LDAP Attribute Reference on docs.oracle.com

- OpenLDAP: RFC 4512

Troubleshoot Realms and User Downloads

If you notice unexpected server connection behavior, consider tuning your realm configuration, device settings, or server settings. For other related troubleshooting information, see:

- Troubleshoot the User Agent Identity Source, on page 1724
- Troubleshoot the ISE Identity Source, on page 1728
Symptom: Access control policy doesn't match group membership

This solution applies to an AD domain that is in a trust relationship with other AD domains. In the following discussion, *external domain* means a domain other than the one to which the user logs in.

If a user belongs to a group defined in a trusted external domain, Firepower doesn't track membership in the external domain. For example, consider the following scenario:

- Domain controllers 1 and 2 trust each other
- Group A is defined on domain controller 2
- User mparvinder in controller 1 is a member of Group A

Even though user mparvinder is in Group A, the Firepower access control policy rules specifying membership Group A don't match.

**Solution:** Create a similar group in domain controller 1 that contains has all domain 1 accounts that belong to group A. Change the access control policy rule to match any member of Group A or Group B.

Symptom: Access control policy doesn't match child domain membership

If a user belongs to a domain that is child of parent domain, Firepower doesn't track the parent/child relationships between domains. For example, consider the following scenario:

- Domain child.parent.com is child of domain parent.com
- User mparvinder is defined in child.parent.com

Even though user mparvinder is in a child domain, the Firepower access control policy matching the parent.com don't match mparvinder in the child.parent.com domain.

**Solution:** Change the access control policy rule to match membership in either parent.com or child.parent.com.

Symptom: Realm or realm directory test fails

The Test button on the directory page sends an LDAP query to the hostname or IP address you entered. If it fails, check the following:

- The **Hostname** you entered resolves to the IP address of an LDAP server or Active Directory domain controller.
- The **IP Address** you entered is valid.

The Test AD Join button on the realm configuration page verifies the following:

- DNS resolves the **AD Primary Domain** to an LDAP server or Active Directory domain controller’s IP address.
- The **AD Join Username** and **AD Join Password** are correct.
**AD Join Username** must be fully qualified (for example, *administrator@mydomain.com*, not *administrator*).

- The user has sufficient privileges to create a computer in the domain and join the Firepower Management Center to the domain as a Domain Computer.

**Symptom: User timeouts are occurring at unexpected times**

If you notice the system performing user timeouts at unexpected intervals, confirm that the time on your User Agent, ISE, or TS Agent server is synchronized with the time on the Firepower Management Center. If the appliances are not synchronized, the system may perform user timeouts at unexpected intervals.

**Symptom: Users are not included or excluded as specified in your realm configuration**

If you configure an Active Directory realm that includes or excludes users who are members of a sub-group on your server, note that Microsoft Windows servers limit the number of users they report:

- 5000 users per group on Microsoft Windows Server 2008 or 2012

If necessary, you can modify your server configuration to increase this default limit and accommodate more users.

**Symptom: Users are not downloaded**

Possible causes follow:

- If you have the realm **Type** configured incorrectly, users and groups cannot be downloaded because of a mismatch between the attribute the Firepower system expects and what the repository provides. For example, if you configure **Type** as **LDAP** for a Microsoft Active Directory realm, the Firepower system expects the `uid` attribute, which is set to `none` on Active Directory. (Active Directory repositories use `sAMAccountName` for the user ID.)

  **Solution:** Set the realm **Type** field appropriately: **AD** for Microsoft Active Directory or **LDAP** for another supported LDAP repository.

- Users in Active Directory groups that have special characters in the group or organizational unit name might not be available for identity policy rules. For example, if a group or organizational unit name contains the characters asterisk (`*`), equals (`=`), or backslash (`\`), users in those groups are not downloaded and can't be used for identity policies.

  **Solution:** Remove special characters from the group or organizational unit name.

**Symptom: User data for previously-unseen ISE and User Agent users is not displaying in the web interface**

After the system detects activity from an ISE, User Agent, or TS Agent user whose data is not yet in the database, the system retrieves information about them from the server. In some cases, the system requires additional time to successfully retrieve this information from Microsoft Windows servers. Until the data retrieval succeeds, activity seen by the ISE, User Agent, or TS Agent user is not displayed in the web interface.

Note that this may also prevent the system from handling the user's traffic using access control rules.

**Symptom: User data in events is unexpected**

If you notice user or user activity events contain unexpected IP addresses, check your realms. The system does not support configuring multiple realms with the same **AD Primary Domain** value.
Symptom: Users originating from terminal server logins are not uniquely identified by the system

If your deployment includes a terminal server and you have a realm configured for one or more servers connected to the terminal server, you must deploy the Cisco Terminal Services (TS) Agent to accurately report user logins in terminal server environments. When installed and configured, the TS Agent assigns unique ports to individual users so the Firepower System can uniquely identify those users in the web interface.

For more information about the TS Agent, see the Cisco Terminal Services (TS) Agent Guide.

About Identity Policies

Identity policies contain identity rules. Identity rules associate sets of traffic with a realm and an authentication method: passive authentication, active authentication, or no authentication.

You must fully configure the realms and authentication methods you plan to use before you can invoke them in your identity rules:

- You configure realms outside of your identity policy, at System > Integration > Realms. For more information, see Create a Realm, on page 1776.
- You configure the User Agent and ISE, passive authentication identity sources, at System > Integration > Identity Sources. For more information, see Configure the User Agent for User Control, on page 1723 and Configure ISE for User Control, on page 1726.
- You configure the TS Agent, a passive authentication identity source, outside the Firepower System. For more information, see the Cisco Terminal Services (TS) Agent Guide.
- You configure captive portal, the active authentication identity source, in the identity policy. For more information, see How to Configure the Captive Portal for User Control, on page 1733.

After you add multiple identity rules to a single identity policy, order the rules. The system matches traffic to rules in top-down order by ascending rule number. The first rule that traffic matches is the rule that handles the traffic.

After you configure one or more identity policies, you must associate one identity policy with your access control policy. When traffic on your network matches the conditions in your identity rule, the system associates the traffic with the specified realm and authenticates the users in the traffic using the specified identity source.

If you do not configure an identity policy, the system does not perform user authentication.

</tbody>
</table>

For more information about realm configuration fields, see Realm Fields, on page 1777.
You must specify a unique **AD Primary Domain** for every Microsoft Active Directory (AD) realm. Although the system allows you to specify the same **AD Primary Domain** for different AD realms, the system won't function properly. This happens because system assigns a unique ID to every user and group in each realm; therefore, the system cannot definitively identify any particular user or group.

## Procedure

**Step 1** Log in to the Firepower Management Center.

**Step 2** Click **System > Integration**.

**Step 3** Click **Realms**.

**Step 4** To create a new realm, click **New Realm**.

**Step 5** To perform other tasks (such as enable, disable, or delete a realm), see *Manage a Realm, on page 1787*.

**Step 6** Enter realm information as discussed in *Realm Fields, on page 1777*.

**Step 7** Click **OK**.

**Step 8** Configure at least one directory as discussed in *Configure a Realm Directory, on page 1780*.

**Step 9** Configure user and user group download (required for access control) as discussed in *Download Users and Groups, on page 1781*.

**Step 10** Click the **Realm Configuration** tab.

**Step 11** Enter user session timeout values, in minutes, for **Authenticated Users**, **Failed Authentication Users**, and **Guest Users**.

## What to do next

- Configure a Realm Directory, on page 1780
- Edit, delete, enable, or disable a realm; see *Manage a Realm, on page 1787*.
- Compare Realms, on page 1787.
- Optionally, monitor the task status; see *Viewing Task Messages, on page 260*.

## Realm Fields

The following fields are used to configure a realm.

### Realm Configuration Fields

These settings apply to all Active Directory servers or domain controllers (also referred to as **directories**) in a realm.

#### Name

A unique name for the realm. The system supports alphanumeric and special characters.
**Description**
(Optional.) Enter a description of the realm.

**AD Primary Domain**
For Microsoft Active Directory realms only. Domain for the Active Directory server where users should be authenticated.

---

**Note**
You must specify a unique AD Primary Domain for every Microsoft Active Directory (AD) realm. Although the system allows you to specify the same AD Primary Domain for different AD realms, the system won't function properly. This happens because system assigns a unique ID to every user and group in each realm; therefore, the system cannot definitively identify any particular user or group.

**AD Join Username and AD Join Password**
For Microsoft Active Directory realms intended for Kerberos captive portal active authentication, the distinguished username and password of any Active Directory user with appropriate rights to create a Domain Computer account in the Active Directory domain.

Keep the following in mind:

- DNS must be able to resolve the domain name to an Active Directory domain controller's IP address.
- The user you specify must be able to join computers to the Active Directory domain.
- The user name must be fully qualified (for example, administrator@mydomain.com, not administrator).

If you choose Kerberos (or HTTP Negotiate, if you want Kerberos as an option) as the Authentication Type in an identity rule, the Realm you select must be configured with an AD Join Username and AD Join Password to perform Kerberos captive portal active authentication.

**Directory Username and Directory Password**
The distinguished username and password for a user with appropriate access to the user information you want to retrieve.

Note the following:

- For Microsoft Active Directory, the user does not need elevated privileges. You can specify any user in the domain.
- For OpenLDAP, the user's access privileges are determined by the <level> parameter discussed in 8 of the OpenLDAP specification. The user's <level> should be auth or better.
- The user name must be fully qualified (for example, administrator@mydomain.com, not administrator).

**Base DN**
The directory tree on the server where the Firepower Management Center should begin searching for user data.

Typically, the base distinguished name (DN) has a basic structure indicating the company domain name and operational unit. For example, the Security organization of the Example company might have a base DN of ou=security,dc=example,dc=com.
Group DN

The directory tree on the server where the Firepower Management Center should search for users with the group attribute. A list of supported group attributes is shown in Supported Server Object Class and Attribute Names, on page 1772.

Note
Neither the group name nor the organizational unit name can contain special characters like asterisk (*), equals (=), or backslash (\) because users in those groups are not downloaded and cannot be used in identity policies.

Group Attribute

(Optional.) The group attribute for the server, Member or Unique Member.

Type

The type of realm, AD for Microsoft Active Directory or LDAP for other supported LDAP repositories. For a list of supported LDAP repositories, see Supported Servers for Realms, on page 1771.

Note
Only captive portal supports an LDAP realm.

Realm Configuration Fields

Active Directory information

Active Directory information fields are discussed earlier in this section.

User Session Timeout

Enter the number of minutes before user sessions time out. The default is 1440 (24 hours) after the user's login event. After the timeout is exceeded, the user's session ends; if the user continues to access the network without logging in again, the user is seen by the Firepower Management Center as Unknown.

Note
The user session timeout values apply to both active authentication (captive portal) and passive authentication (TS Agent, user agent, ISE). Setting a large value might prevent user sessions from ending, resulting in those sessions being claimed by other users.

Realm Directory Fields

These settings apply to individual servers (such as Active Directory domain controllers) in a realm.

Encryption

The encryption method to use for the Firepower Management Center-server connection:

- STARTTLS—encrypted LDAP connection
- LDAPS—encrypted LDAP connection
- None—unencrypted LDAP connection (unsecured traffic)
Hostname / IP Address

The host name or IP address of an Active Directory domain controller. If you specify an Encryption method, you must specify a host name in this field.

Port

The port to use for the Firepower Management Center-controller connection.

SSL Certificate

The SSL certificate to use for authentication to the server. You must configure STARTTLS or LDAPS as the Encryption type in order to use an SSL certificate.

If you are using a certificate to authenticate, the name of the server in the certificate must match the server Hostname / IP Address. For example, if you use 10.10.10.250 as the IP address but computer1.example.com in the certificate, the connection fails.

User Download Fields

Available Groups, Add to Include, Add to Exclude

Identifies the groups to download and make available for user awareness and user control.

- If you leave a group in the Available Groups box, the group is not downloaded.
- If you move a group to the Add to Include box, the group is downloaded and user data is available for user awareness and user control.
- If you move a group to the Add to Exclude box, the group is downloaded and user data is available for user awareness, but not for user control.
- To include users from groups that are not included, enter the user name in the field below Groups to Include and click Add.
- To exclude users from groups that are not excluded, enter the user name in the field below Groups to Exclude and click Add.

Begin automatic download at, Repeat every

Specifies the frequency of the automatic downloads.

Download users and groups (required for user access control)

Enables you to download users and groups for user awareness and user control.

Configure a Realm Directory

This procedure enables you to create a realm directory, which corresponds to an LDAP server or a Microsoft Active Directory domain controller. An Active Directory server can have multiple domain controllers, each of which is capable of authenticating different users and groups.
For more information about realm directory configuration fields, see Realm Fields, on page 1777.

Before you begin

To optionally use an SSL certificate to authenticate with the directory, PKI Objects or have your certificate data and key available on the machine from which you're accessing the Firepower Management Center.

Procedure

**Step 1**  
If you haven't done so already, log in to the Firepower Management Center and click Integration > Realms.

**Step 2**  
On the Realms tab page, click the name of the realm for which to configure a directory.

**Step 3**  

**Step 4**  
Enter the Hostname / IP Address and Port for the LDAP server or Active Directory domain controller. The system sends an LDAP query to the hostname or IP address you specify. If the host name resolves to the IP address of an LDAP server or Active Directory domain controller, the Test succeeds.

**Step 5**  
Select an Encryption Mode.

**Step 6**  
(Optional.) Choose an SSL Certificate from the list or click the add icon (➕) to add a certificate.

**Step 7**  
To test the connection, click Test.

**Step 8**  
Click OK.

**Step 9**  
Click Save. You are returned to the Realms tab page

**Step 10**  
If you haven't already enabled the realm, on the Realms tab page, slide State to enabled.

What to do next

- Download Users and Groups, on page 1781.

Download Users and Groups

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Administrator, Access Admin, Network Admin</td>
</tr>
</tbody>
</table>

This section discusses how to download users and groups from your Active Directory server to the Firepower Management Center. If you do not specify any groups to include, the system retrieves user data for all the groups that match the parameters you provided. For performance reasons, Cisco recommends that you explicitly include only the groups that represent the users you want to use in access control.

The maximum number of users the Firepower Management Center can retrieve from the server depends on your Firepower Management Center model. If the download parameters in your realm are too broad, the Firepower Management Center obtains information on as many users as it can and reports the number of users it failed to retrieve in the Task tab of the Message Center.
User names that include Unicode characters do not display in the Firepower Management Center. Before you download users and groups, make sure to replace Unicode characters with alphanumeric characters.

For more information about realm configuration fields, see Realm Fields, on page 1777.

Procedure

Step 1 Log in to the Firepower Management Center.
Step 2 Click System > Integration > Realms.
Step 3 To download users and groups manually, click the download icon ( ) next to the realm to download users and user groups. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration. You can skip the remainder of this procedure.
Step 4 To configure the realm for automatic user and group download, click the edit icon ( ) next to the realm to configure for automatic user and group download.
Step 5 On the User Access Control tab page, check Download users and groups (required for user access control).
Step 6 Select a time to Begin automatic download at from the lists.
Step 7 Select a download interval from the Repeat Every list.
Step 8 To include or exclude user groups from the download, choose user groups from the Available Groups column and click Add to Include or Add to Exclude.

Separate multiple users with commas. You can also use an asterisk (*) as a wildcard character in this field.

Note You must Add to Include if you want to perform user control on users in that group.

Use the following guidelines:

• If you leave a group in the Available Groups box, the group is not downloaded.

• If you move a group to the Add to Include box, the group is downloaded and user data is available for user awareness and user control.

• If you move a group to the Add to Exclude box, the group is downloaded and user data is available for user awareness, but not for user control.

• To include users from groups that are not included, enter the user name in the field below Groups to Include and click Add.

• To exclude users from groups that are not excluded, enter the user name in the field below Groups to Exclude and click Add.
Create an Identity Policy

Before you begin

- Create and enable one or more realms as described in Create a Realm, on page 1776.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Log in to the Firepower Management Center.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Policies &gt; Access Control &gt; Identity and click New Policy.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter a Name and, optionally, a Description.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click Save.</td>
</tr>
<tr>
<td>Step 5</td>
<td>To add a rule to the policy, click Add Rule as described in Create an Identity Rule, on page 1783.</td>
</tr>
<tr>
<td>Step 6</td>
<td>To create a rule category, click Add Category.</td>
</tr>
<tr>
<td>Step 7</td>
<td>To configure captive portal active authentication, click the Active Authentication tab as described in How to Configure the Captive Portal for User Control, on page 1733.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Click Save to save the identity policy.</td>
</tr>
</tbody>
</table>

What to do next

- Add rules to your identity policy that specify which users to match and other options; see Create an Identity Rule, on page 1783.
- Associate the identity policy with an access control policy to allow or block selected users from accessing specified resources; see Associating Other Policies with Access Control, on page 1088.
- Deploy configuration changes to managed devices; see Deploy Configuration Changes, on page 279.

Create an Identity Rule

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Administrator, Access Admin, Network Admin</td>
</tr>
</tbody>
</table>

For details about configuration options for identity rules, see Identity Rule Fields, on page 1784.
Procedure

Step 1  If you haven't done so already, log in to the Firepower Management Center.

Step 2  Click Policies > Access Control > Identity.

Step 3  Click edit (EDIT) next to the identity policy to which to add the identity rule.

If a view icon (VIEW) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 4  Click Add Rule.

Step 5  Enter a Name.

Step 6  Specify whether the rule is Enabled.

Step 7  To add the rule to an existing category, indicate where you want to Insert the rule. To add a new category, click Add Category.

Step 8  Choose a rule Action from the list.

Step 9  Click the Realms & Settings tab.

Step 10  Choose a realm for the identity rule from the Realms list. You must associate a realm with every identity rule.

The only exception to the realm requirement is implementing user control using only the ISE SGT attribute tag. In this case, you do not need to configure a realm for the ISE server. ISE SGT attribute conditions can be configured in policies with or without an associated identity policy.

Step 11  If you're configuring captive portal, see How to Configure the Captive Portal for User Control, on page 1733.

Step 12  (Optional) To add conditions to the identity rule, see Rule Condition Types, on page 294.

Step 13  Click Add.

Step 14  In the policy editor, set the rule position. Click and drag or use the right-click menu to cut and paste. Rules are numbered starting at 1. The system matches traffic to rules in top-down order by ascending rule number. The first rule that traffic matches is the rule that handles that traffic. Proper rule order reduces the resources required to process network traffic and prevents rule preemption.

Step 15  Click Save.

Related Topics
   Snort® Restart Scenarios, on page 281

Identity Rule Fields

Use the following fields to configure identity rules.

Enabled

Choosing this option enables the identity rule in the identity policy. Deselecting this option disables the identity rule.

Action

Specify the type of authentication you want to perform on the users in the specified realm: Passive Authentication (default), Active Authentication, or No Authentication. You must fully configure the authentication method, or identity source, before selecting it as the action in an identity rule.
Adding the first or removing the last active authentication rule when SSL decryption is disabled (that is, when the access control policy does not include an SSL policy) restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 282 for more information.

Note that an active authentication rule has either an Active Authentication rule action, or a Passive Authentication rule action with Use active authentication if passive authentication cannot identify user selected.

For information about which passive and active authentication methods are supported in your version of the Firepower System, see About User Identity Sources, on page 1721.

Realm

The realm containing the users you want to perform the specified Action on. You must fully configure a realm before selecting it as the realm in an identity rule.

Note

If you select Kerberos (or HTTP Negotiate, if you want Kerberos as an option) as the Authentication Type for the identity rule, the Realm you select must be configured with an AD Join Username and AD Join Password to perform Kerberos captive portal active authentication.

Use active authentication if passive authentication cannot identify user

Selecting this option authenticates users using captive portal active authentication if a passive or a VPN authentication fails to identify them. You must configure captive portal active authentication in your identity policy in order to select this option.

If you disable this option, users that do not have a VPN identity or that passive authentication cannot identify are identified as Unknown.

Identify as Special Identities/Guest if authentication cannot identify user

This field is displayed only if you configure Active Authentication (that is, captive portal authentication) as the rule Action.

Authentication Type

The method to use to perform captive portal active authentication. The selections vary depending on the type of realm, LDAP or AD:

- Choose HTTP Basic if you want to authenticate users using an unencrypted HTTP Basic Authentication (BA) connection. Users log in to the network using their browser's default authentication popup window.

Most web browsers cache the credentials from HTTP Basic logins and use the credentials to seamlessly begin a new session after an old session times out.

- Choose NTLM to authenticate users using a NT LAN Manager (NTLM) connection. This selection is available only when you select an AD realm. If transparent authentication is configured in a user's browser, the user is automatically logged in. If transparent authentication is not configured, users log in to the network using their browser's default authentication popup window.
• Choose **Kerberos** to authenticate users using a Kerberos connection. This selection is available only when you select an AD realm for a server with secure LDAP (LDAPS) enabled. If transparent authentication is configured in a user's browser, the user is automatically logged in. If transparent authentication is not configured, users log in to the network using their browser's default authentication popup window.

**Note**
The Realm you select must be configured with an AD Join Username and AD Join Password to perform Kerberos captive portal active authentication.

**Note**
If you are creating an identity rule to perform Kerberos captive portal and you have DNS resolution configured, you must configure your DNS server to resolve the fully qualified domain name (FQDN) of the captive portal device. The FQDN must match the host name you provided when configuring DNS.

For ASA with FirePOWER Services and Firepower Threat Defense devices, the FQDN must resolve to the IP address of the routed interface used for captive portal.

• Choose **HTTP Negotiate** to allow the captive portal server to choose between HTTP Basic, Kerberos, or NTLM for the authentication connection. This type is available only when you select an AD realm.

**Note**
The Realm you choose must be configured with an AD Join Username and AD Join Password for HTTP Negotiate to choose Kerberos captive portal active authentication.

**Note**
If you are creating an identity rule to perform HTTP Negotiate captive portal and you have DNS resolution configured, you must configure your DNS server to resolve the fully qualified domain name (FQDN) of the captive portal device. The FQDN of the device you are using for captive portal must match the hostname you provided when configuring DNS.

For ASA with FirePOWER Services devices, the FQDN is the FQDN of the ASA FirePOWER module.
Manage a Realm

This section discusses how to perform various maintenance tasks for a realm using controls on the Realms page. Note the following:

- If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

- If a view icon (🔒) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Procedure

Step 1 Log in to the Firepower Management Center.
Step 2 Click System > Integration.
Step 3 Click Realms.
Step 4 To delete a realm, click the delete icon (🗑).
Step 5 To edit a realm, click the edit icon (✏) next to the realm and make changes as described in Create a Realm, on page 1776.
Step 6 To enable a realm, slide State to the right; to disable a realm, slide it to the left.
Step 7 To download users and user groups, click the download icon (📥).
Step 8 To copy a realm, click the copy icon (복사).
Step 9 To compare realms, see Compare Realms, on page 1787.

Compare Realms
Procedure

Step 1  Log in to the Firepower Management Center.
Step 2  Click **System > Integration**.
Step 3  Click **Realms**.
Step 4  Click **System > Integration**.
Step 5  Click **Realms**.
Step 6  Click **Compare Realms**.
Step 7  Choose **Compare Realm** from the **Compare Against** list.
Step 8  Choose the realms you want to compare from the **Realm A** and **Realm B** lists.
Step 9  Click **OK**.
Step 10 To navigate individually through changes, click **Previous** or **Next** above the title bar.
Step 11 (Optional.) Click **Comparison Report** to generate the realm comparison report.
Step 12 (Optional.) Click **New Comparison** to generate a new realm comparison view.

### Manage an Identity Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Administrator, Access Admin, Network Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Procedure

Step 1  If you haven't done so already, log in to the Firepower Management Center.
Step 2  Click **Policies > Access Control > Identity**.
Step 3  To delete a policy, click delete (🗑️). If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
Step 4  To edit a policy, click edit (✏️) next to the policy and make changes as described in **Create an Identity Policy**, on page 1783. If a view icon (🔧) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
Step 5  To copy a policy, click the copy icon (📋).
Step 6  To generate a report for the policy, click the report icon (🗂️) as described in **Generating Current Policy Reports**, on page 288.
Step 7 To compare policies, see Comparing Policies, on page 287.

## Manage an Identity Rule

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Administrator, Access Admin, Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** If you haven't already done so, log in to the Firepower Management Center.

**Step 2** Click Policies > Access Control > Identity.

**Step 3** Click the edit icon (📝) next to the policy you want to edit. If a view icon (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4** To edit an identity rule, click the edit icon (📝) and make changes as described in Create an Identity Policy, on page 1783.

**Step 5** To delete an identity rule, click the delete icon (🗑).

**Step 6** To create a rule category, click Add Category and choose the position and rule.

**Step 7** Click Save.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.
PART XXI

Correlation and Compliance

• Compliance White Lists, on page 1793
• Correlation Policies, on page 1809
• Traffic Profiling, on page 1847
• Remediations, on page 1859
The following topics describe how to configure compliance white lists before you add them to correlation policies.

- Introduction to Compliance White Lists, on page 1793
- Creating a Compliance White List, on page 1798
- Managing Compliance White Lists, on page 1804
- Managing Shared Host Profiles, on page 1806

Introduction to Compliance White Lists

A compliance white list, sometimes abbreviated as white list, is a set of criteria that specifies which operating systems, applications (web and client), and protocols are allowed on hosts on your network. The system generates an event if a host violates the white list.

A compliance white list has two main components:

- **Targets** are the hosts you select for white list evaluation. You can evaluate all or some monitored hosts, constraining by subnet, VLAN, and host attribute. In a multidomain deployment, you can target domains and subnets within or across domains.

- **Host profiles** specify the compliance criteria for the targets. The global host profile is operating system agnostic. You can also configure operating-system specific host profiles, either unique to one white list or shared across white lists.

The Cisco Talos Security Intelligence and Research Group (Talos) provides a default white list with recommended settings. You can also create custom white lists. A simple custom white list might allow only hosts running a certain operating system. A more complex white list might allow all operating systems, but specify which operating system a host must use to run a certain application protocol on a specific port.

**Note**

The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1649. This limitation may affect the way you build compliance white lists.
Implementing Compliance White Lists

To implement white lists, add the white list to an active correlation policy. The system evaluates the targets and assigns every host a corresponding attribute:

- **Compliant** — The host does not violate the white list.
- **Non-Compliant** — The host violates the white list.
- **Not Evaluated** — The host is not a target of the white list, the host is currently being evaluated, or the system has insufficient information to determine whether the host is in compliance.

To delete the host attribute, delete its corresponding white list. Deactivating, deleting, or removing a white list from a correlation policy does not delete the host attribute, nor does it change the attribute’s value for each host.

After its initial evaluation, the system generates a white list event whenever a monitored host goes out of compliance with an active white list; it also records a white list violation.

You can use workflows, dashboards, and network maps to monitor system-wide compliance activity and determine when and how an individual host violates your white lists. You can also automatically respond to white list violations with remediations and alerts.

Example: Restricting HTTP to Web Servers

Your security policy states that only web servers may run HTTP. You create a white list that evaluates your entire network, excluding your web farm, to determine which hosts are running HTTP.

Using the network map and the dashboard, you can obtain an at-a-glance summary of the compliance of your network. In just a few seconds, you can determine exactly which hosts in your organization are running HTTP in violation of your policy, and take appropriate action.

Then, using the correlation feature, you can configure the system to alert you whenever a host that is not in your web farm starts running HTTP.

Related Topics

Configuring Correlation Policies, on page 1810

Compliance White List Target Networks

A target network specifies the hosts you want to evaluate for white list compliance. A white list can have more than one target network, and it evaluates hosts that meet the criteria of any of its targets.

Initially, you constrain a target network by IP address or range. In multidomain deployments, the initial constraints also include a domain.

The system-provided default white list targets all monitored hosts: 0.0.0.0/0 and ::/0. In a multidomain deployment, the default white list is constrained to (and only available in) the Global domain.

If you modify a target network or a host so that the host is no longer a valid target for the white list, the host is no longer evaluated by the white list and is considered neither compliant nor non-compliant.
**Surveying and Refining Target Networks**

When you add a target network to a white list, the system prompts you to survey the network map to help you characterize compliant hosts. The survey adds a target to the white list that represents the hosts you surveyed.

You can survey a subnet or individual host. In a multidomain deployment, you can survey an entire domain, or you can survey across domains. Surveying an ancestor domain causes the system to survey that domain’s descendants.

In addition to the added target, the survey also populates the white list with one host profile for each operating system detected in the survey. These host profiles allow all the clients, application protocols, web applications, and protocols that the system has detected on the applicable operating systems.

After you survey a target network (or skip the survey), refine the target. You can exclude hosts by IP address, or constrain target networks by host attribute or VLAN.

**Targeting Domains with Compliance White Lists**

In a multidomain deployment, domains and target networks are closely linked.

- Leaf-domain administrators can create white lists that evaluate hosts within their leaf domains.
- Higher-level domain administrators can create white lists that evaluate hosts across domains. You can target different subnets in different domains in the same white list.

Consider a scenario where you are a Global domain administrator, and you want to apply the same compliance criteria to web servers across the entire deployment. You can create one white list in the Global domain that defines the compliance criteria. Then, constrain the white list with target networks that specify the IP space (or individual IP addresses) of the web servers in each leaf domain.

---

**Compliance White List Host Profiles**

In a compliance white list, host profiles specify which operating systems, clients, application protocols, web applications, and protocols are allowed to run on the target hosts. There are three types of host profile you can use in a compliance white list; each type appears differently in the compliance white list editor.

**Table 223: Compliance White List Host Profile Types**

<table>
<thead>
<tr>
<th>Host Profile Type</th>
<th>Appearance</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>global</td>
<td>Any Operating System</td>
<td>specifies what is allowed to run on target hosts, regardless of operating system</td>
</tr>
<tr>
<td>operating-system specific</td>
<td>is listed in plain text</td>
<td>specifies what is allowed to run on target hosts of a particular operating system</td>
</tr>
</tbody>
</table>
### Operating System-Specific Host Profiles

In a compliance white list, *operating-system specific host profiles* indicate not only which operating systems are allowed to run on your network, but also the application protocols, clients, web applications, and protocols that are allowed to run on those operating systems.

For example, you could require that compliant hosts run a particular version of Microsoft Windows. As another example, you could allow SSH to run on Linux hosts on port 22, and further restrict the vendor and version of the SSH client.

Create one host profile for each operating system you want to allow on your network. To disallow an operating system on your network, do not create a host profile for that operating system. For example, to make sure that all the hosts on your network are running Windows, configure the white list to only contain host profiles for that operating system.

#### Note

Unidentified hosts remain in compliance with all white lists until they are identified. You can, however, create a white list host profile for unknown hosts. *Unidentified* hosts are hosts about which the system has not yet gathered enough information to identify their operating systems. *Unknown* hosts are hosts whose operating systems do not match known fingerprints.

### Shared Host Profiles

In a compliance white list, *shared host profiles* are tied to specific operating systems, but you can use each shared host profile in more than one white list.

For example, you might have offices worldwide with a separate white list for each location, but you want to use the same profile for all hosts running Apple Mac OS X. You can create a shared profile for that operating system and use it in all your white lists.

The default white list uses a special category of shared host profiles, called *built-in host profiles*. These profiles use built-in application protocols, web applications, protocols, and clients. In the compliance white list editor, the system marks these profiles with the built-in host profile icon (🪞).

In a multidomain deployment, the system displays shared host profiles created in the current domain, which you can edit. It also displays shared host profiles from ancestor domains, which you cannot edit. To view and edit shared host profiles created in a lower domain, switch to that domain.

#### Note

If you modify a shared host profile (including built-ins), or modify a built-in application protocol, protocol, or client, your change affects every white list that uses it. If you make unintentional changes to or delete these built-in elements, you can reset to factory defaults.
White List Violation Triggers

The white list compliance of a host can change when the system:

- detects a change in a host’s operating system
- detects an identity conflict for a host’s operating system or an application protocol on the host
- detects a new TCP server port (for example, a port used by SMTP or web servers) active on a host, or a new UDP server running on a host
- detects a change in a discovered TCP or UDP server running on a host, for example, a version change due to an upgrade
- detects a new client or web application running on a host
- drops a client or web application from its database due to inactivity
- detects that a host is communicating with a new network or transport protocol
- detects a new jailbroken mobile device
- detects that a TCP or UDP port has closed or timed out on a host

In addition, you can trigger a compliance change for a host by using the host input feature or the host profile to:

- add a client, protocol, or server to a host
- delete a client, protocol, or server from a host
- set the operating system definition for a host
- change a host attribute for a host so that the host is no longer a valid target

To avoid overwhelming you with events, the system does not generate white list events for non-compliant hosts on its initial evaluation, nor hosts made non-compliant as a result of you modifying an active white list or shared host profile. The violations, however, are still recorded. If you want to generate white list events for all non-compliant targets, purge discovery data. Rediscovering network assets may trigger white list events.

Example: Operating System Compliance

If your white list specifies that only Microsoft Windows hosts are allowed on your network, and the system detects a host running Mac OS X, the system generates a white list event. In addition, the host attribute associated with the white list changes from Compliant to Non-Compliant for that host.

For the host in this example to come back into compliance, one of the following must occur:

- you edit the white list so that the Mac OS X operating system is allowed
- you manually change the operating system definition of the host to Microsoft Windows
- the system detects that the operating system has changed back to Microsoft Windows
Example: Deleting a Non-Compliant Asset from the Network Map

If your white list disallows the use of FTP, and you then delete FTP from the application protocols network map or from an event view, hosts running FTP become compliant. However, if the system detects the application protocol again, the system generates a white list event and the hosts become non-compliant.

Example: Triggering on Complete Information Only

If your white list allows only TCP FTP traffic on port 21, and the system detects indeterminate activity on port 21/TCP, the white list does not trigger. The white list triggers only when the system identifies the traffic as something other than FTP, or you use the host input feature to designate the traffic as non-FTP traffic. The system does not record a violation with only partial information.

Creating a Compliance White List

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you create a white list, the system prompts you to survey your network to create an initial target and to help you characterize compliant hosts.

Procedure

**Step 1**  
Choose Policies > Correlation, then click the White List tab.

**Step 2**  
Click New White List.

**Step 3**  
Optionally, enter the IP Address and Netmask for an initial target network. In a multidomain deployment, choose the Domain where the target network resides.

**Tip**  
To survey the entire monitored network, use the default values of 0.0.0.0/0 and ::/0.

**Note**  
After you choose a domain for the target network, you cannot change it. Targeting a subnet in a higher-level domain targets the same subnet in each of the descendant leaf domains. The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

**Step 4**  
Add the target network:
- Add—To add the target network without a survey, click Add.
- Add and Survey Network—To add and survey the target network, click Add and Survey Network.
- Skip—To create a white list without surveying your network, click Skip.

**Step 5**  
Optionally, enter a new Name and Description for the white list.

**Step 6**  
Optionally, Allow Jailbroken Mobile Devices on your network. Disabling this option causes jailbroken devices to generate white list violations.

**Step 7**  
Add at least one Target Network to the white list, as described in Setting Target Networks for a Compliance White List, on page 1799.
Characterize compliant hosts using **Allowed Host Profiles**:

- **Global Host Profile**—To edit the white list’s global host profile, click **Any Operating System** and proceed as described in Building White List Host Profiles, on page 1800.

- **Edit Surveyed Profiles**—To edit an existing operating system-specific host profile created by a network survey, click its name and proceed as described in Building White List Host Profiles, on page 1800.

- **Create New Profiles**—To create a new operating system-specific host profile for this white list, click the add icon (新增) next to **Allowed Host Profiles**, and proceed as described in Building White List Host Profiles, on page 1800.

- **Add Shared Host Profile**—To add an existing shared host profile to the white list, click **Add Shared Host Profile**, select the shared host profile you want to add, then click **OK**. Shared host profiles appear in italics.

**Step 9**

Click **Save White List**.

### What to do next

- Add the white list to an active correlation policy as described in Configuring Correlation Policies, on page 1810. The system immediately starts evaluating the white list and generating violations.

### Related Topics

- Compliance White List Target Networks, on page 1794
- Creating a Compliance White List Based on Selected Hosts, on page 2203
- Firepower System IP Address Conventions, on page 13

### Setting Target Networks for a Compliance White List

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you add a target network, you can survey it to characterize compliant hosts. This survey populates the white list with one host profile for each operating system detected in the survey. These host profiles allow all the clients, application protocols, web applications, and protocols that the system has detected on the applicable operating systems.

**Procedure**

**Step 1**

In the compliance white list editor, click **Add Target Network**.

**Step 2**

Enter the **IP Address** and **Netmask** for the target network.

**Step 3**

In a multidomain deployment, choose the **Domain** where the target network resides.

**Note**

After you choose a domain for the target network, you cannot change it. Targeting a subnet in a higher-level domain targets the **same** subnet in each of the descendant leaf domains. The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.
Step 4  Add the target network:

- Add — To add the target network without a survey, click Add.
- Add and Survey Network — To add and survey the target network, click Add and Survey Network.

Step 5  Optionally, click the new target to configure it further:

- Name — Enter a new Name.

- Add Networks — To target additional hosts, click the add icon ( ), then enter the IP Address and Netmask. To exclude the network from white list compliance, select Exclude.

- Add Host Attributes — To target hosts with a specific host attribute, click the add icon ( ), then specify the Attribute and its Value.

- Add VLANs — To target a VLAN, click the add icon ( ), then type a VLAN number (for 802.1q VLANs).

- Delete — To remove a target restriction, click the delete icon ( ).

Step 6  To immediately implement all changes made since the last time you saved, click Save White List.

Related Topics

Building White List Host Profiles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Host profiles specify the white list’s compliance criteria, that is, which operating systems, clients, application protocols, web applications, and protocols are allowed to run on the target hosts.

Every white list has a global host profile which is operating-system agnostic. For example, instead of editing multiple Microsoft Windows and Linux host profiles to allow Mozilla Firefox, you can configure the global host profile to allow Firefox regardless of the operating system where it was detected.

You can also configure operating-system specific host profiles, either unique to one white list or shared across white lists.

Note

If you modify a shared host profile (including built-ins), or modify a built-in application protocol, protocol, or client, your change affects every white list that uses it. If you make unintended changes to or delete these built-in elements, you can reset to factory defaults.

Before you begin

- Create or edit a host profile within a white list as described in Editing a Compliance White List, on page 1805, or create or edit a shared host profile as described in Managing Shared Host Profiles, on page 1806.
Procedure

Step 1
In the compliance white list host profile editor, configure a host profile:

- Name — Type a Name.

- Operating System — To restrict the host profile to a specific operating system, use the OS Vendor, OS Name, and Version drop-down lists. Because its purpose is to apply to hosts running any operating system, you cannot restrict a global host profile.

- Application Protocol — To allow an application protocol, click the add icon ( ) and proceed as described in White Listing an Application Protocol, on page 1801.

- Client — To allow a client, click the add icon ( ) and proceed as described in White Listing a Client, on page 1802.

- Web Application — To allow a web application, click the add icon ( ) and proceed as described in White Listing a Web Application, on page 1803.

- Protocol — To allow a protocol, click the add icon ( ) and proceed as described in White Listing a Protocol, on page 1803.

- Delete — To disallow an item you previously allowed, click the delete icon ( ).

- Edit Properties — To edit the properties of an allowed application protocol, client, or protocol, click its name. The changes you make are reflected in every host profile that uses that element.

Tip
Select the appropriate Allow all... check box to allow all application protocols, clients, or web applications for hosts matching this profile.

Step 2
To immediately implement all changes made since the last time you saved, click Save White List (or Save All Profiles if you are editing a shared host profile).

White Listing an Application Protocol

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Using white list host profiles, you can white list application protocols either globally or on specific operating systems. Optionally, you can restrict the application protocol by port, vendor, or version. For example, you could allow a particular version of OpenSSH to run on Linux hosts on port 22/TCP.

Procedure

Step 1
While you are creating or modifying a white list host profile, click the add icon ( ) next to Allowed Application Protocols (or next to Globally Allowed Application Protocols if you are modifying the global host profile).

Step 2
You have two options:
• If the application protocols you want to allow are listed, select them. The web interface lists application protocols that have been allowed or are currently allowed by the white list.

• To allow an application protocol not in the list, select *<New Application Protocol>* and click OK to display the application protocol editor. Select the application protocol Type and Protocol you want to allow. Optionally, restrict the application protocol by port, Vendor, and Version.

  **Note**  
  You must type the vendor and version exactly as they would appear in a table view of applications. If you do not specify a vendor or version, the white list allows all vendors and versions as long as the type and protocol match.

**Step 3** Click OK.

**Step 4** To immediately implement all changes made since the last time you saved, click Save White List.

---

**White Listing a Client**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Using white list host profiles, you can white list clients either globally or on specific operating systems. Optionally, you can require that the client be a specific version. For example, you could allow only Microsoft Internet Explorer 10 to run on Microsoft Windows hosts.

**Procedure**

**Step 1** While you are creating or modifying a white list host profile, click the add icon (’à) next to Allowed Clients (or next to Globally Allowed Clients if you are modifying the global host profile).

**Step 2** You have two options:

• If the clients you want to allow are listed, select them. The web interface lists clients that have been allowed or are currently allowed by the white list.

• To allow a client not in the list, select *<New Client>* and click OK to display the client editor. Select the **Client** you want to allow from the drop-down list, and, optionally, restrict the client to an allowed Version.

  **Note**  
  You must type the version exactly as it would appear in a table view of clients. If you do not specify a version, the white list allows all versions.

**Step 3** Click OK.

**Step 4** To immediately implement all changes made since the last time you saved, click Save White List.
White Listing a Web Application

Using white list host profiles, you can white list web applications either globally or on specific operating systems.

Procedure

**Step 1** While you are creating or modifying a white list host profile, click the add icon (➕) next to **Allowed Web Applications** (or next to **Globally Allowed Web Applications** if you are modifying the global host profile).

**Step 2** Select the web applications you want to allow.

**Step 3** Click **OK**

**Step 4** To immediately implement all changes made since the last time you saved, click **Save White List**.

White Listing a Protocol

Using white list host profiles, you can white list protocols either globally or on specific operating systems. ARP, IP, TCP, and UDP are always allowed to run on any host; you cannot disallow them.

Procedure

**Step 1** While you are creating or modifying a white list host profile, click the add icon (➕) next to **Allowed Protocols** (or next to **Globally Allowed Protocols** if you are modifying the global host profile).

**Step 2** You have two options:

- If the protocols you want to allow are listed, select them. The web interface lists protocols that have been allowed or are currently allowed by the white list.

- To allow a protocol not in the list, select **<New Protocol>** and click **OK** to display the protocol editor. From the **Type** drop-down list, select the protocol type (**Network** or **Transport**), then select the **Protocol** from the drop-down list.

**Tip** Select **Other (manual entry)** to specify a protocol that is not in the list. For network protocols, type the appropriate number as listed in [http://www.iana.org/assignments/ethernet-numbers/](http://www.iana.org/assignments/ethernet-numbers/). For transport protocols, type the appropriate number as listed in [http://www.iana.org/assignments/protocol-numbers/](http://www.iana.org/assignments/protocol-numbers/).

**Step 3** Click **OK**.
Managing Compliance White Lists

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can use the White List page to manage compliance white lists and shared host profiles. The default white list represents recommended settings and uses a special category of shared host profiles, called built-in host profiles.

In a multidomain deployment, the system displays compliance white lists created in the current domain, which you can edit. It also displays selected white lists from ancestor domains, which you cannot edit. To view and edit white lists created in a lower domain, switch to that domain.

**Note**
The system does not display configurations from ancestor domains if the configurations expose information about unrelated domains, including names, managed devices, and so on. The default white list is only available in the Global domain.

**Procedure**

**Step 1** Choose *Policies > Correlation*, then click the *White List* tab.

**Step 2** Manage your compliance white lists:

- **Create** — To create a new white list, click *New White List* and proceed as described in *Creating a Compliance White List*, on page 1798.

- **Delete** — To delete a white list that is not in use, click the delete icon (🗑️), then confirm you want to delete the white list. Deleting a white list also removes its associated host attribute from all hosts on your network. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

- **Edit** — To modify an existing white list, click the edit icon (📝) and proceed as described in *Editing a Compliance White List*, on page 1805. If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

- **Shared Host Profiles** — To manage your white lists’ shared host profiles, click *Edit Shared Profiles* and proceed as described in *Managing Shared Host Profiles*, on page 1806.
Editing a Compliance White List

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you modify and save a compliance white list that is included in an active correlation policy, the system immediately re-evaluates the compliance of the hosts in the white list’s target networks. Although this re-evaluation may bring some hosts into or out of compliance, the system does not generate any white list events.

**Procedure**

**Step 1**
Choose **Policies > Correlation**, then click the **White List** tab.

**Step 2**
Next to the white list you want to modify, click the edit icon (✎).

If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3**
Edit your compliance white list:

- **Name and Description** — To change the name or description, click the white list name in the left panel to display basic white list information, then type the new information.

- **Allow Jailbroken Devices** — To allow jailbroken mobile devices on your network, click the white list name in the left panel to display basic white list information, then enable **Allow Jailbroken Mobile Devices**. Disabling this option causes jailbroken devices to generate white list violations.

- **Add Allowed Host Profile** — To create an operating system-specific host profile for this white list, click the add icon (➕) next to Allowed Host Profiles and proceed as described in Building White List Host Profiles, on page 1800.

- **Add Shared Host Profile** — To add an existing shared host profile to the white list, click **Add Shared Host Profile**, select the shared host profile you want to add, then click **OK**. Shared host profiles appear in italics.

- **Add Target Network** — To add a new target network without surveying its hosts, click the add icon (➕) next to Target Networks and proceed as described in Setting Target Networks for a Compliance White List, on page 1799.

- **Delete Host Profile** — To delete a shared or operating-system specific host profile from the white list, click the delete icon (🗑️) next to the host profile, then confirm your choice. Deleting a shared host profile removes it from the white list, but does not delete the profile or remove it from any other white lists that use it. You cannot delete a white list’s global host profile.

- **Delete Target Network** — To remove a target network from the white list, click the delete icon (🗑️) next to the network, then confirm your choice.

- **Edit Global Host Profile** — To edit the white list’s global host profile, click **Any Operating System** and proceed as described in Building White List Host Profiles, on page 1800.
• Edit Other Host Profile — To edit a shared or operating-system specific host profile, click the host profile’s name and proceed as described in Building White List Host Profiles, on page 1800.

• Edit Target Network — To edit a target network, click the network’s name and proceed as directed in Setting Target Networks for a Compliance White List, on page 1799.

**Step 4**
To immediately implement all changes made since the last time you saved, click **Save White List**.

---

# Managing Shared Host Profiles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a compliance white list, *shared host profiles* are tied to specific operating systems, but you can use each shared host profile in more than one white list. If you create multiple white lists but want to use the same host profile to evaluate hosts running a particular operating system across the white lists, use a shared host profile.

In a multidomain deployment, the system displays shared host profiles created in the current domain, which you can edit. It also displays shared host profiles from ancestor domains, which you cannot edit. To view and edit shared host profiles created in a lower domain, switch to that domain.

---

**Note**
If you modify a shared host profile (including built-ins), or modify a built-in application protocol, protocol, or client, your change affects every white list that uses it. If you make unintended changes to or delete these built-in elements, you can reset to factory defaults.

---

**Procedure**

**Step 1** Choose **Policies > Correlation**, then click the **White List** tab.

**Step 2** Click **Edit Shared Profiles**.

**Step 3** Manage your shared host profiles:

- Create Shared Host Profile — To create a new shared host profile without surveying hosts, click the add icon (➕) next to Shared Host Profiles and proceed as described in Building White List Host Profiles, on page 1800.

- Create Shared Host Profile by Survey — To create multiple new shared host profiles by surveying a network, click **Add Target Network** and proceed as described in Setting Target Networks for a Compliance White List, on page 1799.

- Delete — To delete a shared host profile, click the delete icon (🗑️), then confirm your choice.

- Edit — To modify an existing shared host profile (including a built-in shared host profile), click its name and proceed as described in Building White List Host Profiles, on page 1800.
• Reset Built-In Host Profiles — To reset all built-in host profiles to factory defaults, click **Built-in Host Profiles**, then click **Reset to Factory Defaults** and confirm your choice.

**Step 4**
To immediately implement all changes made since the last time you saved, click **Save All Profiles**.
CHAPTER 91

Correlation Policies

The following topics describe how to configure correlation policies and rules.

• Introduction to Correlation Policies and Rules, on page 1809
• Configuring Correlation Policies, on page 1810
• Configuring Correlation Rules, on page 1813
• Configuring Correlation Response Groups, on page 1844

Introduction to Correlation Policies and Rules

You can use the correlation feature to respond in real time to threats to your network, using correlation policies.

A correlation policy violation occurs when the activity on your network triggers either a correlation rule or compliance white list within an active correlation policy.

Correlation Rules

When a correlation rule in an active correlation policy triggers, the system generates a correlation event. Correlation rules can trigger when:

• The system generates a specific type of event (connection, intrusion, malware, discovery, user activity, and so on).

• Your network traffic deviates from its normal profile.

You can constrain correlation rules in the following ways:

• Add a host profile qualification to constrain the rule using information from the host profile of a host involved in the triggering event.

• Add a connection tracker to a correlation rule so that after the rule’s initial criteria are met, the system begins tracking certain connections. Then, a correlation event is generated only if the tracked connections meet additional criteria.

• Add a user qualification to a correlation rule to track certain users or groups of users. For example, you can constrain a correlation rule so that it triggers only for a particular user's traffic, or traffic from a specific department.
• Add snooze periods. When a correlation rule triggers, a snooze period causes that rule not to trigger again for a specified interval. After the snooze period elapses, the rule can trigger again and start a new snooze period.

• Add inactive periods. During inactive periods, correlation rules do not trigger.

Although you can configure correlation rules without licensing your deployment, rules that use unlicensed components do not trigger.

**Compliance White Lists**

A compliance white list specifies which operating systems, applications (web and client), and protocols are allowed on hosts on your network. When a host violates a white list used in an active correlation policy, the system generates a white list event.

**Correlation Responses**

*Responses* to correlation policy violations include simple alerts and various remediations (such as scanning a host). You can associate each correlation rule or white list with a single response or group of responses.

If network traffic triggers multiple rules or white lists, the system launches all the responses associated with each rule and white list.

**Correlation and Multitenancy**

In a multidomain deployment, you can create correlation policies at any domain level, using whatever rules, white lists, and responses are available at that level. Higher-level domain administrators can perform correlation within or across domains:

• Constraining a correlation rule by domain matches events reported by that domain’s descendants.

• Higher-level domain administrators can create compliance white lists that evaluate hosts across domains. You can target different subnets in different domains in the same white list.

**Note**

The system builds a separate network map for each leaf domain. Using literal configurations (such as IP addresses, VLAN tags, and usernames) to constrain cross-domain correlation rules can have unexpected results.

## Configuring Correlation Policies

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>
Use correlation rules, compliance white lists, alert responses, and remediations to build correlation policies. In a multidomain deployment, you can create correlation policies at any domain level, using whatever constituent configurations are available at that level.

You can assign a priority to each correlation policy, and to each rule and white list used in that policy. Rule and white list priorities override correlation policy priorities. If network traffic violates the correlation policy, the resultant correlation events display the policy priority value, unless the violated rule or white list has its own priority.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Policies &gt; Correlation.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Create Policy.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter a Policy Name and Policy Description.</td>
</tr>
<tr>
<td>Step 4</td>
<td>From the Default Priority drop-down list, choose a priority for the policy. Choose None to use rule priorities only.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Click Add Rules, check the rules and white lists that you want to use in the policy, then click Add.</td>
</tr>
<tr>
<td>Step 6</td>
<td>From the Priority list for each rule or white list, choose a priority:</td>
</tr>
<tr>
<td></td>
<td>• A priority value from 1 to 5</td>
</tr>
<tr>
<td></td>
<td>• None</td>
</tr>
<tr>
<td></td>
<td>• Default to use the policy’s default priority</td>
</tr>
<tr>
<td>Step 7</td>
<td>Add responses to rules and white lists as described in Adding Responses to Rules and White Lists, on page 1811.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Click Save.</td>
</tr>
</tbody>
</table>

**What to do next**

• Activate the policy by clicking the slider.

**Adding Responses to Rules and White Lists**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

You can associate each correlation rule or white list with a single response or group of responses. If network traffic triggers multiple rules or white lists, the system launches all the responses associated with each rule and white list. Note that an Nmap remediation does not launch when used as a response to a traffic profile change.

In a multidomain deployment, you can use responses created in the current domain or in ancestor domains.
Managing Correlation Policies

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
</tbody>
</table>

Changes made to active correlation policies take effect immediately.

When you activate a correlation policy, the system immediately begins processing events and triggering responses. Note that the system does not generate white list events for non-compliant hosts on its initial, post-activation evaluation.

In a multidomain deployment, the system displays correlation policies created in the current domain, which you can edit. It also displays selected correlation policies from ancestor domains, which you cannot edit. To view and edit correlation policies created in a lower domain, switch to that domain.

The system does not display configurations from ancestor domains if the configurations expose information about unrelated domains, including names, managed devices, and so on.

Procedure

**Step 1** Choose Policies > Correlation.

**Step 2** Manage your correlation policies:

- **Activate or Deactivate** — Click the slider. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- **Create** — Click Create Policy; see Configuring Correlation Policies, on page 1810.
- **Edit** — Click the edit icon ( ); see Configuring Correlation Policies, on page 1810. If a view icon ( ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Related Topics

- Firepower Management Center Alert Responses, on page 1905
- Introduction to Remediations, on page 1859

Procedure

**Step 1** In the correlation policy editor, next to a rule or white list where you want to add responses, click the responses icon ( ● ).

**Step 2** Under Unassigned Responses, choose the responses you want to launch when the rule or white list triggers, and click the up arrow ( ▲ ).

**Step 3** Click Update.
Configuring Correlation Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

A simple correlation rule requires only that an event of a certain type occurs. You do not need to provide more specific conditions. For example, correlation rules based on traffic profile changes do not require conditions. You can also create complex correlation rules, with multiple conditions and added constraints.

When you create correlation rule trigger criteria, host profile qualifications, user qualifications, or connection trackers, the syntax varies but the mechanics remain consistent.

Note

In a multidomain deployment, constraining a correlation rule by an ancestor domain matches events reported by that domain's descendants.

Before you begin

- Confirm that your deployment is collecting the type of information you want to use to trigger correlation events. For example, the information available for any individual connection or connection summary event depends on several factors, including the detection method, the logging method, and event type. The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1649.

Procedure

Step 1  Choose Policies > Correlation, then click the Rule Management tab.
Step 2  Click Create Rule.
Step 3  Enter a Rule Name and Rule Description.
Step 4  Optionally, choose a Rule Group for the rule.
Step 5  Choose a base event type and, optionally, specify additional trigger criteria for the correlation rule. You can choose the following base event types:

- **an intrusion event occurs**—See Syntax for Intrusion Event Trigger Criteria, on page 1814.
- **a malware event occurs**—See Syntax for Malware Event Trigger Criteria, on page 1817.
- **a discovery event occurs**—See Syntax for Discovery Event Trigger Criteria, on page 1818.
- **user activity is detected**—See Syntax for User Activity Event Trigger Criteria, on page 1821.
- **a host input event occurs**—See Syntax for Host Input Event Trigger Criteria, on page 1822.
- **a connection event occurs**—See Syntax for Connection Event Trigger Criteria, on page 1823.
• a traffic profile changes—See Syntax for Traffic Profile Changes, on page 1826.

**Step 6**
Optionally, further constrain the correlation rule by adding any or all of the following:

- Host Profile Qualification—Click Add Host Profile Qualification; see Syntax for Correlation Host Profile Qualifications, on page 1828.
- Connection Tracker—Click Add Connection Tracker; see Connection Trackers, on page 1832.
- User Qualification—Click Add User Qualification; see Syntax for User Qualifications, on page 1831.
- Snooze Period—Under Rule Options, use the Snooze text field and drop-down list to specify the interval that the system should wait to trigger a correlation rule again, after the rule triggers.
- Inactive Period—Under Rule Options, click Add Inactive Period. Using the text field and drop-down lists, specify when and how often you want the system to refrain from evaluating network traffic against the correlation rule.

**Tip** To remove a snooze period, specify an interval of 0 (seconds, minutes, or hours).

**Step 7**
Click Save Rule.

---

**Example Simple Correlation Rule**
The following simple correlation rule triggers if a new host is detected in a specific subnet. Note that when the category represents an IP address, choosing *is in* or *is not in* as the operator allows you to specify whether the IP address *is in* or *is not in* a block of IP addresses, as expressed in special notation such as CIDR.

![Select the type of event for this rule](image)

**What to do next**
• Use the rule in correlation policies as described in Configuring Correlation Policies, on page 1810.

**Related Topics**
- Managing Correlation Rules, on page 1843
- Correlation Rule Building Mechanics, on page 1840
- Snooze and Inactive Periods, on page 1840
- Differences between NetFlow and Managed Device Data, on page 1649

**Syntax for Intrusion Event Trigger Criteria**
The following table describes how to build a correlation rule condition when you choose an intrusion event as the base event.
### Table 224: Syntax for Intrusion Events

<table>
<thead>
<tr>
<th>If you specify...</th>
<th>Choose an operator, then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Control Policy</td>
<td>Choose one or more access control policies that use the intrusion policy that generated the intrusion event.</td>
</tr>
<tr>
<td>Access Control Rule Name</td>
<td>Enter all or part of the name of the access control rule that uses the intrusion policy that generated the intrusion event.</td>
</tr>
<tr>
<td>Application Protocol</td>
<td>Choose one or more application protocols associated with the intrusion event.</td>
</tr>
<tr>
<td>Application Protocol Category</td>
<td>Choose one or more category of application protocol.</td>
</tr>
<tr>
<td>Classification</td>
<td>Choose one or more classifications.</td>
</tr>
<tr>
<td>Client</td>
<td>Choose one or more clients associated with the intrusion event.</td>
</tr>
<tr>
<td>Client Category</td>
<td>Choose one or more category of client.</td>
</tr>
<tr>
<td>Destination Country or Source</td>
<td>Choose one or more countries associated with the source or destination IP address in the intrusion event.</td>
</tr>
<tr>
<td>Country</td>
<td>Enter a single IP address or address block.</td>
</tr>
<tr>
<td>Destination IP, Source IP, Both</td>
<td>Enter the port number or ICMP type for source traffic or the port number or ICMP code for destination traffic.</td>
</tr>
<tr>
<td>Source IP and Destination IP, or</td>
<td></td>
</tr>
<tr>
<td>Either Source IP or Destination IP</td>
<td></td>
</tr>
<tr>
<td>Destination Port/ICMP Code or</td>
<td>Choose one or more devices that may have generated the event.</td>
</tr>
<tr>
<td>Source Port/ICMP Type</td>
<td>Choose one or more interfaces.</td>
</tr>
<tr>
<td>Domain</td>
<td>Choose one or more domains. In a multidomain deployment, constraining by an ancestor domain matches data reported by that domain's descendants. This field is only present if you have ever configured the Firepower Management Center for multitenancy.</td>
</tr>
<tr>
<td>Egress Interface or Ingress</td>
<td>Choose one or more security zones or tunnel zones.</td>
</tr>
<tr>
<td>Interface</td>
<td></td>
</tr>
<tr>
<td>Egress Security Zone or Ingress</td>
<td></td>
</tr>
<tr>
<td>Security Zone</td>
<td></td>
</tr>
<tr>
<td>Generator ID</td>
<td>Choose one or more preprocessors.</td>
</tr>
<tr>
<td>Impact Flag</td>
<td>Choose the impact level assigned to the intrusion event. The impact level defines the severity of the event and can be used for triage and prioritization. The impact levels are: Normal, Caution, Alert, and Critical.</td>
</tr>
</tbody>
</table>

Because no operating system information is available for hosts added to the network map from NetFlow data, the system cannot assign Vulnerable (impact level 1: red) impact levels for intrusion events involving those hosts. In such cases, use the host input feature to manually set the operating system identity for the hosts.
<table>
<thead>
<tr>
<th>If you specify...</th>
<th>Choose an operator, then...</th>
</tr>
</thead>
</table>
| Inline Result                     | Choose whether the system dropped or would have dropped packets as a result of the intrusion policy violation.  
   The system can drop packets in an inline, switched, or routed deployment. It does not drop packets in a passive deployment, including when an inline set is in tap mode, regardless of intrusion rule state or the drop behavior of the intrusion policy. |
| Intrusion Policy                  | Choose one or more intrusion policies that generated the intrusion event.                     |
| IOC Tag                           | Choose whether an indication of compromise tag was set as a result of the intrusion event.   |
| Priority                          | Choose the rule priority.  
   For rule-based intrusion events, the priority corresponds to either the value of the priority keyword or the value for the classtype keyword. For other intrusion events, the priority is determined by the decoder or preprocessor. |
| Protocol                          | Enter the name or number of the transport protocol as listed in http://www.iana.org/assignments/protocol-numbers. |
| Rule Message                      | Enter all or part of the rule message.                                                      |
| Rule SID                          | Enter a single Snort ID (SID) or multiple SIDs separated by commas.  
   If you choose is in or is not in as the operator, you cannot use the multi-selection pop-up window. You must enter a comma-separated list of SIDs. |
| Rule Type                         | Specify whether the rule is local.  
   Local rules include custom standard text intrusion rules, standard text rules that you modified, and any new instances of shared object rules created when you saved the rule with modified header information. |
| SSL Actual Action                 | Choose the SSL rule action that indicates how the system handled an encrypted connection. |
| SSL Certificate Fingerprint       | Enter the fingerprint of the certificate used to encrypt the traffic, or choose a subject common name associated with the fingerprint. |
| SSL Certificate Subject Common Name (CN) | Enter all or part of the subject common name of the certificate used to encrypt the session. |
| SSL Certificate Subject Country (C) | Choose one or more subject country codes of the certificate used to encrypt the session. |
| SSL Certificate Subject Organization (O) | Enter all or part of the subject organization name of the certificate used to encrypt the session. |
| SSL Certificate Subject Organizational Unit (OU) | Enter all or part of the subject organizational unit name of the certificate used to encrypt the session. |
| SSL Flow Status                   | Choose one or more statuses based on the result of the system’s attempt to decrypt the traffic. |
| Username                          | Enter the username of the user logged into the source host in the intrusion event.          |
| VLAN ID                           | Enter the innermost VLAN ID associated with the packet that triggered the intrusion event.   |
Syntax for Malware Event Trigger Criteria

To base a correlation rule on a malware event, first specify the type of malware event you want to use. Your choice determines the set of trigger criteria you can use. You can choose:

• **by endpoint-based malware detection** (AMP for Endpoints)

• **by network-based malware detection** (AMP for Networks)

• **by retrospective network-based malware detection** (AMP for Networks)

The following table describes how to build a correlation rule condition when you choose a malware event as the base event.

**Table 225: Syntax for Malware Events**

<table>
<thead>
<tr>
<th>If you specify...</th>
<th>Choose an operator, then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Protocol</td>
<td>Choose one or more application protocols associated with the malware event.</td>
</tr>
<tr>
<td>Application Protocol Category</td>
<td>Choose one or more category of application protocol.</td>
</tr>
<tr>
<td>Client</td>
<td>Choose one or more clients associated with the malware event.</td>
</tr>
<tr>
<td>Client Category</td>
<td>Choose one or more category of client.</td>
</tr>
<tr>
<td>Destination Country or Source Country</td>
<td>Choose one or more countries associated with the source or destination IP address in the malware event.</td>
</tr>
<tr>
<td>Destination IP, Host IP, or Source IP</td>
<td>Enter a single IP address or address block.</td>
</tr>
<tr>
<td>Destination Port/ICMP Code</td>
<td>Enter the port number or ICMP code for destination traffic.</td>
</tr>
<tr>
<td>Disposition</td>
<td>Choose either or both <strong>Malware</strong> or <strong>Custom Detection</strong>.</td>
</tr>
<tr>
<td>Domain</td>
<td>Choose one or more domains. In a multidomain deployment, constraining by an ancestor domain matches data reported by that domain's descendants. This field is only present if you have ever configured the Firepower Management Center for multitenancy.</td>
</tr>
<tr>
<td>Event Type</td>
<td>Choose one or more event types associated with the endpoint-based malware event.</td>
</tr>
</tbody>
</table>
### Syntax for Discovery Event Trigger Criteria

To base a correlation rule on a discovery event, first specify the type of discovery event you want to use. Your choice determines the set of trigger criteria you can use. The following table lists the discovery event types you can choose.

You cannot trigger a correlation rule on hops changes, or when the system drops a new host due to reaching the host limit. You can, however, choose **there is any type of event** to trigger the rule when any type of discovery event occurs.

<table>
<thead>
<tr>
<th>If you specify...</th>
<th>Choose an operator, then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Name</td>
<td>Enter the name of the file.</td>
</tr>
<tr>
<td>File Type</td>
<td>Choose the file type.</td>
</tr>
<tr>
<td>File Type Category</td>
<td>Choose one or more file type categories.</td>
</tr>
<tr>
<td>IOC Tag</td>
<td>Choose whether an indication of compromise tag <strong>is</strong> or <strong>is not</strong> set as a result of the malware event.</td>
</tr>
<tr>
<td>SHA-256</td>
<td>Enter or paste the SHA-256 hash value of the file.</td>
</tr>
<tr>

**Syntax for Traffic Profile Changes**

To base a correlation rule on a traffic profile change, first choose the traffic profile you want to use. The rule triggers when network traffic deviates from the pattern characterized by the profile you choose.

You can trigger the rule based on either raw data or on the statistics calculated from the data. For example, you could write a rule that triggers if the amount of data traversing your network (measured in bytes) suddenly...
spikes, which could indicate an attack or other security policy violation. You could specify that the rule trigger if either:

- the number of bytes traversing your network spikes above a certain number of bytes
- the number of bytes traversing your network spikes above a certain number of standard deviations above or below the mean amount of traffic

Note that to create a rule that triggers when the number of bytes traversing your network falls outside a certain number of standard deviations (whether above or below), you must specify upper and lower bounds, as shown in the following graphic.

To create a rule that triggers when the number of bytes traversing is greater than a certain number of standard deviations above the mean, use only the first condition shown in the graphic.

To create a rule that triggers when the number of bytes traversing is greater than a certain number of standard deviations below the mean, use only the second condition.

Check the use velocity data check box to trigger the correlation rule based on rates of change between data points. If you wanted to use velocity data in the above example, you could specify that the rule triggers if either:

- the change in the number of bytes traversing your network spikes above or below a certain number of standard deviations above the mean rate of change
- the change in the number of bytes traversing your network spikes above a certain number of bytes

The following table describes how to build a condition in a correlation rule when you choose a traffic profile change as the base event.

**Table 232: Syntax for Traffic Profile Changes**

</tbody>
</table>
### Syntax for Correlation Host Profile Qualifications

To constrain a correlation rule based on the host profile of a host involved in the event, add a *host profile qualification*. You cannot add a host profile qualification to a correlation rule that triggers on a malware event, traffic profile change, or on the detection of a new IP host.

When you build a host profile qualification, first specify the host you want to use to constrain your correlation rule. The host you can choose depends on the rule's base event type:

- **connection event** — Choose `Responder Host` or `Initiator Host`.
- **intrusion event** — Choose `Destination Host` or `Source Host`.

**Using Implied or Generic Clients to Build a Host Profile Qualification**

When system reports a detected client using an application protocol name followed by client (for example, HTTPS client), that client is an implied or generic client. In these cases, the system has not detected a particular client, but is inferring the existence of a client based on server response traffic.

To create a host profile qualification using an implied or generic client, constrain using the application protocol running on the responder host, not the client.

**Using Event Data to Build a Host Profile Qualification**

You can often use data from the correlation rule's base event when constructing a host profile qualification.

For example, assume your correlation rule triggers when the system detects the use of a particular browser on one of your monitored hosts. Further assume that when you detect this use, you want to generate an event if the browser version is not the latest.

You could add a host profile qualification to this correlation rule so that the rule triggers only if the Client is the Event Client, but the Client Version is not the latest version.

**Example Host Profile Qualification**

The following host profile qualification constrains a correlation rule so the rule triggers only if the host involved in the discovery event on which the rule is based is running a version of Microsoft Windows.
If you are using a connection, intrusion, discovery, or host input event to trigger your correlation rule, you can constrain the rule based on the identity of a user involved in the event. This constraint is called a user qualification. For example, you could constrain a correlation rule so that it triggers only when the identity of the source or destination user is one from the sales department.

You cannot add a user qualification to a correlation rule that triggers on a traffic profile change or on the detection of user activity. Also, the system obtains user details through the Firepower Management Center-server connection established in an identity realm. This information may not be available for all users in the database.

When you build a user qualification, first specify the identity you want to use to constrain your correlation rule. The identity you can choose depends on the rule's base event type:

- connection event — Choose **Identity on Initiator** or **Identity on Responder**.
- intrusion event — Choose **Identity on Destination** or **Identity on Source**.
- discovery event — Choose **Identity on Host**.
- host input event — Choose **Identity on Host**.

The following table describes how to build a user qualification for a correlation rule.

<table>

**Connection Trackers**

A *connection tracker* constrains a correlation rule so that after the rule’s initial criteria are met (including host profile and user qualifications), the system begins tracking certain connections. The system generates a correlation event for the rule if the tracked connections meet additional criteria gathered over a time period that you specify.

---

**Tip**

Connection trackers typically monitor very specific traffic and, when triggered, run only for a finite, specified time. Compare connection trackers with traffic profiles, which typically monitor a broad range of network traffic and run persistently.

There are two ways a connection tracker can generate an event.

**Connection Trackers That Fire Immediately When Conditions Are Met**

You can configure a connection tracker so that the correlation rule fires as soon as network traffic meets the tracker’s conditions. When this happens, the system stops tracking connections for this connection tracker instance, even if the timeout period has not expired. If the same type of policy violation that triggered the correlation rule occurs again, the system creates a new connection tracker.

However, if time expires before network traffic meets the conditions in the connection tracker, the system does not generate a correlation event, and also stops tracking connections for that rule instance.

For example, a connection tracker can serve as a kind of event threshold by generating a correlation event only if a certain type of connection occurs more than a specific number of times within a specific time period. Or, you can generate a correlation event only if the system detects excessive data transfer after an initial connection.

**Connection Trackers That Fire at the End of the Timeout Period**

You can configure a connection tracker so that it relies on data collected over the entire timeout period, and therefore cannot fire until the end of the timeout period.

For example, if you configure a connection tracker to fire if you detect fewer than a certain number of bytes being transferred during a certain time period, the system waits until that time period passes and then generates an event if network traffic met that condition.
## Adding a Connection Tracker

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

### Before you begin

- Create a correlation rule based on a connection, intrusion, discovery, user identity, or host input event. You cannot add a connection tracker to a rule based on a malware event or traffic profile change.

### Procedure

**Step 1**  
In the correlation rule editor, click **Add Connection Tracker**.

**Step 2**  
Specify the connections to track; see **Syntax for Connection Trackers**, on page 1833.

**Step 3**  
Based on the tracked connections, specify when you want to generate a correlation event; see **Syntax for Connection Tracker Events**, on page 1836.

**Step 4**  
Specify the interval (in seconds, minutes, or hours) during which the tracker's conditions must be met.

### Syntax for Connection Trackers

The following table describes how to build a connection tracker condition that specifies the kind of connections you want to track.

**Table 235: Syntax for Connection Trackers**

<table>
<thead>
<tr>
<th>If you specify...</th>
<th>Choose an operator, then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Control Policy</td>
<td>Choose one or more access control policies that handled the connections you want to track.</td>
</tr>
</tbody>
</table>
| Access Control Rule Action         | Choose one or more access control rule actions associated with the access control rule that logged the connections you want to track.  
                                        | Choose **Monitor** to track connections that match the conditions of any Monitor rule, regardless of the rule or default action that later handles the connections. |
| Access Control Rule Name           | Enter all or part of the name of the access control rule that logged the connections you want to track.  
                                        | To track connections that match a Monitor rule, enter the name of the Monitor rule. The system tracks the connections, regardless of the rule or default action that later handles them. |
| Application Protocol               | Choose one or more application protocols. |

---

**Using Event Data to Build a Connection Tracker**

You can often use data from the correlation rule's base event when constructing a connection tracker.

For example, assume your correlation rule triggers when the system detects a new client. When you add a connection tracker to this type of correlation rule, the system automatically populates the tracker with constraints that refer to the base event:

- The **Initiator/Responder IP** is set to the **Event IP Address**.
- The **Client** is set to the **Event Client**.
To track connections for a specific IP address or block of IP addresses, click **switch to manual entry** to manually specify the IP. Click **switch to event fields** to go back to using the IP address in the event.

**Related Topics**
- Connection and Security Intelligence Event Fields, on page 2053
- Firepower System IP Address Conventions, on page 13

### Syntax for Connection Tracker Events

The following table describes how to build a connection tracker condition that specifies when you want to generate a correlation event based on the connections you are tracking.

**Table 236: Syntax for Connection Tracker Events**

<table>

</tbody>
</table>

### Sample Configuration for Excessive Connections From External Hosts

Consider a scenario where you archive sensitive files on network 10.1.0.0/16, and where hosts outside this network typically do not initiate connections to hosts inside the network. An occasional connection initiated from outside the network might occur, but you have determined that when four or more connections are initiated within two minutes, there is cause for concern.
The rule shown in the following graphic specifies that when a connection occurs from outside the 10.1.0.0/16 network to inside the network, the system begins tracking connections that meet that criterion. The system then generates a correlation event if the system detects four connections (including the original connection) within two minutes that match that signature.

The following diagram shows how network traffic can trigger the above correlation rule.

In this example, the system detected a connection that met the basic conditions of the correlation rule, that is, the system detected a connection from a host outside the 10.1.0.0/16 network to a host inside the network. This created a connection tracker.

The connection tracker is processed in the following stages:

- First, the system starts tracking connections when it detects a connection from Host A outside the network to Host 1 inside the network.
- The system detects two more connections that match the connection tracker signature: Host B to Host 2 and Host C to Host 1.
• The system detects a fourth qualifying connection when Host A connects to Host 3 within the two-minute time limit. The rule conditions are met.
• Finally, the system generates a correlation event and the system stops tracking connections.

Sample Configuration for Excessive BitTorrent Data Transfers

Consider a scenario where you want to generate a correlation event if the system detects excessive BitTorrent data transfers after an initial connection to any host on your monitored network.

The following graphic shows a correlation rule that triggers when the system detects the BitTorrent application protocol on your monitored network. The rule has a connection tracker that constrains the rule so that the rule triggers only if hosts on your monitored network (in this example, 10.1.0.0/16) collectively transfer more than 7MB of data (7340032 bytes) via BitTorrent in the five minutes following the initial policy violation.

The following diagram shows how network traffic can trigger the above correlation rule.
In this example, the system detected the BitTorrent TCP application protocol on two different hosts: Host 1 and Host 2. These two hosts transmitted data via BitTorrent to four other hosts: Host A, Host B, Host C, and Host D.

This connection tracker is processed in the following stages:

- First, the system starts tracking connections at the 0-second marker when the system detects the BitTorrent application protocol on Host 1. Note that the connection tracker will expire if the system does not detect 7MB of BitTorrent TCP data being transmitted in the next 5 minutes (by the 300-second marker).

- At 5 seconds, Host 1 has transmitted 3MB of data that matches the signature:
  - 1MB from Host 1 to Host A, at the 1-second marker (1MB total BitTorrent traffic counted towards fulfilling the connection tracker)
  - 2MB from Host 1 to Host B, at the 5-second marker (3MB total)

- At 7 seconds, the system detects the BitTorrent application protocol on Host 2 and starts tracking BitTorrent connections for that host as well.

- At 20 seconds, the system has detected additional data matching the signature being transmitted from both Host 1 and Host 2:
  - 1MB from Host 2 to Host A, at the 10-second marker (4MB total)
  - 2MB from Host 1 to Host C, at the 15-second marker (6MB total)
  - 1MB from Host 2 to Host B, at the 20-second marker (7MB total)
• Although Host 1 and Host 2 have now transmitted a combined 7MB of BitTorrent data, the rule does not trigger because the total number of bytes transmitted must be more than 7MB (Responder Bytes are greater than 7340032). At this point, if the system were to detect no additional BitTorrent transfers for the remaining 280 seconds in the tracker’s timeout period, the tracker would expire and the system would not generate a correlation event.

• However, at 30 seconds, the system detects another BitTorrent transfer, and the rule conditions are met:
  • 2MB from Host 1 to Host D at the 30-second marker (9MB total)

• Finally, the system generates a correlation event. The system also stops tracking connections for this connection tracker instance, even though the 5-minute period has not expired. If the system detects a new connection using the BitTorrent TCP application protocol at this point, it will create a new connection tracker. Note that the system generates the correlation event after Host 1 transmits the entire 2MB to Host D, because it does not tally connection data until the session terminates.

Snooze and Inactive Periods

You can configure snooze periods in correlation rules. When a correlation rule triggers, a snooze period instructs the system to stop firing that rule for a specified interval, even if the rule is violated again during the interval. When the snooze period has elapsed, the rule can trigger again (and start a new snooze period).

For example, you may have a host on your network that should never generate traffic. A simple correlation rule that triggers whenever the system detects a connection involving that host may create multiple correlation events in a short period of time, depending on the network traffic to and from the host. To limit the number of correlation events exposing your policy violation, you can add a snooze period so that the system generates a correlation event only for the first connection (within a time period that you specify) that the system detects involving that host.

You can also set up inactive periods in correlation rules. During inactive periods, the correlation rule will not trigger. You can set up inactive periods to recur daily, weekly, or monthly. For example, you might perform a nightly Nmap scan on your internal network to look for host operating system changes. In that case, you could set a daily inactive period on the affected correlation rules for the time and duration of your scan so that those rules do not trigger erroneously.

Correlation Rule Building Mechanics

You build a correlation rule by specifying the conditions under which it triggers. The syntax you can use within conditions varies depending on the element you are creating, but the mechanics are the same.

Most conditions have three parts: a category, an operator, and a value:

• The categories you can choose depend on whether you are building correlation rule triggers, a host profile qualification, a connection tracker, or a user qualification. Within correlation rule triggers, the categories further depend on the base event type for the rule. Some conditions may contain several categories, each of which may have their own operators and values.

• A condition’s available operators depend on the category.

• The syntax you can use to specify a condition’s value depends on the category and operator. Sometimes you type the value in a text field. Other times, you can choose a value (or multiple values) from a drop-down list.
For example, if you want to generate a correlation event every time a new host is detected, you can create a simple rule with no conditions.

If you want to further constrain the rule and generate an event only if that new host was detected on the 10.4.x.x network, you can add a single condition.

When your construct includes more than one condition, you must link them with an AND or an OR operator. Conditions on the same level are evaluated together:

- The AND operator requires that all conditions on the level it controls must be met.
- The OR operator requires that at least one of the conditions on the level it controls must be met.

The following rule, which detects SSH activity on a nonstandard port on the 10.4.x.x network and the 192.168.x.x network, has four conditions, with the bottom two constituting a complex condition.

Logically, the rule is evaluated as follows:

\[(A \text{ and } B \text{ and } (C \text{ or } D))\]

<table>
<thead>
<tr>
<th>Where...</th>
<th>Is the condition that states...</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Application Protocol is SSH</td>
</tr>
<tr>
<td>B</td>
<td>Application Port is not 22</td>
</tr>
<tr>
<td>C</td>
<td>IP Address is in 10.0.0.0/8</td>
</tr>
<tr>
<td>D</td>
<td>IP Address is in 196.168.0.0/16</td>
</tr>
</tbody>
</table>
Evaluating complex correlation rules that trigger on frequently occurring events can degrade system performance. For example, a multicondition rule that the system must evaluate against every logged connection can cause resource overload.

### Adding and Linking Conditions in Correlation Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**

In the correlation rule editor, add a simple or complex condition:

- Simple — Click **Add condition**.
- Complex — Click **Add complex condition**.

**Step 2**

Link conditions by choosing the **AND** or **OR** operator from the drop-down list to the left of the conditions.

**Example: Simple vs Complex Conditions**

The following graphic shows a correlation rule with two simple conditions joined by the **OR** operator.

The following graphic shows a correlation rule with one simple condition and one complex condition, joined by the **OR** operator. The complex condition comprises two simple conditions joined by the **AND** operator.
Using Multiple Values in Correlation Rule Conditions

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>SupportedDomains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

When you are building a correlation condition, and the condition syntax allows you to pick a value from a drop-down list, you can often use multiple values from the list.

**Procedure**

**Step 1** In the correlation rule editor, build a condition, choosing *is in* or *is not in* as the operator.

**Step 2** Click anywhere in the text field or on the *Edit* link.

**Step 3** Under *Available*, choose multiple values. You can also click and drag to choose multiple adjacent values.

**Step 4** Click the right arrow (>) to move the selected entries to *Selected*.

**Step 5** Click *OK*.

Managing Correlation Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>SupportedDomains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays correlation rules and groups created in the current domain, which you can edit. It also displays selected correlation rules and groups from ancestor domains, which you cannot edit. To view and edit correlation rules and groups created in a lower domain, switch to that domain.

**Note**

The system does not display configurations from ancestor domains if the configurations expose information about unrelated domains, including names, managed devices, and so on.

Changes made to rules in active correlation policies take effect immediately.

**Before you begin**

- If you want to delete a rule, delete it from all correlation policies, as described in Managing Correlation Policies, on page 1812.

**Procedure**

**Step 1** Choose *Policies > Correlation*, then click the *Rule Management* tab.

**Step 2** Manage your rules:
• Create — Click Create Rule; see Configuring Correlation Rules, on page 1813.
• Create Group — Click Create Group, enter a name for the group, and click Save. To add a rule to a group, edit the rule.
• Edit — Click the edit icon (; see Configuring Correlation Rules, on page 1813. If a view icon appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
• Delete Rule or Rule Group — Click the delete icon (;). Deleting a rule group ungroups the rules. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

---

## Configuring Correlation Response Groups

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can create a *correlation response group* of alerts and remediations, then activate and assign the group to a correlation rule within an active correlation policy. The system launches all the grouped responses when network traffic matches the correlation rule.

When used in an active correlation policy, changes to an active group or any of its grouped responses take effect immediately.

**Procedure**

**Step 1** Choose Policies > Correlation, then click Groups.
**Step 2** Click Create Group.
**Step 3** Enter a Name.
**Step 4** Check the Active check box if you want to activate the group upon creation.

Deactivated groups do not launch responses.

**Step 5** Choose the Available Responses to group. then click the right arrow (>) to move them to the Responses in Group. To move responses the other way, use the left arrow (<).

**Step 6** Click Save.

**What to do next**

• If you did not activate the group upon creation and you want to activate it now, click the slider.

**Related Topics**

Firepower Management Center Alert Responses, on page 1905
Introduction to Remediations, on page 1859
Managing Correlation Response Groups

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

You can delete a response group if it is not used in a correlation policy. Deleting a response group ungroups its responses. You can also temporarily deactivate a response group without deleting it. This leaves the group on the system but does not launch it when policies are violated.

In a multidomain deployment, the system displays groups created in the current domain, which you can edit. It also displays groups created in ancestor domains, which you cannot edit. To view and edit groups created in a lower domain, switch to that domain.

Changes made to active, in-use response groups take effect immediately.

Procedure

**Step 1** Choose Policies &gt; Correlation, then click Groups.
**Step 2** Manage response groups:
- Activate or Deactivate — Click the slider. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Create — Click Create Group; see Configuring Correlation Response Groups, on page 1844.
- Edit — Click the edit icon ( strokeWidth ). See Configuring Correlation Response Groups, on page 1844. If a view icon ( strokeWidth ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Delete — Click the delete icon ( strokeWidth ). If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
Traffic Profiling

The following topics describe how to configure traffic profiles:

- Introduction to Traffic Profiles, on page 1847
- Managing Traffic Profiles, on page 1851
- Configuring Traffic Profiles, on page 1852

Introduction to Traffic Profiles

A traffic profile is a graph of network traffic based on connection data collected over a profiling time window (PTW). This measurement presumably represents normal network traffic. After the learning period, you can detect abnormal network traffic by evaluating new traffic against your profile.

The default PTW is one week, but you can change it to be as short as an hour or as long as several weeks. By default, traffic profiles generate statistics on connection events generated by the system over five-minute intervals. However, you can increase this sampling rate to as long as an hour.

Tip

Cisco recommends that the PTW include at least 100 data points. Configure your PTW and sampling rate so that your traffic profiles contain enough data to be statistically meaningful.

The following graphic shows a traffic profile with a PTW of one day and a sampling rate of five minutes.
You can also set up inactive periods in traffic profile. Traffic profiles collect data during inactive periods, but do not use that data when calculating profile statistics. Traffic profile graphs plotted over time show inactive periods as a shaded region.

For example, consider a network infrastructure where all the workstations are backed up at midnight every night. The backup takes about 30 minutes and spikes the network traffic. You could configure recurring inactive period for your traffic profile to coincide with the scheduled backups.

---

**Note**

The system uses end-of-connection data to create connection graphs and traffic profiles. To use traffic profiles, make sure you log end-of-connection events to the Firepower Management Center database.

---

**Implementing Traffic Profiles**

When you activate a traffic profile, the system collects and evaluates connection data for the learning period (PTW) you configured. After the learning period, the system evaluates correlation rules written against the traffic profile.

For example, you could write a rule that triggers if the amount of data traversing your network (measured in packets, KBytes, or number of connections) suddenly spikes to three standard deviations above the mean amount of traffic, which could indicate an attack or other security policy violation. Then, you could include that rule in a correlation policy to alert you of the traffic spike or to perform a remediation in response.

**Targeting Traffic Profiles**

*Profile conditions* and *host profile qualifications* constrain traffic profiles.

Using profile conditions, you can profile all network traffic, or you can restrict the traffic profile to monitoring a domain, subnets within or across domains, or individual hosts. In a multidomain deployment:

- Leaf-domain administrators can profile network traffic within their leaf domains.
- Higher-level domain administrators can profile traffic within or across domains.
Profile conditions can also constrain traffic profiles using criteria based on connection data. For example, you could set the profile conditions so that the traffic profile only profiles sessions using a specific port, protocol, or application.

Finally, you can also constrain traffic profiles using information about the tracked hosts. This constraint is called a host profile qualification. For example, you could collect connection data only for hosts with high criticality.

### Note

Constraining a traffic profile to a higher-level domain aggregates and profiles the same type of traffic in each of the descendant leaf domains. The system builds a separate network map for each leaf domain. In a multidomain deployment, profiling traffic across domains can have unexpected results.

### Related Topics

[Introduction to Correlation Policies and Rules](#), on page 1809

## Traffic Profile Conditions

You can create simple traffic profile conditions and host profile qualifications, or you can create more elaborate constructs by combining and nesting conditions.

Conditions have three parts: a category, an operator, and a value:

- The categories you can use depend on whether you are building traffic profile conditions or a host profile qualification.
- The operators you can use depend on the category you choose.
- The syntax you can use to specify a condition’s value depends on the category and operator. Sometimes you must enter the value in a text field. Other times, you can pick one or more values from a drop-down list.

For a host profile qualification, you must also specify whether you are constraining the traffic profile using information data about the initiating or responding hosts.

When your construct includes more than one condition, you must link them with an AND or an OR operator. Conditions on the same level are evaluated together:

- The AND operator requires that all conditions on the level it controls must be met.
- The OR operator requires that at least one of the conditions on the level it controls must be met.

### Unconstrained Traffic Profile

If you want to create a traffic profile that collects data for your entire monitored network segment, you can create a very simple profile with no conditions, as shown in the following graphic.
Simple Traffic Profile
If you wanted to constrain the profile and collect data only for a subnet, you can add a single condition, as shown in the following graphic.

Complex Traffic Profile
The following traffic profile contains two conditions linked by **AND**. This means that the traffic profile collects connection data only if both conditions are true. In this example, it collects HTTP connections for all hosts with IP addresses in a specific subnet.

In contrast, the following traffic profile, which collects connection data for HTTP activity in either of two subnets, has three conditions, with the last constituting a complex condition.

Logically, the above traffic profile is evaluated as follows:
(A and (B or C))

<table>
<thead>
<tr>
<th>Where...</th>
<th>Is the condition that states...</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Application Protocol Name is HTTP</td>
</tr>
<tr>
<td>B</td>
<td>IP Address is in 10.4.0.0/16</td>
</tr>
<tr>
<td>C</td>
<td>IP Address is in 192.168.0.0/16</td>
</tr>
</tbody>
</table>

### Managing Traffic Profiles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

Only rules written against active, complete traffic profiles can trigger a correlation policy violation. A slider icon next to each traffic profile indicates whether the profile is active and collecting data. A progress bar shows the status of the traffic profile’s learning period.

In a multidomain deployment, the system displays traffic profiles created in the current domain, which you can edit. It also displays selected traffic profiles from ancestor domains, which you cannot edit. To view and edit traffic profiles created in a lower domain, switch to that domain.

#### Note

The system does not display traffic profiles from ancestor domains if the profiles' conditions expose information about unrelated domains, including names, managed devices, and so on.

#### Procedure

**Step 1**
Choose **Policies > Correlation**, then click the **Traffic Profiles** tab.

**Step 2**
Manage your traffic profiles:

- **Activate/Deactivate** — To activate or deactivate a traffic profile, click the slider. Deactivating a traffic profile deletes its associated data. If you reactivate the profile, you must wait the length of its PTW before rules written against it will trigger.
- **Create** — To create a new traffic profile, click **New Profile** and proceed as described in **Configuring Traffic Profiles, on page 1852**. You can also click the copy icon (_Copy_ ) to edit a copy of an existing traffic profile.
- **Delete** — To delete a traffic profile, click the delete icon ( _Trash_ ), then confirm your choice.
- **Edit** — To modify an existing traffic profile, click the edit icon ( _Pen_ ) and proceed as described in **Configuring Traffic Profiles, on page 1852**. If a traffic profile is active you can only change its name and description.
• Graph — To view the traffic profile as a graph, click the graph icon ( ). In a multidomain deployment, you cannot view the graph for a traffic profile that belongs to an ancestor domain if the graph exposes information about unrelated domains.

### Configuring Traffic Profiles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

Constraining a traffic profile to a higher-level domain aggregates and profiles the same type of traffic in each of the descendant leaf domains. The system builds a separate network map for each leaf domain. In a multidomain deployment, profiling traffic across domains can have unexpected results.

**Procedure**

**Step 1** Choose **Policies > Correlation**, then click the **Traffic Profiles** tab.

**Step 2** Click **New Profile**.

**Step 3** Enter a **Profile Name**, and optionally, a **Profile Description**.

**Step 4** Optionally, constrain the traffic profile:

- Copy Settings — To copy settings from an existing traffic profile, click **Copy Settings**, choose the traffic profile you want to use, and click **Load**.
- Profile Conditions — To constrain the traffic profile using information from tracked connections, proceed as described in **Adding Traffic Profile Conditions**, on page 1853.
- Host Profile Qualification — To constrain the traffic profile using information from tracked hosts, proceed as described in **Adding Host Profile Qualifications to a Traffic Profile**, on page 1853.
- Profiling Time Window (PTW) — To change the **Profiling Time Window**, enter a time unit, then choose **hour(s)**, **day(s)**, or **week(s)**.
- Sampling Rate — Choose a **Sampling Rate**, in minutes.
- Inactive Period — Click **Add Inactive Period** and use the drop-down lists to specify when and how often you want the traffic profile remain inactive. Inactive traffic profiles do not trigger correlation rules. Traffic profiles do not include data from inactive periods in profile statistics.

**Step 5** Save the traffic profile:

- To save the profile and start collecting data immediately, click **Save & Activate**.
- To save the profile without activating it, click **Save**.
Adding Traffic Profile Conditions

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Procedure

**Step 1**  
In the traffic profile editor, under Profile Conditions, click **Add condition** or **Add complex condition** for each condition you want to add. Conditions on the same level are evaluated together.

- To require that all conditions on the level that the operator controls are met, choose **AND**.
- To require that only one of the conditions on the level that the operator controls is met, choose **OR**.

**Step 2**  
Specify a category, operator, and value for each condition as described in **Syntax for Traffic Profile Conditions**, on page 1854 and **Traffic Profile Conditions**, on page 1849.

If you choose **is in** or **is not in** as the operator, you can select multiple values in a single condition as described in **Using Multiple Values in a Traffic Profile Condition**, on page 1858.

When the category represents an IP address, choosing **is in** or **is not in** as the operator allows you to specify whether the IP address is in or is not in a range of IP addresses.

**Example**

The following traffic profile collects information on a specific subnet. The category of the condition is **Initiator/Responder IP**, the operator is **is in**, and the value is **10.4.0.0/16**.

```
Profile Conditions
Collect connection information for all traffic that matches the following conditions:

Add condition  Add complex condition

Initiator/Responder IP is in 10.4.0.0/16
```

Adding Host Profile Qualifications to a Traffic Profile

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>
Procedure

**Step 1**
In the traffic profile editor, click **Add Host Profile Qualification**.

**Step 2**
Under Host Profile Qualification, click **Add condition** or **Add complex condition** for each condition you want to add. Conditions on the same level are evaluated together.

- To require that all conditions on the level that the operator controls are met, choose **AND**.
- To require that only one of the conditions on the level that the operator controls is met, choose **OR**.

**Step 3**
Specify a host type, category, operator, and value for each condition as described in Syntax for Host Profile Qualifications in a Traffic Profile, on page 1855 and Traffic Profile Conditions, on page 1849.

If you choose **is in** or **is not in** as the operator, you can select multiple values in a single condition as described in Using Multiple Values in a Traffic Profile Condition, on page 1858.

Example

The following host profile qualification constrains a traffic profile such that it collects connection data only if the responding host in the detected connection is running a version of Microsoft Windows.

Syntax for Traffic Profile Conditions

The following table describes how to build a traffic profile condition. Keep in mind the connection data available to build a traffic profile depends on several factors, including traffic characteristics and detection method.

<table>
<thead>
<tr>
<th>If you choose...</th>
<th>Choose an operator, then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Protocol</td>
<td>Choose one or more application protocols.</td>
</tr>
<tr>
<td>Application Protocol Category</td>
<td>Choose one or more application protocol categories.</td>
</tr>
<tr>
<td>Client</td>
<td>Choose one or more clients.</td>
</tr>
<tr>
<td>Client Category</td>
<td>Choose one or more client categories.</td>
</tr>
<tr>
<td>If you choose...</td>
<td>Choose an operator, then...</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Connection Type</td>
<td>Choose whether the profile uses connection data from traffic monitored by Firepower System managed devices or from exported NetFlow records. If you do not specify a connection type, the traffic profile includes both.</td>
</tr>
<tr>
<td>Destination Country or Source Country</td>
<td>Choose one or more countries.</td>
</tr>
<tr>
<td>Domain</td>
<td>Choose one or more domains. In a multidomain deployment, constraining by an ancestor domain matches data reported by that domain's descendants.</td>
</tr>
<tr>
<td>Initiator IP, Responder IP, or Initiator/Responder IP</td>
<td>Enter an IP address or range of IP addresses. The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.</td>
</tr>
<tr>
<td>NetFlow Device</td>
<td>Choose the NetFlow exporter whose data you want to use to create the traffic profile.</td>
</tr>
<tr>
<td>Responder Port/ICMP Code</td>
<td>Enter the port number or ICMP code.</td>
</tr>
<tr>
<td>Security Intelligence Category</td>
<td>Choose one or more a Security Intelligence categories. To use a Security Intelligence category for a traffic profile condition, that category must be set to <strong>Monitor</strong> instead of <strong>Block</strong> in your access control policy.</td>
</tr>
<tr>
<td>SSL Encrypted Session</td>
<td>Choose <strong>Successfully Decrypted</strong>.</td>
</tr>
<tr>
<td>Transport Protocol</td>
<td>Enter <strong>TCP</strong> or <strong>UDP</strong> as the transport protocol.</td>
</tr>
<tr>
<td>Web Application</td>
<td>Choose one or more web applications.</td>
</tr>
<tr>
<td>Web Application Category</td>
<td>Choose one or more web application categories.</td>
</tr>
</tbody>
</table>

**Syntax for Host Profile Qualifications in a Traffic Profile**

When you build a host profile qualification condition, you must first choose the host you want to use to constrain your traffic profile. You can choose either **Responder Host** or **Initiator Host**. After you choose the host role, continue building your host profile qualification condition.

Although you can add hosts to the network map using NetFlow records, the available information about these hosts is limited. For example, there is no operating system data available for these hosts, unless you provide it using the host input feature. In addition, if your traffic profile uses connection data from exported NetFlow records, keep in mind that NetFlow records do not contain information about which host in the connection is
the initiator and which is the responder. When the system processes NetFlow records, it uses an algorithm to determine this information based on the ports each host is using, and whether those ports are well-known.

To match against implied or generic clients, create a host profile qualification based on the application protocol used by the server responding to the client. When the client list on a host that acts as the initiator or source of a connection includes an application protocol name followed by `client`, that client may actually be an implied client. In other words, the system reports that client based on server response traffic that uses the application protocol for that client, not on detected client traffic.

For example, if the system reports HTTPS client as a client on a host, create a host profile qualification for Responder Host where Application Protocol is set to HTTPS, because HTTPS client is reported as a generic client based on the HTTPS server response traffic sent by the responder or destination host.

<table>

</tbody>
</table>

When you are building a condition, and the condition syntax allows you to pick a value from a drop-down list, you can often use multiple values from the list.

For example, if you want to add a host profile qualification to a traffic profile that requires that a host be running some flavor of UNIX, instead of constructing multiple conditions linked with the OR operator, use the following procedure.

**Procedure**

**Step 1** While building a traffic profile or host profile qualification condition, choose **is in** or **is not in** as the operator. The drop-down list changes to a text field.

**Step 2** Click anywhere in the text field or on the **Edit** link.

**Step 3** Under **Available**, choose multiple values.

**Step 4** Click the right arrow to move the selected entries to **Selected**.

**Step 5** Click **OK**.
Remediations

The following topics contain information on configuring remediations:

- Introduction to Remediations, on page 1859
- Managing Remediation Modules, on page 1870
- Managing Remediation Instances, on page 1871
- Managing Instances for a Single Remediation Module, on page 1872

Introduction to Remediations

A remediation is a program that the Firepower System launches in response to a correlation policy violation. When a remediation runs, the system generates a remediation status event. Remediation status events include details such as the remediation name, the correlation policy and rule that triggered it, and the exit status message.

The system supports several remediation modules:

- Cisco ISE Endpoint Protection Services (EPS) — quarantines, unquarantines, or shuts down traffic sent to a host or network involved in a correlation policy violation
- Cisco IOS Null Route — blocks traffic sent to a host or network involved in a correlation policy violation (requires Cisco IOS Version 12.0 or higher)
- Nmap Scanning — scans hosts to determine running operating systems and servers
- Set Attribute Value — sets a host attribute on a host involved in a correlation policy violation

Tip

You can install custom modules that perform other tasks; see the Firepower System Remediation API Guide.

Implementing Remediations

To implement a remediation, first create at least one instance for the module you choose. You can create multiple instances per module, where each instance is configured differently. For example, to communicate with multiple routers using the Cisco IOS Null Route remediation module, configure multiples instances of that module.
You can then add multiple remediations to each instance that describe the actions you want to perform when a policy is violated.

Finally, associate remediations with rules in correlation policies, so that the system launches the remediations in response to correlation policy violations.

**Remediations and Multitenancy**

In a multidomain deployment, you can install custom remediation modules at any domain level. The system-provided modules belong to the Global domain.

Though you cannot add a remediation to an instance created in an ancestor domain, you can create a similarly configured instance in the current domain and add remediations to that instance. You can also use remediations created in ancestor domains as correlation responses.

**Related Topics**

- Firepower Management Center Alert Responses, on page 1905
- Nmap Scanning, on page 1678
- Adding Responses to Rules and White Lists, on page 1811

## Cisco ISE EPS Remediations

If you have Endpoint Protection Service (EPS) enabled and configured in your ISE deployment, you can configure your Firepower Management Center to launch remediations using ISE. When fully configured, ISE EPS remediations run the following Mitigation Actions on the source or destination host involved in a correlation policy violation:

- **quarantine**—Limits or denies an endpoint's access to the network
- **unquarantine**—Reverses an endpoint's quarantine status and allows full access to the network
- **shutdown**—Deactivates an endpoint's network attached system (NAS) port to disconnect it from the network

You can also **Whitelist** networks so that the system does not perform ISE EPS remediations on those addresses.

**Note**

Your ISE version and configuration impact how you can use ISE in the Firepower System. For more information, see The ISE Identity Source, on page 1725 for more information.

For more information about ISE EPS actions, see the Cisco Identity Services Engine User Guide.

### Configuring ISE EPS Remediations

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin Discovery Admin</td>
</tr>
</tbody>
</table>

You can respond to correlation policy violations by running ISE EPS remediations on the source or destination host.
Before you begin

- Configure EPS operations on your ISE server.
- Configure a connection to ISE as described in Configure ISE for User Control, on page 1726.

Procedure

Step 1
Choose Policies > Actions > Instances.

Step 2
Add a pxGrid mitigation instance as described in Adding an ISE EPS Instance, on page 1861.

Step 3
Add one or more ISE EPS remediations as described in Adding ISE EPS Remediations, on page 1862.

What to do next

- Assign remediations as responses to correlation policy violations as described in Adding Responses to Rules and White Lists, on page 1811.

Adding an ISE EPS Instance

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin Discovery Admin</td>
</tr>
</tbody>
</table>

Create ISE EPS instances to group individual remediations by logging type.

Procedure

Step 1
Choose Policies > Actions > Instances.

Step 2
From the Add a New Instance list, choose pxGrid Mitigation(v1.0) as the module type and click Add.

Step 3
Enter an Instance Name and Description.

Step 4
Set the Enable Logging option to enable or disable system logging.

Step 5
Click Create.

What to do next

- Create an ISE EPS remediation as described in Adding Set Attribute Value Remediations, on page 1869.

Related Topics

Firepower System IP Address Conventions, on page 13
Adding ISE EPS Remediations

Add one or more ISE EPS remediations within an instance to run Mitigation Actions on the source or destination host involved in a correlation policy violation.

In a multidomain deployment, you cannot add a remediation to an instance created in an ancestor domain.

Before you begin

- Create an ISE EPS instance as described in Adding an ISE EPS Instance, on page 1861.

Procedure

**Step 1** Choose Policies > Actions > Instances.

**Step 2** Next to the instance where you want to add the remediation, click the view icon ( ).

**Step 3** In the Configured Remediations section, choose the Mitigate Destination or Mitigate Source and click Add.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4** Enter a Remediation Name and Description.

**Step 5** Choose a Mitigation Action: quarantine, unquarantine, or shutdown.

**Step 6** (Optional) Enter the IP addresses or ranges you want to Whitelist and exempt from the remediation.

**Step 7** Click Create, then click Done.

What to do next

- Assign remediations as responses to correlation policy violations; see Adding Responses to Rules and White Lists, on page 1811.

Cisco IOS Null Route Remediations

The Cisco IOS Null Route remediation module allows you to block an IP address or range of addresses using Cisco’s “null route” command. This drops all traffic sent to a host or network by routing it to the router’s NULL interface. This does not block traffic sent from the violating host or network.

**Note**

Do not use a destination-based remediation as a response to a correlation rule that is based on a discovery or host input event. These events are associated with source hosts.
When a Cisco IOS remediation is activated, there is no timeout period. To unblock the IP address or network, you must manually clear the routing change from the router.

**Caution**

Configuring Remediations for Cisco IOS Routers

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin DiscoveryAdmin</td>
</tr>
</tbody>
</table>

**Note**

Do not use a destination-based remediation as a response to a correlation rule that is based on a discovery or host input event. These events are associated with source hosts.

**Caution**

When a Cisco IOS remediation is activated, there is no timeout period. To unblock the IP address or network, you must manually clear the routing change from the router.

**Before you begin**

- Confirm that your Cisco router is running Cisco IOS 12.0 or higher.
- Confirm that you have level 15 administrative access to the router.

**Procedure**

**Step 1**  
Enable Telnet on the Cisco router as described in the documentation provided with your Cisco router or IOS software.

**Step 2**  
On the Firepower Management Center, add a Cisco IOS Null Route instance for each Cisco IOS router you plan to use; see Adding a Cisco IOS Instance, on page 1864.

**Step 3**  
Create remediations for each instance, based on the type of response you want to elicit on the router when correlation policies are violated:

- Adding Cisco IOS Block Destination Remediations, on page 1865
- Adding Cisco IOS Block Destination Network Remediations, on page 1865
- Adding Cisco IOS Block Source Remediations, on page 1866
- Adding Cisco IOS Block Source Network Remediations, on page 1867
What to do next

- Assign remediations as responses to correlation policy violations; see Adding Responses to Rules and White Lists, on page 1811.

Adding a Cisco IOS Instance

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

If you have multiple routers where you want to send remediations, create a separate instance for each router.

Before you begin

- Configure Telnet access on the Cisco IOS router as described in the documentation provided with the router or IOS software.

Procedure

Step 1  Choose Policies > Actions > Instances.
Step 2  From the Add a New Instance list, choose Cisco IOS Null Route and click Add.
Step 3  Enter an Instance Name and Description.
Step 4  In the Router IP field, enter the IP address of the Cisco IOS router you want to use for the remediation.
Step 5  In the Username field, enter the Telnet user name for the router. This user must have level 15 administrative access on the router.
Step 6  In the Connection Password fields, enter the Telnet user’s user password.
Step 7  In the Enable Password fields, enter the Telnet user’s enable password. This is the password used to enter privileged mode on the router.
Step 8  In the White List field, enter IP addresses or ranges that you want to exempt from the remediation, one per line.

Note  The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

Step 9  Click Create.

What to do next

- Add specific remediations to be used by correlation policies as described in Adding Cisco IOS Block Destination Remediations, on page 1865, Adding Cisco IOS Block Destination Network Remediations, on page 1865, Adding Cisco IOS Block Source Remediations, on page 1866, and Adding Cisco IOS Block Source Network Remediations, on page 1867.

Related Topics

- Firepower System IP Address Conventions, on page 13
Adding Cisco IOS Block Destination Remediations

<table>

</tbody>
</table>

The Cisco IOS Block Destination remediation blocks traffic sent from the router to the destination host involved in a correlation policy violation. Do not use this remediation as a response to a correlation rule that is based on a discovery or host input event. These events are associated with source hosts.

In a multidomain deployment, you cannot add a remediation to an instance created in an ancestor domain.

**Before you begin**

- Add a Cisco IOS instance as described in *Adding a Cisco IOS Instance, on page 1864.*

**Procedure**

**Step 1** Choose Policies > Actions > Instances.

**Step 2** Next to the instance where you want to add the remediation, click the view icon ( ).

**Step 3** In the **Configured Remediations** section, choose Block Destination and click Add.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4** Enter a Remediation Name and Description.

**Step 5** Click Create, then click Done.

**What to do next**

- Assign remediations as responses to correlation policy violations; see *Adding Responses to Rules and White Lists, on page 1811.*

Adding Cisco IOS Block Destination Network Remediations

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

The Cisco IOS Block Destination Network remediation blocks traffic sent from the router to the network of the destination host involved in a correlation policy violation. Do not use this remediation as a response to a correlation rule that is based on a discovery or host input event. These events are associated with source hosts.

In a multidomain deployment, you cannot add a remediation to an instance created in an ancestor domain.
Before you begin

- Add a Cisco IOS instance as described in Adding a Cisco IOS Instance, on page 1864.

Procedure

**Step 1** Choose Policies > Actions > Instances.

**Step 2** Next to the instance where you want to add the remediation, click the view icon (唐宇).

**Step 3** In the Configured Remediations section, choose Block Destination Network and click Add.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4** Enter a Remediation Name and Description.

**Step 5** In the Netmask field, enter the subnet mask or use CIDR notation to describe the network that you want to block traffic to.

For example, to block traffic to an entire Class C network when a single host triggered a rule (this is not recommended), use 255.255.255.0 or 24 as the netmask.

As another example, to block traffic to 30 addresses that include the triggering IP address, specify 255.255.255.224 or 27 as the netmask. In this case, if the IP address 10.1.1.15 triggers the remediation, all IP addresses between 10.1.1.1 and 10.1.1.30 are blocked. To block only the triggering IP address, leave the field blank, enter 32, or enter 255.255.255.255.

**Step 6** Click Create, then click Done.

What to do next

- Assign remediations as responses to correlation policy violations; see Adding Responses to Rules and White Lists, on page 1811.

The Cisco IOS Block Source Network remediation blocks traffic sent from the router to the network of the source host involved in a correlation policy violation.

In a multidomain deployment, you cannot add a remediation to an instance created in an ancestor domain.

**Before you begin**
- Add a Cisco IOS instance as described in Adding a Cisco IOS Instance, on page 1864.

**Procedure**

**Step 1** Choose **Policies > Actions > Instances**.

**Step 2** Next to the instance where you want to add the remediation, click the view icon (🔍).

**Step 3** In the **Configured Remediations** section, choose **Block Source Network** and click **Add**. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4** Enter a **Remediation Name** and **Description**.

**Step 5** In the **Netmask** field, enter the subnet mask or CIDR notation that describes the network that you want to block traffic to.
For example, to block traffic to an entire Class C network when a single host triggered a rule (this is not recommended), use 255.255.255.0 or 24 as the netmask.

As another example, to block traffic to 30 addresses that include the triggering IP address, specify 255.255.255.224 or 27 as the netmask. In this case, if the IP address 10.1.1.15 triggers the remediation, all IP addresses between 10.1.1.1 and 10.1.1.30 are blocked. To block only the triggering IP address, leave the field blank, enter 32, or enter 255.255.255.255.

**Step 6** Click Create, then click Done.

---

**What to do next**

- Assign remediations as responses to correlation policy violations; see Adding Responses to Rules and White Lists, on page 1811.

**Related Topics**

- Firepower System IP Address Conventions, on page 13

---

**Nmap Scan Remediations**

The Firepower System integrates with Nmap™, an open source active scanner for network exploration and security auditing. You can respond to a correlation policy violation using an Nmap remediation, which triggers an Nmap scan remediation.

For more information about Nmap scanning, see Nmap Scanning, on page 1678.

**Set Attribute Value Remediations**

You can respond to a correlation policy violation by setting a host attribute value on the host where the triggering event occurred. For text host attributes, you can use the description from the event as the attribute value.

**Configuring Set Attribute Remediations**

<table>
<thead>
<tr>

<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin Discovery Admin</td>
</tr>
</tbody>
</table>

The Set Attribute Value remediation sets a host attribute on a host involved in a correlation policy violation. Create a remediation for each attribute value you want set. For text attributes, you can use the description from the triggering event as the attribute value.

In a multidomain deployment, you cannot add a remediation to an instance created in an ancestor domain.

Before you begin

- Create a set attribute instance as described in Adding a Set Attribute Value Instance, on page 1869.

Procedure

Step 1 Choose Policies > Actions > Instances.
Managing Remediation Modules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin Discovery Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays remediation modules installed in the current domain, which you can delete. It also displays modules installed in ancestor domains, which you cannot delete. To manage remediation modules in a lower domain, switch to that domain.

**Procedure**

**Step 1** Choose **Policies > Actions > Modules**.

**Step 2** Manage your remediation modules:

- **Configure** — To view the Module Detail page for a module and configure its instances and remediations, click the view icon ( ). In a multidomain deployment, you cannot use the Module Detail page to add, delete, or edit instances in the current domain for a module installed in an ancestor domain. Instead, use the Instances page (**Policies > Actions > Instances**); see **Managing Remediation Instances**, on page 1871.

- **Delete** — To delete a custom module that is not in use, click the delete icon ( ). You cannot delete system-provided modules.
• Install — To install a custom module, click **Choose File**, browse to the module, and click **Install**. For more information, see the *Firepower System Remediation API Guide*.

## Managing Remediation Instances

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin Discovery Admin</td>
</tr>
</tbody>
</table>

The Instances page lists all configured instances for all remediation modules.

In a multidomain deployment, the system displays remediation instances created in the current domain, which you can edit. It also displays instances created in ancestor domains, which you cannot edit. To manage remediation instances in a lower domain, switch to that domain.

Though you cannot add a remediation to an instance created in an ancestor domain, you can create a similarly configured instance in the current domain and add remediations to that instance. You can also use remediations created in ancestor domains as correlation responses.

### Procedure

**Step 1** Choose Policies > Actions > Instances.

**Step 2** Manage your remediation instances:

- **Add**—To add an instance, choose the remediation module for which you want to add an instance and click **Add**. For system-provided modules, see:
  - Adding an ISE EPS Instance, on page 1861
  - Adding a Cisco IOS Instance, on page 1864
  - Adding an Nmap Scan Instance, on page 1689
  - Adding a Set Attribute Value Instance, on page 1869

  For help adding a custom module, see the documentation for that module, if available.

- **Configure**—To configure instance details and add remediations to the instance, click the view icon ( ).

- **Delete**—To delete an instance that is not in use, click the delete icon ( ).
Managing Instances for a Single Remediation Module

<table>
<thead>
<tr>

<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

The Module Detail page displays all of the instances and remediations configured for a particular remediation module.

In a multidomain deployment, you can access the Module Detail page for remediation modules installed in the current domain and in ancestor domains. However, you cannot use the Module Detail page to add, delete, or edit instances in the current domain for a module installed in an ancestor domain. Instead, use the Instances page (Policies > Actions > Instances); see Managing Remediation Instances, on page 1871.

**Procedure**

1. **Step 1** Choose Policies > Actions > Modules.
2. **Step 2** Next to the remediation module whose instances you want to manage, click the view icon ().
3. **Step 3** Manage your remediation instances:
   - **Add** — To add an instance, click Add. For system-provided modules, see:
     - Adding an ISE EPS Instance, on page 1861
     - Adding a Cisco IOS Instance, on page 1864
     - Adding an Nmap Scan Instance, on page 1689
     - Adding a Set Attribute Value Instance, on page 1869
   - **Configure** — To configure instance details and add remediations to the instance, click the view icon ().
   - **Delete** — To delete an instance that is not in use, click the delete icon ().
PART XXII

Reporting and Alerting

• Working with Reports, on page 1875
• External Alerting with Alert Responses, on page 1905
• External Alerting for Intrusion Events, on page 1913
CHAPTER 94

Working with Reports

The following topics describe how to work with reports in the Firepower System:

- Introduction to Reports, on page 1875
- Risk Reports, on page 1875
- Standard Reports, on page 1876
- About Working with Generated Reports, on page 1900

Introduction to Reports

The Firepower System offers two types of reports:

- Risk Reports, on page 1875 — High-level summaries of risks found on your network.
- Standard Reports, on page 1876 — Detailed, customizable reports about all aspects of your Firepower System.

Risk Reports

Risk reports are portable, high-level, easy-to-interpret summaries of risks found in your organization. You can use these reports to share information about areas of risk, and recommendations for addressing these risks, with people who do not have access to your system and who may not be network security experts. These reports are intended to facilitate discussion about areas for investment in the security of your network.

Generating, Viewing, and Printing Risk Reports

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst/Maintenance User</td>
</tr>
</tbody>
</table>

Templates for standard reports do not apply to risk reports.

Reports pertain to the current domain.

Each risk report generates as an HTML file.
To schedule risk report generation, see Automating Report Generation, on page 178.

Before you begin

• Make sure your system is configured to detect the risks that you want to summarize.

• If you want to email the report and you have not yet configured a Relay Host, you can do so now. For information, see Configuring a Mail Relay Host and Notification Address, on page 784.

Procedure

Step 1  Choose Overview > Reporting.
Step 2  Click the Report Templates tab.
Step 3  Click the Generate Report icon for the desired report.
Step 4  Enter information.

• Information that you enter in the Input Parameters section will appear on the title page of the report. You can leave these fields blank.

Step 5  Click Generate.
Step 6  Click OK.

What to do next

• To view, download, move, or delete a risk report, see About Working with Generated Reports, on page 1900.

• You can print to PDF any risk report from most supported browsers. For best results, enable background colors, images, and optionally headers and footers, in the print or print preview settings of your browser. Supported page sizes are A4 and US letter.

Standard Reports

The Firepower System provides a flexible reporting system that allows you to quickly and easily generate multi-section reports with the event views or dashboards that appear on your Firepower Management Center. You can also design your own custom reports from scratch.

A report is a document file formatted in PDF, HTML, or CSV with the content you want to communicate. A report template specifies the data searches and formats for the report and its sections. The Firepower System includes a powerful report designer that automates the design of report templates. You can replicate the content of any event view table or dashboard graphic displayed in the web interface.

You can build as many report templates as you need. Each report template defines the individual sections in the report and specifies the database search that creates the report’s content, as well as the presentation format (table, chart, detail view, and so on) and the time frame. Your template also specifies document attributes, such as the cover page and table of contents and whether the document pages have headers and footers (available only for reports in PDF format). You can export a report template in a single configuration package file and import it for reuse on another Firepower Management Center.
You can include input parameters in a template to expand its usefulness. Input parameters allow you to produce tailored variations of the same report. When you generate a report with input parameters, the generation process prompts you to enter a value for each input parameter. The values you type constrain the report contents on a one-time basis. For example, you can place an input parameter in the destination IP field of the search that produces an intrusion event report; at report generation time, you can specify a department’s network segment when prompted for the destination IP address. The generated report then contains only information concerning that particular department.

**About Designing Reports**

**Report Templates**

You use report templates to define the content and format of the data in each of the report’s sections, as well as the document attributes of the report file (cover page, table of contents, and page headers and footers). After you generate a report, the template stays available for reuse until you delete it.

Your reports contain one or more information sections. You choose the format (text, table, or chart) for each section individually. The format you select for a section may constrain the data that can be included. For example, you cannot show time-based information in certain tables using a pie chart format. You can change the data criteria or format of a section at any time to obtain optimum presentation.

You can base a report’s initial design on a predefined event view, or you can start your design by importing content from any defined dashboard, workflow, or summary. You can also start with an empty template, adding sections and defining their attributes one by one.

---

**Note**

In a multidomain deployment, you can view but not edit report templates belonging to ancestor domains. To generate reports from these templates, you must copy them to your current domain.

---

**Report Template Fields**

The following table describes the fields you can use to build a section in your report template. Not all fields are used in all types of sections; after you choose the section format, the system displays the appropriate fields.
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Section Types</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>n/a</td>
<td>Choose the format of the section data:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Bar chart: Compares quantities of the selected variables.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Line chart: Shows trends/changes over time of a selected variable. Available only for time-based tables.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Pie chart: Shows each selected variable as a percentage of the whole. Variables with quantities of zero are dropped from the chart. Very small quantities are clustered into a category labeled Other.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Table view: Shows values of attributes for each record. Not available for summary or statistical data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Detail view: Shows complex object data associated with certain events, such as packets (for intrusion events) and host profiles (for host events). This format is available only for certain event types that involve such objects. Output may degrade performance if large numbers are requested.</td>
</tr>
<tr>
<td>Table</td>
<td>All</td>
<td>Choose the table from which the section data is extracted.</td>
</tr>
<tr>
<td>Preset</td>
<td>All</td>
<td>Predefined searches. Select an appropriate preset to initialize the search criteria when you define a new search.</td>
</tr>
<tr>
<td>Search or Filter</td>
<td>All</td>
<td>For most tables, you can constrain a report using a predefined or saved Search. You can also create a new search by clicking the edit icon ( ). For the Application Statistics table, you use a user-defined application Filter to constrain a report.</td>
</tr>
<tr>
<td>X-Axis</td>
<td>Bar chart</td>
<td>Available data for the X-axis of the selected chart.</td>
</tr>
<tr>
<td></td>
<td>Line chart</td>
<td>For line charts, the X-axis value is always Time. For bar and pie charts, you cannot select Time as the X-axis value.</td>
</tr>
<tr>
<td></td>
<td>Pie chart</td>
<td></td>
</tr>
<tr>
<td>Y-Axis</td>
<td>Bar chart</td>
<td>Available data for the Y-axis of the selected chart.</td>
</tr>
<tr>
<td></td>
<td>Line chart</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Pie chart</td>
<td></td>
</tr>
<tr>
<td>Section</td>
<td>All</td>
<td>Descriptive text that precedes the search data in the section. Enter a combination of text and input parameters. The default for a new section is $&lt;Time Window&gt; and $&lt;Constraints&gt;.</td>
</tr>
<tr>
<td>Description</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Time Window</td>
<td>All</td>
<td>The time window for the data that appears in the section. If the section searches time-based tables, you can select the check box to inherit the report’s global time window. Alternatively, you can set a specific time window for the section.</td>
</tr>
<tr>
<td>Maximum Results</td>
<td>Table view</td>
<td>The maximum number of matching records to include.</td>
</tr>
<tr>
<td></td>
<td>Detail view</td>
<td></td>
</tr>
</tbody>
</table>
### Report Template Creation

A report template is a framework of sections, each independently built from its own database query.

You can build a new report template by creating a new template, using an existing template, basing a template off an event view, or importing a dashboard or workflow.

If you do not want to copy an existing report template, you can create an entirely new template. The first step in creating a template is to generate the framework that allows you to add and format the sections. Then, in the order you prefer, you design the individual template sections and set attributes for the report document.

Each template section consists of a dataset generated by a search or filter, and has a format specification (table, pie chart, and so on) that determines the mode of presentation. You further determine section content by selecting the fields in the data records you want to include in the output, as well as the time frame and number of records to show.

---

**Note**

Use the section preview utility to check the column selection and output characteristics such as pie chart colors. It is not a reliable indicator of the correctness of your configured search.

---

The report you generate from the template has several document attributes that span all sections and control features, such as the cover page, headers and footers, page numbering, and so on.

Note that if you selected CSV as your document format, you have no document attributes to set.

If you identify a good model among your existing templates, you can copy the template and edit its attributes to create a new report template. Cisco also provides a set of predefined report templates, visible on the Reports Tab in the list of templates.

From an event view, you can create a report template and modify it to meet your needs. You can add additional sections, modify automatically included sections, and delete sections.

You can quickly create a new report by importing dashboards, workflows, and statistics summaries. The import creates a section for each widget graphic in your dashboard and each event view in your workflow. You can delete any unnecessary sections to focus on the most important information.
Procedure

Step 1  Choose Overview > Reporting.
Step 2  Click the Report Templates tab.
Step 3  Click Create Report Template.
Step 4  Enter a name for your new template in the Report Title field.
Step 5  To add an input parameter to the report title, place your cursor in the title where the parameter value should appear, then click the insert input parameter icon ( ).
Step 6  Use the set of add icons under the Report Sections title bar to insert sections as necessary.
Step 7  Configure section content as described in Report Template Configuration, on page 1883.
Tip  You can click Preview at the bottom of the section window to view the column layout or graphic format you chose.
Step 8  Click Advanced to set attributes for PDF and HTML reports as described in Document Attributes in a Report Template, on page 1892.
Step 9  Click Save.

If you see an error, look for a yellow triangle beside the results value in each section. If you see any such triangles, do one of the following:

• For each field that displays a yellow triangle, mouse over the triangle and reduce the number of results to the number indicated.
• Click Generate and include an output format other than PDF.

Creating a Report Template from an Existing Template

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1  Choose Overview > Reporting.
Step 2  Click the Report Templates tab.
Step 3  Click the copy icon ( ) next to the report template you want to copy.
Step 4  In the Report Title field, enter a name.
Step 5  Click Save.
Step 6  Make changes to the template as needed.
Creating a Report Template from an Event View

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1  Populate an event view with the events you want in the report:
- Use an event search to define the events you want to view.
- Drill down through a workflow until you have the appropriate events in your event view.

Step 2  From the event view page, click Report Designer.
The Report Sections page displays a section for each view in the captured workflow.

Step 3  Optionally, enter a new name in the Report Title field and click Save.

Step 4  You can:
- Add a cover page, table of contents, starting page number, or header and footer text — Click Advanced Settings.
- Add page breaks — Click the add page break icon ( ), and drag the new page break object from the template bottom to the front of the section that should start the new page.
- Add text sections — Click the add text section icon ( ), and drag the new text section from the template bottom to the place where you want it to appear in the report template.
- Change the title of a section — Click the section title in the title bar, enter the section title, and click OK.
- Configure the report sections — Adjust the field settings in each section.

**Tip**  To view the current column layout or chart formatting for a section, click the section’s Preview link.

- Exclude template sections from the report — Click the delete icon ( ) in the section’s title bar, and confirm the deletion.

**Note**  The last report section in some workflows contains detail views that show packets, host profiles, or vulnerabilities, depending on the workflow. Retrieving large numbers of events with these detail views when generating your report may affect performance of the Firepower Management Center.

Step 5  Click Save.

Creating a Report Template by Importing a Dashboard or Workflow

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
Procedure

**Step 1** Identify the dashboard, workflow, or summary you want to replicate in your report.

**Step 2** Choose Overview > Reporting.

**Step 3** Click the Report Templates tab.

**Step 4** Click Create Report Template.

**Step 5** Enter a name for your new report template in the Report Title field.

**Step 6** Click Save.

**Step 7** Click the import sections icon ( ). You can choose any of the data sources described in Data Source Options on Import Report Sections, on page 1882.

**Step 8** Choose a dashboard, workflow, or summary from the drop-down menus.

**Step 9** For the data sources you want to add, click Import.

For dashboards, each widget graphic will have its own section; for workflows, each event view will have its own section.

**Step 10** Make changes to the content of your sections as needed.

**Note** The last report section in some workflows contains detail views that show packets, host profiles, or vulnerabilities, depending on the workflow. Retrieving large numbers of events with these detail views when generating your report may affect performance of the Firepower Management Center.

**Step 11** Click Save.

---

**Data Source Options on Import Report Sections**

**Table 240: Data Source Options on Import Report Sections Window**

<table>
<thead>
<tr>
<th>Select this option...</th>
<th>To import...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import Dashboard</td>
<td>any custom analysis widget on the selected dashboard.</td>
</tr>

<td>any predefined or custom workflow. Selections have the format: Table - Workflow name. For example, Connection Events - Traffic by Port imports the views in the Traffic by Port workflow generated from the Connection Events table.</td>
</tr>
<tr>
<td>Import Summary Sections</td>
<td>any of the following generic summaries:</td>
</tr>
<tr>
<td></td>
<td>• Intrusion Detailed Summary</td>
</tr>
<tr>
<td></td>
<td>• Intrusion Short Summary</td>
</tr>
<tr>
<td></td>
<td>• Discovery Detailed Summary</td>
</tr>
<tr>
<td></td>
<td>• Discovery Short Summary</td>
</tr>
</tbody>
</table>
Report Template Configuration

You can modify and customize a report template once you create it. You can modify a variety of report section attributes to adjust the content of the section and its data presentation.

Each section in a report template queries a database table to generate content for that section. Changing the section’s data format uses the same data query, but modifies the fields that appear in the section according to the analytical purpose of the format type. For example, the table view of intrusion events populates the section with a large number of data fields per event record, while a pie chart section shows the portion of all matching records that each selected attribute represents, with no details about individual events. Bar chart sections compare the total counts of matching records that have specific attributes. Line charts summarize changes in the matching records over time with respect to a single attribute. Line charts are available only for data that is time-based, not for information about hosts, users, third-party vulnerabilities, and so on.

The search or filter in a report section specifies the database query on which the section content is based. For most tables, you can constrain a report using a predefined or saved search, or you can create a new search on the fly:

- Predefined searches serve as examples for searching certain event tables and can provide quick access to important information about your network that you may want to include in reports.
- Saved event searches include all public event searches that you or others have created, plus all your saved private event searches.
- Saved searches for the current report template are accessible only in the report template itself. The search names of saved report template searches end with the string “Custom Search.” Users create these searches while designing reports.

For the Application Statistics table, you use a user-defined application filter to constrain a report.

If you include table data in a section, you can choose which fields in the data record to show. All fields in the table are available for inclusion or exclusion. You select fields that accomplish the purpose of the report, then order and sort them accordingly.

You can add text sections to your templates to provide custom text, such as an introduction, for the whole report or for individual sections.

You can add page breaks before or after any section in the template. This feature is particularly helpful for multi-section reports with text pages that introduce the various sections.

A report template’s time window defines the template’s reporting period.

---

**Note**

Security Analysts can edit only report templates they created. In multidomain deployments, you cannot edit report templates from ancestor domains, but you can copy them to create descendant versions.

---

**Setting the Table and Data Format for a Report Template Section**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
Procedure

**Step 1**  
In the report template section, use the **Table** drop-down menu to choose the table to query.  
Icons appear in the **Format** field for each of the output formats available for the table you chose.

**Step 2**  
Choose the applicable output format icon for the section.

**Step 3**  
To change the search constraints, click the edit icon ((formatter icon)) next to the **Search** or **Filter** field.

**Step 4**  
For graphic output formats (pie chart, bar chart, and so on), adjust the **X-Axis** and **Y-Axis** parameters using the drop-down menus.  
When you choose a value for the X-axis, only compatible values appear in the Y-axis drop-down menu, and vice versa.

**Step 5**  
For table output, choose the columns, order of appearance, and sort order in your output.

**Step 6**  
Click **Save**.

### Specifying the Search or Filter for a Report Template Section

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**  
In the report template section, choose the database table to query from the **Table** drop-down menu:

- For most tables, the **Search** drop-down list appears.
- For the Application Statistics table, the **Filter** drop-down list appears.

**Step 2**  
Choose the search or filter you want to use to constrain the report.

You can view the search criteria or create a new search by clicking the edit icon (formatter icon).

**Related Topics**  
- Application Filters, on page 350

### Setting the Search Fields that Appear in Table Format Sections

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
Procedure

**Step 1**
For table format report sections, click the edit icon (-pencil) next to the **Fields** parameter.

**Step 2**
If you want to modify the section, you must add and delete fields, and drag the field icons into the column order you want.

**Step 3**
If you want to change the sort order of any column, you must use the drop-down lists on each field icon to set the sort order and priority.

**Step 4**
Click **OK**.

---

### Adding a Text Section to a Report Template

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Text sections can have rich text with multiple font sizes and styles (bold, italic, and so on) as well as input parameters and imported images.

---

**Tip**
Text sections are useful for introductions to your report or your report sections.

---

Procedure

**Step 1**
In the report template editor, click the add text section icon (keyboard). 

**Step 2**
Drag the new text section to its intended position in the report template.

**Step 3**
If you want to position the text section first or last on a page, add page breaks before or after the text section.

**Step 4**
If you want to change the text section's generic name, click section’s name in the title bar, and enter a new name.

**Step 5**
Add formatted text and images to the body of the text section.
You can include input parameters that dynamically update when you generate the report.

**Step 6**
Click **Save**.

---

**Related Topics**

- [Input Parameters](#), on page 1888

---

### Adding a Page Break to a Report Template

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
### Procedure

**Step 1**
In the report template editor, click the add page break icon (.visicon).  
A page break appears at the bottom of the template.

**Step 2**
Drag the page break to its intended location, before or after a section.

**Step 3**
Click Save.

---

### Global Time Windows and Report Template Sections

Report templates with time-based data (such as intrusion or discovery events) have a global time window, which the time-based sections in the template inherit by default when created. Changing the global time window changes the local time window for the sections that are configured to inherit the global time window. You can disable time window inheritance for an individual section by clearing its Inherit Time Window check box. You can then edit the local time window.

---

### Note

Global time window inheritance applies only to report sections with data from time-based tables, such as intrusion events and discovery events. For sections that report on network assets (hosts and devices) and related information (such as vulnerabilities), you must set each time window individually.

---

### Setting the Global Time Window for a Report Template and Its Sections

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

---

### Tip
Your report can have different time ranges per section. For example, your first section could be a summary for the month, and the remaining sections could drill down into details at the week level. In such cases, you set the section-level time windows individually.

---

### Procedure

**Step 1**
In the report template editor, click Generate.

**Step 2**
To modify the global time window, click the time window icon (.visicon).

**Step 3**
Modify time settings in the Events Time Window tab.

**Step 4**
Click Apply.

**Step 5**
Click Generate to generate the report and Yes to confirm.
Setting the Local Time Window for Report Template Sections

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** On the Report Sections page of a template, clear the Inherit Time Window check box for the section if it is present.

**Step 2** To change the section’s local time window, click the time window icon (zeichnet).

**Note** Sections with data from statistics tables can have only sliding time windows.

**Step 3** Click Apply on the Events Time Window.

**Step 4** Click Save.

Renaming a Report Template Section

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** In the report template editor, click the current section name in the section header.

**Step 2** Enter a new name for the section.

**Step 3** Click OK.

Previewing a Report Template Section

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

The preview function shows the field layout and sort order for table views and important legibility characteristics of graphics, such as pie chart colors.

Procedure

**Step 1** At any time while editing a report template section, click Preview for the section.
Searches in Report Template Sections

The key to generating successful reports is defining the searches that populate the report’s sections. The Firepower System provides a search editor to view the searches available in your report templates and to define new custom searches.

Searching in Report Template Sections

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1  From the relevant section in the report template, click the edit icon (edit icon) next to the Search field.

Step 2  If you want to base a custom search on a predefined search, you must choose a predefined search from the Saved Searches drop-down list.

This list includes all available predefined searches for this table, including system-wide and report-specific predefined searches.

Step 3  Edit the search criteria in the appropriate fields.

For certain fields, your constraints can include the same operators (<, <=, and so on) as event searches. If you enter multiple criteria, the search returns only the records that match all the criteria.

Step 4  If you want to insert an input parameter from the drop-down menu instead of entering a constraint value, you must click the input parameter icon (input parameter icon).

Note  When you edit the constraints of a reporting search, the system saves your edited search under the following name: section custom search, where section is the name in the section title bar followed by the string custom search. To have meaningful names for your saved custom searches, be sure you change the section name before you save the edited search. You cannot rename a saved reporting search.

Step 5  Click OK.

Input Parameters

You can use input parameters in a report template that the report can dynamically update at generation time. The input parameter icon (input parameter icon) indicates the fields that can process them. There are two kinds of input parameters:

• Predefined input parameters are resolved by internal system functions or configuration information. For example, at report generation time, the system replaces the $<Time>$ parameter with the current date and time.
• **User-defined input parameters** supply constraints in section searches. Constraining a search with an input parameter instructs the system to collect a value at generation time from the person who requests the report. In this way, you can dynamically tailor a report at generation time to show a particular subset of data without changing the template. For example, you can provide an input parameter for the **Destination IP** field of a report section’s search. Then, when you generate the report, you can enter the IP network segment for a particular department to get data for that department only.

You can also define string-type input parameters to add dynamic text in certain fields of your report, such as in emails (subject or body), report file names, and text sections. You can personalize reports for different departments, with customized report file names, email addresses, and email messages, using the same template for all.

**Predefined Input Parameters**

Table 241: Predefined Input Parameters

<table>
<thead>
<tr>
<th>Insert this parameter...</th>
<th>...to include this information in your template:</th>
</tr>
</thead>
<tbody>
<tr>
<td>$&lt;Logo&gt;$</td>
<td>The selected uploaded logo</td>
</tr>
<tr>
<td>$&lt;Report Title&gt;$</td>
<td>The report title</td>
</tr>
<tr>
<td>$&lt;Time&gt;$</td>
<td>The date and time of day the report ran, with one-second granularity</td>
</tr>
<tr>
<td>$&lt;Month&gt;$</td>
<td>The current month</td>
</tr>
<tr>
<td>$&lt;Year&gt;$</td>
<td>The current year</td>
</tr>
<tr>

<td>yes</td>
<td>yes</td>
<td>yes</td>
<td>yes</td>
<td>yes</td>
<td>yes</td>
</tr>
</tbody>
</table>
User-Defined Input Parameters

You use input parameters to expand the usefulness of your searches. The input parameter instructs the system to collect a value at generation time from the person who requests the report. In this way, you can dynamically constrain a report at generation time to show a particular subset of data without changing the search. For example, you can provide an input parameter for the Destination IP field of a report section that drills down on security events at a department level. When you generate the report, you can type the IP network segment for a particular department to get data for that department only.

An input parameter’s type determines the search fields where you can use it. You can use a given type only in appropriate fields. For example, a user parameter you define as a string type is available for insertion in text fields but not in fields that take an IP address.

Each input parameter you define has a name and a type.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Generate Report File Name</th>
<th>Generate Report Email Subject, Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>$&lt;Model Number&gt;</td>
<td>yes</td>
<td>yes</td>
</tr>
<tr>
<td>$&lt;Time Window&gt;</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>$&lt;Constraints&gt;</td>
<td>no</td>
<td>no</td>
</tr>
</tbody>
</table>

### Table 243: User-Defined Input Parameter Types

<table>
<thead>
<tr>
<th>Use this parameter type...</th>
<th>With fields with this data...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network/IP</td>
<td>any IP address or network segment in CIDR format</td>
</tr>
<tr>
<td>Application</td>
<td>name of an application protocol, client application, or web application</td>
</tr>
<tr>
<td>Event Message</td>
<td>any event view message</td>
</tr>
<tr>
<td>Device</td>
<td>a Management Center or managed device</td>
</tr>
<tr>
<td>Username</td>
<td>user identification such as initiator user and responder user</td>
</tr>
<tr>
<td>Number (VLAN ID, Snort ID, Vuln ID)</td>
<td>any VLAN ID, Snort ID, or vulnerability ID</td>
</tr>
<tr>
<td>String</td>
<td>text fields such as application or OS version, notes, or descriptions</td>
</tr>
</tbody>
</table>

### Creating User-Defined Input Parameters

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
Procedure

Step 1  In the report template editor, click Advanced.
Step 2  Click the add input parameter icon ( ).
Step 3  Enter the parameter Name.
Step 4  Choose a value from the Type drop-down list.
Step 5  Click OK to add the parameter.
Step 6  Click OK to return to the editor.

Editing User-Defined Input Parameters

The Input Parameters section of the report template lists all available user-defined parameters for the template.

Procedure

Step 1  In the report template editor, click Advanced.
Step 2  Click the edit icon ( ) next to the parameter you want to modify.
Step 3  Enter a new Name.
Step 4  Use the Type drop-down list to change the parameter type.
Step 5  Click OK to save your changes.
Step 6  If you want to delete an input parameter, click the delete icon ( ) next to the input parameter and confirm.
Step 7  Click OK to return to the report template editor.

Constraining a Search with User-Defined Input Parameters

Input parameters you define are available only for search fields that match their parameter type. For example, a parameter of type Network/IP is available only for fields that accept IP addresses or network segments in CIDR format.
Procedure

Step 1
In the report template editor, click the edit icon (📝) next to the Search field within the section.

Fields that can take an input parameter are marked with the input parameter icon (🔧).

Step 2
Click the input parameter icon (🔧) next to the field, then choose the input parameter from the drop-down menu.

User-defined input parameters are marked with the icon (錄).

Step 3
Click OK.

Document Attributes in a Report Template

Before you generate your report, you can set document attributes that affect the report’s appearance. These attributes include the optional cover page and table of contents. Support for some attributes depends on the selected report format: PDF, HTML, or CSV.

Table 244: Document Attribute Support

<table>
<thead>
<tr>
<th>Attribute</th>
<th>PDF Support?</th>
<th>HTML Support?</th>
<th>CSV Support?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cover page</td>
<td>yes, with optional logo and custom appearance</td>
<td>yes, with optional logo and custom appearance</td>
<td>no</td>
</tr>
<tr>
<td>Table of contents</td>
<td>yes</td>
<td>yes</td>
<td>no</td>
</tr>
<tr>
<td>Page headers and footers</td>
<td>yes, with optional text or logo in any field</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>Custom starting page number</td>
<td>yes</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>Option to suppress numbering of first page</td>
<td>yes</td>
<td>no</td>
<td>no</td>
</tr>
</tbody>
</table>

Editing Document Attributes in a Report Template

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1
In the report template editor, click Advanced.

Step 2
You have the following choices:
• Add cover page — To add a cover page, check the Include Cover Page check box.
• Customize cover page — To edit the cover page design, see Customizing a Cover Page, on page 1893.
• Add table of contents — To add a table of contents, check the Include Table of Contents check box.
• Manage logos — To manage the logo image associated with the template, see Managing Report Template Logos, on page 1893.
• Configure header and footer — To specify elements for the header and footer of the template, use the drop-down lists in the Header and Footer fields.
• Set first page number — To specify the page number of the report's first page, enter a Page Number Start value.
• Show first page number — To show the page number on the report's first page, check the Number First Page? checkbox. If you choose this option, the cover page is not numbered.

**Step 3**
Click OK to save your changes.

---

### Customizing a Cover Page

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can customize a report template’s cover page. Cover pages can have rich text with multiple font sizes and styles (bold, italic, and so on) as well as input parameters and imported images.

**Procedure**

**Step 1**
In the report template editor, click Advanced.

**Step 2**
Click the edit icon (edit) next to Cover Page Design.

**Step 3**
Edit the cover page design within the rich text editor.

**Step 4**
Click OK.

---

### Managing Report Template Logos

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can store multiple logos on the Firepower Management Center and associate them with different report templates. You set the logo association when you design the template. If you export the template, the export package contains the logo.

When you upload a logo to the Firepower Management Center, it is available for:

• all report templates on the Firepower Management Center, or
• in a multidomain deployment, all report templates in your current domain
Logo images can be in GIF, JPG, or PNG format.

You can change the logo in a report to any JPG image uploaded to your Firepower Management Center. For example, if you reuse a template, you can associate a logo for a different organization with the report.

You can delete any uploaded logos. Deleting a logo removes it from all templates where it is used. The deletion cannot be undone. Note that you cannot delete the predefined Cisco logo.

**Procedure**

**Step 1**

In the report template editor, click Advanced.

The logo currently associated with the template appears under Logo in General Settings.

**Step 2**

Click the edit icon (📝) next to the logo.

**Step 3**

You have the following choices:

- Add — Add a new logo as described in Adding a New Logo, on page 1894.
- Change — Change a report template’s logo as described in Changing the Logo for a Report Template, on page 1894.
- Delete — Delete a logo as described in Deleting a Logo, on page 1895.

---

### Adding a New Logo

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**

In the report template editor, click Advanced.

**Step 2**

Click the edit icon (📝) next to the Logo field.

**Step 3**

Click Upload Logo.

**Step 4**

Click the Browse button, browse to the file’s location, and click Open.

**Step 5**

Click Upload.

**Step 6**

If you want to associate the new logo with the current template, choose it, and click OK.

---

### Changing the Logo for a Report Template

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
**Procedure**

**Step 1**
In the report template editor, click *Advanced*.

**Step 2**
Click the edit icon (_trials) next to the *Logo* field.

**Step 3**
From the Select Logo dialog, choose the logo to associate with the report template.

**Step 4**
Click *OK*.

---

### Deleting a Logo

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**
In the report template editor, click *Advanced*.

**Step 2**
Click the edit icon (_trials) next to the *Logo* field.

**Step 3**
From the Select Logo dialog, choose the logo you want to delete.

**Step 4**
Click *Delete Logo*.

**Step 5**
Click *OK*.

### Managing Report Templates

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays report templates created in the current domain, which you can edit. It also displays report templates created in ancestor domains, which you cannot edit. To view and edit report templates in a lower domain, switch to that domain. The system displays reports created in the current domain only.

**Procedure**

**Step 1**
Choose *Overview > Reporting*.

**Step 2**
Click the *Report Templates* tab.

**Step 3**
You have the following choices:

- Delete — Next to the template you want to delete, click the delete icon ( Trials ) and confirm.
You cannot delete system-provided report templates. Security Analysts can delete only report templates they created. In a multidomain deployment, you can delete report templates belonging to the current domain only.

- **Edit** — To edit report templates; see Editing Report Templates, on page 1896.
- **Export** — To export report templates, see Exporting Report Templates, on page 1897.

**Tip**
You can also export report templates using the standard configuration export process; see Exporting Configurations, on page 167.

- **Import** — To import report templates, see Importing Configurations, on page 168.

### Editing Report Templates

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays report templates created in the current domain, which you can edit. It also displays report templates created in ancestor domains, which you cannot edit. To view and edit report templates in a lower domain, switch to that domain.

**Procedure**

**Step 1** Choose **Overview > Reporting**.

**Step 2** Click the **Report Templates** tab.

**Step 3** Click the edit icon (edit) for the template you want to edit.

If a view icon (view) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4** You have the following choices:

- Add a page break; see Adding a Page Break to a Report Template, on page 1885.
- Add a text section; see Adding a Text Section to a Report Template, on page 1885.
- Configure section content as described in Report Template Configuration, on page 1883.
- Create input parameters; see Creating User-Defined Input Parameters, on page 1890.
- Edit input parameters; see Editing User-Defined Input Parameters, on page 1891.
- Edit document attributes; see Editing Document Attributes in a Report Template, on page 1892.
- Search template sections; see Searching in Report Template Sections, on page 1888.
- Set document attributes described in Document Attributes in a Report Template, on page 1892 by clicking **Advanced**.
- Set the global time window; see Setting the Global Time Window for a Report Template and Its Sections, on page 1886.
- Set the local time window; see Setting the Local Time Window for Report Template Sections, on page 1887.
- Set the search fields; see Setting the Search Fields that Appear in Table Format Sections, on page 1884.
• Set the table and data format; see Setting the Table and Data Format for a Report Template Section, on page 1883.
• Specify searches and filters; see Specifying the Search or Filter for a Report Template Section, on page 1884.

### Exporting Report Templates

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

#### Procedure

**Step 1** Choose **Overview > Reporting**.
**Step 2** Choose the **Report Templates** tab.
**Step 3** For the template you want to export, click the export icon (外出).  
**Step 4** Click **Save file** and **OK** to save the file to your local computer.

### About Generating Reports

#### Generating Reports

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

After you create and customize your report template, you are ready to generate the report. The generation process lets you select the report’s format (HTML, PDF, or CSV). You can also adjust the report’s global time window, which applies a consistent time frame to all sections except those you exempt.

For PDF reports:

- File names using Unicode (UTF-8) characters are not supported.
- Any report sections that include special Unicode file names (such as those appearing in file or malware events) display these file names in transliterated form.

If the report template includes user input parameters in its search specification, the generation process prompts you to enter values, which tailor this run of the report to a subset of the data.

If you have a DNS server configured and IP address resolution enabled, reports contain host names if resolution was successful.

In a multidomain deployment, when you generate a report in an ancestor domain, it can include results from all descendant domains. To generate a report for a specific leaf domain, switch to that domain.
Procedure

Step 1 Choose Overview > Reporting.

Step 2 Click the Report Templates tab.

Step 3 Click the report icon next to the template you want to use to generate a report. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Tip To generate a report from an ancestor’s template, copy the template into the current domain.

Step 4 Optionally, configure the report name:
  • Enter a new File Name. If you do not enter a new name, the system uses the name specified in the report template.
  • Use the input parameter icon to add one or more input parameters to the file name.

Step 5 Choose the output format for the report by clicking the corresponding icon: HTML, PDF, or CSV.

Step 6 If you want to change the global time window, click the time window icon.

Note Setting the global time window affects the content of individual report sections only if they are configured to inherit the global setting.

Step 7 Enter values for any fields that appear in the Input Parameters section.

Tip You can ignore user parameters by typing the * wildcard character in the field. This eliminates the user parameter’s constraint on the search.

Note The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses or VLAN tags to constrain report results can have unexpected results.

Step 8 If you enabled an email relay host in the Firepower Management Center configuration, click Email to automate email delivery of the report when it generates.

Step 9 Click Generate and confirm when prompted.

Clicking Generate saves Generate settings with the report template.

If you click Cancel, your selections are saved only for the duration of your session.

Step 10 You have the following choices:
  • Click the report link to display the report in a new window.
  • Click OK to return to the report template editor.

Report Generation Options

You can configure report generation options to:
  • Schedule generation of future reports, either once or recurring. See Automating Report Generation, on page 178. You can customize the schedule on a full range of time frames such as daily, weekly, monthly, and so on.
• Distribute email reports using the scheduler. You must configure your report template and a mail relay host before scheduling the task.

• Automatically send the report as an email attachment to a list of recipients when you generate a report. You must have a properly configured mail relay host to deliver a report by email.

• Save newly generated report files to your configured remote storage location. To use remote storage, you must first configure a remote storage location.

Note
If you store remotely and then switch back to local storage, the reports in remote storage do not appear on the Reports tab list. Similarly, if you switch from one remote storage location to another, the reports in the previous location do not appear in the list.

Distributing Reports by Email at Generation Time

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1 Choose Overview > Reporting.
Step 2 Click the Report Templates tab.
Step 3 Click the report icon (E) next to the template you want to use to generate a report.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Tip To generate a report from an ancestor's template, copy the template into the current domain.

Step 4 Expand the Email section of the window.
Step 5 In the Email Options field, choose Send Email.
Step 6 In the Recipient List, CC, and BCC fields, enter recipients’ email addresses in comma-separated lists.
Step 7 In the Subject field, enter an email subject.

Tip You can provide input parameters in the Subject field and the message body to dynamically generate information in the email, such as a timestamp or the name of the Firepower Management Center.

Step 8 Enter a cover letter in the email body as necessary.
Step 9 Click OK and confirm.

Schedule Future Reports

See Automating Report Generation, on page 178.

About Working with Generated Reports

Access and work with previously-generated reports on the Reports tab page.

Viewing Reports

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

The Reports tab lists all previously generated reports, with report name, date and time of generation, generating user, and whether the report is stored locally or remotely. A status column indicates whether the report is already generated, is in the generation queue (for example, for scheduled tasks), or failed to generate (for example, due to lack of disk space).

Note that users with Administrator access can view all reports; other users can view only the reports they generated.

In a multidomain deployment, you can view reports generated in the current domain only.

The Reports tab page shows all locally stored reports. It shows remotely stored reports as well, if remote storage is currently configured. The Location column data for remotely-stored reports is Remote.

**Note**

If you store remotely and then switch back to local storage, the reports in remote storage do not appear on the Reports tab list. Similarly, if you switch from one remote storage location to another, the reports in the previous location do not appear in the list.

**Procedure**

**Step 1** Choose Overview > Reporting.

**Step 2** Click the Reports tab.

**Step 3** Click the report you want to view.

Downloading Reports

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
You can download any report file to your local computer. From there, you can email it or distribute it electronically by other available means.

In a multidomain deployment, you can download reports generated in the current domain only.

**Procedure**

**Step 1** Choose **Overview** > **Reporting**.

**Step 2** Click the **Reports** tab.

**Step 3** Check the check boxes next to the reports you want to download, then click **Download**.

**Tip** Click the check box at the top left of the page to download all reports on the page. If you have multiple pages of reports, a second check box appears that you can click to download all reports on all pages.

**Step 4** Follow your browser’s prompts to download the reports. If you chose multiple reports, they are downloaded in a single .zip file.

### Storing Reports Remotely

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

The location of your currently configured report storage appears at the bottom of the **Overview** > **Reporting** > **Reports** page, with disk usage for local, NFS, and SMB storage. If you access remote storage using SSH, disk usage data is not available.

**Note**

If you store remotely and then switch back to local storage, the reports in remote storage do not appear on the Reports tab list. Similarly, if you switch from one remote storage location to another, the reports in the previous location do not appear in the list.

**Before you begin**

- Configure a remote storage location as described in Remote Storage Management, on page 767.

**Procedure**

**Step 1** Choose **Overview** > **Reporting**.

**Step 2** Choose the **Reports** tab.

**Step 3** Check the **Enable Remote Storage of Reports** check box at the bottom of the page.
What to do next

• Move reports from local storage to remote storage; see Moving Reports to Remote Storage, on page 1902.

Related Topics
Remote Storage Management, on page 767
Moving Reports to Remote Storage, on page 1902

Moving Reports to Remote Storage

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can move your reports in local storage to a remote storage location in batch mode or singly.

Note
If you store remotely and then switch back to local storage, the reports in remote storage do not appear on the Reports tab list. Similarly, if you switch from one remote storage location to another, the reports in the previous location do not appear in the list.

Before you begin

• Configure a remote storage location as described in Remote Storage Management, on page 767.

Procedure

Step 1
Choose Overview > Reporting.

Step 2
Choose the Reports tab.

Step 3
Choose the check boxes next to the reports you want to move, then click Move.

Tip
Check the check box at the top left of the page to move all reports on the page. If you have multiple pages of reports, a second check box appears that you can check to move all reports on all pages.

Step 4
Confirm that you want to move the reports.

Deleting Reports

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
You can delete your report files at any time. The procedure completely removes the files, and no recovery is possible. Although you still have the report template that generated the report, it may be difficult to regenerate a particular report file if the time window was expanding or sliding. Regeneration may also be difficult if your template uses input parameters.

In a multidomain deployment, you can delete reports generated in the current domain only.

**Procedure**

**Step 1** Choose Overview > Reporting.

**Step 2** Click the Reports tab.

**Step 3** You have the following choices:

- Delete selected — Check the check boxes next to the reports you want to delete, then click Delete.
- Delete all — Check the check box at the top left of the page to delete all reports on the page. If you have multiple pages of reports, a second check box appears that you can check to delete all reports on all pages.

**Step 4** Confirm the deletion.
External Alerting with Alert Responses

The following topics describe how to send external event alerts from the Firepower Management Center using alert responses:

- Firepower Management Center Alert Responses, on page 1905
- Creating an SNMP Alert Response, on page 1906
- Creating a Syslog Alert Response, on page 1907
- Creating an Email Alert Response, on page 1910
- Configuring Impact Flag Alerting, on page 1911
- Configuring Discovery Event Alerting, on page 1911
- Configuring AMP for Networks Alerting, on page 1912

Firepower Management Center Alert Responses

External event notification via SNMP, syslog, or email can help with critical-system monitoring. The Firepower Management Center uses configurable alert responses to interact with external servers. An alert response is a configuration that represents a connection to an email, SNMP, or syslog server. They are called responses because you can use them to send alerts in response to events detected by Firepower. You can configure multiple alert responses to send different types of alerts to different monitoring servers and/or people.

Note

Alerts that use alert responses are sent by the Firepower Management Center. Intrusion email alerts, which do not use alert responses, are also sent by the Firepower Management Center. By contrast, SNMP and syslog alerts that are based on individual intrusion rules triggering are sent directly by managed devices. For more information, see External Alerting for Intrusion Events, on page 1913.

In most cases, the information in an external alert is the same as the information in any associated event you logged to the database. However, for correlation event alerts where the correlation rule contains a connection tracker, the information you receive is the same as for an alert on a traffic profile change, regardless of the base event type.

You create and manage alert responses on the Alerts page (Policies > Actions > Alerts). New alert responses are automatically enabled. To temporarily stop alert generation, you can disable alert responses rather than deleting them.
If you are using alert responses to send connection logs to an SNMP trap or syslog server (external email alerting is not supported for connection events), you must deploy configuration changes after you edit those alert responses. Otherwise, changes to alert responses take effect immediately.

In a multidomain deployment, when you create an alert response it belongs to the current domain. This alert response can also be used by descendant domains.

## Configurations Supporting Alert Responses

After you create an alert response, you can use it to send the following external alerts from the Firepower Management Center.

<table>
<thead>
<tr>
<th>Alert/Event Type</th>
<th>For More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intrusion events, by impact flag</td>
<td>Configuring Impact Flag Alerting, on page 1911</td>
</tr>
<tr>
<td>Discovery events, by type</td>
<td>Configuring Discovery Event Alerting, on page 1911</td>
</tr>
<tr>
<td>Network-based malware and retrospective malware events</td>
<td>Configuring AMP for Networks Alerting, on page 1912</td>
</tr>
<tr>
<td>Correlation events, by correlation policy violation</td>
<td>Adding Responses to Rules and White Lists, on page 1811</td>
</tr>
<tr>
<td>Connection events, by the logging rule or default action (email alerts not supported)</td>
<td>Configurable Connection Logging, on page 2038</td>
</tr>
<tr>
<td>Health events, by health module and severity level</td>
<td>Creating Health Monitor Alerts, on page 230</td>
</tr>
</tbody>
</table>

### Creating an SNMP Alert Response

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except Firepower Threat Defense</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can create SNMP alert responses using SNMPv1, SNMPv2, or SNMPv3.

**Note**

When selecting SNMP versions for the SNMP protocol, note that SNMPv2 only supports read-only communities and SNMPv3 only supports read-only users. SNMPv3 also supports encryption with AES128.

If you want to monitor 64-bit values with SNMP, you must use SNMPv2 or SNMPv3. SNMPv1 does not support 64-bit monitoring.

**Before you begin**

- If your network management system requires the Firepower Management Center’s management information base (MIB) file, obtain it at /etc/sf/DCEALERT.MIB.
Procedure

**Step 1** Choose Policies > Actions > Alerts.

**Step 2** From the Create Alert drop-down menu, choose Create SNMP Alert.

**Step 3** Enter a Name to identify the SNMP response.

**Step 4** In the Trap Server field, enter the hostname or IP address of the SNMP trap server.

**Note** The system does not warn you if you enter an invalid IPv4 address (such as 192.169.1.456) in this field. Instead, the invalid address is treated as a hostname.

**Step 5** From the Version drop-down list, choose the SNMP version you want to use. SNMP v3 is the default.

**Step 6** Depending on the version on SNMP you use, do one of the following:

- For SNMP v1 or SNMP v2, enter the SNMP community name in the Community String field and skip to step 12.
- For SNMP v3, enter the name of the user that you want to authenticate with the SNMP server in the User Name field and continue to the next step.

**Step 7** From the Authentication Protocol drop-down list, choose the protocol you want to use for authentication.

**Step 8** In the Authentication Password field, enter the password required for authentication with the SNMP server.

**Step 9** From the Privacy Protocol list, choose None to use no privacy protocol or DES to use Data Encryption Standard as the privacy protocol.

**Step 10** In the Privacy Password field, enter the privacy password required by the SNMP server.

**Step 11** In the Engine ID field, enter an identifier for the SNMP engine, in hexadecimal notation, using an even number of digits.

When you use SNMPv3, the system uses an Engine ID value to encode the message. Your SNMP server requires this value to decode the message.

Cisco recommends that you use the hexadecimal version of the Firepower Management Center’s IP address. For example, if the Firepower Management Center has an IP address of 10.1.1.77, use 0a01014D0.

**Step 12** Click Save.

---

**Creating a Syslog Alert Response**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When configuring a syslog alert response, you can specify the severity and facility associated with the syslog messages to ensure that they are processed properly by the syslog server. The facility indicates the subsystem that creates the message and the severity defines the severity of the message. Facilities and severities are not displayed in the actual message that appears in the syslog, but are instead used to tell the system that receives the syslog message how to categorize it.
For more detailed information about how syslog works and how to configure it, refer to the documentation for your system. On UNIX systems, the man pages for `syslog` and `syslog.conf` provide conceptual information and configuration instructions.

Although you can choose any type of facility when creating a syslog alert response, you should choose one that makes sense based on your syslog server; not all syslog servers support all facilities. For UNIX syslog servers, the `syslog.conf` file should indicate which facilities are saved to which log files on the server.

**Before you begin**

- Confirm that the syslog server can accept remote messages.

**Procedure**

1. **Choose Policies > Actions > Alerts.**
2. **Step 2** From the Create Alert drop-down menu, choose Create Syslog Alert.
3. **Step 3** Enter a Name for the alert.
4. **Step 4** In the Host field, enter the hostname or IP address of your syslog server.
   
   **Note** The system does not warn you if you enter an invalid IPv4 address (such as 192.168.1.456) in this field. Instead, the invalid address is treated as a hostname.

5. **Step 5** In the Port field, enter the port the server uses for syslog messages. By default, this value is 514.
6. **Step 6** From the Facility list, choose a facility described in Syslog Alert Facilities, on page 1908.
7. **Step 7** From the Severity list, choose a severity described in Syslog Severity Levels, on page 1909.
8. **Step 8** In the Tag field, enter the tag name that you want to appear with the syslog message.

   For example, if you wanted all messages sent to the syslog to be preceded with FromMC, enter FromMC in the field.

9. **Step 9** Click Save.

### Syslog Alert Facilities

The following table lists the syslog facilities you can select.

<table>
<thead>
<tr>
<th>Facility</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALERT</td>
<td>An alert message.</td>
</tr>
<tr>
<td>AUDIT</td>
<td>A message generated by the audit subsystem.</td>
</tr>
<tr>
<td>AUTH</td>
<td>A message associated with security and authorization.</td>
</tr>
</tbody>
</table>
Facility | Description
---|---
AUTHPRIV | A restricted access message associated with security and authorization. On many systems, these messages are forwarded to a secure file.
CLOCK | A message generated by the clock daemon. Note that syslog servers running a Windows operating system will use the CLOCK facility.
CRON | A message generated by the clock daemon. Note that syslog servers running a Linux operating system will use the CRON facility.
DAEMON | A message generated by a system daemon.
FTP | A message generated by the FTP daemon.
KERN | A message generated by the kernel. On many systems, these messages are printed to the console when they appear.
LOCAL0-LOCAL7 | A message generated by an internal process.
LPR | A message generated by the printing subsystem.
MAIL | A message generated by a mail system.
NEWS | A message generated by the network news subsystem.
NTP | A message generated by the NTP daemon.
SYSLOG | A message generated by the syslog daemon.
USER | A message generated by a user-level process.
UUCP | A message generated by the UUCP subsystem.

### Syslog Severity Levels

The following table lists the standard syslog severity levels you can select.

**Table 246: Syslog Severity Levels**

<table>
<thead>
<tr>
<th>Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALERT</td>
<td>A condition that should be corrected immediately.</td>
</tr>
<tr>
<td>CRIT</td>
<td>A critical condition.</td>
</tr>
<tr>
<td>DEBUG</td>
<td>Messages that contain debugging information.</td>
</tr>
<tr>
<td>EMERG</td>
<td>A panic condition broadcast to all users.</td>
</tr>
</tbody>
</table>
### Creating an Email Alert Response

<table>
<thead>
<tr>
<th>Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERR</td>
<td>An error condition.</td>
</tr>
<tr>
<td>INFO</td>
<td>Informational messages.</td>
</tr>
<tr>
<td>NOTICE</td>
<td>Conditions that are not error conditions, but require attention.</td>
</tr>
<tr>
<td>WARNING</td>
<td>Warning messages.</td>
</tr>
</tbody>
</table>

#### Before you begin

- Confirm that the Firepower Management Center can reverse-resolve its own IP address.
- Configure your mail relay host as described in Configuring a Mail Relay Host and Notification Address, on page 784.

**Note**

You cannot use email alerting to log connections.

#### Procedure

**Step 1** Choose **Policies > Actions > Alerts**.

**Step 2** From the **Create Alert** drop-down menu, choose **Create Email Alert**.

**Step 3** Enter a **Name** for the alert response.

**Step 4** In the **To** field, enter the email addresses where you want to send alerts, separated by commas.

**Step 5** In the **From** field, enter the email address that you want to appear as the sender of the alert.

**Step 6** Next to **Relay Host**, verify the listed mail server is the one that you want to use to send the alert.

**Tip**

To change the email server, click the edit icon (📝).

**Step 7** Click **Save**.
**Configuring Impact Flag Alerting**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can configure the system to alert you whenever an intrusion event with a specific impact flag occurs. Impact flags help you evaluate the impact an intrusion has on your network by correlating intrusion data, network discovery data, and vulnerability information.

**Procedure**

**Step 1**
Choose Policies > Actions > Alerts.

**Step 2**
Click the Impact Flag Alerts tab.

**Step 3**
In the Alerts section, choose the alert response you want to use for each alert type.

**Tip**
To create a new alert response, choose New from any drop-down list.

**Step 4**
In the Impact Configuration section, check the appropriate check boxes to specify the alerts you want to receive for each impact flag.

For definitions of the impact flags, see Intrusion Event Impact Levels, on page 2087.

**Step 5**
Click Save.

---

**Configuring Discovery Event Alerting**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can configure the system to alert you whenever a specific type of discovery event occurs.

**Before you begin**
- Configure your network discovery policy to log the discovery event types you want to configure alerting for as described in Configuring Network Discovery Event Logging, on page 1765.

**Procedure**

**Step 1**
Choose Policies > Actions > Alerts.

**Step 2**
Click the Discovery Event Alerts tab.

**Step 3**
In the Alerts section, choose the alert response you want to use for each alert type.
Tip To create a new alert response, choose New from any drop-down list.

Step 4 In the Events Configuration section, check the check boxes that correspond to the alerts you want to receive for each discovery event type.

Step 5 Click Save.

Configuring AMP for Networks Alerting

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Malware</td>
<td>Malware</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can configure the system to alert you whenever any network-based malware event, including a retrospective event, is generated. You cannot, however, alert on endpoint-based (AMP for Endpoints) malware events.

Before you begin

- Configure a file policy to perform malware cloud lookups and associate that policy with an access control rule as described in Access Control Using Intrusion and File Policies, on page 1105.

Procedure

Step 1 Choose Policies > Actions > Alerts.

Step 2 Click the Advanced Malware Protections Alerts tab.

Step 3 In the Alerts section, choose the alert response you want to use for each alert type.

Tip To create a new alert response, choose New from any drop-down list.

Step 4 In the Event Configuration section, check the check boxes that correspond to the alerts you want to receive for each malware event type.

Keep in mind that All network-based malware events includes Retrospective Events.

Step 5 Click Save.
CHAPTER 96

External Alerting for Intrusion Events

The following topics describe how to configure external alerting for intrusion events:
- About External Alerting for Intrusion Events, on page 1913
- Configuring SNMP Alerting for Intrusion Events, on page 1914
- Configuring Syslog Alerting for Intrusion Events, on page 1915
- Configuring Email Alerting for Intrusion Events, on page 1917

About External Alerting for Intrusion Events

External intrusion event notification can help with critical-system monitoring:
- SNMP—Configured per intrusion policy and sent from managed devices. You can enable SNMP alerting per intrusion rule.
- Syslog—Configured per intrusion policy and sent from managed devices. When you enable syslog alerting in an intrusion policy, you turn it on for every rule in the policy.
- Email—Configured across all intrusion policies and sent from the Firepower Management Center. You can enable email alerts per intrusion rule, as well as limit their length and frequency.

Keep in mind that if you configured intrusion event suppression or thresholding, the system may not generate intrusion events (and thus may not send alerts) every time a rule triggers.

In a multidomain deployment, you can configure external alerting in any domain. In ancestor domains, the system generates notifications for intrusion events in descendant domains.

Note
The Firepower Management Center also uses SNMP, syslog, and email alert responses to send different types of external alerts; see Firepower Management Center Alert Responses, on page 1905. The system does not use alert responses to send alerts based on individual intrusion events.

Related Topics
- Intrusion Event Notification Filters in an Intrusion Policy, on page 1332
Configuring SNMP Alerting for Intrusion Events

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

After you enable external SNMP alerting in an intrusion policy, you can configure individual rules to send SNMP alerts when they trigger. These alerts are sent from the managed device.

Procedure

**Step 1**
In the intrusion policy editor's navigation pane, click **Advanced Settings**.

**Step 2**
Make sure **SNMP Alerting** is **Enabled**, then click **Edit**.
A message at the bottom of the page identifies the intrusion policy layer that contains the configuration.

**Step 3**
Choose an **SNMP Version**, then specify configuration options as described in Intrusion SNMP Alert Options, on page 1914.

**Step 4**
In the navigation pane, click **Rules**.

**Step 5**
In the rules pane, choose the rules where you want to set SNMP alerts, then choose **Alerting** > **Add SNMP Alert**.

**Step 6**
To save changes you made in this policy since the last policy commit, choose **Policy Information**, then click **Commit Changes**.
If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Intrusion SNMP Alert Options

If your network management system requires a management information base file (MIB), you can obtain it from the Firepower Management Center at `/etc/sf/DCEALERT.MIB`.

**SNMP v2 Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Trap Type| The trap type to use for IP addresses that appear in the alerts.  
If your network management system correctly renders the INET_IPV4 address type, choose as **Binary**. Otherwise, choose as **String**. For example, HP OpenView requires as **String**. |
### SNMP v3 Options

Managed devices encode SNMPv3 alerts with an Engine ID value. To decode the alerts, your SNMP server requires this value, which is the hexadecimal version of the sending device's management interface IP address, appended with "01."

For example, if the device sending the SNMP alert has a management interface IP address of 172.16.1.50, the Engine ID value is 0xAC10013201.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>

</table>

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trap Type</td>
<td>The trap type to use for IP addresses that appear in the alerts. If your network management system correctly renders the INET_IPV4 address type, choose <strong>as Binary</strong>. Otherwise, choose <strong>as String</strong>. For example, HP OpenView requires <strong>as String</strong>.</td>
</tr>
<tr>
<td>Trap Server</td>
<td>The server that will receive SNMP traps notification. You can specify a single IP address or hostname.</td>
</tr>
<tr>
<td>Authentication Password</td>
<td>The password required for authentication. SNMP v3 uses either the Message Digest 5 (MD5) hash function or the Secure Hash Algorithm (SHA) hash function to encrypt this password, depending on configuration. If you specify an authentication password, authentication is enabled.</td>
</tr>
<tr>
<td>Private Password</td>
<td>The SNMP key for privacy. SNMP v3 uses the Data Encryption Standard (DES) block cipher to encrypt this password. When you enter an SNMP v3 password, the password displays in plain text during initial configuration but is saved in encrypted format. If you specify a private password, privacy is enabled, and you must also specify an authentication password.</td>
</tr>
<tr>
<td>User Name</td>
<td>Your SNMP user name.</td>
</tr>
</tbody>

### Configuring Syslog Alerting for Intrusion Events

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>
After you enable syslog alerting in an intrusion policy, the system sends all intrusion events to the syslog, either on the managed device itself or to an external host or hosts. If you specify an external host, syslog alerts are sent from the managed device.

**Procedure**

**Step 1** In the intrusion policy editor's navigation pane, click **Advanced Settings**.

**Step 2** Make sure **Syslog Alerting is Enabled**, then click **Edit**.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration.

**Step 3** Enter the IP addresses of the **Logging Hosts** where you want to send syslog alerts.

If you leave this field blank, the managed device logs intrusion events using its own syslog facility.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

**Step 4** Choose **Facility** and **Priority** levels as described in Facilities and Priorities for Intrusion Syslog Alerts, on page 1916.

**Step 5** To save changes you made in this policy since the last policy commit, choose **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

### Facilities and Priorities for Intrusion Syslog Alerts

Managed devices can send intrusion events as syslog alerts using a particular facility and priority, so that the logging host can categorize the alerts. The **facility** specifies the subsystem that generated it. The **priority** specifies its severity. These facility and priority values do not appear in the actual syslog messages.

Choose values that make sense based on your environment. Local configuration files (such as syslog.conf on UNIX-based logging hosts) may indicate which facilities are saved to which log files.

#### Syslog Alert Facilities

<table>
<thead>
<tr>
<th>Facility</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTH</td>
<td>A message associated with security and authorization.</td>
</tr>
<tr>
<td>AUTHPRIV</td>
<td>A restricted access message associated with security and authorization. On many systems, these messages are forwarded to a secure file.</td>
</tr>
<tr>
<td>CRON</td>
<td>A message generated by the clock daemon.</td>
</tr>
<tr>
<td>DAEMON</td>
<td>A message generated by a system daemon.</td>
</tr>
</tbody>
</table>
### Facility

<table>
<thead>

### Configuring Email Alerting for Intrusion Events

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

If you enable intrusion email alerting, the system can send email when it generates an intrusion event, regardless of which managed device or intrusion policy detected the intrusion. These alerts are sent from the Firepower Management Center.
Before you begin

- Configure your mail host to receive email alerts; see Configuring a Mail Relay Host and Notification Address, on page 784.
- Ensure that the Firepower Management Center can reverse resolve its own IP address.

Procedure

**Step 1** Choose Policies > Actions > Alerts.
**Step 2** Click the Intrusion Email tab.
**Step 3** Choose alerting options, including the intrusion rules or rule groups for which you want to alert, as described in Intrusion Email Alert Options, on page 1918.
**Step 4** Click Save.

Intrusion Email Alert Options

**On/Off**
Enables or disables intrusion email alerts.

**Note**
Enabling it will enable alerting for all rules unless individual rules are selected.

**From/To Addresses**
The email sender and recipients. You can specify a comma-separated list of recipients.

**Max Alerts and Frequency**
The maximum number of email alerts (Max Alerts) that the Firepower Management Center will send per time interval (Frequency).

**Coalesce Alerts**
Reduces the number of alerts sent by grouping alerts that have the same source IP and rule ID.

**Summary Output**
Enables brief alerts, suitable for text-limited devices. Brief alerts contain:
- Timestamp
- Protocol
- Source and destination IPs and ports
- Message
• The number of intrusion events generated against the same source IP

For example: 2011-05-18 10:35:10 10.1.1.100 icmp 10.10.10.1:8 -> 10.2.1.3:0
snort_decoder: Unknown Datagram decoding problem! (116:108)

If you enable **Summary Output**, also consider enabling **Coalesce Alerts**. You may also want to lower **Max Alerts** to avoid exceeding text-message limits.

**Time Zone**

The time zone for alert timestamps.

**Email Alerting on Specific Rules Configuration**

Allows you to choose the rules where you want to set email alerts.

• Using the Network Map, on page 1945
• Incidents, on page 1955
• Using Lookups, on page 1963
CHAPTER 97

Using the Context Explorer

The following topics describe how to use the Context Explorer in the Firepower System:

- About the Context Explorer, on page 1923
- Refreshing the Context Explorer, on page 1936
- Setting the Context Explorer Time Range, on page 1937
- Minimizing and Maximizing Context Explorer Sections, on page 1937
- Drilling Down on Context Explorer Data, on page 1938
- Filters in the Context Explorer, on page 1939

About the Context Explorer

The Firepower System Context Explorer displays detailed, interactive graphical information in context about the status of your monitored network, including data on applications, application statistics, connections, geolocation, indications of compromise, intrusion events, hosts, servers, Security Intelligence, users, files (including malware files), and relevant URLs. Distinct sections present this data in the form of vivid line, bar, pie, and donut graphs, accompanied by detailed lists. The first section, a line chart of traffic and event counts over time, provides an at-a-glance picture of recent trends in your network’s activity.

You can easily create and apply custom filters to fine-tune your analysis, and you can examine data sections in more detail by simply clicking or hovering your cursor over graph areas. You can also configure the explorer’s time range to reflect a period as short as the last hour or as long as the last year. Only users with the Administrator, Security Analyst, or Security Analyst (Read Only) user roles have access to the Context Explorer.

The Firepower System dashboard is highly customizable and compartmentalized and updates in real time. In contrast, the Context Explorer is manually updated, designed to provide broader context for its data, and has a single, consistent layout designed for active user exploration.

You use the dashboard to monitor real-time activity on your network and appliances according to your own specific needs. Conversely, you use the Context Explorer to investigate a predefined set of recent data in granular detail and clear context: for example, if you notice that only 15% of hosts on your network use Linux, but account for almost all YouTube traffic, you can quickly apply filters to view data only for Linux hosts, only for YouTube-associated application data, or both. Unlike the compact, narrowly focused dashboard widgets, the Context Explorer sections are designed to provide striking visual representations of system activity in a format useful to both expert and casual users of the Firepower System.
The data displayed depends on such factors as how you license and deploy your managed devices, and whether you configure features that provide the data. You can also apply filters to constrain the data that appears in all Context Explorer sections.

In a multidomain deployment, the Context Explorer displays aggregated data from all subdomains when you view it in an ancestor domain. In a leaf domain, you can view data specific to that domain only.

**Differences Between the Dashboard and the Context Explorer**

The following table summarizes some of the key differences between the dashboard and the Context Explorer.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Dashboard</th>
<th>Context Explorer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displayable data</td>
<td>Anything monitored by the Firepower System</td>
<td>Applications, application statistics, geolocation, indications of compromise, intrusion events, files (including malware files), hosts, Security Intelligence events, servers, users, and URLs</td>
</tr>
<tr>
<td>Customizability</td>
<td>• Selection of widgets for a dashboard is customizable</td>
<td>• Cannot change base layout</td>
</tr>
<tr>
<td></td>
<td>• Individual widgets can be customized to varying degrees</td>
<td>• Applied filters appear in explorer URL and can be bookmarked for later use</td>
</tr>
<tr>
<td>Data update frequency</td>
<td>Automatic (default); user-configured</td>
<td>Manual</td>
</tr>
<tr>
<td>Data filtering</td>
<td>Possible for some widgets (must edit widget preferences)</td>
<td>Possible for all parts of the explorer, with support for multiple filters</td>
</tr>
<tr>
<td>Graphical context</td>
<td>Some widgets (particularly Custom Analysis) can display data in graph form</td>
<td>Extensive graphical context for all data, including uniquely detailed donut graphs</td>
</tr>
<tr>
<td>Links to relevant web interface pages</td>
<td>In some widgets</td>
<td>In every section</td>
</tr>
<tr>
<td>Time range of displayed data</td>
<td>User-configured</td>
<td>User-configured</td>
</tr>

*About Dashboards*, on page 195

**The Traffic and Intrusion Event Counts Time Graph**

At the top of the Context Explorer is a line chart of traffic and intrusion events over time. The X-axis plots time intervals (which range from five minutes to one month, depending on the selected time window). The Y-axis plots traffic in kilobytes (blue line) and intrusion event count (red line).

Note that the smallest X-axis interval is five minutes. To accommodate this, the system will round the beginning and ending points in your selected time range down to the nearest five-minute interval.

By default, this section shows all network traffic and all generated intrusion events for the selected time range. If you apply filters, the chart changes to display only traffic and intrusion events associated with the criteria.
specified in the filters. For example, filtering on the OS Name of Windows causes the time graph to display only traffic and events associated with hosts using Windows operating systems.

If you filter the Context Explorer on intrusion event data (such as a Priority of High), the blue Traffic line is hidden to allow greater focus on intrusion events alone.

You can hover your pointer over any point on the graph lines to view exact information about traffic and event counts. Hovering your pointer over one of the colored lines also brings that line to the forefront of the graph, providing clearer context.

This section draws data primarily from the Intrusion Events and Connection Events tables.

The Indications of Compromise Section

The Indications of Compromise (IOC) section of the Context Explorer contains two interactive sections that provide an overall picture of potentially compromised hosts on your monitored network: a proportional view of the most prevalent IOC types triggered, as well as a view of hosts by number of triggered indications.

The Hosts by Indication Graph

The Hosts by Indication graph, in donut form, displays a proportional view of the Indications of Compromise (IOC) triggered by hosts on your monitored network. The inner ring divides by IOC category (such as CnC Connected or Malware Detected), while the outer ring further divides that data by specific event type (such as Impact 2 Intrusion Event — attempted-admin or Threat Detected in File Transfer).

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Hosts and Indications of Compromise tables.

The Indications by Host Graph

The Indications by Host graph, in bar form, displays counts of unique Indications of Compromise (IOC) triggered by the 15 most IOC-active hosts on your monitored network.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Hosts and Indications of Compromise tables.

The Network Information Section

The Network Information section of the Context Explorer contains six interactive graphs that display an overall picture of connection traffic on your monitored network: sources, destinations, users, and security zones associated with traffic, a breakdown of operating systems used by hosts on the network, as well as a proportional view of access control actions your Firepower System has performed on network traffic.

The Operating Systems Graph

The Operating Systems graph, in donut form, displays a proportional representation of operating systems detected on hosts on your monitored network. The inner ring divides by OS name (such as Windows or Linux), while the outer ring further divides that data by specific operating system version (such as Windows Server 2008 or Linux 11.x). Some closely related operating systems (such as Windows 2000, Windows XP, and
Windows Server 2003) are grouped together. Very scarce or unrecognized operating systems are grouped under **Other**.

Note that this graph reflects all available data regardless of date and time constraints. If you change the explorer time range, the graph does not change.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Hosts table.

### The Traffic by Source IP Graph

The Traffic by Source IP graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top 15 most active source IP addresses on your monitored network. For each source IP address listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

**Note**

If you filter on intrusion event information, the Traffic by Source IP graph is hidden.

This graph draws data primarily from the Connection Events table.

### The Traffic by Source User Graph

The Traffic by Source User graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top 15 most active source users on your monitored network. For each source IP address listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

**Note**

If you filter on intrusion event information, the Traffic by Source User graph is hidden.

This graph draws data primarily from the Connection Events table. It displays authoritative user data.

### The Connections by Access Control Action Graph

The Connections by Access Control Action graph, in pie form, displays a proportional view of access control actions (such as **Block** or **Allow**) that your Firepower System deployment has taken on monitored traffic.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

**Note**

If you filter on intrusion event information, the Traffic by Source User graph is hidden.

This graph draws data primarily from the Connection Events table.
The Traffic by Destination IP Graph

The Traffic by Destination IP graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top 15 most active destination IP addresses on your monitored network. For each destination IP address listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

---

**Note**

If you filter on intrusion event information, the Traffic by Destination IP graph is hidden.

This graph draws data primarily from the Connection Events table.

The Traffic by Ingress/Egress Security Zone Graph

The Traffic by Ingress/Egress Security Zone graph, in bar form, displays counts of incoming or outgoing network traffic (in kilobytes per second) and unique connections for each security zone configured on your monitored network. You can configure this graph to display either ingress (the default) or egress security zone information, according to your needs.

For each security zone listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

---

**Tip**

To constrain the graph so it displays only traffic by egress security zone, hover your pointer over the graph, then click **Egress** on the toggle button that appears. Click **Ingress** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Ingress view.

---

**Note**

If you filter on intrusion event information, the Traffic by Ingress/Egress Security Zone graph is hidden.

This graph draws data primarily from the Connection Events table.

The Application Information Section

The Application Information section of the Context Explorer contains three interactive graphs and one table-format list that display an overall picture of application activity on your monitored network: traffic, intrusion events, and hosts associated with applications, further organized by the estimated risk or business relevance assigned to each application. The Application Details list provides an interactive list of each application and its risk, business relevance, category, and host count.

For all instances of “application” in this section, the Application Information graph set, by default, specifically examines application protocols (such as DNS or SSH). You can also configure the Application Information section to specifically examine client applications (such as PuTTY or Firefox) or web applications (such as Facebook or Pandora).
Focusing the Application Information Section

<table>
<thead>
<tr>

<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

Step 1 Choose **Analysis > Context Explorer**.

Step 2 Hover your pointer over the **Application Protocol Information** section.

**Note** If you previously changed this setting in the same Context Explorer session, the section title may appear as **Client Application Information** or **Web Application Information** instead.

Step 3 Click **Application Protocol**, **Client Application**, or **Web Application**.

The Traffic by Risk/Business Relevance and Application Graph

The Traffic by Risk/Business Relevance and Application graph, in donut form, displays a proportional representation of application traffic detected on your monitored network, arranged by the applications’ estimated risk (the default) or estimated business relevance. The inner ring divides by estimated risk/business relevance level (such as Medium or High), while the outer ring further divides that data by specific application (such as SSH or NetBIOS). Scarcely detected applications are grouped under **Other**.

Note that this graph reflects all available data regardless of date and time constraints. If you change the explorer time range, the graph does not change.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

**Tip**

To constrain the graph so it displays traffic by business relevance and application, hover your pointer over the graph, then click **Business Relevance** on the toggle button that appears. Click **Risk** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Risk view.

**Note**

If you filter on intrusion event information, the Traffic by Risk/Business and Application graph is hidden.

This graph draws data primarily from the Connection Events and Application Statistics tables.

The Intrusion Events by Risk/Business Relevance and Application Graph

The Intrusion Events by Risk/Business Relevance and Application graph, in donut form, displays a proportional representation of intrusion events detected on your monitored network and the applications associated with
those events, arranged by the applications’ estimated risk (the default) or estimated business relevance. The inner ring divides by estimated risk/business relevance level (such as Medium or High), while the outer ring further divides that data by specific application (such as SSH or NetBIOS). Scarcely detected applications are grouped under Other.

Hover your pointer over any part of the donut graph to view more detailed information. Click any part of the graph to filter or drill down on that information, or (where applicable) to view application information.

Tip
To constrain the graph so it displays intrusion events by business relevance and application, hover your pointer over the graph, then click Business Relevance on the toggle button that appears. Click Risk to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Risk view.

This graph draws data primarily from the Intrusion Events and Application Statistics tables.

The Hosts by Risk/Business Relevance and Application Graph

The Hosts by Risk/Business Relevance and Application graph, in donut form, displays a proportional representation of hosts detected on your monitored network and the applications associated with those hosts, arranged by the applications’ estimated risk (the default) or estimated business relevance. The inner ring divides by estimated risk/business relevance level (such as Medium or High), while the outer ring further divides that data by specific application (such as SSH or NetBIOS). Very scarce applications are grouped under Other.

Hover your pointer over any part of the donut graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Tip
To constrain the graph so it displays hosts by business relevance and application, hover your pointer over the graph, then click Business Relevance on the toggle button that appears. Click Risk to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Risk view.

This graph draws data primarily from the Applications table.

The Application Details List

At the bottom of the Application Information section is the Application Details List, a table that provides estimated risk, estimated business relevance, category, and hosts count information for each application detected on your monitored network. The applications are listed in descending order of associated host count.

The Application Details List table is not sortable, but you can click on any table entry to filter or drill down on that information, or (where applicable) to view application information. This table draws data primarily from the Applications table.

Note that this list reflects all available data regardless of date and time constraints. If you change the explorer time range, the list does not change.

The Security Intelligence Section

The Security Intelligence section of the Context Explorer contains three interactive bar graphs that display an overall picture of traffic on your monitored network that is blacklisted or monitored by Security Intelligence.
The graphs sort such traffic by category, source IP address, and destination IP address, respectively; both the amount of traffic (in kilobytes per second) and the number of applicable connections appear.

**The Security Intelligence Traffic by Category Graph**

The Security Intelligence Traffic by Category graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top Security Intelligence categories of traffic on your monitored network. For each category listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to drill down on that information.

---

**Note**

If you filter on intrusion event information, the Security Intelligence Traffic by Category graph is hidden.

This graph draws data primarily from the Security Intelligence Events table.

**The Security Intelligence Traffic by Source IP Graph**

The Security Intelligence Traffic by Source IP graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top source IP addresses of Security Intelligence-monitored traffic on your monitored network. For each category listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to drill down on that information.

---

**Note**

If you filter on intrusion event information, the Security Intelligence Traffic by Source IP graph is hidden.

This graph draws data primarily from the Security Intelligence Events table.

**The Security Intelligence Traffic by Destination IP Graph**

The Security Intelligence Traffic by Destination IP graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top destination IP addresses of Security Intelligence-monitored traffic on your monitored network. For each category listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to drill down on that information.

---

**Note**

If you filter on intrusion event information, the Security Intelligence Traffic by Destination IP graph is hidden.

This graph draws data primarily from the Security Intelligence Events table.
The Intrusion Information Section

The Intrusion Information section of the Context Explorer contains six interactive graphs and one table-format list that display an overall picture of intrusion events on your monitored network: impact levels, attack sources, target destinations, users, priority levels, and security zones associated with intrusion events, as well as a detailed list of intrusion event classifications, priorities, and counts.

The Intrusion Events by Impact Graph

The Intrusion Events by Impact graph, in pie form, displays a proportional view of intrusion events on your monitored network, grouped by estimated impact level (from 0 to 4).

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the IDS Statistics and Intrusion Events tables.

The Top Attackers Graph

The Top Attackers graph, in bar form, displays counts of intrusion events for the top attacking host IP addresses (causing those events) on your monitored network.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Intrusion Events table.

The Top Users Graph

The Top Users graph, in bar form, displays users on your monitored network that are associated with the highest intrusion event counts, by event count.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the IDS User Statistics and Intrusion Events tables. It displays authoritative user data.

The Intrusion Events by Priority Graph

The Intrusion Events by Priority graph, in pie form, displays a proportional view of intrusion events on your monitored network, grouped by estimated priority level (such as High, Medium, or Low).

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Intrusion Events table.

The Top Targets Graph

The Top Targets graph, in bar form, displays counts of intrusion events for the top target host IP addresses (targeted in the connections causing those events) on your monitored network.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Intrusion Events table.
The Top Ingress/Egress Security Zones Graph

The Top Ingress/Egress Security Zones graph, in bar form, displays counts of intrusion events associated with each security zone (ingress or egress, depending on graph settings) configured on your monitored network.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Tip
To constrain the graph so it displays only traffic by egress security zone, hover your pointer over the graph, then click Egress on the toggle button that appears. Click Ingress to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Ingress view.

This graph draws data primarily from the Intrusion Events table.

You can configure this graph to display either ingress (the default) or egress security zone information, according to your needs.

The Intrusion Event Details List

At the bottom of the Intrusion Information section is the Intrusion Event Details List, a table that provides classification, estimated priority, and event count information for each intrusion event detected on your monitored network. The events are listed in descending order of event count.

The Intrusion Event Details List table is not sortable, but you can click on any table entry to filter or drill down on that information. This table draws data primarily from the Intrusion Events table.

The Files Information Section

The Files Information section of the Context Explorer contains six interactive graphs that display an overall picture of file and malware events on your monitored network.

Five of the graphs display data related to AMP for Networks (formerly called AMP for Firepower): the file types, file names, and malware dispositions of the files detected in network traffic, as well as the hosts sending (uploading) and receiving (downloading) those files. The final graph displays all malware threats detected in your organization, whether by AMP for Networks or AMP for Endpoints.

Note
If you filter on intrusion information, the entire Files Information Section is hidden.

The Top File Types Graph

The Top File Types graph, in donut form, displays a proportional view of the file types detected in network traffic (outer ring), grouped by file category (inner ring).

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note that you must have a Malware license to for this graph to display AMP for Networks data.

This graph draws data primarily from the File Events table.
The Top File Names Graph

The Top File Names graph, in bar form, displays counts of the top unique file names detected in network traffic.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note that you must have a Malware license to for this graph to display AMP for Networks data.

This graph draws data primarily from the File Events table.

The Files by Disposition Graph

The Top File Types graph, in pie form, displays a proportional view of the malware dispositions for files detected by the AMP for Networks feature (formerly called AMP for Firepower). Note that only files for which the Firepower Management Center performed a malware cloud lookup have dispositions. Files that did not trigger a cloud lookup have a disposition of N/A. The disposition Unavailable indicates that the Firepower Management Center could not perform a malware cloud lookup.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note that you must have a Malware license to for this graph to display AMP for Networks data.

This graph draws data primarily from the File Events table.

The Top Hosts Sending Files Graph

The Top Hosts Sending Files graph, in bar form, displays counts of the number of files detected in network traffic for the top file-sending host IP addresses.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Tip

To constrain the graph so it displays only hosts sending malware, hover your pointer over the graph, then click Malware on the toggle button that appears. Click Files to return to the default files view. Note that navigating away from the Context Explorer also returns the graph to the default files view.

Note that you must have a Malware license to for this graph to display AMP for Networks data.

This graph draws data primarily from the File Events table.

The Top Hosts Receiving Files Graph

The Top Hosts Receiving Files graph, in bar form, displays counts of the number of files detected in network traffic for the top file-receiving host IP addresses.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.
To constrain the graph so it displays only hosts receiving malware, hover your pointer over the graph, then click **Malware** on the toggle button that appears. Click **Files** to return to the default files view. Note that navigating away from the Context Explorer also returns the graph to the default files view.

Tip

Note that you must have a Malware license to for this graph to display AMP for Networks data.

The Top Malware Detections Graph

The Top Malware Detections graph, in bar form, displays counts of the top malware threats detected in your organization, whether by AMP for Networks or AMP for Endpoints.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note that you must have a Malware license to for this graph to display AMP for Networks data.

This graph draws data primarily from the File Events table.

The Geolocation Information Section

The Geolocation Information section of the Context Explorer contains three interactive donut graphs that display an overall picture of countries with which hosts on your monitored network are exchanging data: unique connections by initiator or responder country, intrusion events by source or destination country, and file events by sending or receiving country.

The Connections by Initiator/Responder Country Graph

The Connections by Initiator/Responder Country graph, in donut form, displays a proportional view of the countries involved in connections on your network as either the initiator (the default) or the responder. The inner ring groups these countries together by continent.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Tip

To constrain the graph so it displays only countries acting as the responder in connections, hover your pointer over the graph, then click **Responder** on the toggle button that appears. Click **Initiator** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Initiator view.

This graph draws data primarily from the Connection Summary Data table.

The Intrusion Events by Source/Destination Country Graph

The Intrusion Events by Source/Destination Country graph, in donut form, displays a proportional view of the countries involved in intrusion events on your network as either the source of the event (the default) or the destination. The inner ring groups these countries together by continent.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Tip

To constrain the graph so it displays only countries acting as the responder in connections, hover your pointer over the graph, then click **Responder** on the toggle button that appears. Click **Initiator** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Initiator view.
To constrain the graph so it displays only countries acting as the destinations of intrusion events, hover your pointer over the graph, then click **Destination** on the toggle button that appears. Click **Source** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Source view.

This graph draws data primarily from the Intrusion Events table.

**The File Events by Sending/Receiving Country Graph**

The File Events by Sending/Receiving Country graph, in donut form, displays a proportional view of the countries detected in file events on your network as either sending (the default) or receiving files. The inner ring groups these countries together by continent.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

**Tip**

To constrain the graph so it displays only countries receiving files, hover your pointer over the graph, then click **Receiver** on the toggle button that appears. Click **Sender** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Sender view.

This graph draws data primarily from the File Events table.

**The URL Information Section**

The URL Information section of the Context Explorer contains three interactive bar graphs that display an overall picture of URLs with which hosts on your monitored network are exchanging data: traffic and unique connections associated with URLs, sorted by individual URL, URL category, and URL reputation. You cannot filter on URL information.

If you filter on intrusion event information, the entire URL Information Section is hidden.

Note that you must have a URL Filtering license for this graph to include URL category and reputation data.

**The Traffic by URL Graph**

The Traffic by URL graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top 15 most requested URLs on your monitored network. For each URL listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to drill down on that information.

If you filter on intrusion event information, the Traffic by URL graph is hidden.

Note that you must have a URL Filtering license for this graph to include URL category and reputation data.
This graph draws data primarily from the Connection Events table.

**The Traffic by URL Category Graph**

The Traffic by URL Category graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the most requested URL categories (such as Search Engines or Streaming Media) on your monitored network. For each URL category listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to drill down on that information.

**Note**

If you filter on intrusion event information, the Traffic by URL Category graph is hidden.

Note that you must have a URL Filtering license for this graph to include URL category and reputation data.

This graph draws data primarily from the URL Statistics and Connection Events tables.

**The Traffic by URL Reputation Graph**

The Traffic by URL Reputation graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the most requested URL reputation groups (such as Well known or Benign sites with security risks) on your monitored network. For each URL reputation listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to drill down on that information.

**Note**

If you filter on intrusion event information, the Traffic by URL Reputation graph is hidden.

Note that you must have a URL Filtering license for this graph to include URL category and reputation data.

This graph draws data primarily from the URL Statistics and Connection Events tables.

**Refreshing the Context Explorer**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

The Context Explorer does not automatically update the information it displays. To incorporate new data, you must manually refresh the explorer.

Note that, although reloading the Context Explorer itself (by refreshing the browser program or navigating away from, then back to, the Context Explorer) refreshes all displayed information, this does not preserve any changes you made to section configuration (such as the Ingress/Egress graphs and the Application Information section) and may cause delays in loading.
In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1**  Choose **Analysis > Context Explorer**.

**Step 2**  Click **Reload** at the upper right.

The **Reload** button is dimmed until your refresh is finished.

---

### Setting the Context Explorer Time Range

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can configure the Context Explorer time range to reflect a period as short as the last hour (the default) or as long as the last year. Note that when you change the time range, the Context Explorer does not automatically update to reflect the change. To apply the new time range, you must manually refresh the explorer.

Changes to the time range persist even if you navigate away from the Context Explorer or end your login session.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1**  Choose **Analysis > Context Explorer**.

**Step 2**  From the **Show the last** drop-down list, choose a time range.

**Step 3**  Optionally, to view data from the new time range, click **Reload**.

**Tip**  Clicking **Apply Filters** also applies any time range updates.

---

### Minimizing and Maximizing Context Explorer Sections

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
You can minimize and hide one or more sections of the Context Explorer. This is useful if you want to focus on only certain sections, or if you want a simpler view. You cannot minimize the Traffic and Intrusion Event Counts Time Graph.

Context Explorer sections retain the minimized or maximized states that you configure even if you refresh the page or log out of the appliance.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose **Analysis > Context Explorer**.

**Step 2** To minimize a section, click the minimize icon (−) in a section’s title bar.

**Step 3** To maximize a section, click the maximize icon (□) in a minimized section’s title bar.

### Drilling Down on Context Explorer Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

If you want to examine graph or list data in more detail than the Context Explorer allows, you can drill down to the table views of the relevant data. (Note that you cannot drill down on the Traffic and Intrusion Events over Time graph.) For example, drilling down on an IP address in the Traffic by Source IP graph displays the Connections with Application Details view of the Connection Events table, including only data associated with the source IP address you selected.

Depending on the type of data you examine, additional options can appear in the context menu. Data points that are associated with specific IP addresses offer the option to view host or whois information on the IP address you select. Data points associated with specific applications offer the option to view application information on the application you select. Data points associated with a specific user offer the option to view that user’s user profile page. Data points associated with an intrusion event message offer the option to view the rule documentation for that event’s associated intrusion rule, and data points associated with a specific IP address offer the option to blacklist or whitelist that address.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose **Analysis > Context Explorer**.

**Step 2** In any section but **Traffic and Intrusion Events over Time**, click a data point that you want to investigate.

**Step 3** Depending on the data point you selected, you have several options:
• To view more details of this data in a table view, choose **Drill into Analysis**.
• If you chose a data point associated with a specific IP address and want more information about the associated host, choose **View Host Information**.
• If you chose a data point with a specific IP address and want to make a whois search on that address, choose **Whois**.
• If you chose a data point associated with a specific application and want more information about that application, choose **View Application Information**.
• If you chose a data point associated with a specific user and want more information about that user, choose **View User Information**.
• If you chose a data point associated with a specific intrusion event message and want more information about the associated intrusion rule, choose **View Rule Documentation**.
• If you chose a data point associated with a specific IP address and want to add that IP address to the Security Intelligence global blacklist or whitelist, choose the appropriate option: **Blacklist Now** or **Whitelist Now**.

---

**Filters in the Context Explorer**

Beyond the basic, wide-ranging data that the Context Explorer initially displays, you have the option to filter that data for a more granular contextual picture of activity on your network. Filters encompass all types of Firepower System data except URL information, support exclusion as well as inclusion, can be applied quickly by clicking on Context Explorer graph data points, and affect the entire explorer. You can apply up to 20 filters at a time.

You can add filters to Context Explorer data in several ways:

• from the Add Filter dialog
• from the context menu, when you select a data point in the explorer
• from the text links that appear in certain detail view pages (Application Detail, Host Profile, Rule Detail, and User Profile). Clicking these links automatically opens and filters the Context Explorer according to the relevant data on the detail view page. For example, clicking the Context Explorer link on a user detail page for the user *jenkins* constrains the explorer to show only data associated with that user.

Some filter types are incompatible with others: for example, filters that relate to intrusion events (such as **Device** and **Inline Result**) cannot be applied at the same time as connection event-related filters (such as **Access Control Action**) because the system cannot sort connection event data by intrusion event data. The system automatically prevents incompatible filters from simultaneously applying; when one filter type is more recently activated, filters of the incompatible type are hidden as long as the incompatibility exists.

When multiple filters are active, values for the same data type are treated as OR search criteria: all data that matches at least one of the values appears. Values for different data types are treated as AND search criteria: to appear, data must match at least one value for each filtered data type. For example, data that appears for the filter set of **Application: 2channel**, **Application: Reddit**, and **User: edickinson** must be associated with the user *edickinson* AND either the application **2channel** OR the application **Reddit**.

In a multidomain deployment, you can filter by multiple descendant domains when viewing the Context Explorer in an ancestor domain. In such cases, use caution when also adding **IP Address** filters. The system builds a separate network map for each leaf domain. Using literal IP addresses to constrain this configuration can have unexpected results.
Note that the data displayed depends on such factors as how you license and deploy your managed devices and whether you configure features that provide the data.

Filters function as a simple, agile tool to get the precise Firepower data context you need at any given time. They are not intended as permanent configuration settings, and disappear when you navigate away from the Context Explorer or end your session. To preserve filter settings for later use, see Saving Filtered Context Explorer Views, on page 1943.

## Data Type Field Options

The following table lists the data types available as filters, with examples and brief definitions of each.

<table>
<thead>
<tr>
<th>Type</th>
<th>Example Values</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Control Action</td>
<td>Allow, Block</td>
<td>Action taken by your access control policy to allow or block traffic.</td>
</tr>
<tr>
<td>Application Category</td>
<td>web browser, email</td>
<td>General classification of an application’s most essential function.</td>
</tr>
<tr>
<td>Application Name</td>
<td>Facebook, HTTP</td>
<td>Name of an application.</td>
</tr>
<tr>
<td>Application Risk</td>
<td>Very High, Medium</td>
<td>Estimated security risk of an application.</td>
</tr>
<tr>
<td>Application Tag</td>
<td>encrypts communications, sends mail</td>
<td>Additional information about an application; applications can have any number of tags, including none.</td>
</tr>
<tr>
<td>Application Type</td>
<td>Client, Web Application</td>
<td>Type of an application: application protocol, client, or web application.</td>
</tr>
<tr>
<td>Business Relevance</td>
<td>Very Low, High</td>
<td>Estimated relevance of an application to business activity (as opposed to recreation).</td>
</tr>
<tr>
<td>Continent</td>
<td>North America, Asia</td>
<td>Continent associated with a routable IP address detected on your monitored network.</td>
</tr>
<tr>
<td>Country</td>
<td>Canada, Japan</td>
<td>Country associated with a routable IP address detected on your monitored network.</td>
</tr>
<tr>
<td>Device</td>
<td>device1.example.com, 192.168.1.3</td>
<td>Name or IP address of a device on your monitored network.</td>
</tr>
<tr>
<td>Domain</td>
<td>Asia Division, Europe Division</td>
<td>The domain of the device whose network activity you want to graph. This data type is only present in a multidomain deployment.</td>
</tr>
<tr>
<td>Type</td>
<td>Example Values</td>
<td>Definition</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Event Classification</td>
<td>Potential Corporate Policy Violation, Attempted Denial of Service</td>
<td>Capsule description of an intrusion event, determined by the classification of the rule, decoder, or preprocessor that triggered it.</td>
</tr>
<tr>
<td>Event Message</td>
<td>dns response, P2P</td>
<td>Message generated by an event, determined by the rule, decoder, or preprocessor that triggered it.</td>
</tr>
<tr>
<td>File Disposition</td>
<td>Malware, Clean</td>
<td>Disposition of a file for which the Firepower Management Center performed a malware cloud lookup.</td>
</tr>
<tr>
<td>File Name</td>
<td>Packages.bz2</td>
<td>Name of a file detected in network traffic.</td>
</tr>
<tr>
<td>File SHA256</td>
<td>any 32-bit string</td>
<td>SHA-256 hash value of a file for which the Firepower Management Center performed a malware cloud lookup.</td>
</tr>
<tr>
<td>File Type</td>
<td>GZ, SWF, MOV</td>
<td>File type detected in network traffic.</td>
</tr>
<tr>
<td>File Type Category</td>
<td>Archive, Multimedia, Executables</td>
<td>General category of file type detected in network traffic.</td>
</tr>
<tr>
<td>IP Address</td>
<td>192.168.1.3, 2001:0db8:85a3::0000/24</td>
<td>IPv4 or IPv6 addresses, address ranges, or address blocks. Note that searching for an IP address returns events where that address was either the source or the destination for the event.</td>
</tr>
<tr>
<td>Impact Level</td>
<td>Impact Level 1, Impact Level 2</td>
<td>Estimated impact of an event on your monitored network.</td>
</tr>
<tr>
<td>Inline Result</td>
<td>dropped, would have dropped</td>
<td>Whether traffic was dropped, would have been dropped, or was not acted upon by the system.</td>
</tr>
<tr>
<td>IOC Category</td>
<td>High Impact Attack, Malware Detected</td>
<td>Category for a triggered Indication of Compromise (IOC) event.</td>
</tr>
<tr>
<td>IOC Event Type</td>
<td>exploit-kit, malware-backdoor</td>
<td>Identifier associated with a specific Indication of Compromise (IOC), referring to the event that triggers it.</td>
</tr>
<tr>
<td>Malware Threat Name</td>
<td>W32.Trojan.a6b1</td>
<td>The name of a malware threat.</td>
</tr>
<tr>
<td>OS Name</td>
<td>Windows, Linux</td>
<td>Name of an operating system.</td>
</tr>
<tr>
<td>OS Version</td>
<td>XP, 2.6</td>
<td>Specific version of an operating system.</td>
</tr>
<tr>
<td>Priority</td>
<td>high, low</td>
<td>Estimated urgency of an event.</td>
</tr>
</tbody>
</table>
### Creating a Filter from the Add Filter Window

<table>
<thead>
<tr>
<th>Type</th>
<th>Example Values</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Intelligence Category</td>
<td>Malware, Spam</td>
<td>Category of risky traffic, as determined by Security Intelligence.</td>
</tr>
<tr>
<td>Security Zone</td>
<td>My Security Zone, Security Zone X</td>
<td>A set of interfaces through which traffic is analyzed and, in an inline deployment, passes.</td>
</tr>
<tr>
<td>SSL</td>
<td>yes, no</td>
<td>SSL- or TLS-encrypted traffic.</td>
</tr>
<tr>
<td>User</td>
<td>wsmith, mtwain</td>
<td>Identity of a user logged in to a host on your monitored network.</td>
</tr>
</tbody>
</table>

Use this procedure to create filters from scratch with the Add Filter window. (You can also use the context menu to create quick filters.)

The Add Filter window, which you access by clicking the plus icon (⁺) under Filters at the top left of the Context Explorer, contains only two fields:

- The **Data Type** drop-down list contains many different types of Firepower System data you can use to constrain the Context Explorer. After you select a data type, you then enter a specific value for that type in the **Filter** field (for example, a value of `Asia` for the type **Continent**). To assist you, the Filter field presents several grayed-out example values for the data type you select. (These are erased when you enter data in the field.)

- In the **Filter** field, you can input special search parameters such as `*` and `!` essentially as you can in event searches. You can create exclusionary filters by prefixing filter parameters with the `!` symbol.

**Note**

Filters that you add are not automatically applied; you must click **Apply Filters** to see the filtering in the Context Explorer.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose **Analysis > Context Explorer**.

**Step 2** Under **Filters** at the top left, click the plus icon (⁺).

**Step 3** From the **Data Type** drop-down list, choose the data type you want to filter on.

Creating a Quick Filter from the Context Menu

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

While exploring Context Explorer graph and list data, you can click on data points, then use the context menu to quickly create a filter based on that data, either inclusive or exclusive. If you use the context menu to filter on information of data type Application, User, or Intrusion Event Message, or any individual host, the filter widget includes a widget information icon that links to the relevant detail page for that data type (such as Application Detail for application data). Note that you cannot filter on URL data.

You can also use the context menu to investigate specific graph or list data in more detail.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

**Step 1** Choose Analysis > Context Explorer.

**Step 2** In any explorer section except Traffic and Intrusion Events over Time or sections that contain URL data, click a data point you want to filter on.

**Step 3** You have two options:

- To add a filter for this data, click **Add Filter**.
- To add an exclusion filter for this data, click **Add Exclude Filter**. The filter, when applied, displays all data **not** associated with the excluded value. Exclude filters display an exclamation point (!) before the filter value.

Saving Filtered Context Explorer Views

To preserve filter settings in the Context Explorer after you navigate away from the Context Explorer or end your session, create a browser bookmark of the Context Explorer with your preferred filters applied. Because applied filters are incorporated in the Context Explorer page URL, loading a bookmark of that page also loads the corresponding filters.
Procedure

Create a browser bookmark of the Context Explorer with your preferred filters applied.

Viewing Filter Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

Step 1  Choose Analysis > Context Explorer.
Step 2  Click the information icon (i) on any eligible filter widget.

Deleting a Filter

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1  Choose Analysis > Context Explorer.
Step 2  Under Filters at the top left, click the clear icon (X) on any filter widget.
Tip       If you want to delete all filters at once, you can click the Clear button.
Using the Network Map

The following topics describe how to use the network map:

- The Network Map, on page 1945
- Custom Network Topologies, on page 1951

The Network Map

The Firepower System monitors traffic traveling over your network, decodes the traffic data, and then compares the data to established operating systems and fingerprints. The system then uses this data to build a detailed representation of your network, called a network map. In multidomain deployments, the system creates an individual network map for each leaf domain.

The system gathers data from the managed devices identified for monitoring in the network discovery policy. The managed devices detect network assets directly from monitored traffic and indirectly from processed NetFlow records. If multiple devices detect the same network asset, the system combines the information into a composite representation of the asset.

To augment data from passively detection, you can:

- Actively scan hosts using the open-source scanner, Nmap™, and add the scan results to your network map.
- Manually add host data from a third-party application using the host input feature.

The network map displays your network topology in terms of detected hosts and network devices.

You can use the network map to:

- Obtain a quick, overall view of your network.
- Select different views to suit the analysis you want to perform. Each view of the network map has the same format: a hierarchical tree with expandable categories and sub-categories. When you click a category, it expands to show you the sub-categories beneath it.
- Organize and identify subnets via the custom topology feature. For example, if each department in your organization uses a different subnet, you can assign familiar labels to those subnets using the custom topology feature.
- View detailed information by drilling down to any monitored host's host profile.
- Delete an asset if you are no longer interested in investigating it.
If the system detects activity associated with a host you deleted from a network map, it re-adds the host to the network map. Similarly, deleted applications are re-added to the network map if the system detects a change in the application (for example, if an Apache web server is upgraded to a new version). Vulnerabilities are reactivated on specific hosts if the system detects a change that makes the host vulnerable.

Note

If you want to permanently exclude a host or subnet from the network map, modify the network discovery policy. You may wish to exclude load balancers and NAT devices from monitoring if you find that they are generating excessive or irrelevant events.

Tip

If you want to permanently exclude a host or subnet from the network map, modify the network discovery policy. You may wish to exclude load balancers and NAT devices from monitoring if you find that they are generating excessive or irrelevant events.

Related Topics

Configuring the Network Discovery Policy, on page 1746

The Hosts Network Map

The network map on the Hosts tab displays a host count and a list of host IP addresses and MAC addresses. Each address or partial address is a link to the next level. This network map view provides a count of all unique hosts detected by the system, regardless of whether the hosts have one IP address or multiple IP addresses.

Use the hosts network map to view the hosts on your network, organized by subnet in a hierarchical tree, as well as to drill down to the host profiles for specific hosts.

The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1649.

By creating a custom topology for your network, you can assign meaningful labels to your subnets, such as department names, that appear in the hosts network map. You can also view the hosts network map according to the organization you specified in the custom topology.

You can delete entire networks, subnets, or individual hosts from the hosts network map. For example, if you know that a host is no longer attached to your network, you can delete it to simplify your analysis. If the system afterwards detects activity associated with the deleted host, it re-adds the host to the network map. If you want to permanently exclude a host or subnet from the network map, modify the network discovery policy.

Caution

Do not delete network devices from the network map. The system uses them to determine network topology.

The Network Devices Network Map

The network map on the Network Devices tab displays the network devices (bridges, routers, NAT devices, and load balancers) that connect one segment of your network to another. The map contains two sections listing devices identified by an IP address and devices identified by a MAC address.

The map also provides a count of all unique network devices detected by the system, regardless of whether the devices have one IP address or multiple IP addresses.
If you create a custom topology for your network, the labels you assign to your subnets appear in the network devices network map.

The methods the system uses to distinguish network devices include:

- the analysis of Cisco Discovery Protocol (CDP) messages, which can identify network devices and their types (Cisco devices only)
- the detection of the Spanning Tree Protocol (STP), which identifies a device as a switch or bridge
- the detection of multiple hosts using the same MAC address, which identifies the MAC address as belonging to a router
- the detection of TTL value changes from the client side, or TTL values that change more frequently than a typical boot time, which identify NAT devices and load balancers

If a network device communicates using CDP, it may have one or more IP addresses. If it communicates using STP, it may only have a MAC address.

You cannot delete network devices from the network map, because the system uses their locations to determine network topology.

The host profile for a network device has a Systems section rather than an Operating Systems section, which includes a Hardware column that reflects the hardware platform for any mobile devices detected behind the network device. If a value for a hardware platform is listed under Systems, that system represents a mobile device or devices detected behind the network device. Note that mobile devices may or may not have hardware platform information, but hardware platform information is never detected for systems that are not mobile devices.

The Mobile Devices Network Map

The network map on the Mobile Devices tab displays mobile devices attached to your network. This network map also provides a count of all unique mobile devices detected by the system, regardless of whether the devices have one IP address or multiple IP addresses.

Each address or partial address is a link to the next level. You can also delete a subnet or IP address; if the system rediscovers the device, it re-adds the device to the network map.

You can also drill down to view the host profiles for the mobile devices.

To identify mobile devices, the system:

- analyzes User-Agent strings in HTTP traffic from the mobile device’s mobile browser
- monitors the HTTP traffic of specific mobile applications

If you create a custom topology for your network, the labels you assign to your subnets appear in the mobile devices network map.

The Indications of Compromise Network Map

The network map on the Indications of Compromise tab displays the compromised hosts on your network, organized by IOC category. Affected hosts are listed beneath each category. Each address or partial address is a link to the next level.
The system uses data from multiple sources to determine a host’s compromised status, including intrusion events, Security Intelligence, and Cisco Advanced Malware Protection (AMP).

From the indications of compromise network map, you can view the host profile of each host determined to have been compromised in a specific way. You can also delete (mark as resolved) any IOC category or any specific host, which removes the IOC tag from the relevant hosts. For example, you can delete an IOC category from the network map if you have determined that the issue is addressed and unlikely to recur.

Marking a host or IOC category resolved from the network map does not remove it from your network. A resolved host or IOC category reappears in the network map if your system newly detects information that triggers that IOC.

The Application Protocols Network Map

The network map on the Application Protocols tab displays the applications running on your network, organized in a hierarchical tree by application name, vendor, version, and finally by the hosts running each application.

The applications that the system detects may change with system software and VDB updates, and if you import any add-on detectors. The release notes or advisory text for each system or VDB update contains information on any new and updated detectors. For a comprehensive up-to-date list of detectors, see the Cisco Support Site (http://www.cisco.com/cisco/web/support/index.html).

From this network map, you can view the host profile of each host that runs a specific application.

You can also delete any application category, any application running on all hosts, or any application running on a specific host. For example, you can delete an application from the network map if you know it is disabled on the host and you want to make sure the system does not use it for impact level qualification.

Deleting an application from the network map does not remove it from your network. A deleted application reappears in the network map if your system detects a change in the application (for example, if an Apache web server is upgraded to a new version) or if you restart your system’s discovery function.

Depending on what you delete, the behavior differs:

- **Application Category** — Deleting removes the application category from the network map. All applications that reside beneath the category are removed from any host profile that contains the applications.

  For example, if you delete **http**, all applications identified as **http** are removed from all host profiles and **http** no longer appears in the applications view of the network map.

- **Specific Application, Vendor, or Version** — Deleting removes the affected application from the network map and from any host profiles that contain it.

  For example, if you expand the **http** category and delete **Apache**, all applications listed as Apache with any version listed beneath Apache are removed from any host profiles that contain them. Similarly, if instead of deleting **Apache**, you delete a specific version (1.3.17, for example), only the version you selected will be deleted from affected host profiles.

- **Specific IP Address** — Deleting the IP address removes it from the application list and removes the application itself from the host profile of the IP address you selected.

  For example, if you expand **http, Apache, 1.3.17 (Win32)**, and then delete **172.16.1.50:80/tcp**, the Apache 1.3.17 (Win32) application is deleted from the host profile of IP address 172.16.1.50.
The Vulnerabilities Network Map

The network map on the Vulnerabilities tab displays vulnerabilities that the system has detected on your network, organized by legacy vulnerability ID (SVID), Bugtraq ID, CVE ID, or Snort ID. By default, vulnerabilities are displayed by SVID. The vulnerabilities are arranged by identification number, with affected hosts listed beneath each vulnerability.

From this network map, you can view the details of specific vulnerabilities, as well as the host profile of any host subject to a specific vulnerability. This information can help you evaluate the threat posed by that vulnerability to specific affected hosts.

If you determine that a specific vulnerability is not applicable to the hosts on your network (for example, you have applied a patch), you can deactivate the vulnerability. Deactivated vulnerabilities still appear on the network map, but the IP addresses of their previously affected hosts appear in gray italics. The host profiles for those hosts show deactivated vulnerabilities as invalid, though you can manually mark them as valid for individual hosts.

If there is an identity conflict for an application or operating system on a host, the system lists the vulnerabilities for both potential identities. When the identity conflict is resolved, the vulnerabilities remain associated with the current identity.

By default, the network map displays the vulnerabilities of a detected application only if the packet contains the application’s vendor and version. However, you can configure the system to list the vulnerabilities for applications lacking vendor and version data by enabling the vulnerability mapping setting for the application in the Firepower Management Center configuration.

The numbers next to a vulnerability ID (or range of vulnerability IDs) represent two counts:

**Affected Hosts**

The first number is a count of non-unique hosts that are affected by a vulnerability or vulnerabilities. If a host is affected by more than one vulnerability, it is counted multiple times. Therefore, it is possible for the count to be higher than the number of hosts on your network. Deactivating a vulnerability decrements this count by the number of hosts that are potentially affected by the vulnerability. If you have not deactivated any vulnerabilities for any of the potentially affected hosts for a vulnerability or range of vulnerabilities, this count is not displayed.

**Potentially Affected Hosts**

The second number is a count of the total number of non-unique hosts that the system has determined are potentially affected by a vulnerability or vulnerabilities.

Deactivating a vulnerability renders it inactive only for the hosts you designate. You can deactivate a vulnerability for all hosts that have been judged vulnerable or for a specified individual vulnerable host. After a vulnerability is deactivated, the applicable hosts’ IP addresses appear in gray italics in the network map. In addition, host profiles for those hosts show deactivated vulnerabilities as invalid.

If the system subsequently detects the vulnerability on a host where it has not been deactivated (for example, on a new host in the network map), the system activates the vulnerability for that host. You have to explicitly deactivate the newly discovered vulnerability. Also, if the system detects an operating system or application change for a host, it may reactivate associated deactivated vulnerabilities.
The Host Attributes Network Map

The network map on the Host Attributes tab displays the hosts on your network organized by either user-defined or compliance white list host attributes. You cannot organize hosts using predefined host attributes in this display.

When you choose the host attribute you want to use to organize your hosts, the Firepower Management Center lists the possible values for that attribute in the network map and groups hosts based on their assigned values. For example, if you choose to organize your hosts by white list host attributes, the system displays them in categories of Compliant, Non-Compliant, and Not Evaluated.

You can also view the host profile of any host assigned a specific host attribute value.

Host Attributes in the Host Profile, on page 2172

Viewing Network Maps

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** Choose Analysis > Hosts > Network Map.

**Step 2** Click the tab of the network map you want to view.

**Step 3** Continue as appropriate:

- **Choose Domain** — In multidomain environments, choose a leaf domain from the Domain drop-down list.
- **Filter Hosts** — If you want to filter by IP or MAC addresses, enter an address into the search field. To clear the search, click the clear icon (×).
- **Drill Down** — If you want to investigate a category or host profile, drill down through the categories or subnets in the map. If you have defined a custom topology, click (topology) from the Hosts tab to view it, then click on (hosts) if you want to toggle back to the default view.
- **Delete** — Click the delete icon (🗑️) next to the appropriate element to:
  - Remove an element from the map on the Hosts, Network Devices, Mobile Devices, or Application Protocols tab.
  - Mark an IOC category, compromised host, or group of compromised hosts resolved on the Indications of Compromise tab.
  - Deactivate a vulnerability for all hosts or a single host on the Vulnerabilities tab.

- **Specify Vulnerabilities Class** — On the Vulnerabilities tab, choose the class of vulnerabilities you want to view from the Type drop-down list.
• Specify Organizing Attribute — On the Host Attributes tab, choose an attribute from the Attribute drop-down list.

Custom Network Topologies

Use the custom topology feature to help you organize and identify subnets in your hosts and network devices network maps.

For example, if each department within your organization uses a different subnet, you can label those subnets using the custom topology feature.

You can also view the hosts network map according to the organization you specified in the custom topology.

<table>
<thead>
<tr>
<th>Custom Topology</th>
<th>(Hosts)</th>
</tr>
</thead>
<tbody>
<tr>
<td>San Antonio - 10.0.0.0/16 (1)</td>
<td></td>
</tr>
<tr>
<td>Boston - 10.1.0.0/16 (10)</td>
<td></td>
</tr>
<tr>
<td>New York - 10.2.0.0/16 (94)</td>
<td></td>
</tr>
<tr>
<td>Juno - 10.3.0.0/16 (7)</td>
<td></td>
</tr>
<tr>
<td>Washington, DC - 10.4.0.0/16 (364)</td>
<td></td>
</tr>
<tr>
<td>Unassigned (2164)</td>
<td></td>
</tr>
</tbody>
</table>

You can specify a custom topology’s networks using any or all of the following strategies:

• You can import networks from the network discovery policy to add the networks that you configured the system to monitor.

• You can add networks to your topology manually.

The Custom Topology page lists your custom topologies and their status. If the light bulb icon next to the policy name is lit, the topology is active and affects your network map. If it is dimmed, the topology is inactive.

</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Discovery Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1 Choose Policies > Network Discovery.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 2** Click **Custom Topology** in the toolbar.

**Step 3** Click **Create Topology**.

**Step 4** Enter a **Name**.

**Step 5** Optionally, enter a **Description**.

**Step 6** Add networks to your topology. You can use any or all of the following strategies:

- Import networks from a network discovery policy as described in Importing Networks from the Network Discovery Policy, on page 1952.
- Manually add networks as described in Manually Adding Networks to Your Custom Topology, on page 1953.

**Step 7** Click **Save**.

---

**What to do next**

- Activate the topology as described in Activating and Deactivating Custom Topologies, on page 1953.

Changes you make to an active topology take effect immediately.

**Procedure**

Step 1 Choose Policies > Network Discovery.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 2 Click Custom Topology.

Step 3 Click the edit icon (éd) next to the topology you want to edit.

Step 4 Edit the topology as described in Creating Custom Topologies, on page 1951.

Step 5 Click Save.
CHAPTER 99

Incidents

The following topics describe how to configure incident handling:

- About Incident Handling, on page 1955
- Creating Custom Incident Types, on page 1958
- Creating an Incident, on page 1959
- Editing an Incident, on page 1960
- Generating Incident Reports, on page 1960

About Incident Handling

Incident handling refers to the response an organization takes when a violation of its security policies is suspected. The Firepower System includes features to support you as you collect and process information that is relevant to your investigation of an incident. You can use these features to gather intrusion events and packet data that may be related to the incident. You can also use the incident as a repository for notes about any activity that you take outside of the Firepower System to mitigate the effects of the attack. For example, if your security policies require that you quarantine compromised hosts from your network, you can note that in the incident.

The Firepower System also supports an incident life cycle, allowing you to change an incident’s status as you progress through your response to an attack. When you close an incident, you can note any changes you have made to your security policies as a result of any lessons learned.

Definition of an Incident

Generally, an incident is defined as one or more intrusion events that you suspect are involved in a possible violation of your security policies. In the Firepower System, the term also describes the feature you can use to track your response to an incident.

Some intrusion events are more important than others to the availability, confidentiality, and integrity of your network assets. For example, the port scan detection can keep you informed of port scanning activity on your network. Your security policy, however, may not specifically prohibit port scanning or see it as a high priority threat, so rather than take any direct action, you may instead want to keep logs of any port scanning for later forensic study.

On the other hand, if the system generates events that indicate hosts within your network have been compromised and are participating in distributed denial-of-service (DDoS) attacks, this activity is likely a
clear violation of your security policy, and you should create an incident in the Firepower System to help you track your investigation of these events.

Common Incident Handling Processes

Preparation
You can prepare for incidents in two ways:

- by having clear and comprehensive security policies in place, as well as the hardware and software resources to enforce them
- by having a clearly defined plan to respond to incidents and a properly trained team that can implement the plan

A key part of incident handling is understanding which parts of your network are at the greatest risk. By deploying Firepower System components on those network segments, you can increase your awareness of when and how incidents occur. Also, by taking the time to carefully tune the intrusion policy for each managed device, you can ensure that the events that are generated are of the highest quality.

Detection and Notification
You cannot respond to an incident unless you can detect it. Your incident handling process should note the kinds of security-related events that you can detect and the mechanisms, both software and hardware, that you use to detect them. You should also note where you can detect violations of your security policies. If your network includes segments that are not actively or passively monitored, you need to note that as well.

The managed devices that you deploy on your network are responsible for analyzing the traffic on the segments where they are installed, for detecting intrusions, and for generating events that describe them. Keep in mind that the access control policy you deploy to each of the managed devices governs what kinds of activity they detect and how it is prioritized. You can also set notification options for certain types of intrusion events so that the incident team does not need to sift through hundreds of events. You can specify that you are notified automatically when certain high priority, high severity events are detected.

Investigation and Qualification
Your incident handling process should specify how, after a security incident is detected, an investigation is conducted. In some organizations, junior members of the team triage all the incidents and handle the less severe or lower priority cases themselves, while more senior members of the team handle high severity and high priority incidents. You should carefully outline the escalation process so that each team member understands the criteria for raising an incident’s importance.

Part of the escalation process is tied to understanding how a detected event can affect the security of your network assets. For example, an attack against hosts running Microsoft SQL Server is not a high priority for organizations that use a different database server. Similarly, the attack is less important to you if you use SQL Server on your network, but you are confident that all the servers are patched and are not vulnerable to the attack. However, if someone has recently installed a copy of the vulnerable version of the software (perhaps for testing purposes), you may have a greater problem than a cursory investigation would suggest.

The Firepower System is particularly well suited to supporting the investigation and qualification process. You can create your own event classifications, and then apply them in a way that best describes the vulnerabilities on your network. When traffic on your network triggers an event, that event is automatically...
prioritized and qualified for you with special indicators showing which attacks are directed against hosts that are known to be vulnerable.

The incident tracking feature in the Firepower System also includes a status indicator that you can change to show which incidents have been escalated.

**Communication**

All incident handling processes should specify how an incident is communicated between the incident handling team and both internal and external audiences. For example, you should consider what kinds of incidents require management intervention and at what level. Also, your process should outline how and when you communicate with outside organizations. Consider the following:

• Will some incidents require that you notify law enforcement agencies?

• If your hosts are participating in a distributed denial of service (DDoS) against a remote site, will you inform them?

• Do you want to share information with organizations such as the CERT Coordination Center (CERT/CC) or FIRST?

The Firepower System has features that you can use to gather intrusion data in standard formats such as HTML, PDF, and CSV (comma-separated values) so that you can easily share intrusion data with others. For example, CERT/CC collects standard information about security incidents on its web site. CERT/CC looks for the kinds of information that you can easily extract from the Firepower System, such as:

• information about the affected machines, including:
  • the host name and IP
  • the time zone
  • the purpose or function of the host

• information about the sources of the attack, including:
  • the host name and IP
  • the time zone
  • whether you had any contact with an attacker
  • the estimated cost of handling the incident

• a description of the incident, including:
  • dates
  • methods of intrusion
  • the intruder tools involved
  • the software versions and patch levels
  • any intruder tool output
  • the details of vulnerabilities exploited
  • the source of the attack
You can also use the comment section of an incident to record when you communicate issues and with whom.

**Containment and Recovery**

Your incident handling process should clearly indicate what steps are taken when a host or other network component is compromised. The range of containment and recovery options stretches from applying patches to vulnerable hosts to shutting down the target and removing it from the network. You should also consider the importance, depending upon the nature and severity of the attack, of preserving evidence in case you pursue criminal charges.

You can use the incident feature of Firepower System to maintain a record of the actions you take during the containment and recovery phase of the incident.

**Lessons Learned**

Each security incident, whether or not it is a successful attack, is an opportunity to review your security policies. Do you need to update your firewall rules? Do you need a more structured approach to patch management? Are unauthorized wireless access points a new security issue? Each lesson learned should feed back into your security policies and help you prepare better for the next incident.

**Incident Types in the Firepower System**

You can assign an incident type to each incident you create. The following types are supported by default in the Firepower System:

- Intrusion
- Denial of Service
- Unauthorized Admin Access
- Web Site Defacement
- Compromise of System Integrity
- Hoax
- Theft
- Damage
- Unknown

You can also create your own incident types.

**Creating Custom Incident Types**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>
Procedure

Step 1  Choose Analysis > Intrusions > Incidents.
Step 2  Click Create Incident.
Step 3  In the Type area, click Types.
        The default incident types are listed at the bottom of the page.
Step 4  In the Incident Type Name field, enter a name for the new incident type.
Step 5  Click Add.
Step 6  Click Done.
        You can use the new incident type the next time you create or edit an incident.

Creating an Incident

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can view and modify incidents created in the current domain only. In an ancestor domain, you can add events to incidents from any descendant domains.

Procedure

Step 1  Choose Analysis > Intrusions > Incidents.
Step 2  Click Create Incident.
Step 3  From the Type drop-down menu, choose the option that best describes the incident.
Step 4  In the Time Spent field, enter the amount of time you spent on the incident in the #d #h #m #s format, where # represents the number of days, hours, minutes, or seconds.
Step 5  In the Summary text box, enter a short description of the incident (up to 255 alphanumeric characters, spaces, and symbols).
Step 6  In the Add Comment text box, enter a more complete description for the incident (up to 8191 alphanumeric characters, spaces, and symbols).
Step 7  Add events to the incident:
    • To add a selection of events, choose the events on the clipboard, and click Add to Incident.
    • To add all events from the clipboard, click Add All to Incident.
Note  If you want to add individual events from more than one page on the clipboard, you must add the events from one page, then add the events from the other pages separately.
Step 8  Click Save.
Editing an Incident

**Procedure**

Step 1  Choose **Analysis > Intrusions > Incidents**.
Step 2  Click the edit icon (✏️) next to the incident you want to edit.
Step 3  You can edit any of the following aspects of the incident:
- change the status
- change the type
- add events from the clipboard
- delete events

Step 4  In the **Time Spent** field, enter the amount of additional time you spent on the incident.
Step 5  In the **Add Comment** text box, indicate your changes to the incident (up to 8191 alphanumeric characters, spaces and symbols) for the incident.
Step 6  Optionally, you can add or delete events from the incident:
- To add events from the clipboard, choose the events on the clipboard and click Add to Incident.
- To add all the events from the clipboard, click Add All to Incident.
- To delete specific events from the incident, choose the events and click Delete.
- To delete all events from the incident, click Delete All.
- To update the incident without adding or deleting events, click Save.

Generating Incident Reports

You can use the Firepower System to generate incident reports. These reports can include the incident summary, incident status, and any comments along with information from the events you add to the incident. You can also specify whether you want to include event summary information in the report.
## Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose <strong>Analysis &gt; Intrusions &gt; Incidents</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Click the edit icon (&lt;) next to the incident you want to include in your report.</td>
</tr>
</tbody>
</table>
| Step 3   | You have two options:  
  - To include all the events from the incident in the report, click **Generate Report All**.  
  - To include specific events from the incident in the report, check the check boxes next to the events you want, and click **Generate Report**. |
| Step 4   | Enter a name for the report. |
| Step 5   | In **Incident Report Sections**, check the check boxes for the portions of the incident that you want to include in the report: **status**, **summary**, and **comments**. |
| Step 6   | If you want to include event information in the report, choose the workflow you want to use and then, in **Report Sections**, specify whether you want to include event summary information. |
| Step 7   | Check the check boxes next to the workflow pages you want to include in the report. |
| Step 8   | Check the check boxes next to the output formats you want to use for the report: **PDF**, **HTML**, and **CSV**.  
**Note** CSV-based incident reports include only event information. They do not include the status, summary, or comments from the incident. |
| Step 9   | Click **Generate Report** and confirm that you want to update the report profile. |
Using Lookups

The following topics explain how to look up information about entities that may or may not be known to the Firepower System:

- Introduction to Lookups, on page 1963
- Performing Whois Lookups, on page 1963
- Finding Geolocation Information for an IP Address, on page 1964

Introduction to Lookups

If your Firepower Management Center is connected to the Internet, you can use manual lookup features to find the following information:

- Regional Information Registries (RIR) information (whois) for any IP address.
- Geolocation information for any IP address: country name, country code, and continent name. (To ensure that you are using up-to-date geolocation information, Cisco strongly recommends that you regularly update the Geolocation Database (GeoDB) on your Firepower Management Center.)

Related Topics

- Update the Geolocation Database (GeoDB), on page 141

Performing Whois Lookups

Workflows

- Workflows, on page 1967
- Searching for Events, on page 2007
- Custom Workflows, on page 2017
- Custom Tables, on page 2025
Workflows

The following topics describe how to use workflows:

- Overview: Workflows, on page 1967
- Predefined Workflows, on page 1967
- Custom Table Workflows, on page 1977
- Using Workflows, on page 1977
- Bookmarks, on page 2004

Overview: Workflows

A workflow is a tailored series of data pages on the Firepower Management Center web interface that analysts can use to evaluate events generated by the system.

The following types of workflows are available on the Firepower Management Center:

Predefined Workflows

Preset workflows delivered with the system. You cannot edit or delete a predefined workflow. You can, however, copy a predefined workflow and use it as the basis for a custom workflow.

Saved Custom Workflows

Custom workflows based on saved custom tables delivered with the Firepower Management Center. You can edit, delete, and copy these workflows.

Custom Workflows

Workflows that you create and customize for your specific needs, or that the system generates automatically when you create custom tables. You can edit, delete, and copy these workflows.

The data displayed in a workflow often depends on such factors as how you license and deploy your managed devices, and whether you configure features that provide the data.

Predefined Workflows

The predefined workflows described in the following sections are delivered with the system. You cannot edit or delete a predefined workflow, but you can copy a predefined workflow and use it as the basis for a custom workflow.
Predefined Intrusion Event Workflows

The following table describes the predefined intrusion event workflows included with the Firepower System.

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination Port</td>
<td>Because destination ports are usually tied to an application, this workflow can help you detect applications that are experiencing an uncommonly high volume of alerts. The Destination Port column can also help you identify applications that should not be present on your network.</td>
</tr>
</tbody>
</table>
| Event-Specific                      | This workflow provides two useful features. Events that occur frequently may indicate:  
                                          • false positives  
                                          • a worm  
                                          • a badly misconfigured network  
                                          Events that occur infrequently are most likely evidence of a targeted attack and warrant special attention. |
| Events by Priority and Classification| This workflow lists events and their type in order of event priority, along with a count showing how many times each event has occurred. |
| Events to Destinations              | This workflow provides a high-level view of which host IP addresses are being attacked and the nature of the attack; where available, you can also see information about the countries involved in attacks. |
| IP-Specific                         | This workflow shows which host IP addresses are generating the most alerts. Hosts with the greatest number of events are either public-facing and receiving worm-type traffic (indicating a good place to look for tuning) or require further investigation to determine the cause of the alerts. Hosts with the lowest counts also warrant investigation as they could be the subject of a targeted attack. Low counts may also indicate that a host may not belong on the network. |
| Impact and Priority                 | This workflow lets you find high-impact recurring events quickly. The reported impact level is shown with the number of times the event has occurred. Using this information, you can identify the high-impact events that recur most often, which might be an indicator of a widespread attack on your network. |
**Workflow Name**  | **Description**  
---|---  
Impact and Source | This workflow can help you identify the source of an attack in progress. The reported impact level is shown with the associated source IP address for the event. If, for example, events with a level 1 impact are coming from the same source IP address repeatedly, they may indicate an attacker who has identified vulnerable systems and is targeting them.  
Impact to Destination | You can use this workflow to identify events repeatedly occurring on vulnerable computers, so you can address the vulnerabilities on those systems and stop any attacks in progress.  
Source Port | This workflow indicates which servers are generating the most alerts. You can use this information to identify areas that require tuning, and to decide which servers require attention.  
Source and Destination | This workflow identifies host IP addresses sharing high levels of alerts. Pairs at the top of the list could be false positives, and may identify areas that require tuning. You can check pairs at the bottom of the list for targeted attacks, for users accessing resources they should not be accessing, or for hosts that do not belong on the network.  

**Predefined Malware Workflows**

The following table describes the predefined malware workflows included on the Firepower Management Center. All predefined malware workflows use the table view of malware events.

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Malware Summary | This workflow provides a list of the malware detected in network traffic or by AMP for Endpoints Connectors, grouped by individual threat.  
| Malware Event Summary | This workflow provides a quick breakdown of the different malware event types and subtypes.  
| Hosts Receiving Malware | This workflow provides a list of host IP addresses that have received malware, grouped by the malware files’ associated dispositions.  
| Hosts Sending Malware | This workflow provides a list of host IP addresses that have sent malware, grouped by the malware files’ associated dispositions.  
| Applications Introducing Malware | This workflow provides a list of host IP addresses that have received files, grouped by the associated malware dispositions for those files.  

Firepower Management Center Configuration Guide, Version 6.1
Predefined File Workflows

The following table describes the predefined file event workflows included on the Firepower Management Center. All the predefined file event workflows use the table view of file events.

Table 251: Predefined File Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Summary</td>
<td>This workflow provides a quick breakdown of the different file event categories and types, along with any associated malware dispositions.</td>
</tr>
<tr>
<td>Hosts Receiving Files</td>
<td>This workflow provides a list of host IP addresses that have received files, grouped by the associated malware dispositions for those files.</td>
</tr>
<tr>
<td>Hosts Sending Files</td>
<td>This workflow provides a list of host IP addresses that have sent files, grouped by the associated malware dispositions for those files.</td>
</tr>
</tbody>
</table>

Predefined Captured File Workflows

The following table describes the predefined captured file workflows included on the Firepower Management Center. All predefined captured file workflows use the table view of captured files.

Table 252: Predefined Captured File Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Captured File Summary</td>
<td>This workflow provides a breakdown of captured files based on type, category, and threat score.</td>
</tr>
<tr>
<td>Dynamic Analysis Status</td>
<td>This workflow provides a count of captured files based on whether they have been submitted for dynamic analysis.</td>
</tr>
</tbody>
</table>

Predefined Connection Data Workflows

The following table describes the predefined connection data workflows included on the Firepower Management Center. All the predefined connection data workflows use the table view of connection data.

Table 253: Predefined Connection Data Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Events</td>
<td>This workflow provides a summary view of basic connection and detected application information, which you can then use to drill down to the table view of events.</td>
</tr>
<tr>
<td>Workflow Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Connections by Application</td>
<td>This workflow contains a graph of the 10 most active applications on the monitored network segment, based on the number of detected connections.</td>
</tr>
<tr>
<td>Connections by Initiator</td>
<td>This workflow contains a graph of the 10 most active host IP addresses on the monitored network segment, based on the number of connections where the host initiated the connection transaction.</td>
</tr>
<tr>
<td>Connections by Port</td>
<td>This workflow contains a graph of the 10 most active ports on the monitored network segment, based on the number of detected connections.</td>
</tr>
<tr>
<td>Connections by Responder</td>
<td>This workflow contains a graph of the 10 most active host IP addresses on the monitored network segment, based on the number of connections where the host IP was the responder in the connection transaction.</td>
</tr>
<tr>
<td>Connections over Time</td>
<td>This workflow contains a graph of the total number of connections on the monitored network segment over time.</td>
</tr>
<tr>
<td>Traffic by Application</td>
<td>This workflow contains a graph of the 10 most active applications on the monitored network segment, based on the number of kilobytes transmitted.</td>
</tr>
<tr>
<td>Traffic by Initiator</td>
<td>This workflow contains a graph of the 10 most active host IP addresses on the monitored network segment, based on the total number of kilobytes transmitted from each address.</td>
</tr>
<tr>
<td>Traffic by Port</td>
<td>This workflow contains a graph of the 10 most active ports on the monitored network segment, based on the number of kilobytes transmitted.</td>
</tr>
<tr>
<td>Traffic by Responder</td>
<td>This workflow contains a graph of the 10 most active host IP addresses on the monitored network segment, based on the total number of kilobytes received by each address.</td>
</tr>
<tr>
<td>Traffic over Time</td>
<td>This workflow contains a graph of the total kilobytes transmitted on the monitored network segment over time.</td>
</tr>
<tr>
<td>Unique Initiators by Responder</td>
<td>This workflow contains a graph of the 10 most active responding host IP addresses on the monitored network segment, based on the number of unique initiators that contacted each address.</td>
</tr>
<tr>
<td>Unique Responders by Initiator</td>
<td>This workflow contains a graph of the 10 most active initiating host IP addresses on the monitored network segment, based on the number of unique responders that the addresses contacted.</td>
</tr>
</tbody>
</table>
Predefined Security Intelligence Workflows

The following table describes the predefined Security Intelligence workflows included on the Firepower Management Center. All the predefined Security Intelligence workflows use the table view of Security Intelligence events.

Table 254: Predefined Security Intelligence Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Intelligence Events</td>
<td>This workflow provides a summary view of basic Security Intelligence and detected application information, which you can then use to drill down to the table view of events.</td>
</tr>
<tr>
<td>Security Intelligence Summary</td>
<td>This workflow is identical to the Security Intelligence Events workflow, but begins with the Security Intelligence Summary page, which lists security intelligence events by category and count only.</td>
</tr>
<tr>
<td>Security Intelligence with DNS Details</td>
<td>This workflow is identical to the Security Intelligence Events workflow, but begins with the Security Intelligence with DNS Details page, which lists Security Intelligence events by category and DNS-related characteristics.</td>
</tr>
</tbody>
</table>

Predefined Host Workflows

The following table describes the predefined workflows that you can use with host data.

Table 255: Predefined Host Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hosts</td>
<td>This workflow contains a table view of hosts followed by the host view. Workflow views based on the Hosts table allow you to easily view data on all IP addresses associated with a host.</td>
</tr>
<tr>
<td>Operating System Summary</td>
<td>You can use this workflow to analyze the operating systems in use on your network.</td>
</tr>
</tbody>
</table>

Predefined Indications of Compromise Workflows

The following table describes the predefined workflows that you can use with IOC (Indications of Compromise) data.
Table 256: Predefined Indications of Compromise Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indications of Compromise</td>
<td>This workflow begins with a summary view of IOC data grouped by count and category, and provides a detail view that further subdivides the summary data by event type. Access this workflow via the Analysis &gt; Hosts menu.</td>
</tr>
<tr>
<td>Indications of Compromise by Host</td>
<td>You can use this workflow to gauge which hosts on your network are most likely to be compromised (based on IOC data). Access this workflow via the Analysis &gt; Hosts menu.</td>
</tr>
</tbody>
</table>

Predefined Applications Workflows

The following table describes the predefined workflows that you can use with application data.

Table 257: Predefined Applications Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Business Relevance</td>
<td>You can use this workflow to analyze running applications of each estimated business relevance level on your network, so you can monitor appropriate use of your network resources.</td>
</tr>
<tr>
<td>Application Category</td>
<td>You can use this workflow to analyze running applications of each category (such as email, search engine, or social networking) on your network, so you can monitor appropriate use of your network resources.</td>
</tr>
<tr>
<td>Application Risk</td>
<td>You can use this workflow to analyze running applications of each estimated security risk level on your network, so you can estimate the potential risk of users’ activity and take appropriate action.</td>
</tr>
<tr>
<td>Application Summary</td>
<td>You can use this workflow to obtain detailed information about the applications and associated hosts on your network, so you can closely examine host application activity.</td>
</tr>
<tr>
<td>Applications</td>
<td>You can use this workflow to analyze running applications on your network, so you can gain an overview of how the network is being used.</td>
</tr>
</tbody>
</table>

Predefined Application Details Workflows

The following table describes the predefined workflows that you can use with application detail and client data.
Predefined Servers Workflows

The following table describes the predefined workflows that you can use with server data.

Table 259: Predefined Servers Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network Applications by Count</td>
<td>You can use this workflow to analyze the most frequently used applications on your network.</td>
</tr>
<tr>
<td>Network Applications by Hit</td>
<td>You can use this workflow to analyze the most active applications on your network.</td>
</tr>
<tr>
<td>Server Details</td>
<td>You can use this workflow to analyze the vendors and versions of detected server application protocols in detail.</td>
</tr>
<tr>
<td>Servers</td>
<td>This workflow contains a table view of applications followed by the host view.</td>
</tr>
</tbody>
</table>

Predefined Host Attributes Workflows

The following table describes the predefined workflow that you can use with host attribute data.

Table 260: Predefined Host Attributes Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attributes</td>
<td>You can use this workflow to monitor IP addresses of hosts on your network and the hosts’ status.</td>
</tr>
</tbody>
</table>

The Predefined Discovery Events Workflow

The following table describes the predefined workflow that you can use to view discovery and identity data.
Table 261: Predefined Discovery Event Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery Events</td>
<td>This workflow provides a detailed list, in table view form, of discovery events, followed by the host view.</td>
</tr>
</tbody>
</table>

Predefined User Workflows

The following table describes the predefined workflow that you can use to view user discovery and user identity data.

Table 262: Predefined User Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td>This workflow provides a list of user information collected by user identity sources.</td>
</tr>
</tbody>
</table>

Predefined Vulnerabilities Workflows

The following table describes the predefined vulnerabilities workflow included on the Firepower Management Center.

Table 263: Predefined Vulnerabilities Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vulnerabilities</td>
<td>You can use this workflow to review vulnerabilities in the database, including a table view of only those active vulnerabilities that apply to the detected hosts on your network. The workflow provides a vulnerability detail view, which contains a detailed description for every vulnerability that meets your constraints.</td>
</tr>
</tbody>
</table>

Predefined Third-Party Vulnerabilities Workflows

The following table describes the predefined third-party vulnerabilities workflows included on the Firepower Management Center.

Table 264: Predefined Third-Party Vulnerabilities Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vulnerabilities by IP Address</td>
<td>You can use this workflow to quickly see how many third-party vulnerabilities you have detected per host IP address on your monitored network.</td>
</tr>
</tbody>
</table>
Predefined Correlation and White List Workflows

There is a predefined workflow for each type of correlation data, white list events, white list violations, and remediation status events.

Table 265: Predefined Correlation Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vulnerabilities by Source</td>
<td>You can use this workflow to quickly see how many third-party vulnerabilities you have detected per third-party vulnerability source, such as the QualysGuard Scanner.</td>
</tr>
<tr>
<td>Correlation Events</td>
<td>This workflow contains a table view of correlation events.</td>
</tr>
<tr>
<td>White List Events</td>
<td>This workflow contains a table view of white list events.</td>
</tr>
<tr>
<td>Host Violation Count</td>
<td>This workflow provides a series of pages that list all the host IP addresses that violate at least one white list.</td>
</tr>
<tr>
<td>White List Violations</td>
<td>This workflow includes a table view of white list violations that lists all violations with the most recently detected violation at the top of the list. Each row in the table contains a single detected violation.</td>
</tr>
<tr>
<td>Status</td>
<td>This workflow contains a table view of remediation status, which includes the name of the policy that was violated and the name and status of the remediation that was applied.</td>
</tr>
</tbody>
</table>

Predefined System Workflows

The Firepower System is delivered with some additional workflows, including system events such as audit events and health events, as well as workflows that list results from rule update imports and active scans.

Table 266: Additional Predefined Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audit Log</td>
<td>This workflow contains a table view of the audit log that lists audit events.</td>
</tr>
<tr>
<td>Health Events</td>
<td>This workflow displays events triggered by the health monitoring policy.</td>
</tr>
<tr>
<td>Rule Update Import Log</td>
<td>This workflow contains a table view listing information about both successful and failed rule update imports.</td>
</tr>
<tr>
<td>Workflow Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Scan Results</td>
<td>This workflow contains a table view listing each completed scan.</td>
</tr>
</tbody>
</table>

**Custom Table Workflows**

You can use the custom tables feature to create tables that use the data from two or more types of events. This is useful because you can, for example, create tables and workflows that correlate intrusion event data with discovery data to allow simple searches for events that affect critical systems.

When you create a custom table, the system automatically creates a workflow that you can use to view the events associated with the table. The features in the workflow differ depending on which type of table you use. For example, custom table workflows based on the intrusion event table always end with the packet view. However, custom table workflows based on discovery events end with the host view.

Unlike workflows based on the predefined event tables, workflows based on custom tables do not have links to other types of workflows.

**Using Workflows**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Security Analyst</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>(depending on workflow)</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**  Choose the appropriate menu path and option as described in Workflow Selection, on page 1979.

**Step 2**  Navigate within the current workflow:

- To view all of the columns available in your chosen event data type, use table view pages; see Using Table View Pages, on page 1985.
- To view a subset of the columns available in your chosen event data type, use drill-down pages; see Using Drill-Down Pages, on page 1985.
- To display the corresponding row in the next page of the workflow, click the blue down-arrow icon (down arrow).
- To move among the pages of a multipage workflow, use the tools at the bottom of each page; see Workflow Page Traversal Tools, on page 1982.
- To view the same constraints applied within a workflow for a different type of event, click **Jump to** and choose the event view from the drop-down list.

**Step 3**  Modify the display of the current workflow:
• Check the check boxes by one or more rows on a page to indicate which row(s) you want to affect, then click one of the buttons at the bottom of the page (for example, the View button) to perform that action for all selected rows.

• Check the check box at the top of the row to select all the rows on the page, then click one of the buttons at the bottom of the page (for example, the View button) to perform that action for all rows on the page.

• Constrain the columns in the display by clicking the close icon (✗) in the column heading that you want to hide. In the pop-up window that appears, click Apply.

Tip To hide or show other columns, check or clear the appropriate check boxes before you click Apply. To add a disabled column back to the view, click the expand arrow to expand the search constraints, then click the column name under Disabled Columns.

• Constrain the data view by selected values for selected fields. For information, see Event View Constraints, on page 2001 and Compound Event View Constraints, on page 2002.

• Change the time constraints on the event view. The date range located in the upper right corner of the page sets a time range for events to include in the workflow; for information, see Event Time Constraints, on page 1994.

Note Events that were generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.

• To sort data by columns, click the name of a column. To reverse the sort order, click the column name again. The direction icon indicates which column the data is sorted by, and whether the sort is ascending (▲) or descending (▼).

• Click a workflow page link to display that page using any active constraints. Workflow page links appear in the upper left corner of predefined workflow table views and drill-down pages, above events and below the workflow name.

Step 4 View additional data within the current workflow:

• To view the file's trajectory map in a new window, click the network file trajectory icon in filename and SHA-256 hash value columns. The icon is different depending on the file status; see File Trajectory Icons, on page 1982.

• To display a pop-up window of the host profile associated with an IP address, click the host profile icon in any IP address column. The icon is different depending on the file status; see Host Profile Icons, on page 1983.

• To view the Dynamic Analysis Summary report for the highest threat score associated with a file, click the threat score icon in any threat score column. The icon is different depending on the file’s highest threat score; see Threat Score Icons, on page 1983.

• To view user profile information, click the user icon (👤) or, for users associated with an indication of compromise, (🔍) in any user identity column. The user icon is dimmed if that user cannot be in the database (that is, is an AMP for Endpoints Connector user).
• To view vulnerability details for third-party vulnerabilities, click the vulnerability icon (مؤشر) in any third-party vulnerability ID column.

• When viewing aggregated data points, hover your pointer over the flag icon to view the country name.

• When viewing individual data points, click the flag icon to view further geolocation details described in *Geolocation, on page 1986.*

**Step 5**

Navigate to a different workflow:

To view the same event type using a different workflow, click *(switch workflow)* next to the workflow title, then choose the workflow you want to use. Note that you **cannot** use a different workflow for scan results.

---

**Workflow Access by User Role**

Access to a workflow is determined by the user's role. See the table below for more information.

<table>
<thead>
<tr>
<th>User Role</th>
<th>Accessible Workflows</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator</td>
<td>Can access any workflow, and are the only users who can access the audit log, scan results, and the rule update import log.</td>
</tr>
<tr>
<td>Maintenance User</td>
<td>Can access health events.</td>
</tr>
<tr>
<td>Security Analyst and Security Analyst (Read Only)</td>
<td>Can access intrusion, malware, file, connection, discovery, vulnerability, correlation, and health workflows.</td>
</tr>
</tbody>
</table>

**Workflow Selection**

The Firepower System provides predefined workflows for the types of data listed in the following table.

*Table 267: Features Using Workflows*

<table>
<thead>
<tr>

<td>n/a</td>
</tr>
<tr>
<td>Scan Results</td>
<td>Policies &gt; Actions &gt; Scanners</td>
<td>n/a</td>
</tr>
</tbody>
</table>

When you view any of the kinds of data described in the above table, events appear on the first page of the default workflow for that data. You can specify a different default workflow by configuring your event view settings. Note that workflow access depends on your user role.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Related Topics**

- [Configuring Event View Settings](#), on page 33
Workflow Pages

Although the data in each type of workflow is different, all workflows share a common set of features. Workflows can include several types of pages. The actions you can perform on a workflow page depend on the type of page.

Drill-down and table view pages in workflows allow you to quickly narrow your view of the data so you can zero in on events that are significant to your analysis. Table view pages and drill-down pages both support many features you can use to constrain the set of events you want to view or to navigate the workflow. When viewing data on drill-down pages or in the table view in a workflow, you can sort the data in ascending or descending order based on any available column. If the database contains more events than can be displayed on a single workflow page, you can click the links at the bottom of the page to display more events. When you click one of these links, the time window automatically pauses so that you do not see the same events twice; you can unpause the time window when you are ready.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Table Views
Table views include a column for each of the fields in the database on which your workflow is based if the page is enabled by default.

Note that when you disable a column on a table view, the Firepower System adds the Count column to the event view if disabling the column would create two or more identical rows. When you click on a value in a table view page, you constrain by that value. When you create a custom workflow, you add a table view to it by clicking Add Table View.

Drill-Down Pages
Generally, drill-down pages are intermediate pages that you use to narrow your investigation to a few events before moving to a table view page. Drill-down pages contain a subset of columns that are available in the database.

For example, a drill-down page for discovery events might include only the IP Address, MAC Address, and Time columns. A drill-down page for intrusion events, on the other hand, might include the Priority, Impact Flag, Inline Result, and Message columns.

Drill-down pages allow you to narrow the scope of events you are viewing and to move forward in the workflow. If you click on a value in a drill-down page, for example, you constrain by that value and move to the next page in the workflow, focusing more closely on events that match your selected values. Clicking a value in a drill-down page does not disable the column where the value is, even if the page you advance to is a table view. Note that drill-down pages for predefined workflows always have a Count column. When you create a custom workflow, you add a drill-down page to it by clicking Add Page.

Graphs
Workflows based on connection data can include graph pages, also called connection graphs.

For example, a connection graph might display a line graph that shows the number of connections detected by the system over time. Generally, connection graphs are, like drill-down pages, intermediate pages that you use to narrow your investigation.
Final Pages

The final page of a workflow depends on the type of event on which the workflow is based:

- The host view is the final page for workflows based on applications, application details, discovery events, hosts, indications of compromise (IOC), servers, white list violations, host attributes, or third-party vulnerabilities. Viewing host profiles from this page allows you to easily view data on all IP addresses associated with hosts that have multiple addresses.

- The user detail view is the final page for workflows based on users and user activity.

- The vulnerability detail view is the final page for workflows based on Cisco vulnerabilities.

- The packet view is the final page for workflows based on intrusion events.

Workflows based on other kinds of events (for example, audit log events or malware events) do not have final pages.

On the final page of a workflow, you can expand detail sections to view specific information about each object in the set you focused on over the course of the workflow. Although the web interface does not list the constraints on the final page of a workflow, previously set constraints are retained and applied to the set of data.

Workflow Page Navigation Tools

Workflow pages provide visual cues to facilitate navigating among them and choosing what information to display during event analysis.

Workflow Page Traversal Tools

If a workflow contains multiple pages of data, the bottom of each page displays the number of pages in the workflow, as well as the tools listed in the table below which you may use to navigate among the pages:

<table>
<thead>
<tr>
<th>Table 268: Workflow Page Traversal Tools</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Page Traversal Tool</strong></td>
</tr>
<tr>
<td>page number</td>
</tr>
<tr>
<td>(To view a different page, enter the number you wish to view, then press Enter.)</td>
</tr>
<tr>
<td>&gt;</td>
</tr>
<tr>
<td>&lt;</td>
</tr>
<tr>
<td>&gt;</td>
</tr>
<tr>
<td>&lt;</td>
</tr>
</tbody>
</table>

File Trajectory Icons

When a workflow page provides the opportunity to view the trajectory map for a file in a new window, a network trajectory icon appears. This icon differs depending upon the file status.
Table 269: File Trajectory Icons

<table>
<thead>
<tr>
<th>File Trajectory Icon</th>
<th>File Status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Clean</td>
</tr>
<tr>
<td></td>
<td>Malware</td>
</tr>
<tr>
<td></td>
<td>Custom detection</td>
</tr>
<tr>
<td></td>
<td>Unknown</td>
</tr>
<tr>
<td></td>
<td>Unavailable</td>
</tr>
</tbody>
</table>

**Host Profile Icons**

When a workflow page provides the opportunity to view the host profile associated with an IP address in a pop-up window, a host profile icon appears. If the host profile icon is dimmed, you cannot view the host profile because that host cannot be in the network map (for example, 0.0.0.0). This icon appears different depending on the status of the host.

Table 270: Host Profile Icons

<table>
<thead>
<tr>
<th>Host Profile Icon</th>
<th>Host Status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Host is not tagged as potentially compromised.</td>
</tr>
<tr>
<td></td>
<td>Host is tagged as potentially compromised by triggered indications of compromise (IOC) rules.</td>
</tr>
<tr>
<td></td>
<td>Blacklisted (Appears only if you are performing traffic filtering based on Security Intelligence data.)</td>
</tr>
<tr>
<td></td>
<td>Blacklisted, set to monitor (Appears only if you are performing traffic filtering based on Security Intelligence data.)</td>
</tr>
</tbody>
</table>

**Threat Score Icons**

When a workflow page provides the opportunity to view a Dynamic Analysis Summary report for the highest threat score associate with a file, a threat score icon appears. The icon differs depending on the file’s highest threat score.

Table 271: Threat Score Icons

<table>
<thead>
<tr>
<th>Threat Score Icon</th>
<th>Threat Score Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Low</td>
</tr>
</tbody>
</table>
The Workflow Toolbar

Each page in a workflow includes a toolbar that offers quick access to related features. The following table describes each of the links on the toolbar.

### Table 272: Workflow Toolbar Links

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bookmark This Page</td>
<td>Bookmarks the current page so you can return to it later. Bookmarking captures the constraints in effect on the page you are viewing so you can return to the same data (assuming the data still exists) at a later time.</td>
</tr>
<tr>
<td>Report Designer</td>
<td>Opens the report designer with the currently constrained workflow as the selection criteria.</td>
</tr>
<tr>
<td>Dashboard</td>
<td>Opens a dashboard relevant to your current workflow. For example, Connection Events workflows link to the Connection Summary dashboard.</td>
</tr>
<tr>
<td>View Bookmarks</td>
<td>Displays a list of saved bookmarks from which you can select.</td>
</tr>
<tr>
<td>Search</td>
<td>Displays a Search page where you can perform advanced searches on data in the workflow. You can also click the down arrow icon to select and use a saved search.</td>
</tr>
</tbody>
</table>

Using Drill-Down Pages

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Security Analyst</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>(depending on workflow)</td>
</tr>
</tbody>
</table>

Procedure

**Step 1**
Access a workflow by choosing the appropriate menu path and option as described in Table 267: Features Using Workflows.

**Step 2**
In any workflow, you have the following options:

- To drill down to the next workflow page constraining on a specific value, click a value within a row. Note that this works only on drill-down pages. Clicking a value within a row in a table view only constrains the table view and does not drill down to the next page.

- To drill down to the next workflow page constraining on some events, check the check boxes next to the events you want to view on the next workflow page, then click View.

- To drill down to the next workflow page keeping the current constraints, click View All.

**Tip**
Table views always include “Table View” in the page name.

Using Table View Pages

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Security Analyst</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>(depending on workflow)</td>
</tr>
</tbody>
</table>

Table view pages provide some features not available on drill-down, host view, packet view, or vulnerability detail pages. Use these features as described below:

**Procedure**

**Step 1**
Access a workflow by choosing the appropriate menu path and option as described in Workflow Selection, on page 1979.

**Step 2**
Choose a table view from the workflow path displayed beneath the workflow name.

**Step 3**
Use the features listed below to arrange and navigate within the table view as needed:
• To display the list of disabled columns, click the Search Constraints expand arrow (►).

• To hide the list of disabled columns, click the Search Constraints collapse arrow (►).

• To add a disabled column back to the event view, click the Search Constraints expand arrow (►) to expand the search constraints, then click the column name under Disabled Columns.

• To show or hide (disable) a column, click the clear icon (×) next to any column name. In the pop-up window that appears, check or clear the appropriate check boxes to indicate which column(s) you want to display, then click Apply.

---

**Geolocation**

The geolocation feature provides data about the geographical sources of routable IP addresses (country, continent, and so on). This information is available in events, asset profiles, the Context Explorer, dashboard, and other analysis tools.

---

**Note**

For mobile devices and other hosts detected moving from country to country, the system may report a continent instead of a specific country.

You can use geolocation data to filter network traffic. For example, you can determine if connections are originating from or terminating in countries unconnected with your organization. In an inline deployment, you can block or rate limit those connections.

The system stores geolocation data in its geolocation database (GeoDB). Cisco issues periodic updates to the GeoDB. The About page (Help > About) shows the current GeoDB update version.

If you accept GeoDB updates, you can click the small country flag icons and ISO country codes in the Firepower Management Center web interface to obtain geolocation details about specific IP addresses; see Geolocation Detail Information, on page 1986. You can also pinpoint the detected location with third-party map tools. If you do not update the GeoDB, these details are unavailable.

You cannot view geolocation details for aggregate geolocation information, such as on the Connection Summary dashboard.

**Related Topics**

**Geolocation Detail Information**

Depending on availability, a number of fields may appear on the Geolocation Details page. The following table contains information on these fields. (Fields with no information are not displayed.)

---
### Table 273: Geolocation Detail Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Country</td>
<td>Country associated with the host’s IP address, accompanied by the country’s flag. The continent is listed in parentheses.</td>
</tr>
<tr>
<td></td>
<td><strong>Examples:</strong> United States (North America), Equatorial Guinea (Africa)</td>
</tr>
<tr>
<td>Region</td>
<td>State, province, or other subregion of the country where the host is located. <strong>Examples:</strong> VA, 35</td>
</tr>
<tr>
<td>City</td>
<td>City where the host is located. <strong>Examples:</strong> Seattle, Fukuoka</td>
</tr>
<tr>
<td>Postal Code</td>
<td>Postal code of the region where the host is located. <strong>Examples:</strong> 361000, 90210</td>
</tr>
<tr>
<td>Latitude/Longitude</td>
<td>Exact coordinates of the host’s location. <strong>Examples:</strong> 40.0375, -76.1053; 53.4050, -0.5484</td>
</tr>
<tr>
<td>Maps</td>
<td>Links to external mapping sites (Google Maps, Yahoo Maps, Bing Maps, and OpenStreetMap). Click any link to view a contextual map of the host’s approximate location.</td>
</tr>
<tr>
<td>Timezone</td>
<td>Time zone of the host’s location, with Daylight Savings Time noted where applicable. <strong>Examples:</strong> GMT+8:00, GMT-4:00 (In DST)</td>
</tr>
<tr>
<td>ASN</td>
<td>Autonomous System Number (ASN) associated with the host’s IP address, and any additional information about that ASN.</td>
</tr>
<tr>
<td></td>
<td><strong>Examples:</strong> 14618 (Amazon.com Inc.); 4837 (Cncgroup China169 Backbone)</td>
</tr>
<tr>
<td>ISP</td>
<td>Internet service provider (ISP) associated with the host’s IP address. <strong>Examples:</strong> Atlantic Broadband, China Unicom IP Network</td>
</tr>
<tr>
<td>Home/Business</td>
<td>Whether the host’s connection is used for Home or Business purposes.</td>
</tr>
<tr>
<td>Organization</td>
<td>Organization associated with the host’s IP address. <strong>Examples:</strong> Amazon.com, Bank of America</td>

<tr>
<td>Domain Name</td>
<td>Domain name associated with the host’s IP address. <strong>Examples:</strong> amazonaws.com, xmcnc.net</td>
</tr>
<tr>
<td>Connection Type</td>
<td>Connection type associated with the host’s IP address. <strong>Examples:</strong> Broadband, DSL</td>
</tr>
<tr>
<td>Proxy Type</td>
<td>The type of proxy used. <strong>Examples:</strong> Anonymous, Corporate</td>
</tr>
</tbody>
</table>
### Connection Event Graphs

In addition to workflows that use tabular drill-down pages and a final table view of events, the system can present certain connection data graphically, using data aggregated over five-minute intervals. Note that you can graph only the information used to aggregate data: source and destination IP addresses (and those hosts’ associated users), destination port, transport protocol, and application protocol.

---

**Tip**

You cannot graph Security Intelligence events separately from their associated connection events. For a graphical overview of Security Intelligence filtering activity, use dashboards and the Context Explorer.

There are three different types of connection graphs:

- **Pie charts** display data from one dataset grouped into discrete categories.
- **Bar graphs** display data from one or more datasets grouped into discrete categories.
- **Line graphs** plot data from one or more datasets over time, using either a standard or a velocity (rate of change) view.

---

**Note**

The system displays traffic profiles as line graphs, which you can manipulate in the same way as you would any other connection graph, with some restrictions. To view traffic profiles, you must have Administrator access.

Like workflow tables, you can drill down and constrain workflow graphs to focus your analysis.

Both bar graphs and line graphs can display multiple datasets; that is, they can display several values on the y-axis for each x-axis data point. For example, you could display the total number of unique initiators and responders. Pie charts can only display one dataset.

You can display different data and datasets on a connection graph by changing either the x-axis, the y-axis, or both. On a pie chart, changing the x-axis changes the independent variable and changing the y-axis changes the dependent variable.

### Using Connection Event Graphs

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

On the Firepower Management Center, you can view connection event graphs and manipulate them depending on the information you are looking for.
The page you see when you access connection graphs differs depending on the workflow you use. You can use a predefined workflow, which terminates in a table view of connection events. You can also create a custom workflow that displays only the information that matches your specific needs.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1**  Choose **Analysis > Connections > Events**.

**Note**  If a connection event table appears instead of a graph, or to view a different graph, click **(switch workflow)** by the workflow title and choose a predefined workflow that includes graphs, or a custom workflow. Note that all predefined connection event workflows—including connection graphs—terminate in a table view of connections.

**Step 2**  You have the following options:

- **Time Range** — To adjust the time range, which is useful if the graph is blank, see Changing the Time Window, on page 1997.
- **Field Names** — To learn more about the data you can graph, see Connection and Security Intelligence Event Fields, on page 2053.
- **Host Profile** — To view the host profile for an IP address, on a graph displaying connection data by initiator or responder, click either a bar on a bar graph or a wedge on a pie chart and choose **View Host Profile**.
- **User Profile** — To view user profile information, on a graph displaying connection data by initiator user, click either a bar on a bar graph or a wedge on a pie chart and choose **View User Profile**.
- **Other Information** — To learn more information about the graphed data, position your cursor over a point on a line graph, a bar in a bar graph, or a wedge in a pie chart.
- **Constrain** — To constrain a connection graph by any x-axis (independent variable) criterion without advancing the workflow to the next page, click a point on a line graph, a bar on a bar graph, or a wedge on a pie chart, and choose a **View by...** option.
- **Data Selection** — To change the data displayed on the graph, click **X-Axis** or **Y-Axis** and choose the new data to graph. Note that changing the x-axis to or from **Time** also changes the graph type; changing the y-axis affects the displayed datasets.
- **Datasets** — To change the graph’s dataset, click **Datasets** and choose a new dataset.
- **Detach** — To detach a connection graph so you can perform further analysis without affecting the default time range, click **Detach**.

**Tip**  Click **New Window** in a detached graph to create a copy. You can then perform different analyses on each of the detached graphs. Note that traffic profiles are detached graphs.

- **Drill Down** — To drill down to the next page in the workflow, click a point on a line graph, a bar on a bar graph, or a wedge on a pie chart, then choose **Drill-down**. Clicking a point on a line graph changes the time range on the next page to a 10-minute span, centered on the point you clicked. Clicking a bar on a bar graph or a wedge on a pie chart constrains the next page based on the criterion represented by the bar or wedge.
• Export — To export the connection data for a graph as a CSV (comma-separated values) file, Export Data. Then, click Download CSV File and save the file.

• Graph Type: Line — To switch between a standard and velocity (rate of change) line graph, click Velocity, then choose Standard or Velocity.

• Graph Type: Bar and Pie — To switch between a bar graph and pie chart, click Switch to Bar or Switch to Pie. Because you cannot display multiple datasets on a pie chart, if you switch to a pie chart from a bar graph that has multiple datasets, the pie chart shows only one dataset, which is selected automatically. When choosing which dataset to display, the Firepower Management Center favors total statistics over initiator and responder statistics, and favors initiator statistics over responder statistics.

• Navigate Between Pages — To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page.

• Navigate Between Event Views — To navigate to other event views to view associated events, click Jump to and choose the event view from the drop-down list.

• Recenter — To recenter a line graph around a point in time without changing the length of the time range, click that point, then choose Recenter.

• Zoom — To recenter a line graph around a point in time while zooming in or out, click that point, choose Zoom, then choose a new time span.

Note: Unless you are working with a detached graph, constraining, recentering, and zooming changes the default time range for the Firepower Management Center.

---

**Example: Constraining a Connection Graph**

**Example: Changing X-Axis and Y-Axis on a Pie Chart**

Consider a graph of connections over time. If you constrain a point on the graph by port, a bar graph appears, showing the 10 most active ports based on the number of detected connection events, but constrained by the ten-minute time span that is centered on the point you clicked.

If you further constrain the graph by clicking on one of the bars and choosing View by Initiator IP, a new bar graph appears, constrained by not only the same ten-minute time span as before, but also by the port represented by the bar you clicked.

Consider a pie chart that graphs kilobytes per port. In this case, the x-axis is Responder Port and the y-axis is KBytes. This pie chart represents the total kilobytes of data transmitted over a monitored network during a certain interval. The wedges of the pie represent the percent of the data that was detected on each port.

- If you change the x-axis of the chart to Application Protocol, the pie chart still represents the total kilobytes of data transmitted, but the wedges of the pie represent the percentage of the data transmitted for each detected application protocol.

- If you change the y-axis of the chart to Packets, the pie chart represents the total number of packets transmitted over the monitored network during a certain interval, and the wedges of the pie represent the percentage of the total number of packets that was detected on each port.

Connection Graph Data Options

You can display different data on a connection graph by changing either the x-axis, the y-axis, or both. On a pie chart, changing the x-axis changes the independent variable and changing the y-axis changes the dependent variable.

Table 274: X-Axis Options

<table>
<thead>
<tr>
<th>X-Axis Option</th>
<th>Graph Type</th>
<th>Graphs This Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Protocol</td>

<td>number of connections</td>
</tr>
<tr>
<td>KBytes</td>
<td>kilobytes transmitted</td>
</tr>
<tr>
<td>KBytes Per Second</td>
<td>kilobytes per second</td>
</tr>
</tbody>
</table>
### Connection Graphs with Multiple Datasets

Both bar graphs and line graphs can display multiple datasets; that is, they can display several values on the y-axis for each x-axis data point. For example, you could display the total number of unique initiators and responders.

---

**Note**

You **cannot** display multiple datasets on a pie chart. If you switch to a pie chart from a bar graph that has multiple datasets, the pie chart shows only one dataset, which is selected automatically. When selecting which dataset to display, the Firepower Management Center favors total statistics over initiator and responder statistics, and favors initiator statistics over responder statistics.

---

On line graphs, multiple datasets appear as multiple lines, each with a different color. For example, the following graphic displays the total number of unique initiators and the total number of unique responders detected on a monitored network over a one hour interval.

![Graph showing unique initiators and responders over time](image)

On bar graphs, multiple datasets appear as a set of colored bars for each x-axis data point. For example, the following bar graph displays the total packets transmitted on a monitored network, packets transmitted by initiators, and packets transmitted by responders.
The following table describes the datasets you can display on the x-axis of a connection graph.

### Table 276: Dataset Options

<table>

</tbody>
</table>

## Event Time Constraints

Each event has a time stamp that indicates when the event occurred. You can constrain the information that appears in some workflows by setting the time window, sometimes called the time range.

Workflows based on events that can be constrained by time include a time range line at the top of the page. By default, workflows use an expanding time window set to the past hour. For example, if you log in at 11:30 AM, you will see events that occurred between 10:30 AM and 11:30 AM. As time moves forward, the time window expands. At 12:30 PM, you will see events that occurred between 10:30 AM and 12:30 PM.

You can change this behavior by setting your own default time window in the event view settings. This governs three properties:

- time window type (static, expanding, or sliding)
- time window length
- the number of time windows (either multiple time windows or a single global time window)

Regardless of the default time window setting, you can manually change the time window during your event analysis by clicking the time range at the top of the page, which displays the Date/Time pop-up window. Depending on the number of time windows you configured and the type of appliance you are using, you can also use the Date/Time window to change the default time window for the type of event you are viewing.
Finally, you can pause the time window, which allows you to examine the data provided by the workflow without the time window changing and removing or adding events that you are not interested in. Note that to avoid displaying the same events on different workflow pages, the time window automatically pauses when you click a link at the bottom of the page to display another page of events; you can unpause the time window when you are ready.

**Related Topics**
- Configuring Event View Settings, on page 33
- Using Connection and Security Intelligence Event Tables, on page 2071

## Time Window Customization for Events

Regardless of the default time window, you can manually change the time window during your event analysis.

---

**Note**

Manual time window settings are valid for only the current session. When you log out and then log back in, time windows are reset to the default.

---

Depending on the number of time windows you configured, changing the time window for one workflow may affect other workflows on the appliance. For example, if you have a single, global time window, changing the time window for one workflow changes it for all other workflows on the appliance. On the other hand, if you are using multiple time windows, changing the audit log or health event workflow time windows has no effect on any other time window, while changing the time window for other kinds of events affects all events that can be constrained by time (with the exception of audit events and health events).

Note that because not all workflows can be constrained by time, time window settings have no effect on workflows based on hosts, host attributes, applications, application details, vulnerabilities, users, or white list violations.

Use the Time Window tab on the Date/Time window to manually configure a time window. Depending on the number of time windows you configured in your default time window settings, the tab’s title is one of the following:

- **Events Time Window**, if you configured multiple time windows and are setting the time window for a workflow other than the audit log or health events workflow
- **Health Monitoring Time Window**, if you configured multiple time windows and are setting the time window for the health events workflow
- **Audit Log Time Window**, if you configured multiple time windows and are setting the time window for the audit log
- **Global Time Window**, if you configured a single time window

The first decision you must make when configuring a time window is the type of time window you want to use:

- A *static* time window displays all the events generated from a specific start time to a specific end time.
- An *expanding* time window displays all the events generated from a specific start time to the present; as time moves forward, the time window expands and new events are added to the event view.
- A *sliding* time window displays all the events generated from a specific start time (for example, one week ago) to the present; as time moves forward, the time window “slides” so that you see only the events for the range you configured (in this example, for the last week).
Depending on what type you select, the Date/Time window changes to give you different configuration options.

**Note**

The Firepower System uses a 24-hour clock based on the time you specified in your time zone preferences.

### Time Window Settings

The following table explains the various settings you can configure on the Time Window tab.

#### Table 277: Time Window Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Time Window Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time window type drop-down list</td>
<td>n/a</td>
<td>Select the type of time window you want to use: static, expanding, or sliding. Note that events that were generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.</td>
</tr>
<tr>
<td>Start Time calendar</td>
<td>static and expanding</td>
<td>Specify a start date and time for your time window. The maximum time range for all time windows is from midnight on January 1, 1970 (UTC) to 3:14:07 AM on January 19, 2038 (UTC). Instead of using the calendar, you can use the Presets options, described below.</td>
</tr>
<tr>
<td>End Time calendar</td>
<td>static</td>
<td>Specify an end date and time for your time window. The maximum time range for all time windows is from midnight on January 1, 1970 (UTC) to 3:14:07 AM on January 19, 2038 (UTC). Note that if you are using an expanding time window, the End Time calendar is grayed out and specifies that the end time is “Now.” Instead of using the calendar, you can use the Presets options, described below.</td>
</tr>
<tr>
<td>Show the Last field and drop-down list</td>
<td>sliding</td>
<td>Configure the length of the sliding time window.</td>
</tr>
</tbody>
</table>
Changing the Time Window

<table>
<thead>
<tr>
<th>Setting</th>
<th>Time Window Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Presets: Last</td>
<td>all</td>
<td>Click one of the time ranges in the list to change the time window, based on the local time of the appliance. For example, clicking <strong>1 week</strong> changes the time window to reflect the last week. Clicking a preset changes the calendars to reflect the preset you choose.</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>
Procedure

Step 1  On a workflow constrained by time, click the time range icon (⏲️) to go to the Date/Time window.

Step 2  On the Events Time Window tab, set the time window as described in Time Window Settings, on page 1996.

Tip  Click Reset to change the time window back to the default settings.

Step 3  Click Apply.

The Default Time Window for Events

During your event analysis, you can use the Preferences tab on the Date/Time window to change the default time window for the type of event you are viewing without having to use the event view settings.

Keep in mind that changing the default time window in this way changes the default time window for only the type of event you are viewing. For example, if you configured multiple time windows, changing the default time window on the Preferences tab changes the settings for either the events, health monitoring, or audit log window, in other words, whichever time window is indicated by the first tab. If you configured a single time window, changing the default time window on the Preferences tab changes the default time window for all types of events.

</tr>
<tr>
<td>Default Time Window: Show the Last - Sliding</td>
<td>This setting allows you to configure a sliding default time window of the length you specify.</td>
</tr>
<tr>
<td></td>
<td>The appliance displays all the events generated from a specific start time (for example, 1 hour ago) to the present. As you change event views, the time window “slides” so that you always see events from the last hour.</td>
</tr>
<tr>
<td>Preference</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Default Time Window: Show the Last - Static/Expanding</td>
<td>This setting allows you to configure either a static or expanding default time window of the length you specify. For static time windows (enable the Use End Time check box), the appliance displays all the events generated from a specific start time (for example, 1 hour ago), to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window. For expanding time windows (disable the Use End Time check box), the appliance displays all the events generated from a specific start time (for example, 1 hour ago), to the present. As you change event views, the time window expands to the present time.</td>
</tr>
<tr>
<td>Default Time Window: Current Day - Static/Expanding</td>
<td>This setting allows you to configure either a static or expanding default time window for the current day. The current day begins at midnight, based on the time zone setting for your current session. For static time windows (enable the Use End Time check box), the appliance displays all the events generated from midnight to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window. For expanding time windows (disable the Use End Time check box), the appliance displays all the events generated from midnight to the present. As you change event views, the time window expands to the present time. Note that if your analysis continues for over 24 hours before you log out, this time window can be more than 24 hours.</td>
</tr>
<tr>
<td>Default Time Window: Current Week - Static/Expanding</td>
<td>This setting allows you to configure either a static or expanding default time window for the current week. The current week begins at midnight on the previous Sunday, based on the time zone setting for your current session. For static time windows (enable the Use End Time check box), the appliance displays all the events generated from midnight to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window. For expanding time windows (disable the Use End Time check box), the appliance displays all the events generated from midnight Sunday to the present. As you change event views, the time window expands to the present time. Note that if your analysis continues for over 1 week before you log out, this time window can be more than 1 week.</td>

</tbody>
</table>

**Procedure**

**Step 1** On a workflow constrained by time, click the time range icon (borahab) to go to the Date/Time window.

**Step 2** Click the **Preferences** tab and change your preferences, as described in Default Time Window Options for Event Types, on page 1998.

**Step 3** Click **Save Preferences**.

**Step 4** You have two options:

- To apply your new default time window settings to the event view you are using, click **Apply** to close the Date/Time window and refresh the event view.

- To continue with your analysis without applying the default time window settings, close the Date/Time window without clicking **Apply**.

**Time Window Progression**

You can pause the time window, which allows you to examine a snapshot of the data provided by the workflow. This is useful because when an unpaued workflow updates, it may remove events that you want to examine or add events that you are not interested in.

Note that you cannot pause a static time window. In addition, pausing an event time window has no effect on dashboards, nor does pausing a dashboard have any effect on pausing an event time window.

When you are finished with your analysis, you can unpause the time window. Unpausing the time window updates it according to your preferences, and also updates the event view to reflect the unpaused time window.

If the database contains more events than can be displayed on a single workflow page, you can click the links at the bottom of the page to display more events. When you do this, the time window automatically pauses so that you do not see the same events twice.

**Pausing/Unpausing the Time Window**

<table>
<thead>

</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>
Procedure

On a workflow constrained by time, choose the desired time range control:

- To pause the time window, click the time range control pause icon (II).
- To unpause the time window, click the time range control play icon (▶).

Event View Constraints

The information that you see on a workflow page is determined by the constraints that you impose. For example, when you initially open an event workflow, the information is constrained to events that were generated in the previous hour.

To advance to the next page in the workflow and constrain the data you are viewing by specific values, select the rows with those values on the page and click View. To advance to the next page in the workflow retaining the current constraints and carrying forward all events, select View All.

Note

If you select a row with multiple non-count values and click View, you create a compound constraint.

There is a third method for constraining data in a workflow. To constrain the page to the rows with values that you selected and also add the selected value to the list of constraints at the top of the page, click a value within a row on the page. For example, if you are viewing a list of logged connections and want to constrain the list to only those you allowed using access control, click Allow in the Action column. As another example, if you are viewing intrusion events and want to constrain the list to only events where the destination port is 80, click 80 (http)/tcp in the Destination Port/ICMP Code column.

Tip

The procedure for constraining connection events based on Monitor rule criteria is slightly different and you may need to take some extra steps. Additionally, you cannot constrain connection events by associated file or intrusion information.

You can also use searches to constrain the information in a workflow. Use this feature when you want to constrain against multiple values in a single column. For example, if you want to view the events related to two IP addresses, click Edit Search, then modify the appropriate IP address field on the Search page to include both addresses, and then click Search.

The search criteria you enter on the search page are listed as the constraints at the top of the page, with the resulting events constrained accordingly. On the Firepower Management Center, the current constraints are also applied when navigating to other workflows, unless they are compound constraints.

When searching, you must pay careful attention to whether your search constraints apply to the table you are searching. For example, client data is not available in connection summaries. If you search for connection events based on the detected client in the connection and then view the results in a connection summary event view, the Firepower Management Center displays connection data as if you had not constrained it at all. Invalid constraints are labeled as not applicable (N/A) and are marked with a strikethrough.
Constraining Events

<table>
<thead>
<tr>
<th></th>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** Access a workflow by choosing the appropriate menu path and option as described in *Workflow Selection*, on page 1979.

**Step 2** In any workflow, you have the following options:

- To constrain the view to events that match a single value, click the desired value within a row on the page.
- To constrain the view to events that match multiple values, check the check boxes for events with those values, and click View.

  **Note** A compound constraint is added if the row contains multiple non-count values.

- To remove a constraint, click the Search Constraints expand arrow (▶) and click the name of the constraint in the expanded Search Constraints list.
- To edit constraints using the Search page, click Edit Search.
- To save constraints as a saved search, click Save Search and give the query a name.

  **Note** You cannot save queries containing compound constraints.

- To use the same constraints with another event view, click Jump to and choose the event view.

  **Note** You do not retain compound constraints when you switch to another workflow.

- To toggle the display of constraints click the Search Constraints expand arrow (▶) or the Search Constraints collapse arrow (◀). This is useful when the list of constraints is large and takes up most of the screen.

**Compound Event View Constraints**

Compound constraints are based on all non-count values for a specific event. When you select a row with multiple non-count values, you set a compound constraint that retrieves only events matching all the non-count values in that row on that page. For example, if you select a row that has a source IP address of 10.10.31.17 and a destination IP address of 10.10.31.15 and a row that has a source IP address of 172.10.10.17 and a destination IP address of 172.10.10.15, you retrieve all of the following:
• Events that have a source IP address of 10.10.31.17 AND a destination IP address of 10.10.31.15

OR

• Events that have a source IP address of 172.10.31.17 AND a destination IP address of 172.10.31.15

When you combine compound constraints with simple constraints, the simple constraints are distributed across each set of compound constraints. If, for example, you added a simple constraint for a protocol value of tcp to the compound constraints listed above, you retrieve all of the following:

• Events that have a source IP address of 10.10.31.17 AND a destination IP address of 10.10.31.15 AND a protocol of tcp

OR

• Events that have a source IP address of 172.10.31.17 AND a destination IP address of 172.10.31.15 AND a protocol of tcp

You cannot perform a search or save a search on a compound constraint. You also cannot retain compound constraints when you use the event view links or click (switch workflow) to switch to another workflow. If you bookmark an event view with compound constraints applied, the constraints are not saved with the bookmark.

**Using Compound Event View Constraints**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**
Access a workflow by choosing the appropriate menu path and option as described in Workflow Selection, on page 1979.

**Step 2**
To manage compound constraints, you have the following options:

• To create a compound constraint, choose one or more rows with multiple non-count values and click View.

• To clear compound constraints, click the Search Constraints expand arrow ( ) and click Compound Constraints.

**Inter-Workflow Navigation**

You can navigate to other workflows using the links in the Jump to... drop-down list on a workflow page. Select the drop-down list to view and select additional workflows.
When you select a new workflow, properties shared by the rows you select and the constraints you set are used in the new workflow, if they are applicable. If configured constraints or event properties do not map to fields in the new workflow, they are dropped. In addition, compound constraints are not retained when you switch from one workflow to another. In addition, constraints from the captured files workflow only transfer to file and malware event workflows.

**Note**

When you view event counts over a time range, the total number of events may not reflect the number of events for which more detailed data is available. This occurs because the system sometimes prunes older event details to manage disk space usage. To minimize the occurrence of event detail pruning, you can fine-tune event logging to log only those events most important to your deployment.

Note that unless you have either paused the time window or have configured a static time window, the time window changes when you change workflows.

This feature enhances your ability to investigate suspicious activity. For example, if you are viewing connection data and notice that an internal host is transmitting an abnormally large amount of data to an external site, you can select the responder IP address and the port as constraints and then jump to the Applications workflow. The applications workflow will use the responder IP address and port as IP Address and Port constraints and display additional information about the application, such as what kind of application it is. You can also click Hosts at the top of the page to view the host profile for the remote host.

After finding more information about the application, you can select Correlation Events to return to the connection data workflow, remove the Responder IP from the constraints, add the Initiator IP to constraints, and select Application Details to see what client the user on the initiating host used when transferring data to the remote host. Note that the Port constraint is not transferred to the Application Details page. While keeping the local host as a constraint, you can also use other navigation buttons to find additional information:

- To discover if any policies have been violated by the local host, keep the IP address as a constraint and select Correlation Events from the Jump to drop-down list.
- To find out if an intrusion rule triggered against the host, indicating a compromise, select Intrusion Events from the Jump to drop-down list.
- To view the host profile for the local host and determine if the host is susceptible to any vulnerabilities that may have been exploited, select Hosts from the Jump to drop-down list.

**Bookmarks**

Create a bookmark if you want to return quickly to a specific location and time in an event analysis. Bookmarks retain information about:

- the workflow you are using
- the part of the workflow you are viewing
- the page number within the workflow
- any search constraints
- any disabled columns
- the time range you are using
The bookmarks you create are available to all user accounts with bookmark access. This means that if you uncover a set of events that require more in-depth analysis, you can easily create a bookmark and turn over the investigation to another user with the appropriate privileges.

**Note**

If the events that appear in a bookmark are deleted (either directly by a user or by automatic database cleanup), the bookmark no longer displays the original set of events.

### Creating Bookmarks

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can only view bookmarks created in the current domain.

**Procedure**

1. **Step 1** During an event analysis, with the events of interest displayed, click **Bookmark This Page**.
2. **Step 2** In the **Bookmark Name** field, enter a name.
3. **Step 3** Click **Save Bookmark**.

### Viewing Bookmarks

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can only view bookmarks created in the current domain.

**Procedure**

From any event view, you have two options:

- Hover your pointer over **View Bookmarks**, and click on the desired bookmark in the drop-down menu.
- Click on click **View Bookmarks** and on the View Bookmarks page, click on the desired bookmark name or the view icon (.scenes) next to it.
Note: If the events that originally appeared in a bookmark are deleted (either directly by a user or by automatic database cleanup), the bookmark no longer displays the original set of events.
Searching for Events

The following topics describe how to search for events within a workflow:

- Event Searches, on page 2007
- Query Overrides Via the Shell, on page 2014

Event Searches

The Firepower System generates information that is stored as events in database tables. Events contain multiple fields that describe the activity that caused the appliance to generate the event. You can create and save searches customized for your environment for any of the different event types and save them to reuse later.

When you save a search you give it a name and specify whether the search will be available to you alone or to all users of the appliance. If you want to use the search as a data restriction for a custom user role, you must save it as a private search. If you previously saved a search, you can load it, make any necessary modifications, and then start the search. Custom analysis dashboard widgets, report templates, and custom roles can also use saved searches. If you have saved searches, you can delete them from the Search page.

For some event types, the Firepower System provides predefined searches that serve as examples and can provide quick access to important information about your network. You can modify fields within the predefined searches for your network environment, then save the searches to reuse later.

The search criteria you can use depends on the type of search, but the mechanics are the same. Searches return only records that match the search criteria specified for all fields.

Note

Searching a custom table requires a slightly different procedure.

Related Topics

- Searching Custom Tables, on page 2033

Search Constraints

Each database table has its own search page where you can enter search constraint values to apply to fields defined for the table. Depending on the type of field, special syntax may be used to specify criteria such as wildcard characters or a range of numeric values.
Search results appear on workflow pages displaying each table field in columnar layout. Some database tables can additionally be searched using fields that are not displayed as columns on workflow pages. To determine whether such a constraint applies to your search results when viewing the results on a workflow page, click on the expand icon (►) to view the active search constraints.

**General Search Constraints**

When searching for events, observe the following general guidelines:

- All fields accept negation (!).

- All fields accept comma-separated lists of search values. Records that contain any of the listed values in the specified field match that search criteria.

- All fields accept comma-separated lists enclosed in quotation marks as search values.
  
  - For fields that may contain only a single value, records with the specified field containing the exact string specified within the quotation marks match the search criteria. For instance, a search for A, B, "C, D, E" will match records where the specified field contains "A" or "B" or "C, D, E". This permits matching on fields that include the comma in possible values.
  
  - For fields that may contain multiple values at the same time, records with the specified fields containing all of the values in the quote-enclosed comma-separated list match that search criteria.

  - For fields that may contain multiple values at the same time, search criteria may include single values as well as quote-enclosed comma-separated lists. For instance, a search for A, B, "C, D, E" on a field that may contain one of more of these letters matches records where the specified field contains A or B, or all of C, D, and E.

  - Specify n/a in any field to identify events where information is not available for that field; use !n/a to identify the events where that field is populated.

  - You can precede many numeric fields with greater than (>), greater than or equal to (>=), less than (<), less than or equal to (<=), equal to (=), or not equal to (<>) operators.

*Tip* When searching a field with long complicated values (such as SHA-256 hash values), you can copy the search criteria value from source material and paste it into the appropriate field on the search page.

**Wildcards and Symbols in Searches**

Many text fields on search pages allow you to use an asterisk (*) to match characters in a string. For example, specifying net* matches network, netware, netscape, and so on.

If you want to search for non-alphanumeric characters (including the asterisk character), enclose the search string in quotation marks. For example, to search for the string:

Find an asterisk (*)

enter:

"Find an asterisk (*)"
Note that in text fields that allow a wildcard, you must use the wildcard if you want to match a partial string. For example, if you are searching the audit log for all audit records that involve page views (that is, the message is Page View), searching for Page returns no results. Instead, specify Page*.

In some fields you can search for all or part of the field contents without using asterisks. In these cases, you must use quotation marks around a search string to make exact matches--otherwise, the system performs a partial match. For example, if you were to search such a field for the string Scan Completed with Detection without using quotation marks, the system would return records where the field contains the following strings as well as those where the field exactly matches the search string:

Scan Completed, No Detections
Scan completed With Detections

**Objects and Application Filters in Searches**

The Firepower System allows you to create named objects, object groups, and application filters that can be used as part of your network configuration. You can use these objects, groups, and filters as search criteria when performing or saving searches.

When you perform a search, objects, object groups, and application filters appear in the format, ${object_name}. For example, a network object with the object name ten_ten_network appears as ${ten_ten_network} in a search.

You can click the add object icon (+) that appears next to a search field where you can use an object as a search criterion.

**Related Topics**

The Object Manager, on page 337

**Time Constraints in Searches**

The formats accepted by search criteria fields that take a time value are shown in the following table.

<table>
<thead>
<tr>
<th>Time Formats</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>today [at HH:MMam</td>
<td>pm]</td>
</tr>
<tr>
<td></td>
<td>today at 12:45pm</td>
</tr>
</tbody>
</table>

You can precede a time value with one of the following operators:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Example</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;</td>
<td>&gt; today at 2:45pm</td>
<td>Returns events with a timestamp later than today at 2:45 PM.</td>
</tr>
</tbody>
</table>
IP Addresses in Searches

When specifying IP addresses in searches, you can enter an individual IP address, a comma-separated list of addresses, an address block, or a range of IP addresses separated with a hyphen (-). You can also use negation.

For searches that support IPv6 (such as intrusion event, connection data, and correlation event searches) you can enter IPv4 and IPv6 addresses and CIDR/prefix length address blocks in any combination. When you search for hosts by IP address, the results include all hosts for which at least one IP address matches your search conditions, that is, a search for an IPv6 address may return hosts whose primary address in IPv4.

When you use CIDR or prefix length notation to specify a block of IP addresses, the Firepower System uses only the portion of the network IP address specified by the mask or prefix length. For example, if you type 10.1.2.3/8, the Firepower System uses 10.0.0.0/8.

Because IP addresses can be represented by network objects, you can also click the add network object icon (+) that appears next to an IP address search field to use a network object as an IP address search criterion.

Table 281: Acceptable IP Address Syntax

<table>
<thead>
<tr>
<th>To specify...</th>
<th>Type...</th>
<th>For example...</th>
</tr>
</thead>
<tbody>
<tr>
<td>a single IP address</td>
<td>the IP address.</td>
<td>192.168.1.1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2001:db8::abcd</td>
</tr>
<tr>
<td>multiple IP addresses using a list</td>
<td>a comma-separated list of IP addresses. Do</td>
<td>192.168.1.1,192.168.1.2</td>
</tr>
<tr>
<td></td>
<td><strong>not</strong> add a space before or after the commas.</td>
<td>2001:db8::b3ff,2001:db8::0202</td>
</tr>
<tr>
<td>a range of IP addresses that can be</td>
<td>the IP address block in IPv4 CIDR or IPv6</td>
<td>192.168.1.0/24</td>
</tr>
<tr>
<td>specified with a CIDR block or prefix length</td>
<td>prefix length notation.</td>
<td>This specifies any IP in the 192.168.1.0 network with a subnet mask of 255.255.255.0, that is, 192.168.1.0 through 192.168.1.255.</td>
</tr>
<tr>
<td>a range of IP addresses that cannot be specified with a CIDR block or prefix</td>
<td>the IP address range using a hyphen. Do <strong>not</strong> add a space before or after the hyphen.</td>
<td>192.168.1.1-192.168.1.5</td>
</tr>
<tr>

<td>!192.168.1.10,!2001:db8::/32</td>
</tr>
</tbody>
</table>

Related Topics

Firepower System IP Address Conventions, on page 13

Managed Devices in Searches

When creating a search using a managed device as a constraint, you can specify any of the following in the Device search criteria field:

- A managed device name, IP address, or host name
- A device group name
• A device stack name
• A 7000 or 8000 Series device high-availability pair name

If the system finds a match for a group, device high-availability pair, or stack, it replaces the group, device high-availability pair, or stack name with the appropriate member device names for the purpose of performing the search. When you save a search that uses a device group, device high-availability pair, or stack in the device field the system saves the name specified in the device field and performs the device name replacement again each time the search is executed.

### Ports in Searches

The Firepower System accepts specific syntax for port numbers in searches. You can enter:

- a single port number
- a comma-separated list of port numbers
- two port numbers separated by a dash to represent a range of port numbers
- a port number followed by a protocol abbreviation, separated by a forward slash (only when searching for intrusion events)
- a port number or range of port numbers preceded by an exclamation mark to indicate a negation of the specified ports

**Note**

Do **not** use spaces when specifying port numbers or ranges.

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>21</td>
<td>Returns all events on port 21, including TCP and UDP events.</td>
</tr>
<tr>
<td>!23</td>
<td>Returns all events except those on port 23.</td>
</tr>
<tr>
<td>25/tcp</td>
<td>Returns all TCP-related intrusion events on port 25.</td>
</tr>
<tr>
<td>21/tcp,25/tcp</td>
<td>Returns all TCP-related intrusion events on ports 21 and 25.</td>
</tr>
<tr>
<td>21-25</td>
<td>Returns all events on ports 21 through 25.</td>
</tr>
</tbody>
</table>

### Event Fields in Searches

When searching for events, you can use the following fields as search criteria:

- [Audit Log Workflow Fields, on page 2249](#)
- [Application Data Fields, on page 2214](#)
- [Application Detail Data Fields, on page 2216](#)
• Captured File Fields, on page 2145
• White List Event Fields, on page 2240
• Connection and Security Intelligence Event Fields, on page 2053
• Correlation Event Fields, on page 2236
• Discovery Event Fields, on page 2196
• The Health Events Table, on page 241
• Host Attribute Data Fields, on page 2204

Performing a Search

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** Choose *Analysis > Search.*

*Tip* You may also click *Search* from any page on a workflow.

**Step 2** From the table drop-down list, choose the type of event or data to search.

**Step 3** Enter your search criteria in the appropriate fields; see *Search Constraints, on page 2007.*

**Step 4** If you want to use the search again in the future, save the search as described in *Saving a Search, on page 2013.*
Step 5

Click **Search** to start the search. Your search results appear in the default workflow for the table you are searching, constrained by time (if applicable).

---

**What to do next**

- To analyze the search results using workflows, see *Using Workflows, on page 1977*.

**Related Topics**

- *Configuring Event View Settings, on page 33*

---

## Saving a Search

<table>
<thead>
<tr>
<th></th>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Admin Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays saved searches created in the current domain, which you can edit. It also displays searches saved in ancestor domains, which you cannot edit. To view and edit searches created in a lower domain, switch to that domain.

**Before you begin**

- Establish search criteria as described in *Performing a Search, on page 2012*, or load a saved search as described in *Loading a Saved Search, on page 2014*.

**Procedure**

---

**Step 1**

From the Search page, if you want to save the search as private so only you can access it, check the **Private** checkbox.

**Tip**

If you want to use the search as a data restriction for a custom user role, you **must** save it as a private search.

**Step 2**

You have two options:

- If you want to save a new version of a loaded search, click **Save As New**.
- If you want to save a new search, or overwrite a custom search using the same name, click **Save**. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
Loading a Saved Search

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays saved searches created in the current domain, which you can edit. It also displays searches saved in ancestor domains, which you cannot edit. To view and edit searches created in a lower domain, switch to that domain.

Procedure

**Step 1**
Choose Analysis > Search.

**Tip** You may also click Search from any page on a workflow.

**Step 2**
From the table drop-down list, choose the type of event or data to search.

**Step 3**
Choose the search you want to load from the Custom Searches list or the Predefined Searches list.

**Step 4**
If you want to use different search criteria, change the search constraints.

**Step 5**
If you want to use a changed search again in the future, save the search as described in Saving a Search, on page 2013.

**Step 6**
Click Search.

Query Overrides Via the Shell

System administrators can use a shell-based query management tool to locate and stop long-running queries.

The query management tool allows you to locate queries running longer than a specified number of minutes and stop those queries. The tool logs an event to the audit log and to syslog when you stop a query.

Note that the only locally-created user with shell access on Firepower Management Centers is the admin user. If you use an external authentication object which grants shell access, users matching the shell access filter can also log into the shell.

**Note**
Leaving the search page in the web interface does not stop a query. Queries that take a long time to return results impact overall system performance while the query is running.

Shell-Based Query Management Syntax

Use the following syntax to manage long-running queries:

```
query_manager [-v] [-l [minutes]] [-k query_id [...] [--kill-all minutes]
```
Table 283: query_manager Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>Prints a brief help message.</td>
</tr>
<tr>
<td>-l, --list [minutes]</td>
<td>Lists all queries taking longer than passed-in minutes. By default it will show all queries taking longer than 1 minute.</td>
</tr>
<tr>
<td>-k, --kill query_id [...]</td>
<td>Kills the query with the passed-in id. The option can take multiple ids.</td>
</tr>
<tr>
<td>--kill-all minutes</td>
<td>Kills all queries taking longer than passed-in minutes.</td>
</tr>
<tr>
<td>-v, --verbose</td>
<td>Verbose output including full SQL queries.</td>
</tr>
</tbody>
</table>

⚠️ **Caution**

Shell access should be limited to system administrators.

### Stopping Long-Running Queries

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>admin or other user-granted shell access</td>
</tr>
</tbody>
</table>

**Procedure**

1. **Step 1** Connect to the Firepower Management Center via `ssh`.
2. **Step 2** Run `query_manager` under `sudo` using the syntax described in [Shell-Based Query Management Syntax, on page 2014](#).
Custom Workflows

The following topics describe how to use custom workflows:

- **Introduction to Custom Workflows**, on page 2017
- **Saved Custom Workflows**, on page 2017
- **Custom Workflow Creation**, on page 2018
- **Custom Workflow Use and Management**, on page 2022

**Introduction to Custom Workflows**

If the predefined and Cisco-provided custom workflows do not meet your needs, you can create and manage custom workflows.

Custom workflows are workflows that you create to meet the unique needs of your organization. When you create a custom workflow, you choose the kind of event (or database table) on which the workflow is based. On the Firepower Management Center, you can base a custom workflow on a custom table. You can also choose the pages a custom workflow contains; custom workflows can contain drill-down, table view, and host or packet view pages.

If your event evaluation process changes, you can edit custom workflows to meet your new needs. Note that you cannot edit any of the predefined workflows.

**Tip**

You can set a custom workflow as the default workflow for any event type.

**Saved Custom Workflows**

In addition to predefined workflows, which cannot be modified, the Firepower Management Center includes several saved custom workflows. Each of these workflows is based on a custom table and can be modified.

In a multidomain deployment, these saved workflows belong to the Global domain and cannot be modified in lower domains.
Table 284: Saved Custom Workflows

<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Events by Impact, Priority, and Host Criticality</td>
<td>You can use this workflow to quickly pick out and focus in on hosts that are important to your network, currently vulnerable, and possibly currently under attack. This workflow is based on the Intrusion Events with Destination Criticality custom table.</td>
</tr>
<tr>
<td>Events by Priority and Classification</td>
<td>This workflow lists events and their type in order of event priority, along with a count showing how many times each event has occurred. This workflow is based on the Intrusion Events custom table.</td>
</tr>
<tr>
<td>Events with Destination, Impact, and Host Criticality</td>
<td>You can use this workflow to find the most recent attacks on hosts that are important to your network and currently vulnerable. This workflow is based on the Intrusion Events with Destination Criticality custom table.</td>
</tr>
<tr>
<td>Hosts with Servers Default Workflow</td>
<td>You can use this workflow to quickly view the basic information in the Hosts with Servers custom table. This workflow is based on the Hosts with Servers custom table.</td>
</tr>
<tr>
<td>Intrusion Events with Destination Criticality Default Workflow</td>
<td>You can use this workflow to quickly view the basic information in the Intrusion Events with Destination Criticality custom table. This workflow is based on the Intrusion Events with Destination Criticality custom table.</td>
</tr>
<tr>
<td>Intrusion Events with Source Criticality Default Workflow</td>
<td>You can use this workflow to quickly view the basic information in the Intrusion Events with Source Criticality custom table. This workflow is based on the Intrusion Events with Source Criticality custom table.</td>
</tr>
<tr>
<td>Server and Host Details</td>
<td>You can use this workflow to determine what servers are most frequently used on your network and which hosts are running those servers. This workflow is based on the Hosts with Servers custom table.</td>
</tr>
</tbody>
</table>

**Custom Workflow Creation**

If the predefined and Cisco-provided custom workflows do not meet your needs, you can create custom workflows.
Instead of creating a new custom workflow, you can export a custom workflow from another appliance and then import it onto your appliance. You can then edit the imported workflow to suit your needs.

When you create a custom workflow, you:

- Select a table to be the source of the workflow
- Provide a workflow name
- Add drill-down pages and table view pages to the workflow

For each drill-down page in the workflow, you can:

- Provide a name that appears at the top of the page in the web interface
- Include up to five columns per page
- Specify a default sort order, ascending or descending

You can add table view pages in any position in the sequence of workflow pages. They do not have any editable properties, such as a page name, sort order, or user-definable column positions.

You must add at least one drill-down page or a table view of events to a custom workflow.

If you selected **Vulnerabilities** as the table type, then add **IP Address** as a table column, the IP Address column does not appear when you are viewing vulnerabilities using your custom workflow, unless you use the search feature to constrain the workflow to view a specific IP address or block of addresses.

The final page of a custom workflow depends on the table on which you base the workflow, as described in the following table. These final pages are added by default when you create the workflow.

**Table 285: Custom Workflow Final Pages**

<table>
<thead>
<tr>
<th>Event/Asset Type</th>
<th>Final Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery events</td>
<td>Hosts</td>
</tr>
<tr>
<td>Vulnerabilities</td>
<td>Vulnerability detail</td>
</tr>
<tr>
<td>Third-party vulnerabilities</td>
<td>Hosts</td>
</tr>
<tr>
<td>Users</td>
<td>Users</td>
</tr>
<tr>
<td>Indications of compromise</td>
<td>Hosts</td>
</tr>
<tr>
<td>Intrusion events</td>
<td>Packets</td>
</tr>
</tbody>
</table>

The system does not add a final page to custom workflows based on other kinds of events (for example, audit log or malware events).
Custom workflows based on connection data are like other custom workflows, except you can include drill-down pages containing connection summary data, and connection data graph pages as well as drill-down pages containing data for individual connections and table view pages.

## Creating Custom Workflows Based on Non-Connection Data

### Procedure

**Step 1** Choose Analysis > Custom > Custom Workflows.

**Step 2** Click Create Custom Workflow.

**Step 3** Enter a name for the workflow in the Name field.

**Step 4** Optionally, enter a Description.

**Step 5** Choose the table you want to include from the Table drop-down list.

**Step 6** If you want to add one or more drill-down pages to the workflow, click Add Page.

**Step 7** Enter a name for the page in the Page Name field.

**Step 8** Under Column 1, choose a sort priority and a table column. This column will appear in the leftmost column of the page.

### Example:

For example, to create a page showing the destination ports that are targeted, and to sort the page by count, choose 2 from the Sort Priority drop-down list and Destination Port/ICMP Code from the Field drop-down list.

**Step 9** Continue choosing fields to include and setting their sort priority until you have specified all the fields you want to appear on the page.

**Step 10** If you want to add a table view page to the workflow, click Add Table View.

**Step 11** Click Save.

---

## Creating Custom Connection Data Workflows

### Procedure

**Step 1** Choose Analysis > Custom > Custom Workflows.

**Step 2** Click Create Custom Workflow.

**Step 3** Enter a name for the workflow in the Name field.

**Step 4** Optionally, enter a Description.

**Step 5** Choose the table you want to include from the Table drop-down list.

**Step 6** If you want to add one or more drill-down pages to the workflow, click Add Page.

**Step 7** Enter a name for the page in the Page Name field.

**Step 8** Under Column 1, choose a sort priority and a table column. This column will appear in the leftmost column of the page.

### Example:

For example, to create a page showing the destination ports that are targeted, and to sort the page by count, choose 2 from the Sort Priority drop-down list and Destination Port/ICMP Code from the Field drop-down list.

**Step 9** Continue choosing fields to include and setting their sort priority until you have specified all the fields you want to appear on the page.

**Step 10** If you want to add a table view page to the workflow, click Add Table View.

**Step 11** Click Save.

---

Custom workflows based on connection data are like other custom workflows, except you can include connection data graph pages as well as drill-down pages and table view pages. You can include as many of each type of page in the workflow as you want, in any order. Each connection data graph page contains a single graph, which can be a line graph, bar graph, or pie chart. On line and bar graphs, you may include more than one dataset.
Procedure

Step 1 Choose Analysis > Custom > Custom Workflows.
Step 2 Click Create Custom Workflow.
Step 3 Enter a name for the workflow in the Name field.
Step 4 Optionally, enter a Description.
Step 5 From the Table drop-down list, choose Connection Events.
Step 6 If you want to add one or more drill-down pages to the workflow, you have two options:
   - Click Add Page to add a drill-down page that contains data on individual connections,
   - Click Add Summary Page to add a drill-down page that contains connection summary data.

Step 7 Enter a name for the page in the Page Name field.
Step 8 Under Column 1, choose a sort priority and a table column. This column will appear in the leftmost column of the page.
Step 9 Continue choosing fields to include and setting their sort priority until you have specified all the fields you want to appear on the page.

Example:
For example, to create a page showing the amount of traffic transmitted over your monitored network and to sort the page by the responders that transmitted the most traffic, choose 1 from the Sort Priority drop-down list and Responder Bytes from the Field drop-down list.

Step 10 If you want to add one or more graph pages to the workflow, click Add Graph.
Step 11 Enter a name for the page in the Graph Name field.
Step 12 Choose the type of graph you want to include on the page:
   - line graph
   - bar graph
   - pie chart

Step 13 Specify what kind of data you want to graph by choosing the x- and y-axes of the graph.
On a pie chart, the x-axis represents the independent variable and the y-axis represents the dependent variable.

Step 14 Choose the datasets you want to include on the graph.
Note that pie charts can include only one data set.

Step 15 If you want to add a table view of connection data, click Add Table View.
Table views are not configurable.

Step 16 Click Save.
Custom Workflow Use and Management

The method you use to view a workflow depends on whether the workflow is based on one of the predefined event tables or on a custom table.

If your custom workflow is based on a predefined event table, access it in the same way that you would access a workflow that ships with the appliance. For example, to access a custom workflow based on the Hosts table, choose Analysis > Hosts > Hosts. If, on the other hand, your custom workflow is based on a custom table, you must access it from the Custom Tables page.

If your event evaluation process changes, you can edit custom workflows to meet your new needs. Note that you cannot edit any of the predefined workflows.

Tip: You can set a custom workflow as the default workflow for any event type.

Viewing Custom Workflows Based on Predefined Tables

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any Security Analyst (depending on workflow)</td>
</tr>
</tbody>
</table>

Procedure

- **Step 1** Choose the appropriate menu path and option for the table on which you based your custom workflow, as described in the Workflow Selection, on page 1979.
- **Step 2** To use a different workflow, including a custom workflow, click (switch workflow) next to the current workflow title.
- **Step 3** If no events appear and the workflow can be constrained by time, you may need to adjust the time range; see Event Time Constraints, on page 1994.

Viewing Custom Workflows Based on Custom Tables

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays custom workflows created in the current domain, which you can edit. It also displays custom workflows created in ancestor domains, which you cannot edit. To view and edit custom workflows in a lower domain, switch to that domain.
Procedure

Step 1 Choose **Analysis > Custom > Custom Tables**.
Step 2 Click the view icon (🔍) next to the custom table you want to view, or click the name of the custom table.
Step 3 To use a different workflow, including a custom workflow, click *(switch workflow)* beside the current workflow title.
Step 4 If no events appear and the workflow can be constrained by time, you may need to adjust the time range; see Event Time Constraints, on page 1994.

Editing Custom Workflows

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays custom workflows created in the current domain, which you can edit. It also displays custom workflows created in ancestor domains, which you cannot edit. To view and edit custom workflows in a lower domain, switch to that domain.

Procedure

Step 1 Choose **Analysis > Custom > Custom Workflows**.
Step 2 Click the edit icon (✍️) next to the name of the workflow that you want to edit.

If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3 Make any changes that you want to the workflow.
Step 4 Click *Save*. 
Custom Tables

The following topics describe how to use custom tables:

- Introduction to Custom Tables, on page 2025
- Predefined Custom Tables, on page 2025
- User-Defined Custom Tables, on page 2030
- Searching Custom Tables, on page 2033

Introduction to Custom Tables

As the Firepower System collects information about your network, the Firepower Management Center stores it in a series of database tables. When you use a workflow to view the resulting information, the Firepower Management Center pulls the data from one of these tables. For example, the columns on each page of the Network Applications by Count workflow are taken from the fields in the Applications table.

If you determine that your analysis of the activity on your network would be enhanced by combining fields from different tables, you can create a custom table. For example, you could combine the host criticality information from the predefined Host Attributes table with the fields from the predefined Connection Data table and then examine connection data in a new context.

Note that you can create custom workflows for either predefined or custom tables.

Predefined Custom Tables

Custom tables contain fields from two or more predefined tables. The Firepower System is delivered with a number of system-defined custom tables, but you can create additional custom tables that contain only information that matches your specific needs.

For example, the Firepower System is delivered with system-defined custom tables that correlate intrusion event data with host data, so you can search for events that impact critical systems and view the results of that search in one workflow.

In a multidomain deployment, the predefined custom tables belong to the Global domain and cannot be modified in lower domains.

The following table describes the custom tables provided with the system.
### Table 286: System-Defined Custom Tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hosts with Servers</td>
<td>Includes fields from the Hosts and Servers tables, providing you with information about the detected applications running on your network, as well as basic operating system information about the hosts running those applications.</td>
</tr>
<tr>
<td>Intrusion Events with Destination Criticality</td>
<td>Includes fields from the Intrusion Events table and the Hosts table, providing you with information on the intrusion events, as well as the host criticality of the destination host involved in each intrusion event. You can use this table to search for intrusion events involving destination hosts with high host criticality.</td>
</tr>
<tr>
<td>Intrusion Events with Source Criticality</td>
<td>Includes fields from the Intrusion Events table and the Hosts table, providing you with information on the intrusion events and the host criticality of the source host involved in each intrusion event. You can use this table to search for intrusion events involving source hosts with high host criticality.</td>
</tr>
</tbody>
</table>

### Possible Table Combinations

When you create a custom table, you can combine fields from predefined tables that have related data. The following table lists the predefined tables you can combine to create a new custom table. Keep in mind that you can create a custom table that combines fields from more than two predefined custom tables.

**Table 287: Custom Table Combinations**

<table>
<thead>
<tr>
<th>You can combine fields from...</th>
<th>With fields from...</th>
</tr>
</thead>
</table>
| Applications                   | • Correlation Events
|                                | • Intrusion Events
|                                | • Connection Summary Data
|                                | • Host Attributes
|                                | • Application Details

</tr>
</tbody>
</table>
Sometimes a field in one table maps to more than one field in another table. For example, the predefined **Intrusion Events with Destination Criticality** custom table combines fields from the Intrusion Events table and the Hosts table. Each event in the Intrusion Events table has two IP addresses associated with it—a source IP address and a destination IP address. However, the “events” in the Hosts table each represent a single host IP address (hosts may have multiple IP addresses). Therefore, when you create a custom table based on the Intrusion Events table and the Hosts table, you must choose whether the data you display from the Hosts table applies to the host source IP address or the host destination IP address in the Intrusion Events table.

When you create a new custom table, a default workflow that displays all the columns in the table is automatically created. Also, just as with predefined tables, you can search custom tables for data that you want to use in your network analysis. You can also generate reports based on custom tables, as you can with predefined tables.
User-Defined Custom Tables

Instead of creating a new custom table, you can export a custom table from another Firepower Management Center, then import it onto your Firepower Management Center.

To create a custom table, decide which predefined tables delivered with the Firepower System contain the fields you want to include in your custom table. You can then choose which fields you want to include and, if necessary, configure field mappings for any common fields.

Data involving the Hosts table allows you to view data associated with all IP addresses from one host, rather than one specific IP address.

For example, consider a custom table that combines fields from the Correlation Events table and the Hosts table. You can use this custom table to get detailed information about the hosts involved in violations of any of your correlation policies. Note that you must decide whether to display data from the Hosts table that matches the source IP address or the destination IP address in the Correlation Events table.

If you view the table view of events for this custom table, it displays correlation events, one per row. You can configure the custom table to include the following information:

- the date and time the event was generated
- the name of the correlation policy that was violated
- the name of the rule that triggered the violation
- the IP address associated with the source, or initiating, host involved in the correlation event
- the source host’s NetBIOS name
- the operating system and version the source host is running
- the source host criticality

You could create a similar custom table that displays the same information for destination, or responding, hosts.

Creating a Custom Table

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any/Admin</td>
</tr>
</tbody>
</table>
Procedure

Step 1: Choose Analysis > Custom > Custom Tables.

Step 2: Click Create Custom Table.

Step 3: In the Name field, enter a name for the custom table.

Example:
For example, you might enter Correlation Events with Host Information (Src IP).

Step 4: From the Tables drop-down list, choose Correlation Events.

Step 5: Under Fields, choose Time and click Add to add the date and time when a correlation event was generated.

Step 6: Repeat step 5 to add the Policy and Rule fields.

Tip: You can use Ctrl or Shift while clicking to choose multiple fields. You can also click and drag to choose multiple adjacent values. However, if you want to specify the order the fields appear in the table view of events associated with the table, add the fields one at a time.

Step 7: From the Tables drop-down list, choose Hosts.

Step 8: Add the IPAddress, NetBIOS Name, OS Name, OS Version, and Host Criticality fields to the custom table.

Step 9: Under Common Fields, next to Correlation Events, choose Source IP.

Your custom table is configured to display the host information you chose in step 8 for the source, or initiating, hosts involved in correlation events.

Tip: You can create a custom table that displays detailed host information for the destination, or responding, hosts involved in a correlation event by following this procedure but choosing Destination IP instead of Source IP.

Step 10: Click Save.

Modifying a Custom Table

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any/Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays custom tables created in the current domain, which you can edit. It also displays custom tables created in ancestor domains, which you cannot edit. To view and edit custom tables in a lower domain, switch to that domain.

Procedure

Step 1: Choose Analysis > Custom > Custom Tables.

Step 2: Click the edit icon (✍️) next to the table you want to edit.
If a view icon ( ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3**
Optionally, remove fields from the table by clicking the delete icon ( ) next to the fields you want to remove.

**Note** If you delete fields currently in use in reports, the system will prompt you prompted to confirm that you want to remove the sections using those fields from those reports.

**Step 4**
Make other changes as needed.

**Step 5**
Click Save.

---

### Deleting a Custom Table

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any/Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays custom tables created in the current domain, which you can delete. It also displays custom tables created in ancestor domains, which you cannot delete. To delete custom tables in a lower domain, switch to that domain.

**Procedure**

**Step 1** Choose Analysis > Custom > Custom Tables.

**Step 2** Click the delete icon ( ) next to the custom table you want to delete.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

---

### Viewing a Workflow Based on a Custom Table

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any/Admin</td>
</tr>
</tbody>
</table>

When you create a custom table, the system automatically creates a default workflow for it. The first page of this workflow displays a table view of events. If you include intrusion events in your custom table, the second page of the workflow is the packet view. Otherwise, the second page of the workflow is a hosts page. You can also create your own custom workflows based on your custom table.

**Tip**
If you create a custom workflow based on a custom table, you can specify it as the default workflow for that table.
You can use the same techniques to view events in your custom table that you use for event views based on predefined tables.

In a multidomain deployment, the system displays custom tables created in the current domain, which you can edit. It also displays custom tables created in ancestor domains, which you cannot edit. To view and edit custom tables in a lower domain, switch to that domain.

**Procedure**

**Step 1**
Choose Analysis > Custom > Custom Tables.

**Step 2**
Click the view icon ( ) next to the custom table related to the workflow you want to see.

### Searching Custom Tables

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any/Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays custom tables created in the current domain, which you can edit. It also displays custom tables created in ancestor domains, which you cannot edit. To view and edit custom tables in a lower domain, switch to that domain.

**Procedure**

**Step 1**
Choose Analysis > Custom > Custom Tables.

**Step 2**
Click the view icon ( ) next to the custom table you want to search.

**Tip**
To use a different workflow, including a custom workflow, click (switch workflow) next to the workflow title.

**Step 3**
Click Search.

**Tip**
To search the database for a different kind of event or data, choose it from the table drop-down list.

**Step 4**
Enter your search criteria in the appropriate fields.

If you enter criteria for multiple fields, the search returns only the records that match search criteria specified for all fields.

**Tip**
Click the object icon ( ) next to a search field to use an object as a search criterion.

**Step 5**
Optionally, if you plan to save the search, you can check the Private check box to save the search as private so only you can access it. Otherwise, leave the check box clear to save the search for all users.

**Tip**
If you want to use the search as a data restriction for a custom user role, you must save it as a private search.
Step 6  Optionally, you can save the search to be used again in the future. You have the following options:

- Click **Save** to save the search criteria. The search is visible only to your account if you checked the **Private** check box.
- Click **Save As New** to save a new search or assign a name to a search you created by altering a previously-saved search. The search is saved and visible only to your account if you checked the **Private** check box.

Step 7  Click **Search** to start the search.
Your search results appear in the default workflow for the custom table, constrained by the current time range (if applicable).

CHAPTER 105

Connection Logging

The following topics describe how to configure the Firepower System to log connections made by hosts on your monitored network:

- About Connection Logging, on page 2037
- Connection Logging Strategies, on page 2038
- Logging Connections with Tunnel and Prefilter Rules, on page 2045
- Logging Decryptable Connections with SSL Rules, on page 2046
- Logging Connections with Security Intelligence, on page 2047
- Logging Connections with Access Control Rules, on page 2047
- Logging Connections with a Policy Default Action, on page 2048
- Limiting Logging of Long URLs, on page 2049

About Connection Logging

The system can generate logs of the connections its managed devices detect. These logs are called connection events. Settings in rules and policies give you granular control over which connections you log, when you log them, and where you store the data. Special connection events, called Security Intelligence events, represent connections blacklisted (blocked) by the reputation-based Security Intelligence feature.

Connection events contain data about the detected sessions. The information available for any individual connection event depends on several factors, but in general includes:

- Basic connection properties: timestamp, source and destination IP address, ingress and egress zones, the device that handled the connection, and so on
- Additional connection properties discovered or inferred by the system: applications, requested URLs, or users associated with the connection, and so on
- Metadata about why the connection was logged: which configuration handled the traffic, whether the connection was allowed or blocked, details about encrypted and decrypted connections, and so on

Note

You can supplement the connection logs gathered by your managed devices with connection data generated from exported NetFlow records. This is especially useful if you have NetFlow-enabled routers or other devices deployed on networks that your Firepower System managed devices cannot monitor.
Connection Logging Strategies

Log connections according to the security and compliance needs of your organization. If your goal is to limit the number of events you generate and improve performance, only enable logging for the connections critical to your analysis. However, if you want a broad view of your network traffic for profiling purposes, you can enable logging for additional connections.

Tip
To perform detailed analysis of connection data, Cisco recommends you log the ends of critical connections to the Firepower Management Center database.

Because the system can log a connection for multiple reasons, disabling logging in one place does not ensure that matching connections will not be logged. Also, unless you disable connection event storage, the system automatically logs some connections; for example, those associated with detected files, malware, intrusions, and Intelligent Application Bypass (IAB).

You cannot log:

• Connections fastpathed with 8000 Series fastpath rules
• The outer session of a plaintext, passthrough tunnel whose encapsulated connections are inspected by access control

Configurable Connection Logging

So that you log only critical connections, enable connection logging on a per-rule basis. If you enable connection logging for a rule, the system logs all connections handled by that rule.

You can also log connections handled by policy default actions. Depending on the rule or default action (and for access control, a rule's inspection configuration), your logging options differ.

Prefilter Policy: Rules and Default Action

You can log connections (including entire plaintext, passthrough tunnels) that you fastpath or block with a prefilter policy.

Prefiltering uses outer-header criteria to handle traffic. For tunnels that you log, the resulting connection events contain information from the outer, encapsulation headers.

For traffic subject to further analysis, logging in the prefilter policy is disabled, although matching connections may still be logged by other configurations. The system performs all further analysis using inner headers, that is, the system independently handles and logs each connection within an allowed tunnel.

SSL Policy: Rules and Default Action

You can log connections that match an SSL rule or SSL policy default action.
For blocked connections, the system immediately ends the session and generates an event. For monitored connections and connections that you pass to access control rules, the system generates an event when the session ends.

**Access Control Policy: Security Intelligence Decisions**

You can log a connection whenever it is blacklisted (blocked) by the reputation-based Security Intelligence feature.

Optionally, and recommended in passive deployments, you can use a monitor-only setting for Security Intelligence filtering. This allows the system to further analyze connections that would have been blacklisted, but still log the match to the blacklist. Security Intelligence monitoring also allows you to create traffic profiles using Security Intelligence information.

When the system logs a connection event as the result of Security Intelligence filtering, it also logs a matching Security Intelligence event, which is a special kind of connection event that you can view and analyze separately, and that is also stored and pruned separately. So that you can identify the blacklisted IP address in the connection, host icons next to blacklisted and monitored IP addresses look slightly different in the tables on the pages under the Analysis > Connections menus.

**Access Control Policy: Rules and Default Action**

You can log connections that match an access control rule or access control policy default action.

**Related Topics**

Actions and Connection Logging, on page 2042

---

**Automatic Connection Logging**

Unless you disable connection event storage, the system automatically saves the following end-of-connection events to the Firepower Management Center database, regardless of any other logging configurations.

**Connections Associated with Intrusions**

The system automatically logs connections associated with intrusion events, unless the connection is handled by the access control policy's default action.

When an intrusion policy associated with the access control default action generates an intrusion event, the system does not automatically log the end of the associated connection. Instead, you must explicitly enable default action connection logging. This is useful for intrusion prevention-only deployments where you do not want to log any connection data.

An exception to this rule occurs if you enable beginning-of-connection logging for the default action. In that case, the system does log the end of the connection when an associated intrusion policy triggers, in addition to logging the beginning of the connection.

**Connections Associated with File and Malware Events**

The system automatically logs connections associated with file and malware events.
File events generated by inspecting NetBIOS-ssn (SMB) traffic do not immediately generate connection events because the client and server establish a persistent connection. The system generates connection events after the client or server ends the session.

**Connections Associated with Intelligent Application Bypass**

The system automatically logs bypassed and would-have-bypassed connections associated with IAB.

**Beginning vs End-of-Connection Logging**

You can log a connection at its beginning or its end, with the following exceptions for blocked traffic:

- Blocked traffic—Because blocked traffic is immediately denied without further inspection, usually you can log only beginning-of-connection events for blocked or blacklisted traffic. There is no unique end of connection to log.

- Blocked encrypted traffic—When you enable connection logging in an SSL policy, the system logs end-of-connection rather than beginning-of-connection events. This is because the system cannot determine if a connection is encrypted using the first packet in the session, and thus cannot immediately block encrypted sessions.

To optimize performance, log either the beginning or the end of any connection, but not both. Monitoring a connection for any reason forces end-of-connection logging. For a single non-blocked connection, the end-of-connection event contains all of the information in the beginning-of-connection event, as well as information gathered over the duration of the session.

The following table details the differences between beginning and end-of-connection events, including the advantages to logging each.

**Table 288: Comparing Beginning and End-of-Connection Events**

<table>
<thead>
<tr>
<th>Can be generated...</th>
<th>Beginning-of-Connection Events</th>
<th>End-of-Connection Events</th>
</tr>
</thead>
</table>
| All connections except those blocked by the SSL policy | When the system detects the beginning of a connection (or, after the first few packets if event generation depends on application or URL identification) | When the system:  
  - Detects the close of a connection  
  - Does not detect the end of a connection after a period of time  
  - Can no longer track the session due to memory constraints |

All connections, though you may not be able to configure end-of-connection logging in all places
### Events and Assets

<table>
<thead>
<tr>
<th><strong>Beginning-of-Connection Events</strong></th>
<th><strong>End-of-Connection Events</strong></th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

### Firepower Management Center vs External Logging

If you store connection and Security Intelligence event logs on the Firepower Management Center, you can use the Firepower System's reporting, analysis, and data correlation features. For example:

- Dashboards and the Context Explorer provide you with graphical, at-a-glance views of the connections logged by the system.
- Event views (most of the options available under the Analysis menu) present detailed information on the connections logged by the system, which you can display in a graphical or tabular format or summarize in a report.
- Traffic profiling uses connection data to create a profile of your normal network traffic that you can then use as a baseline against which to detect and track anomalous behavior.
- Correlation policies allow you to generate events and trigger responses (such as alerts or external remediations) to specific types of connections or traffic profile changes.

The number of events the Firepower Management Center can store depends on its model.
To use these features, you must log connections (and in most cases, the end of those connections rather than the beginning). This is why the system automatically logs critical connections—those associated with logged intrusions, prohibited files, and malware.

You can also log events to an external syslog or SNMP trap server, using a connection you configure called an alert response.

Related Topics
Firepower Management Center Alert Responses, on page 1905

Actions and Connection Logging

Where you can configure connection logging, rule actions and policy default actions determine not only how the system inspects and handles matching traffic, but also when and how you can log details about matching traffic. Connection events contain metadata about why the connection was logged, including which configurations handled the traffic.

Related Topics
Tunnel and Prefilter Rule Components, on page 1143
SSL Rule Actions, on page 1202
Access Control Rule Actions, on page 1099
Connection and Security Intelligence Event Fields, on page 2053

Logging for Fastpathed Connections

You can log fastpathed connections and non-encrypted tunnels, which includes traffic matching the following rules and actions in the prefilter policy:

- Tunnel rules—Fastpath action (logs the outer session)
- Prefilter rules—Fastpath action

Fastpathed traffic bypasses the rest of access control and QoS, so connection events for fastpathed connections contain limited information. You cannot log connections fastpathed with 8000 Series fastpath rules.

Logging for Monitored Connections

The system always logs the ends of connections for traffic matching the following configurations, even if the traffic matches no other rules and you do not enable default action logging:

- Security Intelligence—Blacklists set to monitor (also generates a Security Intelligence event)
- SSL rules—Monitor action
- Access control rules—Monitor action

The system does not generate a separate event each time a single connection matches a Monitor rule. Because a single connection can match multiple Monitor rules, each connection event can include and display information on the first eight Monitor access control rules that the connection matches, as well as the first matching SSL Monitor rule.
Similarly, if you send connection events to an external syslog or SNMP trap server, the system does not send a separate alert each time a single connection matches a Monitor rule. Rather, the alert that the system sends at the end of the connection contains information on the Monitor rules the connection matched.

Logging for Trusted Connections

You can log the beginnings and ends of trusted connections, which includes traffic matching the following rules and actions:

- Access control rules—**Trust** action
- Access control default action—**Trust All Traffic**

Trusted connections are not subject to deep inspection or discovery, so connection events for trusted connections contain limited information.

The system logs TCP connections handled by a Trust access control rule differently depending on the device that detected the connection:

- For 7000 and 8000 Series devices, TCP connections detected by a Trust rule on the first packet generate different events depending on the presence of a preceding enabled Monitor rule. If the Monitor rule is active, the system evaluates the packet and generates both a beginning and end-of-connection event. If no Monitor rule is active, the system only generates an end-of-connection event.
- For all other models, TCP connections detected by a Trust rule on the first packet only generate an end-of-connection event. The system generates the event one hour after the final session packet.

Logging for Blocked Connections

You can log blocked connections, which includes traffic matching the following rules and actions:

- Tunnel rules—**Block**
- Prefilter rules—**Block**
- Prefilter default action—**Block all tunnel traffic**
- Security Intelligence—Blacklists set to block (also generates a Security Intelligence event)
- SSL rules—**Block** and **Block with reset**
- SSL default action—**Block** and **Block with reset**
- Access control rules—**Block**, **Block with reset**, and **Interactive Block**
- Access control default action—**Block All Traffic**

Only devices deployed inline (that is, using routed, switched, or transparent interfaces, or inline interface pairs) can block traffic. Because blocked connections are not actually blocked in passive deployments, the system may report multiple beginning-of-connection events for each blocked connection.

---

**Caution**

Logging blocked TCP connections during a Denial of Service (DoS) attack can affect system performance and overwhelm the database with multiple similar events. Before you enable logging for a Block rule, consider whether the rule monitors traffic on an Internet-facing interface or other interface vulnerable to DoS attack.
Beginning vs End-of-Connection Logging for Blocked Connections

When you log a blocked connection, how the system logs it depends on why the connection was blocked; this is important to keep in mind when configuring correlation rules based on connection logs:

- For SSL rules and SSL policy default actions that block encrypted traffic, the system logs end-of-connection events. This is because the system cannot determine if a connection is encrypted using the first packet in the session.
- For other blocking actions, the system logs beginning-of-connection events. Matching traffic is denied without further inspection.

Logging Bypassed Interactive Blocks

Interactive blocking access control rules, which cause the system to display a warning page when a user browses to a prohibited website, allow you to configure end-of-connection logging. This is because if the user clicks through the warning page, the connection is considered a new, allowed connection which the system can monitor and log.

Therefore, for packets that match an Interactive Block or Interactive Block with reset rule, the system can generate the following connection events:

- a beginning-of-connection event when a user’s request is initially blocked and the warning page is displayed; this event has an associated action of Interactive Block or Interactive Block with reset
- multiple beginning- or end-of-connection events if the user clicks through the warning page and loads the originally requested page; these events have an associated action of Allow and a reason of User Bypass

Logging for Allowed Connections

You can log allowed connections, which includes traffic matching the following rules and actions:

- SSL rules—Decrypt action
- SSL rules—Do not decrypt action
- SSL default action—Do not decrypt
- Access control rules—Allow action
- Access control default action—Network Discovery Only and any intrusion prevention option

Enabling logging for these configurations ensures the connection is logged, while also permitting (or specifying) the next phase of inspection and traffic handling. SSL logging is always end-of-connection; access control configurations also allow beginning-of-connection logging.

Although the Analyze action in tunnel and prefilter rules also allows connections to continue with access control, logging is disabled for rules with this action. Matching connections may still be logged by other configurations. Allowed tunnels may have their encapsulated sessions evaluated and logged individually.

When you allow traffic with an access control rule or default action, you can use an associated intrusion policy to further inspect traffic and block intrusions. For access control rules, you can also use a file policy to detect and block prohibited files, including malware. Unless you disable connection event storage, the system automatically logs most allowed connections associated with intrusion, file, and malware events. For detailed
information, see Automatic Connection Logging, on page 2039. Note that connections with encrypted payloads are not subject to deep inspection, so connection events for encrypted connections contain limited information.

**File and Malware Event Logging for Allowed Connections**

When a file policy detects or blocks a file, it logs one of the following events to the Firepower Management Center database:

- *file events*, which represent detected or blocked files, including malware files
- *malware events*, which represent detected or blocked malware files only
- *retrospective malware events*, which are generated when the malware disposition for a previously detected file changes

You can disable this logging on a per-access-control-rule basis. Or, disable file and malware event storage entirely.

---

**Note**

Cisco recommends you leave file and malware event logging enabled.

---

**Logging Connections with Tunnel and Prefilter Rules**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Before you begin**

- Set the rule action to Block or Fastpath. Logging is disabled for the Analyze action, which allows connections to continue with access control, where other configurations determine their handling and logging.

**Procedure**

**Step 1**

In the prefILTER policy editor, click the edit icon (✏️) next to the rule where you want to configure logging.

If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 2**

Click the Logging tab.

**Step 3**

Specify whether you want to Log at Beginning of Connection or Log at End of Connection.

To optimize performance, log either the beginning or the end of any connection, but not both. Because blocked traffic is immediately denied without further inspection, you cannot log end-of-connection events for Block rules.
Step 4 Specify where to send connection events.
Send events to the event viewer if you want to perform Firepower Management Center-based analysis on these connection events.

Step 5 Click Save to save the rule.

Step 6 Click Save to save the policy.

What to do next
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Logging Decryptable Connections with SSL Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>

<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1 In the SSL policy editor, click the edit icon (edit icon) next to the rule where you want to configure logging.
If a view icon (view icon) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 2 Click the Logging tab.

Step 3 Check Log at End of Connection.
For monitored traffic, end-of-connection logging is required.

Step 4 Specify where to send connection events.
Send events to the event viewer if you want to perform Firepower Management Center-based analysis on these connection events. For monitored traffic, this is required.

Step 5 Click Save to save the rule.

Step 6 Click Save to save the policy.

What to do next
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.
Logging Connections with Security Intelligence

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**
In the access control policy editor, click the **Security Intelligence** tab.

**Step 2**
Click the logging icons () to enable Security Intelligence logging using the following criteria:
- By IP address—Click the logging icon next to **Networks**.
- By URL—Click the logging icon next to **URLs**.
- By Domain Name—Click the logging icon next to the **DNS Policy** drop-down list.

If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 3**
Check the **Log Connections** check box.

**Step 4**
Specify where to send connection and Security Intelligence events.
Send events to the event viewer if you want to perform Firepower Management Center-based analysis, or if you want to set blacklisted objects to monitor-only.

**Step 5**
Click **OK** to set logging options.

**Step 6**
Click **Save** to save the policy.

**What to do next**
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Logging Connections with Access Control Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>

<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Depending on your choices for the rule action and deep inspection options, your logging options differ; see Actions and Connection Logging, on page 2042.
Procedure

Step 1 In the access control policy editor, click the edit icon (✏️) next to the rule where you want to configure logging.

If a view icon (👀) appears instead, the configuration is inherited from an ancestor policy, belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 2 Click the Logging tab.

Step 3 Specify whether you want to Log at Beginning of Connection or Log at End of Connection.

To optimize performance, log either the beginning or the end of any connection, but not both.

Step 4 (Optional) Check the Log Files check box to log file and malware events associated with the connection. Cisco recommends you leave this option enabled.

Step 5 Specify where to send connection events.

Send events to the Firepower Management Center if you want to perform Management Center-based analysis on these connection events, or if the rule action is Monitor.

Step 6 Click Save to save the rule.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Logging Connections with a Policy Default Action

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

A policy's default action determines how the system handles traffic that matches none of the rules in the policy (except Monitor rules in access control and SSL policies, which match and log—but do not handle or inspect—traffic).

Logging settings for the SSL policy default action also govern how the system logs undecryptable sessions.

Before you begin

• For prefilter default action logging, set the default action to Block all tunnel traffic. Logging is disabled for the Allow all tunnel traffic action, which allows connections to continue with access control, where other configurations determine their handling and logging.
Procedure

Step 1
In the policy editor, click the logging icon () next to the Default Action drop-down list.

Step 2
Specify when you want to log matching connections:

- Log at Beginning of Connection—Not supported for SSL default actions.
- Log at End of Connection—Not supported if you choose the access control Block All Traffic default action or the prefilter Block all tunnel traffic default action.

To optimize performance, log either the beginning or the end of any connection, but not both.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration. In an access control policy, the configuration may also be inherited from an ancestor policy.

Step 3
Specify where to send connection events.

Send events to the event viewer if you want to perform Firepower Management Center-based analysis on these connection events.

Step 4
Click OK.

Step 5
Click Save to save the policy.

What to do next
- Deploy configuration changes; see Deploy Configuration Changes, on page 279.

Limiting Logging of Long URLs

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>

</table>

End-of-connection events for HTTP traffic record the URL requested by monitored hosts. Disabling or limiting the number of stored URL characters may improve system performance. Disabling URL logging (storing zero characters) does not affect URL filtering. The system filters traffic based on requested URLs even though the system does not record them.

Procedure

Step 1
In the access control policy editor, click the Advanced tab, then click the edit icon () next to General Settings.
If a view icon (🔒) appears instead, the configuration is inherited from an ancestor policy, belongs to an ancestor domain, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 2** Enter the **Maximum URL characters to store in connection events**.

**Step 3** Click **OK**.

**Step 4** Click **Save** to save the policy.

---

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes, on page 279**.
The following topics describe how to use connection and security events tables.

- About Connection Events, on page 2051
- Connection and Security Intelligence Event Fields, on page 2053
- Using Connection and Security Intelligence Event Tables, on page 2071
- Viewing the Connection Summary Page, on page 2075

About Connection Events

The system can generate logs of the connections its managed devices detect. These logs are called connection events. Settings in rules and policies give you granular control over which connections you log, when you log them, and where you store the data. Special connection events, called Security Intelligence events, represent connections blacklisted (blocked) by the reputation-based Security Intelligence feature. For detailed information, see Connection Logging, on page 2037.

Related Topics
- About Security Intelligence, on page 1117

Connection vs. Security Intelligence Events

A Security Intelligence event is a connection event that is generated whenever a session is blacklisted (blocked) or monitored by the reputation-based Security Intelligence feature.

However, for every Security Intelligence event, there is an identical connection event. You can view and analyze Security Intelligence events independently. The system also stores and prunes Security Intelligence events separately.

Note that the system enforces Security Intelligence before more resource-intensive evaluations. When a connection is blocked by Security Intelligence, the resulting event does not contain the information that the system would have gathered from subsequent evaluation, for example, user identity.

In this guide, information about connection events also pertains to Security Intelligence events, unless otherwise noted.
**NetFlow Connections**

To supplement the connection data gathered by your managed devices, you can use records broadcast by NetFlow exporters to generate connection events. This is especially useful if the NetFlow exporters are monitoring different networks than those monitored by your managed devices.

The system logs NetFlow records as unidirectional end-of-connection events in the Firepower Management Center database. The available information for these connections differs somewhat from connections detected by your access control policy; see Differences between NetFlow and Managed Device Data, on page 1649.

**Related Topics**
- Netflow Data in the Firepower System, on page 1647

**Connection Summaries (Aggregated Data for Graphs)**

The Firepower System aggregates connection data collected over five-minute intervals into connection summaries, which the system uses to generate connection graphs and traffic profiles. Optionally, you can create custom workflows based on connection summary data, which you use in the same way as you use workflows based on individual connection events.

Note that there are no connection summaries specifically for Security Intelligence events, although corresponding end-of-connection events can be aggregated into connection summary data.

To be aggregated, multiple connections must:

- represent the end of connections
- have the same source and destination IP addresses, and use the same port on the responder (destination) host
- use the same protocol (TCP or UDP)
- use the same application protocol
- either be detected by the same Firepower System managed device or by the same NetFlow exporter

Each connection summary includes total traffic statistics, as well as the number of connections in the summary. Because NetFlow exporters generate unidirectional connections, a summary’s connection count is incremented by two for every connection based on NetFlow data.

Note that connection summaries do not contain all of the information associated with the summaries’ aggregated connections. For example, because client information is not used to aggregate connections into connection summaries, summaries do not contain client information.

**Long-Running Connections**

If a monitored session spans two or more five-minute intervals over which connection data is aggregated, the connection is considered a long-running connection. When calculating the number of connections in a connection summary, the system increments the count only for the five-minute interval in which a long-running connection was initiated.

Also, when calculating the number of packets and bytes transmitted by the initiator and responder in a long-running connection, the system does not report the number of packets and bytes that were actually transmitted during each five-minute interval. Instead, the system assumes a constant rate of transmission and
calculates estimated figures based on the total number of packets and bytes transmitted, the length of the connection, and what portion of the connection occurred during each five-minute interval.

**Combined Connection Summaries from External Responders**

To reduce the space required to store connection data and speed up the rendering of connection graphs, the system combines connection summaries when:

- one of the hosts involved in the connection is not on your monitored network
- other than the IP address of the external host, the connections in the summaries meet the summary aggregation criteria

When viewing connection summaries in the Analysis > Connections submenu pages, and when working with connection graphs, the system displays external instead of an IP address for the non-monitored hosts.

As a consequence of this aggregation, if you attempt to drill down to the table view of connection data (that is, access data on individual connections) from a connection summary or graph that involves an external responder, the table view contains no information.

**Connection and Security Intelligence Event Fields**

Connection and Security Intelligence events, which you can view and search using tabular and graphical workflows, contain the fields described below. Keep in mind that the information available for any individual event can vary depending on how, why, and when the system logged the connection.

---

**Note**

For each Security Intelligence event, there is an identical, separately stored connection event. All Security Intelligence events have a populated Security Intelligence Category field.

Because connection graphs are based on connection summaries, the same criteria that constrain connection summaries also constrain connection graphs. Fields marked with an asterisk (*) on search pages constrain connection graphs and connection summaries. If you search connection summaries using invalid search constraints and view your results using a connection summary page in a custom workflow, the invalid constraints are labeled as not applicable (N/A) and are marked with a strikethrough.

**General Information**

**Access Control Policy**

The access control policy that monitored the connection.

**Access Control Rule**

The access control rule or default action that handled the connection, as well as up to eight Monitor rules matched by that connection.

If the connection matched one Monitor rule, the Firepower Management Center displays the name of the rule that handled the connection, followed by the Monitor rule name. If the connection matched more than one Monitor rule, the number of matching Monitor rules is displayed, for example, Default Action + 2 Monitor Rules.
To display a pop-up window with a list of the first eight Monitor rules matched by the connection, click *Monitor Rules*.

**Action**

The action associated with the configuration that logged the connection.

For Security Intelligence-monitored connections, the action is that of the first non-Monitor access control rule triggered by the connection, or the default action. Similarly, because traffic matching a Monitor rule is always handled by a subsequent rule or by the default action, the action associated with a connection logged due to a Monitor rule is never Monitor. However, you can still trigger correlation policy violations on connections that match Monitor rules.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow</td>
<td>Connections either allowed by access control explicitly, or allowed because a user bypassed an interactive block.</td>
</tr>
<tr>
<td>Block, Block with reset</td>
<td>Blocked connections, including:</td>
</tr>
<tr>
<td></td>
<td>• tunnels and other connections blocked by the prefiler policy</td>
</tr>
<tr>
<td></td>
<td>• connections blacklisted by Security Intelligence</td>
</tr>
<tr>
<td></td>
<td>• encrypted connections blocked by an SSL policy</td>
</tr>
<tr>
<td></td>
<td>• connections where an exploit was blocked by an intrusion policy</td>
</tr>
<tr>
<td></td>
<td>• connections where a file (including malware) was blocked by a file policy</td>
</tr>
<tr>
<td></td>
<td>For connections where the system blocks an intrusion or file, system displays Block, even though you use access control Allow rules to invoke deep inspection.</td>
</tr>
<tr>
<td>Fastpath</td>
<td>Non-encrypted tunnels and other connections fastpathed by the prefiler policy.</td>
</tr>
<tr>
<td>Interactive Block,</td>
<td>Connections logged when the system initially blocks a user’s HTTP request using an Interactive Block rule. If the user clicks through the warning page that the system displays, additional connections logged for the session have an action of Allow.</td>
</tr>
<tr>
<td>Interactive Block</td>
<td>with reset</td>
</tr>
<tr>
<td>Trust</td>
<td>Connections trusted by access control. The system logs trusted TCP connections differently depending on the device model; see Logging for Trusted Connections, on page 2043.</td>
</tr>
<tr>
<td>Default Action</td>
<td>Connections handled by the access control policy's default action.</td>
</tr>
</tbody>
</table>

**Connections**

The number of connections in a connection summary. For long-running connections, that is, connections that span multiple connection summary intervals, only the first connection summary interval is incremented. To view meaningful results for searches using the **Connections** criterion, use a custom workflow that has a connection summary page.

**Count**

The number of connections that match the information that appears in each row. Note that the **Count** field appears only after you apply a constraint that creates two or more identical rows. If you create a
custom workflow and do not add the Count column to a drill-down page, each connection is listed individually and packets and bytes are not summed.

**Endpoint Location**

The IP address of the network device that used ISE to authenticate the user, as identified by ISE.

**Endpoint Profile**

The user's endpoint device type, as identified by ISE.

**First Packet or Last Packet**

The date and time the first or last packet of the session was seen.

**Initiator/Responder Bytes**

The total number of bytes transmitted by the session initiator or session responder.

**Initiator/Responder Packets**

The total number of packets transmitted by the session initiator.

**Initiator User (constrains summaries and graphs)**

The user logged into the session initiator. If this field is populated with No Authentication, the user traffic:

- matched an access control policy without an associated identity policy
- did not match any rules in the identity policy

**IOC**

Whether the event triggered an indication of compromise (IOC) against a host involved in the connection.

**Network Analysis Policy**

The network analysis policy (NAP), if any, associated with the generation of the event.

**Prefilter Policy**

The prefilter policy that handled the connection.

**Reason**

The reason or reasons the connection was logged, in many situations. For a full list, see [Connection Event Reasons, on page 2064](#).

Connections with a Reason of IP Block, DNS Block, and URL Block have a threshold of 15 seconds per unique initiator-responder pair. After the system blocks one of those connections, it does not generate connection events for additional blocked connections between those two hosts for the next 15 seconds, regardless of port or protocol.

**Security Context**

For connections handled by ASA FirePOWER in multiple context mode, the metadata identifying the virtual firewall group through which the traffic passed.

**Security Group Tag**

The Security Group Tag (SGT) attribute of the packet involved in the connection. The SGT specifies the privileges of a traffic source within a trusted network. Security Group Access (a feature of both Cisco TrustSec and Cisco ISE) applies the attribute as packets enter the network.
Security Intelligence Category
The name of the blacklisted object that represents or contains the blacklisted IP address in the connection. The Security Intelligence category can be the name of a network object or group, a blacklist, a custom Security Intelligence list or feed, or one of the categories in the Intelligence Feed.
For more information about the categories in the Intelligence Feed, see Security Intelligence Options, on page 1121.

TCP Flags
For connections generated from NetFlow data, the TCP flags detected in the connection. When searching this field, enter a list of comma-separated TCP flags to view all connections that have at least one of those flags.

Time
The ending time of the five-minute interval that the system used to aggregate connections in a connection summary. This field is not searchable.

Traffic (KB) (search only)
The total amount of data transmitted in the connection, in kilobytes.

Total Packets (search only)
The total number of packets transmitted in the connection.

Tunnel/Prefilter Rule
The tunnel rule, prefilter rule, or prefilter policy default action that handled the connection.

Networking

Destination Port/ICMP Code (constrains summaries and graphs)
The port or ICMP code used by the session responder.

DNS Query
The DNS query submitted in a connection to the name server to look up a domain name.

DNS Record Type
The type of the DNS resource record used to resolve a DNS query submitted in a connection.

DNS Response
The DNS response returned in a connection to the name server when queried.

DNS Sinkhole Name
The name of the sinkhole server where the system redirected a connection.

DNS TTL
The number of seconds a DNS server caches the DNS resource record.

HTTP Response Code
The HTTP status code sent in response to a client's HTTP request over a connection.

Ingress/Egress Security Zone
The ingress or egress security zone associated with the connection.
For rezoned encapsulated connections, the ingress field displays the tunnel zone you assigned, instead of the original ingress security zone. The egress field is blank.

**Initiator/Responder IP (constrains summaries and graphs)**

The IP address (and host name, if DNS resolution is enabled) of the session initiator or responder. So that you can identify the blacklisted IP address in a blacklisted connection, host icons next to blacklisted IP addresses look slightly different.

For plaintext, passthrough tunnels either blocked or fastpathed by the prefILTER policy, these IP addresses represent the tunnel endpoints—the routed interfaces of the network devices on either side of the tunnel.

**Original Client IP**

The original client IP address from an X-Forwarded-For (XFF), True-Client-IP, or custom-defined HTTP header. To populate this field, you must enable an access control rule that handles proxied traffic based on its original client.

**Protocol (constrains summaries and graphs, search only)**

The transport protocol used in the connection. To search for a specific protocol, use the name or number protocol as listed in [http://www.iana.org/assignments/protocol-numbers](http://www.iana.org/assignments/protocol-numbers).

**Source Port/ICMP Type (constrains summaries and graphs)**

The port or ICMP type used by the session initiator.

**VLAN ID**

The innermost VLAN ID associated with the packet that triggered the connection.

**Geolocation**

**Initiator/Responder Country**

When a routable IP is detected, the country associated with the IP address of the session initiator or responder. The system displays an icon of the country’s flag, and the country’s ISO 3166-1 alpha-3 country code. Hover your pointer over the flag icon to view the country’s full name.

**Initiator/Responder Continent**

When a routable IP is detected, the continent associated with the IP address for the session initiator or responder.

**Original Client Country**

The country where the original client IP address belongs. To obtain this value, the system extracts the original client IP address from an X-Forwarded-For (XFF), True-Client-IP, or custom-defined HTTP header, then maps it to the country using the geolocation database (GeoDB). To populate this field, you must enable an access control rule that handles proxied traffic based on its original client.

**Device**

**Device (constrains summaries and graphs)**

The managed device that detected the connection or, for connections generated from NetFlow data, the managed device that processed the data.
Domain
The domain of the managed device that detected the connection or, for connections generated from NetFlow data, the domain of the managed device that processed the data. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Ingress/Egress Interface
The ingress or egress interface associated with the connection. If your deployment includes an asynchronous routing configuration, the ingress and egress interface may belong to the same interface set.

SSL
SSL Actual Action (search only)
The action the system applied to encrypted traffic in the SSL policy. The system displays field values in the SSL Status field on search workflow pages.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block/Block with reset</td>
<td>Represents blocked encrypted connections.</td>
</tr>
<tr>
<td>Decrypt (Resign)</td>
<td>Represents an outgoing connection decrypted using a re-signed server certificate.</td>
</tr>
<tr>
<td>Decrypt (Replace Key)</td>
<td>Represents an outgoing connection decrypted using a self-signed server certificate with a substituted public key.</td>
</tr>
<tr>
<td>Decrypt (Known Key)</td>
<td>Represents an incoming connection decrypted using a known private key.</td>
</tr>
<tr>
<td>Default Action</td>
<td>Indicates the connection was handled by the default action.</td>
</tr>
<tr>
<td>Do not Decrypt</td>
<td>Represents a connection the system did not decrypt.</td>
</tr>
</tbody>
</table>

SSL Certificate Status
This applies only if you configured a Certificate Status SSL rule condition. If encrypted traffic matches an SSL rule, this field displays one or more of the following server certificate status values:

- Self Signed
- Valid
- Invalid Signature
- Invalid Issuer
- Expired
- Unknown
• Not Valid Yet
• Revoked

If undecryptable traffic matches an SSL rule, this field displays Not Checked.

**SSL Certificate Information (search only)**

The information stored on the public key certificate used to encrypt traffic, including:

• Subject/Issuer Common Name
• Subject/Issuer Organization
• Subject/Issuer Organization Unit
• Not Valid Before/After
• Serial Number
• Certificate Fingerprint
• Public Key Fingerprint

**SSL Cipher Suite**

A macro value representing a cipher suite used to encrypt the connection. See [www.iana.org/assignments/tls-parameters/tls-parameters.xhtml](http://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml) for cipher suite value designations.

**SSL Encryption applied to the connection (search only)**

Enter **yes** or **no** in the SSL search field to view SSL-encrypted or non-encrypted connections.

**SSL Expected Action (search only)**

The action the system expected to apply to encrypted traffic, given the SSL rules in effect. Enter any of the values listed for **SSL Actual Action**.

**SSL Failure Reason**

The reason the system failed to decrypt encrypted traffic:

• Unknown
• No Match
• Success
• Uncached Session
• Unknown Cipher Suite
• Unsupported Cipher Suite
• Unsupported SSL Version
• SSL Compression Used
• Session Undecryptable in Passive Mode
• Handshake Error
• Decryption Error
• Pending Server Name Category Lookup
• Pending Common Name Category Lookup
• Internal Error
• Network Parameters Unavailable
• Invalid Server Certificate Handle
• Server Certificate Fingerprint Unavailable
• Cannot Cache Subject DN
• Cannot Cache Issuer DN
• Unknown SSL Version
• External Certificate List Unavailable
• External Certificate Fingerprint Unavailable
• Internal Certificate List Invalid
• Internal Certificate List Unavailable
• Internal Certificate Unavailable
• Internal Certificate Fingerprint Unavailable
• Server Certificate Validation Unavailable
• Server Certificate Validation Failure
• Invalid Action

Field values are displayed in the **SSL Status** field on the search workflow pages.

**SSL Flow Error**

The error name and hexadecimal code if an error occurred during the SSL session; **Success** if no error occurred.

**SSL Flow Flags**

The first ten debugging level flags for an encrypted connection. On a workflow page, to view all flags, click the ellipsis (...).

**SSL Flow Messages**

The keywords below indicate encrypted traffic is associated with the specified message type exchanged between client and server during the SSL handshake. See [http://tools.ietf.org/html/rfc5246](http://tools.ietf.org/html/rfc5246) for more information.

• HELLO_REQUEST
• CLIENT_ALERT
• SERVER_ALERT
• CLIENT_HELLO
• SERVER_HELLO
- SERVER_CERTIFICATE
- SERVER_KEY_EXCHANGE
- CERTIFICATE_REQUEST
- SERVER_HELLO_DONE
- CLIENT_CERTIFICATE
- CLIENT_KEY_EXCHANGE
- CERTIFICATE_VERIFY
- CLIENT_CHANGE_CIPHER_SPEC
- CLIENT_FINISHED
- SERVER_CHANGE_CIPHER_SPEC
- SERVER_FINISHED
- NEW_SESSION_TICKET
- HANDSHAKE_OTHER
- APP_DATA_FROM_CLIENT
- APP_DATA_FROM_SERVER

SSL Policy

The SSL policy that handled the connection.

SSL Rule

The SSL rule or default action that handled the connection, as well as the first Monitor rule matched by that connection. If the connection matched a Monitor rule, the Firepower Management Center displays the name of the rule that handled the connection, followed by the Monitor rule name.

SSL Session ID

The hexadecimal Session ID negotiated between the client and server during the SSL handshake.

SSL Status

The action associated with the SSL Actual Action (SSL rule, default action, or undecryptable traffic action) that logged the encrypted connection. The lock icon (🔒) links to SSL certificate details. If the certificate is unavailable (for example, for connections blocked due to SSL handshake error), the lock icon is dimmed.

If the system fails to decrypt an encrypted connection, it displays the SSL Actual Action (undecryptable traffic action) taken, as well as the SSL Failure Reason. For example, if the system detects traffic encrypted with an unknown cipher suite and allows it without further inspection, this field displays Do Not Decrypt (Unknown Cipher Suite).

When searching this field, enter one or more of the SSL Actual Action and SSL Failure Reason values to view encrypted traffic the system handled or failed to decrypt.
SSL Subject/Issuer Country (search only)
A two-character ISO 3166-1 alpha-2 country code for the subject or issuer country associated with the encryption certificate.

SSL Ticket ID
A hexadecimal hash value of the session ticket information sent during the SSL handshake.

SSL Version
The SSL or TLS protocol versions used to encrypt the connection:
• Unknown
• SSLv2.0
• SSLv3.0
• TLSv1.0
• TLSv1.1
• TSLv1.2

Application
Application Protocol (constrains summaries and graphs)
The application protocol, which represents communications between hosts, detected in the connection.

Application Protocol Category and Tag
Criteria that characterize the application to help you understand the application's function.

Application Risk
The risk associated with the application traffic detected in the connection: Very High, High, Medium, Low, or Very Low. Each type of application detected in the connection has an associated risk; this field displays the highest of those.

Business Relevance
The business relevance associated with the application traffic detected in the connection: Very High, High, Medium, Low, or Very Low. Each type of application detected in the connection has an associated business relevance; this field displays the lowest (least relevant) of those.

Client and Client Version
The client application and version of that client detected in the connection.

If the system cannot identify the specific client used in the connection, the field displays the word "client" appended to the application protocol name to provide a generic name, for example, FTP client.

Client Category and Tag
Criteria that characterize the application to help you understand the application's function.

HTTP Referrer
The HTTP referrer, which represents the referrer of a requested URL for HTTP traffic detected in the connection (such as a website that provided a link to, or imported a link from, another URL).
Referenced Host

If the protocol in the connection is HTTP or HTTPS, this field displays the host name that the respective protocol was using.

User Agent

The user-agent string application information extracted from HTTP traffic detected in the connection.

Web Application

The web application, which represents the content or requested URL for HTTP traffic detected in the connection.

If the web application does not match the URL for the event, the traffic is probably referred traffic, such as advertisement traffic. If the system detects referred traffic, it stores the referring application (if available) and lists that application as the web application.

If the system cannot identify the specific web application in HTTP traffic, this field displays Web Browsing.

Web Application Category and Tag

Criteria that characterize the application to help you understand the application's function.

URL

The URL requested by the monitored host during the session and its associated category and reputation, if available.

If the system identifies or blocks an SSL application, the requested URL is in encrypted traffic, so the system identifies the traffic based on an SSL certificate. For SSL applications, therefore, this field indicates the common name contained in the certificate.

NetFlow

NetBIOS Domain

The NetBIOS domain used in the session.

NetFlow Source/Destination Autonomous System

For connections generated from NetFlow data, the border gateway protocol autonomous system number for the source or destination of traffic in the connection.

NetFlow Source/Destination Prefix

For connections generated from NetFlow data, the source or destination IP address ANDed with the source or destination prefix mask.

NetFlow Source/Destination TOS

For connections generated from NetFlow data, the setting for the type-of-service (TOS) byte when connection traffic entered or exited the NetFlow exporter.

NetFlow SNMP Input/Output

For connections generated from NetFlow data, the interface index for the interface where connection traffic entered or exited the NetFlow exporter.
Source Device (constrains summaries and graphs)

The IP address of the NetFlow exporter that broadcast the data used to generate for the connection. If the connection was detected by a managed device, this field displays Firepower.

QoS

QoS-Dropped Initiator/Responder Bytes
The number of bytes dropped from the session initiator or session responder due to rate limiting.

QoS-Dropped Initiator/Responder Packets
The number of packets dropped from the session initiator or session responder due to rate limiting.

QoS-Applied Interface
For rate-limited connections, the name of the interface where you applied rate limiting.

QoS Policy
The QoS policy that rate limited the connection.

QoS Rule
The QoS rule that rate limited the connection.

Associated Events
You cannot use the connection/Security Intelligence events Search page to search for events associated with a connection.

Files

The file events, if any, associated with the connection. The view files icon links to a list of files. The number on the icon indicates the number of files (including malware files) detected or blocked in that connection.

Intrusion Events

The intrusion events, if any, associated with the connection. The view intrusion events icon links to a list of events.

Connection Event Reasons

The Reason field in a connection event displays the reason or reasons the connection was logged, in the following situations:

<table>
<thead>
<tr>
<th>Reason</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content Restriction</td>
<td>The system modified the packet to enforce content restrictions related to either the Safe Search or YouTube EDU feature.</td>
</tr>
<tr>
<td>DNS Block</td>
<td>The system denied the connection without inspection, based on the domain name and Security Intelligence data. A reason of DNS Block is paired with an action of Block, Domain not found, or Sinkhole, depending on the DNS rule action.</td>
</tr>
<tr>
<td>DNS Monitor</td>
<td>The system would have denied the connection based on the domain name and Security Intelligence data, but you configured the system to monitor, rather than deny, the connection.</td>
</tr>
<tr>
<td>File Block</td>
<td>The connection contained a file or malware file that the system prevented from being transmitted. A reason of File Block is always paired with an action of Block.</td>
</tr>
<tr>
<td>Reason</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>File Custom Detection</td>
<td>The connection contained a file on the custom detection list that the system prevented from being transmitted.</td>
</tr>
<tr>
<td>File Monitor</td>
<td>The system detected a particular type of file in the connection.</td>
</tr>
<tr>
<td>File Resume Allow</td>
<td>File transmission was originally blocked by a Block Files or Block Malware file rule. After a new access control policy allowing the file was deployed, the HTTP session automatically resumed. This reason only appears in inline deployments.</td>
</tr>
<tr>
<td>File Resume Block</td>
<td>File transmission was originally allowed by a Detect Files or Malware Cloud Lookup file rule. After a new access control policy blocking the file was deployed, the HTTP session automatically stopped. This reason only appears in inline deployments.</td>
</tr>
</tbody>
</table>
| Intelligent App Bypass      | The Intelligent Application Bypass (IAB) mode:  
  • If the action is Trust, IAB was in bypass mode. Matching traffic passed without further inspection.                                    
  • If the action is Allow, IAB was in test mode. Matching traffic was available for further inspection.                                           |
| Intrusion Block             | The system blocked or would have blocked an exploit (intrusion policy violation) detected in the connection. A reason of Intrusion Block is paired with an action of Block for blocked exploits and Allow for would-have-blocked exploits. |
| Intrusion Monitor           | The system detected, but did not block, an exploit detected in the connection. This occurs when the state of the triggered intrusion rule is set to Generate Events.                                                |
| IP Block                    | The system denied the connection without inspection, based on the IP address and Security Intelligence data. A reason of IP Block is always paired with an action of Block.                                             |
| IP Monitor                  | The system would have denied the connection based on the IP address and Security Intelligence data, but you configured the system to monitor, rather than deny, the connection.                                    |
| SSL Block                   | The system blocked an encrypted connection based on the SSL inspection configuration. A reason of SSL Block is always paired with an action of Block.                                                              |
| URL Block                   | The system denied the connection without inspection, based on the URL and Security Intelligence data. A reason of URL Block is always paired with an action of Block.                                               |
| URL Monitor                 | The system would have denied the connection based on the URL and Security Intelligence data, but you configured the system to monitor, rather than deny, the connection.                                    |
| User Bypass                 | The system initially blocked a user’s HTTP request, but the user clicked through a warning page to view the site. A reason of User Bypass is always paired with an action of Allow.                          |
Requirements for Populating Connection Event Fields

The information available for a connection event, Security Intelligence event, or connection summary depends on several factors.

Appliance Model and License
Many features require that you enable specific licensed capabilities on target devices, and many features are only available on some models.
For example, NGIPSv devices do not support SSL inspection. They cannot inspect encrypted traffic; logged connection events do not contain information about encrypted connections.

Traffic Characteristics
The system only reports information present (and detectable) in network traffic. For example, there could be no user associated with an initiator host, or no referenced host detected in a connection where the protocol is not DNS, HTTP, or HTTPS.

Origin/Detection Method: Traffic-Based Detection vs NetFlow
With the exception of NetFlow-only fields, the information available in NetFlow records is more limited than the information generated by traffic-based detection; see Differences between NetFlow and Managed Device Data, on page 1649.

Evaluation Stage
Each type of traffic inspection and control occurs where it makes the most sense for maximum flexibility and performance.
For example, the system enforces Security Intelligence before more resource-intensive evaluations. When a connection is blocked by Security Intelligence, the resulting event does not contain the information that the system would have gathered from subsequent evaluation, for example, user identity.

Logging Method: Beginning or End of Connection
When the system detects a connection, whether you can log it at its beginning or its end (or both) depends on how you configure the system to detect and handle it.
Beginning-of-connection events do not have information that must be determined by examining traffic over the duration of the session (for example, the total amount of data transmitted or the timestamp of the last packet in the connection). Beginning-of-connection events are also not guaranteed to have information about application or URL traffic in the session, and do not contain any details about the session’s encryption. Beginning-of-connection logging is usually the only option for blocked connections.

Connection Event Type: Individual vs Summary
Connection summaries do not contain all of the information associated with their aggregated connections. For example, because client information is not used to aggregate connections into connection summaries, summaries do not contain client information.
Keep in mind that connection graphs are based on connection summary data, which use only end-of-connection logs. If your system is configured to log only beginning-of-connection data, connection graphs and connection summary event views contain no data.
Other Configurations

Other configurations that affect connection logging include, but are not limited to:

- ISE-related fields are populated only if you configure ISE, in connections associated with users who authenticate via an Active Directory domain controller. Connection events do not contain ISE data for users who authenticate via LDAP, RADIUS, or RSA domain controllers.

- The Security Group Tag field is populated only if you configure ISE as an identity source or add custom SGT rule conditions.

- Prefilter-related fields (including tunnel zone information in security zone fields) are populated only in connections handled by a prefilter policy.

- SSL-related fields are populated only in encrypted connections handled by an SSL policy.

- File information fields are populated only in connections logged by access control rules associated with file policies.

- Intrusion information fields are populated only in connections logged by access control rules either associated with intrusion policies or using the default action.

- QoS-related fields are populated only in connections subject to rate limiting.

- The Reason field is populated only in specific situations, such as when a user bypasses an Interactive Block configuration.

- The Domain field is only present if you have ever configured the Firepower Management Center for multitenancy.

- An advanced setting in the access control policy controls the number of characters the system stores in the connection log for each URL requested by monitored hosts in HTTP sessions. If you use this setting to disable URL logging, the system does not display individual URLs in the connection log, although you can still view category and reputation data, if it exists.

Information Available in Connection Event Fields

The table in this topic indicates when the system can populate connection and Security Intelligence fields. The columns in the table represent the following event types:

- Origin: Direct—Events that represent connections detected and handled by a Firepower System managed device.

- Origin: NetFlow—Events that represent connections exported by a NetFlow exporter.

- Logging: Start—Events that represent connections logged at their beginning.

- Logging: End—Events that represent connections logged at their end.

A "yes" in the table does not mean that the system must populate a connection event field, rather, that it can. The system only reports information present (and detectable) in network traffic. For example, SSL-related fields are populated only for records of encrypted connections handled by an SSL policy.

You can use the Firepower Management Center to view a table of connection or Security Intelligence events. Then, you can manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access connection graphs differs depending on the workflow you use. You can use a predefined workflow, which terminates in a table view of events. You can also create a custom workflow that displays only the information that matches your specific needs.

When you are using a connection or Security Intelligence workflow table, you can perform many common actions.

Note that when you constrain connection events on a drill-down page, the packets and bytes from identical events are summed. However, if you are using a custom workflow and did not add a Count column to a drill-down page, the events are listed individually and packets and bytes are not summed.

Note that Connection Events table view displays **1 of Many** instead of how many pages of events are available if your system generates more than 25 connection events.

**Procedure**

**Step 1** Choose either of the following:

- Analysis > Connections > Events (for connection events)
- Analysis > Connections > Security Intelligence Events

**Note** If a connection graph appears instead of a table, click (switch workflow) by the workflow title, and choose the predefined Connection Events workflow, or a custom workflow. Note that all predefined connection event workflows—including connection graphs—terminate in a table view of connections.

**Step 2** You have the following choices:

- Time Range — To adjust the time range, which is useful if no events appear, see Changing the Time Window, on page 1997.
• Field Names — To learn more about the contents of the columns in the table, see Connection and Security Intelligence Event Fields, on page 2053.

Tip In the table view of events, several fields are hidden by default, including the Category and Tag fields for each type of application, NetFlow-related fields, SSL-related fields, and others. To show a hidden field in an event view, expand the search constraints, then click the field name under Disabled Columns.

• Host Profile — To view the host profile for an IP address, click the host profile icon ( ) or, for hosts with active indications of compromise (IOC) tags, the compromised host icon ( ) that appears next to the IP address.

• User Profile — To view user identity information, click the user icon that appears next to the user identity ( ).

• Files and Malware — To view the files, including malware, detected or blocked in a connection, click the view files icon ( ) and proceed as described in Viewing Files and Malware Detected in a Connection, on page 2073.

• Intrusion Events — To view the intrusion events associated with a connection, as well as their priority and impact, click the intrusion events icon ( ) in the Intrusion Events column and proceed as described in Viewing Intrusion Events Associated with a Connection, on page 2074.

Tip To quickly view intrusion, file, or malware events associated with one or more connections, check the connections using the check boxes in the table, then choose the appropriate option from the Jump to drop-down list. Note that because they are blocked before access control rule evaluation, there can be no files or intrusions associated with connections blacklisted by Security Intelligence. You can only see this information for a Security Intelligence event if you configured Security Intelligence to monitor, rather than blacklist, connections.

• Certificate — To view details about an available certificate used to encrypt a connection, click an enabled lock icon ( ) in the SSL Status column.

• Constrain — To constrain the columns that appear, click the close icon ( ) in the column heading that you want to hide. In the pop-up window that appears, click Apply.

Tip To hide or show other columns, check or clear the appropriate check boxes before you click Apply. To add a disabled column back to the view, expand the search constraints, then click the column name under Disabled Columns.

• Delete Events — To delete some or all items in the current constrained view, check the check boxes next to items you want to delete and click Delete or click Delete All.

• Drill Down — See Using Drill-Down Pages, on page 1985.

Tip To drill down using one of several Monitor rules that matched a logged connection, click an N Monitor Rules value. In the pop-up window that appears, click the Monitor rule you want to use to constrain connection events.

• Navigate This Page — See Workflow Page Traversal Tools, on page 1982.
• Navigate Between Pages — To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page.

• Navigate Between Event Views — To navigate to other event views to view associated events, click **Jump to** and choose the event view from the drop-down list.

• Sort — To sort data in a workflow, click the column title. Click the column title again to reverse the sort order.

### Viewing Files and Malware Detected in a Connection

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat or Malware</td>
<td>Protection or</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security</td>
</tr>
<tr>
<td></td>
<td>Malware</td>
<td></td>
<td></td>
<td>Analyst</td>
</tr>
</tbody>
</table>

If you associate a file policy with one or more access control rules, the system can detect files (including malware) in matching traffic. Use the Analysis > Connections menu options to see the file events, if any, associated with the connections logged by those rules. Instead of a list of files, the Firepower Management Center displays the view files icon ( ), in the Files column. The number on the icon indicates the number of files (including malware files) detected or blocked in that connection.

Not all file and malware events are associated with connections. Specifically:

- Endpoint-based malware events are not associated with connections. Those events are imported from your AMP for Endpoints deployment.

- Many IMAP-capable email clients use a single IMAP session, which ends only when the user exits the application. Although long-running connections are logged by the system, files downloaded in the session are not associated with the connection until the session ends.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1**
Go to **Analysis > Connections** and choose the relevant option.

**Step 2**
While using a connection event table, click the view files icon ( ).
A pop-up window appears with a list of the files detected in the connection as well as their types, and if applicable, their malware dispositions.

**Step 3**
You have the following choices:

- View — To view a table view of file events, click a file's view icon ( ).
Viewing Intrusion Events Associated with a Connection

- View — To view details in a table view of malware events, click a malware file’s view icon ( ).
- Track — To track the file’s transmission through your network, click a file’s trajectory icon ( ).
- View — To view details on all of the connection’s detected file or network-based malware events, click View File Events or View Malware Events.

<table>

</tbody>
</table>

If you associate an intrusion policy with an access control rule or default action, the system can detect exploits in matching traffic. Use the Analysis > Connections menu options to see the intrusion events, if any, associated with logged connections, as well as their priority and impact.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1**
Go to Analysis > Connections and choose the relevant option.

**Step 2**
While using a connection event table, click the intrusion events icon ( ) in the Intrusion Events column.

**Step 3**
In the pop-up window that appears, you have the following options:

- Click a listed event’s view icon ( ) to view details in the packet view.
- Click View Intrusion Events to view details on all of the connection’s associated intrusion events.

**Encrypted Connection Certificate Details**

You can use options under the Analysis > Connections menu to display the public key certificate (if available) used to encrypt a connection handled by the system. The certificate contains the following information.

**Table 289: Encrypted Connection Certificate Details**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject/Issuer Common Name</td>
<td>The host and domain name of the certificate subject or certificate issuer.</td>

</tr>
<tr>
<td>Public Key Fingerprint</td>
<td>The SHA hash value used to authenticate the public key contained within the certificate.</td>
</tr>
</tbody>
</table>

**Viewing the Connection Summary Page**

The Connection Summary page is visible only to users who have custom roles that are restricted by searches on connection events and who have been granted explicit menu-based access to the Connection Summary page. This page provides graphs of the activity on your monitored network organized by different criteria. For example, the Connections over Time graph displays the total number of connections on your monitored network over the interval that you choose.

You can perform almost all the same actions on connection summary graphs that you can perform on connection graphs. However, because the graphs on the Connection Summary page are based on aggregated data, you cannot examine the individual connection events on which the graphs are based. In other words, you cannot drill down to a connection data table view from a connection summary graph.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose Overview > Summary > Connection Summary.

**Step 2** From the Select Device list, choose the device whose summary you want to view, or choose All to view a summary of all devices.

**Step 3** To manipulate and analyze the connection graphs, proceed as described in Using Connection Event Graphs, on page 1988.

**Tip** To detach a connection graph so you can perform further analysis without affecting the default time range, click View.

CHAPTER 107

Working with Intrusion Events

The following topics describe how to work with intrusion events.

• About Intrusion Events, on page 2077
• Viewing Intrusion Events, on page 2078
• Intrusion Event Workflow Pages, on page 2094
• The Intrusion Events Clipboard, on page 2113
• Viewing Intrusion Event Statistics, on page 2114
• Viewing Intrusion Event Performance Graphs, on page 2116
• Viewing Intrusion Event Graphs, on page 2121

About Intrusion Events

The Firepower System can help you monitor your network for traffic that could affect the availability, integrity, and confidentiality of a host and its data. By placing managed devices on key network segments, you can examine the packets that traverse your network for malicious activity. The system has several mechanisms it uses to look for the broad range of exploits that attackers have developed.

When the system identifies a possible intrusion, it generates an intrusion event, which is a record of the date, time, the type of exploit, and contextual information about the source of the attack and its target. For packet-based events, a copy of the packet or packets that triggered the event is also recorded. Managed devices transmit their events to the Firepower Management Center where you can view the aggregated data and gain a greater understanding of the attacks against your network assets.

You can also deploy a managed device as an inline, switched, or routed intrusion system, which allows you to configure the device to drop or replace packets that you know to be harmful.

The Firepower System also provides you with the tools you need to review intrusion events and evaluate whether they are important in the context of your network environment and your security policies. These tools include:

• an event summary page that gives you an overview of the current activity on your managed devices
• text-based and graphical reports that you can generate for any time period you choose; you can also design your own reports and configure them to run at scheduled intervals
• an incident-handling tool that you can use to gather event data related to an attack; you can also add notes to help you track your investigation and response
• automated alerting that you can configure for SNMP, email, and syslog
You view an intrusion event to determine whether there is a threat to your network security.

The initial intrusion events view differs depending on the workflow you use to access the page. You can use one of the predefined workflows, which includes one or more drill-down pages, a table view of intrusion events, and a terminating packet view, or you can create your own workflow. You can also view workflows based on custom tables, which may include intrusion events.

An event view may be slow to display if it contains a large number of IP addresses and you have enabled the Resolve IP Addresses event view setting.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose **Analysis > Intrusions > Events**.

**Step 2** You have the following choices:

- Adjust time range — Adjust the time range for the event view as described in **Changing the Time Window**, on page 1997.
- Change workflows — If you are using a custom workflow that does not include the table view of intrusion events, choose any of the system-provided workflows by clicking *(switch workflow)* next to the workflow title.
- Constrain — To narrow your view to the intrusion events that are important to your analysis, see **Using Intrusion Event Workflows**, on page 2095.
- Delete event — To delete an event from the database, click **Delete** to delete the event whose packet you are viewing or click **Delete All** to delete all the events whose packets you previously selected.
- Mark reviewed — To mark intrusion events reviewed, see **Marking Intrusion Events Reviewed**, on page 2090.
- View connection data — To view connection data associated with intrusion events, see **Viewing Connection Data Associated with Intrusion Events**, on page 2089.
- View contents — To view the contents of the columns in the table as described in **Intrusion Event Fields**, on page 2079.

**Related Topics**

- **Using the Intrusion Event Packet View**, on page 2098
Intrusion Event Fields

When the system identifies a possible intrusion, it generates an *intrusion event*, which is a record of the date, time, the type of exploit, and contextual information about the source of the attack and its target. For packet-based events, a copy of the packet or packets that triggered the event is also recorded.

When searching intrusion events, keep in mind that the information available for any individual event can vary depending on how, why, and when the system logged the event. For example, only intrusion events triggered on decrypted traffic contain SSL information.

Some fields in the table view of intrusion events are disabled by default. To enable a field for the duration of your session, expand the search constraints, then click the column name under *Disabled Columns*.

**Access Control Policy**

The access control policy associated with the intrusion policy where the intrusion, preprocessor, or decoder rule that generated the event is enabled.

**Access Control Rule**

The access control rule that invoked the intrusion policy that generated the event. *Default Action* indicates that the intrusion policy where the rule is enabled is not associated with a specific access control rule but, instead, is configured as the default action of the access control policy.

This field is blank if intrusion inspection was associated with neither an access control rule nor the default action, for example, if the packet was examined by the default intrusion policy.

**Application Protocol**

The application protocol, if available, which represents communications between hosts detected in the traffic that triggered the intrusion event.

**Application Protocol Category and Tag**

Criteria that characterize the application to help you understand the application's function.

**Application Risk**

The risk associated with detected applications in the traffic that triggered the intrusion event: Very High, High, Medium, Low, and Very Low. Each type of application detected in a connection has an associated risk; this field displays the highest risk of those.

**Business Relevance**

The business relevance associated with detected applications in the traffic that triggered the intrusion event: Very High, High, Medium, Low, and Very Low. Each type of application detected in a connection has an associated business relevance; this field displays the lowest (least relevant) of those.

**Classification**

The classification where the rule that generated the event belongs.
When searching this field, enter the classification number, or all or part of the classification name or description for the rule that generated the events you want to view. You can also enter a comma-separated list of numbers, names, or descriptions. Finally, if you add a custom classification, you can also search using all or part of its name or description.

**Client**
The client application, if available, which represents software running on the monitored host detected in the traffic that triggered the intrusion event.

**Client Category and Tag**
Criteria that characterize the application to help you understand the application's function.

**Count**
The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable.

**Destination Continent**
The continent of the receiving host involved in the intrusion event.

**Destination Country**
The country of the receiving host involved in the intrusion event.

**Destination IP**
The IP address used by the receiving host involved in the intrusion event.

**Destination Port / ICMP Code**
The port number for the host receiving the traffic. For ICMP traffic, where there is no port number, this field displays the ICMP code.

**Destination User**
The User ID for any known user logged in to the destination host.

**Device**
The managed device where the access control policy was deployed.

Note that the primary and secondary devices in a stacked configuration report intrusion events as if they were separate devices.

**Domain**
The domain of the device that detected the intrusion. This field is only present if you have ever configured the Firepower Management Center for multitenancy.
Egress Interface
The egress interface of the packet that triggered the event. This interface column is not populated for a passive interface.

Egress Security Zone
The egress security zone of the packet that triggered the event. This security zone field is not populated in a passive deployment.

Email Attachments
The MIME attachment file name that was extracted from the MIME Content-Disposition header. To display attachment file names, you must enable the SMTP preprocessor `Log MIME Attachment Names` option. Multiple attachment file names are supported.

Email Headers (search only)
The data that was extracted from the email header.
To associate email headers with intrusion events for SMTP traffic, you must enable the SMTP preprocessor `Log Headers` option.

Email Recipient
The address of the email recipient that was extracted from the SMTP RCPT TO command. To display a value for this field, you must enable the SMTP preprocessor `Log To Addresses` option. Multiple recipient addresses are supported.

Email Sender
The address of the email sender that was extracted from the SMTP MAIL FROM command. To display a value for this field, you must enable the SMTP preprocessor `Log From Address` option. Multiple sender addresses are supported.

Generator
The component that generated the event.

HTTP Hostname
The host name, if present, that was extracted from the HTTP request Host header. Note that request packets do not always include the host name.
To associate host names with intrusion events for HTTP client traffic, you must enable the HTTP Inspect preprocessor `Log Hostname` option.
In table views, this column displays the first fifty characters of the extracted host name. You can hover your pointer over the displayed portion of an abbreviated host name to display the complete name, up to 256 bytes. You can also display the complete host name, up to 256 bytes, in the packet view.

HTTP Response Code
The HTTP status code sent in response to a client’s HTTP request over the connection that triggered the event.
**HTTP URI**

The raw URI, if present, associated with the HTTP request packet that triggered the intrusion event. Note that request packets do not always include a URI.

To associate URIs with intrusion events for HTTP traffic, you must enable the HTTP Inspect preprocessor Log URI option.

To see the associated HTTP URI in intrusion events triggered by HTTP responses, you should configure HTTP server ports in the **Perform Stream Reassembly on Both Ports** option; note, however, that this increases resource demands for traffic reassembly.

This column displays the first fifty characters of the extracted URI. You can hover your pointer over the displayed portion of an abbreviated URI to display the complete URI, up to 2048 bytes. You can also display the complete URI, up to 2048 bytes, in the packet view.

**Impact**

The impact level in this field indicates the correlation between intrusion data, network discovery data, and vulnerability information.

When searching this field, do not specify impact icon colors or partial strings. For example, do not use **blue**, **level 1**, or **0**. Valid case-insensitive values are:

- Impact 0, Impact Level 0
- Impact 1, Impact Level 1
- Impact 2, Impact Level 2
- Impact 3, Impact Level 3
- Impact 4, Impact Level 4

Because no operating system information is available for hosts added to the network map from NetFlow data, the system cannot assign Vulnerable (impact level 1: red) impact levels for intrusion events involving those hosts. In such cases, use the host input feature to manually set the operating system identity for the hosts.

**Ingress Interface**

The ingress interface of the packet that triggered the event. Only this interface column is populated for a passive interface.

**Ingress Security Zone**

The ingress security zone or tunnel zone of the packet that triggered the event. Only this security zone field is populated in a passive deployment.

**Inline Result**

In workflow and table views, this field displays one of the following:

- a black down arrow, indicating that the system dropped the packet that triggered the rule
- a gray down arrow, indicating that IPS would have dropped the packet if you enabled the **Drop when Inline** intrusion policy option (in an inline deployment), or if a Drop and Generate rule generated the event while the system was pruning
• blank, indicating that the triggered rule was not set to Drop and Generate Events

The system does not drop packets in a passive deployment, including when an inline interface is in tap mode, regardless of the rule state or the inline drop behavior of the intrusion policy.

When searching this field, enter either of the following:

• **dropped** to specify whether the packet is dropped in an inline deployment

• **would have dropped** to specify whether the packet would have dropped if the intrusion policy had been set to drop packets in an inline deployment

**Intrusion Policy**

The intrusion policy where the intrusion, preprocessor, or decoder rule that generated the event was enabled. You can choose an intrusion policy as the default action for an access control policy, or you can associate an intrusion policy with an access control rule.

**IOC**

Whether the traffic that triggered the intrusion event also triggered an indication of compromise (IOC) for a host involved in the connection. When searching this field, specify **triggered** or **n/a**.

**Message**

The explanatory text for the event. For rule-based intrusion events, the event message is pulled from the rule. For decoder- and preprocessor-based events, the event message is hard coded.

**MPLS Label**

The Multiprotocol Label Switching label associated with the packet that triggered the intrusion event.

**Network Analysis Policy**

The network analysis policy, if any, associated with the generation of the event.

This column displays the first fifty characters of the extracted URI. You can hover your pointer over the displayed portion of an abbreviated URI to display the complete URI, up to 2048 bytes. You can also display the complete URI, up to 2048 bytes, in the packet view.

**Original Client IP**

The original client IP address that was extracted from an X-Forwarded-For (XFF), True-Client-IP, or custom-defined HTTP header.

To display a value for this field, you must enable the HTTP preprocessor **Extract Original Client IP Address** option in the network analysis policy. Optionally, in the same area of the network analysis policy, you can also specify up to six custom client IP headers, as well as set the priority order in which the system selects the value for the Original Client IP event field.

**Priority**

The event priority as determined by the Cisco Talos Security Intelligence and Research Group (Talos). The priority corresponds to either the value of the **priority** keyword or the value for the **classtype** keyword.
For other intrusion events, the priority is determined by the decoder or preprocessor. Valid values are high, medium, and low.

**Protocol (search only)**

The name or number of the transport protocol used in the connection as listed in [http://www.iana.org/assignments/protocol-numbers](http://www.iana.org/assignments/protocol-numbers). This is the protocol associated with the source and destination port/ICMP column.

**Reviewed By**

The name of the user who reviewed the event. When searching this field, you can enter `unreviewed` to search for events that have not been reviewed.

**Security Context**

The metadata identifying the virtual firewall group through which the traffic passed. The system only populates this field for ASA FirePOWER in multiple context mode.

**Snort ID (search only)**

Specify the Snort ID (SID) of the rule that generated the event or, optionally, specify the combination Generator ID (GID) and SID of the rule, where the GID and SID are separated with a colon (:) in the format GID:SID. You can specify any of the values in the following table:

<table>
<thead>
<tr>
<th>Value</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>a single SID</td>
<td>10000</td>
</tr>
<tr>
<td>a SID range</td>
<td>10000-11000</td>
</tr>
<tr>
<td>greater than a SID</td>
<td>&gt;10000</td>
</tr>
<tr>
<td>greater than or equal to a SID</td>
<td>&gt;=10000</td>
</tr>
<tr>
<td>less than a SID</td>
<td>&lt;10000</td>
</tr>
<tr>
<td>less than or equal to a SID</td>
<td>&lt;=10000</td>
</tr>
<tr>
<td>a comma-separated list of SIDs</td>
<td>10000,11000,12000</td>
</tr>
<tr>
<td>a single GID:SID combination</td>
<td>1:10000</td>
</tr>
<tr>
<td>a comma-separated list of GID:SID combinations</td>
<td>1:10000,1:11000,1:12000</td>
</tr>
<tr>
<td>a comma-separated list of SIDs and GID:SID combinations</td>
<td>10000,1:11000,12000</td>
</tr>
</tbody>
</table>

The SID of the events you are viewing is listed in the Message column.

**Source Continent**

The continent of the sending host involved in the intrusion event.
**Source Country**
The country of the sending host involved in the intrusion event.

**Source IP**
The IP address used by the sending host involved in the intrusion event.

**Source Port / ICMP Type**
The port number on the sending host. For ICMP traffic, where there is no port number, this field displays the ICMP type.

**Source User**
The UserID for any known user logged into the source host.

**SSL Actual Action (search only)**
The action the system applied to encrypted traffic:

- **Block/Block with reset**
  Represents blocked encrypted connections.

- **Decrypt (Resign)**
  Represents an outgoing connection decrypted using a re-signed server certificate.

- **Decrypt (Replace Key)**
  Represents an outgoing connection decrypted using a self-signed server certificate with a substituted public key.

- **Decrypt (Known Key)**
  Represents an incoming connection decrypted using a known private key.

**Default Action**
Indicates the connection was handled by the default action.

**Do not Decrypt**
Represents a connection the system did not decrypt.

Field values are displayed in the **SSL Status** field on the search workflow pages.

**SSL Certificate Information (search only)**
The information stored on the public key certificate used to encrypt traffic, including:

- Subject/Issuer Common Name
- Subject/Issuer Organization
- Subject/Issuer Organization Unit
- Not Valid Before/After
- Serial Number
• Certificate Fingerprint
• Public Key Fingerprint

**SSL Failure Reason (search only)**

The reason the system failed to decrypt encrypted traffic:

• Unknown
• No Match
• Success
• Uncached Session
• Unknown Cipher Suite
• Unsupported Cipher Suite
• Unsupported SSL Version
• SSL Compression Used
• Session Undecryptable in Passive Mode
• Handshake Error
• Decryption Error
• Pending Server Name Category Lookup
• Pending Common Name Category Lookup
• Internal Error
• Network Parameters Unavailable
• Invalid Server Certificate Handle
• Server Certificate Fingerprint Unavailable
• Cannot Cache Subject DN
• Cannot Cache Issuer DN
• Unknown SSL Version
• External Certificate List Unavailable
• External Certificate Fingerprint Unavailable
• Internal Certificate List Invalid
• Internal Certificate List Unavailable
• Internal Certificate Unavailable
• Internal Certificate Fingerprint Unavailable
• Server Certificate Validation Unavailable
• Server Certificate Validation Failure
• Invalid Action

Field values are displayed in the **SSL Status** field on the search workflow pages.

**SSL Status**

The action associated with the **SSL Actual Action** (SSL rule, default action, or undecryptable traffic action) that logged the encrypted connection.

If the system fails to decrypt an encrypted connection, it displays the **SSL Actual Action** (undecryptable traffic action) taken, as well as the **SSL Failure Reason**. For example, if the system detects traffic encrypted with an unknown cipher suite and allows it without further inspection, this field displays **Do Not Decrypt (Unknown Cipher Suite)**.

Click the lock icon (🔒) to view certificate details.

When searching this field, enter one or more of the **SSL Actual Action** and **SSL Failure Reason** values to view encrypted traffic the system handled or failed to decrypt.

**SSL Subject/Issuer Country (search only)**

A two-character ISO 3166-1 alpha-2 country code for the subject or issuer country associated with the encryption certificate.

**Time**

The date and time of the event. This field is not searchable.

**VLAN ID**

The innermost VLAN ID associated with the packet that triggered the intrusion event.

**Web Application**

The web application, which represents the content or requested URL for HTTP traffic detected in the traffic that triggered the intrusion event.

If the system detects an application protocol of HTTP but cannot detect a specific web application, the system supplies a generic web browsing designation here.

**Web Application Category and Tag**

Criteria that characterize the application to help you understand the application's function.

**Intrusion Event Impact Levels**

To help you evaluate the impact an event has on your network, the Firepower Management Center displays an impact level in the table view of intrusion events. For each event, the system adds an impact level icon whose color indicates the correlation between intrusion data, network discovery data, and vulnerability information.
Because no operating system information is available for hosts added to the network map from NetFlow data, the system cannot assign Vulnerable (impact level 1: red) impact levels for intrusion events involving those hosts. In such cases, use the host input feature to manually set the operating system identity for the hosts.

The following table describes the possible values for the impact levels.

<table>
<thead>
<tr>
<th>Impact Level</th>
<th>Vulnerability</th>
<th>Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Unknown</td>
<td>gray</td>
<td>Neither the source nor the destination host is on a network that is monitored by network discovery.</td>
</tr>
<tr>
<td>1</td>
<td>Vulnerable</td>
<td>red</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• the source or the destination host is in the network map, and a vulnerability is mapped to the host</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• the source or destination host is potentially compromised by a virus, trojan, or other piece of malicious software</td>
</tr>
<tr>
<td>2</td>
<td>Potentially Vulnerable</td>
<td>orange</td>
<td>Either the source or the destination host is in the network map and one of the following is true:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• for port-oriented traffic, the port is running a server application protocol</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• for non-port-oriented traffic, the host uses the protocol</td>
</tr>
<tr>
<td>Impact Level</td>
<td>Vulnerability</td>
<td>Color</td>
<td>Description</td>
</tr>
<tr>

<tr>
<td>3</td>
<td>Currently Not Vulnerable</td>
<td>yellow</td>
<td>Either the source or the destination host is in the network map and one of the following is true:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• for port-oriented traffic (for example, TCP or UDP), the port is not open</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• for non-port-oriented traffic (for example, ICMP), the host does not use the protocol</td>
</tr>
<tr>
<td>4</td>
<td>Unknown Target</td>
<td>blue</td>
<td>Either the source or destination host is on a monitored network, but there is no entry for the host in the network map.</td>
</tr>
</tbody>
</table>

### Viewing Connection Data Associated with Intrusion Events

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

The system can log the connections where intrusion events are detected. Although this logging is automatic for intrusion policies associated with access control rules, you must manually enable connection logging to see associated connection data for the default action.

Viewing associated data is most useful when navigating between table views of events.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose Analysis > Intrusions > Events.

**Step 2** Choose the intrusion events using the check boxes in the table, then choose Connections from the Jump to drop-down list.

**Tip** You can view the intrusion events associated with particular connections in a similar way. For more information, see Inter-Workflow Navigation, on page 2003.

</tr>
</tbody>
</table>

If you are confident that an intrusion event is not malicious, you can mark the event reviewed.

If you have examined an intrusion event and are confident that the event does not represent a threat to your network security (for example, because you know that none of the hosts on your network are vulnerable to the detected exploit), you can mark the event reviewed. Reviewed events are stored in the event database and are included in the event summary statistics, but no longer appear in the default intrusion event pages. Your name appears as the reviewer.

In a multidomain deployment, if you mark an event reviewed, the system marks it reviewed in all domains that can view that event.

If you perform a backup and then delete reviewed intrusion events, restoring your backup restores the deleted intrusion events but does not restore their reviewed status. You view those restored intrusion events under Intrusion Events, not under Reviewed Events.

Procedure

On a page that displays intrusion events, you have two options:

- To mark one or more intrusion events from the list of events, check the check boxes next to the events and click **Review**.

- To mark all intrusion events from the list of events, click **Review All**.

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, if you mark an event reviewed, the system marks it reviewed in all domains that can view that event.
Procedure

Step 1
Choose Analysis > Intrusions > Reviewed Events.

Step 2
You have the following choices:

- Adjust the time range as described in Changing the Time Window, on page 1997.
- If you are using a custom workflow that does not include the table view of intrusion events, choose any of the system-provided workflows by clicking (switch workflow) next to the workflow title.
- To learn more about the events that appear, see Intrusion Event Fields, on page 2079.

</tr>
</tbody>
</table>

You can return a reviewed event to the default intrusion events view by marking the event unreviewed.

In a multidomain deployment, if you mark an event reviewed, the system marks it reviewed in all domains that can view that event.

Procedure

On a page that displays reviewed events, you have two choices:

- To remove individual intrusion events from the list of reviewed events, check the check boxes next to specific events and click Unreview.
- To remove all intrusion events from the list of reviewed events, click Unreview All.

Preprocessor Events

Preprocessors provide two functions: performing the specified action on the packet (for example, decoding and normalizing HTTP traffic) and reporting the execution of specified preprocessor options by generating an event whenever a packet triggers that preprocessor option and the associated preprocessor rule is enabled. For example, you can enable the Double Encoding HTTP Inspect option and the associated preprocessor rule with the HTTP Inspect Generator (GID) 119 and the Snort ID (SID) 2 to generate an event when the preprocessor encounters IIS double-encoded traffic.

Generating events to report the execution of preprocessors helps you detect anomalous protocol exploits. For example, attackers can craft overlapping IP fragments to cause a DoS attack on a host. The IP defragmentation preprocessor can detect this type of attack and generate an intrusion event for it.
Preprocessor events differ from rule events in that the packet display does not include a detailed rule description for the event. Instead, the packet display shows the event message, the GID, SID, the packet header data, and the packet payload. This allows you to analyze the packet’s header information, determine if its header options are being used and if they can exploit your system, and inspect the packet payload. After the preprocessors analyze each packet, the rules engine executes appropriate rules against it (if the preprocessor was able to defragment it and establish it as part of a valid session) to further analyze potential content-level threats and report on them.

**Preprocessor Generator IDs**

Each preprocessor has its own Generator ID number, or GID, that indicates which preprocessor was triggered by the packet. Some of the preprocessors also have related SIDs, which are ID numbers that classify potential attacks. This helps you analyze events more effectively by categorizing the type of event much the way a rule’s Snort ID (SID) can offer context for packets triggering rules. You can list preprocessor rules by preprocessor in the Preprocessors filter group on the intrusion policy Rules page; you can also list preprocessor rules in the preprocessor and packet decoder sub-groupings in the Category filter group.

---

**Note**

Events generated by standard text rules have a generator ID of 1. For shared object rules, the events have a generator ID of 3. For both, the event’s SID indicates which specific rule triggered.

The following table describes the types of events that generate each GID.

<table>
<thead>
<tr>
<th>ID</th>

</table>
Intrusion Event Workflow Pages

The preprocessor, decoder, and intrusion rules that are enabled in the current intrusion policy generate intrusion events whenever the traffic that you monitor violates the policy.

The Firepower System provides a set of predefined workflows, populated with event data, that you can use to view and analyze intrusion events. Each of these workflows steps you through a series of pages to help you pinpoint the intrusion events that you want to evaluate.

The predefined intrusion event workflows contain three different types of pages, or event views:

- one or more drill-down pages
- the table view of intrusion events
- a packet view

*Drill-down pages* generally include two or more columns in a table (and, for some drill-down views, more than one table) that allow you to view one specific type of information.

When you “drill down” to find more information for one or more destination ports, you automatically select those events and the next page in the workflow appears. In this way, drill-down tables help you reduce the number of events you are analyzing at one time.

The initial *table view* of intrusion events lists each intrusion event in its own row. The columns in the table list information such as the time, the source IP address and port, the destination IP address and port, the event priority, the event message, and more.

When you select events on a table view, instead of selecting events and displaying the next page in the workflow, you add to what are called *constraints*. Constraints are limits that you impose on the types of events that you want to analyze.

For example, if you click the close column icon (×) in any column and clear *Time* from the drop-down list, you can remove Time as one of the columns. To narrow the list of events in your analysis, you can click the link for a value in one of the rows in the table view. For example, to limit your analysis to the events generated

<table>
<thead>
<tr>
<th>ID</th>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>141</td>
<td>IMAP Preprocessor</td>
<td>The event was generated by the IMAP preprocessor.</td>
</tr>
<tr>
<td>142</td>
<td>POP Preprocessor</td>
<td>The event was generated by the POP preprocessor.</td>
</tr>
<tr>
<td>143</td>
<td>GTP Preprocessor</td>
<td>The event was generated by the GTP preprocessor.</td>
</tr>
<tr>
<td>144</td>
<td>Modbus Preprocessor</td>
<td>The event was generated by the Modbus SCADA preprocessor.</td>
</tr>
<tr>
<td>145</td>
<td>DNP3 Preprocessor</td>
<td>The event was generated by the DNP3 SCADA preprocessor.</td>
</tr>
</tbody>
</table>
from one of the source IP addresses (presumably, a potential attacker), click the IP address in the **Source IP Address** column.

If you select one or more rows in a table view and then click **View**, the packet view appears. A **packet view** provides information about the packet that triggered the rule or the preprocessor that generated the event. Each section of the packet view contains information about a specific layer in the packet. You can expand collapsed sections to see more information.

**Note**

Because each portscan event is triggered by multiple packets, portscan events use a special version of the packet view.

If the predefined workflows do not meet your specific needs, you can create custom workflows that display only the information you are interested in. Custom intrusion event workflows can include drill-down pages, a table view of events, or both; the system automatically includes a packet view as the last page. You can easily switch between the predefined workflows and your own custom workflows depending on how you want to investigate events.

### Using Intrusion Event Workflows

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

The drill-down views and table view of events share some common features that you can use to narrow a list of events and then concentrate your analysis on a group of related events.

To avoid displaying the same intrusion events on different workflow pages, the time range pauses when you click a link at the bottom of the page to display another page of events, and resumes when you click to take any other action on the subsequent page.

**Tip**

At any point in the process, you can save the constraints as a set of search criteria. For example, if you find that over the course of a few days your network is being probed by an attacker from a single IP address, you can save your constraints during your investigation and then use them again later. You cannot, however, save compound constraints as a set of search criteria.

**Procedure**

**Step 1** Access an intrusion event workflow using **Analysis > Intrusions > Events**.

**Step 2** Optionally, constrain the number of intrusion events that appear on the event views as described in **Intrusion Event Drill-Down Page Constraints**, on page 2096 or **Intrusion Event Table View Constraints**, on page 2097.

**Step 3** You have the following choices:

- To learn more about the columns that appear, see **Intrusion Event Fields**, on page 2079.

- To view a host’s profile, click the host profile icon (🔗) that appears next to the host IP address.
To view geolocation details, click the flag icon that appears in the Source Country or Destination Country columns.

To modify the time and date range for displayed events, see Changing the Time Window, on page 1997.

**Tip**  If no intrusion events appear on the event views, adjusting the specified time range might return results. If you specified an older time range, events in that time range might have been deleted. Adjusting the rule threshold configuration might generate events.

**Note**  Events generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.

To sort events on the current workflow page or navigate within the current workflow page, see Using Workflows, on page 1977.

To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page.

To add events to the clipboard so you can transfer them to an incident at a later time, click Copy or Copy All.

To delete events from the event database, check the check boxes next to events you want to delete, then click Delete, or click Delete All.

To mark events reviewed to remove them from intrusion event pages, but not the event database, see Marking Intrusion Events Reviewed, on page 2090.

To download a local copy of the packet (a packet capture file in libpcap format) that triggered each selected event, check the check boxes next to events triggered by the packets you want to download, then click Download Packets, or click Download All Packets. Captured packets are saved in libpcap format. This format is used by several popular protocol analyzers.

To navigate to other event views to view associated events, see Inter-Workflow Navigation, on page 2003.

To temporarily use a different workflow, click (switch workflow).

To bookmark the current page so that you can quickly return to it, click Bookmark This Page.

To view the Intrusion Events section of the Summary Dashboard, click Dashboards.

To navigate to the bookmark management page, click View Bookmarks.

To generate a report based on the data in the current view, see Creating a Report Template from an Event View, on page 1881.

**Intrusion Event Drill-Down Page Constraints**

The following table describes how to use the drill-down pages.
Table 293: Constraining Events on Drill-Down Pages

<table>
<thead>
<tr>
<th>To...</th>
<th>You can...</th>
</tr>
</thead>
<tbody>
<tr>
<td>drill down to the next workflow page</td>
<td>you can click the value.</td>
</tr>
<tr>
<td>constraining on a specific value</td>
<td>For example, on the Destination Port workflow, to constrain the events to those with a destination of port 80, click 80/tcp in the DST Port/ICMP Code column. The next page of the workflow, Events, appears and contains only port 80/tcp events.</td>
</tr>
<tr>
<td>drill down to the next workflow page</td>
<td>you can select the check boxes next to the events you want to view on the next workflow page, then click View.</td>
</tr>
<tr>
<td>constraining on selected events</td>
<td>For example, on the Destination Port workflow, to constrain the events to those with destination ports 20/tcp and 21/tcp, select the check boxes next to the rows for those ports and click View. The next page of the workflow, Events, appears and contains only port 20/tcp and 21/tcp events.</td>
</tr>
<tr>
<td>drill down to the next workflow page</td>
<td>you can click View All.</td>
</tr>
<tr>
<td>keeping the current constraints</td>
<td>Note that if you constrain on multiple rows and the table has more than one column (not including a Count column), you build what is called a compound constraint. Compound constraints ensure that you do not include more events in your constraint than you mean to. For example, if you use the Event and Destination workflow, each row that you select on the first drill-down page creates a compound constraint. If you pick event 1:100 with a destination IP address of 10.10.10.100 and you also pick event 1:200 with a destination IP address of 192.168.10.100, the compound constraint ensures that you do not also select events with 1:100 as the event type and 192.168.10.100 as the destination IP address or events with 1:200 as the event type and 10.10.10.100 as the destination IP address.</td>
</tr>
</tbody>
</table>

Intrusion Event Table View Constraints

The following table describes how to use the table view.

Table 294: Constraining Events on the Table View of Events

<table>
<thead>
<tr>
<th>To...</th>
<th>You can...</th>
</tr>
</thead>
<tbody>
<tr>
<td>constrain the view to events with a single attribute</td>
<td>you can click the attribute.</td>
</tr>
<tr>
<td></td>
<td>For example, to constrain the view to events with a destination of port 80, click 80/tcp in the DST Port/ICMP Code column.</td>
</tr>
</tbody>
</table>
To... | You can...
---|---
remove a column from the table | click the close icon ( ✗ ) in the column heading that you want to hide. In the pop-up window that appears, click Apply. If you want to hide or show other columns, select or clear the appropriate check boxes before you click Apply. To add a disabled column back to the view, click the expand arrow ( ▲ ) to expand the search constraints, then click the column name under Disabled Columns.

view the packets associated with one or more events | either:
• click the down arrow icon ( ⬇️ ) next to the event whose packets you want to view.
• select one or more events whose packets you want to view, and, at the bottom of the page, click View.
• at the bottom of the page, click View All to view the packets for all events that match the current constraints.

Using the Intrusion Event Packet View

<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

A packet view provides information about the packet that triggered the rule that generated an intrusion event.

**Tip**
The packet view on a Firepower Management Center does not contain packet information when the Transfer Packet option is disabled for the device detecting the event.

The packet view indicates why a specific packet was captured by providing information about the intrusion event that the packet triggered, including the event’s time stamp, message, classification, priority, and, if the event was generated by a standard text rule, the rule that generated the event. The packet view also provides general information about the packet, such as its size.

In addition, the packet view has a section that describes each layer in the packet: data link, network, and transport, as well as a section that describes the bytes that comprise the packet. If the system decrypted the packet, you can view the decrypted bytes. You can expand collapsed sections to display detailed information.

**Note**
Because each portscan event is triggered by multiple packets, portscan events use a special version of the packet view.
In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** On the table view of intrusion events, choose packets to view as described in Intrusion Event Table View Constraints, on page 2097.

**Step 2** Optionally, if you chose more than one event, you can page through the packets in the packet view by using the page numbers at the bottom of the page.

**Step 3** You also have the following options:

- Adjust — To modify the date and time range in the packet views, see Changing the Time Window, on page 1997.
- Clipboard — To add an event to the clipboard so you can transfer it to the incidents at a later time, click Copy to copy the event whose packet you are viewing or click Copy All to copy all the events whose packets you previously selected.
- Configure — To configure the intrusion rule that triggered the event, click the arrow next to Actions and continue as described in Configuring Intrusion Rules within the Packet View, on page 2102.
- Delete — To delete an event from the database, click Delete to delete the event whose packet you are viewing or click Delete All to delete all the events whose packets you previously selected.
- Download — To download a local copy of the packet (a packet capture file in libpcap format) that triggered the event, click Download Packet to save a copy of the captured packet for the event you are viewing or click Download All Packets to save copies of the captured packets for all the events whose packets you previously selected. The captured packet is saved in libpcap format. This format is used by several popular protocol analyzers.

**Note** You cannot download a portscan packet because single portscan events are based on multiple packets; however, the portscan view provides all usable packet information. You must have at least 15% available disk space in order to download.

- Mark reviewed — To mark an event reviewed to remove it from event views, but not the event database, click Review to mark the event whose packet you are viewing or click Review All to mark all the events whose packets you previously selected. For more information, see Marking Intrusion Events Reviewed, on page 2090.
- View additional information — To expand or collapse a page section, click the arrow next to the section. For details, see Event Information Fields, on page 2099, Frame Information Fields, on page 2105, and Data Link Layer Information Fields, on page 2106.
- View network layer information — See Viewing Network Layer Information, on page 2107.
- View packet byte information — See Viewing Packet Byte Information, on page 2112.
- View transport layer information — See Viewing Transport Layer Information, on page 2110

**Related Topics**

- Portscan Detection, on page 1619
- The Intrusion Events Clipboard, on page 2113

**Event Information Fields**

On the packet view, you can view information about the packet in the Event Information section.
Event
The event message. For rule-based events, this corresponds to the rule message. For other events, this is determined by the decoder or preprocessor.

The ID for the event is appended to the message in the format (GID:SID:Rev). GID is the generator ID of the rules engine, the decoder, or the preprocessor that generated the event. SID is the identifier for the rule, decoder message, or preprocessor message. Rev is the revision number of the rule.

Timestamp
The time that the packet was captured.

Classification
The event classification. For rule-based events, this corresponds to the rule classification. For other events, this is determined by the decoder or preprocessor.

Priority
The event priority. For rule-based events, this corresponds to either the value of the priority keyword or the value for the class-type keyword. For other events, this is determined by the decoder or preprocessor.

Ingress Security Zone
The ingress security zone of the packet that triggered the event. Only this security zone field is populated in a passive deployment.

Egress Security Zone
The egress security zone of the packet that triggered the event. This field is not populated in a passive deployment.

Domain
The domain where the managed device belongs. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Device
The managed device where the access control policy was deployed.

Note that the primary and secondary devices in a stacked configuration report intrusion events as if they were separate devices.

Security Context
The metadata identifying the virtual firewall group through which the traffic passed. Note that the system only populates this field for ASA FirePOWER in multiple context mode.

Ingress Interface
The ingress interface of the packet that triggered the event. Only this interface column is populated for a passive interface.
**Egress Interface**

For an inline set, the egress interface of the packet that triggered the event.

**Source/Destination IP**

The host IP address or domain name where the packet that triggered the event (source) originated, or the target (destination) host of the traffic that triggered the event.

**Source Port/ICMP Type**

Source port of the packet that triggered the event. For ICMP traffic, where there is no port number, the system displays the ICMP type.

**Destination Port/ICMP Code**

The port number for the host receiving the traffic. For ICMP traffic, where there is no port number, the system displays the ICMP code.

**Email Headers**

The data that was extracted from the email header. Note that email headers do not appear in the table view of intrusion events, but you can use email header data as a search criterion.

To associate email headers with intrusion events for SMTP traffic, you must enable the SMTP preprocessor Log Headers option. For rule-based events, this row appears when email data is extracted.

**HTTP Hostname**

The hostname, if present, extracted from the HTTP request Host header. This row displays the complete host name, up to 256 bytes. You can expand the complete host name if it is longer than a single row.

To display host names, you must enable the HTTP Inspect preprocessor Log Hostname option.

Note that HTTP request packets do not always include a host name. For rule-based events, this row appears when the packet contains the HTTP host name or the HTTP URI.

**HTTP URI**

The raw URI, if present, associated with the HTTP request packet that triggered the intrusion event. This row displays the complete URI, up to 2048 bytes. You can expand the complete URI if it is longer than a single row.

To display the URI, you must enable the HTTP Inspect preprocessor Log URI option.

Note that HTTP request packets do not always include a URI. For rule-based events, this row appears when the packet contains the HTTP host name or the HTTP URI.

To see the associated HTTP URI in intrusion events triggered by HTTP responses, you should configure HTTP server ports in the Perform Stream Reassembly on Both Ports option; note, however, that this increases resource demands for traffic reassembly.

**Intrusion Policy**

The intrusion policy, if present, where the intrusion, preprocessor, or decoder rule that generated the intrusion event was enabled. You can choose an intrusion policy as the default action for an access control policy or associate an intrusion policy with an access control rule.
Access Control Policy

The access control policy that includes the intrusion policy where the intrusion, preprocessor, or decoder rule that generated the event is enabled.

Access Control Rule

The access control rule associated with an intrusion rule that generated the event. Default Action indicates that the intrusion policy where the rule is enabled is not associated with an access control rule but, instead, is configured as the default action of the access control policy.

Rule

For standard text rule events, the rule that generated the event.

Note that if the event is based on a shared object rule, a decoder, or a preprocessor, the rule is not available.

Because rule data may contain sensitive information about your network, administrators may toggle users’ ability to view rule information in the packet view with the View Local Rules permission in the user role editor.

Actions

For standard text rule events, expand Actions to take any of the following actions on the rule that triggered the event:

• edit the rule
• view documentation for the revision of the rule
• add a comment to the rule
• change the state of the rule
• set a threshold for the rule
• suppress the rule

Note that if the event is based on a shared object rule, a decoder, or a preprocessor, the rule is not available.

Configuring Intrusion Rules within the Packet View

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
<tr>
<td>Admin</td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Within the packet view of an intrusion event, you can take several actions on the rule that triggered the event. Note that if the event is based on a shared object rule, a decoder, or a preprocessor, the rule is not available.

Procedure

Step 1
Within the packet view of an intrusion event that was generated by an intrusion rule, expand Actions in the Event Information section.

Step 2
You have the following choices:
• Comment — For standard text rule events, click **Rule Comment** to add a text comment to the rule that generated the event. This allows you to provide additional context and information about the rule and the exploit or policy violation it identifies. You can also add and view rule comments in the intrusion rules editor.

• Disable — Click **Disable this rule...** to disable the rule.

If this event is generated by a standard text rule, you can disable the rule, if necessary. You can set the rule in all policies that you can edit locally. Alternately, you can set the rule only in the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by the system.

**Note**  You cannot disable shared object rules from the packet view, nor can you disable rules in the default policies.

• Drop packets — Click **Set this rule to drop the triggering packet...** to set the rule to drop packets that trigger it.

If your managed device is deployed inline on your network, you can set the rule that triggered the event to drop packets that trigger the rule in all policies that you can edit locally. Alternately, you can set the rule only in the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by the system. Note also that this option appears only when **Drop when Inline** is enabled in the current policy.

• Edit — For standard text rule events, click **Edit** to modify the rule that generated the event. If the event is based on a shared object rule, a decoder, or a preprocessor, the rule is not available.

**Note**  If you edit a system-provided rule (as opposed to a custom standard text rule), you actually create a new local rule. Make sure you set the local rule to generate events and also disable the original rule in the current intrusion policy. Note, however, that you cannot enable local rules in the default policies.

• Generate events — Click **Set this rule to generate events...** to set the rule to generate events.

If this event is generated by a standard text rule, you can set the rule to generate events in all policies that you can edit locally. Alternately, you can set the rule only in the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by the system.

**Note**  You cannot set shared object rules to generate events from the packet view, nor can you disable rules in the default policies.

• Set suppression options — Expand **Set Suppression Options** and continue as described in **Setting Suppression Options within the Packet View, on page 2105.**

You can use this option to suppress the rule that triggered this event in all policies that you can edit locally. Alternately, you can suppress the rule only in the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by Cisco.
• Set threshold options — Expand **Set Thresholding Options** and continue as described in **Setting Threshold Options within the Packet View, on page 2104**.

You can use this option to create a threshold for the rule that triggered this event in all policies that you can edit locally. Alternately, you create a threshold only for the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default intrusion policy provided by the system.

• View documentation — For standard text rule events, click **View Documentation** to learn more about the rule revision that generated the event.

---

### Setting Threshold Options within the Packet View

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You can control the number of events that are generated per rule over time by setting the threshold options in the packet view of an intrusion event. You can set threshold options in all policies that you can edit locally or, when it can be edited locally, only in the in the current policy (that is, the policy that caused the event to be generated).

**Procedure**

**Step 1** Within the packet view of an intrusion event that was generated by an intrusion rule, expand **Actions** in the Event Information section.

**Step 2** Expand **Set Thresholding Options** and choose one of the two possible options:

- **in the current policy**
- **in all locally created policies**

**Note** The current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by the system.

**Step 3** Choose the type of threshold you want to set:

- Click **limit** to limit notification to the specified number of event instances per time period.
- Click **threshold** to provide notification for each specified number of event instances per time period.
- Click **both** to provide notification once per time period after a specified number of event instances.

**Step 4** Click the appropriate radio button to indicate whether you want the event instances tracked by **Source** or **Destination** IP address.

**Step 5** In the **Count** field, enter the number of event instances you want to use as your threshold.

**Step 6** In the **Seconds** field, enter a number between 1 and 86400 that specifies the time period for which event instances are tracked.
Step 7  If you want to override any current thresholds for this rule in existing intrusion policies, check the Override any existing settings for this rule check box.

Step 8  Click Save Thresholding.

---

Setting Suppression Options within the Packet View

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You can use the suppression options to suppress intrusion events altogether, or based on the source or destination IP address. You can set suppression options in all policies that you can edit locally. Alternately, you can set suppression options only in the current policy (that is, the policy that generated the event) when the current policy can be edited locally.

Procedure

Step 1  Within the packet view of an intrusion event that was generated by an intrusion rule, expand Actions in the Event Information section.

Step 2  Expand Set Suppression Options and click one of the two possible options:

• in the current policy

• in all locally created policies

Note  The current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by Cisco.

Step 3  Choose one of the following Track By options:

• Click Source to suppress events generated by packets originating from a specified source IP address.

• Click Destination to suppress events generated by packets going to a specified destination IP address.

• Click Rule to completely suppress events for the rule that triggered this event.

Step 4  In the IP address or CIDR block field, enter the IP address or CIDR block/prefix length you want to specify as the source or destination IP address.

Step 5  Click Save Suppression.

Related Topics

Firepower System IP Address Conventions, on page 13

Frame Information Fields

On the packet view, click the arrow next to Frame to view information about the captured frame. The packet view may display a single frame or multiple frames. Each frame provides information about an individual network packet. You would see multiple frames, for example, in the case of tagged packets or packets in reassembled TCP streams.
Frame n
The captured frame, where n is 1 for single-frame packets and the incremental frame number for multi-frame packets. The number of captured bytes in the frame is appended to the frame number.

Arrival Time
The date and time the frame was captured.

Time delta from previous captured frame
For multi-frame packets, the elapsed time since the previous frame was captured.

Time delta from previous displayed frame
For multi-frame packets, the elapsed time since the previous frame was displayed.

Time since reference or first frame
For multi-frame packets, the elapsed time since the first frame was captured.

Frame Number
The incremental frame number.

Frame Length
The length of the frame in bytes.

Capture Length
The length of the captured frame in bytes.

Frame is marked
Whether the frame is marked (true or false).

Protocols in frame
The protocols included in the frame.

Related Topics
- The tag Keyword, on page 1467
- TCP Stream Reassembly, on page 1605

Data Link Layer Information Fields
On the packet view, click the arrow next to the data link layer protocol (for example, Ethernet II) to view the data link layer information about the packet, which contains the 48-bit media access control (MAC) addresses for the source and destination hosts. It may also display other information about the packet, depending on the hardware protocol.
Note that this example discusses Ethernet link layer information; other protocols may also appear.

The packet view reflects the protocol used at the data link layer. The following listing describes the information you might see for an Ethernet II or IEEE 802.3 Ethernet packet in the packet view.

**Destination**
The MAC address for the destination host.

Note
Ethernet can also use multicast and broadcast addresses as the destination address.

**Source**
The MAC address for the source host.

**Type**
For Ethernet II packets, the type of packet that is encapsulated in the Ethernet frame; for example, IPv6 or ARP datagrams. Note that this item only appears for Ethernet II packets.

**Length**
For IEEE 802.3 Ethernet packets, the total length of the packet, in bytes, not including the checksum. Note that this item only appears for IEEE 802.3 Ethernet packets.

### Viewing Network Layer Information

<table>

<th>Classic License</th>
<th>Smart License</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
<td>Any</td>
<td>Protection</td>
<td>Threat</td>
</tr>
</tbody>
</table>

**Procedure**

On the packet view, click the arrow next to the network layer protocol (for example, Internet Protocol) to view more detailed information about network layer information related to the packet.

Note
Note that this example discusses IP packets; other protocols may also appear.

### IPv4 Network Layer Information Fields

The following listing describes protocol-specific information that might appear in an IPv4 packet.
IPv4 Network Layer Information Fields

Version
The Internet Protocol version number.

Header Length
The number of bytes in the header, including any IP options. An IP header with no options is 20 bytes long.

Differentiated Services Field
The values for differentiated services that indicate how the sending host supports Explicit Congestion Notification (ECN):

- **0x0** — does not support ECN-Capable Transport (ECT)
- **0x1** and **0x2** — supports ECT
- **0x3** — Congestion Experienced (CE)

Total Length
The length of the IP packet, in bytes, minus the IP header.

Identification
The value that uniquely identifies an IP datagram sent by the source host. This value is used to trace fragments of the same datagram.

Flags
The values that control IP fragmentation, where:

Values for the Last Fragment flag indicate whether there are more fragments associated with the datagram:

- **0** — there are no more fragments associated with the datagram
- **1** — there are more fragments associated with the datagram

Values for the Don’t Fragment flag control whether the datagram can be fragmented:

- **0** — the datagram can be fragmented
- **1** — the datagram must **not** be fragmented

Fragment Offset
The value for the fragment offset from the beginning of the datagram.

Time to Live (ttl)
The remaining number of hops that the datagram can make between routers before the datagram expires.

Protocol
The transport protocol that is encapsulated in the IP datagram; for example, ICMP, IGMP, TCP, or UDP.
Header Checksum

The indicator for whether the IP checksum is valid. If the checksum is invalid, the datagram may have been corrupted during transit or may be being used in an intrusion evasion attempt.

Source/Destination

The IP address or domain name for the source (or destination) host.

Note that to display the domain name, you must enable IP address resolution.

Click the address or domain name to view the context menu, then select Whois to do a whois search on the host, View Host Profile to view host information, or Blacklist Now or Whitelist Now to add the address to a global blacklist or whitelist.

IPv6 Network Layer Information Fields

The following listing describes protocol-specific information that might appear in an IPv6 packet.

Traffic Class

An experimental 8-bit field in the IPv6 header for identifying IPv6 packet classes or priorities similar to the differentiated services functionality provided for IPv4. When unused, this field is set to zero.

Flow Label

A optional 20-bit IPv6 hexadecimal value 1 to FFFF that identifies a special flow such as non-default quality of service or real-time service. When unused, this field is set to zero.

Payload Length

A 16-bit field identifying the number of octets in the IPv6 payload, which is comprised of all of the packet following the IPv6 header, including any extension headers.

Next Header

An 8-bit field identifying the type of header immediately following the IPv6 header, using the same values as the IPv4 Protocol field.

Hop Limit

An 8-bit decimal integer that each node that forwards the packet decrements by one. The packet is discarded if the decremented value reaches zero.

Source

The 128-bit IPv6 address for the source host.

Destination

The 128-bit IPv6 address for the destination host.
Viewing Transport Layer Information

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**  
On the packet view, click the arrow next to the transport layer protocol (for example, TCP, UDP, or ICMP).

**Step 2**  
Optionally, click **Data** when present to view the first twenty-four bytes of the payload for the protocol immediately above it in the Packet Information section of the packet view.

**Step 3**  
View the contents of the transport layer for TCP, UDP, and ICMP protocols as described in TCP Packet View Fields, on page 2110, UDP Packet View Fields, on page 2111, or ICMP Packet View Fields, on page 2111.

**Note**  
Note that these examples discuss TCP, UDP, and ICMP packets; other protocols may also appear.

**TCP Packet View Fields**

This section describes the protocol-specific information for a TCP packet.

**Source port**

The number that identifies the originating application protocol.

**Destination port**

The number that identifies the receiving application protocol.

**Sequence number**

The value for the first byte in the current TCP segment, keyed to initial sequence number in the TCP stream.

**Next sequence number**

In a response packet, the sequence number of the next packet to send.

**Acknowledgement number**

The TCP acknowledgement, which is keyed to the sequence number of the previously accepted data.

**Header Length**

The number of bytes in the header.

**Flags**

The six bits that indicate the TCP segment’s transmission state:

- U — the urgent pointer is valid
UDP Packet View Fields

This section describes the protocol-specific information for a UDP packet.

Source port
The number that identifies the originating application protocol.

Destination port
The number that identifies the receiving application protocol.

Length
The combined length of the UDP header and data.

Checksum
The indicator for whether the UDP checksum is valid. If the checksum is invalid, the datagram may have been corrupted during transit.

ICMP Packet View Fields

This section describes the protocol-specific information for an ICMP packet.

Type
The type of ICMP message:
• 0 — echo reply
• 3 — destination unreachable
• 4 — source quench
• 5 — redirect
• 8 — echo request
• 9 — router advertisement
• 10 — router solicitation
• 11 — time exceeded
• 12 — parameter problem
• 13 — timestamp request
• 14 — timestamp reply
• 15 — information request (obsolete)
• 16 — information reply (obsolete)
• 17 — address mask request
• 18 — address mask reply

**Code**
The accompanying code for the ICMP message type. ICMP message types 3, 5, 11, and 12 have corresponding codes as described in RFC 792.

**Checksum**
The indicator for whether the ICMP checksum is valid. If the checksum is invalid, the datagram may have been corrupted during transit.

**Viewing Packet Byte Information**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

**Procedure**
On the packet view, click the arrow next to **Packet Bytes** to view hexadecimal and ASCII versions of the bytes that comprise the packet. If the system decrypted traffic, you can view the decrypted packet bytes.
The Intrusion Events Clipboard

The clipboard is a holding area where you can copy intrusion events from any of the intrusion event views. The contents of the clipboard are sorted by the date and time that the events were generated. After you add intrusion events to the clipboard, you can delete them from the clipboard as well as generate reports on the contents of the clipboard.

You can also add intrusion events from the clipboard to incidents, which are compilations of events that you suspect are involved in a possible violation of your security policies.

Related Topics

- Using the Intrusion Event Packet View, on page 2098
- Creating an Incident, on page 1959

Generating Clipboard Reports

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>

You can generate a report for the events on the clipboard just as you would from any of the event views.

Before you begin
- Add one or more events to the clipboard as described in Using Intrusion Event Workflows, on page 2095 or Using the Intrusion Event Packet View, on page 2098.

Procedure

Step 1
Choose Analysis > Intrusions > Clipboard.

Step 2
You have the following options:
- To include specific events from a page on the clipboard, navigate to that page, check the check box next to the events, and click Generate Report.
- To include all the events from the clipboard, click Generate Report All.

Step 3
Specify how you want your report to look, then click Generate.

Step 4
Choose one or more output formats and, optionally, modify any of the other settings.

Step 5
Click Generate, then click Yes.

Step 6
You have the following choices:
- Click a report link to display the report in a new window.
- Click OK to return to the Report Templates page where you can modify your report design.
Deleting Events from the Clipboard

If you have intrusion events on the clipboard that you do not want to add to an incident, you can delete the events.

Note
Deleting an event from the clipboard does not delete the event from the event database. However, deleting an event from the event database does delete the event from the clipboard.

Procedure

Step 1 Choose Analysis > Intrusions > Clipboard.
Step 2 You have the following options:

• Delete specific events — To delete specific intrusion events from a page on the clipboard, navigate to the page, check the check box next to the events, and click Delete.
• Delete all events — To delete all the intrusion events from the clipboard, click Delete All. Note that if you choose the Confirm 'All' Actions option in the Event Preferences, you are first prompted to confirm that you want to delete all the events.

Viewing Intrusion Event Statistics

The Intrusion Event Statistics page provides you with a quick summary of the current state of your appliance and any intrusion events generated for your network.

Each of the IP addresses, ports, protocols, event messages, and so on shown on the page is a link. Click any link to view the associated event information. For example, if one of the top 10 destination ports is 80 (http/tcp), clicking that link displays the first page in the default intrusion events workflow, and lists the events targeting that port. Note that only the events (and the managed devices that generate events) in the current time range appear. Also, intrusion events that you have marked reviewed continue to appear in the statistics. For example, if the current time range is the past hour but the first event was generated five hours ago...
ago, when you click the **First Event** link, the resulting event pages will not show the event until you change the time range.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1**  Choose **Overview > Summary > Intrusion Event Statistics**.

**Step 2**  From the two selection boxes at the top of the page, choose the zones and devices whose statistics you want to view, or choose **All Security Zones** and **All Devices** to view statistics for all the devices that are collecting intrusion events.

**Step 3**  Click **Get Statistics**.

**Tip**  To view data from a custom time range, click the link in the upper right page area and follow the directions in **Changing the Time Window**, on page 1997.

**Host Statistics**

The Host Statistics section of the Intrusion Event Statistics page provides information about the appliance itself. On the Firepower Management Center, this section also provides information about any managed devices.

This information includes the following:

**Time**

The current time on the appliance.

**Uptime**

The number of days, hours, and minutes since the appliance itself was restarted. On the Firepower Management Center, the uptime also shows the last time each managed device was rebooted, the number of users logged in, and the load average.

**Disk Usage**

The percentage of the disk that is being used.

**Memory Usage**

The percentage of system memory that is being used.

**Load Average**

The average number of processes in the CPU queue for the past 1 minute, 5 minutes, and 15 minutes.

**Event Overview**

The Event Overview section of the Intrusion Event Statistics page provides an overview of the information in the intrusion event database.

These statistics include the following:
Events

The number of events in the intrusion event database.

Events in Time Range

The currently selected time range as well as the number and percentage of events from the database that fall within the time range.

First Event

The event message for the first event in the event database.

Last Event

The event message for the last event in the event database.

Note

If you select a managed device while viewing intrusion event data on the Firepower Management Center, the Event Overview section for that device appears instead.

Event Statistics

The Event Statistics section of the Intrusion Event Statistics page provides more specific information about the information in the intrusion event database.

This information includes details on:

- the top 10 event types
- the top 10 source IP addressees
- the top 10 destination IP addresses
- the top 10 destination ports
- the protocols, ingress and egress security zones, and devices with the greatest number of events

Note

In a multidomain deployment, the system builds a separate network map for each leaf domain. As a result, a leaf domain can contain an IP address that is unique within its network, but identical to an IP address in another leaf domain. When you view event statistics in an ancestor domain, the system may display multiple instances of that repeated IP address. At first glance, they might appear to be duplicate entries. However, if you drill down to the host profile information for each IP address, the system shows that they belong to different leaf domains.

Viewing Intrusion Event Performance Graphs

<table>
<thead>
<tr>

<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Intrusion Admin</td>
</tr>
</tbody>
</table>
The intrusion event performance page allows you to generate graphs that depict performance statistics for intrusion events over a specific period of time for a Firepower Management Center or a managed device. Graphs can be generated to reflect number of intrusion events per second, number of megabits per second, average number of bytes per packet, the percent of packets uninspected by Snort, and the number of packets blocked as the result of TCP normalization. These graphs can show statistics for the last hour, last day, last week, or last month of operation.

Note

New data is accumulated for statistics graphs every five minutes. Therefore, if you reload a graph quickly, the data may not change until the next five-minute increment occurs. Each graph displays average values in the intervals shown (day, hour, or five minutes) for the selected time period (last month, week, day, or hour). Decimal values are displayed when the average is less than one.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

Step 1 Choose Overview > Summary > Intrusion Event Performance.
Step 2 From the Select Device list, choose the devices whose data you want to view.
Step 3 From the Select Graph(s) list, choose the type of graph you want to create as described in Intrusion Event Performance Statistics Graph Types, on page 2117.
Step 4 From the Select Time Range list, choose the time range you would like to use for the graph.
Step 5 Click Graph.
Step 6 To save the graph, right-click it and follow the instructions for your browser to save the image.

Intrusion Event Performance Statistics Graph Types

The following table lists the available graph types. Note that graph types display differently if they are populated with data affected by the network analysis policy Inline Mode setting. If Inline Mode is disabled, the graph types marked with an asterisk (*) in the web interface (a yes in the column below) populate with data about the traffic the system would have modified or dropped if Inline Mode was enabled.

The Firepower System provides graphs that show you intrusion event trends over time. You can generate intrusion event graphs over time ranging from the last hour to the last month, for one or all managed devices.
In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose **Overview > Summary > Intrusion Event Graphs**.

**Step 2** Under **Select Device**, choose **all** to include all devices, or choose the specific device you want to include in the graph.

**Step 3** Under **Select Graph(s)**, choose the type of graph you want to generate:
- Top 10 Destination Ports
- Top 10 Source IP Addresses
- Top 10 Event Messages

**Step 4** Under **Select Time Range**, choose the time range for the graph:
- Last Hour
- Last Day
- Last Week
- Last Month

**Step 5** Click **Graph**.
CHAPTER 108

File/Malware Events and Network File Trajectory

The following topics provide an overview of file and malware events, local malware analysis, dynamic analysis, captured files, and network file trajectories.

- About File/Malware Events and Network File Trajectory, on page 2123
- File and Malware Events, on page 2123
- Local Malware Analysis, on page 2137
- Dynamic Analysis, on page 2138
- File Analysis Evaluation, on page 2140
- Captured Files and File Storage, on page 2142
- Network File Trajectory, on page 2148

About File/Malware Events and Network File Trajectory

To help you identify and mitigate the effects of malware, the Firepower System’s file control, network file trajectory, and AMP for Networks components can detect, track, capture, analyze, log, and optionally block the transmission of files, including malware files and nested files inside archive files.

You can also integrate the system with your organization’s AMP for Endpoints deployment to import records of scans, malware detections, and quarantines, as well as indications of compromise (IOC).

The Context Explorer, dashboards, and reporting features can also aid a deeper understanding of the files and malware detected, captured, and blocked. You can also use events to trigger correlation policy violations, or alert you via email, SMTP, or syslog.

---

Note

The Firepower System supports the display and input of file names that use Unicode (UTF-8) characters. However, Unicode file names appear in PDF reports in transliterated form. Additionally, the SMB protocol replaces unprintable characters in file names with periods.

File and Malware Events

The Firepower Management Center can log various types of file and malware events. The information available for any individual event can vary depending on how and why it was generated:
• *File events* represent files, including malware, detected by AMP for Networks. File events do not contain AMP for Endpoints-related fields.

• *Malware events* represent malware detected by either AMP for Networks or AMP for Endpoints; malware events can also record data other than threats from your AMP for Endpoints deployment, such as scans and quarantines.

• *Retrospective malware events* represent files detected by AMP for Networks whose dispositions (whether the files are malware) have changed.

---

**Note**

Files identified as malware by AMP for Networks generate both a file event and a malware event. Endpoint-based malware events do not have corresponding file events.

---

### File and Malware Event Types

#### File Events

The system logs the file events generated when a managed device detects or blocks a file in network traffic, according to the rules in currently deployed file policies.

When the system generates a file event, the system also logs the end of the associated connection to the Firepower Management Center database, regardless of the logging configuration of the invoking access control rule.

#### Network-Based Malware Events (AMP for Networks)

The system can detect malware in network traffic as part of your overall access control configuration. AMP for Networks can generate a malware event, containing the disposition of the resulting event, and contextual data about how, where, and when the malware was detected.

**Table 296: AMP for Networks Malware Event Generation Scenarios**

<table>
<thead>
<tr>
<th>When AMP for Networks detects a file and...</th>
<th>Disposition</th>
</tr>
</thead>
<tbody>
<tr>
<td>successfully queries the AMP cloud (performs a malware cloud lookup) for the file’s disposition</td>
<td>Malware, Clean, or Unknown</td>
</tr>
<tr>
<td>queries the AMP cloud but cannot establish a connection or the cloud is otherwise unavailable</td>
<td>Unavailable</td>
</tr>
<tr>
<td>the threat score associated with a file exceeds the malware threshold threat score defined in the file policy that detected the file, or local malware analysis identifies malware</td>
<td>Malware</td>
</tr>
<tr>
<td>it is on the custom detection list (manually marked as malware)</td>
<td>Custom Detection</td>
</tr>
<tr>
<td>it is on the on the clean list (manually marked as clean),</td>
<td>Clean</td>
</tr>
</tbody>
</table>
Retrospective Malware Events (AMP for Networks)

For malware detected in network traffic, dispositions can change. For example, the AMP cloud can determine that a file that was previously thought to be clean is now identified as malware, or the reverse—that a malware-identified file is actually clean. When the disposition changes for a file you queried in the last week, the AMP cloud notifies the system. Then, two things happen:

- The Firepower Management Center generates a new retrospective malware event.
  This new retrospective malware event represents a disposition change for all files detected in the last week that have the same SHA-256 hash value. For that reason, these events contain limited information: the date and time the Firepower Management Center was notified of the disposition change, the new disposition, the SHA-256 hash value of the file, and the threat name. They do not contain IP addresses or other contextual information.

- The Firepower Management Center changes the file disposition for previously detected files with the retrospective event’s associated SHA-256 hash value.
  If a file’s disposition changes to Malware, the Firepower Management Center logs a new malware event to its database. Except for the new disposition, the information in this new malware event is identical to that in the file event generated when the file was initially detected.
  If a file’s disposition changes to Clean, the Firepower Management Center does not delete the malware event. Instead, the event reflects the change in disposition. This means that files with clean dispositions can appear in the malware table, but only if they were originally thought to be malware. Files that were never identified as malware appear only in the files table.

Endpoint-Based Malware Events (AMP for Endpoints)

If your organization uses AMP for Endpoints, individual users install lightweight connectors on endpoints: computers and mobile devices. Connectors can inspect files upon upload, download, execution, open, copy, move, and so on. These connectors communicate with the AMP cloud to determine if inspected files contain malware.

When a file is positively identified as malware, the AMP cloud sends the threat identification to the Firepower Management Center. The AMP cloud can also send other kinds of information to the Firepower Management Center, including data on scans, quarantines, blocked executions, and cloud recalls. The Firepower Management Center logs this information as malware events.

Note

The IP addresses reported in endpoint-based malware events may not be in your network map—and may not even be in your monitored network at all. Depending on your deployment, level of compliance, and other factors, endpoints in your organization monitored by AMP for Endpoints may not be the same hosts as those monitored by AMP for Networks.

Using File and Malware Event Workflows

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
Use this procedure to view file and malware events in a table and to manipulate the event view depending on the information relevant to your analysis. The page you see when you access events differs depending on the workflow, which is simply a series of pages you can use to evaluate events by moving from a broad to a more focused view. You can also create a custom workflow that displays only the information that matches your specific needs.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

Choose one of the following:

- Analysis > Files > File Events
- Analysis > Files > Malware Events

**Tip**
In the table view of events, several fields are hidden by default. To show a hidden field in an event view, expand the search constraints, then click the field name under Disabled Columns.

**Tip**
To quickly view the connections where specific files were detected, choose the files using the check boxes in the table, then choose **Connections Events** from the **Jump to** drop-down list.

**Related Topics**
- File and Malware Event Fields, on page 2126
- Predefined File Workflows, on page 1970
- Predefined Malware Workflows, on page 1969
- Configuring Event View Settings, on page 33

**File and Malware Event Fields**

File and malware events, which you can view and search using workflows, contain the fields listed in this section. Keep in mind that the information available for any individual event can vary depending on how and why it was generated.

**Note**
Files identified as malware by AMP for Networks generate both a file event and a malware event. Endpoint-based malware events do not have corresponding file events, and file events do not have AMP for Endpoints-related fields.

**Action**
The action associated with file policy rule that detected the file, and any associated file rule action options.

**AMP Cloud**
The name of the AMP cloud where the AMP for Endpoints event originated.
**Application File Name**
The client application accessing the malware file when AMP for Endpoints detection occurred. These applications are **not** tied to network discovery or application control.

**Application File SHA256**
The SHA-256 hash value of the parent file accessing the AMP for Endpoints-detected or quarantined file when detection occurred.

**Application Protocol**
The application protocol used by the traffic in which a managed device detected the file.

**Application Protocol Category or Tag**
The criteria that characterize the application to help you understand the application's function.

**Application Risk**
The risk associated with the application traffic detected in the connection: Very High, High, Medium, Low, or Very Low. Each type of application detected in the connection has an associated risk; this field displays the highest of those.

**Archive Depth**
The level (if any) at which the file was nested in an archive file.

**Archive Name**
The name of the archive file (if any) with which the malware file is associated. To view the contents of an archive file, go to any table under Analysis > Files that lists the archive file, right-click on the archive file’s table row to open the context menu, then click **View Archive Contents**.

**Archive SHA256**
The SHA-256 hash value of the archive file (if any) with which the malware file is associated. To view the contents of an archive file, go to any table under Analysis > Files that lists the archive file, right-click on that archive file’s table row to open the context menu, then click **View Archive Contents**.

**Business Relevance**
The business relevance associated with the application traffic detected in the connection: Very High, High, Medium, Low, or Very Low. Each type of application detected in the connection has an associated business relevance; this field displays the lowest (least relevant) of those.

**Category / File Type Category**
The general categories of file type, for example: Office Documents, Archive, Multimedia, Executables, PDF files, Encoded, Graphics, or System Files.

**Client**
The client application that runs on one host and relies on a server to send a file.
**Client Category or Tag**
The criteria that characterize the application to help you understand the application's function.

**Count**
After you apply a constraint that creates two or more identical rows, the number of events that match the information in each row.

**Detection Name**
The name of the detected malware.

**Detector**
The AMP for Endpoints detector that identified the malware, such as ClamAV, Spero, or SHA.

**Device**
For file events and network-based malware events, the name of the device that detected the file.
For endpoint-based malware events and retrospective malware events generated by the AMP cloud, the name of the Firepower Management Center.

**Disposition / File Disposition**
The file’s disposition:

- **Malware**
  Indicates that the AMP cloud categorized the file as malware, local malware analysis identified malware, or the file’s threat score exceeded the malware threshold defined in the file policy.

- **Clean**
  Indicates that the AMP cloud categorized the file as clean, or that a user added the file to the clean list. Clean files appear in the malware table only if they were changed to clean.

- **Unknown**
  Indicates that the system queried the AMP cloud, but the file has not been assigned a disposition; in other words, the AMP cloud has not categorized the file.

- **Custom Detection**
  Indicates that a user added the file to the custom detection list.

- **Unavailable**
  Indicates that the system could not query the AMP cloud. You may see a small percentage of events with this disposition; this is expected behavior.

- **N/A**
  Indicates a Detect Files or Block Files rule handled the file and the Firepower Management Center did not query the AMP cloud.

File dispositions appear only for files where the system queried the AMP cloud.
Domain
For file events and network-based malware events, the domain of the device that detected the file. For endpoint-based malware events and retrospective malware events generated by the AMP cloud, the domain associated with the AMP cloud connection that reported the event.
This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Event Subtype
The AMP for Endpoints action that led to malware detection, for example, Create, Execute, Move, or Scan.

Event Type
The sub-type of malware event.

File Name
The name of the malware file.

File Path
The file path of the malware file detected by AMP for Endpoints, not including the filename.

File Policy
The file policy that detected the file.

File Storage / Stored (search only)
The storage status of the file associated with the event:

Stored
Returns all events where the associated file is currently stored.

Stored in connection
Returns all events where the system captured and stored the associated file, regardless of whether the associated file is currently stored.

Failed
Returns all events where the system failed to store the associated file.

File Timestamp
The time and date that AMP for Endpoints detected the malware file was created.

HTTP Response Code
The HTTP status code sent in response to a client's HTTP request when a file is transferred.

IOC
Whether the malware event triggered an indication of compromise (IOC) against a host involved in the connection. When AMP for Endpoints data triggers an IOC rule, a full malware event is generated, with the type AMP IOC.
**Message**
Additional information associated with a malware event. For file events and network-based malware events, this field is populated only for files whose disposition has changed, that is, that have an associated retrospective event.

**Receiving Continent**
The continent of the host receiving the file.

**Receiving Country**
The country of the host receiving the file.

**Receiving IP**
For file events and network-based malware events, the IP address of the host receiving the file. For endpoint-based malware events, the IP address of the endpoint whose connector reported the event.

**Receiving Port**
The destination port used by the traffic where the file was detected.

**Security Context**
The metadata identifying the virtual firewall group through which the traffic passed. Note that the system only populates this field for ASA FirePOWER in multiple context mode.

**Sending Continent**
The continent of the host sending the file.

**Sending Country**
The country of the host sending the file.

**Sending IP**
The IP address of the host sending the file.

**Sending Port**
The source port used by the traffic where the file was detected.

**SHA256 / File SHA256**
The SHA-256 hash value of the file, as well as a network file trajectory icon that represents the most recently detected file event and file disposition, and that links to the network file trajectory. To have a SHA256 value, the file must have been handled by one of:
- a Detect Files file rule with Store files enabled
- a Block Files file rule with Store files enabled
- a Malware Cloud Lookup file rule
• a Block Malware file rule
• AMP for Endpoints

**Size (KB) / File Size (KB)**

The size of the file, in kilobytes. Note that if the system determines the file type of a file before the file is fully received, the file size may not be calculated and this field is blank.

**SSL Actual Action (search only)**

The action the system applied to encrypted traffic:

- **Block/Block with reset**
  Represents blocked encrypted connections.

- **Decrypt (Resign)**
  Represents an outgoing connection decrypted using a re-signed server certificate.

- **Decrypt (Replace Key)**
  Represents an outgoing connection decrypted using a self-signed server certificate with a substituted public key.

- **Decrypt (Known Key)**
  Represents an incoming connection decrypted using a known private key.

- **Default Action**
  Indicates the connection was handled by the default action.

- **Do not Decrypt**
  Represents a connection the system did not decrypt.

Field values are displayed in the SSL Status field on the search workflow pages.

**SSL Certificate Information (search only)**

The information stored on the public key certificate used to encrypt traffic, including:

- Subject/Issuer Common Name
- Subject/Issuer Organization
- Subject/Issuer Organization Unit
- Not Valid Before/After
- Serial Number, Certificate Fingerprint
- Public Key Fingerprint

**SSL Failure Reason (search only)**

The reason the system failed to decrypt encrypted traffic:

- Unknown
• No Match
• Success
• Uncached Session
• Unknown Cipher Suite
• Unsupported Cipher Suite
• Unsupported SSL Version
• SSL Compression Used
• Session Undecryptable in Passive Mode
• Handshake Error
• Decryption Error
• Pending Server Name Category Lookup
• Pending Common Name Category Lookup
• Internal Error
• Network Parameters Unavailable
• Invalid Server Certificate Handle
• Server Certificate Fingerprint Unavailable
• Cannot Cache Subject DN
• Cannot Cache Issuer DN
• Unknown SSL Version
• External Certificate List Unavailable
• External Certificate Fingerprint Unavailable
• Internal Certificate List Invalid
• Internal Certificate List Unavailable
• Internal Certificate Unavailable
• Internal Certificate Fingerprint Unavailable
• Server Certificate Validation Unavailable
• Server Certificate Validation Failure
• Invalid Action

Field values are displayed in the SSL Status field on the search workflow pages.
SSL Status
The action associated with the **SSL Actual Action** (SSL rule, default action, or undecryptable traffic action) that logged the encrypted connection. The lock icon (🔒) links to SSL certificate details. If the certificate is unavailable (for example, for connections blocked due to SSL handshake error), the lock icon is grayed out.

If the system fails to decrypt an encrypted connection, it displays the **SSL Actual Action** (undecryptable traffic action) taken, as well as the **SSL Failure Reason**. For example, if the system detects traffic encrypted with an unknown cipher suite and allows it without further inspection, this field displays **Do Not Decrypt** (Unknown Cipher Suite).

When searching this field, type one or more of the **SSL Actual Action** and **SSL Failure Reason** values to view encrypted traffic the system handled or failed to decrypt.

SSL Subject/Issuer Country (search only)
The two-character ISO 3166-1 alpha-2 country code for the subject or issuer country associated with the encryption certificate.

Threat Name
The name of the detected malware.

Threat Score
The threat score most recently associated with this file. The threat score icon links to the Dynamic Analysis Summary report.

Time
The date and time the event was generated. This field is not searchable.

Type / File Type
The type of file, for example, HTML or MSEXE.

URI / File URI
The originating URI of the file, for example, the URL where a user downloaded it.

User
The user of the host (Receiving IP) where the event occurred.

For file events and network-based malware events, this user is determined by network discovery. Because the user is associated with the destination host, users are not associated with malware events where the user uploaded a malware file.

For endpoint-based malware events, AMP for Endpoints determine user names. These users **cannot** be tied to user discovery or control. They do not appear in the Users table, nor can you view details for these users.

Web Application
The application that represents the content or requested URL for HTTP traffic detected in the connection.
**Web Application Category or Tag**

Criteria that characterize the application to help you understand the application's function.

**Malware Event Sub-Types**

The following table lists the malware event subtypes, whether a network-based or endpoint-based malware event can have that subtype, and whether the system uses that subtype to build network file trajectories.

**Table 297: Malware Event Types**

### Information Available in File and Malware Event Fields

The following table lists whether the system displays information for each file and malware event field. Keep in mind that not every field is populated for every event. For example:

- Because AMP for Networks detects malware files in network traffic, file events and network-based malware events contain port, application protocol, and originating IP address information about the connection used to transmit the file.

- Malware events and indications of compromise (IOCs) imported from your AMP for Endpoints deployment do not contain contextual connection information, but they do include information obtained at download or execution time, such as file path, invoking client application, and so on.

- File event table views do not display AMP for Endpoints-related fields.

### Local Malware Analysis

Local malware analysis allows a managed device to locally inspect executables, PDFs, office documents, and other types of files for the most common types of malware, using a detection rule set provided by the Cisco Talos Security Intelligence and Research Group (Talos). Because it does not require submitting a file to the AMP cloud, and does not run the file, local malware analysis saves time and system resources.

</tbody>
</table>
If the system identifies malware through local malware analysis, it updates the existing file disposition from Unknown to Malware. The system then generates a new malware event. If the system does not identify malware, it does not update the file disposition from Unknown to Clean. After the system runs local malware analysis, it caches file information such as SHA-256 hash value, timestamp, and disposition, so that if detected again within a certain period of time, the system can identify malware without additional analysis.

From a table under the Analysis > Files menu, you can manually submit for local malware analysis one file at a time using the context menu, or up to twenty-five captured files at a time. The system runs local analysis, then submits these files to the cloud for dynamic analysis. However, if local analysis is not enabled in a file policy, and you manually submit a file for analysis, the file will only be sent for dynamic analysis.

Local malware analysis does not require establishing communications with the AMP Threat Grid cloud. However, you must configure communications with the cloud to submit files preclassified as malware for dynamic analysis, and to download updates to the local malware analysis ruleset.

**File Composition**

If you configure local malware analysis or dynamic analysis, the system generates a file composition report after analyzing a file. This report allows you to further analyze files and determine whether they may carry embedded malware.

The file composition report lists file properties, any objects embedded in the file, and any detected viruses. The file composition report may also list additional information specific to that file type. When the system prunes stored files, it also prunes the associated file composition report.

**Dynamic Analysis**

If you want to improve the accuracy of the AMP cloud and provide additional malware analysis and threat identification, you can submit eligible captured files to the AMP Threat Grid cloud or an on-premises AMP Threat Grid appliance for dynamic analysis. The AMP cloud runs files in a sandbox environment to determine if a file contains malware.

Whether you can submit a file for dynamic analysis depends on:

- the file type
- the file size
- the file rule’s action
- the system preclassifying a file as malware for automatic submission

If a rule is configured to block malware or perform a malware cloud lookup, the system submits only matching files with an Unknown or Unavailable disposition.

The AMP Threat Grid cloud queues files for dynamic analysis, running each file in a sandbox environment. The cloud returns a threat score, which details the likelihood a file contains malware. You can automatically block files whose threat score falls above a defined threshold.

From a table on a page under the Analysis > Files menu, captured files view, or a network file trajectory, you can determine whether a file has been submitted for dynamic analysis, manually submit a file for local malware and dynamic analysis, or view a summary of why the cloud assigned the threat score. You can also retrieve a dynamic analysis summary report, which describes the various ratings that comprise the overall threat score, as well as other processes started when the cloud attempted to run the file.
Automatic Dynamic and Spero Analysis

You can configure your file policy to automatically submit a file preclassified as malware for dynamic analysis. To supplement dynamic analysis, you can automatically submit queried files for Spero analysis. Spero analysis supplements analysis of SHA-256 hash values, allowing for more complete identification of malware in executable files. Spero analysis involves examining file structural characteristics such as metadata and header information. After generating a Spero signature based on this information, the device submits it to the Spero heuristic engine in the AMP cloud. Based on the Spero signature, the Spero engine returns whether the file is malware. If the file also currently has an Unknown file disposition, the system assigns a Malware file disposition. Note that you can only submit executable files for Spero analysis upon detection; you cannot manually submit them later. You can also submit files for Spero analysis without also submitting for dynamic analysis.

Manually Send a File for Dynamic Analysis

You can manually submit a stored file for dynamic analysis from a table under the Analysis menu or its submenus, context menu, or network file trajectory. From the captured files view (Analysis > Files > Captured Files), you can manually submit up to 25 stored files at once. In addition to executable files, you can also submit file types not eligible for automatic submission, such as .swf, .jar, and others. This allows you to more quickly analyze a broad range of files, regardless of disposition, and pinpoint the exact causes of an incident. If local analysis is not enabled in a file policy, and you manually submit a file for analysis, the file will only be sent for dynamic analysis.

Note

The system checks the AMP cloud for updates (no more than once a day) to the list of file types eligible for dynamic analysis and the minimum and maximum file sizes you can submit.

Dynamic Analysis and Capacity Handling

Capacity handling allows you to temporarily store files on a device when you cannot currently submit them to the cloud for dynamic analysis. The device stores files either on its hard drive or malware storage pack. The system can temporarily store any file for which you perform a malware cloud lookup, with dynamic analysis enabled. The system stores a file if the file is preclassified as malware, and the device either reached the maximum number of submissions to the cloud, or cannot communicate with the cloud. The device resubmits stored files to the cloud in either of the following cases:

• The device could not communicate with the cloud, and reestablishes cloud communications.
• The device reached the maximum number of cloud submissions, and a sufficient amount of time passed.
Threat Scores and Dynamic Analysis Summary Reports

Threat Scores

Table 299: Threat Score Ratings

<table>
<thead>
<tr>
<th>Threat Score</th>
<th>Icon</th>
</tr>
</thead>

</tr>
<tr>
<td>Very High</td>
<td>🌟🌟🌟🌟🌟</td>
</tr>
</tbody>
</table>

The Firepower Management Center caches a file’s threat score for the same amount of time as the file’s disposition. If the system later detects these files, it displays the cached threat scores instead of re-querying the AMP Threat Grid cloud or an AMP Threat Grid on-premises appliance. You can automatically assign a malware file disposition to any file with a threat score that exceeds the defined malware threshold threat score.

Dynamic Analysis Summary

If a dynamic analysis summary is available, you can click the threat score icon to view it. If multiple reports exist, this summary is based on the most recent report matching the exact threat score. If none match the exact threat score, the report with the highest threat score is displayed. If more than one report exists, you can select a threat score to view each separate report.

The summary lists each component threat comprising the threat score. Each component threat is expandable to list the AMP cloud findings, as well as any processes related to this component threat.

The process tree shows the processes that started when the AMP Threat Grid cloud attempted to run the file. This can help identify whether a file that contains malware is attempting to access processes and system resources beyond what is expected (for example, running a Word document opens Microsoft Word, then starts Internet Explorer, then runs the Java Runtime Environment).

Each listed process contains a process identifier you can use to verify the actual process. Child nodes in the process tree represent processes started as a result of parent processes.

From the dynamic analysis summary, you can click View Full Report to view the full Analysis Report, detailing the AMP cloud’s full analysis, including general file information, a more in-depth review of all detected processes, a breakdown of the file analysis, and other relevant information.

File Analysis Evaluation

Based on the results of Spero analysis, local malware analysis, dynamic analysis, or a combination, the system may update a file's disposition.

The system runs Spero analysis on a file first, then local malware analysis, then dynamic analysis. Even if the system identifies malware, if it preclassified the file as malware, it submits the file to the AMP Threat Grid cloud.
If you configure local malware analysis or dynamic analysis in a file rule, the system preclassifies files matching the rule and generates a file composition report. It does not change the file's disposition as a result of the preclassification.

The following table details the benefits and drawbacks of each type of file analysis, as well as how the system changes file dispositions based on the analysis.

**Table 300: Comparison of File Analysis Types**

<table>
<thead>
<tr>
<th>Analysis Type</th>
<th>Benefit</th>
<th>Limitations</th>
<th>Malware Identification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spero analysis</td>
<td>structural analysis of executable files, submits Spero signature to the AMP Cloud for analysis</td>
<td>less thorough than local malware analysis or dynamic analysis, only for executable files</td>
<td>Disposition changes from Unknown to Malware only on positive identification of malware.</td>
</tr>
<tr>
<td>local malware analysis</td>
<td>consumes fewer resources than dynamic analysis, and returns results more quickly, especially if the detected malware is common</td>
<td>less thorough results than dynamic analysis</td>

<td>thorough results in using both types of file analysis</td>
<td>consumes more resources than either alone</td>
<td>Threat score changes based on dynamic analysis results for files preclassified as possible malware. Disposition changes from Unknown to Malware if local malware analysis identifies malware, or based on configured threat score threshold in the file policy.</td>
</tr>
<tr>
<td>Spero analysis, local malware analysis and dynamic analysis</td>
<td>most thorough results</td>
<td>consumes most resources in running all three types of file analysis</td>
<td>Threat score changes based on dynamic analysis results for files preclassified as possible malware. Disposition changes from Unknown to Malware if Spero analysis or local malware analysis identifies malware, or based on configured threat score threshold in the file policy.</td>
</tr>
</tbody>
</table>

**Captured Files and File Storage**

Based on your file policy configuration, you can use the file control feature to detect and block files. However, files originating from a suspicious host or network, or an excess of files sent to a monitored host on your network, may require further analysis. The file storage feature allows you to capture selected files detected in traffic, and automatically store them to a device’s hard drive or, if installed, the malware storage pack.

When a device detects a file in traffic, it can capture that file. This creates a copy the system can either store or submit for dynamic analysis. After your device captures the files, you have several options:

- Store captured files on the device’s hard drive for later analysis.
- Download the stored file to a local computer for further manual analysis or archival purposes.
- Submit captured files to the AMP cloud for dynamic analysis.

Note that once a device stores a file, it will not re-capture it if the file is detected in the future and the device still has that file stored.

---

**Note**

When a file is detected for the first time on your network, you can generate a file event that represents the file’s detection. However, if your file rule performs a malware cloud lookup, the system requires additional time to query the AMP cloud and return a disposition. Due to this delay, the system cannot store this file until the second time it is seen on your network, and the system can immediately determine the file’s disposition.

Whether the system captures or stores a file, you can:
• Review information about the captured file from Analysis > Files > Captured Files, including whether the file was stored or submitted for dynamic analysis, file disposition, and threat score, allowing you to quickly review possible malware threats detected on your network.

• View the file’s trajectory to determine how it traversed your network and which hosts have a copy.

• Add the file to the clean list or custom detection list to always treat the file as if it had a clean or malware disposition on future detection.

You configure file rules in a file policy to capture and store files of a specific type, or with a particular file disposition, if available. After you associate the file policy with an access control policy and deploy it to your devices, matching files in traffic are captured and stored. You can also limit the minimum and maximum file sizes to store. You cannot include stored files in system backup files.

Malware Storage Pack

Based on your file policy configuration, your device may store a substantial amount of file data to the hard drive. You can install a malware storage pack in the device; the system stores files to the malware storage pack, allowing more room on the primary hard drive to store events and configuration files. The system periodically deletes older files. If the device's primary hard drive does not have enough available space, and does not have an installed malware storage pack, you cannot store files.

Caution

Do not attempt to install a hard drive that was not supplied by Cisco in your device. Installing an unsupported hard drive may damage the device. Malware storage pack kits are available for purchase only from Cisco, and are for use only with 8000 Series devices. Contact Support if you require assistance with the malware storage pack. See the Firepower System Malware Storage Pack Guide for more information.

Without a malware storage pack installed, when you configure a device to store files, it allocates a set portion of the primary hard drive’s space to captured file storage. If you configure capacity handling to temporarily store files for dynamic analysis, the system uses the same hard drive allocation to store these files until it can resubmit them to the cloud.

When you install a malware storage pack in a device and configure file storage or capacity handling, the device allocates the entire malware storage pack for storing these files. The device cannot store any other information on the malware storage pack.

When the allocated space for captured file storage fills to capacity, the system deletes the oldest stored files until the allocated space reaches a system-defined threshold. Based on the number of files stored, you may see a substantial drop in disk usage after the system deletes files.

If a device has already stored files when you install a malware storage pack, the next time you restart the device, any captured files or capacity handling files stored on the primary hard drive are moved to the malware storage pack. Any future files the device stores are stored to the malware storage pack.

Stored Files Download

Once a device stores a file, as long as the Firepower Management Center can communicate with that device and it has not deleted the file, you can download the file to a local host for long-term storage and analysis, and manually analyze the file. You can download a file from any associated file event, malware event, captured file view, or the file’s trajectory.
Because malware is harmful, by default, you must confirm every file download. However, you can disable the confirmation in your User Preferences.

Because files with a disposition of Unknown may contain malware, when you download a file, the system first archives the file in a .zip package. The .zip file name contains the file disposition and file type, if available, and SHA-256 hash value. You can password-protect the .zip file to prevent accidental unpacking. You can edit or remove the default .zip file password in your User Preferences.

Caution
Cisco strongly recommends you do not download malware, as it can cause adverse consequences. Exercise caution when downloading any file, as it may contain malware. Ensure you have taken any necessary precautions to secure the download destination before downloading files.

Using Captured File Workflows

<table>
<thead>

</tr>
</tbody>
</table>

When a managed device captures a file detected in network traffic, it logs an event.

Note
If a device captures a file containing malware, the device generates two events: a file event when it detects the file, and a malware event when it identifies malware.

Use this procedure to view a list of captured files in a table and manipulate the event view depending on the information relevant to your analysis. The page you see when you access captured files differs depending on the workflow, which is simply a series of pages you can use to evaluate events by moving from a broad to a more focused view. You can also create a custom workflow that displays only the information that matches your specific needs.

If the system recaptures a file after a configuration change, such as an updated file policy, it updates existing information for that file.

For example, if you configure a file policy to capture files with a Malware Cloud Lookup action, the system stores the file disposition and threat score along with the file. Then, if you update your file policy, and the system recaptures the same file due to a new Detect Files action, the system updates the file's Last Changed value. However, the system does not remove the existing disposition and threat score, even though you did not perform another malware cloud lookup.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

Choose Analysis > Files > Captured Files.
Tip: In the table view of events, several fields are hidden by default. To show a hidden field in an event view, expand the search constraints, then click the field name under Disabled Columns.

Captured File Fields

The table view of captured files, which is the final page in predefined captured file workflows, and which you can add to custom workflows, includes a column for each field in the captured files table.

When searching this table keep in mind that your search results depend on the available data in the events you are searching; depending on the available data, your search constraints may not apply. For example, if a file has never been submitted for dynamic analysis, it may not have an associated threat score.

</tbody>
</table>
| Disposition         | The file’s AMP for Networks disposition:  
  - Malware indicates that local malware analysis identified malware, the AMP cloud categorized the file as malware, or that the file’s threat score exceeded the malware threshold defined in the file policy.  
  - Clean indicates that the AMP cloud categorized the file as clean, or that a user added the file to the clean list.  
  - Unknown indicates that the system queried the AMP cloud, but the file has not been assigned a disposition; in other words, the AMP cloud has not categorized the file.  
  - Custom Detection indicates that a user added the file to the custom detection list.  
  - Unavailable indicates that the system could not query the AMP cloud. You may see a small percentage of events with this disposition; this is expected behavior.  
  - N/A indicates a Detect Files or Block Files rule handled the file and the Firepower Management Center did not query the AMP cloud. |
| Domain              | The domain where the captured file was detected. This field is only present if you have ever configured the Firepower Management Center for multitenancy. |
One or more of the following values indicating whether the file was submitted for dynamic analysis:

- **Analysis Complete** — file submitted for dynamic analysis that received a threat score and dynamic analysis summary report
- **Capacity Handled** — file stored because it could not be submitted currently
- **Capacity Handled (Network Issue)** — file stored because it could not be submitted due to a network connectivity issue
- **Capacity Handled (Rate Limit)** — file stored because it could not be submitted due to the maximum number of submissions reached
- **Device Not Activated** — file not submitted because the device is not activated on the on-premises AMP Threat Grid appliance. If you see this status, contact Support.
- **Failure (Analysis Timeout)** — file submitted for which the AMP cloud has yet to return a result
- **Failure (Cannot Run File)** — file submitted that the AMP cloud could not run in the test environment
- **Failure (Network Issue)** — file that did not get submitted due to a network connectivity failure
- **Not Sent for Analysis** — file not submitted
- **Not Suspicious (Not Sent For Analysis)** — file pre-classified as non-malware
- **Previously Analyzed** — file with a cached threat score that a user tried to submit again
- **Sent for Analysis** — file pre-classified as malware and queued for dynamic analysis

</table>
### Network File Trajectory

The network file trajectory feature maps how hosts transferred files, including malware files, across your network. A trajectory charts file transfer data, the disposition of the file, and if a file transfer was blocked or the file was quarantined. You can determine which hosts may have transferred malware, which hosts are at risk, and observe file transfer trends.

You can track the transmission of any file with a AMP cloud-assigned disposition. The system can use information related to detecting and blocking malware from both AMP for Networks and AMP for Endpoints to build the a trajectory.

### Recently Detected Malware and Analyzed Trajectories

The Network File Trajectory List page displays the malware most recently detected on your network, as well as the files whose trajectory maps you have most recently viewed. From these lists, you can view when each
file was most recently seen on the network, the file’s SHA-256 hash value, name, type, current file disposition, contents (for archive files), and the number of events associated with the file.

The page also contains a search box that lets you locate files, either based on SHA-256 hash value or file name, or by the IP address of the host that transferred or received a file. After you locate a file, you can click the File SHA256 value to view the detailed trajectory map.

**Network File Trajectory Detailed View**

You can trace a file through the network by viewing the detailed network file trajectory. Search for a file's SHA 256 value or click a File SHA 256 link in the Network File Trajectory list to view details about that file.

The network file trajectory details page has three parts:

- **Summary Information** — A file’s trajectory page displays summary information about the file, including file identification information; when the file was first seen and most recently seen on the network; the number of related events and hosts associated with the file; and the file’s current disposition. From this section, if the managed device stored the file, you can download it locally, submit the file for dynamic analysis, or add the file to a file list.

- **Trajectory Map** — A file’s trajectory map visually tracks a file from the first detection on your network to the most recent. The map shows when hosts transferred or received the file, how often they transferred the file, and when the file was blocked or quarantined. Vertical lines between data points represent file transfers between hosts. Horizontal lines connecting the data points show a host’s file activity over time.

  The map also shows how often file events occurred for the file and when the system assigned the file a disposition or retrospective disposition. You can select a data point in the map and highlight a path that traces back to the first instance the host transferred that file; this path also intersects with every occurrence involving the host as either sender or receiver of the file.

- **Related Events** — The Events table lists event information for each data point in the map. Using the table and the map, you can pinpoint specific file events, hosts on the network that transferred or received this file, related events in the map, and other related events in a table constrained on selected values.

**Network File Trajectory Summary Information**

The following summary information appears at the top of the details page for a file that appears in the Network File Trajectory list.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Archive Contents</td>
<td>For inspected archive files, the number of files the archive contains.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Current Disposition</td>
<td>One of the following AMP for Networks file dispositions:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Malware</strong> indicates that the AMP cloud categorized the file as malware, local malware analysis identified malware, or the file’s threat score exceeded the malware threshold defined in the file policy.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Clean</strong> indicates that the AMP cloud categorized the file as clean, or that a user added the file to the clean list.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unknown</strong> indicates that the system queried the AMP cloud, but the file has not been assigned a disposition; in other words, the AMP cloud has not categorized the file.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Custom Detection</strong> indicates that a user added the file to the custom detection list.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unavailable</strong> indicates that the system could not query the AMP cloud. You may see a small percentage of events with this disposition; this is expected behavior.</td>
</tr>
<tr>
<td></td>
<td>• <strong>N/A</strong> indicates a Detect Files or Block Files rule handled the file and the Firepower Management Center did not query the AMP cloud.</td>
</tr>
<tr>
<td>Detection Name</td>
<td>Name of the malware detected by local malware analysis.</td>
</tr>
<tr>
<td>Event Count</td>
<td>The number of events seen on the network associated with the file, and the number of events displayed in the map if there are more than 250 detected events.</td>
</tr>
<tr>
<td>File Category</td>
<td>The general categories of file type, for example, <strong>Office Documents</strong> or <strong>System Files</strong>.</td>
</tr>
<tr>
<td>File Names</td>
<td>The names of the file associated with the event, as seen on the network. If multiple file names are associated with a SHA-256 hash value, the most recent detected file name is listed. You can expand this to view the remaining file names by clicking more.</td>
</tr>
<tr>
<td>File SHA256</td>
<td>The SHA-256 hash value of the file. The hash is displayed by default in a condensed format. To view the full hash value, hover your pointer over it. If multiple SHA-256 hash values are associated with a file name, hover your pointer over the link to view all of the hash values.</td>
</tr>
<tr>
<td>File Size (KB)</td>
<td>The size of the file, in kilobytes.</td>
</tr>
<tr>
<td>File Type</td>
<td>The file type of the file, for example, <strong>HTML</strong> or <strong>MSEXE</strong>.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>First Seen</td>
<td>The first time AMP for Networks or AMP for Endpoints detected the file, as well as the IP address of the host that first uploaded the file.</td>
</tr>
<tr>
<td>Last Seen</td>
<td>The most recent time AMP for Networks or AMP for Endpoints detected the file, as well as the IP address of the host that last downloaded the file.</td>
</tr>
<tr>
<td>Parent Application</td>
<td>The client application accessing the malware file when detection occurred by AMP for Endpoints. These applications are not tied to network discovery or application control.</td>
</tr>
<tr>
<td>Seen On</td>
<td>The number of hosts that either sent or received the file. Because one host can upload and download a file at different times, the total number of hosts may not match the total number of senders plus the total number of receivers in the Seen On Breakdown field.</td>
</tr>
<tr>
<td>Seen On Breakdown</td>
<td>The number of hosts that sent the file, followed by the number of hosts that received the file.</td>
</tr>
<tr>
<td>Threat Name</td>
<td>Name of the threat associated with the detected malware by AMP for Endpoints.</td>
</tr>
<tr>
<td>Threat Score</td>
<td>The file’s threat score.</td>
</tr>
</tbody>
</table>

**Network File Trajectory Map and Related Events List**

The file trajectory map’s y-axis contains a list of all host IP addresses that have interacted with the file. The IP addresses are listed in descending order based on when the system first detected the file on that host. Each row contains all events associated with that IP address, whether a single file event, file transfer, or retrospective event. The x-axis contains the date and time the system detected each event. The timestamps are listed in chronological order. If multiple events occurred within a minute, all are listed within the same column. You can scroll the map horizontally and vertically to view additional events and IP addresses.

The map displays up to 250 events associated with the file SHA-256 hash. If there are more than 250 events, the map displays the first 10, then truncates extra events with an arrow icon (↑↓). The map then displays the remaining 240 events.

The first page of the File Events default workflow appears in a new window with all the extra events constrained based on the file type. If endpoint-based malware events are not displayed, you must switch to the Malware Events table to view these.

Each data point represents an event plus the file disposition, as described in the legend below the map. For example, a Malware Block event icon combines the Malicious Disposition icon and the Block Event icon.

Endpoint-based malware events include one icon. A retrospective event displays an icon in the column for each host on which the file is detected. File transfer events always include two icons, one file send icon and one file receive icon, connected by a vertical line. Arrows indicate the file transfer direction from sender to receiver.
To track a file’s progress through the network, you can click any data point to highlight a path that includes all data points related to the selected data point. This includes data points associated with the following types of events:

- any file transfers in which the associated IP address was either sender or receiver
- any endpoint-based malware events involving the associated IP address
- if another IP address was involved, all file transfers in which that associated IP address was either sender or receiver
- if another IP address was involved, any endpoint-based malware events involving the other IP address

All IP addresses and timestamps associated with any highlighted data point are also highlighted. The corresponding event in the Events table is also highlighted. If a path includes truncated events, the path itself is highlighted with a dotted line. Truncated events might intersect the path, but are not displayed in the map.

### Using a Network File Trajectory

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Malware (AMP for Networks)</td>
<td>Malware (AMP for Networks)</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
<tr>
<td>Any (AMP for Endpoints)</td>
<td>Any (AMP for Endpoints)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

### Procedure

**Step 1**
Choose **Analysis > Files > Network File Trajectory**.

**Tip** You can also access a file’s trajectory from the Context Explorer, dashboard, or event views with file information.

**Step 2**
Click a **File SHA 256** link in the list.

**Step 3**
Optionally, enter a complete SHA-256 hash value, the host IP address, or the name of a file you want to track into the search field, and press Enter.

**Tip** If only one result matches, the Network File Trajectory page for that file appears.

**Step 4**
In the Summary Information section, you can:

- Add a file to a file list — To add a file or remove a file from the clean list or custom detection list, click the edit icon (📝).
- Download a file — To download a file, click the download file icon (/octet), and if prompted, confirm you want to download the file. If the file is unavailable for download, this icon is dimmed.
- Report — Click the threat score icon to view the Dynamic Analysis Summary report.
• Submit for dynamic analysis — Click the AMP cloud icon (⩓) to submit the file for dynamic analysis. If the file is unavailable for submission or you cannot connect to the AMP cloud, this icon is dimmed.

• View archive contents — To view information about an archive file’s contents, click the view icon (⩫).

• View file composition — To view a file's composition, click the file list icon (⩲). If the system has not generated a file composition report, this icon is dimmed.

• View captured files with same threat score — Click the threat score link to view all captured files with that threat score.

Note Cisco strongly recommends you do not download malware, as it can cause adverse consequences. Exercise caution when downloading any file, as it may contain malware. Ensure you have taken any necessary precautions to secure the download destination before downloading files.

Step 5 On the trajectory map, you can:

• Locate the first instance — Click an IP address to locate the first time a file event occurred involving an IP address. This highlights a path to that data point, as well as any intervening file events and IP addresses related to the first file event. The corresponding event in the Events table is also highlighted. The map scrolls to that data point if not currently visible.

• Track — Click any data point to highlight a path that includes all data points related to the selected data point, tracking a file’s progress through the network.

• View hidden events — Click the arrow icon to view all events not displayed in the File Summary event view.

• View matching file events — Hover your pointer over the event icon (⩬) to view summary information for the event. If you click any event summary information link, the first page of the File Events default workflow appears in a new window with all the extra events constrained based on the file type. The File Summary event view opens in a new window, displaying all file events that match on the criteria value you clicked.

Step 6 In the Events table, you can:

• Highlight — Choose a table row to highlight a data point in the map. The map scrolls to display the selected file event if not currently visible.

• Sort — Click the column headers to sort events in ascending or descending order.
Using Host Profiles

The following topics describe how to use host profiles:

- Host Profiles, on page 2155
- Basic Host Information in the Host Profile, on page 2157
- Operating Systems in the Host Profile, on page 2159
- Servers in the Host Profile, on page 2164
- Web Applications in the Host Profile, on page 2168
- Host Protocols in the Host Profile, on page 2170
- Indications of Compromise in the Host Profile, on page 2171
- VLAN Tags in the Host Profile, on page 2171
- User History in the Host Profile, on page 2171
- Host Attributes in the Host Profile, on page 2172
- White List Violations in the Host Profile, on page 2176
- Malware Detections in the Host Profile, on page 2177
- Vulnerabilities in the Host Profile, on page 2178
- Scan Results in the Host Profile, on page 2181

Host Profiles

A host profile provides a complete view of all the information the system has gathered about a single host. To access a host profile:

- navigate from any network map view.
- navigate from any event view that includes the IP addresses of hosts on monitored networks.

Host profiles provide basic information about detected hosts or devices, such as the host name or MAC addresses. Depending on your licenses and system configuration, host profiles can also provide you with the following information:

- the operating system running on a host
- the servers running on a host
- the clients and web applications running on a host
- the protocols running on a host
• the indications of compromise (IOC) tags on a host
• the VLAN tags on a host
• the last twenty-four hours of user activity on your network
• the white list violations associated with a host
• the most recent malware events for a host
• the vulnerabilities associated with a host
• the Nmap scan results for a host

Host attributes are also listed in the profile. You can use host attributes to classify hosts in ways that are important to your network environment. For example, you can:

• assign a host attribute that indicates the building where the host is located

• use the host criticality attribute to designate the business criticality of a given host and tailor correlation policies and alerts based on host criticality

From a host profile, you can view the existing host attributes applied to that host and modify the host attribute values.

If you use adaptive profile updates as part of a passive intrusion prevention deployment, you can tailor the way the system processes traffic so it best fits the type of operating system on the host and the servers and clients the host is running.

Optionally, you can perform an Nmap scan from the host profile to augment the server and operating system information in your host profile. The Nmap scanner actively probes the host to obtain information about the operating system and servers running on the host. The results of the scan are added to the list of operating system and server identities for the host.

Host profile limitations include:

**Unavailable Hosts**

A host profile may not be available for every host on your network. Possible reasons include:

• The host was deleted from the network map because it timed out.

• You have reached your host license limit.

• The host resides in a network segment that is not monitored by the network discovery policy.

**Unavailable Information**

The information displayed in a host profile may vary according to the type of host and the information available about the host.

For example:

• If your system detects a host using a non-IP-based protocol like STP, SNAP, or IPX, the host is added to the network map as a MAC host and much less information is available than for an IP host.

• The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1649.

**Procedure**

You have two choices:

- On any network map, drill down to the IP address of the host whose profile you want to view.

- On any event view, click the host profile icon (📍) or the compromised host icon (☐) next to the IP address of the host whose profile you want to view.

---

**Basic Host Information in the Host Profile**

Each host profile provides basic information about a detected host or other device. Descriptions of each of the basic host profile fields follow.

**Domain**

The domain associated with the host.

**IP Addresses**

All IP addresses (both IPv4 and IPv6) associated with the host. The system detects IP addresses associated with hosts and, where supported, groups multiple IP addresses used by the same host. IPv6 hosts often have at least two IPv6 addresses (local-only and globally routable), and may also have IPv4 addresses. IPv4-only hosts may have multiple IPv4 addresses.

The host profile lists all detected IP addresses associated with that host. Where available, routable host IP addresses also include a flag icon and country code indicating the geolocation data associated with that address.

Note that only the first three addresses are shown by default. Click **show all** to show all addresses for a host.

**Hostname**

The fully qualified domain name of the host, if known.
**NetBIOS Name**

The NetBIOS name of the host, if available. Microsoft Windows hosts, as well as Macintosh, Linux, or other platforms configured to use NetBIOS, can have a NetBIOS name. For example, Linux hosts configured as Samba servers have NetBIOS names.

**Device (Hops)**

Either:

- the reporting device for the network where the host resides, as defined in the network discovery policy, or
- the device that processed the NetFlow data that added the host to the network map

The number of network hops between the device that detected the host and the host itself follows the device name, in parentheses. If multiple devices can see the host, the reporting device is displayed in bold.

If this field is blank, either:

- the host was added to the network map by a device that is not explicitly monitoring the network where the host resides, as defined in the network discovery policy, or
- the host was added using the host input feature and has not also been detected by the Firepower System.

**MAC Addresses (TTL)**

The host’s detected MAC address or addresses and associated NIC vendors, with the NIC’s hardware vendor and current time-to-live (TTL) value in parentheses. If the MAC address is displayed in a bold font, the MAC address is the actual MAC address of the host, detected by the system through ARP and DHCP traffic. If multiple devices detected the host, the Firepower Management Center displays all MAC addresses and TTL values associated with the host, regardless of which device reported them.

Router host profiles typically show the hosts (IP addresses) in the network segments they route in this list, and the IP addresses of monitored routers frequently appear in this list for monitored workstations and servers.

The true IP address for the MAC address is displayed in bold.

**Host Type**

The type of device that the system detected: host, mobile device, jailbroken mobile device, router, bridge, NAT device, or load balancer.

The methods the system uses to distinguish network devices include:

- the analysis of Cisco Discovery Protocol (CDP) messages, which can identify network devices and their type (Cisco devices only)
- the detection of the Spanning Tree Protocol (STP), which identifies a device as a switch or bridge
- the detection of multiple hosts using the same MAC address, which identifies the MAC address as belonging to a router
- the detection of TTL value changes from the client side, or TTL values that change more frequently than a typical boot time, which identify NAT devices and load balancers
- The methods the system uses to distinguish mobile devices include:
  - analysis of User-Agent strings in HTTP traffic from the mobile device’s mobile browser
monitoring of HTTP traffic of specific mobile applications

If a device is not identified as a network device or a mobile device, it is categorized as a host.

Last Seen
The date and time that any of a host’s IP addresses was last detected.

Current User
The user most recently logged into this host.

Note that a non-authoritative user logging into a host only registers as the current user on the host if the existing current user is not an authoritative user.

View
Links to views of connection, discovery, malware, and intrusion event data, using the default workflow for that event type and constrained to show events related to the host; where possible, these events include all IP addresses associated with the host.

Operating Systems in the Host Profile

The system passively detects the identity of the operating system running on a host by analyzing the network and application stack in traffic generated by the host or by analyzing host data reported by the User Agent. The system also collates operating system information from other sources, such as the Nmap scanner or application data imported through the host input feature. The system considers the priority assigned to each identity source when determining which identity to use. By default, user input has the highest priority, followed by application or scanner sources, followed by the discovered identity.

Sometimes the system supplies a general operating system definition rather than a specific one because the traffic and other identity sources do not provide sufficient information for a more focused identity. The system collates information from the sources to use the most detailed definition possible.

Because the operating system affects the vulnerabilities list for the host and the event impact correlation for events targeting the host, you may want to manually supply more specific operating system information. In addition, you can indicate that fixes have been applied to the operating system, such as service packs and updates, and invalidate any vulnerabilities addressed by the fixes.

For example, if the system identifies a host’s operating system as Microsoft Windows 2003, but you know that the host is actually running Microsoft Windows XP Professional with Service Pack 2, you can set the operating system identity accordingly. Setting a more specific operating system identity refines the list of vulnerabilities for the host, so your impact correlation for that host is more focused and accurate.

If the system detects operating system information for a host and that information conflicts with a current operating system identity that was supplied by an active source, an identity conflict occurs. When an identity conflict is in effect, the system uses both identities for vulnerabilities and impact correlation.

You can configure the network discovery policy to add discovery data to the network map for hosts monitored by NetFlow exporters. However, there is no operating system data available for these hosts, unless you set the use the host input feature to set the operating system identity.

If a host is running an operating system that violates a compliance white list in an activated network discovery policy, the Firepower Management Center marks the operating system information with the white list violation
icon (⚠️). In addition, if a jailbroken mobile device violates an active white list, the icon appears next to the operating system for the device.

You can set a custom display string for the host’s operating system identity. That display string is then used in the host profile.

---

**Note**

Changing the operating system information for a host may change its compliance with a compliance white list.

In the host profile for a network device, the label for the Operating Systems section changes to Systems and an additional Hardware column appears. If a value for a hardware platform is listed under Systems, that system represents a mobile device or devices detected behind the network device. Note that mobile devices may or may not have hardware platform information, but hardware platform information is never detected for systems that are not mobile devices.

Descriptions of the operating system information fields displayed in the host profile follow.

### Hardware

The hardware platform for a mobile device.

### OS Vendor/Vendor

The operating system vendor.

### OS Product/Product

One of the following values:

- the operating system determined most likely to be running on the host, based on the identity data collected from all sources
- **Pending** if the system has not yet identified an operating system and no other identity data is available
- **unknown** if the system cannot identify the operating system and no other identity data is available for the operating system

---

**Note**

If the host’s operating system is not one the system is capable of detecting, see Identifying Host Operating Systems, on page 1658:

### OS Version/Version

The operating system version. If a host is a jailbroken mobile device, **Jailbroken** is indicated in parentheses after the version.

### Source

One of the following values:

- User: user_name
• Application: app_name
• Scanner: scanner_type (Nmap or other scanner)
• Firepower

The system may reconcile data from multiple sources to determine the identity of an operating system.

### Viewing Operating System Identities

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can view the specific operating system identities discovered or added for a host. The system uses source prioritization to determine the current identity for the host. In the list of identities, the current identity is highlighted by boldface text.

Note that the **View** button is only available if multiple operating system identities exist for the host.

**Procedure**

**Step 1**
Click **View** in the **Operating System** or **Operating System Conflicts** section of a host profile.

**Step 2**
View the information described in **Operating Systems in the Host Profile, on page 2159**.

**Step 3**
Optionally, click the delete icon (🗑️) next to any operating system identity.

**Note**
You cannot delete Cisco-detected operating system identities.

This system removes the identity from the Operating System Identity Information pop-up window and, if applicable, updates the current identity for the operating system in the host profile.

### Setting the Current Operating System Identity

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can set the current operating system identity for a host using the Firepower System web interface. Setting the identity through the web interface overrides all other identity sources so that identity is used for vulnerability assessment and impact correlation. However, if the system detects a conflicting operating system identity for the host after you edit the operating system, an operating system conflict occurs. Both operating systems are then considered current until you resolve the conflict.
Procedure

Step 1  Click **Edit** in the **Operating System** section of a host profile.

Step 2  You have several options:

- Choose **Current Definition** from the **OS Definition** drop-down list to confirm the current operating system identity through host input, then skip to step 6.
- Choose a variation on the current operating system identity from the **OS Definition** drop-down list, then skip to step 6.
- Choose **User-Defined** from the **OS Definition** drop-down list, then continue with step 3.

Step 3  Optionally, choose **Use Custom Display String** and modify the custom strings you want to display in the **Vendor String**, **Product String**, and **Version String** fields.

Step 4  Optionally, to change to an operating system from a different vendor, choose from the **Vendor** and **Product** drop-down lists.

Step 5  Optionally, to configure the operating system product release level, choose from the **Major**, **Minor**, **Revision**, **Build**, **Patch**, and **Extension** drop-down lists.

Step 6  Optionally, if you want to indicate that fixes for the operating system have been applied, click **Configure Fixes**.

Step 7  Choose the applicable fixes in the drop-down list, and click **Add**.

Step 8  Optionally, add the relevant patches and extensions using the **Patch** and **Extension** drop-down lists.

Step 9  Click **Finish**.

Related Topics

- Operating System Identity Conflicts, on page 2162

Operating System Identity Conflicts

An operating system identity conflict occurs when a new identity detected by the system conflicts with the current identity, if that identity was provided by an active source, such as a scanner, application, or user.

The list of operating system identities in conflict displays in bold in the host profile.

You can resolve an identity conflict and set the current operating system identity for a host through the system web interface. Setting the identity through the web interface overrides all other identity sources so that identity is used for vulnerability assessment and impact correlation.

Making a Conflicting Operating System Identity Current

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>
Procedure

Step 1 Navigate to the Operating System section of a host profile.
Step 2 You have two choices:
  • Click Make Current next to the operating system identity you want to set as the operating system for the host.
  • If the identity that you do not want as the current identity came from an active source, delete the unwanted identity.

Resolving an Operating System Identity Conflict

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

Step 1 Click Resolve in the Operating System Conflicts section of a host profile.
Step 2 You have the following choices:
  • Choose Current Definition from the OS Definition drop-down list to confirm the current operating system identity through host input, then skip to step 6.
  • Choose a variation on one of the conflicting operating system identities from the OS Definition drop-down list, then skip to step 6.
  • Choose User-Defined from the OS Definition drop-down list, then continue with step 3.
Step 3 Optionally, choose Use Custom Display String and enter the custom strings you want to display in the Vendor String, Product String, and Version String fields.
Step 4 Optionally, to change to an operating system from a different vendor, choose from the Vendor and Product drop-down lists.
Step 5 Optionally, to configure the operating system product release level, choose from the Major, Minor, Revision, Build, Patch, and Extension drop-down lists.
Step 6 Optionally, if you want to indicate that fixes for the operating system have been applied, click Configure Fixes.
Step 7 Add the fixes you have applied to the fixes list.
Step 8 Click Finish.

Servers in the Host Profile

The Servers Section of the host profile lists servers either detected on hosts on your monitored network, added from exported NetFlow records, or added through an active source like a scanner or the host input feature.

The list can include up to 100 servers per host. After that limit is reached, new server information from any source, whether active or passive, is discarded until you delete a server from the host or a server times out.

If you scan a host using Nmap, Nmap adds the results of previously undetected servers running on open TCP ports to the Servers list. If you perform an Nmap scan or import Nmap results, an expandable Scan Results section also appears in the host profile, listing the server information detected on the host by the Nmap scan. In addition, if the host is deleted from the network map, the Nmap scan results for that server for the host are discarded.

The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1649.

The process for working with servers in the host profile differs depending on how you access the profile:

• If you access the host profile by drilling down through the network map, the details for that server appear with the server name highlighted in bold. If you want to view the details for any other server on the host, click the view icon next to that server name.

• If you access the host profile in any other way, expand the Servers section and click the view icon next to the server whose details you want to see.

If the host is running a server that violates a compliance white list in an activated correlation policy, the Firepower Management Center marks the non-compliant server with the white list violation icon.

Descriptions of the columns in the Servers list follow.

Protocol
The name of the protocol the server uses.

Port
The port where the server runs.

Application Protocol
One of:

• the name of the application protocol

• pending if the system cannot positively or negatively identify the application protocol for one of several reasons
• unknown if the system cannot identify the application protocol based on known application protocol fingerprints, or if the server was added through host input by adding a vulnerability with port information without adding a corresponding server

When you hover the mouse on an application protocol name, the tags display.

**Vendor and Version**

The vendor and version identified by the Firepower System, Nmap, or another active source, or acquired via the host input feature. The field is blank if none of the available sources provides an identification.

---

**Server Details in the Host Profile**

The Firepower Management Center lists up to 16 passively detected identities per server. Passive detection sources include network discovery data and NetFlow records. A server can have multiple passive identities if the system detects multiple vendors or versions of that server. For example, a load balancer between your managed device and your web server farm may cause your system to identify multiple passive identities for HTTP if your web servers are not running the same version of the server software. Note that the Firepower Management Center does not limit the number of server identities from active sources such as user input, scanners, or other applications.

The Firepower Management Center displays the current identity in bold. The system uses the current identity of a server for multiple purposes, including assigning vulnerabilities to a host, impact assessment, evaluating correlation rules written against host profile qualifications and compliance white lists, and so on.

The server detail may also display updated sub-server information known about the selected server.

The server detail may also display the server banner, which appears below the server details when you view a server from the host profile. Server banners provide additional information about a server that may help you identify the server. The system cannot identify or detect a misidentified server when an attacker purposely alters the server banner string. The server banner displays the first 256 bytes of the first packet detected for the server. It is collected only once, the first time the server is detected by the system. Banner content is listed in two columns, with a hexadecimal representation on the left and a corresponding ASCII representation on the right.

---

**Note**

To view server banners, you must enable the **Capture Banners** check box in the network discovery policy. This option is disabled by default.

The server details section of the host profile includes the following information:

**Protocol**

The name of the protocol the server uses.

**Port**

The port where the server runs.
Hits

The number of times the server was detected by a Firepower System managed device or an Nmap scanner. The number of hits is 0 for servers imported through host input, unless the system detects traffic for that server.

Last Used

The time and date the server was last detected. The last used time for host input data reflects the initial data import time unless the system detects new traffic for that server. Scanner and application data imported through the host input feature times out according to settings in the Firepower Management Center configuration, but user input through the Management Center web interface does not time out.

Application Protocol

The name of the application protocol used by the server, if known.

Vendor

The server vendor. This field does not appear if the vendor is unknown.

Version

The server version. This field does not appear if the version is unknown.

Source

One of the following values:

• User: user_name
• Application: app_name
• Scanner: scanner_type (Nmap or other scanner)
• Firepower, Firepower Port Match, or Firepower Pattern Match for applications detected by the Firepower System
• NetFlow for servers added to the network map from NetFlow records

The system may reconcile data from multiple sources to determine the identity of a server.

You can manually update the identity settings for a server on a host and configure any fixes that you have applied to the host to remove the vulnerabilities addressed by the fixes. You can also delete server identities. Deleting an identity does not delete the server, even if you delete the only identity. Deleting an identity does remove the identity from the Server Detail pop-up window and, if applicable, updates the current identity for the server in the host profile.

You cannot edit or delete server identities added by a Cisco-managed device.

Procedure

**Step 1** Navigate to the **Servers** section of a host profile.

**Step 2** Click **View** to open the Server Detail pop-up window.

**Step 3** To delete a server identity, click the delete icon ( ) next to the server identity you want to remove.

**Step 4** To modify a server identity, click the edit icon ( ) next to the server in the servers list.

**Step 5** You have two choices:

- Choose the current definition from the **Select Server Type** drop-down list.
- Choose the type of server from the **Select Server Type** drop-down list.

**Step 6** Optionally, to only list vendors and products for that server type, choose the **Restrict by Server Type** check box.

**Step 7** Optionally, to customize the name and version of the server, choose the **Use Custom Display String**, and enter a **Vendor String** and **Version String**.

**Step 8** In the **Product Mappings** section, choose the operating system, product, and versions you want to use.

**Example:**

For example, if you want the server to map to Red Hat Linux 9, choose **Redhat, Inc.** as the vendor, **Redhat Linux** as the product, and **9** as the version.

**Step 9** If you want to indicate that fixes for the server have been applied, click **Configure Fixes**, and add the patches you want to apply for that server to the fixes list.

**Step 10** Click **Finish**.

</table>

A server identity conflict occurs when an active source, such as an application or scanner, adds identity data for a server to a host, after which the system detects traffic for that port that indicates a conflicting server identity.

**Procedure**

**Step 1**
In a host profile, navigate to the **Servers** section.

**Step 2**
Click the resolve icon next to a server.

**Step 3**
Choose the type of server from the **Select Server Type** drop-down list.

**Step 4**
Optionally, to only list vendors and products for that server type, choose the **Restrict by Server Type** check box.

**Step 5**
Optionally, to customize the name and version of the server, choose **Use Custom Display String**, and enter a **Vendor String** and **Version String**.

**Step 6**
In the **Product Mappings** section, choose the operating system, product, and versions you want to use.

**Example:**
For example, if you want the server to map to Red Hat Linux 9, choose **Redhat, Inc.** as the vendor, **Redhat Linux** as the product, and **9** as the version.

**Step 7**
If you want to indicate that fixes for the server have been applied, click **Configure Fixes**, and add the patches you want to apply for that server to the fixes list.

**Step 8**
Click **Finish**.

**Related Topics**
- **Configuring Network Discovery Identity Conflict Resolution**, on page 1760

Web Applications in the Host Profile

The Web Application section of the host profile displays the clients and web applications that the system identifies as running on the hosts on your network. The system can identify client and web application information from both passive and active detection sources, although the information for hosts added from NetFlow records is limited.

Details in this section include the product and version of the detected applications on a host, any available client or web application information, and the time that the application was last detected in use.

The section lists up to 16 clients running on the host. After that limit is reached, new client information from any source, whether active or passive, is discarded until you delete a client application from the host or the system deletes the client from the host profile due to inactivity (the client times out).
Additionally, for each detected web browser, the system displays the first 100 web applications accessed. After that limit is reached, new web applications associated with that browser from any source, whether active or passive, are discarded until either:

- the web browser client application times out, or
- you delete application information associated with a web application from the host profile

If the host is running an application that violates a compliance white list in an activated correlation policy, the Firepower Management Center marks the non-compliant application with the white list violation icon (●).

Tip
To analyze the connection events associated with a particular application on the host, click the events icon (●) next to the application. The first page of your preferred workflow for connection events appears, showing connection events constrained by the type, product, and version of the application, as well as the IP address(es) of the host. If you do not have a preferred workflow for connection events, you must select one.

Descriptions of the application information that appears in a host profile follow.

**Application Protocol**
Displays the application protocol used by the application (HTTP browser, DNS client, and so on).

**Client**
Client information derived from payload if identified by the Firepower System, captured by Nmap, or acquired via the host input feature. The field is blank if none of the available sources provides an identification.

**Version**
Displays the version of the client.

**Web Application**
For web browsers, the content detected by the system in the http traffic. Web application information indicates the specific type of content (for example, WMV or QuickTime) identified by the Firepower System, captured by Nmap, or acquired via the host input feature. The field is blank if none of the available sources provides an identification.

### Deleting Web Applications from the Host Profile

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can delete an application from a host profile to remove applications that you know are not running on the host. Note that deleting an application from a host may bring the host into compliance with a white list.
If the system detects the application again, it re-adds it to the network map and the host profile.

**Procedure**

**Step 1**  
In a host profile, navigate to the **Applications** section.

**Step 2**  
Click the delete icon (삭제) next to the application you want to delete.

### Host Protocols in the Host Profile

Each host profile contains information about the protocols detected in the network traffic associated with the host. This information includes:

**Protocol**  
The name of a protocol used by the host.

**Layer**  
The network layer where the protocol runs (Network or Transport).

If a protocol displaying in the host profile violates a compliance white list in an activated correlation policy, the Firepower Management Center marks the non-compliant protocol with the white list violation icon (⚠️).

If the host profile lists protocols that you know are not running on the host, you can delete those protocols. Deleting a protocol from a host may bring the host into compliance with a compliance white list.

**Note**  
If the system detects the protocol again, it re-adds it to the network map and the host profile.

### Deleting a Protocol From the Host Profile

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**  
Navigate to the **Protocols** section of a host profile.

**Step 2**  
Click the delete icon (삭제) next to the protocol you want to delete.
Indications of Compromise in the Host Profile

The Firepower System correlates various types of data (intrusion events, Security Intelligence, connection events, and file or malware events) to determine whether a host on your monitored network is likely to be compromised by malicious means. Certain combinations and frequencies of event data trigger indications of compromise (IOC) tags on affected hosts.

The Indications of Compromise section of the host profile displays all indication of compromise tags for a host.

To configure the system to tag indications of compromise, see Enabling Indications of Compromise Rules, on page 1762.

For more information about working with indications of compromise, see Indications of Compromise Data, on page 2205 and the subtopics under that topic.

Related Topics

Indications of Compromise, on page 1761

VLAN Tags in the Host Profile

The VLAN Tag section of the host profile appears if the host is a member of a Virtual LAN (VLAN). Physical network equipment often uses VLANs to create logical network segments from different network blocks. The system detects 802.1q VLAN tags and displays the following information for each:

- **VLAN ID** identifies the VLAN where the host is a member. This can be any integer between zero and 4095 for 802.1q VLANs.

- **Type** identifies the encapsulated packet containing the VLAN tag, which can be either Ethernet or Token Ring.

- **Priority** identifies the priority in the VLAN tag, which can be any integer from zero to 7, where 7 is the highest priority.

If VLAN tags are nested within the packet, the system processes and the Firepower Management Center displays the innermost VLAN tag. The system collects and displays VLAN tag information only for MAC addresses that it identifies through ARP and DHCP traffic.

VLAN tag information can be useful, for example, if you have a VLAN composed entirely of printers and the system detects a Microsoft Windows 2000 operating system in that VLAN. VLAN information also helps the system generate more accurate network maps.

User History in the Host Profile

The user history portion of the host profile provides a graphic representation of the last twenty-four hours of user activity. A typical user logs off in the evening and may share the host resource with another user. Periodic login requests, such as those made to check email, are indicated by short regular bars. A list of user identities is provided with bar graphs to indicate when the user login was detected. Note that for non-authoritative logins, the bar graph is gray.
Note that the system does associate a non-authoritative user login to a host with an IP address of that host, so the user does appear in the host’s user history. However, if an authoritative user login is detected for the same host, the user associated with the authoritative user login takes over the association with the host IP address, and new non-authoritative user logins do not disrupt that user association with the host IP address. If you configure capture of failed logins in the network discovery policy, the list includes users that failed to log into the host.

**Host Attributes in the Host Profile**

You can use *host attributes* to classify hosts in ways that are important to your network environment. Three types of attributes are present in the Firepower System:

- *predefined host attributes*
- *white list host attributes*
- *user-defined host attributes*

After you set a predefined host attribute or create a user-defined host attribute, you must assign a host attribute value.

**Note**

Host attributes can be defined at any domain level. You can assign host attributes created in current and ancestor domains.

**Predefined Host Attributes**

The Firepower Management Center provides two predefined host attributes:

**Host Criticality**

Use this attribute to designate the business criticality of a given host and to tailor correlation responses to host criticality. For example, if you consider your organization’s mail servers more critical to your business than a typical user workstation, you can assign a value of High to your mail servers and other business-critical devices and Medium or Low to other hosts. You can then create a correlation policy that launches different alerts based on the criticality of an affected host.

**Notes**

Use this host-specific attribute to record information about the host that you want other analysts to view. For example, if you have a computer on the network that has an older, unpatched version of an operating system that you use for testing, you can use the Notes feature to indicate that the system is intentionally unpatched.

**White List Host Attributes**

Each compliance white list that you create automatically creates a host attribute with the same name as the white list. Possible values for white list host attributes are:

- Compliant — Identifies hosts that are compliant with the white list.
- Non-Compliant — Identifies hosts that violate the white list.
Not Evaluated — Identifies hosts that are not valid targets of the white list or have not been evaluated for any reason.

You cannot edit the value of a white list host attribute or delete a white list host attribute.

User-Defined Host Attributes

If you want to identify hosts using criteria that differs from those used in the predefined host attributes or white list host attributes, you can create user-defined host attributes. For example, you can:

• Assign physical location identifiers to hosts, such as a facility code, city, or room number.

• Assign a Responsible Party Identifier that indicates which system administrator is responsible for a given host. You can then craft correlation rules and policies to send alerts to the correct system administrator when problems related to a host are detected.

• Automatically assign values to hosts from a predefined list based on the hosts’ IP addresses. This feature can be useful to assign values to new hosts when they appear on your network for the first time.

User-defined host attributes appear in the host profile page, where you can assign values on a per-host basis. You can also:

• Use the attributes in correlation policies and searches.

• View the attributes on the host attribute table view of events and generate reports based on them.

User-defined host attributes can be one of the following types:

Text

Allows you to manually assign a text string to a host.

Integer

Allows you to specify the first and last number of a range of positive integers, then manually assign one of these numbers to a host.

List

Allows you to create a list of string values, then manually assign one of the values to a host. You can also automatically assign values to hosts based on the host’s IP addresses.

If you auto-assign values based on one IP address of a host with multiple IP addresses, those values will apply across all addresses associated with that host. Keep this in mind when you view the Host Attributes table.

When automatically assigning list values, consider using network objects rather than literal IP addresses. This approach can improve maintainability, particularly in a multidomain deployment where using override-enabled objects allows descendant domain administrators to tailor ancestor configurations to their local environments. In a multidomain deployment, be careful when defining auto-assigned lists at ancestor domain levels to avoid matching unintended hosts when the descendant domains use overlapping IP addresses.

URL

Allows you to manually assign a URL value to a host.

Deleting a user-defined host attribute removes it from every host profile where it is used.
Creating Text- or URL-Based Host Attributes

<table>
<thead>
<tr>

<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

**Procedure**

---

**Step 1** Choose Analysis > Hosts > Host Attributes.

**Step 2** Click Host Attribute Management.

**Step 3** Click Create Attribute.

**Step 4** Enter a Name.

**Step 5** Choose the Type of attribute that you want to create as described in User-Defined Host Attributes, on page 2173.

**Step 6** Click Save.

---

Creating Integer-Based Host Attributes

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

When you define an integer-based host attribute, you must specify the range of numbers that the attribute accepts.

**Procedure**

---

**Step 1** Choose Analysis > Hosts > Host Attributes.

**Step 2** Click Host Attribute Management.

**Step 3** Click Create Attribute.

**Step 4** Enter a Name.

**Step 5** Choose the Type of attribute that you want to create as described in User-Defined Host Attributes, on page 2173.

**Step 6** In the Min field, enter the minimum integer value that can be assigned to a host.

**Step 7** In the Max field, enter the maximum integer value that can be assigned to a host.

**Step 8** Click Save.
Creating List-Based Host Attributes

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

When you define a list-based host attribute, you must supply each of the values for the list. These values can contain alphanumeric characters, spaces, and symbols.

**Procedure**

**Step 1** Choose Analysis > Hosts > Host Attributes.

**Step 2** Click Host Attribute Management.

**Step 3** Click Create Attribute.

**Step 4** Enter a Name.

**Step 5** Choose the Type of attribute that you want to create as described in User-Defined Host Attributes, on page 2173.

**Step 6** To add a value to the list, click Add Value.

**Step 7** In the Name field, enter the first value you want to add.

**Step 8** Optionally, to auto-assign the attribute value you just added to your hosts, click Add Networks.

**Step 9** Choose the value you added from the Value drop-down list.

**Step 10** In the IP Address and Netmask fields, enter the IP address and network mask (IPv4) that represent the IP address block where you want to auto-assign this value.

**Step 11** Repeat steps 6 through 10 to add additional values to the list and assign them automatically to new hosts that fall within an IP address block.

**Step 12** Click Save.

Setting Host Attribute Values

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can set values for predefined and user-defined host attributes. You cannot set values for white list host attributes generated by the system.

**Procedure**

**Step 1** Open the host profile you want to modify.

**Step 2** In the Attributes section, click Edit Attributes.

**Step 3** Update attribute as desired.
White List Violations in the Host Profile

A compliance white list (or white list) is a set of criteria that allows you to specify the operating systems, application protocols, clients, web applications, and protocols that are allowed to run on a specific subnet.

If you add a white list to an active correlation policy, when the system detects that a host is violating the white list, the Firepower Management Center logs a white list event—which is a special kind of correlation event—to the database. Each of these white list events is associated with a white list violation, which indicates how and why a particular host is violating a white list. If a host violates one or more white lists, you can view these violations in its host profile in two ways.

First, the host profile lists all of the individual white list violations associated with the host. Descriptions of the white list violation information in the host profile follow.

**Type**

The type of the violation, that is, whether the violation occurred as a result of a non-compliant operating system, application, server, or protocol.

**Reason**

The specific reason for the violation. For example, if you have a white list that allows only Microsoft Windows hosts, the host profile displays the current operating system running on the host (such as Linux 2.4, 2.6).

**White List**

The name of the white list associated with the violation.

Second, in the sections associated with operating systems, applications, protocols, and servers, the Firepower Management Center marks non-compliant elements with the white list violation icon ( ). For example, for a white list that allows only Microsoft Windows hosts, the host profile displays the white list violation icon next to the operating system information for that host.

**Note**

You can use a host’s profile to create a shared host profile for compliance white lists.

Creating Shared White List Host Profiles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Shared host profiles for compliance white lists specify which operating systems, application protocols, clients, web applications, and protocols are allowed to run on target hosts across multiple white lists. That is, if you create multiple white lists but want to use the same host profile to evaluate hosts running a particular operating system across the white lists, use a shared host profile.
You can use a host profile of any host with a known IP address to create a shared host profile that your compliance white lists can use. However, note that you cannot create a shared host profile based on an individual host’s host profile if the system has not yet identified the operating system of the host.

Procedure

**Step 1**
In a host profile, click **Generate White List Profile**.

**Step 2**
Modify and save the shared host profile according to your specific needs.

Building White List Host Profiles, on page 1800

---

## Malware Detections in the Host Profile

The Most Recent Malware Detections section lists the most recent malware events where the host sent or received a malware file, up to 100 events. The host profile lists both network-based (AMP for Networks) and endpoint-based (AMP for Endpoints) malware events.

If the host is involved in a file event where the file is then retrospectively identified as malware, the original events where the file was transmitted appear in the malware detections list after the malware identification occurs. When a file identified as malware is retrospectively determined not to be malware, the malware events related to that file no longer appear in the list. For example, if a file has a disposition of **Malware** and that disposition changes to **Clean**, the event for that file is removed from the malware detections list on the host profile.

When viewing malware detections in the host profile, you can view malware events for that host by clicking the malware icon (🔍).

Description of the columns in the Most Recent Malware Detections sections of the host profile follow.

**Time**

The date and time the event was generated.

For an event where the file was retrospectively identified as malware, note that this is the time of the original event, not the time when the malware was identified.

**Host Role**

The host’s role in the transmission of detected malware, either sender or receiver. Note that for endpoint-based malware events, the host is always the receiver.

**Threat Name**

The name of the detected malware.

**File Name**

The name of the malware file.
Vulnerabilities in the Host Profile

The Vulnerabilities sections of the host profile list the vulnerabilities that affect that host. These vulnerabilities are based on the operating system, servers, and applications that the system detected on the host.

If there is an identity conflict for either the identity of the host’s operating system or one of the application protocols on the host, the system lists vulnerabilities for both identities until the conflict is resolved.

Because no operating system information is available for hosts added to the network map from NetFlow data, the system cannot assign Vulnerable (impact level 1: red) impact levels for intrusion events involving those hosts. In such cases, use the host input feature to manually set the operating system identity for the hosts.

Server vendor and version information is often not included in traffic. By default, the system does not map the associated vulnerabilities for the sending and receiving hosts of such traffic. However, you can configure the system to map vulnerabilities for specific application protocols that do not have vendor or version information.

If you use the host input feature to add third-party vulnerability information for the hosts on your network, additional Vulnerabilities sections appear. For example, if you import vulnerabilities from a QualysGuard Scanner, host profiles on your include a QualysGuard Vulnerabilities section. For third-party vulnerabilities, the information in the corresponding Vulnerabilities section in the host profile is limited to the information that you provided when you imported the vulnerability data using the host input feature.

You can associate third-party vulnerabilities with operating systems and application protocols, but not clients. For information on importing third-party vulnerabilities, see the Firepower System Host Input API Guide.

Descriptions of the columns in the Vulnerabilities sections of the host profile follow.

Name

The name of the vulnerability.

Remote

Indicates whether the vulnerability can be remotely exploited. If this column is blank, the vulnerability definition does not include this information.

Component

The name of the operating system, application protocol, or client associated with the vulnerability.

Port

A port number, if the vulnerability is associated with an application protocol running on a specific port.

**Downloading Patches for Vulnerabilities**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can download patches to mitigate the vulnerabilities discovered on the hosts on your network.

**Procedure**

**Step 1** Access the host profile of a host for which you want to download a patch.
**Step 2** Expand the **Vulnerabilities** section.
**Step 3** Click the name of the vulnerability you want to patch.
**Step 4** Expand the **Fixes** section to display the list of patches for the vulnerability.
**Step 5** Click **Download** next to the patch you want to download.
**Step 6** Download the patch and apply it to your affected systems.

**Deactivating Vulnerabilities for Individual Hosts**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can use the host vulnerability editor to deactivate vulnerabilities on a host-by-host basis. When you deactivate a vulnerability for a host, it is still used for impact correlations for that host, but the impact level is automatically reduced one level.

**Procedure**

**Step 1** Navigate to the **Vulnerabilities** section of a host profile.
**Step 2** Click **Edit Vulnerabilities**.
**Step 3** Choose the vulnerability from the **Valid Vulnerabilities** list, and click the down arrow to move it to the **Invalid Vulnerabilities** list.

**Tip** You can click and drag to choose multiple adjacent vulnerabilities; you can also double-click any vulnerability to move it from list to list.

**Step 4** Click **Save**.
What to do next

• Optionally, activate the vulnerability for the host by moving it from the Invalid Vulnerabilities list to the Valid Vulnerabilities list.

Related Topics
  Deactivating Individual Vulnerabilities, on page 2180

<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

If you deactivate a vulnerability in a host profile, it deactivates it for all hosts in your network map. However, you can reactivate it at any time.

In a multidomain deployment, deactivating a vulnerability in an ancestor domain deactivates it in all descendant domains. Leaf domains can activate or deactivate a vulnerability for their devices if the vulnerability is activated in the ancestor domain.

Procedure

Step 1 Access the vulnerability detail:

• In an affected host profile, expand the Vulnerabilities section, and click the name of the vulnerability you want to enable or disable.
• In the predefined workflow, choose Analysis > Vulnerabilities > Vulnerabilities, and click the view icon (🔍) next to the vulnerability you want to enable or disable.

Step 2 Choose Disabled from the Impact Qualification drop-down list.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3 Confirm that you want to change the Impact Qualification value for all hosts on the network map.

Step 4 Click Done.

What to do next

• Optionally, activate the vulnerability by choosing Enabled from the Impact Qualification drop-down list while performing the steps above.

Scan Results in the Host Profile

When you scan a host using Nmap, or when you import results from an Nmap scan, those results appear in the host profile for any hosts included in the scan.

The information that Nmap collects about the host operating system and any servers running on open unfiltered ports is added directly into the Operating System and Servers sections of the host profile, respectively. In addition, Nmap adds a list of the scan results for that host in the Scan Results section. Note that the scan must find open ports on the host for Scan Results section to appear in the profile.

Each result indicates the source of the information, the number and type of the scanned port, the name of the server running on the port, and any additional information detected by Nmap, such as the state of the port or the vendor name for the server. If you scan for UDP ports, servers detected on those ports only appear in the Scan Results section.

Note that you can run an Nmap scan from the host profile.

Scanning a Host from the Host Profile

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can perform a Nmap scan against a host from the host profile. After the scan completes, server and operating system information for that host are updated in the host profile. Any additional scan results are added to the Scan Results section of the host profile.

Caution

Nmap-supplied server and operating system data remains static until you run another Nmap scan or override it with higher priority host input. If you plan to scan a host using Nmap, regularly schedule scans.

Before you begin

- Add an Nmap scan instance; see Adding an Nmap Scan Instance, on page 1689.

Procedure

Step 1
In the host profile, click Scan Host.

Step 2
Click Scan next to the scan remediation you want to use to scan the host.
The system scans the host and adds the results to the host profile.

Working with Discovery Events

The following topics describe how to work with discovery events:

- Discovery and Identity Data in Discovery Events, on page 2183
- Viewing Discovery Event Statistics, on page 2184
- Viewing Discovery Performance Graphs, on page 2187
- Using Discovery and Identity Workflows, on page 2188

Discovery and Identity Data in Discovery Events

The system generates tables of events that represent the changes detected in your monitored network. You can use these tables to review the user activity on your network and determine how to respond. The network discovery and identity policies specify the kinds of data you want to collect, the network segments you want to monitor, and the specific hardware interfaces you want to use to do it.

You can use discovery and identity event tables to identify threats associated with hosts, applications, and users on your network. The system provides a set of predefined workflows that you can use to analyze the events that your system generates. You can also create custom workflows that display only the information that matches your specific needs.

To collect and store network discovery and identity data for analysis, you must configure network discovery and identity policies. After you configure an identity policy, you must invoke it in your access control policy and deploy it to the devices you want to use to monitor traffic.

Your network discovery policy provides host, application, and non-authoritative user data. Your identity policy provides authoritative user data.

The following discovery event tables are located under the Analysis > Hosts, Analysis > Users, and Analysis > Vulnerabilities menus.

<table>
<thead>
<tr>

The Discovery Statistics page displays a summary of the hosts, events, protocols, application protocols, and operating systems detected by the system.

The page lists statistics for the last hour and the total accumulated statistics. You can choose to view statistics for a particular device, or all devices. You can also view events that match the entries on the page by clicking the event, server, operating system, or operating system vendor listed within the summary.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1** Choose **Overview > Summary > Discovery Statistics**.

**Step 2** From the **Select Device** list, choose the device whose statistics you want to view. Optionally, choose **All** to view statistics for all devices managed by the Firepower Management Center.

**Step 3** You have the following options:

- In the Statistics Summary, view general statistics as described in The Statistics Summary Section, on page 2185.

- In the Event Breakdown, click the type of event you want to view. If no events appear, you may need to adjust the time range as described in Changing the Time Window, on page 1997.

- In the Protocol Breakdown, view the protocols currently in use by detected hosts.

- In the Application Protocol Breakdown, click the name of the application protocol you want to view.
• In the OS Breakdown, click the OS Name or OS Vendor.

Related Topics
- The Event Breakdown Section, on page 2186
- The Protocol Breakdown Section, on page 2186
- The Application Protocol Breakdown Section, on page 2186
- The OS Breakdown Section, on page 2186

The Statistics Summary Section

Descriptions of the rows of the Statistics Summary section follow.

Total Events
Total number of discovery events stored on the Firepower Management Center.

Total Events Last Hour
Total number of discovery events generated in the last hour.

Total Events Last Day
Total number of discovery events generated in the last day.

Total Application Protocols
Total number of application protocols from servers running on detected hosts.

Total IP Hosts
Total number of detected hosts identified by unique IP address.

Total MAC Hosts
Total number of detected hosts not identified by IP address.

Note that the Total MAC Hosts statistic remains the same whether you are viewing discovery statistics for all devices or for a specific device. This is so because managed devices discover hosts based on their IP addresses. This statistic gives the total of all hosts that are identified by other means and is independent of a given managed device.

Total Routers
Total number of detected nodes identified as routers.

Total Bridges
Total number of detected nodes identified as bridges.
Host Limit Usage

Total percentage of the host limit currently in use. The host limit is defined by the model of your Firepower Management Center. Note that the host limit usage only appears if you are viewing statistics for all managed devices.

---

Note

If the host limit is reached and a host is deleted, the host will not reappear on the network map you purge discovery data.

---

Last Event Received

The date and time that the most recent discovery event occurred.

Last Connection Received

The date and time that the most recent connection was completed.

The Event Breakdown Section

The Event Breakdown section lists a count of each type of discovery event and host input event that occurred within the last hour, as well as a count of the total number of each event type stored in the database.

You can also use the Event Breakdown section to view details on discovery and host input events.

Related Topics

Discovery and Host Input Events, on page 2190

The Protocol Breakdown Section

The Protocol Breakdown section lists the protocols currently in use by detected hosts. It displays each detected protocol name, its “layer” in the protocol stack, and the total number of hosts that communicate using the protocol.

The Application Protocol Breakdown Section

The Application Protocol Breakdown section lists the application protocols that are currently in use by detected hosts. It lists the protocol name, the total number of hosts running the application protocol in the past hour, and the total number of hosts that have been detected running the protocol at any point.

You can also use the Application Protocol Breakdown section to view details on servers using the detected protocols.

Related Topics

Server Data, on page 2209

The OS Breakdown Section

The OS Breakdown section lists the operating systems currently running on the monitored network, along with their vendors and the total number of hosts running each operating system.
A value of unknown for the operating system name or version means that the operating system or its version does not match any of the system’s fingerprints. A value of pending means that the system has not yet gathered enough information to identify the operating system or its version.

You can use the OS Breakdown section to view details on the detected operating systems.

Host Data, on page 2197

### Viewing Discovery Performance Graphs

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

You can generate graphs that display performance statistics for managed devices with discovery events. New data is accumulated for statistics graphs every five minutes. Therefore, if you reload a graph quickly, the data may not change until the next five-minute increment occurs.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

#### Procedure

1. Choose **Overview > Summary > Discovery Performance**.
2. From the **Select Device** list, choose the Firepower Management Center or managed devices you want to include.
3. From the **Select Graph(s)** list, choose the type of graph you want to create as described in Discovery Performance Graph Types, on page 2187.
4. From the **Select Time Range** list, choose the time range you would like to use for the graph.
5. Click **Graph** to graph the selected statistics.

#### Discovery Performance Graph Types

Descriptions of the available graph types follow.

**Processed Events/Sec**

Displays a graph that represents the number of events that the Data Correlator processes per second

**Processed Connections/Sec**

Displays a graph that represents the number of connections that the Data Correlator processes per second

**Generated Events/Sec**

Displays a graph that represents the number of events that the system generates per second
Mbits/Sec  
Displays a graph that represents the number of megabits of traffic that are analyzed by the discovery process per second.

Avg Bytes/Packet  
Displays a graph that represents the average number of bytes included in each packet analyzed by the discovery process.

K Packets/Sec  
Displays a graph that represents the number of packets analyzed by the discovery process per second, in thousands.

Using Discovery and Identity Workflows

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>task dependent</td>
</tr>
</tbody>
</table>

The Firepower Management Center provides a set of event workflows that you can use to analyze the discovery and identity data that is generated for your network. The workflows are, along with the network map, a key source of information about your network assets.

The Firepower Management Center provides predefined workflows for discovery and identity data, detected hosts and their host attributes, servers, applications, application details, vulnerabilities, user activities, and users. You can also create custom workflows.

Procedure

**Step 1**  
To access a predefined workflow:

- Discovery and Host Input Data — See Viewing Discovery and Host Input Events, on page 2196.
- Host Data — See Viewing Host Data, on page 2198.
- Host Attributes Data — See Viewing Host Attributes, on page 2203.
- Indications of Compromise Data — See Viewing Indications of Compromise Data, on page 2206.
- Server Data — See Viewing Server Data, on page 2210.
- Application Data — See Viewing Application Data, on page 2213.
- Application Detail Data — See Viewing Application Detail Data, on page 2215.
- User Data — See Viewing User Data, on page 2230.
- User Activity Data — See Viewing User Activity Data, on page 2233.
- Network Map — See Viewing Network Maps, on page 1950.

**Step 2**  
To access a custom workflow, choose Analysis > Custom > Custom Workflows.
Step 3
To access a workflow based on a custom table, choose Analysis > Custom > Custom Tables.

Step 4
Perform any of the following actions, which are common to all of the pages accessed in the network discovery workflows:

- **Constrain Columns** — To constrain the columns that display, click the close icon (×) in the column heading that you want to hide. In the pop-up window that appears, click **Apply**.

  **Tip** To hide or show other columns, check or clear the appropriate check boxes before you click **Apply**. To add a disabled column back to the view, click the expand arrow to expand the search constraints, then click the column name under Disabled Columns.

- **Delete** — To delete some or all items in the current constrained view, check the check boxes next to items you want to delete and click **Delete**, or click **Delete All**. These items remain deleted until the system’s discovery function is restarted, when they may be detected again.

  **Caution** Before you delete a session on the Analysis > Users > Users page, verify that the session is actually closed. After you delete the active session, an applicable policy will not be able to detect the session on the device, and therefore the session will not be monitored or blocked even if the policy was configured to perform those actions.

  **Note** You cannot delete Cisco (as opposed to third-party) vulnerabilities; you can, however, mark them reviewed.

- **Drill Down** — To drill down to the next page in the workflow, see Using Drill-Down Pages, on page 1985.

- **Navigate Current Page** — To navigate within the current workflow page, see Workflow Page Navigation Tools, on page 1982.

- **Navigate within a Workflow** — To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page.

- **Navigate to Other Workflows** — To navigate to other event views to examine associated events, see Inter-Workflow Navigation, on page 2003.

- **Sort Data** — To sort data in a workflow, click the column title. Click the column title again to reverse the sort order.

- **View Host Profile** — To view the host profile for an IP address, click the host profile icon (_addresses) or, for hosts with active indications of compromise (IOC) tags, the compromised host icon (Addresses) that appears next to the IP address.

- **View User Profile** — To view user identity information, click the user icon that appears next to the user identity (Addresses).

**Related Topics**
- Using Workflows, on page 1977
- Purging Data from the Management Center Database, on page 191
Discovery and Host Input Events

The system generates discovery events that communicate the details of changes in your monitored network segments. New events are generated for newly discovered network features, and change events are generated for any change in previously identified network assets.

During its initial network discovery phase, the system generates new events for each host and any TCP or UDP servers discovered running on each host. Optionally, you can configure the system to use exported NetFlow records to generate these new host and server events.

In addition, the system generates new events for each network, transport, and application protocol running on each discovered host. You can disable detection of application protocols in discovery rules configured to monitor NetFlow exporters, but not in discovery rules configured to monitor Firepower System managed devices. If you enable host or user discovery in non-NetFlow discovery rules, applications are automatically discovered.

After the initial network mapping is complete, the system continuously records network changes by generating change events. Change events are generated whenever the configuration of a previously discovered asset changes.

When a discovery event is generated, it is logged to the database. You can use the Firepower Management Center web interface to view, search, and delete discovery events. You can also use discovery events in correlation rules. Based on the type of discovery event generated as well as other criteria that you specify, you can build correlation rules that, when used in a correlation policy, launch remediations and syslog, SNMP, and email alert responses when network traffic meets your criteria.

You can add data to the network map using the host input feature. You can add, modify, or delete operating system information, which causes the system to stop updating that information for that host. You can also manually add, modify, or delete application protocols, clients, servers, and host attributes or modify vulnerability information. When you do this, the system generates host input events.

Discovery Event Types

You can configure the types of discovery events the system logs in your network discovery policy. When you view the discovery events table, the event type is listed in the Event column. Descriptions of the discovery event types follow.

Additional MAC Detected for Host

This event is generated when the system detects a new MAC address for a previously discovered host.

This event is often generated when the system detects hosts passing traffic through a router. While each host has a different IP address, they all appear to have the MAC address associated with the router. When the system detects the actual MAC address associated with the IP address, it displays the MAC address in bold text within the host profile and displays an “ARP/DHCP detected” message within the event description in the event view.

Client Timeout

This event is generated when the system drops a client from the database due to inactivity.

Client Update

This event is generated when the system detects a payload (that is, a specific type of content, such as audio, video, or webmail) in HTTP traffic.
**DHCP: IP Address Changed**

This event is generated when the system detects that a host IP address has changed due to DHCP address assignment.

**DHCP: IP Address Reassigned**

This event is generated when a host is reusing an IP address; that is, when a host obtains an IP address formerly used by another physical host due to DHCP IP address assignment.

**Hops Change**

This event is generated when the system detects a change in the number of network hops between a host and the device that detects the host. This may happen if:

- The device sees host traffic through different routers and is able to make a better determination of the host’s location.
- The device detects an ARP transmission from the host, indicating that the host is on a local segment.

**Host Deleted: Host Limit Reached**

This event is generated when the host limit on the Firepower Management Center is exceeded and a monitored host is deleted from the network map.

**Host Dropped: Host Limit Reached**

This event is generated when the host limit on the Firepower Management Center is reached and a new host is dropped. Compare this with the previous event where old hosts are deleted from the network map when the host limit is reached.

To drop new hosts when the host limit is reached, go to **Policies > Network Discovery > Advanced** and set **When Host Limit Reached** to **Drop hosts**.

**Host IOC Set**

This event is generated when an IOC (Indications of Compromise) is set for a host and generates an alert.

**Host Timeout**

This event is generated when a host is dropped from the network map because the host has not produced traffic within the interval defined in the network discovery policy. Note that individual host IP addresses and MAC addresses time out individually; a host does not disappear from the network map unless all of its associated addresses have timed out.

If you change the networks you want to monitor in your network discovery policy, you may want to manually delete old hosts from the network map so that they do not count against your host limit.

**Host Type Changed to Network Device**

This event is generated when the system detects that a detected host is actually a network device.
Identity Conflict

This event is generated when the system detects a new server or operating system identity that conflicts with a current active identity for that server or operating system.

If you want to resolve identity conflicts by rescanning the host to obtain newer active identity data, you can use Identity Conflict events to trigger an Nmap remediation.

Identity Timeout

This event is generated when server or operating system identity data from an active source times out.

If you want to refresh identity data by rescanning the host to obtain newer active identity data, you can use Identity Conflict events to trigger an Nmap remediation.

MAC Information Change

This event is generated when the system detects a change in the information associated with a specific MAC address or TTL value.

This event often occurs when the system detects hosts passing traffic through a router. While each host hats a different IP address, they will all appear to have the MAC address associated with the router. When the system detects the actual MAC address associated with the IP address, it displays the MAC address in bold text within the host profile and displays an “ARP/DHCP detected” message within the event description in the event view. The TTL may change because the traffic may pass through different routers or if the system detects the actual MAC address of the host.

NETBIOS Name Change

This event is generated when the system detects a change to a host’s NetBIOS name. This event will only be generated for hosts using the NetBIOS protocol.

New Client

This event is generated when the system detects a new client.

To collect and store client data for analysis, make sure that you enable application detection in your discovery rules in the network discovery policy.

New Host

This event is generated when the system detects a new host running on the network.

This event can also be generated when a device processes NetFlow data that involves a new host. To generate an event in this case, configure the network discovery rule that manages NetFlow data to discover hosts.

New Network Protocol

This event is generated when the system detects that a host is communicating with a new network protocol (IP, ARP, and so on).
New OS
This event is generated when the system either detects a new operating system for a host, or a change in a host’s operating system.

New TCP Port
This event is generated when the system detects a new TCP server port (for example, a port used by SMTP or web services) active on a host. This event is not used to identify the application protocol or the server associated with it; that information is transmitted in the TCP Server Information Update event.

This event can also be generated when a device processes NetFlow data involving a server on your monitored networks that does not already exist in the network map. To generate an event in this case, configure the network discovery rule that manages NetFlow data to discover applications.

New Transport Protocol
This event is generated when the system detects that a host is communicating with a new transport protocol, such as TCP or UDP.

New UDP Port
This event is generated when the system detects a new UDP server port running on a host.

This event can also be generated when a device processes NetFlow data involving a server on your monitored networks that does not already exist in the network map. To generate an event in this case, configure the network discovery rule that manages NetFlow data to discover applications.

TCP Port Closed
This event is generated when the system detects that a TCP port has closed on a host.

TCP Port Timeout
This event is generated when the system has not detected activity from a TCP port within the interval defined in the system’s network discovery policy.

TCP Server Information Update
This event is generated when the system detects a change in a discovered TCP server running on a host.
This event may be generated if a TCP server is upgraded.

UDP Port Closed
This event is generated when the system detects that a UDP port has closed on a host.

UDP Port Timeout
This event is generated when the system has not detected activity from a UDP port within the interval defined in the network discovery policy.

UDP Server Information Update
This event is generated when the system detects a change in a discovered UDP server running on a host.
This event may be generated if a UDP server is upgraded.

**VLAN Tag Information Update**

This event is generated when the system detects a change in the VLAN tag attributed to a host.

**Related Topics**

- Host Input Event Types, on page 2194
- Network Discovery Data Storage Settings, on page 1763
- Application and Operating System Identity Conflicts, on page 1647
- Network Discovery Identity Conflict Settings, on page 1759

## Host Input Event Types

When you view a table of discovery events, the event type is listed in the *Event* column.

Contrast host input events, which are generated when a user takes a specific action (such as manually adding a host), with discovery events, which are generated when the system itself detects a change in your monitored network (such as detecting traffic from a previously undetected host).

You can configure the types of host input events that the system logs by modifying your network discovery policy.

If you understand the information the different types of host input events provide, you can more effectively determine which events you want to log and alert on, and how to use these alerts in correlation policies. In addition, knowing the names of the event types can help you craft more effective event searches. Descriptions of the different types of host input events follow.

**Add Client**

This event is generated when a user adds a client.

**Add Host**

This event is generated when a user adds a host.

**Add Protocol**

This event is generated when a user adds a protocol.

**Add Scan Result**

This event is generated when the system adds the results of an Nmap scan to a host.

**Add Port**

This event is generated when a user adds a server port.

**Delete Client**

This event is generated when a user deletes a client from the system.

**Delete Host/Network**

This event is generated when a user deletes an IP address or subnet from the system.
Delete Protocol
This event is generated when a user deletes a protocol from the system.

Delete Port
This event is generated when a user deletes a server port or group of server ports from the system.

Host Attribute Add
This event is generated when a user creates a new host attribute.

Host Attribute Delete
This event is generated when a user deletes a user-defined host attribute.

Host Attribute Delete Value
This event is generated when a user deletes a value assigned to a host attribute.

Host Attribute Set Value
This event is generated when a user sets a host attribute value for a host.

Host Attribute Update
This event is generated when a user changes the definition of a user-defined host attribute.

Set Host Criticality
This event is generated when a user sets or modifies the host criticality value for a host.

Set Operating System Definition
This event is generated when a user sets the operating system for a host.

Set Server Definition
This event is generated when a user sets the vendor and version definitions for a server.

Set Vulnerability Impact Qualification
This event is generated when a vulnerability impact qualification is set.

When a vulnerability is disabled at a global level from being used for impact qualifications, or when a vulnerability is enabled at a global level, this event is generated.

Vulnerability Set Invalid
This event is generated when a user invalidates (or reviews) a vulnerability or vulnerabilities.

Vulnerability Set Valid
This event is generated when a user validates a vulnerability that was previously marked as invalid.
Viewing Discovery and Host Input Events

Discovery events workflows allow you to view data from both discovery events and host input events. You can manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access events differs depending on the workflow you use. You can use the predefined workflow, which includes the table view of discovery events and a terminating host view page. You can also create a custom workflow that displays only the information that matches your specific needs.

Procedure

**Step 1**  
Choose Analysis > Hosts > Discovery Events.

**Step 2**  
You have the following options:

- Adjust the time range as described in Changing the Time Window, on page 1997.

  **Note**  
  Events that were generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.

- Use a different workflow, including a custom workflow, by clicking **switch workflow**.
- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2188.
- Learn more about the contents of the columns in the table; see Discovery Event Fields, on page 2196.

Related Topics

Using Discovery and Identity Workflows, on page 2188

Discovery Event Fields

Descriptions of the fields that can be viewed and searched in the discovery events table follow.

**Time**  
The time that the system generated the event.

**Event**  
The discovery event type or host input event type.
IP Address
The IP address associated with the host involved in the event.

User
The last user to log into the host involved in the event before the event was generated. If only non-authoritative users log in after an authoritative user, the authoritative user remains the current user for the host unless another authoritative user logs in.

MAC Address
The MAC address of the NIC used by the network traffic that triggered the discovery event. This MAC address can be either the actual MAC address of the host involved in the event, or the MAC address of a network device that the traffic passed through.

MAC Vendor
The MAC hardware vendor of the NIC used by the network traffic that triggered the discovery event. When searching this field, enter **virtual_mac_vendor** to match events that involve virtual hosts.

Port
The port used by the traffic that triggered the event, if applicable.

Description
The text description of the event.

Domain
The domain of the device that discovered the host. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Device
The name of the managed device that generated the event. For new host and new server events based on NetFlow data, this is the managed device that processed the data.

Related Topics
- Event Searches, on page 2007

Host Data
The system generates an event when it detects a host and collects information about it to build the host profile. You can use the Firepower Management Center web interface to view, search, and delete hosts.

While viewing hosts, you can create traffic profiles and compliance white lists based on selected hosts. You can also assign host attributes, including host criticality values (which designate business criticality) to groups of hosts. You can then use these criticality values, white lists, and traffic profiles within correlation rules and policies.

The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1649.
Related Topics

Differences between NetFlow and Managed Device Data, on page 1649

Viewing Host Data

You can use the Firepower Management Center to view a table of hosts that the system has detected. Then, you can manipulate the view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access hosts differs depending on the workflow you use. Both predefined workflows terminate in a host view, which contains a host profile for every host that meets your constraints. You can also create a custom workflow that displays only the information that matches your specific needs.

Procedure

Step 1

Access the host data:

• If you are using the predefined workflow, choose Analysis > Hosts > Hosts.
• If you are using a custom workflow that does not include the table view of hosts, click (switch workflow), then choose Hosts.

Step 2

You have the following options:

• Use a different workflow, including a custom workflow, by clicking (switch workflow).
• Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2188.
• Learn more about the contents of the columns in the table; see Host Data Fields, on page 2198.
• Assign a host attribute to specific hosts; see Setting Host Attributes for Selected Hosts, on page 2195.
• Create traffic profiles for specific hosts, see Creating a Traffic Profile for Selected Hosts, on page 2202.
• Create a compliance white list based on specific hosts, see Creating a Compliance White List Based on Selected Hosts, on page 2203.

Host Data Fields

When the system discovers a host, it collects data about that host. That data can include the host’s IP addresses, the operating system it is running, and more. You can view some of that information in the table view of hosts.

Descriptions of the fields that can be viewed and searched in the hosts table follow below.

Last Seen

The date and time any of the host’s IP addresses was last detected by the system. The Last Seen value is updated at least as often as the update interval you configured in the network discovery policy, as well as when the system generates a new host event for any of the host’s IP addresses.
For hosts with operating system data updated using the host input feature, the Last Seen value indicates the date and time when the data was originally added.

**IP Address**
The IP addresses associated with the host.

**MAC Address**
The host’s detected MAC address of the NIC.
The MAC Address field appears in the Table View of Hosts, which you can find in the Hosts workflow. You can also add the MAC Address field to:
- custom tables that include fields from the Hosts table
- drill-down pages in custom workflows based on the Hosts table

**MAC Vendor**
The host’s detected MAC hardware vendor of the NIC.
The MAC Vendor field appears in the Table View of Hosts, which you can find in the Hosts workflow. You can also add the MAC Vendor field to:
- custom tables that include fields from the Hosts table
- drill-down pages in custom workflows based on the Hosts table

When searching this field, enter `virtual_mac_vendor` to match events that involve virtual hosts.

**Current User**
The user identity (username) of the currently logged in user on the host.

Note that when a non-authoritative user logs into a host, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user logs into the host, only a login by another authoritative user changes the current user. In addition, when a non-authoritative user is the current user on a host, that user still cannot be used for user control.

**Host Criticality**
The user-specified criticality value assigned to the host.

**NetBIOS Name**
The NetBIOS name of the host. Only hosts running the NetBIOS protocol will have a NetBIOS name.

**VLAN ID**
VLAN ID used by the host.

**Hops**
The number of network hops from the device that detected the host to the host.
**Host Type**

The type of host. Can be any of the following: host, mobile device, jailbroken mobile device, router, bridge, NAT device, and load balancer.

The methods the system uses to distinguish network devices include:

- the analysis of Cisco Discovery Protocol (CDP) messages, which can identify network devices and their type (Cisco devices only)
- the detection of the Spanning Tree Protocol (STP), which identifies a device as a switch or bridge
- the detection of multiple hosts using the same MAC address, which identifies the MAC address as belonging to a router
- the detection of TTL value changes from the client side, or TTL values that change more frequently than a typical boot time, which identify NAT devices and load balancers

If a device is not identified as a network device, it is categorized as a host.

When searching this field, enter `!host` to search for all network devices.

**Hardware**

The hardware platform for a mobile device.

**OS**

One of the following:

- The operating system (name, vendor, and version) either detected on the host or updated using Nmap or the host input feature
  - `unknown` if the operating system does not match any known fingerprint
  - `pending` if the system has not yet gathered enough information to identify the operating system

If the system detects multiple identities, it displays those identities in a comma-separated list.

This field appears when you invoke the hosts event view from the Custom Analysis widget on the dashboard. It is also a field option in custom tables based on the Hosts table.

When searching this field, enter `n/a` to include hosts where the operating system has not yet been identified.

**OS Conflict**

This field is search only.

**OS Vendor**

One of the following:

- The vendor of the operating system detected on the host or updated using Nmap or the host input feature
  - `unknown` if the operating system does not match any known fingerprint
  - `pending` if the system has not yet gathered enough information to identify the operating system

If the system detects multiple vendors, it displays those vendors in a comma-separated list.
When searching this field, enter n/a to include hosts where the operating system has not yet been identified.

**OS Name**

One of the following:
- The operating system detected on the host or updated using Nmap or the host input feature
- unknown if the operating system does not match any known fingerprint
- pending if the system has not yet gathered enough information to identify the operating system

If the system detects multiple names, it displays those names in a comma-separated list.

When searching this field, enter n/a to include hosts where the operating system has not yet been identified.

**OS Version**

One of the following:
- The version of the operating system detected on the host or updated using Nmap or the host input feature
- unknown if the operating system does not match any known fingerprint
- pending if the system has not yet gathered enough information to identify the operating system

If the system detects multiple versions, it displays those versions in a comma-separated list.

When searching this field, enter n/a to include hosts where the operating system has not yet been identified.

**Source Type**

The type of source used to establish the host’s operating system identity:
- User: user_name
- Application: app_name
- Scanner: scanner_type (Nmap or scanner added through network discovery configuration)
- Firepower for operating systems detected by the system

The system may reconcile data from multiple sources to determine the identity of an operating system.

**Confidence**

One of the following:
- the percentage of confidence that the system has in the identity of the operating system running on the host, for hosts detected by the system
- 100%, for operating systems identified by an active source, such as the host input feature or Nmap scanner
- unknown, for hosts for which the system cannot determine an operating system identity, and for hosts added to the network map based on NetFlow data

When searching this field, enter n/a to include hosts added to the network map based on NetFlow data.
Notes
The user-defined content of the Notes host attribute.

Domain
The domain associated with the host. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Device
Either the managed device that detected the traffic or the device that processed NetFlow or host input data.
If this field is blank, either of the following conditions is true:
• The host was added to the network map by a device that is not explicitly monitoring the network where the host resides, as defined in the network discovery policy.
• The host was added using the host input feature and has not also been detected by the system.

Count
The number of events that match the information that appears in each row. This field appears only after you apply a constraint that creates two or more identical rows.

</tr>
</tbody>
</table>

A traffic profile is a profile of the traffic on your network, based on connection data collected over a timespan that you specify. After you create a traffic profile, you can detect abnormal network traffic by evaluating new traffic against your profile, which presumably represents normal network traffic.

You can use the Hosts page to create a traffic profile for a group of hosts that you specify. The traffic profile will be based on connections detected where one of the hosts you specify is the initiating host. Use the sort and search features to isolate the hosts for which you want to create a profile.

Procedure

Step 1 On a table view in the hosts workflow, check the check boxes next to the hosts for which you want to create a traffic profile.
Step 2 At the bottom of the page, click Create Traffic Profile.
Step 3 Modify and save the traffic profile according to your specific needs.

</table>

Compliance white lists allow you to specify which operating systems, clients, and network, transport, or application protocols are allowed on your network.

You can use the Hosts page to create a compliance white list based on the host profiles of a group of hosts that you specify. Use the sort and search features to isolate the hosts that you want to use to create a white list.

**Procedure**

**Step 1**
On a table view in the hosts workflow, check the check boxes next to the hosts for which you want to create a white list.

**Step 2**
At the bottom of the page, click **Create White List**.

**Step 3**
Modify and save the white list according to your specific needs.

**Related Topics**

**Host Attribute Data**

The Firepower System collects information about the hosts it detects and uses that information to build host profiles. However, there may be additional information about the hosts on your network that you want to provide to your analysts. You can add notes to a host profile, set the business criticality of a host, or provide any other information that you choose. Each piece of information is called a host attribute.

You can use host attributes in host profile qualifications, which constrain the data you collect while building a traffic profile, and also can limit the conditions under which you want to trigger a correlation rule. You can also set attribute values in response to a correlation rule.

You can use the Firepower Management Center to view a table of hosts detected by the system, along with their host attributes. Then, you can manipulate the view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.
The page you see when you access host attributes differs depending on the workflow you use. You can use the predefined workflow, which includes a table view of host attributes that lists all detected hosts and their attributes, and terminates in a host view page, which contains a host profile for every host that meets your constraints.

You can also create a custom workflow that displays only the information that matches your specific needs.

**Procedure**

**Step 1**
Access the host attributes data:

- If you are using the predefined workflow, choose **Analysis > Hosts > Host Attributes**.
- If you are using a custom workflow that does not include the table view of host attributes, click **(switch workflow)**, then choose **Attributes**.

**Step 2**
You have the following options:

- Use a different workflow, including a custom workflow, by clicking **(switch workflow)**.
- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2188.
- Learn more about the contents of the columns in the table; see Host Attribute Data Fields, on page 2204.
- Assign a host attribute to specific hosts; see Setting Host Attributes for Selected Hosts, on page 2205.

**Host Attribute Data Fields**

Note that the host attributes table does not display hosts identified only by MAC addresses.

Descriptions of the fields that can be viewed and searched in the host attributes table follow.

**IP Address**
The IP addresses associated with a host.

**Current User**
The user identity (username) of the currently logged in user on the host.

Note that when a non-authoritative user logs into a host, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user logs into the host, only a login by another authoritative user changes the current user. In addition, when a non-authoritative user is the current user on a host, that user still cannot be used for user control.

**Host Criticality**
The user-assigned importance of a host to your enterprise. You can use the host criticality in correlation rules and policies to tailor policy violations and their responses to the importance of a host involved in an event. You can assign a host criticality of low, medium, high, or none.

**Notes**
Information about the host that you want other analysts to view.
Any user-defined host attribute, including those for compliance white lists

The value of the user-defined host attribute. The host attributes table contains a field for each user-defined host attribute.

Domain

The domain associated with the host. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Count

The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows.

Related Topics

You can configure predefined and user-defined host attributes from a host workflow.

Procedure

Step 1  In a host workflow, check the check boxes next to the hosts to which you want to add a host attribute.
Tip  Use the sort and search features to isolate the hosts to which you want to assign particular attributes.

Step 2  At the bottom of the page, click Set Attributes.

Step 3  Optionally, set the host criticality for the hosts you selected. You can choose None, Low, Medium, or High.

Step 4  Optionally, add notes to the host profiles of the hosts you selected in the text box.

Step 5  Optionally, set any user-defined host attributes you have configured.

Step 6  Click Save.

Indications of Compromise Data

The Firepower System correlates various types of data (intrusion events, Security Intelligence, connection events, and file or malware events) to determine whether a host on your monitored network is likely to be compromised by malicious means. Certain combinations and frequencies of event data trigger indications of compromise (IOC) tags on affected hosts. The IP addresses of these hosts appear in event views with a red compromised host icon ( ![compromised host icon](https://firepower.com)).

You can view and work with IOC data in several parts of the Firepower System web interface:
• Event Viewer (various tabs under the Analysis menu) — Connection, Security Intelligence, intrusion, malware, and IOC discovery event views indicate whether an event triggered an IOC. Note that endpoint-based malware events that trigger IOC rules have the event type AMP IOC and appear with an event subtype that specifies the compromise.

• Dashboard — In the dashboard, the Threats tab of the Summary Dashboard displays, by default, IOC tags by host and new IOC rules triggered over time. The Custom Analysis widget offers presets based on IOC data.

• Context Explorer — The Indications of Compromise section of the Context Explorer displays graphs of hosts by IOC category and IOC categories by host.

• Network Map page — The Indications of Compromise tab under Analysis > Hosts > Network Map groups potentially compromised hosts on your network by type of compromise and IP address.

• Network File Trajectory details page — The details pages for files listed under Analysis > Files > Network File Trajectory let you track indications of compromise on your network.

• Indications of Compromise page — The Indications of Compromise page under the Analysis > Hosts menu lists monitored hosts, grouped by IOC tag. Use the workflows on this page to drill down into your data.

• Host Profile page — The host profile for a potentially compromised host displays all IOC tags associated with that host, and lets you resolve IOC tags and configure IOC rule states.

To configure the system to tag events as indications of compromise, see Enabling Indications of Compromise Rules, on page 1762.

### Viewing Indications of Compromise Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can use the Firepower Management Center to view tables showing Indications of Compromise (IOC). Manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see depends on the workflow you use. The predefined IOC workflows terminate in a profile view, which contains a host profile for every host that meets your constraints. You can also create a custom workflow that displays only the information that matches your specific needs.

**Before you begin**

• For your system to detect and tag indications of compromise (IOC), you must activate the IOC feature in the network discovery policy and enable at least one IOC rule. See Enabling Indications of Compromise Rules, on page 1762.
Procedure

Step 1
If you are using the predefined workflow, choose Analysis > Hosts > Indications of Compromise.
If you are using a custom workflow that does not include the Host IOC table view, click (switch workflow), then choose Indications of Compromise.

Step 2
You have the following options:
• Use a different workflow, including a custom workflow, by clicking (switch workflow).
• Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2188.
• Learn more about the contents of the columns in the table; see Indications of Compromise Data Fields, on page 2207.
• View the host profile for a compromised host by clicking the compromised host icon ( ) in the IP Address column.
• Mark IOC events resolved so they no longer appear in the list. To do so, check the check boxes next to the IOC events you want to modify, then click Mark Resolved.
• View details of events that triggered the IOC by clicking the view icon ( ) in the First Seen or Last Seen columns.

Indications of Compromise Data Fields

The following are the fields in IOC (indication of compromise) tables. Not every IOC-related table includes all fields.

IP Address
The IP address associated with the host that triggered the IOC.

Category
Brief description of the type of compromise indicated, such as Malware Executed or Impact 1 Attack.

Event Type
Identifier associated with a specific IOC, referring to the event that triggered it.

Description
Description of the impact on the potentially compromised host, such as This host may be under remote control or Malware has been executed on this host.

First Seen/Last Seen
The first/most recent date and time that events triggering the IOC occurred.
**Domain**

The domain of the host that triggered the IOC. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

### Editing Indication of Compromise Rule States for a Single Host

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst except Read Only</td>
</tr>
</tbody>
</table>

When enabled in a network discovery policy, indication of compromise rules apply to all hosts in the monitored network. You can disable a rule for an individual host to avoid unhelpful IOC tags (for example, you may not want to see IOC tags for a DNS server.) If a rule is disabled in the applicable network discovery policy, it cannot be enabled for a specific host.

**Procedure**

**Step 1** Navigate to the Indications of Compromise section of a host profile.

**Step 2** Click Edit Rule States.

**Step 3** In the Enabled column for a rule, click the slider to enable or disable it.

**Step 4** Click Save.

---

### Viewing Source Events for Indication of Compromise Tags

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can use the Indications of Compromise section of the host profile to navigate quickly to the events that triggered the IOC tags. Analyzing these events can give you the information you need to determine what, and whether, action is required to address threats of compromise.

Clicking the view icon (👀) next to the timestamp of an IOC tag navigates to the table view of events for the relevant event type, constrained to show only the event that triggered the IOC tag.

**Procedure**

**Step 1** In a host profile, navigate to the Indications of Compromise section.
Step 2  Click the view icon ( ) in the First Seen or Last Seen column for the IOC tag you want to investigate.

---

**Resolving Indication of Compromise Tags**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

After you have analyzed and addressed the threats indicated by an indication of compromise (IOC) tag, or if you determine that an IOC tag represents a false positive, you can mark an event resolved. Marking an event resolved removes it from the host profile; when all active IOC tags on a profile are resolved, the compromised host icon ( ) no longer appears. You can still view the IOC-triggering events for the resolved IOC.

If the events that triggered the IOC tag recur, the tag is set again unless you have disabled the IOC rule for the host.

**Procedure**

**Step 1**  In a host profile, navigate to the **Indications of Compromise** section.

**Step 2**  You have two choices:

- To mark an individual IOC tag resolved, click the delete icon ( ) to the right of the tag you want to resolve.
- To mark all IOC tags on the profile resolved, click **Mark All Resolved**.

---

**Server Data**

The Firepower System collects information about all servers running on hosts on monitored network segments. This information includes:

- the name of the server
- the application and network protocols used by the server
- the vendor and version of the server
- the IP address associated with the host running a server
- the port on which the server communicates

When the system detects a server, it generates a discovery event unless the associated host has already reached its maximum number of servers. You can use the Firepower Management Center web interface to view, search, and delete server events.

You can also base correlation rules on server events. For example, you could trigger a correlation rule when the system detects a chat server, such as ircd, running on one of your hosts.
The system can add hosts to the network map from exported NetFlow records, but the available information for these hosts is limited; see Differences between NetFlow and Managed Device Data, on page 1649.

Related Topics
- Host Limits and Discovery Event Logging, on page 1704
- Differences between NetFlow and Managed Device Data, on page 1649

Viewing Server Data

You can use the Firepower Management Center to view a table of detected servers. Then, you can manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access servers differs depending on the workflow you use. All the predefined workflows terminate in a host view, which contains a host profile for every host that meets your constraints. You can also create a custom workflow that displays only the information that matches your specific needs.

Procedure

Step 1
Access the server data:

- If you are using the predefined workflow, choose Analysis > Hosts > Servers.
- If you are using a custom workflow that does not include the table view of servers, click (switch workflow), then choose Servers.

Step 2
You have the following options:

- Use a different workflow, including a custom workflow, by clicking (switch workflow).
- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2188.
- Learn more about the contents of the columns in the table; see Server Data Fields, on page 2210.
- Edit server identities by checking the check boxes next to the events for servers you want to edit, then clicking Set Server Identity.

Related Topics
- Editing Server Identities, on page 2167

Server Data Fields

Descriptions of the fields that can be viewed and searched in the servers table follow below.

Last Used

The date and time the server was last used on the network or the date and time that the server was originally updated using the host input feature. The Last Used value is updated at least as often as the update interval
you configured in the network discovery policy, as well as when the system detects a server information update.

**IP Address**
The IP address associated with the host running the server.

**Port**
The port where the server is running.

**Protocol**
The network or transport protocol used by the server.

**Application Protocol**
One of the following:
- the name of the application protocol for the server
- pending if the system cannot positively or negatively identify the server for one of several reasons
- unknown if the system cannot identify the server based on known server fingerprints or if the server was added through host input and did not include the application protocol

**Category, Tags, Risk, or Business Relevance for Application Protocols**
The categories, tags, risk level, and business relevance assigned to the application protocol. These filters can be used to focus on a specific set of data.

**Vendor**
One of the following:
- the server vendor as identified by the system, Nmap or another active source, or that you specified using the host input feature
- blank, if the system cannot identify its vendor based on known server fingerprints, or if the server was added to the network map using NetFlow data

**Version**
One of the following:
- the server version as identified by the system, Nmap or another active source, or that you specified using the host input feature
- blank, if the system cannot identify its version based on known server fingerprints, or if the server was added to the network map using NetFlow data
**Web Application**

The web application based on the payload content detected by the system in the HTTP traffic. Note that if the system detects an application protocol of HTTP but cannot detect a specific web application, the system supplies a generic web browsing designation.

**Category, Tags, Risk, or Business Relevance for Web Applications**

The categories, tags, risk level, and business relevance assigned to the web application. These filters can be used to focus on a specific set of data.

**Hits**

The number of times the server was accessed. For servers added using the host input feature, this value is always 0.

**Source Type**

One of the following values:

- User: user_name
- Application: app_name
- Scanner: scanner_type (Nmap or scanner added through network discovery configuration)
- Firepower, Firepower Port Match, or Firepower Pattern Match for servers detected by the Firepower System
- NetFlow for servers added using NetFlow data

**Domain**

The domain of the host running the server. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

**Device**

Either the managed device that detected the traffic or the device that processed NetFlow or host input data.

**Current User**

The user identity (username) of the currently logged in user on the host.

When a non-authoritative user logs into a host, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user logs into the host, only a login by another authoritative user changes the current user. In addition, when a non-authoritative user is the current user on a host, that user still cannot be used for user control.

**Count**

The number of events that match the information that appears in each row. This field appears only after you apply a constraint that creates two or more identical rows.
Application and Application Details Data

When a monitored host connects to another host, the system can, in many cases, determine what application was used. The Firepower System detects the use of many email, instant messaging, peer-to-peer, web applications, as well as other types of applications.

For each detected application, the system logs the IP address that used the application, the product, the version, and the number of times its use was detected. You can use the web interface to view, search, and delete application events. You can also update application data on a host or hosts using the host input feature.

If you know which applications are running on which hosts, you can use that knowledge to create host profile qualifications, which constrain the data you collect while building a traffic profile, and also can limit the conditions under which you want to trigger a correlation rule. You can also base correlation rules on the detection of application. For example, if you want your employees to use a specific mail client, you could trigger a correlation rule when the system detects a different mail client running on one of your hosts.

You can obtain the latest information about Firepower's application detectors by carefully reading both the release notes for each Firepower System update and advisories for each VDB update.

To collect and store application data for analysis, make sure that you enable application detection in your network discovery policy.

Viewing Application Data

</table>

You can use the Firepower Management Center to view a table of detected applications. Then, you can manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access applications differs depending on the workflow you use. You can also create a custom workflow that displays only the information that matches your specific needs.

Procedure

**Step 1**
Access the application data:

- If you are using the predefined workflow, choose Analysis > Hosts > Application Details.
- If you are using a custom workflow that does not include the table view of application details, click (switch workflow), then choose Clients.

**Step 2**
You have the following options:

- Use a different workflow, including a custom workflow, by clicking (switch workflow).
• Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2188.
• Learn more about the contents of the table; see Application Data Fields, on page 2214.
• Open the Application Detail View for a specific application by clicking the application detail view icon next to a client, application protocol, or web application.

### Application Data Fields

When the system detects traffic for a known client, application protocol, or web application, it logs information about the application and the host running it.

Descriptions of the fields that can be viewed and searched in the applications table follow.

**Application**

The name of the detected application.

**IP Address**

The IP address associated with the host using the application.

**Type**

The type of application:

- **Application Protocols**
  - Represents communications between hosts.

- **Client Applications**
  - Represents software running on a host.

- **Web Applications**
  - Represents the content or requested URL for HTTP traffic.

**Category**

A general classification for the application that describes its most essential function. Each application belongs to at least one category.

**Tag**

Additional information about the application. Applications can have any number of tags, including none.

**Risk**

How likely the application is to be used for purposes that might be against your organization’s security policy. An application’s risk can range from Very Low to Very High.

Of Application Protocol Risk, Client Risk, and Web Application Risk, the highest of the three detected, when available, in the traffic that triggered the intrusion event.
**Business Relevance**

The likelihood that the application is used within the context of your organization’s business operations, as opposed to recreationally. An application’s business relevance can range from Very Low to Very High.

Of Application Protocol Business Relevance, Client Business Relevance, and Web Application Business Relevance, the lowest of the three detected, when available, in the traffic that triggered the intrusion event.

**Current User**

The user identity (username) of the currently logged in user on the host.

Note that when a non-authoritative user logs into a host, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user logs into the host, only a login by another authoritative user changes the current user. In addition, when a non-authoritative user is the current user on a host, that user still cannot be used for user control.

**Domain**

The domain of the host using the application. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

**Count**

The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows.

### Viewing Application Detail Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can use the Firepower Management Center to view a table of detected application details. Then, you can manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access application details differs depending on the workflow you use. There are two predefined workflows. You can also create a custom workflow that displays only the information that matches your specific needs.

**Procedure**

**Step 1**

Access the application details data:

- If you are using the predefined workflow, choose Analysis > Hosts > Application Details.
• If you are using a custom workflow that does not include the table view of application details, click (switch workflow), then select Clients.

Step 2  You have the following options:
  • Use a different workflow, including a custom workflow, by clicking (switch workflow).
  • Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2188.
  • Learn more about the contents of the columns in the table; see Application Detail Data Fields, on page 2216.
  • Open the Application Detail View for a specific application by clicking the application detail view icon ( ) next to a client.

---

**Application Detail Data Fields**

When the system detects traffic for a known client, application protocol, or web application, it logs information about the application and the host running it.

Descriptions of the fields that can be viewed and searched in the application details table follow.

**Last Used**

The time that the application was last used or the time that the application data was updated using the host input feature. The Last Used value is updated at least as often as the update interval you configured in the network discovery policy, as well as when the system detects an application information update.

**IP Address**

The IP address associated with the host using the application.

**Client**

The name of the application. Note that if the system detected an application protocol but could not detect a specific client, client is appended to the application protocol name to provide a generic name.

**Version**

The version of the application.

**Category, Tags, Risk, or Business Relevance for Clients, Application Protocols, and Web Applications**

The categories, tags, risk level, and business relevance assigned to the application. These filters can be used to focus on a specific set of data.

**Application Protocol**

The application protocol used by the application. Note that if the system detected an application protocol but could not detect a specific client, client is appended to the application protocol name to provide a generic name.
Web Application

The web application based on the payload content or URL detected by the system in the HTTP traffic. Note that if the system detects an application protocol of HTTP but cannot detect a specific web application, the system supplies a generic web browsing designation here.

Hits

The number of times the system detected the application in use. For applications added using the host input feature, this value is always 0.

Domain

The domain of the host using the application. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Device

The device that generated the discovery event containing the application detail.

Current User

The user identity (username) of the currently logged in user on the host.

Note that when a non-authoritative user logs into a host, that login is recorded in the user and host history. If no authoritive user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user logs into the host, only a login by another authoritative user changes the current user. In addition, when a non-authoritative user is the current user on a host, that user still cannot be used for user control.

Count

The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows.

Vulnerability Data

The Firepower System includes its own vulnerability tracking database which is used, in conjunction with the system’s fingerprinting capability, to identify the vulnerabilities associated with the hosts on your network. The operating systems, servers, and clients running on your hosts have different sets of associated vulnerabilities.

You can use the Firepower Management Center to:

- Track and review the vulnerabilities for each host.
- Deactivate vulnerabilities for a host after you patch the host or otherwise judge it immune to a vulnerability.

Vulnerabilities for vendorless and versionless servers are not mapped unless the applications protocols used by the servers are mapped in the Firepower Management Center configuration. Vulnerabilities for vendorless and versionless clients cannot be mapped.
Vulnerability Data Fields

The vulnerability data fields described below can be viewed in the table view of vulnerabilities and in the vulnerability details display as follows:

*Table 303: Vulnerability Data Fields by Display Location*

<table>
<thead>
<tr>
<th>Field</th>
<th>Table View</th>
<th>Details Display</th>

<tr>
<td>Vulnerability Impact</td>
<td>yes</td>
<td>yes</td>
</tr>
</tbody>
</table>

**Additional Information**

Click the arrow to view additional information (if available) about the vulnerability, such as known exploits and their availability, exploit scenarios, and mitigation strategies.

**Available Exploits**

Indicates whether there are known exploits for the vulnerability (true/false).
**Bugtraq ID**

**Count**

The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows.

**CVE ID**

The identification number associated with the vulnerability in MITRE’s Common Vulnerabilities and Exposures (CVE) database ([http://www.cve.mitre.org/](http://www.cve.mitre.org/)).

**Date Published**

The date the vulnerability was published.

**Description**

A brief description of the vulnerability.

**Fixes**

Provides links to downloadable patches for the selected vulnerability.

---

**Tip**

If direct links to fix or patch downloads appear, right-click the link and save it to your local computer.

**Impact Qualification**

Use the drop-down list to enable or disable a vulnerability. The Firepower Management Center ignores disabled vulnerabilities in its impact correlations.

The setting you specify here determines how the vulnerability is treated on a system-wide basis and is not limited to the host profile where you select the value.

**Remote**

Indicates whether the vulnerability is remotely exploitable (TRUE/FALSE).

**Snort ID**

The identification number associated with the vulnerability in the Snort ID (SID) database. That is, if an intrusion rule can detect network traffic that exploits a particular vulnerability, that vulnerability is associated with the intrusion rule’s SID.

Note that a vulnerability can be associated with more than one SID (or no SIDs at all). If a vulnerability is associated with more than one SID, the vulnerabilities table includes a row for each SID.

**Solution**

Information about repairing the vulnerability.
**SVID**
The Cisco vulnerability identification number that the system uses to track vulnerabilities.

Click the view icon ( ), to access the vulnerability details for the SVID.

**Technical Description**
A detailed technical description of the vulnerability.

**Title**
The title of the vulnerability.

**Vulnerability Impact**
Displays the severity assigned to the vulnerability in the Bugtraq database on a scale of 0 to 10, with 10 being the most severe. The vulnerability impact is determined by the writer of the Bugtraq entry based on his or her best judgment and guided by SANS Critical Vulnerability Analysis (CVA) criteria.

**Related Topics**
- Event Searches, on page 2007

**Vulnerability Deactivation**
Deactivating a vulnerability prevents the system from using that vulnerability to evaluate intrusion impact correlations. You can deactivate a vulnerability after you patch the hosts on your network or otherwise judge them immune. Note that if the system discovers a new host that is affected by that vulnerability, the vulnerability is considered valid (and is not automatically deactivated) for that host.

Deactivating a vulnerability within a vulnerabilities workflow that is not constrained by IP addresses deactivates the vulnerability for all detected hosts on your network. You can deactivate vulnerabilities within the vulnerabilities workflow only on:

- the second page of the default vulnerabilities workflow, **Vulnerabilities on the Network**, which shows only the vulnerabilities that apply to the hosts on your network
- a page in a vulnerabilities workflow, custom or predefined, that you constrained based on IP address using a search.

You can deactivate a vulnerability for a single host using the network map, using the host’s host profile, or by constraining the vulnerabilities workflow based on the IP addresses of the host or hosts for which you want to deactivate vulnerabilities. For hosts with multiple associated IP addresses, this function applies only to the single, selected IP address of that host.

In a multidomain deployment, deactivating a vulnerability in an ancestor domain deactivates it in all descendant domains. Leaf domains can activate or deactivate a vulnerability for their devices if the vulnerability is activated in the ancestor domain.

**Related Topics**
- Deactivating Vulnerabilities for Individual Hosts, on page 2179
- Deactivating Individual Vulnerabilities, on page 2180
- Deactivating Multiple Vulnerabilities, on page 2222
Viewing Vulnerability Data

You can use the Firepower Management Center to view a table of vulnerabilities. Then, you can manipulate the event view depending on the information you are looking for.

The page you see when you access vulnerabilities differs depending on the workflow you use. You can use the predefined workflow, which includes a table view of vulnerabilities. The table view contains a row for each vulnerability in the database, regardless of whether any of your detected hosts exhibit the vulnerabilities. The second page of the predefined workflow contains a row for each vulnerability (that you have not deactivated) that applies to detected hosts on your network. The predefined workflow terminates in a vulnerability detail view, which contains a detailed description for every vulnerability that meets your constraints.

Tip

If you want to see the vulnerabilities that apply to a single host or set of hosts, perform a search for vulnerabilities, specifying an IP address or range of IP addresses for the hosts.

You can also create a custom workflow that displays only the information that matches your specific needs.

The table of vulnerabilities is not restricted by domain in a multidomain deployment.

Procedure

Step 1 Access the table of vulnerabilities:

- If you are using the predefined vulnerabilities workflow, choose Analysis > Vulnerabilities > Vulnerabilities.
- If you are using a custom workflow that does not include the table view of vulnerabilities, click (switch workflow), then choose Vulnerabilities.

Step 2 You have the following options:

- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2188.
- Deactivate vulnerabilities so they are no longer used for intrusion impact correlation for currently vulnerable hosts; see Deactivating Multiple Vulnerabilities, on page 2222.
- View the details for a vulnerability by clicking the view icon ( ) in the SVID column. Alternatively, constrain on the vulnerability ID and drill down to the vulnerability details page.
- View the full text of a vulnerability title by right-clicking the title and choosing Show Full Text.
Viewing Vulnerability Details

Procedure

You can view vulnerability details in any of the following ways:

- Choose **Analysis > Vulnerabilities > Vulnerabilities**, and click the view icon (🔍) next to the SVID.
- Choose **Analysis > Vulnerabilities > Third-Party Vulnerabilities** and click the view icon (🔍) next to the SVID.
- Choose **Analysis > Hosts > Network Map**, and click the **Vulnerabilities** tab.
- View the profile of a host affected by the vulnerability, and expand the **Vulnerabilities** section of the profile.

Deactivating Multiple Vulnerabilities

<table>

<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Deactivating a vulnerability within a vulnerabilities workflow that is **not** constrained by IP addresses deactivates the vulnerability for all detected hosts on your network.

In a multidomain deployment, deactivating a vulnerability in an ancestor domain deactivates it in all descendant domains. Leaf domains can activate or deactivate a vulnerability for their devices so long as the vulnerability is activated in the ancestor domain.

Procedure

**Step 1**
Access the table of vulnerabilities:

- If you are using the predefined vulnerabilities workflow, choose **Analysis > Vulnerabilities > Vulnerabilities**.
- If you are using a custom workflow that does not include the table view of vulnerabilities, click **(switch workflow)**, then choose **Vulnerabilities**.

**Step 2**
Click **Vulnerabilities on the Network**.

**Step 3**
Check the check boxes next to vulnerabilities you want to deactivate.

**Step 4**
Click **Review** at the bottom of the page.

Related Topics

- [Deactivating Vulnerabilities for Individual Hosts](#), on page 2179

Third-Party Vulnerability Data

The Firepower System includes its own vulnerability tracking database which is used, in conjunction with the system’s fingerprinting capability, to identify the vulnerabilities associated with the hosts on your network.

You can augment the system's vulnerability data with imported network map data from third-party applications. To do so, your organization must be able to write scripts or create command line import files to import the data. For more information, see the Firepower System Host Input API Guide.

To include imported data in impact correlations, you must map third-party vulnerability information to the operating system and application definitions in the database. You cannot map third-party vulnerability information to client definitions.

Viewing Third-Party Vulnerability Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

After you use the host input feature to import third-party vulnerability data, you can use the Firepower Management Center to view a table of third-party vulnerabilities. Then, you can manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access third-party vulnerabilities differs depending on the workflow you use. There are two predefined workflows. You can also create a custom workflow that displays only the information that matches your specific needs.

Procedure

**Step 1**

Access the third-party vulnerabilities data:

- If you are using the predefined workflow, choose Analysis > Vulnerabilities > Third-Party Vulnerabilities.
- If you are using a custom workflow that does not include the table view of third-party vulnerabilities, click (switch workflow), then choose Vulnerabilities by Source or Vulnerabilities by IP Address.

**Step 2**

You have the following options:

- Use a different workflow, including a custom workflow, by clicking (switch workflow).
- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2188.
- Learn more about the contents of the columns in the table; see Third-Party Vulnerability Data Fields, on page 2224.
- View the vulnerability details for a third-party vulnerability by clicking the view icon () in the SVID column. Alternatively, constrain on the vulnerability ID and drill down to the vulnerability details page.
Third-Party Vulnerability Data Fields

Descriptions of the fields that can be viewed and searched in the third-party vulnerabilities table follow.

**Vulnerability Source**
The source of the third-party vulnerabilities, for example, QualysGuard or NeXpose.

**Vulnerability ID**
The ID number associated with the vulnerability for its source.

**IP Address**
The IP address associated with the host affected by the vulnerability.

**Port**
A port number, if the vulnerability is associated with a server running on a specific port.

**Bugtraq ID**

**CVE ID**
The identification number associated with the vulnerability in MITRE’s Common Vulnerabilities and Exposures (CVE) database ([http://www.cve.mitre.org/](http://www.cve.mitre.org/)).

**SVID**
The legacy vulnerability identification number that the system uses to track vulnerabilities.

Click the view icon (🔍) to access the vulnerability details for the SVID.

**Snort ID**
The identification number associated with the vulnerability in the Snort ID (SID) database. That is, if an intrusion rule can detect network traffic that exploits a particular vulnerability, that vulnerability is associated with the intrusion rule’s SID.

Note that a vulnerability can be associated with more than one SID (or no SIDs at all). If a vulnerability is associated with more than one SID, the vulnerabilities table includes a row for each SID.

**Title**
The title of the vulnerability.

**Description**
A brief description of the vulnerability.
Domain
The domain of the host with the vulnerability. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Count
The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows.

Users and User Activity Data
User and user activity data are displayed in individual user-related workflows:

- Users — this workflow displays all users seen on your network. A single user occupies a single row in this table. For more information, see User Data, on page 2228.

- User Activity — this workflow displays all user activity seen on your network. A single user with more than one instance of user activity would occupy several rows in this table. For more information, see User Activity Data, on page 2231.

For more information about the identity sources that populate these workflows, see About User Identity Sources, on page 1721.

User-Related Fields
User-related data is displayed in the users and user activity tables.

Table 304: Users and User Activity Field Descriptions

### User-Related Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Users Table</th>
<th>User Activity Table</th>
</tr>
</thead>
</table>
| Department         | The user’s department, as obtained by a realm. If there is no department explicitly associated with the user on your servers, the department is listed as whatever default group the server assigns. For example, on Active Directory, this is `Users (ad)`. This field is blank if:  
  - You have not configured a realm.  
  - The Firepower Management Center cannot correlate the user in the Management Center database with an LDAP record (for example, for users added to the database via an AIM, Oracle, or SIP login). | Yes         | No                  |
| Description        | More information, if available, about the user or user activity.                                                                                                                                              | No          | Yes                 |
| Device             | For user activity detected by traffic-based detection, the name of the device that detected the user. For other types of user activity, the managing Firepower Management Center.                                            | No          | Yes                 |
| Domain             | In the Users table, the domain associated with the user’s realm. In the User Activity table, the domain where the user activity was detected. This field is only present if you have ever configured the Firepower Management Center for multitenancy. | Yes         | Yes                 |
| E-Mail             | The user’s email address. This field is blank if:  
  - The user was added to the database via an AIM login.  
  - The user was added to the database via an LDAP login and there is no email address associated with the user on your LDAP servers. | Yes         | No                  |
<p>| Endpoint Location  | The IP address of the network device that used ISE to authenticate the user, as identified by ISE. If you do not configure ISE, this field is blank.                                                            | No          | Yes                 |
| Endpoint Profile   | The user's endpoint device type, as identified by Cisco ISE. If you do not configure ISE, this field is blank.                                                                                                 | No          | Yes                 |
| Event              | The user activity event type.                                                                                                                                                                                 | No          | Yes                 |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Users Table</th>
<th>User Activity Table</th>
</tr>
</thead>
</table>
| **First Name** | The user’s first name, as obtained by a realm. This field is blank if:  
  - You have not configured a realm.  
  - The Firepower Management Center cannot correlate the user in the Management Center database with an LDAP record (for example, for users added to the database via an AIM, Oracle, or SIP login).  
  - There is no first name associated with the user on your servers.                                                                                                                                                                                                                                                   | Yes         | No                  |
| **IP Address** | For User Login activity, the IP address involved in the login, which can be an IP address of the user’s host (for LDAP, POP3, IMAP, FTP, HTTP, MDNS, and AIM logins), the server (for SMTP and Oracle logins), or the session originator (for SIP logins).  
  Note that an associated IP address does not mean the user is the current user for that IP address; when a non-authoritative user logs into a host, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user logs into the host, only a login by another authoritative user changes the current user.  
  For other types of user activity, this field is blank.                                                                                                                                                                                                                           | No          | Yes                 |
| **Last Name** | The user’s last name, as obtained by a realm. This field is blank if:  
  - You have not configured a realm.  
  - The Firepower Management Center cannot correlate the user in the Management Center database with an LDAP record (for example, for users added to the database via an AIM, Oracle, or SIP login).  
  - There is no last name associated with the user on your servers.                                                                                                                                                                                                                               | Yes         | No                  |
| **Phone**   | The user’s telephone number, as obtained by a realm. This field is blank if:  
  - You have not configured a realm.  
  - The Firepower Management Center cannot correlate the user in the Management Center database with an LDAP record (for example, for users added to the database via an AIM, Oracle, or SIP login).  
  - There is no telephone number associated with the user on your servers.                                                                                                                                                                                                                       | Yes         | No                  |
### User Data

When an identity source reports a user login for a user who is not already in the database, the user is added to the database, unless you have specifically restricted that login type.

The system updates the users database when one of the following occurs:

- A user on the Firepower Management Center manually deletes a non-authoritative user from the Users table.

- An identity source reports a logoff by that user.

- A realm ends the user session as specified by the realm's **User Session Timeout: Authenticated Users**, **User Session Timeout: Failed Authentication Users**, or **User Session Timeout: Guest Users** setting.

**Note**

If you have ISE configured, you may see host data in the users table. Because host detection by ISE is not fully supported, you cannot perform user control using ISE-reported host data.

The type of user login that the system detected determines what information is stored about the new user.
<table>

</tr>
<tr>
<td></td>
<td></td>
<td>• type (pop3 or imap)</td>
</tr>
</tbody>
</table>
If you configure a realm to automatically download users, the Firepower Management Center queries the servers based on the interval you specified. It may take five to ten minutes for the Firepower Management Center database to update with user metadata after the system detects a new user login. The Firepower Management Center obtains the following information and metadata about each user:

- username
- first and last names
- email address
- department
- telephone number
- current IP address
- Security Group Tag (SGT), if available
- endpoint profile, if available
- endpoint location, if available
- start port, if available
- end port, if available

The number of users the Firepower Management Center can store in its database depends on your Firepower Management Center model. When a non-authoritative user login to a host is detected, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user login is detected for that host, only another authoritative user login changes the current user.

Note that traffic-based detection of AIM, Oracle, and SIP logins create duplicate user records because they are not associated with any of the user metadata that the system obtains from LDAP servers. To prevent overuse of user count because of duplicate user records from these protocols, configure traffic-based detection to ignore those protocols.

You can search, view, and delete users from the database; you can also purge all users from the database.

For information about general user-related event troubleshooting, see Troubleshoot Realms and User Downloads, on page 1773.

### Viewing User Data

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can view a table of users, and then manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.
The page you see when you access users differs depending on the workflow you use. You can use the predefined workflow, which includes a table view of users that lists all detected users, and terminates in a user details page. The user details page provides information on every user that meets your constraints.

**Procedure**

**Step 1** Access the users data:
- If you are using the predefined workflow, choose **Analysis > Users > Users**.
- If you are using a custom workflow that does not include the table view of users, click (switch workflow), then choose Users.

**Step 2** You have the following options:
- Use a different workflow, including a custom workflow, by clicking (switch workflow).
- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2188.
- Learn more about the contents of the columns in the table; see User-Related Fields, on page 2225.

**User Activity Data**

The Firepower System generates events that communicate the details of user activity on your network. When the system detects user activity, the user activity data is logged to the database. You can view, search, and delete user activity; you can also purge all user activity from the database.

The system logs a user activity event when a user is seen on your network for the first time. Subsequent appearances by that user do not log new user activity events. However, if the user's IP address changes, the system logs a new user activity event.

The Firepower System also correlates user activity with other types of events. For example, intrusion events can tell you the users who were logged into the source and destination hosts at the time of the event. This correlation can tell you who was logged into the host that was targeted by an attack, or who initiated an internal attack or portscan.

You can also use user activity in correlation rules. Based on the type of user activity as well as other criteria that you specify, you can build correlation rules that, when used in a correlation policy, launch remediations and alert responses when network traffic meets your criteria.

**Note**

If you have ISE configured, you may see host data in the users table. Because host detection by ISE is not fully supported, you cannot perform user control using ISE-reported host data.

Descriptions of the four types of user activity data follow.

**New User Identity**

This type of event is generated when the system detects a login by an unknown user that is not in the database.

The system logs a user activity event when a user is seen on your network for the first time. Subsequent appearances by that user do not log new user activity events. However, if the user's IP address changes, the system logs a new user activity event.
**User Login**

This type of event is generated when any of the following occur:

- A User Agent, ISE, or TS Agent reports a successful user login.
- Captive portal performs a successful or failed user authentication.
- Traffic-based detection detects a successful or failed user login.

---

**Note**

SMTP logins detected by traffic-based detection are not recorded unless there is already a user with a matching email address in the database.

When a non-authoritative user logs into a host, that login is recorded in the user and host history. If no authoritative user is associated with the host, a non-authoritative user can be the current user for the host. However, after an authoritative user logs into the host, only a login by another authoritative user changes the current user.

If you are using captive portal or traffic-based detection, note the following about failed user login and failed user authentication data:

- Failed logins reported by traffic-based detection (LDAP, IMAP, FTP, and POP3 traffic) are displayed in the table view of user activity, but not in the table view of users. If a known user failed to log in, the system identifies them by their username. If an unknown user failed to log in, the system uses **Failed Authentication** as their username.
- Failed authentications reported by captive portal are displayed in both the table view of user activity and the table view of users. If a known user failed to authenticate, the system identifies them by their username. If an unknown user failed to authenticate, the system identifies them by the username they entered.

**Delete User Identity**

This type of event is generated when you manually delete a user from the database.

**User Identity Dropped: User Limit Reached**

This type of event is generated when the system detects a user that is not in the database, but cannot add the user because you have reached the maximum number of users in the database as determined by your Firepower Management Center model.

After you reach the user limit, in most cases the system stops adding new users to the database. To add new users, you must either manually delete old or inactive users from the database, or purge all users from the database.

However, the system favors authoritative users. If you have reached the limit and the system detects a login for a previously undetected authoritative user, the system deletes the non-authoritative user who has remained inactive for the longest time, and replaces it with the new authoritative user.

For information about general user-related event troubleshooting, see Troubleshoot Realms and User Downloads, on page 1773.

</table>

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

You can view a table of user activity, and then manipulate the event view depending on the information you are looking for. The page you see when you access user activity differs depending on the workflow you use. You can use the predefined workflow, which includes the table view of user activity and terminates in a user details page, which contains user details for every user that meets your constraints. You can also create a custom workflow that displays only the information that matches your specific needs.

**Procedure**

**Step 1**
Access the user activity data:
- If you are using the predefined workflow, choose Analysis > Users > User Activity.
- If you are using a custom workflow that does not include the table view of user activity, click (switch workflow), then choose User Activity.

**Tip** If no events appear, you may need to adjust the time range; see Changing the Time Window, on page 1997.

**Step 2**
You have the following options:
- Use a different workflow, including a custom workflow, by clicking (switch workflow).
- Perform basic workflow actions; see Using Discovery and Identity Workflows, on page 2188.
- Learn more about the contents of the columns in the table; see User-Related Fields, on page 2225.

**User Profile and Host History**

You can learn more about a specific user by viewing the User pop-up window. The page that appears, called the "User Profile" in this document, is titled "User Identity" in the web interface.

You can display the window from:
- any event view that associates user data with other kinds of events
- the table view of users

User information also appears in the terminating page for users workflows.

The user data you see is the same as you would see in the table view of users.

**Indications of Compromise Section**
For information about this section, see:
- Indications of Compromise, on page 1761
Host History Section

The host history provides a graphic representation of the last twenty-four hours of the user’s activity. A list of IP addresses of the hosts that the user logged into and logged off of approximates login and logout times with bar graphs. A typical user might log on to and off of multiple hosts in the course of a day. For example, periodic automated logins to a mail server would display as multiple short sessions, while longer logins (such as during working hours) display longer sessions.

If you use traffic-based detection or captive portal to capture failed logins, the host history also includes hosts where the user failed to log in.

The data used to generate the host history is stored in the user history database, which by default stores 10 million user login events. If you do not see any data in the host history for a particular user, either that user is inactive, or you may need to increase the database limit.

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

Procedure

You have two options:

- In any event view that lists users, click the user icon that appears next to a user identity ( ).
- In any users workflow, click the Users terminating page.
Correlation and Compliance Events

The following topics describe how to view correlation and compliance events.

- Viewing Correlation Events, on page 2235
- Using Compliance White List Workflows, on page 2239
- Remediation Status Events, on page 2244

Viewing Correlation Events

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

When a correlation rule within an active correlation policy triggers, the system generates a correlation event and logs it to the database.

Note

When a compliance white list within an active correlation policy triggers, the system generates a white list event.

You can view a table of correlation events, then manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access correlation events differs depending on the workflow you use. You can use the predefined workflow, which includes the table view of correlation events. You can also create a custom workflow that displays only the information that matches your specific needs.

Procedure

Step 1

Choose Analysis > Correlation > Correlation Events.

Optionally, to use a different workflow, including a custom workflow, click (switch workflow) by the workflow title.
If you are using a custom workflow that does not include the table view of correlation events, click (switch workflow), then choose Correlation Events.

Tip

If you are using a custom workflow that does not include the table view of correlation events, click (switch workflow), then choose Correlation Events.

**Step 2**

Optionally, adjust the time range as described in Changing the Time Window, on page 1997.

**Step 3**

Perform any of the following actions:

- To learn more about the columns that appear, see Correlation Event Fields, on page 2236.
- To view the host profile for an IP address, click the host profile icon that appears next to the IP address.
- To view user identity information, click the user icon that appears next to the user identity ( ).
- To sort and constrain events or to navigate within the current workflow page, see Using Workflows, on page 1977.
- To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page.
- To drill down to the next page in the Workflows, constraining on a specific value, see Using Drill-Down Pages, on page 1985.
- To delete some or all correlation events, check the check boxes next to the events you want to delete and click Delete, or click Delete All and confirm you want to delete all the events in the current constrained view.
- To navigate to other event views to view associated events, see Inter-Workflow Navigation, on page 2003.

**Correlation Event Fields**

When a correlation rule triggers, the system generates a correlation event. The fields in the correlation events table that can be viewed and searched are described in the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>The description of the correlation event. The information in the description depends on how the rule was triggered. For example, if the rule was triggered by an operating system information update event, the new operating system name and confidence level appears.</td>
</tr>
<tr>
<td>Device</td>
<td>The name of the device that generated the event that triggered the policy violation.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Domain</td>
<td>The domain of the device whose monitored traffic triggered the policy violation. This field is only present if you have ever configured the Firepower Management Center for multitenancy.</td>
</tr>
<tr>
<td>Impact</td>
<td>The impact level assigned to the correlation event based on the correlation between intrusion data, discovery data, and vulnerability information.</td>
</tr>
<tr>
<td></td>
<td>When searching this field, valid case-insensitive values are Impact 0, Impact Level 0, Impact 1, Impact Level 1, Impact 2, Impact Level 2, Impact 3, Impact Level 3, Impact 4, and Impact Level 4. Do not use impact icon colors or partial strings (for example, do not use blue, level 1, or 0).</td>
</tr>
<tr>
<td>Ingress Interface or Egress Interface</td>
<td>The ingress or egress interface in the intrusion or connection event that triggered the policy violation.</td>
</tr>
<tr>
<td>Ingress Security Zone or Egress Security Zone</td>
<td>The ingress or egress security zone in the intrusion or connection event that triggered the policy violation.</td>
</tr>
<tr>
<td>Inline Result</td>
<td>One of:</td>
</tr>
<tr>
<td></td>
<td>• a black down arrow, indicating that the system dropped the packet that triggered the intrusion rule</td>
</tr>
<tr>
<td></td>
<td>• a gray down arrow, indicating that the system would have dropped the packet in an inline, switched, or routed deployment if you enabled the Drop when Inline intrusion policy option</td>
</tr>
<tr>
<td></td>
<td>• blank, indicating that the triggered intrusion rule was not set to Drop and Generate Events</td>
</tr>
<tr>
<td></td>
<td>When using this field to search for policy violations triggered by intrusion events, type either:</td>
</tr>
<tr>
<td></td>
<td>• dropped, to specify whether the packet was dropped in an inline, switched, or routed deployment</td>
</tr>
<tr>
<td></td>
<td>• would have dropped, to specify whether the packet would have dropped if the intrusion policy had been set to drop packets in an inline, switched, or routed deployment</td>
</tr>
<tr>
<td></td>
<td>Note that the system does not drop packets in a passive deployment, including when an inline set is in tap mode, regardless of the rule state or the drop behavior of the intrusion policy.</td>
</tr>
<tr>
<td>Policy</td>
<td>The name of the policy that was violated.</td>
</tr>
<tr>
<td>Priority</td>
<td>The priority of the correlation event, which is determined by the priority of either the triggered rule or the violated correlation policy. When searching this field, enter none for no priority.</td>
</tr>
</tbody>
</table>
### Correlation Event Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule</td>
<td>The name of the rule that triggered the policy violation.</td>
</tr>
<tr>
<td>Security Intelligence Category</td>
<td>The name of the blacklisted object that represents or contains the blacklisted IP address in the event that triggered the policy violation.</td>
</tr>
<tr>
<td></td>
<td>When searching this field, specify the Security Intelligence category associated with the correlation event that triggered the policy violation.</td>
</tr>
<tr>
<td></td>
<td>The Security Intelligence category can be the name of a Security Intelligence object, the global blacklist, a custom Security Intelligence list or feed, or one of the categories in the Intelligence Feed.</td>
</tr>
<tr>
<td>Source Continent or Destination Continent</td>
<td>The continent associated with the source or destination host IP addresses in the event that triggered the policy violation.</td>
</tr>
<tr>
<td>Source Country or Destination Country</td>
<td>The country associated with the source or destination IP address in the event that triggered the policy violation.</td>
</tr>
<tr>
<td>Source Host Criticality or Destination Host Criticality</td>
<td>The user-assigned host criticality of the source or destination host involved in the correlation event: None, Low, Medium, or High.</td>
</tr>
<tr>
<td></td>
<td>Note that only correlation events generated by rules based on discovery events, host input events, or connection events contain a source host criticality.</td>
</tr>
<tr>
<td>Source IP or Destination IP</td>
<td>The IP address of the source or destination host in the event that triggered the policy violation.</td>
</tr>
<tr>
<td>Source Port/ICMP Type or Destination Port/ICMP Code</td>
<td>The source port or ICMP type for the source traffic or the destination port or ICMP code for destination traffic associated with the event that triggered the policy violation.</td>
</tr>
<tr>
<td>Source User or Destination User</td>
<td>The name of the user logged in to the source or destination host in the event that triggered the policy violation.</td>
</tr>
<tr>
<td>Time</td>
<td>The date and time that the correlation event was generated. This field is not searchable.</td>
</tr>
<tr>
<td>Count</td>
<td>The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable</td>
</tr>
</tbody>
</table>

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Analyst/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

The Firepower Management Center provides a set of workflows that you can use to analyze the white list events and violations that are generated for your network. The workflows are, along with the network map and dashboard, a key source of information about the compliance of your network assets.

The system provides predefined workflows for white list events and violations. You can also create custom workflows. When you are using a compliance white list workflow, you can perform many common actions.

**Procedure**

**Step 1**
Access a white list workflow using the Analysis > Correlation menu.

**Step 2**
You have the following options:

- **Switch Workflow** — To use a different workflow, including a custom workflow, click (switch workflow).
- **Time Range** — To adjust the time range, which is useful if no events appear, see Changing the Time Window, on page 1997.
- **Host Profile** — To view the host profile for an IP address, click the host profile icon ( ) or, for hosts with active indications of compromise (IOC) tags, the compromised host icon ( ) that appears next to the IP address.
- **User Profile (events only)** — To view user identity information, click the user icon that appears next to the user identity ( ).
- **Constrain** — To constrain the columns that appear, click the close icon ( ) in the column heading that you want to hide. In the pop-up window that appears, click Apply.

**Tip**
To hide or show other columns, select or clear the appropriate check boxes before you click Apply. To add a disabled column back to the view, expand the search constraints, then click the column name under Disabled Columns.

- **Drill Down** — See Using Drill-Down Pages, on page 1985.
- **Sort** — To sort data in a workflow, click the column title. Click the column title again to reverse the sort order.
- **Navigate This Page** — See Workflow Page Traversal Tools, on page 1982.
- **Navigate Between Pages** — To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page.
• Navigate Between Event Views — To navigate to other event views to view associated events, click **Jump to** and select the event view from the drop-down list.

• Delete Events (events only) — To delete some or all items in the current constrained view, select the check boxes next to items you want to delete and click **Delete** or click **Delete All**.

<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst/Discovery Admin</td>
</tr>
</tbody>
</table>

After its initial evaluation, the system generates a *white list event* whenever a monitored host goes out of compliance with an active white list. White list events are a special kind of correlation event, and are logged to the Management Center correlation event database.

You can use the Firepower Management Center to view a table of compliance white list events. Then, you can manipulate the event view depending on the information you are looking for.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

The page you see when you access white list events differs depending on the workflow you use. You can use a predefined workflow, which terminates in a table view of events. You can also create a custom workflow that displays only the information that matches your specific needs.

### Procedure

**Step 1**  
Choose **Analysis > Correlation > White List Events**.

**Step 2**  
You have the following options:

- To perform basic workflow actions, see Using Compliance White List Workflows, on page 2239.
- To learn more about the contents of the columns in the table, see White List Event Fields, on page 2240.

### White List Event Fields

White list events, which you can view and search using workflows, contain the following fields.
Device
The name of the managed device that detected the white list violation.

Description
A description of how the white list was violated. For example:
Client “AOL Instant Messenger” is not allowed.

Violations that involve an application protocol indicate the application protocol name and version, as well as the port and protocol (TCP or UDP) it is using. If you restrict prohibitions to a particular operating system, the description includes the operating system name. For example:
Server "ssh / 22 TCP (OpenSSH 3.6.1p2)" is not allowed on Operating System “Linux Linux 2.4 or 2.6”.

Domain
The domain of the host that has become non-compliant with the white list. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Host Criticality
The user-assigned host criticality of the source host that is out of compliance with the white list: None, Low, Medium, or High.

IP Address
The IP address of the host that has become non-compliant with the white list.

Policy
The name of the correlation policy that was violated, that is, the correlation policy that includes the white list.

Port
The port, if any, associated with the discovery event that triggered an application protocol white list violation (a violation that occurred as a result of a non-compliant application protocol). For other types of white list violations, this field is blank.

Priority
The priority specified by the policy or white list that triggered the policy violation. This is determined either by the priority of the white list in a correlation policy or by the priority of the correlation policy itself. Note that the white list priority overrides the priority of its policy. When searching this field, enter none for no priority.

Time
The date and time that the white list event was generated. This field is not searchable.

User
The identity of any known user logged in to the host that has become non-compliant with the white list.
**White List**

The name of the white list.

**Count**

The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable.

## Viewing White List Violations

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>

<td>Admin/Any Security</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Analyst/Discovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

The system keeps a record of the current white list violations on your network. Each violation represents something disallowed running on one of your hosts. If a host becomes compliant, the system removes the now-corrected violation from the database.

You can use the Firepower Management Center to view a table of white list violations for all active white lists. Then, you can manipulate the event view depending on the information you are looking for.

The page you see when you access white list violations differs depending on the workflow you use. The predefined workflows terminate in a host view, which contains a host profile for every host that meets your constraints. You can also create a custom workflow that displays only the information that matches your specific needs.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

### Procedure

**Step 1** Choose **Analysis > Correlation > White List Violations**.

**Step 2** You have the following options:

- To perform basic workflow actions, see Using Compliance White List Workflows, on page 2239.
- To learn more about the contents of the columns in the table, see White List Violation Fields, on page 2242.

## White List Violation Fields

White list violations, which you can view and search using workflows, contain the following fields.
Domain
The domain where the non-compliant host resides. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Information
Any available vendor, product, or version information associated with the white list violation. For protocols that violate a white list, this field also indicates whether the violation is due to a network or transport protocol.

IP Address
The IP address of the non-compliant host.

Port
The port, if any, associated with the event that triggered an application protocol white list violation (a violation that occurred as a result of a non-compliant application protocol). For other types of white list violations, this field is blank.

Protocol
The protocol, if any, associated with the event that triggered an application protocol white list violation (a violation that occurred as a result of a non-compliant application protocol). For other types of white list violations, this field is blank.

Time
The date and time that the white list violation was detected.

Type
The type of white list violation, that is, whether the violation occurred as a result of a non-compliant:
- operating system (os) (When searching this field, enter os or operating system.)
- application protocol (server)
- client
- protocol
- web application (web) (When searching this field, enter web application.)

White List
The name of the white list that was violated.

Count
The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable.
Remediation Status Events

When a remediation triggers, the system logs a remediation status event to the database. These events can be viewed on the Remediation Status page. You can search, view, and delete remediation status events.

Related Topics
- Remediation Status Table Fields, on page 2245

Viewing Remediation Status Events

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

The page you see when you access remediation status events differs depending on the workflow you use. You can use the predefined workflow, which includes a table view of remediations. The table view contains a row for each remediation status event. You can also create a custom workflow that displays only the information that matches your specific needs.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

Step 1  Choose Analysis > Correlation > Status.

Step 2  Optionally, adjust the time range as described in Changing the Time Window, on page 1997.

Step 3  Optionally, to use a different workflow, including a custom workflow, click (switch workflow) by the workflow title.

Tip  If you are using a custom workflow that does not include the table view of remediations, click (switch workflow) menu by the workflow title, then choose Remediation Status.

Step 4  You have the following options:

- To learn more about the columns that appear, see Remediation Status Table Fields, on page 2245.
- To sort and constrain the events, see Using Workflows, on page 1977.
- To navigate to the correlation events view to see associated events, click Correlation Events.
- To bookmark the current page so that you can quickly return to it, click Bookmark This Page. To navigate to the bookmark management page, click View Bookmarks.
- To generate a report based on the data in the table view, click Report Designer as described in Creating a Report Template from an Event View, on page 1881.
- To drill down to the next page in the workflow, see Using Drill-Down Pages, on page 1985.
- To delete remediation status events from the system, check the check boxes next to events you want to delete and click Delete or click Delete All and confirm you want to delete all the events in the current constrained view.
Remediation Status Table Fields

The following table describes the fields in the remediation status table that can be viewed and searched.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>The domain of the device whose monitored traffic triggered the policy violation, that in turn triggered the remediation. This field is only present if you have ever configured the Firepower Management Center for multitenancy.</td>
</tr>
<tr>
<td>Policy</td>
<td>The name of the correlation policy that was violated and triggered the remediation.</td>
</tr>
<tr>
<td>Remediation Name</td>
<td>The name of the remediation that was launched.</td>
</tr>
<tr>
<td>Result Message</td>
<td>A message that describes what happened when the remediation was launched. Status messages include:</td>
</tr>
<tr>
<td></td>
<td>* Successful completion of remediation</td>
</tr>
<tr>
<td></td>
<td>* Error in the input provided to the remediation module</td>
</tr>
<tr>
<td></td>
<td>* Error in the remediation module configuration</td>
</tr>
<tr>
<td></td>
<td>* Error logging into the remote device or server</td>
</tr>
<tr>
<td></td>
<td>* Unable to gain required privileges on remote device or server</td>
</tr>
<tr>
<td></td>
<td>* Timeout logging into remote device or server</td>
</tr>
<tr>
<td></td>
<td>* Timeout executing remote commands or servers</td>
</tr>
<tr>
<td></td>
<td>* The remote device or server was unreachable</td>
</tr>
<tr>
<td></td>
<td>* The remediation was attempted but failed</td>
</tr>
<tr>
<td></td>
<td>* Failed to execute remediation program</td>
</tr>
<tr>
<td></td>
<td>* Unknown/unexpected error</td>
</tr>
</tbody>
</table>

If custom remediation modules are installed, you may see additional status messages that are implemented by the custom module.

| Rule               | The name of the correlation rule that triggered the remediation.                                                                              |
### Using the Remediation Status Events Table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time</td>
<td>The date and time that the Firepower Management Center launched the remediation</td>
</tr>
<tr>
<td>Count</td>
<td>The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable.</td>
</tr>
</tbody>
</table>

**Related Topics**
- [Event Searches](#), on page 2007

#### Using the Remediation Status Events Table

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can change the layout of the event view or constrain the events in the view by a field value.

When you disable a column, it is disabled for the duration of your session unless you add it back later. If you disable the first column, the Count column is added.

Clicking a value within a row in a table view constrains the table view and does not drill down to the next page.

---

**Tip**

Table views always include “Table View” in the page name.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

#### Procedure

**Step 1** Choose **Analysis > Correlation > Status**.

**Tip** If you are using a custom workflow that does not include the table view of remediations, click (switch workflow) menu by the workflow title, then choose **Remediation Status**.

**Step 2** You have the following options:

- To learn more about the columns that appear, see **Remediation Status Table Fields**, on page 2245.
- To sort and constrain the events, see **Using Workflows**, on page 1977.
Auditing the System

The following topics describe how to audit activity on your system:

- About System Auditing, on page 2247
- Audit Records, on page 2247
- The System Log, on page 2254

About System Auditing

You can audit activity on your system in two ways. The appliances that are part of the Firepower System generate an audit record for each user interaction with the web interface, and also record system status messages in the system log.

Related Topics

- Standard Reports, on page 1876

Audit Records

Firepower Management Centers and 7000 and 8000 Series devices log read-only auditing information for user activity. Audit logs are presented in a standard event view that allows you to view, sort, and filter audit log messages based on any item in the audit view. You can easily delete and report on audit information and can view detailed reports of the changes that users make.

The audit log stores a maximum of 100,000 entries. When the number of audit log entries exceeds 100,000, the appliance prunes the oldest records from the database to reduce the number to 100,000.

Note

If you reboot a 7000 or 8000 Series device, then log into the auxiliary CLI as soon as you are able, any commands you execute are not recorded in the audit log until the local web interface is available.

Viewing Audit Records

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>
On a Firepower Management Center or 7000 and 8000 Series devices, you can view a table of audit records. The predefined audit workflow includes a single table view of events. You can manipulate the table view depending on the information you are looking for. You can also create a custom workflow that displays only the information that matches your specific needs.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Procedure**

**Step 1**
Access the audit log workflow using **System > Monitoring > Audit**.

**Step 2**
If no events appear, you may need to adjust the time range. For more information, see *Event Time Constraints*, on page 1994.

**Note**
Events that were generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.

**Step 3**
You have the following choices:

- To learn more about the contents of the columns in the table, see *The System Log*, on page 2254.
- To sort and constrain events on the current workflow page, see *Using Table View Pages*, on page 1985.
- To navigate within the current workflow page, see *Time Window Progression*, on page 2000.
- To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page. For more information, see *Using Workflows*, on page 1977.
- To drill down to the next page in the workflow, see *Using Drill-Down Pages*, on page 1985.
- To constrain on a specific value, click a value within a row. If you click a value on a drill-down page, you move to the next page and constrain on the value. Note that clicking a value within a row in a table view constrains the table view and does **not** drill down to the next page. See *Event View Constraints*, on page 2001 for more information.

**Tip**
Table views always include “Table View” in the page name.

- To delete audit records, check the check boxes next to events you want to delete, then click **Delete**, or click **Delete All** to delete all events in the current constrained view.
- To bookmark the current page so you can quickly return to it, click **Bookmark This Page**. For more information, see *Bookmarks*, on page 2004.
- To navigate to the bookmark management page, click **View Bookmarks**. For more information, see *Bookmarks*, on page 2004.
- To generate a report based on the data in the current view, click **Report Designer**. For more information, see *Creating a Report Template from an Event View*, on page 1881.
- To view a summary of a change recorded in the audit log, click the compare icon (>) next to applicable events in the **Message** column. For more information, see *Using the Audit Log to Examine Changes*, on page 2250.

**Related Topics**
- *Event View Constraints*, on page 2001
# Audit Log Workflow Fields

The following table describes the audit log fields that can be viewed and searched.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time</td>
<td>Time and date that the appliance generated the audit record.</td>
</tr>
<tr>
<td>User</td>
<td>User name of the user that triggered the audit event.</td>
</tr>
<tr>
<td>Subsystem</td>
<td>The full menu path the user followed to generate the audit record. For example, <strong>System &gt; Monitoring &gt; Audit</strong> is the menu path to view the audit log. In a few cases where a menu path is not relevant, the Subsystem field displays only the event type. For example, <strong>Login</strong> classifies user login attempts.</td>
</tr>
<tr>
<td>Message</td>
<td>The action the user performed or the button the user clicked on the page. For example, <strong>Page View</strong> signifies that the user simply viewed the page indicated in the Subsystem, while <strong>Save</strong> means that the user clicked the <strong>Save</strong> button on the page. Changes made to the Firepower System appear with a compare icon (🗹️) that you can click to see a summary of the changes.</td>
</tr>
<tr>
<td>Source IP</td>
<td>IP address associated with the host used by the user. Note: When searching this field you must type a specific IP address; you cannot use IP ranges when searching audit logs.</td>
</tr>
<tr>
<td>Domain</td>
<td>The current domain of the user when the audit event was triggered. This field is only present if you have ever configured the Firepower Management Center for multitenancy.</td>
</tr>
<tr>
<td>Configuration Change (search only)</td>
<td>Specifies whether to view audit records of configuration changes in the search results. <em>(yes or no)</em></td>
</tr>
<tr>
<td>Count</td>
<td>The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable.</td>
</tr>
</tbody>
</table>

**Related Topics**

*Event Searches*, on page 2007
The Audit Events Table View

You can change the layout of the event view or constrain the events in the view by a field value. When disabling columns, after you click the close icon (×) in the column heading that you want to hide, in the pop-up window that appears, click **Apply**. When you disable a column, it is disabled for the duration of your session (unless you add it back later). Note that when you disable the first column, the Count column is added.

To hide or show other columns, or to add a disabled column back to the view, select or clear the appropriate check boxes before you click **Apply**.

Clicking a value within a row in a table view constrains the table view and does not drill down to the next page in the workflow.

Tip

Table views always include “Table View” in the page name.

Related Topics

Using Workflows, on page 1977

Using the Audit Log to Examine Changes

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can use the audit log to view detailed reports of changes to your system. These reports compare the current configuration of your system to its most recent configuration before a particular change.

The Compare Configurations page displays the differences between the system configuration before changes and the running configuration in a side-by-side format. The audit event type, time of last modification, and name of the user who made the change are displayed in the title bar above each configuration.

Differences between the two configurations are highlighted:

- Blue indicates that the highlighted setting is different in the two configurations, and the difference is noted in red text.
- Green indicates that the highlighted setting appears in one configuration but not the other.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

**Step 1** Choose **System > Monitoring > Audit**.

**Step 2** Click the compare icon (☞) next to an applicable audit log event in the **Message** column.

Tip You can navigate through changes individually by clicking **Previous** or **Next** above the title bar. If the change summary is more than one page long, you can also use the scroll bar on the right to view additional changes.
Suppressing Audit Records

If your auditing policy does not require that you audit specific types of user interactions with the Firepower System, you can prevent those interactions from generating audit records on a Firepower Management Center or 7000 and 8000 Series devices. For example, by default, each time a user views the online help, the Firepower System generates an audit record. If you do not need to keep a record of these interactions, you can automatically suppress them.

To configure audit event suppression, you must have access to an appliance’s `admin` user account, and you must be able to either access the appliance’s console or open a secure shell.

Caution

Make sure that only authorized personnel have access to the appliance and to its `admin` account.

Procedure

In the `/etc/sf` directory, create one or more AuditBlock files in the following form, where type is one of the types described in Audit Block Types, on page 2251:

```
AuditBlock.type
```

Note

If you create an `AuditBlock.type` file for a specific type of audit message, but later decide that you no longer want to suppress them, you must delete the contents of the `AuditBlock.type` file but leave the file itself on the Firepower System.

Audit Block Types

The contents for each audit block type must be in a specific format, as described in the following table. Make sure you use the correct capitalization for the file names. Note also that the contents of the files are case sensitive.

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Note that when you add an `AuditBlock` file, an audit record with a subsystem of `Audit` and a message of `Audit Filter type Changed` is added to the audit events. For security reasons, this audit record cannot be suppressed.
## Table 308: Audit Block Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>Create a file named <code>AuditBlock.address</code> and include, one per line, each IP address that you want to suppress from the audit log. You can use partial IP addresses provided that they map from the beginning of the address. For example, the partial address 10.1.1 matches addresses from 10.1.1.0 through 10.1.1.255.</td>
</tr>
<tr>
<td>Message</td>
<td>Create a file named <code>AuditBlock.message</code> and include, one per line, the message substrings that you want to suppress. Note that substrings are matched so that if you include <code>backup</code> in your file, all messages that include the word <code>backup</code> are suppressed.</td>
</tr>
<tr>
<td>Subsystem</td>
<td>Create a file named <code>AuditBlock.subsystem</code> and include, one per line, each subsystem that you want to suppress. Note that substrings are <strong>not</strong> matched. You must use exact strings. See Audited Subsystems, on page 2252 for a list of subsystems that are audited.</td>
</tr>
<tr>
<td>User</td>
<td>Create a file named <code>AuditBlock.user</code> and include, one per line, each user account that you want to suppress. You can use partial string matching provided that they map from the beginning of the username. For example, the partial username <code>IPSAnalyst</code> matches the user names <code>IPSAnalyst1</code> and <code>IPSAnalyst2</code>.</td>
</tr>
</tbody>
</table>

### Audited Subsystems

The following table lists audited subsystems.

#### Table 309: Subsystem Names

<table>
<thead>
<tr>
<th>Name</th>
<th>Includes user interactions with...</th>

The **System Log**

The System Log (syslog) page provides you with system log information for the appliance. The system log displays each message generated by the system. The following items are listed in order:
- the date that the message was generated
- the time that the message was generated
- the host that generated the message
- the message itself

<table>

Viewing the System Log

System log information is local. For example, you cannot use the Firepower Management Center to view system status messages in the system logs on your managed devices.

You can filter messages using most syntax accepted by the UNIX file search utility Grep. This includes using Grep-compatible regular expressions for pattern matching.

Procedure

**Step 1** Choose **System** > **Monitoring** > **Syslog**.

**Step 2** To search for specific message content in the system log:

a) Enter a word or query in the filter field as described in **Syntax for System Log Filters**, on page 2255.

   Only Grep-compatible search syntax is supported.

   Examples:

   To search for all log entries that contain the user name “Admin,” use \texttt{Admin}.

   To search for all log entries that are generated on November 27, use \texttt{Nov\[[:space:]\]*27} or \texttt{Nov.*27} (but not \texttt{Nov 27} or \texttt{Nov*27}).

   To search for all log entries that contain authorization debugging information on November 5, use \texttt{Nov\[[:space:]\]*5.*AUTH.*DEBUG}.

   b) To make your search case-sensitive, select **Case-sensitive**. (By default, filters are not case-sensitive.)

   c) To search for all system log messages that do not meet the criteria you entered, select **Exclusion**.

   d) Click **Go**.

Syntax for System Log Filters

The following table shows the regular expression syntax you can use in System Log filters:

<table>
<thead>
<tr>
<th>Syntax Component</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>.</td>
<td>Matches any character or white space</td>
<td>\texttt{Admin} matches Admin, AdminN, AdmiN, and AdmiN</td>
</tr>
<tr>
<td>\texttt{[:alpha:]}</td>
<td>Matches any alphabetic character</td>
<td>\texttt{[:alpha:]}dmin matches Admin, badmin, and Cadmin</td>
</tr>
<tr>
<td>\texttt{[:upper:]}</td>
<td>Matches any uppercase alphabetic character</td>
<td>\texttt{[:upper:]}dmin matches Admin, Badmin, and Cadmin</td>
</tr>
<tr>
<td>Syntax Component</td>
<td>Description</td>
<td>Example</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
<td>---------</td>
</tr>
<tr>
<td>[:lower:]</td>
<td>Matches any lowercase alphabetic character</td>
<td>[:lower:]admin matches admin, badmin, and cdmin</td>
</tr>
<tr>
<td>[:digit:]</td>
<td>Matches any numeric character</td>
<td>[:digit:]dmin matches 0dmin, 1dmin, and 2dmin</td>
</tr>
<tr>
<td>[:alnum:]</td>
<td>Matches any alphanumeric character</td>
<td>[:alnum:]dmin matches 1dmin, admin, 2dmin, and badmin</td>
</tr>
<tr>
<td>[:space:]</td>
<td>Matches any white space, including tabs</td>
<td>Feb[:space:]29 matches logs from February 29th</td>
</tr>
<tr>
<td>*</td>
<td>Matches zero or more instances of the character or expression it follows</td>
<td>ab* matches a, ab, abb, ca, cab, and cabb</td>
</tr>
<tr>
<td>?</td>
<td>Matches zero or one instances</td>
<td>ab? matches a or ab</td>
</tr>
<tr>
<td>\</td>
<td>Allows you to search for a character typically interpreted as regular expression syntax</td>
<td>alert? matches alert?</td>
</tr>
</tbody>
</table>
Security, Internet Access, and Communication Ports

The following topics provide information on system security, internet access, and communication ports:

- Security Requirements, on page 2257
- Internet Access Requirements, on page 2257
- Communication Ports Requirements, on page 2258

Security Requirements

To safeguard the Firepower Management Center, you should install it on a protected internal network. Although the Firepower Management Center is configured to have only the necessary services and ports available, you must make sure that attacks cannot reach it (or any managed devices) from outside the firewall.

If the Firepower Management Center and its managed devices reside on the same network, you can connect the management interfaces on the devices to the same protected internal network as the Firepower Management Center. This allows you to securely control the devices from the Firepower Management Center. You can also configure multiple management interfaces to allow the Firepower Management Center to manage and isolate traffic from devices on other networks.

Regardless of how you deploy your appliances, intra-appliance communication is encrypted. However, you must still take steps to ensure that communications between appliances cannot be interrupted, blocked, or tampered with; for example, with a distributed denial of service (DDoS) or man-in-the-middle attack.

Internet Access Requirements

By default, Firepower appliances are configured to directly connect to the Internet on ports 443/tcp (HTTPS) and 80/tcp (HTTP), which are open by default on all Firepower appliances. Note that most Firepower appliances support use of a proxy server, except for whois queries.

The following table describes the internet access requirements of specific Firepower features.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Appliances</th>
<th>Internet access is required to...</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMP for Networks</td>
<td>Management Center</td>
<td>perform malware cloud lookups.</td>
</tr>
</tbody>
</table>

Table 311: Internet Access Requirements
## Communication Ports Requirements

Firepower appliances communicate using a two-way, SSL-encrypted communication channel, which by default uses port 8305/tcp. This port must remain open for basic intra-platform communication.

Other open ports allow:

- Access to the web interface (Firepower Management Center and 7000 & 8000 Series).
- Secure remote connections.
- Access to local or internet resources required by specific features.

### Feature
<table>
<thead>
<tr>
<th>Appliances</th>
<th>Internet access is required to...</th>

</tr>
<tr>
<td>local malware analysis and file preclassification signature updates</td>
<td>Management Center</td>
</tr>
</tbody>
</table>
| RSS feed dashboard widget | Management Center
7000 & 8000 Series | download RSS feed data from an external source, including Cisco. |
| Security Intelligence filtering | Management Center | download Security Intelligence feed data from an external source, including Cisco-provided intelligence feeds. |
| system software updates | Any except NGIPSv | download or schedule the download of a system update directly to an appliance. |
| URL filtering | Management Center | download URL category and reputation data for access control, and query for uncategorized URLs. |
| whois | Management Center | request whois information for an external host. |
Do not close an open port until you understand how this action will affect your deployment. In general, feature-related ports remain closed until you enable or configure the associated feature.

You can change some communication ports:

- You can specify custom ports for LDAP and RADIUS authentication when you configure a connection between the system and the authentication server.
- You can change the management port (8305/tcp). However, Cisco strongly recommends that you keep the default setting. If you change the management port, you must change it for all appliances in the deployment.
- You can use port 32137/tcp to communicate with the Cisco AMP cloud. However, Cisco recommends you use the default of port 443.

The following table lists the open ports required by each appliance type so you can take full advantage of Firepower features.

**Table 312: Default Communication Ports for Firepower System Features and Operations**

<table>

APPENDIX B

Classic Device Command Line Reference

This reference explains the command line interface (CLI) for the following devices:

- 7000 and 8000 Series
- ASA FirePOWER
- NGIPSv

You cannot use the CLI on the Firepower Management Center. The Firepower Management Center supports Linux shell access, and only under Cisco Technical Assistance Center (TAC) supervision.

Note

For the Firepower Threat Defense command reference, see Command Reference for Firepower Threat Defense.

- About the CLI, on page 2263
- Basic CLI Commands, on page 2264
- Show Commands, on page 2268
- Configuration Commands, on page 2297
- System Commands, on page 2316

About the CLI

After you log into a device via the CLI (see Logging Into the Command Line Interface on Classic Devices, on page 25 or Logging Into the Command Line Interface on Firepower Threat Defense Devices, on page 26), you can use the commands described in this chapter to view, configure, and troubleshoot your device.

Note

If you reboot a 7000 or 8000 Series device and then log in to the CLI as soon as you are able, any commands you execute are not recorded in the audit log until the web interface is available.

Note that CLI commands are case-insensitive with the exception of parameters whose text is not part of the CLI framework, such as user names and search filters.
There are numerous CLI modes, such as `show` and `configure`, that contain sets of commands beginning with the mode name. You may enter a mode and then enter valid commands within that mode, or you may enter an entire full command from any mode. For example, to display information about a user account called Analyst1, you can enter the following at the CLI prompt:

```
show user Analyst1
```

If you have previously entered `show` mode, enter the following at the CLI prompt:

```
user Analyst1
```

### CLI Access Levels

Within each mode, the commands available to a user depend on the user’s CLI access. When you create a user account, you can assign it one of the following CLI access levels:

- **Basic** — The user has read-only access and cannot run commands that impact system performance.
- **Configuration** — The user has read-write access and can run commands that impact system performance.
- **None** — The user is unable to log in to the shell.

On 7000 and 8000 Series devices, you can assign command line permissions on the User Management page in the web interface. On NGIPSv and ASA FirePOWER, you assign command line permissions using the CLI.

### Basic CLI Commands

The basic CLI commands provide the ability to interact with the CLI. These commands do not affect the operation of the device. Basic commands are available to all CLI users.

#### configure password

Allows the current user to change their password. After issuing the command, the CLI prompts the user for their current (or old) password, then prompts the user to enter the new password twice.

**Access**

Basic

**Syntax**

```
configure password
```
Example

configure password
Enter current password:
Enter new password:
Confirm new password:

end

Returns the user to the default mode. (Moves the user up to the default mode from any lower-level CLI context.)

Access
Basic

Syntax
end

Example

configure network ipv4> end
>

exit

Moves the CLI context up to the next highest CLI context level. Issuing this command from the default mode logs the user out of the current CLI session, and is equivalent to issuing the logout CLI command.

Access
Basic

Syntax
exit

Example

configure network ipv4> exit
configure network>

help

Displays an overview of the CLI syntax.
# history

Displays the command line history for the current session.

## Syntax

```
history limit
```

where `limit` sets the size of the history list. To set the size to unlimited, enter zero.

## Example

```
history 25
```

# logout

Logs the current user out of the current CLI console session.

## Syntax

```
logout
```

## Example

```
> logout
```
? (question mark)

Displays context-sensitive help for CLI commands and parameters. Use the question mark (?) command as follows:

- To display help for the commands that are available within the current CLI context, enter a question mark (?) at the command prompt.
- To display a list of the available commands that start with a particular character set, enter the abbreviated command immediately followed by a question mark (?)
- To display help for a command’s legal arguments, enter a question mark (?) in place of an argument at the command prompt.

Note that the question mark (?) is not echoed back to the console.

**Access**
Basic

**Syntax**

```
? abbreviated_command ?
command [arguments] ?
```

**Example**

```
> ?
```

?? (double question marks)

Displays detailed context-sensitive help for CLI commands and parameters.

**Access**
Basic

**Syntax**

```
?? abbreviated_command end??
command [arguments] ??
```

**Example**

```
> configure manager add ??
```
Show Commands

Show commands provide information about the state of the device. These commands do not change the operational mode of the device and running them has minimal impact on system operation. Most show commands are available to all CLI users; however, only users with configuration CLI access can issue the `show user` command.

access-control-config

Displays the currently deployed access control configurations, including:

- Security Intelligence settings
- The names of any subpolicies the access control policy invokes
- Intrusion variable set data
- Logging settings
- Other advanced settings, including policy-level performance, preprocessing, and general settings

Also displays policy-related connection information, such as source and destination port data (including type and code for ICMP entries) and the number of connections that matched each access control rule (hit counts).

Access
Basic

Syntax

```
show access-control-config
```

Example

```
> show access-control-config
```

alarms

Displays currently active (failed/down) hardware alarms on the device. This command is not available on NGIPSv and ASA FirePOWER devices.

Access
Basic

Syntax

```
show alarms
```
Example

> show alarms

**arp-tables**

Displays the Address Resolution Protocol tables applicable to your network. This command is not available on NGIPSv and ASA FirePOWER.

**Access**
Basic

**Syntax**

```
show arp-tables
```

**Example**

> show arp-tables

**audit-log**

Displays the audit log in reverse chronological order; the most recent audit log events are listed first.

**Access**
Basic

**Syntax**

```
show audit-log
```

**Example**

> show audit-log

**audit_cert**

Displays the current audit log client certificate.

**Access**
Basic
Syntax

show audit_cert

Example

> show audit_cert

bypass

On 7000 or 8000 Series devices, lists the inline sets in use and shows the bypass mode status of those sets as one of the following:

- **armed**—the interface pair is configured to go into hardware bypass if it fails (Bypass Mode: Bypass), or has been forced into fail-close with the `configure bypass close` command
- **engaged**—the interface pair has failed open or has been forced into hardware bypass with the `configure bypass open` command
- **off**—the interface pair is set to fail-close (Bypass Mode: Non-Bypass); packets are blocked if the interface pair fails

Access

Basic

Syntax

show bypass

Example

> show bypass
s1p1 ↔ s1p2: status 'armed'
s1p1 ↔ s1p2: status 'engaged'

high-availability Commands

Displays information about high-availability configuration, status, and member devices or stacks. This command is not available on NGIPSv and ASA FirePOWER devices.

Access

Basic

config

Displays the high-availability configuration on the device.
Syntax

show high-availability config

Example

> show high-availability config

high-availability ha-statistics

Displays state sharing statistics for a device in a high-availability pair.

Syntax

show high-availability ha-statistics

Example

> show high-availability ha-statistics

cpu

Displays the current CPU usage statistics appropriate for the platform for all CPUs on the device. For 7000 and 8000 Series devices, the following values are displayed:

- CPU — Processor number.
- Load — The CPU utilization, represented as a number from 0 to 100. 0 is not loaded and 100 is completely loaded.

For NGIPSv and ASA FirePOWER, the following values are displayed:

- CPU — Processor number.
- %user — Percentage of CPU utilization that occurred while executing at the user level (application).
- %nice — Percentage of CPU utilization that occurred while executing at the user level with nice priority.
- %sys — Percentage of CPU utilization that occurred while executing at the system level (kernel). This does not include time spent servicing interrupts or softirqs. A softirq (software interrupt) is one of up to 32 enumerated software interrupts that can run on multiple CPUs at once.
- %iowait — Percentage of time that the CPUs were idle when the system had an outstanding disk I/O request.
- %irq — Percentage of time spent by the CPUs to service interrupts.
- %soft — Percentage of time spent by the CPUs to service softirqs.
- %steal — Percentage of time spent in involuntary wait by the virtual CPUs while the hypervisor was servicing another virtual processor.
• %guest — Percentage of time spent by the CPUs to run a virtual processor.
• %idle — Percentage of time that the CPUs were idle and the system did not have an outstanding disk I/O request.

Access
Basic

Syntax

show cpu [procnum]

where procnum is the number of the processor for which you want the utilization information displayed. Valid values are 0 to one less than the total number of processors on the system. If procnum is used for a 7000 or 8000 Series device, it is ignored because for that platform, utilization information can only be displayed for all processors.

Example

> show cpu

database Commands

The show database commands configure the device’s management interface.

Access
Basic

processes

Displays a list of running database queries.

Access
Basic

Syntax

show database processes

Example

> show database processes

slow-query-log

Displays the slow query log of the database.
Access
Basic

Syntax

show database slow-query-log

Example

> show database slow-query-log

device-settings
Displays information about application bypass settings specific to the current device.

Access
Basic

Syntax

show device-settings

Example

> show device-settings

disk
Displays the current disk usage.

Access
Basic

Syntax

show disk

Example

> show disk
**disk-manager**

Displays detailed disk usage information for each part of the system, including silos, low watermarks, and high watermarks.

**Access**
Basic

**Syntax**

```
show disk-manager
```

**Example**

```
> show disk-manager
```

**dns**

Displays the current DNS server addresses and search domains.

**Access**
Basic

**Syntax**

```
show dns
```

**Example**

```
> show dns
```

**expert**

Invokes the shell.

**Access**
Basic

**Syntax**

```
expert
```
fan-status

Displays the current status of hardware fans. This command is not available on NGIPSv and ASA FirePOWER devices.

**Access**
Basic

**Syntax**

```
show fan-status
```

**Example**

```
> show fan-status
```

fastpath-rules

Displays the currently configured 8000 Series fastpath rules. This command is only available on 8000 Series devices.

**Access**
Basic

**Syntax**

```
show fastpath-rules
```

**Example**

```
> show fastpath-rules
```

gui

Displays the current state of the web interface. This command is not available on NGIPSv and ASA FirePOWER.
hostname

Displays the device’s host name and appliance UUID. If you edit the host name of a device using the CLI, confirm that the changes are reflected on the managing Firepower Management Center. In some cases, you may need to edit the device management settings manually.

Access
Basic

Syntax

show hostname

Example

> show hostname

hosts

Displays the contents of an ASA FirePOWER module’s /etc/hosts file.

Access
Basic

Syntax

show hosts

Example

> show hosts
hyperthreading

Displays whether hyperthreading is enabled or disabled. This command is not available on ASA FirePOWER.

**Access**
Basic

**Syntax**

```
show hyperthreading
```

**Example**

```
> show hyperthreading
```

inline-sets

Displays configuration data for all inline security zones and associated interfaces. This command is not available on ASA FirePOWER.

**Access**
Basic

**Syntax**

```
show inline-sets
```

**Example**

```
> show inline-sets
```

interfaces

If no parameters are specified, displays a list of all configured interfaces. If a parameter is specified, displays detailed information about the specified interface.

**Access**
Basic

**Syntax**

```
show interfaces interface
```

where `interface` is the specific interface for which you want the detailed information.
Example

> show interfaces

**ifconfig**

Displays the interface configuration for an ASA FirePOWER module.

**Access**
Basic

**Syntax**

show ifconfig

**Example**

> show ifconfig

**lcd**

Displays whether the LCD hardware display is enabled or disabled. This command is not available on NGIPSv and ASA FirePOWER.

**Access**
Basic

**Syntax**

show lcd

**Example**

> show lcd

**link-aggregation Commands**

The `show link-aggregation` commands display configuration and statistics information for link aggregation groups (LAGs). This command is not available on NGIPSv and ASA FirePOWER devices.

**Access**
Basic
configuration

Displays configuration details for each configured LAG, including LAG ID, number of interfaces, configuration mode, load-balancing mode, LACP information, and physical interface type.

Access
Basic

Syntax

show link-aggregation configuration

Example

> show link-aggregation configuration

statistics

Displays statistics, per interface, for each configured LAG, including status, link state and speed, configuration mode, counters for received and transmitted packets, and counters for received and transmitted bytes.

Access
Basic

Syntax

show link-aggregation statistics

Example

> show link-aggregation statistics

link-state

Displays type, link, speed, duplex state, and bypass mode of the ports on the device. This command is not available on ASA FirePOWER devices.

Access
Basic

Syntax

show link-state
Example

> show link-state

**log-ips-connection**

Displays whether the logging of connection events that are associated with logged intrusion events is enabled or disabled.

**Access**

Basic

**Syntax**

`show log-ips-connection`

**Example**

> show log-ips-connection

**managers**

Displays the configuration and communication status of the Firepower Management Center. Registration key and NAT ID are only displayed if registration is pending.

If a device is configured as a secondary device in a stacked configuration, information about both the managing Management Center and the primary device is displayed.

**Access**

Basic

**Syntax**

`show managers`

**Example**

> show managers

**memory**

Displays the total memory, the memory in use, and the available memory for the device.
**model**

Displays model information for the device.

**Access**
Basic

**Syntax**

```
show model
```

**Example**

```
> show model
```

**mpls-depth**

Displays the number of MPLS layers configured on the management interface, from 0 to 6. This command is not available on NGIPSv and ASA FirePOWER.

**Access**
Basic

**Syntax**

```
show mpls-depth
```

**Example**

```
> show mpls-depth
```
NAT Commands

The `show nat` commands display NAT data and configuration information for the management interface. This command is not available on NGIPSv and ASA FirePOWER devices.

**Access**

Basic

**active-dynamic**

Displays NAT flows translated according to dynamic rules. These entries are displayed when a flow matches a rule, and persist until the rule has timed out. Therefore, the list can be inaccurate. Timeouts are protocol dependent: ICMP is 5 seconds, UDP is 120 seconds, TCP is 3600 seconds, and all other protocols are 60 seconds.

**Syntax**

```
show nat active-dynamic
```

**Example**

```
> show nat active-dynamic
```

**active-static**

Displays NAT flows translated according to static rules. These entries are displayed as soon as you deploy the rule to the device, and the list does not indicate active flows that match a static NAT rule.

**Syntax**

```
show nat active-static
```

**Example**

```
> show nat active-static
```

**allocators**

Displays information for all NAT allocators, the pool of translated addresses used by dynamic rules.

**Syntax**

```
show nat allocators
```
Example

> show nat allocators

cfg

Displays the current NAT policy configuration for the management interface.

Syntax

show nat config

Example

> show nat config

dynamic-rules

Displays dynamic NAT rules that use the specified allocator ID.

Syntax

show nat dynamic-rules allocator_id

where allocator_id is a valid allocator ID number.

Example

> show nat dynamic-rules 9

flows

Displays the number of flows for rules that use the specified allocator ID.

Syntax

show nat flows allocator-id

where allocator_id is a valid allocator ID number.

Example

> show nat flows 81
**static-rules**

Displays all static NAT rules.

**Syntax**

```
show nat static-rules
```

**Example**

```
> show nat static-rules
```

**netstat**

Displays the active network connections for an ASA FirePOWER module.

**Access**

Basic

**Syntax**

```
show netstat
```

**Example**

```
> show netstat
```

**network**

Displays the IPv4 and IPv6 configuration of the management interface, its MAC address, and HTTP proxy address, port, and username if configured.

**Access**

Basic

**Syntax**

```
show network
```

**Example**

```
> show network
```
network-modules

Displays all installed modules and information about them, including serial numbers. This command is not available on NGIPSv and ASA FirePOWER.

Access
Basic

Syntax

show network-modules

Example

> show network-modules

network-static-routes

Displays all configured network static routes and information about them, including interface, destination address, network mask, and gateway address.

Access
Basic

Syntax

show network-static-routes

Example

> show network-static-routes

ntp

Displays the ntp configuration.

Access
Basic

Syntax

show ntp
Example

> show ntp

perfstats

Displays performance statistics for the device.

Access
Basic

Syntax

show perfstats

Example

> show perfstats

portstats

Displays port statistics for all installed ports on the device. This command is not available on NGIPSv and ASA FirePOWER.

Access
Basic

Syntax

show portstats [copper | fiber | internal | external | all]

where copper specifies for all copper ports, fiber specifies for all fiber ports, internal specifies for all internal ports, external specifies for all external (copper and fiber) ports, and all specifies for all ports (external and internal).

Example

> show portstats fiber

power-supply-status

Displays the current state of hardware power supplies. This command is not available on NGIPSv and ASA FirePOWER.
If an 8000 Series managed device experiences a power failure, it may take up to 15 minutes for the show power-supply-status CLI command to reflect the correct status.

**Access**
Basic

**Syntax**

```
show power-supply-status
```

**Example**

```
> show power-supply-status
```

**process-tree**

Displays processes currently running on the device, sorted in tree format by type.

**Access**
Basic

**Syntax**

```
show process-tree
```

**Example**

```
> show process-tree
```

**processes**

Displays processes currently running on the device, sorted by descending CPU usage.

**Access**
Basic

**Syntax**

```
show processes sort-flag filter
```
where `sort-flag` can be `-m` to sort by memory (descending order), `-u` to sort by username rather than the process name, or `verbose` to display the full name and path of the command. The `filter` parameter specifies the search term in the command or username by which results are filtered. The header row is still displayed.

**Example**

```
> show processes -u user1
```

### route

Displays the routing information for an ASA FirePOWER module.

**Access**

Basic

**Syntax**

```
show route
```

**Example**

```
> show route
```

### routing-table

If no parameters are specified, displays routing information for all virtual routers. If parameters are specified, displays routing information for the specified router and, as applicable, its specified routing protocol type. All parameters are optional. This command is not available on NGIPSv and ASA FirePOWER.

**Access**

Basic

**Syntax**

```
show routing-table name [ ospf | rip | static ]
```

where `name` is the name of the specific router for which you want information, and `ospf`, `rip`, and `static` specify the routing protocol type.

**Example**

```
> show routing-table Vrouter1 static
```
serial-number

Displays the chassis serial number. This command is not available on NGIPSv.

Access
Basic

Syntax

show serial-number

Example

> show serial-number

ssl-policy-config

Displays the currently deployed SSL policy configuration, including policy description, default logging settings, all enabled SSL rules and rule configurations, trusted CA certificates, and undecryptable traffic actions.

Access
Basic

Syntax

show ssl-policy-config

Example

> show ssl-policy-config

stacking

Shows the stacking configuration and position on managed devices; on devices configured as primary, also lists data for all secondary devices. For stacks in a high-availability pair, this command also indicates that the stack is a member of a high-availability pair. The user must use the web interface to enable or (in most cases) disable stacking; if stacking is not enabled, the command will return Stacking not currently configured. This command is not available on NGIPSv and ASA FirePOWER.

Access
Basic
Syntax

show stacking

Example

> show stacking

summary

Displays a summary of the most commonly used information (version, type, UUID, and so on) about the device. For more detailed information, see the following show commands: version, interfaces, device-settings, and access-control-config.

Access
Basic

Syntax

show summary

Example

> show summary

syslog

Displays the system log in reverse chronological order. You can optionally specify a filter to display specific records based on content and the number of records to display per page view (the default is 25).

Access
Basic

Syntax

show syslog ["filter" records_per_page]

where filter specifies a Grep-compatible search filter and records_per_page specifies the number of records to display with each page view. See Syntax for System Log Filters, on page 2255 for more information on search filters.

Example

> show syslog "ssh" 20
The system displays the 20 most recent syslog records containing the string "ssh". To display the next 20 records, press Enter; to stop the display enter q.

**time**

Displays the current date and time in UTC and in the local time zone configured for the current user.

**Access**
Basic

**Syntax**

```
show time
```

**Example**

```
> show time
```

**traffic-statistics**

If no parameters are specified, displays details about bytes transmitted and received from all ports. If a port is specified, displays that information only for the specified port. You cannot specify a port for ASA FirePOWER modules, and the system displays only the data plane interfaces.

**Access**
Basic

**Syntax**

```
show traffic-statistics port
```

where *port* is the specific port for which you want information.

**Example**

```
> show traffic-statistics sl1p1
```

**user**

Applicable to NGIPSv only. Displays detailed configuration information for the specified user(s). The following values are displayed:

- Login — the login name
- UID — the numeric user ID
• Auth (Local or Remote) — how the user is authenticated
• Access (Basic or Config) — the user's privilege level
• Enabled (Enabled or Disabled) — whether the user is active
• Reset (Yes or No) — whether the user must change password at next login
• Exp (Never or a number) — the number of days until the user's password must be changed
• Warn (N/A or a number) — the number of days a user is given to change their password before it expires
• Str (Yes or No) — whether the user's password must meet strength checking criteria
• Lock (Yes or No) — whether the user's account has been locked due to too many login failures
• Max (N/A or a number) — the maximum number of failed logins before the user's account is locked

Access
Configuration

Syntax

show user username username username ...

where username specifies the name of the user and the usernames are space-separated.

Example

> show user jdoe

Applicable to NGIPSv and ASA FirePOWER only. Displays detailed configuration information for all local users. The following values are displayed:

• Login — the login name
• UID — the numeric user ID
• Auth (Local or Remote) — how the user is authenticated
• Access (Basic or Config) — the user's privilege level
• Enabled (Enabled or Disabled) — whether the user is active
• Reset (Yes or No) — whether the user must change password at next login
• Exp (Never or a number) — the number of days until the user's password must be changed
• Warn (N/A or a number) — the number of days a user is given to change their password before it expires
• Str (Yes or No) — whether the user's password must meet strength checking criteria
• Lock (Yes or No) — whether the user's account is locked due to too many login failures
• Max (N/A or a number) — the maximum number of failed logins before the user's account is locked

**Access**
Configuration

**Syntax**

`show users`

**Example**

`> show users`

---

**version**

Displays the product version and build. If the detail parameter is specified, displays the versions of additional components.

**Access**
Basic

**Syntax**

`show version [detail]`

**Example**

`> show version`

---

**virtual-routers**

If no parameters are specified, displays a list of all currently configured virtual routers with DHCP relay, OSPF, and RIP information. If parameters are specified, displays information for the specified router, limited by the specified route type. All parameters are optional. This command is not available on NGIPSv and ASA FirePOWER.

**Access**
Basic

**Syntax**

`show virtual-routers [ dhcprelay | ospf | rip ] name`
where dhcprelay, ospf, and rip specify for route types, and name is the name of the specific router for which you want information. If you specify ospf, you can then further specify neighbors, topology, or lsadb between the route type and (if present) the router name.

Example

> show virtual-routers ospf VRouter2

virtual-switches

If no parameters are specified, displays a list of all currently configured virtual switches. If parameters are specified, displays information for the specified switch. This command is not available on NGIPSv and ASA FirePOWER.

Access
Basic

Syntax

show virtual-switches name

Example

> show virtual-switches Vswitch1

vmware-tools

Indicates whether VMware Tools are currently enabled on a virtual device. This command is available only on NGIPSv.

VMware Tools is a suite of utilities intended to enhance the performance of the virtual machine. These utilities allow you to make full use of the convenient features of VMware products. The system supports the following plugins on all virtual appliances:

- guestInfo
- powerOps
- timeSync
- vmbackup

For more information about VMware Tools and the supported plugins, see the VMware website (http://www.vmware.com).

Access
Basic
Syntax

show vmware-tools

Example

> show vmware-tools

**VPN Commands**

The `show`VPN commands display VPN status and configuration information for VPN connections. This command is not available on NGIPSv and ASA FirePOWER devices.

**Access**

Basic

**config**

Displays the configuration of all VPN connections.

**Syntax**

show vpn config

**Example**

> show vpn config

**config by virtual router**

Displays the configuration of all VPN connections for a virtual router.

**Syntax**

show vpn config virtual router

**Example**

> show vpn config VRouter1

**status**

Displays the status of all VPN connections.
status by virtual router

Displays the status of all VPN connections for a virtual router.

**Syntax**

```
show vpn status virtual router
```

**Example**

```
> show vpn status VRouter1
```

counters

Displays the counters for all VPN connections.

**Syntax**

```
show vpn counters
```

**Example**

```
> show vpn counters
```

counters by virtual router

Displays the counters of all VPN connections for a virtual router.

**Syntax**

```
show vpn counters virtual router
```

**Example**

```
> show vpn counters VRouter1
```
Configuration Commands

The configuration commands enable the user to configure and manage the system. These commands affect system operation; therefore, with the exception of Basic-level configure password, only users with configuration CLI access can issue these commands.

audit_cert Commands

The configure audit_cert commands configure the device’s audit log client certificate for secure audit log streaming.

Access
Configuration

delete

Deletes the current client certificate for secure audit log streaming.

Syntax

configure audit_cert delete

Example

> configure audit_cert delete

import

Imports a client certificate for secure audit log streaming. After the user enters the command, the CLI prompts the user to provide either a client certificate and private key, or a certificate chain.

Syntax

configure audit_cert import

Example

> configure audit_cert import

***************Import Audit Client Certificate***************

1 Import Client Certificate and Private Key
2 Import Certificate Chain
0 Exit

********************************************************************************

Enter choice: 1
Enter your audit client certificate (PEM format) here:
bypass

On 7000 or 8000 Series devices, places an inline pair in fail-open (hardware bypass) or fail-close mode. You can use this command only when the inline set Bypass Mode option is set to Bypass.

Note that rebooting a device takes an inline set out of fail-open mode.

Access
Configuration

Syntax

configure bypass {open | close} {interface}

where interface is the name of either hardware port in the inline pair.

Example

> configure bypass open s1p1

high-availability

Disables or configures bypass for high availability on the device. This command is not available on NGIPSv, ASA FirePOWER, or on devices configured as secondary stack members.

Access
Configuration

Syntax

configure high-availability {disable | bypass}
Example

> configure high-availability disable

gui

Enables or disables the device web interface, including the streamlined upgrade web interface that appears during major updates to the system. This command is not available on NGIPSv and ASA FirePOWER.

Access
Configuration

Syntax

configure gui [enable | disable]

Example

> configure gui disable

lcd

Enables or disables the LCD display on the front of the device. This command is not available on NGIPSv and ASA FirePOWER.

Access
Configuration

Syntax

configure lcd {enable | disable}

Example

> configure lcd disable

log-ips-connections

Enables or disables logging of connection events that are associated with logged intrusion events.

Access
Configuration
Syntax

configure log-ips-connections {enable | disable}

Example

> configure log-ips-connections disable

manager Commands

The configure manager commands configure the device’s connection to its managing Firepower Management Center.

Access

Configuration

add

Configures the device to accept a connection from a managing Firepower Management Center. This command works only if the device is not actively managed.

A unique alphanumeric registration key is always required to register a device to a Firepower Management Center. In most cases, you must provide the hostname or the IP address along with the registration key. However, if the device and the Firepower Management Center are separated by a NAT device, you must enter a unique NAT ID, along with the registration key, and specify DONTRESOLVE instead of the hostname.

Syntax

configure manager add {hostname | IPv4_address | IPv6_address | DONTRESOLVE} regkey [nat_id]

where {hostname | IPv4_address | IPv6_address | DONTRESOLVE} specifies the DNS host name or IP address (IPv4 or IPv6) of the Firepower Management Center that manages this device. If the Firepower Management Center is not directly addressable, use DONTRESOLVE. If you use DONTRESOLVE, nat_id is required. regkey is the unique alphanumeric registration key required to register a device to the Firepower Management Center. nat_id is an optional alphanumeric string used during the registration process between the Firepower Management Center and the device. It is required if the hostname is set to DONTRESOLVE.

Example

> configure manager add DONTRESOLVE abc123 efg456

delete

Removes the Firepower Management Center’s connection information from the device. This command only works if the device is not actively managed.
Syntax

configure manager delete

Example

> configure manager delete

**mpls-depth**

Configures the number of MPLS layers on the management interface. This command is not available on NGIPSv and ASA FirePOWER.

**Access**

Configuration

**Syntax**

configure mpls-depth depth

where depth is a number between 0 and 6.

**Example**

> configure mpls-depth 3

**network Commands**

The `configure network` commands configure the device’s management interface.

**Access**

Configuration

**dns searchdomains**

Replaces the current list of DNS search domains with the list specified in the command.

**Syntax**

configure network dns searchdomains {searchlist}

where searchlist is a comma-separated list of domains.
**dns servers**

Replaces the current list of DNS servers with the list specified in the command.

**Syntax**

`configure network dns servers {dnslist}`

where `dnslist` is a comma-separated list of DNS servers.

**Example**

```
> configure network dns servers foo.bar.com,bar.com
```

**hostname**

Sets the hostname for the device.

**Syntax**

`configure network hostname {name}`

where `name` is the new hostname.

**Example**

```
> configure network hostname sfrocks
```

**http-proxy**

On 7000 & 8000 Series and NGIPSv devices, configures an HTTP proxy. After issuing the command, the CLI prompts the user for the HTTP proxy address and port, whether proxy authentication is required, and if it is required, the proxy username, proxy password, and confirmation of the proxy password.

Use this command on NGIPSv to configure an HTTP proxy server so the virtual device can submit files to the AMP cloud for dynamic analysis.

**Syntax**

`configure network http-proxy`
Example

> configure network http-proxy
Manual proxy configuration
Enter HTTP Proxy address:
Enter HTTP Proxy Port:
Use Proxy Authentication? [y/n] [n]:
Enter Proxy Username:
Enter Proxy Password:
Confirm Proxy Password:

http-proxy-disable

On 7000 Series, 8000 Series, or NGIPSv devices, deletes any HTTP proxy configuration.

Syntax

configure network http-proxy-disable

Example

> configure network http-proxy-disable
Are you sure that you wish to delete the current http-proxy configuration? [y/n]:

ipv4 delete

Disables the IPv4 configuration of the device’s management interface.

Syntax

configure network ipv4 delete [management_interface]

where management_interface is the management interface ID. If you do not specify an interface, this command configures the default management interface. This parameter is needed only if you use the configure management-interface commands to enable more than one management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only. Do not specify this parameter for other platforms. The management interface IDs are eth0 for the default management interface and eth1 for the optional event interface.

Example

> configure network ipv4 delete eth1

ipv4 dhcp

Sets the IPv4 configuration of the device’s management interface to DHCP. The management interface communicates with the DHCP server to obtain its configuration information.
**Syntax**

configure network ipv4 dhcp [management_interface]

where `management_interface` is the management interface ID. DHCP is supported only on the default management interface, so you do not need to use this argument.

**Example**

> configure network ipv4 dhcp

**ipv4 manual**

Manually configures the IPv4 configuration of the device’s management interface.

**Syntax**

configure network ipv4 manual ipaddr netmask [gw] [management_interface]

where `ipaddr` is the IP address, `netmask` is the subnet mask, and `gw` is the IPv4 address of the default gateway. The `management_interface` is the management interface ID. If you do not specify an interface, this command configures the default management interface. This parameter is needed only if you use the `configure management-interface` commands to enable more than one management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only. Do not specify this parameter for other platforms. The management interface IDs are `eth0` for the default management interface and `eth1` for the optional event interface.

**Example**

> configure network ipv4 manual 10.123.1.10 255.255.0.0 10.123.1.1

**ipv6 delete**

Disables the IPv6 configuration of the device’s management interface.

**Syntax**

configure network ipv6 delete [management_interface]

where `management_interface` is the management interface ID. If you do not specify an interface, this command configures the default management interface. This parameter is needed only if you use the `configure management-interface` commands to enable more than one management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only. Do not specify this parameter for other platforms. The management interface IDs are `eth0` for the default management interface and `eth1` for the optional event interface.
Example

> configure network ipv6 delete

**ipv6 dhcp**

Sets the IPv6 configuration of the device’s management interface to DHCP. The management interface communicates with the DHCP server to obtain its configuration information.

**Syntax**

configure network ipv6 dhcp [management_interface]

where management_interface is the management interface ID. DHCP is supported only on the default management interface, so you do not need to use this argument.

**Example**

> configure network ipv6 dhcp

**ipv6 manual**

Manually configures the IPv6 configuration of the device’s management interface.

**Syntax**

configure network ipv6 manual ip6addr/ip6prefix [ip6gw] [management_interface]

where ip6addr/ip6prefix is the IP address and prefix length and ip6gw is the IPv6 address of the default gateway. The management_interface is the management interface ID. If you do not specify an interface, this command configures the default management interface. This parameter is needed only if you use the configure management-interface commands to enable more than one management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only. Do not specify this parameter for other platforms. The management interface IDs are eth0 for the default management interface and eth1 for the optional event interface.

**Example**

**ipv6 router**

Sets the IPv6 configuration of the device’s management interface to Router. The management interface communicates with the IPv6 router to obtain its configuration information.
Syntax

configure network ipv6 router [management interface]

where management interface is the management interface ID. If you do not specify an interface, this command configures the default management interface. This parameter is needed only if you use the configure management-interface commands to enable more than one management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only. Do not specify this parameter for other platforms. The management interface IDs are eth0 for the default management interface and eth1 for the optional event interface.

Example

> configure network ipv6 router

management-interface disable

Disables a management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only.

Syntax

configure network management-interface disable ethn

where n is the number of the management interface you want to configure. eth0 is the default management interface and eth1 is the optional event interface. Cisco recommends that you leave the eth0 default management interface enabled, with both management and event channels enabled. See Management Interfaces, on page 750 for detailed information about using a separate event interface on the Firepower Management Center and on the managed device.

Example

> configure network management-interface disable eth1

management-interface disable-event-channel

Disables the event traffic channel on the specified management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only.

Syntax

configure network management-interface disable-event-channel ethn

where n is the number of the management interface you want to configure. eth0 is the default management interface and eth1 is the optional event interface. Cisco recommends that you leave the eth0 default management interface enabled, with both management and event channels enabled. See Management Interfaces, on page 750 for detailed information about using a separate event interface on the Firepower Management Center and on the managed device.
management-interface disable-management-channel

Disables the management traffic channel on the specified management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only.

Syntax

```plaintext
configure network management-interface disable-management-channel eth n
```

where `n` is the number of the management interface you want to configure. `eth0` is the default management interface and `eth1` is the optional event interface. Cisco recommends that you leave the eth0 default management interface enabled, with both management and event channels enabled. See Management Interfaces, on page 750 for detailed information about using a separate event interface on the Firepower Management Center and on the managed device.

Example

```
> configure network management-interface disable-management-channel eth1
```

management-interface enable

Enables the specified management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only.

Syntax

```plaintext
configure network management-interface enable eth n
```

where `n` is the number of the management interface you want to enable. `eth0` is the default management interface and `eth1` is the optional event interface.

For device management, the Firepower Management Center management interface carries two separate traffic channels: the management traffic channel carries all internal traffic (such as inter-device traffic specific to the management of the device), and the event traffic channel carries all event traffic (such as web events). You can optionally configure a separate event-only interface on the Management Center to handle event traffic (see the Firepower Management Center web interface do perform this configuration). You can only configure one event-only interface. Event traffic can use a large amount of bandwidth, so separating event traffic from management traffic can improve the performance of the Management Center.

The default eth0 interface includes both management and event channels by default. You can optionally enable the eth0 interface as an event-only interface. Event traffic is sent between the device event interface and the Firepower Management Center event interface if possible. If the event network goes down, then event traffic reverts to the default management interface. Separate event interfaces are used when possible, but the management interface is always the backup.

Example

```
> configure network management-interface disable-management-channel eth1
```
When you enable a management interface, both management and event channels are enabled by default. We recommend that you use the default management interface for both management and eventing channels; and then enable a separate event-only interface. The Firepower Management Center event-only interface cannot accept management channel traffic, so you should simply disable the management channel on the device event interface.

Use the `configure network {ipv4 | ipv6} manual` commands to configure the address(es) for management interfaces.

**Example**

```
> configure network management-interface enable eth1
> configure network management-interface disable-management-channel eth1
```

### management-interface enable-event-channel

Enables the event traffic channel on the specified management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only.

**Syntax**

```
configure network management-interface enable-event-channel ethn
```

where `n` is the number of the management interface you want to configure. `eth0` is the default management interface and `eth1` is the optional event interface. Cisco recommends that you leave the `eth0` default management interface enabled, with both management and event channels enabled. See [Management Interfaces, on page 750](#) for detailed information about using a separate event interface on the Firepower Management Center and on the managed device.

**Example**

```
> configure network management-interface enable-event-channel eth1
```

### management-interface enable-management-channel

Enables the management traffic channel on the specified management interface. Multiple management interfaces are supported on 8000 series devices and the ASA 5585-X with FirePOWER services only.

**Syntax**

```
configure network management-interface enable-management-channel ethn
```

where `n` is the number of the management interface you want to configure. `eth0` is the default management interface and `eth1` is the optional event interface. Cisco recommends that you leave the `eth0` default management interface enabled, with both management and event channels enabled. See [Management Interfaces, on page 750](#) for detailed information about using a separate event interface on the Firepower Management Center and on the managed device.
Example

> configure network management-interface enable-management-channel eth1

management-interface tcpport

Changes the value of the TCP port for management.

Syntax

configure network management-interface tcpport port

where port is the management port value you want to configure.

Example

> configure network management-interface tcpport 8500

management-port

Sets the value of the device’s TCP management port.

Syntax

configure network management-port number

where number is the management port value you want to configure.

Example

> configure network management-port 8500

static-routes ipv4 add

Adds an IPv4 static route for the specified management interface.

Syntax

configure network static-routes ipv4 add interface destination netmask gateway

where interface is the management interface, destination is the destination IP address, netmask is the network mask address, and gateway is the gateway address you want to add.
**Example**

```shell
> configure network static-routes ipv4
add eth1 10.115.24.0 255.255.255.0 10.115.9.2
```

### static-routes ipv4 delete

Deletes an IPv4 static route for the specified management interface.

**Syntax**

```shell
configure network static-routes ipv4
delete interface destination netmask gateway
```

where `interface` is the management interface, `destination` is the destination IP address, `netmask` is the network mask address, and `gateway` is the gateway address you want to delete.

**Example**

```shell
> configure network static-routes ipv4
delete eth1 10.115.24.0 255.255.255.0 10.115.9.2
```

### static-routes ipv6 add

Adds an IPv6 static route for the specified management interface.

**Syntax**

```shell
configure network static-routes ipv6
add interface destination prefix gateway
```

where `interface` is the management interface, `destination` is the destination IP address, `prefix` is the IPv6 prefix length, and `gateway` is the gateway address you want to add.

**Example**

```shell
> configure network static-routes ipv6
add eth1 2001:DB8:3ffe:1900:4545:3:200:: f8ff:fe21:67cf 64
```

### static-routes ipv6 delete

Deletes an IPv6 static route for the specified management interface.

**Syntax**

```shell
configure network static-routes ipv6
delete interface destination prefix gateway
```
where interface is the management interface, destination is the destination IP address, prefix is the IPv6 prefix length, and gateway is the gateway address you want to delete.

**Example**

```
> configure network static-routes ipv6
```

**password**

Allows the current user to change their password. After issuing the command, the CLI prompts the user for their current (or old) password, then prompts the user to enter the new password twice.

**Access**

Basic

**Syntax**

configure password

**Example**

```
> configure password
Enter current password:
Enter new password:
Confirm new password:
```

**stacking disable**

On 7000 and 8000 Series devices, removes any stacking configuration present on that device:

- On devices configured as primary, the stack is removed entirely.
- On devices configured as secondary, that device is removed from the stack.

This command is not available on NGIPSv or ASA FirePOWER modules, and you cannot use it to break a device high-availability pair.

Use this command when you cannot establish communication with appliances higher in the stacking hierarchy. If the Firepower Management Center is available for communication, a message appears instructing you to use the Firepower Management Center web interface instead; likewise, if you enter `stacking disable` on a device configured as secondary when the primary device is available, a message appears instructing you to enter the command from the primary device.

**Access**

Configuration
user Commands

Applicable only to NGIPSv, the configure user commands manage the device’s local user database.

Access
Configuration

access

Modifies the access level of the specified user. This command takes effect the next time the specified user logs in.

Syntax

configure user access username [basic | config]

where username specifies the name of the user for which you want to modify access, basic indicates basic access, and config indicates configuration access.

Example

> configure user access jdoe basic

add

Creates a new user with the specified name and access level. This command prompts for the user’s password.

Syntax

configure user add username [basic | config]

where username specifies the name of the new user, basic indicates basic access, and config indicates configuration access.

Example

> configure user add jdoe basic
Enter new password for user jdoe:
Confirm new password for user jdoe:
Forcing the expiration of the user’s password.

Syntax

configure user aging username max_days warn_days

where username specifies the name of the user, max_days indicates the maximum number of days that the password is valid, and warn_days indicates the number of days that the user is given to change the password before it expires.

Example

> configure user aging jdoe 100 3

delete

Deletes the user and the user’s home directory.

Syntax

configure user delete username

where username specifies the name of the user.

Example

> configure user delete jdoe

disable

Disables the user. Disabled users cannot login.

Syntax

configure user disable username

where username specifies the name of the user.

Example

> configure user disable jdoe

enable

Enables the user.
Syntax

configure user enable username
where username specifies the name of the user.

Example

> configure user enable jdoe

forcereset

Forces the user to change their password the next time they login. When the user logs in and changes the password, strength checking is automatically enabled.

Syntax

configure user forcereset username
where username specifies the name of the user.

Example

> configure user forcereset jdoe

maxfailedlogins

Sets the maximum number of failed logins for the specified user.

Syntax

configure user maxfailedlogins username number
where username specifies the name of the user, and number specifies the maximum number of failed logins.

Example

> configure user maxfailedlogins jdoe 3

password

Sets the user’s password. This command prompts for the user’s password.

Syntax

configure user password username
where username specifies the name of the user.
Example

> configure user password jdoe
Enter new password for user jdoe:
Confirm new password for user jdoe:

**strengthcheck**

Enables or disables the strength requirement for a user’s password. When a user’s password expires or if the configure user forcereset command is used, this requirement is automatically enabled the next time the user logs in.

**Syntax**

configure user strengthcheck username {enable | disable}

where **username** specifies the name of the user, **enable** sets the requirement for the specified users password, and **disable** removes the requirement for the specified user’s password.

**Example**

> configure user strengthcheck jdoe enable

**unlock**

Unlocks a user that has exceeded the maximum number of failed logins.

**Syntax**

configure user unlock username

where **username** specifies the name of the user.

**Example**

> configure user unlock jdoe

**vmware-tools**

Enables or disables VMware Tools functionality on NGIPSv. This command is available only on NGIPSv. VMware Tools is a suite of utilities intended to enhance the performance of the virtual machine. These utilities allow you to make full use of the convenient features of VMware products. The system supports the following plugins on all virtual appliances:

- guestInfo
- powerOps
• timeSync
• vmbackup

For more information about VMware Tools and the supported plugins, see the VMware website (http://www.vmware.com).

Access

Basic

Syntax

configure vmware-tools [enable | disable]

Example

> configure vmware-tools enable

System Commands

The system commands enable the user to manage system-wide files and access control settings. Only users with configuration CLI access can issue commands in system mode.

access-control Commands

The system access-control commands enable the user to manage the access control configuration on the device.

Access

Configuration

archive

Saves the currently deployed access control policy as a text file on /var/common.

Syntax

system access-control archive

Example

> system access-control archive
clear-rule-counts

Resets the access control rule hit count to 0.

**Syntax**

```
system access-control clear-rule-counts
```

**Example**

```
> system access-control clear-rule-counts
```

rollback

Reverts the system to the previously deployed access control configuration. You cannot use this command with devices in stacks or high-availability pairs.

**Syntax**

```
system access-control rollback
```

**Example**

```
> system access-control rollback
```

**compliance Commands**

The *compliance* commands display and configure the device’s security certifications compliance mode.

⚠️ **Caution**

After you enable this setting, you cannot disable it. If you need to do so, contact Support for assistance.

**Access**

**Configuration**

**enable cc**

Configures the device’s security certifications compliance to Common Criteria (CC) mode.

⚠️ **Caution**

After you enable this setting, you cannot disable it. If you need to do so, contact Support for assistance.
Syntax

```
> system compliance enable cc
```

**Example**

```
> system compliance enable cc
```

**enable ucapl**

Configures the device's security certifications compliance to Unified Capabilities Approved Products List (UCAPL) mode.

⚠️ **Caution**

After you enable this setting, you cannot disable it. If you need to do so, contact Support for assistance.

Syntax

```
> system compliance enable ucapl
```

**Example**

```
> system compliance enable ucapl
```

**show**

Displays the device's current security certifications compliance mode.

Syntax

```
> system compliance show
```

**Example**

```
> system compliance show
```

**disable-http-user-cert**

Removes all HTTP user certification present on the system.

**Access**

Configuration
Syntax

system disable-http-user-cert

Example

> system disable-http-user-cert

file Commands

The system file commands enable the user to manage the files in the common directory on the device.

Access

Configuration

copy

Uses FTP to transfer files to a remote location on the host using the login username. The local files must be located in the common directory.

Syntax

system file copy hostname username path filenames filenames ...

where hostname specifies the name or ip address of the target remote host, username specifies the name of the user on the remote host, path specifies the destination path on the remote host, and filenames specifies the local files to transfer; the file names are space-separated.

Example

> system file copy sfrocks jdoe /pub *

delete

Removes the specified files from the common directory.

Syntax

system file delete filenames filenames ...

where filenames specifies the files to delete; the file names are space-separated.

Example

> system file delete *
list

If no file names are specified, displays the modification time, size, and file name for all the files in the common directory. If file names are specified, displays the modification time, size, and file name for files that match the specified file names.

**Syntax**

```
system file list filenames
```

where *filenames* specifies the files to display; the file names are space-separated.

**Example**

```
> system file list
```

secure-copy

Uses SCP to transfer files to a remote location on the host using the login username. The local files must be located in the `/var/common` directory.

**Syntax**

```
system file secure-copy hostname username path filenames filenames ...
```

where *hostname* specifies the name or ip address of the target remote host, *username* specifies the name of the user on the remote host, *path* specifies the destination path on the remote host, and *filenames* specifies the local files to transfer; the file names are space-separated.

**Example**

```
> system file secure-copy 10.123.31.1 jdoe /tmp *
```

generate-troubleshoot

Generates troubleshooting data for analysis by Cisco.

**Access**

Configuration

**Syntax**

```
system generate-troubleshoot
```

This syntax displays a list of optional parameters to specify what troubleshooting data should be displayed.
Example

> system generate-troubleshoot

**ldapsearch**

Enables the user to perform a query of the specified LDAP server. Note that all parameters are required.

**Access**

Configuration

**Syntax**

system ldapsearch host port baseDN userDN basefilter

where host specifies the LDAP server domain, port specifies the LDAP server port, baseDN specifies the DN (distinguished name) that you want to search under, userDN specifies the DN of the user who binds to the LDAP directory, and basefilter specifies the record or records you want to search for.

**Example**

> system ldapsearch ldap.example.com 389 cn=users,
dc-example,dc=com cn=user1,cn=users,dc-example,dc=com, cn=user2

**lockdown-sensor**

Removes the `expert` command and access to the bash shell on the device.

⚠️ **Caution**

This command is irreversible without a hotfix from Support. Use with care.

**Access**

Configuration

**Syntax**

system lockdown-sensor

**Example**

> system lockdown-sensor
**nat rollback**

Reverts the system to the previously applied NAT configuration. This command is not available on NGIPSv or ASA FirePOWER. You cannot use this command with devices in stacks or high-availability pairs.

**Access**
Configuration

**Syntax**

```
system nat rollback
```

**Example**

```
> system nat rollback
```

**reboot**

Reboots the device.

**Access**
Configuration

**Syntax**

```
system reboot
```

**Example**

```
> system reboot
```

**restart**

Restarts the device application.

**Access**
Configuration

**Syntax**

```
system restart
```
Example

> system restart

support Commands

The `system support` commands enable the user to manage special SSL ClientHello processing on the device.

Access
Configuration

ssl-client-hello-display

Displays the current settings for processing the ClientHello message during an SSL handshake. For a description of these settings, see the `ssl-client-hello-enabled` and `ssl-client-hello-tuning` commands.

Access
Basic

Syntax

```
system support ssl-client-hello-display
```

Example

> system support ssl-client-hello-display

ssl-client-hello-enabled

Controls special processing of the ClientHello message during the SSL handshake.

⚠️ Caution

Do not use this command unless you are directed to do so by Support.

Access
Configuration

Syntax

```
system support ssl-client-hello-enabled setting {true | false}
```

Possible `setting` values are:

- `feature`
  Controls all special handling of ClientHello messages.
curves
Controls stripping of elliptic curves that the Firepower System does not support:

- **true** (enabled)—The system strips any unsupported elliptic curves from the ClientHello message, increasing the likelihood of traffic decryption. You must also enable the extensions setting.
- **false** (disabled)—The system retains unsupported elliptic curves in the ClientHello message, decreasing the likelihood of traffic decryption.

ciphers
Controls stripping of cipher suites that the Firepower System does not support:

- **true** (enabled)—The system strips unsupported cipher suites from ClientHello messages, increasing the likelihood of traffic decryption.
- **false** (disabled)—The system retains unsupported cipher suites in ClientHello messages. This decreases the likelihood of traffic decryption and can result in a number of Unsupported or Unknown Cipher errors in the SSL Flow Error field of associated connection events.

extensions
Controls stripping of TLS extensions that prevent decryption:

- **true** (enabled)—The system identifies TLS extensions that prevent decryption and strips them from the ClientHello message. This value is required if you want to enable curves, session_ticket, and alpn.
- **false** (disabled)—The system retains all TLS extensions in the ClientHello message. This decreases the likelihood of traffic decryptions and can result in Unknown Session errors in the SSL Flow Error field of associated connection events.

session_ticket
Controls processing of the SessionTicket extension in ClientHello messages. If the system can match a SessionTicket value in an incoming ClientHello message to cached session data, it can resume the session without the client and server performing the full SSL handshake.

- **true** (enabled)—The system strips unrecognized SessionTicket values from the ClientHello message. This increases the likelihood of traffic decryption for the resumed session. You must also enable the extensions setting.
- **false** (disabled)—The system retains all SessionTicket values in the ClientHello message. This decreases the likelihood of traffic decryption and can result in Uncached Session errors in the SSL Flow Error field of associated connection events.

session_id
Controls processing of the Session Identifier element in ClientHello messages. If the system can match the Session Identifier in an incoming ClientHello message to cached session data, it can resume the session without the client and server performing the full SSL handshake.

- **true** (enabled)—The system strips unrecognized Session Identifier values from the ClientHello message. This increases the likelihood of traffic decryption for the resumed session.
- **false** (disabled)—The system retains all Session Identifier values in the ClientHello message. This decreases the likelihood of traffic decryption and can result in Uncached Session errors in the SSL Flow Error field of associated connection events.
alpn
Controls stripping of ALPN protocol values that cannot be decrypted, specifically, the SPDY and HTTP2 protocols:

• true (enabled)—The system prevents the client from establishing SPDY or HTTP2 sessions, increasing the likelihood of traffic decryption and inspection. You must also enable the extensions setting.
• false (disabled)—The system allows the client to establish SPDY or HTTP2 sessions with the server, decreasing the likelihood of traffic decryption and inspection.

compression
Controls stripping of TLS compression requests from ClientHello messages:

• true (enabled)—The system prevents the client from establishing a TLS compressed session with the server.
• false (disabled)—The system allows the client to establish a TLS compressed session with the server. This prevents traffic decryption for the session and can result in Compression Used errors in the SSL Flow Error field of associated connection events.

Example

> system support ssl-client-hello-enabled feature false

ssl-client-hello-force-reset

Resets the configurable settings for ClientHello message processing to default values. The system does not require user confirmation before proceeding.

⚠️ Caution
Do not use this command unless you are directed to do so by Support.

Access
Configuration

Syntax

system support ssl-client-hello-force-reset

Example

> system support ssl-client-hello-force-reset

ssl-client-hello-reset

Resets the configurable settings for ClientHello message processing to default values. The system requires user confirmation before proceeding.
ssl-client-hello-tuning

Do not use this command unless you are directed to do so by Support.

Access
Configuration

Syntax

```plaintext
system support ssl-client-hello-reset
```

Example

```plaintext
> system support ssl-client-hello-reset
```

ssl-client-hello-tuning

Allows you to refine how the managed device modifies ClientHello messages during SSL handshakes. This command tunes the default lists of cipher suites, elliptic curves, and extensions that the system allows in ClientHello messages. This command only adds entries to or removes entries from the default lists of allowed values. It does not overwrite the default lists.

Caution
Do not use this command unless you are directed to do so by Support.

Access
Configuration

Syntax

```plaintext
system support ssl-client-hello-tuning setting value
```

The `value` element supports a comma-delimited list of values. Possible values for the `setting` and `value` elements include:

<table>
<thead>
<tr>
<th>Setting</th>
<th>System Action</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ciphers_allow</td>
<td>Allows the specified cipher suites in ClientHello messages. If you use this command, the system retains the specified cipher suites in any ClientHello messages it modifies.</td>
<td>Obtain individual cipher suite numbers from the IANA website: <a href="https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-4">https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-4</a> IANA provides values in hexadecimal. Convert them to decimal for use in this command.</td>
</tr>
</tbody>
</table>
| ciphers_remove  | Disallows the specified cipher suites in ClientHello messages. If you use this command, the system strips the specified cipher suites from any ClientHello message it modifies. | }
### curves_allow

Allows the specified elliptic curves in ClientHello messages. If you use this command, the system retains the specified elliptic curves in any ClientHello message it modifies.

### curves_remove

Disallows the specified elliptic curves in ClientHello messages. If you use this command, the system strips the specified elliptic curves from any ClientHello message it modifies.

### extensions_allow

Allows the specified extensions in ClientHello messages. If you use this command, the system retains the specified extensions in any ClientHello message it modifies.

### extensions_remove

Disallows the specified elliptic curves in ClientHello messages. The system strips the specified extensions from any ClientHello message it modifies. By default, the system disallows extensions 22, 23, and 30032.

#### Example

```
> system support ssl-client-hello-tuning ciphers_allow 4,7,16,22
```

### shutdown

Shuts down the device. This command is not available on ASA FirePOWER modules.

#### Access

Configuration

#### Syntax

```
system shutdown
```

#### Example

```
> system shutdown
```
shutdown
