CONTENTS

CHAPTER 1

Getting Started With Firepower 1

Introduction to Managed Devices  1
  7000 and 8000 Series Managed Devices  2
  NGIPSv  2
  Cisco ASA with FirePOWER Services  3
  Firepower Threat Defense  3
  Firepower Threat Defense Virtual  3

Introduction to the Firepower Management Center  4
  Firepower Management Center Capabilities  4

Firepower System Components  5
  Redundancy and Resource Sharing  5
  Network Traffic Management for 7000 & 8000 Series Devices  5
  Multitenancy  6
  Discovery and Identity  6
  Access Control  7
  SSL Inspection  7
  Intrusion Detection and Prevention  7
  Cisco Advanced Malware Protection and File Control  8
  Application Programming Interfaces  9
  The Context Menu  10

Switching Domains on the Firepower Management Center  12

Firepower Online Help, How To, and Documentation  12
  Top-Level Documentation Listing Pages for FMC Deployments  12
  License Statements in the Documentation  14
  Supported Devices Statements in the Documentation  14
  Access Statements in the Documentation  15
Contents

Firepower System IP Address Conventions 15

PART I  Your User Account 17

CHAPTER 2  Logging into the Firepower System 19

Firepower System User Accounts 19
Firepower System User Interfaces 21
Web Interface Considerations 23
Session Timeout 24
Logging Into the Firepower Management Center Web Interface 24
Logging Into the Web Interface of a 7000 or 8000 Series Device 25
Logging Into the Firepower Management Center with CAC Credentials 26
Logging Into a 7000 or 8000 Series Device with CAC Credentials 27
Logging Into the CLI on 7000/8000 Series, ASA FirePOWER, and NGIPSv Devices 27
Logging Into the Command Line Interface on FTD Devices 28
Logging Out of a Firepower System Web Interface 29

CHAPTER 3  Specifying User Preferences 31

User Preferences Introduction 31
Changing Your Password 31
Changing an Expired Password 32
Specifying Your Home Page 32
Configuring Event View Settings 33
Event View Preferences 34
File Download Preferences 35
Default Time Windows 35
Default Workflows 37
Setting Your Default Time Zone 37
Specifying Your Default Dashboard 38

PART II  Firepower System Management 39

CHAPTER 4  Firepower System User Management 41
User Roles 41
Contents

External Authentication 74
LDAP Authentication 75
  Required Information for Creating LDAP Authentication Objects 75
  CAC Authentication 77
    Configuring CAC Authentication 77
Creating Basic LDAP Authentication Objects 79
Creating Advanced LDAP Authentication Objects 81
  LDAP Authentication Server Fields 84
  Identifying the LDAP Authentication Server 85
  LDAP-Specific Fields 86
    Configuring LDAP-Specific Parameters 89
  LDAP Group Fields 91
    Configuring Access Rights by Group 92
  LDAP Shell Access Fields 93
    Configuring LDAP Shell Access 94
  Testing LDAP Authentication Connections 95
    Troubleshooting LDAP Authentication Connections 96
RADIUS Authentication 97
  Creating RADIUS Authentication Objects 98
    Configuring RADIUS Connection Settings 100
    Configuring RADIUS User Roles 102
    Configuring RADIUS Shell Access 103
    Defining Custom RADIUS Attributes 104
    Testing RADIUS Authentication Connections 105
Single Sign-on (SSO) 106
  Configuring SSO 106

CHAPTER 5
Licensing the Firepower System 109
  About Firepower Licenses 109
  License Requirements for Firepower Management Center 110
    Firepower Management Center Virtual Licenses 110
  Evaluation License Caveats 110
  Smart vs. Classic Licenses 110
  License Firepower Threat Defense Devices (FTD) 111
Smart Software Manager (CSSM) 111
Periodic Communication with the License Authority 112
Service Subscriptions for FTD Features 112
FTD License Types and Restrictions 113
  Base Licenses 114
  Malware Licenses for Firepower Threat Defense Devices 114
  Threat Licenses 115
  URL Filtering Licenses for Firepower Threat Defense Devices 116
  Licensing for Export-Controlled Functionality 116
  Licensing for FTD Clusters 117
Create a Smart Account to Hold Your Licenses 117
How to Configure Smart Licensing with Direct Internet Access 118
  Obtain a Product License Registration Token for Smart Licensing 119
  Register Smart Licenses 120
Smart Software Satellite Server Overview 121
  How to Deploy a Smart Software Satellite Server 121
Assign Licenses to Multiple Managed Devices 123
View FTD Licenses and License Status 124
  FTD License Status 125
Move or Remove Licenses from FTD Devices 125
Transfer FTD Licenses to a Different Firepower Management Center 126
If FTD License Status is Out of Compliance 126
Deregister a Firepower Management Center from the Cisco Smart Software Manager 127
Synchronize a Firepower Management Center with the Cisco Smart Software Manager 127
Troubleshoot FTD Licensing 128
License Classic Devices (Firepower 7000/8000 Series, ASA FirePOWER, and NGIPSv) 128
  Product License Registration Portal 129
Service Subscriptions for Firepower Features (Classic Licensing) 129
Classic License Types and Restrictions 129
  Protection Licenses 131
  Control Licenses 131
  URL Filtering Licenses for Classic Devices 132
  Malware Licenses for Classic Devices 133
  VPN Licenses for 7000 and 8000 Series Devices 133
Software Update Automation 192
   Automating Software Downloads 193
   Automating Software Pushes 194
   Automating Software Installs 195
Vulnerability Database Update Automation 196
   Automating VDB Update Downloads 196
   Automating VDB Update Installs 197
Automating URL Filtering Updates Using a Scheduled Task 198
Scheduled Task Review 199
   Task List Details 200
   Viewing Scheduled Tasks on the Calendar 200
   Editing Scheduled Tasks 201
   Deleting Scheduled Tasks 201

CHAPTER 10  FMC Database Purge 203
   Purging Data from the FMC Database 203

CHAPTER 11  Firepower Management Center High Availability 205
   About Firepower Management Center High Availability 205
   System Requirements Firepower Management Center High Availability 206
      Hardware Requirements 206
      Software Requirements 206
      License Requirements 206
   Roles v. Status in Firepower Management Center High Availability 207
   Prerequisites to Establish Firepower Management Center High Availability 207
   Event Processing on Firepower Management Center High Availability Pairs 208
      AMP Cloud Connections and Malware Information 208
      URL Filtering and Security Intelligence 208
   User Data Processing During Firepower Management Center Failover 208
   Configuration Management on Firepower Management Center High Availability Pairs 209
   Firepower Management Center High Availability Behavior During a Backup 209
   Firepower Management Center High Availability Split-Brain 209
   Upgrading Firepower Management Centers in a High Availability Pair 209
   Troubleshooting Firepower Management Center High Availability 210
Establishing Firepower Management Center High Availability 211
Viewing Firepower Management Center High Availability Status 213
Configuration Data Synced between Firepower Management Centers during High Availability 214
Using CLI to Resolve Device Registration in Firepower Management Center High Availability 214
Switching Peers in a Firepower Management Center High Availability Pair 215
Pausing Communication Between Paired Firepower Management Centers 216
Restarting Communication Between Paired Firepower Management Centers 216
Changing the IP address of a Firepower Management Center in a High Availability Pair 217
Disabling Firepower Management Center High Availability 218
Replacing FMCs in a High Availability Pair 218
   Replace a Failed Primary FMC (Successful Backup) 219
   Replace a Failed Primary FMC (Unsuccessful Backup) 220
   Replace a Failed Secondary FMC (Successful Backup) 221
   Replace a Failed Secondary FMC (Unsuccessful Backup) 222

CHAPTER 12 Device Management Basics 223
About Device Management 223
   About the Firepower Management Center 223
   What Can Be Managed by a Firepower Management Center? 224
   Beyond Policies and Events 224
   NAT Environments 225
The Device Management Page 227
   Filtering Managed Devices 227
Add Devices to the Firepower Management Center 228
Deleting Devices from the Firepower Management Center 230

### PART V

**Classic Device Configuration Basics** 469

### CHAPTER 21

**Classic Device Management Basics** 471

- Remote Management Configuration (Classic Devices) 471
- Configuring Remote Management on a Managed Device 472
- Editing Remote Management on a Managed Device 472
- Changing the Management Port 473

### Interface Configuration Settings

- The Physical Hardware View 474
- Interface Icons 474
- Using the Physical Hardware View 475
- Configuring Sensing Interfaces 476
- Configuring HA Link Interfaces 477
- Disabling Interfaces 478

- Managing Cisco ASA FirePOWER Interfaces 479
- MTU Ranges for 7000 and 8000 Series Devices and NGIPSv 479
CHAPTER 22
Introduction to IPS Device Deployment and Configuration 483
Passive IPS Deployments 483
Passive Interfaces on the Firepower System 483
Configuring Passive Interfaces 484
Inline IPS Deployments 485
Inline Interfaces on the Firepower System 486
Configuring Inline Interfaces 487
Inline Sets on the Firepower System 488
Viewing Inline Sets 489
Adding Inline Sets 489
Advanced Inline Set Options 491
Configuring Advanced Inline Set Options 492
Deleting Inline Sets 493

PART VI
Classic Device High Availability and Scalability 495

CHAPTER 23
About 7000 and 8000 Series Device High Availability 497
Device High Availability Requirements 498
Device High Availability Failover and Maintenance Mode 498
Configuration Deployment and Upgrade Behavior for High-Availability Pairs 499
Deployment Types and Device High Availability 499
7000/8000 Series High Availability Configuration 501
Establishing Firepower 7000/8000 Series High Availability 501
Editing Device High Availability 502
Configuring Individual Devices in a High-Availability Pair 503
Configuring Individual Device Stacks in a High-Availability Pair 503
Configuring Interfaces on a Device in a High-Availability Pair 504
Switching the Active Peer in a Device High-Availability Pair 505
Placing a High-Availability Peer into Maintenance Mode 505
Replacing a Device in a Stack in a High-Availability Pair 506
CHAPTER 27  
Interface Overview for Firepower Threat Defense 555  
Management/Diagnostic Interface 555  
Management Interface 555  
Diagnostic Interface 555  
Interface Mode and Types 556  
Security Zones and Interface Groups 557  
Auto-MDI/MDIX Feature 557  
Default Settings for Interfaces 557  
Sync Interface Changes with the Firepower Management Center 559  

CHAPTER 28  
Regular Firewall Interfaces for Firepower Threat Defense 561  
Configure EtherChannel and Redundant Interfaces 561  
About EtherChannels and Redundant Interfaces 561  
About Redundant Interfaces (ASA Platform Only) 562  
About EtherChannels 562  
Guidelines for EtherChannels and Redundant Interfaces 564  
Configure a Redundant Interface (ASA Platform Only) 566  
Configure an EtherChannel 567  
Configure VLAN Subinterfaces and 802.1Q Trunking 569  
Guidelines and Limitations for VLAN Subinterfaces 569  
Maximum Number of VLAN Subinterfaces by Device Model 569  
Add a Subinterface 570  
Configure Routed and Transparent Mode Interfaces 571  
About Routed and Transparent Mode Interfaces 571  
Routed Mode Deployment 571  
Transparent Mode Deployment 573  
Dual IP Stack (IPv4 and IPv6) 573  
Guidelines and Requirements for Routed and Transparent Mode Interfaces 573  
Configure Routed Mode Interfaces 575  
Configure Transparent Mode Bridge Group Interfaces 577  
Configure General Bridge Group Member Interface Parameters 577  
Configure the Bridge Virtual Interface (BVI) 578
Configure a Diagnostic (Management) Interface for Transparent Mode 579
Configure IPv6 Addressing 581
  About IPv6 581
  Configure a Global IPv6 Address 582
  Configure IPv6 Neighbor Discovery 584
Configure Advanced Interface Settings 586
  About Advanced Interface Configuration 586
    About MAC Addresses 587
    About the MTU 587
    ARP Inspection for Bridge Group Traffic 588
    MAC Address Table 589
Default Settings 589
Guidelines for ARP Inspection and the MAC Address Table 589
Configure the MTU 589
Configure the MAC Address 590
Add a Static ARP Entry 591
Add a Static MAC Address and Disable MAC Learning for a Transparent Mode Bridge Group 592
Set Security Configuration Parameters 593

CHAPTER 29 Inline Sets and Passive Interfaces for Firepower Threat Defense 597
  About Hardware Bypass for Inline Sets 597
    Hardware Bypass Triggers 597
    Hardware Bypass Switchover 598
    Failsafe vs. Hardware Bypass 598
    Hardware Bypass Status 598
Prerequisites for Inline Sets 598
Guidelines for Inline Sets and Passive Interfaces 599
Configure a Passive Interface 600
Configure an Inline Set 601
History for Inline Sets and Passive Interfaces for Firepower Threat Defense 604

CHAPTER 30 DHCP and DDNS Services for Threat Defense 605
  About DHCP and DDNS Services 605
    About the DHCPv4 Server 605
DHCP Options 605
About the DHCP Relay Agent 606
About DDNS 606
DDNS Update Configurations 606
UDP Packet Size 607
Guidelines for DHCP and DDNS Services 607
Configure the DHCP Server 608
Configure the DHCP Relay Agent 610
Configure DDNS 611

CHAPTER 31
Quality of Service (QoS) for Firepower Threat Defense 613
Introduction to QoS 613
About QoS Policies 613
Rate Limiting with QoS Policies 614
Creating a QoS Policy 615
Setting Target Devices for a QoS Policy 616
Configuring QoS Rules 616
QoS Rule Components 617

PART IX
Firepower Threat Defense High Availability and Scalability 619

CHAPTER 32
High Availability for Firepower Threat Defense 621
About Firepower Threat Defense High Availability 621
High Availability System Requirements 621
Hardware Requirements 621
Software Requirements 622
License Requirements for FTD Devices in a High Availability Pair 622
Failover and Stateful Failover Links 622
Failover Link 622
Stateful Failover Link 623
Avoiding Interrupted Failover and Data Links 624
MAC Addresses and IP Addresses in High Availability 626
Stateful Failover 627
Supported Features 627
Unsupported Features 629
Bridge Group Requirements for High Availability 629
Failover Health Monitoring 630
Unit Health Monitoring 630
Interface Monitoring 630
Failover Triggers and Detection Timing 632
About Active/Standby Failover 632
Primary/Secondary Roles and Active/Standby Status 632
Active Unit Determination at Startup 632
Failover Events 633
Guidelines for High Availability 634
Add a Firepower Threat Defense High Availability Pair 635
Configure Optional High Availability Parameters 636
Configure Standby IP Addresses and Interface Monitoring 637
Edit High Availability Failover Criteria 637
Configure Virtual MAC addresses 638
Manage High Availability 639
Switch the Active Peer in a Firepower Threat Defense High Availability Pair 639
Suspend and Resume High Availability 639
Replace a Unit in an FTD High Availability Pair 640
Replace a Primary FTD HA Unit 640
Replace a Secondary FTD HA Unit 641
Separate Units in a High Availability Pair 642
Unregister a High Availability Pair 643
Monitoring High Availability 644
View Failover History 644
View Stateful Failover Statistics 644

CHAPTER 33

Clustering for the Firepower Threat Defense 647
About Clustering on the Firepower 4100/9300 Chassis 647
Bootstrap Configuration 648
Cluster Members 648
Cluster Control Link 648
Size the Cluster Control Link for Inter-Chassis Clustering 649
Cluster Control Link Redundancy for Inter-Chassis Clustering 649
Cluster Control Link Reliability for Inter-Chassis Clustering 650
Cluster Control Link Network 650
Management Network 650
Management Interface 650
Cluster Interfaces 650
Spanned EtherChannels 651
Connecting to a VSS or vPC 651
Configuration Replication 651
Licenses for Clustering 651
Requirements and Prerequisites for Clustering 652
Clustering Guidelines and Limitations 652
Configure Clustering 652
FXOS: Add a Firepower Threat Defense Cluster 653
Create a Firepower Threat Defense Cluster 653
FMC: Add a Cluster 657
FMC: Configure Data and Diagnostic Interfaces 658
FXOS: Remove a Cluster Member 659
FMC: Manage Cluster Members 661
Add or Replace a Cluster Member 661
Delete a Slave Member 662
Deactivate a Member 662
Rejoin the Cluster 663
FMC: Monitoring the Cluster 664
Reference for Clustering 664
Firepower Threat Defense Features and Clustering 664
Unsupported Features with Clustering 664
Centralized Features for Clustering 664
Dynamic Routing and Clustering 665
FTP and Clustering 666
NAT and Clustering 666
SIP Inspection and Clustering 667
SNMP and Clustering 667
Syslog and Clustering 667
PART X

Firepower Threat Defense Routing 675

CHAPTER 34

Routing Overview for Firepower Threat Defense 677

Path Determination 677

Supported Route Types 678

Static Versus Dynamic 678

Single-Path Versus Multipath 678

Flat Versus Hierarchical 678

Link-State Versus Distance Vector 679

Supported Internet Protocols for Routing 679

Routing Table 680

How the Routing Table Is Populated 680

Administrative Distances for Routes 680

Backup Dynamic and Floating Static Routes 681

How Forwarding Decisions Are Made 682

Dynamic Routing and High Availability 682
CHAPTER 35  Static and Default Routes for Firepower Threat Defense  687

About Static and Default Routes  687

Default Route  687
Static Routes  687
Route to null0 Interface to “Black Hole” Unwanted Traffic  688
Route Priorities  688
Transparent Firewall Mode Routes  688
Static Route Tracking  688
Guidelines for Static and Default Routes  689
Add a Static Route  689

CHAPTER 36  OSPF for Firepower Threat Defense  691

OSPF for Firepower Threat Defense  691

About OSPF  691
OSPF Support for Fast Hello Packets  693
Prerequisites for OSPF Support for Fast Hello Packets  693
OSPF Hello Interval and Dead Interval  693
OSPF Fast Hello Packets  693
Benefits of OSPF Fast Hello Packets  693
Implementation Differences Between OSPFv2 and OSPFv3  694
Guidelines for OSPF  694
Configure OSPFv2  695
Configure OSPF Areas, Ranges, and Virtual Links  695
Configure OSPF Redistribution  698
Configure OSPF Inter-Area Filtering  699
Configure OSPF Filter Rules  700
Configure OSPF Summary Addresses  701
Configure OSPF Interfaces and Neighbors 702
Configure OSPF Advanced Properties 704
Configure OSPFv3 707
Configure OSPFv3 Areas, Route Summaries, and Virtual Links 707
Configure OSPFv3 Redistribution 709
Configure OSPFv3 Summary Prefixes 710
Configure OSPFv3 Interfaces, Authentication, and Neighbors 711
Configure OSPFv3 Advanced Properties 713

CHAPTER 37  BGP for Firepower Threat Defense 717

About BGP 717
Routing Table Changes 717
When to Use BGP 718
BGP Path Selection 718
BGP Multipath 719
Guidelines for BGP 720
Configure BGP 720
Configure BGP Basic Settings 721
Configure BGP General Settings 723
Configure BGP Neighbor Settings 724
Configure BGP Aggregate Address Settings 727
Configure BGPv4 Filtering Settings 728
Configure BGP Network Settings 729
Configure BGP Redistribution Settings 730
Configure BGP Route Injection Settings 730

CHAPTER 38  RIP for Firepower Threat Defense 733

About RIP 733
Routing Update Process 733
RIP Routing Metric 734
RIP Stability Features 734
RIP Timers 734
Guidelines for RIP 734
Configure RIP 735
CHAPTER 39

Multicast Routing for Firepower Threat Defense 739

About Multicast Routing 739

IGMP Protocol 739

Stub Multicast Routing 740

PIM Multicast Routing 740

PIM Source Specific Multicast Support 741

Multicast Bidirectional PIM 741

PIM Bootstrap Router (BSR) 742

PIM Bootstrap Router (BSR) Terminology 742

Multicast Group Concept 743

Multicast Addresses 743

Clustering 743

Guidelines for Multicast Routing 743

Configure IGMP Features 743

Enable Multicast Routing 744

Configure IGMP Protocol 745

Configure IGMP Access Groups 746

Configure IGMP Static Groups 746

Configure IGMP Join Groups 747

Configure PIM Features 748

Configure PIM Protocol 748

Configure PIM Neighbor Filters 749

Configure PIM Bidirectional Neighbor Filters 750

Configure PIM Rendezvous Points 751

Configure PIM Route Trees 752

Configure PIM Request Filters 752

Configure the Firepower Threat Defense Device as a Candidate Bootstrap Router 753

Configure Multicast Routes 754

Configure Multicast Boundary Filters 755

CHAPTER 1

Getting Started With Firepower

Cisco Firepower is an integrated suite of network security and traffic management products, deployed either on purpose-built platforms or as a software solution. The system is designed to help you handle network traffic in a way that complies with your organization’s security policy—your guidelines for protecting your network.

In a typical deployment, multiple traffic-sensing managed devices installed on network segments monitor traffic for analysis and report to a manager:

- Firepower Management Center
- Firepower Device Manager
- Adaptive Security Device Manager (ASDM)

Managers provide a centralized management console with graphical user interface that you can use to perform administrative, management, analysis, and reporting tasks.

This guide focuses on the Firepower Management Center managing appliance. For information about the Firepower Device Manager or ASA with FirePOWER Services managed via ASDM, see the guides for those management methods.

- Cisco Firepower Threat Defense Configuration Guide for Firepower Device Manager
- ASA with FirePOWER Services Local Management Configuration Guide
  
- Introduction to Managed Devices, on page 1
- Introduction to the Firepower Management Center, on page 4
- Firepower System Components, on page 5
- Switching Domains on the Firepower Management Center, on page 12
- Firepower Online Help, How To, and Documentation, on page 12
- Firepower System IP Address Conventions, on page 15

Introduction to Managed Devices

Managed devices installed on network segments monitor traffic for analysis. Deployed passively, managed devices gather detailed information about your organization’s assets: hosts, operating systems, applications, users, sent files (including malware), vulnerabilities, and so on. The Firepower System correlates this information for your analysis so you can monitor the websites your users visit and the applications they use, assess traffic patterns, and receive notifications of intrusions and other attacks.
Deployed inline, the system can affect the flow of traffic using access control, which allows you to specify, in a granular fashion, how to handle the traffic entering, exiting, and traversing your network. The data that you collect about your network traffic and all the information you glean from it can be used to filter and control that traffic based on:

- Simple, easily-determined transport and network layer characteristics: source and destination, port, protocol, and so on
- The latest contextual information on the traffic, including characteristics such as reputation, risk, business relevance, application used, or URL visited
- Microsoft Active Directory and LDAP users in your organization; you can grant different levels of access to different users
- Characteristics of encrypted traffic; you can also decrypt this traffic for further analysis
- Whether unencrypted or decrypted traffic contains a prohibited file, detected malware, or intrusion event

For the system to affect traffic, you must deploy relevant configurations to managed devices using routed, switched, or transparent interfaces, or inline interface pairs.

Note

For the system to affect traffic, you must deploy relevant configurations to managed devices using routed, switched, or transparent interfaces, or inline interface pairs.

Each type of traffic inspection and control occurs where it makes the most sense for maximum flexibility and performance. For example, reputation-based blacklisting, because it uses simple source and destination data, can block prohibited traffic early in the process. In contrast, detecting and blocking intrusions and exploits is a last-line defense.

Network management features on 7000 and 8000 Series devices allow them to serve in switched and routed environments, perform network address translation (NAT), and to build secure virtual private network (VPN) tunnels between virtual routers you configure. You can also configure bypass interfaces, aggregated interfaces, 8000 Series fastpath rules, and strict TCP enforcement.

**7000 and 8000 Series Managed Devices**

Cisco Firepower 7000 and 8000 Series appliances are physical devices purpose-built for the Firepower System. 7000 and 8000 Series devices have a range of throughputs, but share most of the same capabilities. In general, 8000 Series devices are more powerful than 7000 Series; they also support additional features such as 8000 Series fastpath rules, link aggregation, and stacking.

**NGIPSv**

You can deploy NGIPSv (a 64-bit virtual device as an ESXi host) using the VMware vSphere Hypervisor or vCloud Director environment. You can also enable VMware Tools on all supported ESXi versions.

By default, NGIPSv uses e1000 (1 Gbit/s) interfaces. You can also use the VMware vSphere Client to replace the default sensing and management interfaces with vmxnet3 (10 Gbit/s) interfaces.

Regardless of license, NGIPSv does not support any of the system’s hardware-based features: redundancy and resource sharing, switching, routing, and so on.
Cisco ASA with FirePOWER Services

Cisco ASA with FirePOWER Services (or an ASA FirePOWER module) functions similarly to NGIPSv. In an ASA FirePOWER deployment, the ASA device provides the first-line system policy and passes traffic to the Firepower System for discovery and access control.

Regardless of the licenses installed and applied, ASA FirePOWER does not support any of the following Firepower System features:

- ASA FirePOWER does not support the Firepower System 7000 and 8000 Series hardware-based features: device high availability, stacking, switching, routing, VPN, NAT, and so on. However, the ASA platform does provide these features, which you can configure using the ASA CLI and ASDM. See the ASA documentation for more information.
- You cannot use the Firepower Management Center web interface to configure ASA FirePOWER interfaces. The Firepower Management Center does not display ASA interfaces when the ASA FirePOWER is deployed in SPAN port mode.
- You cannot use the Firepower Management Center to shut down, restart, or otherwise manage ASA FirePOWER processes.

ASA FirePOWER has a software and a command line interface (CLI) unique to the ASA platform. You use these ASA-specific tools to install the system and to perform other platform-specific administrative tasks.

Note

If you edit an ASA FirePOWER and switch from multiple context mode to single context mode (or vice versa), the device renames all of its interfaces. You must reconfigure all Firepower System security zones, correlation rules, and related configurations to use the updated ASA FirePOWER interface names.

Firepower Threat Defense

The Firepower Threat Defense appliance provides a unified next-generation firewall and next-generation IPS device. In addition to the IPS features available on Firepower Software models, firewall and platform features include Site-to-Site VPN, robust routing, NAT, clustering (for the Firepower 9300), and other optimizations in application inspection and access control.

The Firepower Threat Defense software is supported on the following platforms:

- Firepower 9300
- Firepower 4100 series
- ASA 5512-X through 5555-X
- ASA 5508-X and 5516-X
- ASA 5506-X series

Firepower Threat Defense Virtual

The Firepower Threat Defense Virtual (a 64-bit virtual appliance) provides unified next-generation firewall and next-generation IPS capabilities to virtualized environments. Firepower Threat Defense Virtual is designed
to work in multiple hypervisor environments, reduce administrative overhead, and increase operational efficiency.

You can deploy Firepower Threat Defense Virtual using the VMware vSphere hypervisor and the KVM (Kernel-based Virtual Machine) hypervisor environments. You can also deploy Firepower Threat Defense Virtual through Amazon Web Services (AWS) cloud platform.

You can use the Firepower Management Center for comprehensive multi-device deployment and management of both the virtual appliance and the physical Firepower Threat Defense appliances.

Introduction to the Firepower Management Center

A Firepower Management Center is a fault-tolerant, purpose-built network appliance that provides a centralized management console and database repository for your Firepower System deployment. You can also deploy 64-bit virtual Firepower Management Centers using the VMware vSphere and the KVM (Kernel-based Virtual Machine) hypervisor environments, and also through Amazon Web Services (AWS) cloud platform. Firepower Management Centers have a range of device management, event storage, host monitoring, and user monitoring capabilities. Any Firepower Management Center can manage any type of Firepower System device.

Firepower Management Centers aggregate and correlate network traffic information and performance data, assessing the impact of events on particular hosts. You can monitor the information that your devices report, and assess and control the overall activity that occurs on your network. Firepower Management Centers also control the network management features on your devices: switching, routing, NAT, VPN, and so on.

Key features of the Firepower Management Center include:

• Device, license, and policy management
• Event and contextual information displayed in tables, graphs, and charts
• Health and performance monitoring
• External notification and alerting
• Correlation, indications of compromise, and remediation features for real-time threat response
• Custom and template-based reporting

Firepower Management Center Capabilities

When running this version, all Firepower Management Centers have similar capabilities, with the primary differences being capacity and speed. Firepower Management Center models vary in terms of how many devices they can manage, how many events they can store, and how many hosts and users they can monitor.

Configuration of features available in the Firepower Management Center web interface may be limited by the license and model of the device you are managing.

The MC4000 introduces Cisco's Unified Computing System (UCS) platform into the Firepower System. The MC4000 does not support Cisco functionality that uses tools on the baseboard management controller (BMC), such as the UCS Manager or the Cisco Integrated Management Controller (CIMC).

Related Topics
   About Device Management, on page 223
   Configuring Database Event Limits, on page 797
Firepower System Components

The topics that follow describe some of the key capabilities of the Firepower System that contribute to your organization’s security, acceptable use policy, and traffic management strategy.

Tip
Many Firepower System features are appliance model, license, and user role dependent. This documentation includes information about which Firepower System licenses and devices are required for each feature, and which user roles have permission to complete each procedure.

Redundancy and Resource Sharing

The redundancy and resource-sharing features of the Firepower System allow you to ensure continuity of operations and to combine the processing resources of multiple 7000 and 8000 Series devices.

Device Stacking

Device stacking allows you to increase the amount of traffic inspected on a network segment by connecting two to four devices in a stacked configuration. When you establish a stacked configuration, you combine the resources of each stacked device into a single, shared configuration.

7000 and 8000 Series Device High Availability

7000 and 8000 Series device high availability allows you to establish redundancy of networking functionality and configuration data between two or more 7000 or 8000 Series devices or stacks. Configuring two or more peer devices or stacks into a high-availability pair results in a single logical system for policy applies, system updates, and registration. With device high availability, the system can fail over either manually or automatically.

In most cases, you can achieve Layer 3 redundancy without configuring a high-availability pair by using SFRP. SFRP allows devices to act as redundant gateways for specified IP addresses. With network redundancy, you can configure two or more devices or stacks to provide identical network connections, ensuring connectivity for other hosts on the network.

Network Traffic Management for 7000 & 8000 Series Devices

The Firepower System’s network traffic management features allow 7000 and 8000 Series devices to act as part of your organization’s network infrastructure. You can configure 7000 and 8000 Series devices to serve in a switched, routed, or hybrid (switched and routed) environment; to perform network address translation (NAT); and to build secure virtual private network (VPN) tunnels.

Switching

You can configure the Firepower System in a Layer 2 deployment so that it provides packet switching between two or more network segments. In a Layer 2 deployment, you configure switched interfaces and virtual switches on 7000 and 8000 Series devices to operate as standalone broadcast domains. A virtual switch uses the MAC address from a host to determine where to send packets. You can also group multiple physical interfaces into a single logical link that provides packet switching between two endpoints in your network.
The endpoints can be two 7000 and 8000 Series devices, or a managed device connected to a third-party access switch.

**Routing**

You can configure the Firepower System in a Layer 3 deployment so that it routes traffic between two or more interfaces. In a Layer 3 deployment, you configure routed interfaces and virtual routers on 7000 and 8000 Series devices to receive and forward traffic. The system routes packets by making packet forwarding decisions according to the destination IP address. Routers obtain the destination from the outgoing interface based on the forwarding criteria, and access control rules designate the security policies to apply.

When you configure virtual routers, you can define static routes. In addition, you can configure Routing Information Protocol (RIP) and Open Shortest Path First (OSPF) dynamic routing protocols. You can also configure a combination of static routes and RIP or static routes and OSPF. You can set up DHCP relay for each virtual router you configure.

If you use both virtual switches and virtual routers in your deployment, you can configure associated hybrid interfaces to bridge traffic between them. These utilities analyze traffic to determine its type and the appropriate response (route, switch, or otherwise). You can also group multiple physical interfaces into a single logical link that routes traffic between two endpoints in your network. The endpoints can be two 7000 and 8000 Series devices, or a managed device connected to a third-party router.

**NAT**

In a Layer 3 deployment, you can configure network address translation (NAT) using 7000 and 8000 Series devices. You can expose an internal server to an external network, or allow an internal host or server to connect to an external application. You can also configure NAT to hide private network addresses from an external network by using a block of IP addresses, or by using a limited block of IP addresses and port translation.

**VPN**

A virtual private network (VPN) is a network connection that establishes a secure tunnel between endpoints via a public source, like the Internet or other network. You can configure the Firepower System to build secure VPN tunnels between the virtual routers of 7000 and 8000 Series devices.

**Multitenancy**

The domains feature allows you to implement multitenancy within a Firepower System deployment, by segmenting user access to managed devices, configurations, and events.

In addition to any restrictions imposed by your user role, your current domain level can also limit your ability to modify configurations. The system limits most management tasks, like system software updates, to the Global domain.

**Discovery and Identity**

Cisco’s discovery and identity technology collects information about hosts, operating systems, applications, users, files, networks, geolocation information, and vulnerabilities, in order to provide you with a complete view of your network:

- *Network discovery* policies monitor traffic on your network and collect host, application, and non-authoritative user data.
Identity policies associate users on your network with a realm and an authentication method in order to collect authoritative user data.

You configure realms alongside your identity policies in order to establish connections to LDAP or AD servers and to perform user data downloads.

You can use certain types of discovery and identity data to build a comprehensive map of your network assets, perform forensic analysis, behavioral profiling, access control, and mitigate and respond to the vulnerabilities and exploits to which your organization is susceptible.

You can also use the Firepower Management Center’s web interface to view and analyze the data collected by the system.

Access Control

Access control is a policy-based feature that allows you to specify, inspect, and log the traffic that can traverse your network. An access control policy determines how the system handles traffic on your network.

The simplest access control policy directs its target devices to handle all traffic using its default action. You can set this default action to block or trust all traffic without further inspection, or to inspect traffic for intrusions and discovery data.

A more complex access control policy can blacklist traffic based on IP, URL, and DNS Security Intelligence data, as well as use access control rules to exert granular control over network traffic logging and handling. These rules can be simple or complex, matching and inspecting traffic using multiple criteria; you can control traffic by security zone, network or geographical location, VLAN, port, application, requested URL, and user. Advanced access control options include decryption, preprocessing, and performance.

Each access control rule also has an action, which determines whether you monitor, trust, block, or allow matching traffic. When you allow traffic, you can specify that the system first inspect it with intrusion or file policies to block any exploits, malware, or prohibited files before they reach your assets or exit your network.

SSL Inspection

SSL inspection is a policy-based feature that allows you to handle encrypted traffic without decryption, or decrypt encrypted traffic for further access control inspection. You can choose to block a source of untrusted encrypted traffic without decrypting or further analyzing the traffic, or you can choose to not decrypt encrypted traffic and inspect it with access control instead.

For further insight into encrypted traffic, you can use public key certificates and paired private keys you upload to the system to decrypt encrypted traffic traversing your network, then inspect the decrypted traffic with access control as if it was never encrypted. If the system does not block the decrypted traffic post-analysis, it reencrypts the traffic before passing it to the destination host. The system can log details about encrypted connections as it acts on them.

Intrusion Detection and Prevention

Intrusion detection and prevention is the system’s last line of defense before traffic is allowed to its destination. Intrusion policies are defined sets of intrusion detection and prevention configurations invoked by your access control policy. Using intrusion rules and other settings, these policies inspect traffic for security violations and, in inline deployments, can block or alter malicious traffic.
Cisco delivers several intrusion policies with the Firepower System. By using system-provided policies you can take advantage of the experience of the Cisco Talos Intelligence Group (Talos). For these policies, Talos sets intrusion and preprocessor rule states (enabled or disabled), as well as provides the initial configurations for other advanced settings. An enabled rule causes the system to generate intrusion events for (and optionally block) traffic matching the rule.

If the system-provided policies do not fully address the security needs of your organization, custom policies can improve the performance of the system in your environment and can provide a focused view of the malicious traffic and policy violations occurring on your network. By creating and tuning custom policies you can configure, at a very granular level, how the system processes and inspects the traffic on your network for intrusions.

**Cisco Advanced Malware Protection and File Control**

To help you identify and mitigate the effects of malware, the Firepower System’s file control, network file trajectory, and Advanced Malware Protection (AMP) components can detect, track, capture, analyze, and optionally block the transmission of files (including malware files and nested files inside archive files) in network traffic.

**File Control**

File control allows managed devices to detect and block your users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols. You configure file control as part of your overall access control configuration; file policies associated with access control rules inspect network traffic that meets rule conditions.

**AMP for Firepower**

AMP for Firepower is a network-based AMP solution, which allows the system to inspect network traffic for malware in several types of files. Appliances can store detected files for further analysis, either to their hard drive or (for some models) a malware storage pack.

You can analyze files locally on your device using local malware analysis to preclassify malware. Regardless of whether you store a detected file, you can submit it to the AMP cloud for a simple known-disposition lookup using the file’s SHA-256 hash value. You can also submit files to the Cisco Threat Grid cloud for dynamic analysis, which produces a threat score. Using this contextual information, you can configure the system to block or allow specific files.

You configure AMP for Firepower as part of your overall access control configuration; file policies associated with access control rules inspect network traffic that meets rule conditions.

**AMP for Endpoints Integration**

AMP for Endpoints is an enterprise-class endpoint-based AMP solution. Individual users install lightweight connectors on their computers and mobile devices that communicate with the AMP cloud. The Firepower Management Center can then import records of scans, malware detections, and quarantines, as well as indications of compromise (IOC), and can display trajectories for detected threats.

Use the AMP for Endpoints management console to configure your AMP for Endpoints deployment. The console helps you quickly identify and quarantine malware. You can identify outbreaks when they occur, track their trajectories, understand their effects, and learn how to successfully recover. You can also use AMP for Endpoints to create custom protections, block execution of certain applications based on group policy, and create custom whitelists.
Network File Trajectory

The network file trajectory feature allows you to track a file’s transmission path across a network. The system uses SHA-256 hash values to track files; so, to track a file, the system must either:

• Calculate the file’s SHA-256 hash value and query the AMP cloud using that value

• Receive endpoint-based threat and quarantine data about that file, using the Firepower Management Center’s integration with your organization’s AMP for Endpoints deployment

Each file has an associated trajectory map, which contains a visual display of the file’s transfers over time and additional information about the file.

Cisco AMP Private Cloud Virtual Appliance

If your organization’s security policy does not allow the system to connect directly to the AMP cloud, whether for AMP for Firepower or AMP for Endpoints, you can configure a Cisco AMP Private Cloud Virtual Appliance (AMPv).

AMPv is a virtual machine that acts as a compressed, on-premises version of, or anonymized proxy to, the AMP cloud. Data and actions that usually involve a direct connection to the AMP cloud (such as events from AMP for Endpoints, file disposition lookups, retrospective events, and so on) are instead handled by a local connection to AMPv. With AMPv, no endpoint event data is shared over an external connection.

When connections to the AMP cloud are necessary (such as for file disposition lookups), AMPv acts as an anonymized proxy between your Firepower Management Center and the AMP cloud.

Cisco AMP Threat Grid On-Premises Appliance

If your organization has privacy or security concerns with submitting files to the public Cisco Threat Grid cloud, you can deploy an on-premises Cisco Threat Grid appliance. Like the public cloud, the on-premises appliance runs eligible files in a sandbox environment, and returns a threat score and dynamic analysis report to the Firepower System. However, the on-premises appliance does not communicate with the public cloud, or any other system external to your network.

Application Programming Interfaces

There are several ways to interact with the system using application programming interfaces (APIs).

eStreamer

The Event Streamer (eStreamer) allows you to stream several kinds of event data from a Firepower Management Center to a custom-developed client application. After you create a client application, you can connect it to the eStreamer server on the Firepower Management Center, start the eStreamer service, and begin exchanging data.

eStreamer integration requires custom programming, but allows you to request specific data from an appliance. If, for example, you display network host data within one of your network management applications, you could write a program to retrieve host criticality or vulnerability data from the Firepower Management Center and add that information to your display.

External Database Access

The database access feature allows you to query several database tables on a Firepower Management Center, using a third-party client that supports JDBC SSL connections.
You can use an industry-standard reporting tool such as Crystal Reports, Actuate BIRT, or JasperSoft iReport to design and submit queries. Or, you can configure your own custom application to query Cisco data. For example, you could build a servlet to report intrusion and discovery event data periodically or refresh an alert dashboard.

**Host Input**

The host input feature allows you to augment discovery data by importing data from third-party sources using scripts or command-line import files.

The web interface also provides some host input functionality; you can modify operating system or application protocol identities, validate or invalidate vulnerabilities, and delete various items from network maps, including clients and server ports.

**Remediation**

The system includes an API that allows you to create remediations that your Firepower Management Center can automatically launch when conditions on your network violate an associated correlation policy or compliance white list. Remediations can automatically mitigate attacks when you are not immediately available to address them, and ensure that your system remains compliant with your organization’s security policy. In addition to remediations that you create, the Firepower Management Center ships with several predefined remediation modules.

**The Context Menu**

Certain pages in the Firepower System web interface support a right-click (most common) or left-click context menu that you can use as a shortcut for accessing other features in the Firepower System. The contents of the context menu depend where you access it—not only the page but also the specific data.

For example:

- IP address hotspots provide information about the host associated with that address, including any available whois and host profile information.
- SHA-256 hash value hotspots allow you to add a file’s SHA-256 hash value to the clean list or custom detection list, or view the entire hash value for copying.

On pages or locations that do not support the Firepower System context menu, the normal context menu for your browser appears.

**Policy Editors**

Many policy editors contain hotspots over each rule. You can insert new rules and categories; cut, copy, and paste rules; set the rule state; and edit the rule.

**Intrusion Rules Editor**

The intrusion rules editor contains hotspots over each intrusion rule. You can edit the rule, set the rule state, configure thresholding and suppression options, and view rule documentation.

**Event Viewer**

Event pages (the drill-down pages and table views available under the Analysis menu) contain hotspots over each event, IP address, URL, DNS query, and certain files’ SHA-256 hash values. While viewing most event types, you can:

- View related information in the Context Explorer.
• Drill down into event information in a new window.

• View the full text in places where an event field contains text too long to fully display in the event view, such as a file’s SHA-256 hash value, a vulnerability description, or a URL.

While viewing connection events, you can add items to the default Security Intelligence whitelists and blacklists:

• An IP address, from an IP address hotspot.
• A URL or domain name, from a URL hotspot.
• A DNS query, from a DNS query hotspot.

While viewing captured files, file events, and malware events, you can:

• Add a file to or remove a file from the clean list or custom detection list.
• Download a copy of the file.
• View nested files inside an archive file.
• Download the parent archive file for a nested file.
• View the file composition.
• Submit the file for local malware and dynamic analysis.

While viewing intrusion events, you can perform similar tasks to those in the intrusion rules editor or an intrusion policy:

• Edit the triggering rule.
• Set the rule state, including disabling the rule.
• Configure thresholding and suppression options.
• View rule documentation.

**Intrusion Event Packet View**

Intrusion event packet views contain IP address hotspots. The packet view uses a left-click context menu.

**Dashboard**

Many dashboard widgets contain hotspots to view related information in the Context Explorer. Dashboard widgets can also contain IP address and SHA-256 hash value hotspots.

**Context Explorer**

The Context Explorer contains hotspots over its charts, tables, and graphs. If you want to examine data from graphs or lists in more detail than the Context Explorer allows, you can drill down to the table views of the relevant data. You can also view related host, user, application, file, and intrusion rule information.

The Context Explorer uses a left-click context menu, which also contains filtering and other options unique to the Context Explorer.

In a multidomain deployment, user role privileges determine which domains a user can access and which privileges the user has within each of those domains. You can associate a single user account with multiple domains and assign different privileges for that user in each domain. For example, you can assign a user read-only privileges in the Global domain, but Administrator privileges in a descendant domain.

Users associated with multiple domains can switch between domains within the same web interface session. Under your user name in the toolbar, the system displays a tree of available domains. The tree:

- Displays ancestor domains, but may disable access to them based on the privileges assigned to your user account.
- Hides any other domain your user account cannot access, including sibling and descendant domains.

When you switch to a domain, the system displays:

- Data that is relevant to that domain only.
- Menu options determined by the user role assigned to you for that domain.

Procedure

From the drop-down list under your user name, choose the domain you want to access.

Firepower Online Help, How To, and Documentation

You can reach the online help from the web interface:

- By clicking the context-sensitive help link on each page
- By choosing Help > Online

Top-Level Documentation Listing Pages for FMC Deployments

The following documents may be helpful when configuring Firepower Management Center deployments, Version 6.0+.
Some of the linked documents are not applicable to Firepower Management Center deployments. For example, some links on Firepower Threat Defense pages are specific to deployments managed by Firepower Device Manager, and some links on hardware pages are unrelated to Firepower. To avoid confusion, pay careful attention to document titles. Also, some documents cover multiple products and therefore may appear on multiple product pages.

License Statements in the Documentation

The License statement at the beginning of a section indicates which Classic or Smart license you must assign to a managed device in the Firepower System to enable the feature described in the section.

Because licensed capabilities are often additive, the license statement provides only the highest required license for each feature.

An “or” statement in a License statement indicates that you must assign a particular license to the managed device to enable the feature described in the section, but an additional license can add functionality. For example, within a file policy, some file rule actions require that you assign a Protection license to the device while others require that you assign a Malware license.

For more information about licenses, see About Firepower Licenses, on page 109.

Related Topics
   About Firepower Licenses, on page 109

Supported Devices Statements in the Documentation

The Supported Devices statement at the beginning of a chapter or topic indicates that a feature is supported only on the specified device series, family, or model. For example, many features are supported only on Firepower Threat Defense devices.

For more information on platforms supported by this release, see the release notes.
Access Statements in the Documentation

The Access statement at the beginning of each procedure in this documentation indicates the predefined user roles required to perform the procedure. Any of the listed roles can perform the procedure.

Users with custom roles may have permission sets that differ from those of the predefined roles. When a predefined role is used to indicate access requirements for a procedure, a custom role with similar permissions also has access. Some users with custom roles may use slightly different menu paths to reach configuration pages. For example, users who have a custom role with only intrusion policy privileges access the network analysis policy via the intrusion policy instead of the standard path through the access control policy.

For more information about user roles, see Predefined User Roles, on page 42 and Custom User Roles, on page 43.

Firepower System IP Address Conventions

You can use IPv4 Classless Inter-Domain Routing (CIDR) notation and the similar IPv6 prefix length notation to define address blocks in many places in the Firepower System.

When you use CIDR or prefix length notation to specify a block of IP addresses, the Firepower System uses only the portion of the network IP address specified by the mask or prefix length. For example, if you type 10.1.2.3/8, the Firepower System uses 10.0.0.0/8.

In other words, although Cisco recommends the standard method of using a network IP address on the bit boundary when using CIDR or prefix length notation, the Firepower System does not require it.

CHAPTER 2

Logging into the Firepower System

The following topics describe how to log into the Firepower System:

- Firepower System User Accounts, on page 19
- Firepower System User Interfaces, on page 21
- Logging Into the Firepower Management Center Web Interface, on page 24
- Logging Into the Web Interface of a 7000 or 8000 Series Device, on page 25
- Logging Into the Firepower Management Center with CAC Credentials, on page 26
- Logging Into a 7000 or 8000 Series Device with CAC Credentials, on page 27
- Logging Into the CLI on 7000/8000 Series, ASA FirePOWER, and NGIPSv Devices, on page 27
- Logging Into the Command Line Interface on FTD Devices, on page 28
- Logging Out of a Firepower System Web Interface, on page 29

Firepower System User Accounts

You must provide a username and password to obtain local access to the web interface, shell, or CLI on an FMC or managed device. On managed devices, CLI users with Config level access can use the `expert` command to access the Linux shell. On the FMC, all CLI users can use the `expert` command. The FTD and FMC can be configured to use external authentication, storing user credentials on an external LDAP or RADIUS server; you can withhold or provide CLI/shell access rights to external users.

The FMC CLI provides a single `admin` user who has access to all commands. The features FMC web interface users can access are controlled by the privileges and administrator grants to the user account. On managed devices, the features that users can access for both the CLI and the web interface are controlled by the privileges an administrator grants to the user account.

The system audits user activity based on user accounts, make sure that users log into the system with the correct account.
Caution

All FMC CLI users and, on managed devices, users with Config level CLI access can obtain root privileges in the Linux shell, which can present a security risk. For system security reasons, we strongly recommend:

- If you establish external authentication, make sure that you restrict the list of users with CLI/shell access appropriately.
- When granting CLI access privileges on managed devices, restrict the list of internal users with Config level CLI access.
- Do not establish Linux shell users; use only the pre-defined admin user and users created by the admin user within the CLI.

Caution

We strongly recommend that you do not use the Linux shell unless directed by Cisco TAC or explicit instructions in the Firepower user documentation.

Different appliances support different types of user accounts, each with different capabilities.

**Firepower Management Centers**

Firepower Management Centers support the following user account types:

- A pre-defined admin account for web interface access, which has the administrator role and can be managed through the web interface.
- Custom user accounts, which provide web interface access and which admin users and users with administrator privileges can create and manage.
- A pre-defined admin account for shell access, which can obtain root privileges.

Caution

For system security reasons, Cisco strongly recommends that you not establish additional Linux shell users on any appliance.

**7000 & 8000 Series Devices**

7000 & 8000 Series devices support the following user account types:

- A pre-defined admin account which can be used for all forms of access to the device.
- Custom user accounts, which admin users and users with the administrator role can create and manage.

The 7000 & 8000 Series supports external authentication for users.

**NGIPSv Devices**

NGIPSv devices support the following user account types:

- A pre-defined admin account which can be used for all forms of access to the device.
- Custom user accounts, which admin users and users with Config access can create and manage.
The NGIPSv does not support external authentication for users.

**Firepower Threat Defense and Firepower Threat Defense Virtual Devices**

Firepower Threat Defense and Firepower Threat Defense Virtual devices support the following user account types:

- A pre-defined **admin** account which can be used for all forms of access to the device.
- Custom user accounts, which **admin** users and users with Config access can create and manage.

The Firepower Threat Defense does not support external authentication for SSH or HTTP users.

**ASA FirePOWER Devices**

The ASA FirePOWER module supports the following user account types:

- A pre-defined **admin** account.
- Custom user accounts, which **admin** users and users with Config access can create and manage.

The ASA FirePOWER module does not support external authentication for users. Accessing ASA devices via the ASA CLI and ASDM is described in the *Cisco ASA Series General Operations CLI Configuration Guide* and the *Cisco ASA Series General Operations ASDM Configuration Guide*.

**Firepower System User Interfaces**

Depending on appliance type, you can interact with Firepower appliances using a web-based GUI, auxiliary CLI, or the Linux shell. In a Firepower Management Center deployment, you perform most configuration tasks from the FMC GUI. Only a few tasks require that you access the appliance directly using the CLI or Linux shell. We strongly discourage using the Linux shell unless directed by Cisco TAC or explicit instructions in the Firepower user documentation.

For information on browser requirements, see the Firepower Release Notes.

### Web Interface Considerations

- If your organization uses Common Access Cards (CACs) for authentication, external users authenticated with LDAP can use CAC credentials to obtain access to the web interface of an appliance.

- The first time you visit the appliance home page during a web session, you can view information about your last login session for that appliance. You can see the following information about your last login:
  - the day of the week, month, date, and year of the login
  - the appliance-local time of the login in 24-hour notation
  - the host and domain name last used to access the appliance

- The menus and menu options listed at the top of the default home page are based on the privileges for your user account. However, the links on the default home page include options that span the range of user account privileges. If you click a link that requires different privileges from those granted to your account, the system displays a warning message and logs the activity.

- Some processes that take a significant amount of time may cause your web browser to display a message that a script has become unresponsive. If this occurs, make sure you allow the script to continue until it finishes.

- Specifying Your Home Page, on page 32
Session Timeout

By default, the Firepower System automatically logs you out of a session after 1 hour of inactivity, unless you are otherwise configured to be exempt from session timeout.

Users with the Administrator role can change the session timeout interval for an appliance via the following settings:

<table>
<thead>
<tr>
<th>Appliance</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firepower Management Center</td>
<td>System &gt; Configuration &gt; Shell Timeout</td>
</tr>
<tr>
<td>7000 &amp; 8000 Series devices</td>
<td>Devices &gt; Platform Settings &gt; Shell Timeout</td>
</tr>
</tbody>
</table>

Related Topics

Configure Session Timeouts, on page 842

Logging Into the Firepower Management Center Web Interface

Users are restricted to a single active session. If you try to log in with a user account that already has an active session, the system prompts you to terminate the other session or log in as a different user.

In a NAT environment where multiple FMCs share the same IP address:

• Each FMC can support only one login session at a time.

• To access different FMCs, use a different browser for each login (for example Firefox and Chrome), or set the browser to incognito or private mode.

Before you begin

• If you do not have access to the web interface, contact your system administrator to modify your account privileges, or log in as a user with Administrator access and modify the privileges for the account.

• Create user accounts as described in Creating a User Account, on page 65.

Procedure

Step 1
Direct your browser to https://ipaddress_or_hostname, where ipaddress or hostname corresponds to your FMC.

Step 2
In the Username and Password fields, enter your user name and password. Pay attention to the following guidelines:

• User names are not case-sensitive.
In a multidomain deployment, prepend the user name with the domain where your user account was created. You are not required to prepend any ancestor domains. For example, if your user account was created in SubdomainB, which has an ancestor DomainA, enter your user name in the following format: `SubdomainB\username`.

If your organization uses SecurID® tokens when logging in, append the token to your SecurID PIN and use that as your password to log in. For example, if your PIN is 1111 and the SecurID token is 222222, enter 1111222222. You must have already generated your SecurID PIN before you can log into the Firepower System.

### Step 3
Click **Login**.

### Logging Into the Web Interface of a 7000 or 8000 Series Device

**Smart License** | **Classical License** | **Supported Devices** | **Supported Domains** | **Access**
--- | --- | --- | --- | ---
N/A | Any | 7000 & 8000 Series | N/A | Any

Users are restricted to a single active session. If you try to log in with a user account that already has an active session, the system prompts you to terminate the other session or log in as a different user.

### Before you begin
- If you do not have access to the web interface, contact your system administrator to modify your account privileges, or log in as a user with Administrator access and modify the privileges for the account.
- Complete the initial setup process and create user accounts as described in the Firepower getting started guide appropriate to the device, and **Creating a User Account**, on page 65.

### Procedure

**Step 1**
Direct your browser to `https://hostname/`, where `hostname` corresponds to the host name of the managed device you want to access.

**Step 2**
In the **Username** and **Password** fields, enter your user name and password. Pay attention to the following guidelines:
- User names are *not* case-sensitive.
- If your organization uses SecurID® tokens when logging in, append the token to your SecurID PIN and use that as your password to log in. For example, if your PIN is 1111 and the SecurID token is 222222, enter 1111222222. You must have already generated your SecurID PIN before you can log into the Firepower System.

**Step 3**
Click **Login**.

Users are restricted to a single active session. If you try to log in with a user account that already has an active session, the system prompts you to terminate the other session or log in as a different user.

In a NAT environment where multiple FMCs share the same IP address:

- Each FMC can support only one login session at a time.
- To access different FMCs, use a different browser for each login (for example Firefox and Chrome), or set the browser to incognito or private mode.

⚠️ **Caution**

Do **not** remove a CAC during an active browsing session. If you remove or replace a CAC during a session, your web browser terminates the session and the system logs you out of the web interface.

**Before you begin**

- If you do not have access to the web interface, contact your system administrator to modify your account privileges, or log in as a user with Administrator access and modify the privileges for the account.
- Create user accounts as described in the Creating a User Account, on page 65.
- Configure CAC authentication and authorization as described in Configuring CAC Authentication, on page 77.

**Procedure**

**Step 1**
Insert a CAC as instructed by your organization.

**Step 2**
Direct your browser to https://ipaddress_or_hostname, where ipaddress or hostname corresponds to your FMC.

**Step 3**
If prompted, enter the PIN associated with the CAC you inserted in step 1.

**Step 4**
If prompted, choose the appropriate certificate from the drop-down list.

**Step 5**
Click **Continue**.

Logging Into the CLI on 7000/8000 Series, ASA FirePOWER, and NGIPSv Devices

With a minimum of basic CLI configuration access, you can log directly into Classic managed devices.

**Before you begin**

- Complete the initial setup process using the default admin user for the initial login.
• Create additional user accounts that can log into the CLI using the `configure user add` command.
• For the 7000 & 8000 Series devices, create user accounts at the web interface as described in Creating a User Account, on page 65.

**Procedure**

**Step 1**  
SSH to the device's management interface (hostname or IP address) or use the console.

With the exception of ASA 5585-X devices, which have dedicated ASA FirePOWER console port, ASA FirePOWER devices accessed via the console default to the operating system CLI. This requires an extra step to access the Firepower CLI: `session sfr`.

If your organization uses SecurID® tokens when logging in, append the token to your SecurID PIN and use that as your password to log in. For example, if your PIN is `1111` and the SecurID token is `222222`, enter `1111222222`. You must have already generated your SecurID PIN before you can log in.

**Step 2**  
At the CLI prompt, use any of the commands allowed by your level of command line access.

---

### Logging Into the Command Line Interface on FTD Devices

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>N/A</td>
<td>CLI Basic</td>
</tr>
</tbody>
</table>

You can log directly into the command line interface on FTD managed devices.

**Before you begin**

Complete the initial setup process using the default `admin` user for the initial login. Create additional user accounts that can log into the CLI using the `configure user add` command.

**Procedure**

**Step 1**  
Connect to the FTD CLI, either from the console port or using SSH.

You can SSH to the management interface of the FTD device. You can also connect to the address on a data interface if you open the interface for SSH connections. SSH access to data interfaces is disabled by default. See Configure Secure Shell, on page 881 to allow SSH connections to specific data interfaces.

You can directly connect to the Console port on the device. Use the console cable included with the device to connect your PC to the console using a terminal emulator set for 9600 baud, 8 data bits, no parity, 1 stop bit, no flow control. See the hardware guide for your device for more information about the console cable.

The initial CLI you access on the Console port differs by device type.

• ASA Series devices—The CLI on the Console port is the regular FTD CLI.
Firepower Series devices—The CLI on the Console port is FXOS. You can get to the FTD CLI using the `connect ftd` command. Use the FXOS CLI for chassis-level configuration and troubleshooting only. Use the FTD CLI for basic configuration, monitoring, and normal system troubleshooting. See the FXOS documentation for information on FXOS commands.

**Step 2**
Log in with the `admin` username and password.

**Step 3**
At the CLI prompt (>), use any of the commands allowed by your level of command line access.

**Step 4**
(Optional) Access the diagnostic CLI:

```
system support diagnostic-cli
```

Use this CLI for advanced troubleshooting. This CLI includes additional `show` and other commands, including the `session wlan console` command needed to enter the CLI for the wireless access point on an ASA 5506W-X.

This CLI has two sub-modes: user EXEC and privileged EXEC mode. More commands are available in privileged EXEC mode. To enter privileged EXEC mode, enter the `enable` command; press enter without entering a password when prompted.

**Example:**

```
> system support diagnostic-cli
firepower> enable
Password: 
firepower#
```

To return to the regular CLI, type `Ctrl-a, d`.

---

### Logging Out of a Firepower System Web Interface

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
</tr>
</tbody>
</table>

When you are no longer actively using a Firepower System web interface, Cisco recommends that you log out, even if you are only stepping away from your web browser for a short period of time. Logging out ends your web session and ensures that no one can use the interface with your credentials.

**Procedure**

From the drop-down list under your user name, choose **Logout**.

**Related Topics**

- [Session Timeout](#)
CHAPTER 3

Specifying User Preferences

The following topics describe how to specify user preferences:

• User Preferences Introduction, on page 31
• Changing Your Password, on page 31
• Changing an Expired Password, on page 32
• Specifying Your Home Page, on page 32
• Configuring Event View Settings, on page 33
• Setting Your Default Time Zone, on page 37
• Specifying Your Default Dashboard, on page 38

User Preferences Introduction

Depending on your user role, you can specify certain preferences for your user account.

In a multidomain deployment, user preferences apply to all domains where your account has access. When specifying home page and dashboard preferences, keep in mind that certain pages and dashboard widgets are constrained by domain.

Changing Your Password

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
</tr>
</tbody>
</table>

All user accounts are protected with a password. You can change your password at any time, and depending on the settings for your user account, you may have to change your password periodically.

If password strength checking is enabled, passwords must be at least eight alphanumeric characters of mixed case and must include at least one numeric character. Passwords cannot be a word that appears in a dictionary or include consecutive repeating characters.

If you are an LDAP or a RADIUS user, you cannot change your password through the web interface.
Procedure

Step 1  From the drop-down list under your user name, choose User Preferences.
Step 2  Enter your Current Password, and click Change.
Step 3  In the New Password and Confirm fields, enter your new password.
Step 4  Click Change.

Changing an Expired Password

Depending on the settings for your user account, your password may expire. The password expiration time period is set when your account is created. If your password has expired, the Password Expiration Warning page appears.

Procedure

On the Password Expiration Warning page, you have two choices:

• Click Change Password to change your password now. If you have zero warning days left, you must change your password.
  Tip  If password strength checking is enabled, passwords must be at least eight alphanumeric characters of mixed case and must include at least one numeric character. Passwords cannot be a word that appears in a dictionary or include consecutive repeating characters.

• Click Skip to change your password later.

Specifying Your Home Page

You can specify the page within the web interface to use as your home page for the appliance. The default home page is the default dashboard (Overview > Dashboards), except for user accounts with no dashboard access. (See Specifying Your Default Dashboard, on page 38 to set the default dashboard.)
In a multidomain deployment, the home page you choose applies to all domains where your user account has access. When choosing a home page for an account that frequently accesses multiple domains, keep in mind that certain pages are constrained to the Global domain.

**Procedure**

**Step 1** From the drop-down list under your user name, choose User Preferences.

**Step 2** Click Home Page.

**Step 3** Choose the page you want to use as your home page from the drop-down list.

The options in the drop-down list are based on the access privileges for your user account. For more information, see User Account Privileges, on page 44.

**Step 4** Click Save.

### Configuring Event View Settings

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Device</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>feature dependent</td>
</tr>
</tbody>
</table>

Use the Event View Settings page to configure characteristics of event views on the Firepower Management Center. Note that some event view configurations are available only for specific user roles. Users with the External Database User role can view parts of the event view settings user interface, but changing those settings has no meaningful result.

**Procedure**

**Step 1** From the drop-down list under your user name, choose User Preferences.

**Step 2** Click Event View Settings.

**Step 3** In the Event Preferences section, configure the basic characteristics of event views; see Event View Preferences, on page 34.

**Step 4** In the File Preferences section, configure file download preferences; see File Download Preferences, on page 35.

**Step 5** In the Default Time Windows section, configure the default time window or windows; see Default Time Windows, on page 35.

**Step 6** In the Default Workflow sections, configure default workflows; see Default Workflows, on page 37.

**Step 7** Click Save.
**Event View Preferences**

Use the Event Preferences section of the Event View Settings page to configure basic characteristics of event views in the Firepower System. This section is available for all user roles, although it has little to no significance for users who cannot view events.

The following fields appear in the Event Preferences section:

- **The Confirm “All” Actions** field controls whether the appliance forces you to confirm actions that affect all events in an event view.

  For example, if this setting is enabled and you click **Delete All** on an event view, you must confirm that you want to delete all the events that meet the current constraints (including events not displayed on the current page) before the appliance will delete them from the database.

- **The Resolve IP Addresses** field allows the appliance, whenever possible, to display host names instead of IP addresses in event views.

  Note that an event view may be slow to display if it contains a large number of IP addresses and you have enabled this option. Note also that for this setting to take effect, you must use management interfaces configuration to establish a DNS server in the system settings.

- **The Expand Packet View** field allows you to configure how the packet view for intrusion events appears.

  By default, the appliance displays a collapsed version of the packet view:

  - **None** - collapse all subsections of the Packet Information section of the packet view
  - **Packet Text** - expand only the Packet Text subsection
  - **Packet Bytes** - expand only the Packet Bytes subsection
  - **All** - expand all sections

  Regardless of the default setting, you can always manually expand the sections in the packet view to view detailed information about a captured packet.

- **The Rows Per Page** field controls how many rows of events per page you want to appear in drill-down pages and table views.

- **The Refresh Interval** field sets the refresh interval for event views in minutes. Entering 0 disables the refresh option. Note that this interval does not apply to dashboards.

- **The Statistics Refresh Interval** controls the refresh interval for event summary pages such as the Intrusion Event Statistics and Discovery Statistics pages. Entering 0 disables the refresh option. Note that this interval does not apply to dashboards.

- **The Deactivate Rules** field controls which links appear on the packet view of intrusion events generated by standard text rules:

  - **All Policies** - a single link that deactivates the standard text rule in all the locally defined custom intrusion policies
  - **Current Policy** - a single link that deactivates the standard text rule in only the currently deployed intrusion policy. Note that you cannot deactivate rules in the default policies.
  - **Ask** - links for each of these options
File Download Preferences

Use the File Preferences section of the Event View Settings page to configure basic characteristics of local file downloads. This section is only available to users with the Administrator, Security Analyst, or Security Analyst (Read Only) user roles.

Note that if your appliance does not support downloading captured files, these options are disabled.

The following fields appear in the File Preferences section:

- The Confirm ‘Download File’ Actions check box controls whether a File Download pop-up window appears each time you download a file, displaying a warning and prompting you to continue or cancel.

  ![Caution]

  Cisco strongly recommends you do not download malware, as it can cause adverse consequences. Exercise caution when downloading any file, as it may contain malware. Ensure you have taken any necessary precautions to secure the download destination before downloading files.

  Note that you can disable this option any time you download a file.

- When you download a captured file, the system creates a password-protected .zip archive containing the file. The Zip File Password field defines the password you want to use to restrict access to the .zip file. If you leave this field blank, the system creates archive files without passwords.

- The Show Zip File Password check box toggles displaying plain text or obfuscated characters in the Zip File Password field. When this field is cleared, the Zip File Password displays obfuscated characters.

Default Time Windows

The time window, sometimes called the time range, imposes a time constraint on the events in any event view. Use the Default Time Windows section of the Event View Settings page to control the default behavior of the time window.

User role access to this section is as follows:

- Administrators and Maintenance Users can access the full section.
- Security Analysts and Security Analysts (Read Only) can access all options except Audit Log Time Window.
- Access Admins, Discovery Admins, External Database Users, Intrusion Admins, Network Admins, and Security Approvers can access only the Events Time Window option.

Note that, regardless of the default time window setting, you can always manually change the time window for individual event views during your event analysis. Also, keep in mind that time window settings are valid
for only the current session. When you log out and then log back in, time windows are reset to the defaults you configured on this page.

There are three types of events for which you can set the default time window:

- The **Events Time Window** sets a single default time window for most events that can be constrained by time.

- The **Audit Log Time Window** sets the default time window for the audit log.

- The **Health Monitoring Time Window** sets the default time window for health events.

You can only set time windows for event types your user account can access. All user types can set event time windows. Administrators, Maintenance Users, and Security Analysts can set health monitoring time windows. Administrators and Maintenance Users can set audit log time windows.

Note that because not all event views can be constrained by time, time window settings have no effect on event views that display hosts, host attributes, applications, clients, vulnerabilities, user identity, or white list violations.

You can either use **Multiple** time windows, one for each of these types of events, or you can use a **Single** time window that applies to all events. If you use a single time window, the settings for the three types of time window disappear and a new **Global Time Window** setting appears.

There are three types of time window:

- **static**, which displays all the events generated from a specific start time to a specific end time

- **expanding**, which displays all the events generated from a specific start time to the present; as time moves forward, the time window expands and new events are added to the event view

- **sliding**, which displays all the events generated from a specific start time (for example, one day ago) to the present; as time moves forward, the time window “slides” so that you see only the events for the range you configured (in this example, for the last day)

The maximum time range for all time windows is from midnight on January 1, 1970 (UTC) to 3:14:07 AM on January 19, 2038 (UTC).

The following options appear in the **Time Window Settings** drop-down list:

- The **Show the Last - Sliding** option allows you configure a sliding default time window of the length you specify.

  The appliance displays all the events generated from a specific start time (for example, 1 hour ago) to the present. As you change event views, the time window “slides” so that you always see events from the last hour.

- The **Show the Last - Static/Expanding** option allows you to configure either a static or expanding default time window of the length you specify.

  For **static** time windows, enable the **Use End Time** check box. The appliance displays all the events generated from a specific start time (for example, 1 hour ago) to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window.

  For **expanding** time windows, disable the **Use End Time** check box. The appliance displays all the events generated from a specific start time (for example, 1 hour ago) to the present. As you change event views, the time window expands to the present time.
• The **Current Day - Static/Expanding** option allows you to configure either a static or expanding default time window for the current day. The current day begins at midnight, based on the time zone setting for your current session.

For **static** time windows, enable the **Use End Time** check box. The appliance displays all the events generated from midnight to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window.

For **expanding** time windows, disable the **Use End Time** check box. The appliance displays all the events generated from midnight to the present. As you change event views, the time window expands to the present time. Note that if your analysis continues for over 24 hours before you log out, this time window can be more than 24 hours.

• The **Current Week - Static/Expanding** option allows you to configure either a static or expanding default time window for the current week. The current week begins at midnight on the previous Sunday, based on the time zone setting for your current session.

For **static** time windows, enable the **Use End Time** check box. The appliance displays all the events generated from midnight to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window.

For **expanding** time windows, disable the **Use End Time** check box. The appliance displays all the events generated from midnight Sunday to the present. As you change event views, the time window expands to the present time. Note that if your analysis continues for over 1 week before you log out, this time window can be more than 1 week.

### Default Workflows

A workflow is a series of pages displaying data that analysts use to evaluate events. For each event type, the appliance ships with at least one predefined workflow. For example, as a Security Analyst, depending on the type of analysis you are performing, you can choose among ten different intrusion event workflows, each of which presents intrusion event data in a different way.

The appliance is configured with a default workflow for each event type. For example, the Events by Priority and Classification workflow is the default for intrusion events. This means whenever you view intrusion events (including reviewed intrusion events), the appliance displays the Events by Priority and Classification workflow.

You can, however, change the default workflow for each event type. The default workflows you are able to configure depend on your user role. For example, intrusion event analysts cannot set default discovery event workflows.

### Setting Your Default Time Zone

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
</tr>
</tbody>
</table>

This setting determines the times displayed in the web interface for your user account only, for things like task scheduling and viewing dashboards. This setting does not change the system time or affect any other user, and does not affect data stored in the system, which generally uses UTC.
The Time Zone function (in User Preferences) assumes that the system clock is set to UTC time. DO NOT ATTEMPT TO CHANGE THE SYSTEM TIME. Changing the system time from UTC is NOT supported, and doing so will require you to reimage the device to recover from an unsupported state.

### Procedure

**Step 1**
From the drop-down list under your user name, choose **User Preferences**.

**Step 2**
Click **Time Zone**.

**Step 3**
Choose the continent or area that contains the time zone you want to use.

**Step 4**
Choose the country and state name that corresponds with the time zone you want to use.

---

### Specifying Your Default Dashboard

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Security Analyst</td>
</tr>
</tbody>
</table>

The default dashboard appears when you choose **Overview > Dashboards**. Unless changed, the default dashboard for all users is the Summary dashboard.

In a multidomain deployment, the default dashboard you choose applies to all domains where your user account has access. When choosing a dashboard for an account that frequently accesses multiple domains, keep in mind that certain dashboard widgets are constrained by domain.

### Procedure

**Step 1**
From the drop-down list under your user name, choose **User Preferences**.

**Step 2**
Click **Dashboard Settings**.

**Step 3**
Choose the dashboard you want to use as your default from the drop-down list. If you choose **None**, when you select **Overview > Dashboards**, you can then choose a dashboard to view.

**Step 4**
Click **Save**.

---

CHAPTER 4

Firepower System User Management

The following topics describe how a user with Administrator access can manage user accounts in the Firepower System:

- User Roles, on page 41
- User Accounts, on page 64
- Firepower System User Authentication, on page 72
- LDAP Authentication, on page 75
- RADIUS Authentication, on page 97
- Single Sign-on (SSO), on page 106

User Roles

The Firepower System lets you allocate user privileges based on the user’s role. For example, you can grant analysts predefined roles such as Security Analyst and Discovery Admin and reserve the Administrator role for the security administrator managing the Firepower System. You can also create custom user roles with access privileges tailored to your organization’s needs.

In the platform settings policy for a managed device, you set a default access role for all users from that device who are externally authenticated. After an externally authenticated user logs in for the first time, you can add or remove access rights for that user on the User Management page. If you do not modify the user’s rights, the user has only the rights granted by default. Because you create internally authenticated users manually, you set the access rights when you create them.

If you configured management of access rights through LDAP groups, the access rights for users are based on their membership in LDAP groups. They receive the default access rights for the group that they belong to that has the highest level of access. If they do not belong to any groups and you have configured group access, they receive the default user access rights configured in the authentication object for the LDAP server. If you configure group access, those settings override the default access setting in the platform settings policy.

Similarly, if you assign a user to specific user role lists in a RADIUS authentication object, the user receives all assigned roles, unless one or more of those roles are mutually incompatible. If a user is on the lists for two mutually incompatible roles, the user receives the role that has the highest level of access. If the user does not belong to any lists and you have configured a default access role in the authentication object, the user receives that role. If you configure default access in the authentication object, those settings override the default access setting in the platform settings policy.

In a multidomain deployment, you can assign users roles in multiple domains. For example, you can assign a user read-only privileges in the Global domain, but Administrator privileges in a subdomain.
Predefined User Roles

The Firepower System includes ten predefined user roles that provide a range of access privilege sets to meet the needs of your organization. Note that 7000 and 8000 Series devices have access to only three of the ten predefined user roles: Administrator, Maintenance User, and Security Analyst.

Although you cannot edit predefined user roles, you can use their access privilege sets as the basis for custom user roles. In addition, you cannot configure them to escalate to another user role.

The following table briefly describes the predefined roles available to you.

- **Access Admin**: Provides access to access control policy and associated features in the **Policies** menu. Access Admins cannot deploy policies.

- **Administrator**: Administrators have access to all functionality; their sessions present a higher security risk if compromised, so you cannot make them exempt from login session timeouts.
  
  You should limit use of the Administrator role for security reasons.

- **Discovery Admin**: Provides access to network discovery, application detection, and correlation features in the **Policies** menu. Discovery Admins cannot deploy policies.

- **External Database User**: Provides read-only access to the Firepower System database using an application that supports JDBC SSL connections. For the third-party application to authenticate to the Firepower System appliance, you must enable database access in the system settings. On the web interface, External Database Users have access only to online help-related options in the **Help** menu. Because this role’s function does not involve the web interface, access is provided only for ease of support and password changes.

- **Intrusion Admin**: Provides access to all intrusion policy, intrusion rule, and network analysis policy features in the **Policies** and **Objects** menus. Intrusion Admins cannot deploy policies.

- **Maintenance User**: Provides access to monitoring and maintenance features. Maintenance Users have access to maintenance-related options in the **Health** and **System** menus.

- **Network Admin**: Provides access to access control, SSL inspection, DNS policy, and identity policy features in the **Policies** menu, as well as device configuration features in the **Devices** menus. Network Admins can deploy configuration changes to devices.

- **Security Analyst**: Provides access to security event analysis features, and read-only access to health events, in the **Overview**, **Analysis**, **Health**, and **System** menus.

- **Security Analyst (Read Only)**: Provides read-only access to security event analysis features and health event features in the **Overview**, **Analysis**, **Health**, and **System** menus.
Security Approver

Provides limited access to access control and associated policies and network discovery policies in the Policies menu. Security Approvers can view and deploy these policies, but cannot make policy changes.

Externally authenticated users, if assigned no other roles, have minimum access rights based on the settings in LDAP or RADIUS authentication objects and in platform settings. You can assign additional rights to these users, but to remove or change minimum access rights, you must perform the following tasks:

- Move the user from one list to another in the authentication object or change the user's attribute value or group membership on the external authentication server.
- Update platform settings.
- Use the User Management page to remove the access from that user account.

Custom User Roles

In addition to the predefined user roles, you can also create custom user roles with specialized access privileges. Custom user roles can have any set of menu-based and system permissions, and may be completely original or based on a predefined user role. Like predefined user roles, custom roles can serve as the default role for externally authenticated users. Unlike predefined roles, you can modify and delete custom roles.

Selectable permissions are hierarchical, and are based on the Firepower System menu layout. Permissions are expandable if they have sub-pages or if they have more fine-grained permissions available beyond simple page access. In that case, the parent permission grants page view access and the children granular access to related features of that page. Permissions that contain the word “Manage” grant the ability to edit and delete information that other users create.

Tip

For pages or features not included in the menu structure, privileges are granted by parent or related pages. For example, the Modify Intrusion Policy privilege also allows you to modify network analysis policies.

You can apply restricted searches to a custom user role. These constrain the data a user may see in the event viewer. You can configure a restricted search by first creating a private saved search and selecting it from the Restricted Search drop-down menu under the appropriate menu-based permission.

When you configure a custom user role on a Firepower Management Center, all menu-based permissions are available for you to grant. When you configure a custom user role on a managed device, only some permissions are available — those relevant to device functions.

The selectable options under System Permissions allow you to create a user role that can make queries to the external database or escalate to the permissions of a target user role.

Optionally, instead of creating a new custom user role, you can export a custom user role from another appliance, then import it onto your appliance. You can then edit the imported role to suit your needs before you apply it.

Example: Custom User Roles and Access Control

You can create custom user roles for access control-related features to designate whether Firepower System users can view and modify access control and associated policies.

The following table lists custom roles that you could create and user permissions granted for each example. The table lists the privileges required for each custom role. In this example, Policy Approvers can view (but not modify) access control and intrusion policies. They can also deploy configuration changes to devices.

<table>
<thead>
<tr>

</table>

User Account Privileges

The following sections provide a list of the configurable user permissions in the Firepower System and the predefined user roles that can access them. Not all permissions are available on managed devices; permissions available only on the Firepower Management Center are marked accordingly.

Overview Menu

The following table lists, in order, the user role privileges required to access each option in the Overview menu and whether the user role has access to the sub-permissions within. The Security Approver, Discovery Admin, Intrusion Admin, Access Admin, Network Admin, and External Database User roles have no permissions in the Overview menu.

Help Menu

The Help menu and its permissions are accessible to all user roles. You cannot restrict Help menu options.

Managing User Roles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Each Firepower System user is associated with a user access role or roles. These user roles are assigned permissions that determine access to menus and other options in the system. For example, an analyst needs access to event data to analyze the security of your network, but might not require access to administrative functions for the Firepower System itself. You can grant Security Analyst access to analysts while reserving the Administrator role for the user or users managing the Firepower System.

The Firepower System includes ten predefined user roles designed for a variety of administrators and analysts. These predefined user roles have a set of predetermined access privileges.

You can also create custom user roles with more granular access privileges.

You can also restrict the data that a user role can view in the event viewer by applying a restricted search to that role. To create a custom role with restricted access, you must choose the tables you want to restrict from the Menu Based Permissions list, then choose private saved searches from the Restrictive Search drop-down lists.

You cannot delete predefined user roles, but you can delete custom roles that are no longer necessary. If you want to disable a custom role without removing it entirely, you can deactivate it instead. Note that you cannot delete your own user role or a role that is set as a default user role in a platform settings policy.

Procedure

Step 1  Choose System > Users.
Step 2
Click the User Roles tab.

Step 3
Manage user roles:

- Activate — Activate or deactivate a predefined user role as described in Activating and Deactivating User Roles, on page 59.
- Create — Create custom user roles as described in Creating Custom User Roles, on page 60.
- Copy — Copy an existing user role to create a new custom user role as described in Copying User Roles, on page 60.
- Edit — Edit a custom user role as described in Editing Custom User Roles, on page 61.
- Delete — Click the delete icon (🗑️) next to the custom role you want to delete. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Note
If a deleted role is the only role assigned to a given user, that user can log in and access the User Preferences menu, but is otherwise unable to access the Firepower System.

## Activating and Deactivating User Roles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You cannot delete predefined user roles, but you can deactivate them. Deactivating a role removes that role and all associated permissions from any user who is assigned that role.

In a multidomain deployment, the system displays custom user roles created in the current domain, which you can edit. It also displays custom user roles created in ancestor domains, which you cannot edit. To view and edit custom user roles in a lower domain, switch to that domain.

Caution
If a deactivated role is the only role assigned to a given user, that user can log in and access the User Preferences menu, but is otherwise unable to access the Firepower System.

### Procedure

**Step 1**
Choose System > Users.

**Step 2**
Click the User Roles tab.

**Step 3**
Click the slider next to the user role you want to activate or deactivate.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
If you deactivate, then reactivate, a role with Lights-Out Management while a user with that role is logged in, or restore a user or user role from a backup during that user’s login session, that user must log back into the web interface to regain access to IPMItool commands.

### Creating Custom User Roles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

1. Choose **System > Users**.
2. Click the **User Roles** tab.
3. Click **Create User Role**.
4. In the **Name** field, enter a name for the new user role. User role names are case sensitive.
5. Optionally, add a **Description**.
6. Choose menu-based permissions for the new role.

   When you choose a permission, all of its children are chosen, and the multi-value permissions use the first value. If you clear a high-level permission, all of its children are cleared also. If you choose a permission but not its children, it appears in italic text.

   Copying a predefined user role to use as the base for your custom role preselects the permissions associated with that predefined role.

7. Optionally, set database access permissions for the new role by checking or unchecking the **External Database Access** checkbox.
8. Optionally, on Firepower Management Centers, set escalation permissions for the new user role as described in Configuring a Custom User Role for Escalation, on page 63.
9. Click **Save**.

### Copying User Roles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can copy an existing role to use as the basis for a new custom role. This preselects the existing role’s permissions in the User Role Editor so you can model one role on another.

You can copy any existing role, including predefined user roles and custom user roles inherited from ancestor domains.
Procedure

**Step 1** Choose System > Users.

**Step 2** Click the User Roles tab.

**Step 3** Click the copy icon (COPY) next to the user role you want to copy.

**Step 4** Enter a new Name.

The system creates a default name for the new user role by combining the name of the original user role and the (copy) suffix.

**Step 5** Enter a new Description.

The system retains the description of the original user role if you do not overwrite it.

**Step 6** Optionally, modify the menu-based permissions inherited from the original user role.

When you choose a permission, all of its children are chosen, and the multi-value permissions use the first value. If you clear a high-level permission, all of its children are cleared also. If you choose a permission but not its children, the permission appears in italic text.

**Step 7** Optionally, set the database access permissions for the new role by checking or unchecking the External Database Access checkbox.

**Step 8** Optionally, set escalation permissions for the new user role as described in Configuring a Custom User Role for Escalation, on page 63.

**Step 9** Click Save.

---

### Editing Custom User Roles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You cannot edit predefined user roles.

In a multidomain deployment, the system displays custom user roles created in the current domain, which you can edit. It also displays custom user roles created in ancestor domains, which you cannot edit. To view and edit custom user roles in a lower domain, switch to that domain.

**Procedure**

**Step 1** Choose System > Users.

**Step 2** Click the User Roles tab.

**Step 3** Click the edit icon (EDIT) next to the custom user role you want to modify. If a view icon (VIEW) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4** Modify the Name and Description fields. User role names are case sensitive.

**Step 5** Choose menu-based permissions for the user role.
When you choose a permission, all of its children are chosen, and the multi-value permissions use the first value. If you clear a high-level permission, all of its children are cleared also. If you choose a permission but not its children, the permission appears in italic text.

**Step 6** Optionally, set the database access permissions for the role by checking or unchecking the *External Database Access* checkbox.

**Step 7** Optionally, on Firepower Management Centers, set escalation permissions for the user role as described in *Configuring a Custom User Role for Escalation, on page 63.*

**Step 8** Click *Save.*

---

**User Role Escalation**

You can give custom user roles the permission, with a password, to temporarily gain the privileges of another, targeted user role in addition to those of the base role. This allows you to easily substitute one user for another during an absence, or to more closely track the use of advanced user privileges.

For example, a user whose base role has very limited privileges may escalate to the Administrator role to perform administrative actions. You can configure this feature so that users can use their own passwords, or so they use the password of another user that you specify. The second option allows you to easily manage one escalation password for all applicable users.

Note that only one user role at a time can be the escalation target role. You can use a custom or predefined user role. Each escalation lasts for the duration of a login session and is recorded in the audit log.

### Setting the Escalation Target Role

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can assign any of your user roles, predefined or custom, to act as the system-wide escalation target role. This is the role to which any other role may escalate, if it has the ability.

**Procedure**

**Step 1** Choose *System > Users.*

**Step 2** Click *User Roles.*

**Step 3** Click *Configure Permission Escalation.*

**Step 4** Choose a user role from the drop-down list.

**Step 5** Click *OK* to save your changes.

**Note** Changing the escalation target role is effective immediately. Users in escalated sessions now have the permissions of the new escalation target.
Configuring a Custom User Role for Escalation

Consider the needs of your organization when you configure the escalation password for a custom role. If you want to easily manage many escalating users, you may want to choose another user whose password serves as the escalation password. If you change that user’s password or deactivate that user, all escalating users who require that password are affected. This allows you to manage user role escalation more efficiently, especially if you choose an externally authenticated user that you can manage centrally.

Procedure

Step 1
Begin configuring your custom user role as described in Creating Custom User Roles, on page 60.

Step 2
In System Permissions, choose the Set this role to escalate to: check box.

Step 3
Choose the password that this role uses to escalate. You have two options:

- If you want users with this role to use their own passwords when they escalate, choose Authenticate with the assigned user’s password.
- If you want users with this role to use the password of another user, choose Authenticate with the specified user’s password and enter that username.

Note
When authenticating with another user’s password, you can enter any username, even that of a deactivated or nonexistent user. Deactivating the user whose password is used for escalation makes escalation impossible for users with the role that requires it. You can use this feature to quickly remove escalation powers if necessary.

Step 4
Click Save.

Users with this role can now escalate to the target user role.

Escalating Your User Role

When a user has an assigned custom user role with permission to escalate, that user may escalate to the target role’s permissions at any time. Note that escalation has no effect on user preferences.

Before you begin

- Confirm that a system administrator configured the escalation target role or custom user role for escalation as described in Setting the Escalation Target Role, on page 62 or Configuring a Custom User Role for Escalation, on page 63.
Procedure

**Step 1**  
From the drop-down list under your user name, choose **Escalate Permissions**.

**Step 2**  
Enter the authentication password.

**Step 3**  
Click **Escalate**. You now have all permissions of the escalation target role in addition to your current role.

**Note**  
Escalation lasts for the remainder of your login session. To return to the privileges of your base role only, you must log out, then begin a new session.

User Accounts

The admin account and optional, custom user accounts on a Firepower Management Center or Firepower 7000 and 8000 Series device allow users to log into these. For internally-authenticated users, accounts must be created manually. For externally-authenticated users, accounts are created automatically.

For Firepower Threat Defense, you can create separate CLI users. These users can access the device through SSH to do additional troubleshooting and system monitoring. However, you must create these users in the CLI, you cannot create them in Firepower Management Center.

Managing User Accounts

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**  
Choose **System > Users**.

**Step 2**  
Manage user accounts:

- **Activate/Deactivate** — Click the slider next to a user to reactivate a deactivated user, or to disable an active user account without deleting it. Only internally authenticated users can be activated and deactivated.
- **Create** — Create a new user account; see **Creating a User Account**, on page 65.
- **Edit** — Edit an existing user account; see **Editing a User Account**, on page 66.
- **Delete** — If you want to delete a user, click the delete icon (🗑️). You can delete user accounts from the system at any time, with the exception of the admin account, which cannot be deleted.

**Related Topics**
- Lights-Out Management User Access Configuration, on page 844
Creating a User Account

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td>7000 &amp; 8000 Series</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When you set up a new user account, you can control which parts of the system the account can access. You can set password expiration and strength settings for the user account during creation. For a local account on a 7000 or 8000 Series device, you can also configure the level of command line access the user will have.

In a multidomain deployment, you can create user accounts in any domain in which you have been assigned Admin access. You can also create accounts in a higher-level domain and assign the users lower-level access only. For example, you might want a single user to be an administrator of two domains, but deny them access to the ancestor domain. This kind of user account can only be modified by switching to a subdomain in which access is assigned.

**Procedure**

**Step 1** Choose System > Users.

**Step 2** Click Create User.

**Step 3** Enter a User Name.

**Step 4** Modify the login options; see User Account Login Options, on page 67.

**Step 5** Enter values in Password and Confirm Password.

The values you construct must be based on the password options you set earlier.

**Step 6** If you are creating a user account on a 7000 or 8000 Series device, assign the appropriate level of Command-Line Interface Access as described in Command Line Access Levels, on page 69.

**Step 7** Assign user roles:

- Check or uncheck the check box next to the user role(s) you want to assign the user.

- In a multidomain deployment, if you are adding a user account to a domain with descendant domains, click the Add Domains button that displays instead of the user role check boxes. Continue as described in Assigning User Roles in Multiple Domains, on page 66.

**Note** User roles determine the user's access rights. For more information, see Managing User Roles, on page 58.

**Step 8** Click Save.
Editing a User Account

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

After adding user accounts to the system, you can modify access privileges, account options, or passwords at any time. Note that password management options do not apply to users who authenticate to an external directory server. You manage those settings on the external server. However, you must configure access rights for all accounts, including those that are externally authenticated.

For externally authenticated users, you cannot remove the minimum access rights through the Firepower System user management page for users assigned an access role because of LDAP group or RADIUS list membership or attribute values. You can, however, assign additional rights. When you modify the access rights for an externally authenticated user, the Authentication Method column on the User Management page provides a status of **External - Locally Modified**.

If you change the authentication for a user from externally authenticated to internally authenticated, you must supply a new password for the user.

Procedure

**Step 1** Choose **System > Users**.

**Step 2** Click the edit icon (📝) next to the user you want to modify.

**Step 3** Modify settings described in **Creating a User Account, on page 65**.

**Step 4** Click **Save**.

Assigning User Roles in Multiple Domains

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can assign users roles in ancestor and descendant domains. For example, you can assign a user read-only privileges in the Global domain, but Admin privileges in a descendant domain.

Procedure

**Step 1** In the user account editor, click **Add Domain**.

**Step 2** Choose a domain from the **Domain** drop-down list.

**Step 3** Check the user roles you want to assign the user.
Converting a User from Internal to External Authentication

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you convert a user from internal to external authentication, the user account retains the permissions already present in that account. The existing permissions override any permissions associated with the associated authentication object group or the default user role set in the platform settings policy.

Before you begin

- A user record with the same user name must be present on the external authentication server.

Procedure

Step 1
Enable LDAP (with or without CAC) or RADIUS authentication. For more information, see LDAP Authentication, on page 75 or RADIUS Authentication, on page 97.

Step 2
Instruct the user to log in with the password stored for that user on the external server.

User Account Login Options

The following table describes some of the options you can use to regulate passwords and account access for Firepower System users.

- Password management options do not apply to users who authenticate to an external directory server. You manage those settings on the external authentication server. After you enable Use External Authentication Method, the system removes password management options from the display.

- If you enable security certifications compliance or Lights-Out Management (LOM) on an appliance, different password restrictions apply. For more information on security certifications compliance, see Security Certifications Compliance, on page 834.
### Table 9: User Account Login Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use External Authentication Method</td>
<td>Select this check box if you want this user's credentials to be externally authenticated. If you enable this option, the password management options are no longer displayed.</td>
</tr>
<tr>
<td></td>
<td>• For users to authenticate to an external directory server, you must also create an authentication object for the server you want to use, and deploy a platform settings policy with authentication enabled.</td>
</tr>
<tr>
<td></td>
<td>• Note that for externally authenticated users, if the authentication object for the server is disabled, the <strong>Authentication Method</strong> column in the Users list displays <strong>External (Disabled)</strong>.</td>
</tr>
<tr>
<td></td>
<td>• If you select this option for the user and the external authentication server is unavailable, that user can log into the web interface but cannot access any functionality.</td>
</tr>
<tr>
<td>Maximum Number of Failed Logins</td>
<td>Enter an integer, without spaces, that determines the maximum number of times each user can try to log in after a failed login attempt before the account is locked. The default setting is five tries; use 0 to allow an unlimited number of failed logins.</td>
</tr>
<tr>
<td>Minimum Password Length</td>
<td>Enter an integer, without spaces, that determines the minimum required length, in characters, of a user’s password. The default setting is 8. A value of 0 indicates that no minimum length is required.</td>
</tr>
<tr>
<td></td>
<td>If you enable the <strong>Check Password Strength</strong> option, and set a value for <strong>Minimum Password Length</strong> that exceeds 8 characters, the higher value applies.</td>
</tr>
<tr>
<td>Days Until Password Expiration</td>
<td>Enter the number of days after which the user’s password expires. The default setting is 0, which indicates that the password never expires. If you set this option, the <strong>Password Lifetime</strong> column of the Users list indicates the days remaining on each user’s password.</td>
</tr>
<tr>
<td>Days Before Password Expiration Warning</td>
<td>Enter the number of warning days users have to change their password before their password actually expires. The default setting is 0 days.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The number of warning days must be less than the number of days before the password expires.</td>
</tr>
<tr>
<td>Force Password Reset on Login</td>
<td>Select this option to force users to change their passwords the next time they log in.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>

A strong password must be at least eight alphanumeric characters of mixed case and must include at least one numeric character and one special character. It cannot be a word that appears in a dictionary or include consecutive repeating characters.</td>
</tr>
<tr>
<td>Exempt from Browser Session Timeout</td>
<td>Select this option if you do not want a user’s login sessions to terminate due to inactivity. Users with the Administrator role cannot be made exempt.</td>
</tr>
</tbody>
</table>

### Command Line Access Levels

You can use the local web interface on a 7000 or 8000 Series device to assign command line interface access to local device users. Note that you can also assign command line access for users on an NGIPSv, but you use commands from the command line interface.

The commands a user can run depend on the level of access you assign to the user. Possible values for the Command-Line Interface Access setting include:

- **None**
  - The user cannot log into the appliance on the command line. Any session the user starts will close when the user provides credentials. The access level defaults to **None** on user creation.

- **Configuration**
  - The user can access any of the command line options. Exercise caution in assigning this level of access to users.

⚠️ **Caution** Command line access granted to externally authenticated users defaults to the **Configuration** level of command line access, granting rights to all command line utilities.

- **Basic**
  - A specific set of commands can be run by the user, listed below.

**Table 10: Basic Command Line Commands**

### Creating Local User Accounts for the FTD CLI

You can create users for CLI access on FTD devices. These accounts do not allow access to the management application, but to the CLI only. The CLI is useful for troubleshooting and monitoring purposes.

You cannot create local user accounts on more than one device at a time. Each device has its own set of unique local user CLI accounts.

#### Procedure

**Step 1**

Log into the device CLI using an account with config privileges.

The admin user account has the required privileges, but any account with config privileges will work. You can use an SSH session or the Console port.

</tr>
<tr>
<td>hostname</td>
<td>virtual-routers</td>
</tr>
<tr>
<td>hyperthreading</td>
<td>virtual-switches</td>
</tr>
<tr>
<td>inline-sets</td>
<td></td>
</tr>
</tbody>
</table>

---
For certain device models, the Console port puts you into the FXOS CLI. Use the `connect ftd` command to get to the FTD CLI.

**Step 2**
Create the user account.

```
configure user add username {basic | config}
```

You can define the user with the following privilege levels:

- **config**—Gives the user configuration access. This gives the user full administrator rights to all commands.
- **basic**—Gives the user basic access. This does not allow the user to enter configuration commands.

**Example:**
The following example adds a user account named joecool with config access rights. The password is not shown as you type it.

```
> configure user add joecool config
Enter new password for user joecool: newpassword
Confirm new password for user joecool: newpassword
> show user
```

**Note** Tell users they can change their passwords using the `configure password` command.

**Step 3**
(Optional.) Adjust the characteristics of the account to meet your security requirements.

You can use the following commands to change the default account behavior.

- **configure user aging** username max_days warn_days
  
  Sets an expiration date for the user's password. Specify the maximum number of days for the password to be valid followed by the number of days before expiration the user will be warned about the upcoming expiration. Both values are 1 to 9999, but the warning days must be less than the maximum days. When you create the account, there is no expiration date for the password.

- **configure user forcereset** username
  
  Forces the user to change the password on the next login.

- **configure user maxfailedlogins** username number
  
  Sets the maximum number of consecutive failed logins you will allow before locking the account, from 1 to 9999. Use the `configure user unlock` command to unlock accounts. The default for new accounts is 5 consecutive failed logins.

- **configure user minpasswdlen** username number
  
  Sets a minimum password length, which can be from 1 to 127.

- **configure user strengthcheck** username {enable | disable}
  
  Enables or disables password strength checking, which requires a user to meet specific password criteria when changing their password. When a user’s password expires or if the `configure user forcereset` command is used, this requirement is automatically enabled the next time the user logs in.
Step 4

Manage user accounts as necessary.

Users can get locked out of their accounts, or you might need to remove accounts or fix other issues. Use the following commands to manage the user accounts on the system.

- `configure user access username {basic | config}`
  Changes the privileges for a user account.

- `configure user delete username`
  Deletes the specified account.

- `configure user disable username`
  Disables the specified account without deleting it. The user cannot log in until you enable the account.

- `configure user enable username`
  Enables the specified account.

- `configure user password username`
  Changes the password for the specified user. Users should normally change their own password using the `configure password` command.

- `configure user unlock username`
  Unlocks a user account that was locked due to exceeding the maximum number of consecutive failed login attempts.

---

Firepower System User Authentication

When a user logs into the web interface on a Firepower Management Center or a managed device, the appliance looks for a match for the user name and password in the local list of users. This process is called authentication.

There are two types of authentication:

- `internal authentication` — The system checks the list in the local database for the user.

- `external authentication` — The system checks the list in the local database for the user and, if the user is not present on that list, queries an external authentication server for its user list.

The authentication process is illustrated below.
When you create a user account, you specify either internal or external authentication for that user.

**Internal Authentication**

In internal authentication, user credentials are verified against records in the internal Firepower System database. This is the default authentication type.

You set the access rights for internal authentication users when you create the user's account.

---

**Note**

When an internally authenticated user is converted to external authentication, you cannot revert to internal authentication.
External Authentication

In external authentication, the Firepower Management Center or managed device retrieves user credentials from a repository on an external server. External servers can be either a Lightweight Directory Access Protocol (LDAP) directory server or a Remote Authentication Dial In User Service (RADIUS) authentication server.

You enable external authentication using a platform settings policy and settings in individual user accounts. Note the following guidelines:

• You can use multiple external authentication objects to authenticate users to access the Firepower Management Center web interface. In other words, if you have five external authentication objects, users from any of them can be authenticated to access the web interface.

• You can use only one external authentication object for shell access to the Firepower Management Center. If you have more than one external authentication object set up, users can authenticate using only the first object in the list.

When the user logs into an appliance for the first time, the appliance associates the external credentials with a set of permissions by creating a local user record. The user is assigned permissions based on either:

• the group or access list they belong to

• the default user access role you set in the platform settings policy for the appliance

If permissions are granted through group or list membership, they cannot be modified. However, if they are assigned by default user role, you can modify them in the user account, and the modifications you make override the default settings. For example:

• If the default role for externally authenticated user accounts is set to a specific access role, users can log into the appliance using their external account credentials without any additional configuration by the system administrator.

• If an account is externally authenticated and by default receives no access privileges, users can log in but cannot access any functionality. You (or your system administrator) can then change the permissions to grant the appropriate access to user functionality.

You cannot manage passwords for externally authenticated users or deactivate externally authenticated users through the Firepower System interface. For externally authenticated users, you cannot remove the minimum access rights through the Firepower System user management page for users assigned an access role because of LDAP group or RADIUS list membership or attribute values. On the Edit User page for an externally authenticated user, rights granted because of settings on an external authentication server are marked with a status of Externally Modified.

You can, however, assign additional rights. When you modify the access rights for an externally authenticated user, the Authentication Method column on the User Management page provides a status of External - Locally Modified.

Related Topics

- LDAP Authentication, on page 75
- RADIUS Authentication, on page 97
LDAP Authentication

LDAP, or the Lightweight Directory Access Protocol, allows you to set up a directory on your network that organizes objects, such as user credentials, in a centralized location. Multiple applications can then access those credentials and the information used to describe them. If you ever need to change a user's credentials, you can change them in one place.

You must create LDAP authentication objects on a Firepower Management Center, but you can use the external authentication object on any managed devices that have a web interface (that is, on 7000 and 8000 Series devices) by deploying a platform settings policy where the object is enabled to the device. When you deploy the policy, the object is copied to the device.

Note
Before enabling external authentication on 7000 and 8000 Series devices, remove any internally-authenticated shell or CLI users that have the same user name as externally-authenticated users included in your shell access filter.

You can use LDAP naming standards for address specification and for filter and attribute syntax in your authentication object. For more information, see the RFCs listed in the Lightweight Directory Access Protocol (v3): Technical Specification, RFC 3377. Examples of syntax are provided throughout this procedure. Note that when you set up an authentication object to connect to a Microsoft Active Directory Server, you can use the address specification syntax documented in the Internet RFC 822 (Standard for the Format of ARPA Internet Text Messages) specification when referencing a user name that contains a domain. For example, to refer to a user object, you might type JoeSmith@security.example.com rather than the equivalent user distinguished name of cn=JoeSmith, ou=security, dc=example, dc=com when using Microsoft Active Directory Server.

Note
Currently, the Firepower System supports LDAP external authentication on LDAP servers running Microsoft Active Directory on Windows Server 2008, Oracle Directory Server Enterprise Edition 7.0 on Windows Server 2008, or OpenLDAP on Linux. However, the Firepower System does not support external authentication for NGIPSv or ASA FirePOWER devices.

Microsoft has announced that Active Directory servers will start enforcing LDAP binding and LDAP signing in 2020. Microsoft is making these a requirement because when using default settings, an elevation of privilege vulnerability exists in Microsoft Windows that could allow a man-in-the-middle attacker to successfully forward an authentication request to a Windows LDAP server. For more information, see 2020 LDAP channel binding and LDAP signing requirement for Windows on the Microsoft support site.

If you have not done so already, we recommend you start using TLS/SSL encryption to authenticate with an Active Directory server.

Required Information for Creating LDAP Authentication Objects

Before you configure a connection to your LDAP server, you should collect the information that you need to create the LDAP authentication object.
You must have TCP/IP access from your local appliance to the authentication server where you want to connect.

You need the following, at minimum, to create a basic authentication object:

- the server name or IP address for the server where you plan to connect
- the server type of the server where you plan to connect
- the user name and password for a user account with sufficient privileges to browse the LDAP tree; Cisco recommends that you use a domain admin user account for this purpose
- if there is a firewall between the appliance and the LDAP server, an entry in the firewall to allow outgoing connections
- if possible, the base distinguished name for the server directory where the user names reside

You can use a third-party LDAP client to browse the LDAP tree and see base DN and attribute descriptions. You can also use that client to confirm that your selected user can browse the base DN you select. Ask your LDAP administrator to recommend an approved LDAP client for your LDAP server.

Depending on how you plan to customize your advanced LDAP authentication object configuration, you might also need the information in the following table.

**Table 11: Additional LDAP Configuration Information**

</tr>
</tbody>
</table>

CAC Authentication

If your organization uses Common Access Cards (CACs), you can configure LDAP authentication to authenticate users logging into the web interface and authorize access to specific functionality based on group membership or default access rights. With CAC authentication and authorization configured, users have the option to log in directly without providing a separate username and password for the appliance.

**Note**

You must have a valid user certificate present in your browser (in this case, a certificate passed to your browser via your CAC) to enable user certificates as part of the CAC configuration process. After you configure CAC authentication and authorization, users on your network must maintain the CAC connection for the duration of their browsing session. If you remove or replace a CAC during a session, your web browser terminates the session and the system logs you out of the web interface.

CAC-authenticated users are identified in the system by their electronic data interchange personal identifier (EDIPI) numbers. After users log in using their CAC credentials for the first time, you can manually add or remove access privileges for those users on the User Management page. If you did not preconfigure a user’s privileges using group-controlled access roles, the user has only the privileges granted by default in the platform settings policy.

**Tip**

The system purges manually configured access privileges when it purges CAC-authenticated users from the User Management page after 24 hours of inactivity. The users are restored to the page after each subsequent login, but you must reconfigure any manual changes to their access privileges.

### Configuring CAC Authentication

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC 7000 and 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Before users on your network can log into Firepower Management Centers and 7000 and 8000 Series devices using their CAC credentials, a user with appropriate permissions must complete the multi-step configuration process for CAC authentication and authorization.

**Before you begin**

- Gather the information described in Required Information for Creating LDAP Authentication Objects, on page 75.
Procedure

**Step 1** Insert a CAC as directed by your organization.

**Step 2** Direct your browser to the web interface of the FMC or device.

**Step 3** If prompted, enter the PIN associated with the CAC you inserted in step 1.

**Step 4** If prompted, choose the appropriate certificate from the drop-down list.

**Step 5** On the Login page, in the **Username** and **Password** fields, log in as a user with Administrator privileges. User names are case sensitive.

You cannot log in using your CAC credentials until you have fully configured CAC authentication and authorization.

**Step 6** Navigate to **System > Users** and click the **External Authentication** tab.

**Step 7** Create an LDAP authentication object exclusively for CAC authentication and authorization.

See **Creating Advanced LDAP Authentication Objects**, on page 81. You must configure:

- The **User Name Template** in the advanced options of the **LDAP-Specific Parameters** section.

- The **UI Access Attribute** in the **Attribute Mapping** section.

- The distinguished names for existing LDAP groups in the **Group Controlled Access Roles** section, if you want to preconfigure access rights through LDAP group membership.

You cannot configure both CAC authentication and shell access in the same authentication object. If you also want to authorize users for shell access, create and enable separate authentication objects.

**Step 8** Click **Save**.

**Step 9** Enable external authentication and CAC authentication.

**Step 10** Select **System > Configuration** and click **HTTPS Certificate**.

**Step 11** Import a HTTPS server certificate, if necessary.

See **Importing HTTPS Server Certificates**, on page 793. The same certificate authority (CA) must issue the HTTPS server certificate and the user certificates on the CACs you plan to use for authentication and authorization.

**Step 12** Under **HTTPS User Certificate Settings**, choose **Enable User Certificates**.

For more information, see **Requiring Valid HTTPS Client Certificates**, on page 794.

---

**What to do next**

- After the user logs in for the first time, you can manually add or remove the user's access rights. If you do not modify the rights, the user has only the rights granted by default. For more information, see **Editing a User Account**, on page 66.

**Related Topics**

- **LDAP Group Fields**, on page 91
- **LDAP-Specific Fields**, on page 86

- **Logging Into the Firepower Management Center with CAC Credentials**, on page 26
Creating Basic LDAP Authentication Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can set up an LDAP authentication object where you customize many of the values. However, if you just want to authenticate all the users in a particular directory, you can create a basic authentication object with the base DN for that directory. If you set defaults to those for your server type and supply authentication credentials for the account used to retrieve user data from the server, you can quickly create an authentication object. Follow the procedure below to do so.

If you prefer to consider and possibly customize each authentication setting when creating the authentication object (to grant shell access, for example), use the advanced procedure to create the object. You should also use the advanced procedure if you plan to encrypt your connection to the server, set user timeouts, customize the user name template, or assign Firepower user roles based on LDAP group membership.

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.

**Before you begin**

- Gather the information described in Required Information for Creating LDAP Authentication Objects, on page 75.

**Procedure**

1. Choose **System > Users**.
2. Click the **External Authentication** tab.
3. Click **Add External Authentication Object**.
4. Choose **LDAP** from the **Authentication Method** drop-down list.
5. Provide a **Name**, **Description**, **Server Type**, and **Primary Server Host Name/IP Address** as described in Identifying the LDAP Authentication Server, on page 85.
   - **Tip** If you click Set Defaults, the system populates the **User Name Template**, **UI Access Attribute**, **Shell Access Attribute**, **Group Member Attribute**, and **Group Member URL Attribute** fields with default values.
6. Choose **Fetch DNs** to specify a base distinguished name and, optionally, provide a **Base Filter** as described in Configuring LDAP-Specific Parameters, on page 89.
7. Enter a distinguished name as the **User Name** and the **Password** for a user who has sufficient credentials to browse the LDAP server as described in Configuring LDAP-Specific Parameters, on page 89.
8. Re-enter the password in the **Confirm Password** field.
9. Test the connection as described in Testing LDAP Authentication Connections, on page 95.
Step 10  Click Save.

Example
The following figures illustrate a basic configuration of an LDAP login authentication object for a Microsoft Active Directory Server. The LDAP server in this example has an IP address of 10.11.3.4. The connection uses port 389 for access.

This example shows a connection using a base distinguished name of

```
OU=security,DC=it,DC=example,DC=com
```

for the security organization in the information technology domain of the Example company.
However, because this server is a Microsoft Active Directory server, it uses the sAMAccountName attribute to store user names rather than the uid attribute. Choosing the MS Active Directory server type and clicking Set Defaults sets the UI Access Attribute to sAMAccountName. As a result, the system checks the sAMAccountName attribute for each object for matching user names when a user attempts to log into the system.

In addition, a Shell Access Attribute of sAMAccountName causes each sAMAccountName attribute to be checked for all objects in the directory for matches when a user logs into a shell or CLI account on the appliance.

Note that because no base filter is applied to this server, the system checks attributes for all objects in the directory indicated by the base distinguished name. Connections to the server time out after the default time period (or the timeout period set on the LDAP server).

What to do next

- If you want to refine the list of users retrieved, see Troubleshooting LDAP Authentication Connections, on page 96 for more information.

Creating Advanced LDAP Authentication Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you create a basic authentication object, you define basic settings that let you connect to an authentication server. When you create an advanced authentication object, you define basic settings and you also choose the directory context and search criteria you want to use to retrieve user data from the server. Optionally, you can configure shell access authentication.

Although you can use the default settings for your server type to quickly set up an LDAP configuration, you can also customize advanced settings to control whether the appliance makes an encrypted connection to the LDAP server, the timeout for the connection, and which attributes the server checks for user information.
For the LDAP-specific parameters, you can use LDAP naming standards and filter and attribute syntax. For more information, see the RFCs listed in the Lightweight Directory Access Protocol (v3): Technical Specification, RFC 3377. Examples of syntax are provided throughout this procedure. Note that when you set up an authentication object to connect to a Microsoft Active Directory Server, you can use the address specification syntax documented in the Internet RFC 822 (Standard for the Format of ARPA Internet Text Messages) specification when referencing a user name that contains a domain. For example, to refer to a user object, you might enter JoeSmith@security.example.com rather than the equivalent user distinguished name of cn=JoeSmith,ou=security, dc=example, dc=com when using Microsoft Active Directory Server.

**Note**

If you are configuring an LDAP authentication object for use with CAC authentication, do **not** remove the CAC inserted in your computer. You **must** have a CAC inserted at all times after enabling user certificates.

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.

**Before you begin**

- Gather the information described in Required Information for Creating LDAP Authentication Objects, on page 75.
- Remove any internally authenticated shell users that have the same user name as externally authenticated users included in your shell access filter.

**Procedure**

1. **Step 1** Choose System > Users.
2. **Step 2** Click External Authentication, then Add External Authentication Object.
3. **Step 3** Identify the authentication server as described in Identifying the LDAP Authentication Server, on page 85.
4. **Step 4** Configure authentication settings as described in Configuring LDAP-Specific Parameters, on page 89.
5. **Step 5** Optionally, configure LDAP groups to use as the basis for default access role assignments as described in Configuring Access Rights by Group, on page 92.
   
   If you plan to use this object for CAC authentication and authorization, we recommend you configure LDAP groups to manage access role assignments.

6. **Step 6** Optionally, configure authentication settings for shell access as described in Configuring LDAP Shell Access, on page 94.
7. **Step 7** Test your configuration as described in Testing LDAP Authentication Connections, on page 95.
8. **Step 8** Click Save.

**Example**

This example illustrates an advanced configuration of an LDAP login authentication object for a Microsoft Active Directory Server. The LDAP server in this example has an IP address of 10.11.3.4. The connection uses port 636 for access.
This example shows a connection using a base distinguished name of
OU=security,DC=it,DC=example,DC=com for the security organization in the information technology
domain of the Example company. However, note that this server has a base filter of (cn=*smith).
The filter restricts the users retrieved from the server to those with a common name ending in smith.

The connection to the server is encrypted using SSL and a certificate named certificate.pem is
used for the connection. In addition, connections to the server time out after 60 seconds because of the Timeout setting.

Because this server is a Microsoft Active Directory server, it uses the sAMAccountName attribute to
store user names rather than the uid attribute. Note that the configuration includes a UI Access
Attribute of sAMAccountName. As a result, the Firepower System checks the sAMAccountName attribute
for each object for matching user names when a user attempts to log into the Firepower System.

In addition, a Shell Access Attribute of sAMAccountName causes each sAMAccountName attribute to
be checked for all objects in the directory for matches when a user logs into a shell account on the
appliance.

This example also has group settings in place. The Maintenance User role is automatically assigned
to all members of the group with a member group attribute and the base domain name of
CN-SFmaintenance,DC-it,DC-example,DC=com.
The shell access filter is set to be the same as the base filter, so the same users can access the appliance through the shell or CLI as through the web interface.

**LDAP Authentication Server Fields**

**CAC**
Select this checkbox if you want to use CAC for authentication and authorization.

**Name**
A name for the authentication server.

**Description**
A description for the authentication server.

**Server Type**
The type of LDAP server you plan to connect to. You have the following options when selecting a type:

- If you are connecting to a Microsoft Active Directory server, select **MS Active Directory**.
• If you are connecting to a Sun Java Systems Directory Server or Oracle Directory Server, select **Oracle Directory**.

• If you are connecting to an OpenLDAP server, select **OpenLDAP**.

• If you are connecting to a LDAP server other than those listed above and want to clear default settings, select **Other**.

---

**Tip**

If you click Set Defaults, the system populates the **User Name Template**, **UI Access Attribute**, **Shell Access Attribute**, **Group Member Attribute**, and **Group Member URL Attribute** fields with default values.

---

**Primary Server Host Name/IP Address**
The IP address or host name for the primary server where you want to obtain authentication data.

---

**Note**

If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used in this field. In addition, IPv6 addresses are not supported for encrypted connections.

---

**Primary Server Port**
The port used by the primary authentication server.

**Backup Server Host Name/IP Address**
The IP address or host name for the backup server where you want to obtain authentication data.

**Backup Server Port**
The port used by the backup authentication server.

### Identifying the LDAP Authentication Server

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you create an authentication object, you first specify the primary and backup server and server port where you want the managed device or Firepower Management Center to connect for authentication.

---

**Note**

If you are configuring an LDAP authentication object for use with CAC authentication, do **not** remove the CAC inserted in your computer. You **must** have a CAC inserted at all times after enabling user certificates.

---

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.
Procedure

**Step 1** Choose System > Users.
**Step 2** Click the External Authentication tab.
**Step 3** Click Add External Authentication Object.
**Step 4** Choose LDAP from the Authentication Method drop-down list.
**Step 5** Optionally, check the check box for CAC if you plan to use this authentication object for CAC authentication and authorization.

*Note* You must follow the procedure in Configuring CAC Authentication, on page 77 to fully configure CAC authentication and authorization.

**Step 6** Enter a name and description for the authentication server in the Name and Description fields.
**Step 7** Choose a Server Type from the drop-down list as described in LDAP Authentication Server Fields, on page 84. Optionally, click Set Defaults.
**Step 8** Enter a Primary Server Host Name/IP Address.

*Note* If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used in this field. In addition, IPv6 addresses are not supported for encrypted connections.

**Step 9** Optionally, enter a Primary Server Port.
**Step 10** Optionally, enter a Backup Server Host Name/IP Address.
**Step 11** Optionally, enter a Backup Server Port.

**What to do next**

- Continue creating your LDAP authentication object as described in Creating Advanced LDAP Authentication Objects, on page 81.

**LDAP-Specific Fields**

The following table describes each of the LDAP-specific parameters.
Table 12: LDAP-Specific Parameters

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base DN</td>
<td>Supplies the base distinguished name of the directory where the appliance searches for user information on the LDAP server. Typically, the base DN has a basic structure indicating the company domain and operational unit. Note that after you identify a primary server, you can automatically retrieve a list of available base DNs from the server and select the appropriate base DN.</td>
<td>The Security organization of the Example company might have a base DN of <code>ou=security, dc=example,dc=com</code></td>
</tr>
<tr>
<td>Base Filter</td>
<td>Focuses your search by only retrieving objects in the base DN that have the specific attribute-value pair set in the filter. The base filter is an attribute type, a comparison operator, and the attribute value you want to use as a filter enclosed in parentheses.</td>
<td>To filter for only users with a common name starting with F, use the filter <code>(cn=F*)</code>.</td>
</tr>
<tr>
<td>User Name/Password</td>
<td>Allows the local appliance to access the user objects. Supplies user credentials for a user with appropriate rights to the authentication objects you want to retrieve. The distinguished name for the user you specify must be unique to the directory information tree for the LDAP server. Server user names associated with a Microsoft Active Directory Server cannot end with the <code>$</code> character.</td>
<td>The user name for the <code>admin</code> user in the Security organization of the Example company might have a user name of <code>cn=admin, ou=security, dc=example,dc=com</code></td>
</tr>
<tr>
<td>Encryption</td>
<td>Determines whether and how the communications are encrypted. You can choose no encryption, Transport Layer Security (TLS), or Secure Sockets Layer (SSL) encryption. Note that if you are using a certificate to authenticate when connecting via TLS or SSL, the name of the LDAP server in the certificate <strong>must</strong> match the <strong>User Name</strong> you supply. If you change the encryption method after specifying the port, the port resets to the default value for the selected server type.</td>
<td>If you enter <code>10.10.10.250</code> in the external authentication settings and <code>computer1.example.com</code> in the certificate, the connection fails, even if <code>computer1.example.com</code> has an IP address of <code>10.10.10.250</code>. Changing the name of the server in the external authentication settings to <code>computer1.example.com</code> causes the connection to succeed.</td>
</tr>
<tr>
<td>SSL Certificate Upload Path</td>
<td>Indicates the path on your local computer to the certificate to be used for encryption.</td>
<td><code>c:/server.crt</code></td>
</tr>
<tr>
<td>Setting</td>
<td>Description</td>
<td>Examples</td>
</tr>
<tr>
<td>-------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| User Name Template      | Indicates how user names entered on login should be formatted, by mapping the string conversion character (%) to the value of the **UI Access Attribute** for the user. The user name template is the format for the distinguished name used for authentication. When a user enters a user name into the login page, the appliance substitutes the name for the string conversion character and uses the resulting distinguished name to search for the user credentials.  
If you want to use this object for CAC authentication and authorization, you **must** enter a **User Name Template**. | %s@security.example.com,  
%s@mail.com,  
%s@mil,  
%s@smil.mil, |
| Timeout                 | Sets a timeout for the connection attempt to the primary server, so the connection rolls over to the backup server. If the number of seconds indicated in this field (or the timeout on the LDAP server) elapses without a response from the primary authentication server, the appliance then queries the backup server.  
However, if LDAP is running on the port of the primary LDAP server and for some reason refuses to service the request, the failover to the backup server does not occur.                                                                                                     | If the primary server has LDAP disabled, the appliance queries the backup server. |
Configuring LDAP-Specific Parameters

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI Access Attribute</td>
<td>Tells the local appliance to match the value of a specific attribute rather than the value of the user distinguished name. You can use any attribute, if the value of the attribute is a valid user name for the Firepower System web interface. If one of the objects has a matching user name and password, the user login request is authenticated. Selecting a server type and setting defaults prepopulates the UI Access Attribute with a value typically appropriate for that type of server. If you leave this field blank, the local appliance checks the user distinguished name value for each user record on the LDAP server to see if it matches the user name. If you want to use this object for CAC authentication and authorization, you must enter a value that corresponds with your User Name Template value.</td>
<td>sAMAccountName, userPrincipalName, mail</td>
</tr>
</tbody>
</table>

The settings in the LDAP-specific parameters section determine the area of the LDAP directory where the appliance searches for user names, and control details of how the appliance connects to the LDAP server.

Valid user names are unique, and can include underscores (_), periods (.), hyphens (-), and alphanumeric characters.

In addition for most LDAP-specific settings, you can use LDAP naming standards and filter and attribute syntax. For more information, see the RFCs listed in the Lightweight Directory Access Protocol (v3): Technical Specification, RFC 3377. Examples of syntax are provided throughout this procedure. Note that when you set up an authentication object to connect to a Microsoft Active Directory Server, you can use the address specification syntax documented in the Internet RFC 822 (Standard for the Format of ARPA Internet Text Messages) specification when referencing a user name that contains a domain. For example, to refer to a user object, you might enter JoeSmith@security.example.com rather than the equivalent user distinguished name of cn=JoeSmith,ou=security, dc=example, dc=com when using Microsoft Active Directory Server.

**Note**

If you are configuring an LDAP authentication object for use with CAC authentication, do **not** remove the CAC inserted in your computer. You **must** have a CAC inserted at all times after enabling user certificates.
## Configuring LDAP-Specific Parameters

### Procedure

**Step 1** In the **LDAP-Specific Parameters** section of the Create External Authentication Object page, you have two options for setting the base DN:

- Click **Fetch DNs**, and choose the appropriate base distinguished name from the drop-down list.
- Enter the base distinguished name for the LDAP directory you want to access in the **Base DN** field. For example, to authenticate names in the Security organization at the Example company, enter `ou=security,dc=example,dc=com`.

**Step 2** Optionally, enter a **Base Filter**.

**Example:**
For example, if the user objects in a directory tree have a `physicalDeliveryOfficeName` attribute and users in the New York office have an attribute value of `NewYork` for that attribute, to retrieve only users in the New York office, enter `(physicalDeliveryOfficeName=NewYork)`.

**Step 3** Enter a distinguished name as the **User Name** and the **Password** for a user who has sufficient credentials to browse the LDAP server.

**Example:**
For example, if you are connecting to an OpenLDAP server where user objects have a `uid` attribute and the object for the administrator in the Security division at our example company has a `uid` value of `NetworkAdmin`, you might enter `uid=NetworkAdmin,ou=security,dc=example,dc=com`.

**Caution** If you are connecting to a Microsoft Active Directory Server, you cannot provide a server user name that ends with the $ character.

**Step 4** Re-enter the password in the **Confirm Password** field.

**Step 5** After you configure the basic LDAP-specific parameters, you have several options:

- To access advanced options, click the arrow next to **Show Advanced Options** and continue with the next step.
- If you want to configure user default roles based on LDAP group membership, continue with **Configuring Access Rights by Group**, on page 92.
- If you are not using LDAP groups for authentication, continue with **Configuring LDAP Shell Access**, on page 94.

**Step 6** Choose an **Encryption** mode for your LDAP connection.

**Note** Note that if you change the encryption method after specifying a port, you reset the port to the default value for that method. For none or TLS, the port uses the default value of 389. If you choose SSL encryption, the port uses the default of 636.

**Step 7** If you choose TLS or SSL encryption and you want to use a certificate to authenticate, **Browse** to the location of a valid TLS or SSL certificate.

**Note** If you previously uploaded a certificate and want to replace it, upload the new certificate and redeploy the configuration to your appliances to copy over the new certificate.

**Step 8** Optionally, provide a **User Name Template** that corresponds with your **UI Access Attribute**.

**Example:**
For example, to authenticate all users who work in the Security organization of our example company by connecting to an OpenLDAP server where the UI access attribute is \texttt{uid}, you might enter \texttt{uid=$s,ou=security,dc=example,dc=com} in the \textit{User Name Template} field. For a Microsoft Active Directory server, you could enter \texttt{$s@security.example.com}.

\textbf{Note} If you want to use CAC credentials for authentication and authorization, you \textbf{must} enter a value in the \textit{User Name Template} field.

\textbf{Step 9} Optionally, in the \textbf{Timeout} field, enter the number of seconds that should elapse before rolling over to the backup connection.

\textbf{Step 10} Optionally, to retrieve users based on an attribute instead of the Base DN and Base Filter, you have two options:

\begin{itemize}
  \item Click \textbf{Fetch Attrs} to retrieve a list of available attributes, and choose the appropriate attribute.
  \item Enter a \textbf{UI Access Attribute}. For example, on a Microsoft Active Directory Server, you may want to use the UI Access Attribute to retrieve users, because there may not be a \texttt{uid} attribute on Active Directory Server user objects. Instead, you can search the \texttt{userPrincipalName} attribute by typing \texttt{userPrincipalName} in the \textit{UI Access Attribute} field.
\end{itemize}

\textbf{Note} If you want to use CAC credentials for authentication and authorization, you \textbf{must} enter a value in the \textit{UI Access Attribute} field.

\textbf{What to do next}

\begin{itemize}
  \item Continue creating your LDAP authentication object as described in \textit{Creating Advanced LDAP Authentication Objects}, on page 81.
\end{itemize}

\section*{LDAP Group Fields}

Any group you reference must exist on the LDAP server. You can reference static LDAP groups or dynamic LDAP groups. Static LDAP groups are groups where membership is determined by group object attributes that point to specific users, and dynamic LDAP groups are groups where membership is determined by creating an LDAP search that retrieves group users based on user object attributes. Group access rights for a role only affect users who are members of the group.

The access rights granted when a user logs into the Firepower System depend on the LDAP configuration:

\begin{itemize}
  \item If no group access rights are configured for your LDAP server, when a new user logs in, the Firepower System authenticates the user against the LDAP server and then grants user rights based on the default minimum access role set in the platform settings policy.
  \item If you configure any group settings, new users belonging to specified groups inherit the minimum access setting for the groups where they are members.
  \item If a new user does not belong to any specified groups, the user is assigned the default minimum access role specified in the Group Controlled Access Roles section of the authentication object.
  \item If a user belongs to more than one configured group, the user receives the access role for the group with the highest access as a minimum access role.
\end{itemize}

You cannot use the Firepower System user management page to remove the minimum access rights for users assigned an access role because of LDAP group membership. You can, however, assign additional rights.
When you modify the access rights for an externally authenticated user, the Authentication Method column on the User Management page provides a status of **External - Locally Modified**.

**Note**

If you use a dynamic group, the LDAP query is used exactly as it is configured on the LDAP server. For this reason, the Firepower System limits the number of recursions of a search to four to prevent search syntax errors from causing infinite loops. If a user’s group membership is not established in those recursions, the default access role defined in the Group Controlled Access Roles section is granted to the user.

**Firepower System User Roles**

The distinguished names for the LDAP groups that contain users who should be assigned each user role.

**Default User Role**

The default minimum access role for users that do not belong to any of the specified groups.

**Group Member Attribute**

The LDAP attribute that contains the LDAP search string in a static group.

**Group Member URL Attribute**

The LDAP attribute that designates membership in a dynamic group.

### Configuring Access Rights by Group

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If you prefer to base default access rights on a user’s membership in an LDAP group, you can specify distinguished names for existing groups on your LDAP server for each of the access roles used by your Firepower System. When you do so, you can configure a default access setting for those users detected by LDAP that do not belong to any specified groups. When a user logs in, the Firepower System dynamically checks the LDAP server and assigns default access rights according to the user’s current group membership.

If you do not configure a user’s privileges using group-controlled access roles, a user has only the privileges granted by default in the platform settings policy.

If you plan to use an object for CAC authentication and authorization, Cisco recommends configuring LDAP groups to manage access role assignments for CAC-authenticated users.

**Note**

If you are configuring an LDAP authentication object for use with CAC authentication, do not remove the CAC inserted in your computer. You must have a CAC inserted at all times after enabling user certificates.

**Before you begin**

- Confirm that the group you plan to reference exists on the LDAP server.
Procedure

Step 1
On the Create External Authentication Object page, click the down arrow next to Group Controlled Access Roles.

Step 2
Optionally, in the DN fields that correspond to Firepower System user roles, enter the distinguished name for the LDAP groups that contain users who should be assigned to those roles.

Example:
For example, you might enter the following in the Administrator field to authenticate names in the information technology organization at the Example company:

cn=itgroup,ou=groups, dc=example,dc=com

Step 3
Choose a Default User Role.

Step 4
If you use static groups, enter a Group Member Attribute.

Example:
For example, if the member attribute is used to indicate membership in the static group you reference for default Security Analyst access, enter member.

Step 5
If you use dynamic groups, enter a Group Member URL Attribute.

Example:
For example, if the memberURL attribute contains the LDAP search that retrieves members for the dynamic group you specified for default Admin access, enter memberURL.

What to do next
• Continue creating your LDAP authentication object as described in Creating Advanced LDAP Authentication Objects, on page 81.

LDAP Shell Access Fields

With the exception of the admin account, shell access is controlled entirely though the shell access attribute you set. The shell access filter you set determines which set of users on the LDAP server can log into the shell.

Note that a home directory for each shell user is created on login, and when an LDAP shell access user account is disabled (by disabling the LDAP connection), the directory remains, but the user shell is set to /bin/false in /etc/password to disable the shell. If the user then is re-enabled, the shell is reset, using the same home directory.

Shell users can log in using user names with lowercase, uppercase, or mixed case letters. Login authentication for the shell is case sensitive.

Shell Access Attribute

The access attribute you want to use for filtering. You can use any attribute if the value of the attribute is a valid user name for shell access.

If you leave this field blank, the user distinguished name is used for shell access authentication.
Selecting a server type and setting defaults prepopulates this field with an attribute typically appropriate for that type of server.

**Shell Access Filter**

The attribute value you want to use to retrieve administrative user entries for shell access. The filter is an attribute name, a comparison operator, and the attribute value.

The **Same as Base Filter** check box allows you to search more efficiently if all users qualified in the base DN are also qualified for shell access privileges. Normally, the LDAP query to retrieve users combines the base filter with the shell access filter. If the shell access filter was the same as the base filter, the same query runs twice, which is unnecessarily time-consuming. You can use the **Same as Base Filter** option to run the query only once for both purposes.

If you leave this field blank, you prevent LDAP authentication of shell access.

### Configuring LDAP Shell Access

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can use the LDAP server to authenticate accounts for shell access on your managed device or Firepower Management Center. Specify a search filter that retrieves entries for users you want to grant shell access.

You **cannot** configure CAC authentication and authorization and shell access in the same authentication object. Instead, create and enable separate authentication objects.

The authentication object for shell access must be the first authentication object on the Firepower Management Center.

Cisco does not support external authentication for NGIPSv devices or ASA FirePOWER devices. In addition, IPv6 is not supported for shell access authentication.

**Caution**

On all appliances, users with shell access (whether obtained through external authentication or through using the CLI **expert** command) have **sudoers** privileges in the shell, which can present a security risk. If you establish external authentication, make sure that you restrict the list of users with shell access appropriately.

Similarly, when granting CLI access privileges, restrict the list of users with **Configuration** level access. Cisco strongly recommends that you do not establish additional shell users on the Firepower Management Center.

You **cannot** configure CAC authentication and authorization and shell access in the same authentication object. Checking the **CAC** check box disables the shell access configuration options on the page. Instead, create and enable separate authentication objects.

**Before you begin**

- Remove any internally-authenticated CLI or shell users that have the same user name as externally-authenticated users included in your shell access filter.
Procedure

**Step 1** On the Create External Authentication Object page, if you want to use a shell access attribute other than the user distinguished type a **Shell Access Attribute**.

**Example:**
For example, on a Microsoft Active Directory Server, use the `sAMAccountName` shell access attribute to retrieve shell access users by typing `sAMAccountName` in the **Shell Access Attribute** field.

**Step 2** Set a shell access account filter. You have multiple options:

- To retrieve administrative user entries based on attribute value, enter the attribute name, a comparison operator, and the attribute value you want to use as a filter, enclosed in parentheses, in the **Shell Access Filter** field. For example, if all network administrators have a `manager` attribute which has an attribute value of `shell`, you can set a base filter of `(manager=shell)`.
- To use the same filter you specified when configuring authentication settings, choose **Same as Base Filter**.
- To prevent LDAP authentication of shell access, leave the field blank.

---

**What to do next**

- Continue creating your LDAP authentication object as described in Creating Advanced LDAP Authentication Objects, on page 81.

### Testing LDAP Authentication Connections

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

After you configure LDAP server and authentication settings, you can specify user credentials for a user who should be able to authenticate to test those settings.

For the **User Name**, you can enter the value for the `uid` attribute for the user you want to test with. If you are connecting to a Microsoft Active Directory Server and supplied a UI access attribute in place of `uid`, use the value for that attribute as the user name. You can also specify a fully qualified distinguished name for the user.

Use the **Password** for the same user.

The test output lists valid and invalid user names. Valid user names are unique, and can include underscores (`_`), periods (`.`), hyphens (`-`), and alphanumeric characters.

Note that testing the connection to servers with more than 1000 users only returns 1000 users because of web interface page size limitations.

**Tip**
If you mistype the name or password of the test user, the test fails even if the server configuration is correct. Test the server configuration without the additional test parameters first. If that succeeds supply a user name and password to test with the specific user.
Procedure

Step 1  On the Add External Authentication Object page, enter a **User Name** and **Password**.

**Example:**

For example, to test to see if you can retrieve the JSmith user credentials at the Example company, enter JSmith and password.

Step 2  Click **Test**. You have two options:

- If the test succeeds, the test output appears at the bottom of the page. Click **Save**.
- If the test fails, see Troubleshooting LDAP Authentication Connections, on page 96 for suggestions for troubleshooting the connection.

**Troubleshooting LDAP Authentication Connections**

If you create an LDAP authentication object and it either does not succeed in connecting to the server you select, or does not retrieve the list of users you want, you can tune the settings in the object.

If the connection fails when you test it, try the following suggestions to troubleshoot your configuration:

- Use the messages displayed at the top of the screen and in the test output to determine which areas of the object are causing the issue.
- Check that the user name and password you used for the object are valid:
  - Check that the user has the rights to browse to the directory indicated in your base distinguished name by connecting to the LDAP server using a third-party LDAP browser.
  - Check that the user name is unique to the directory information tree for the LDAP server.
  - If you see an LDAP bind error 49 in the test output, the user binding for the user failed. Try authenticating to the server through a third-party application to see if the binding fails through that connection as well.
- Check that you have correctly identified the server:
  - Check that the server IP address or host name is correct.
  - Check that you have TCP/IP access from your local appliance to the authentication server where you want to connect.
  - Check that access to the server is not blocked by a firewall and that the port you have configured in the object is open.
  - If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used for the server.
  - Check that you have not used an IPv6 address for the server connection if you are authenticating shell access.
  - If you used server type defaults, check that you have the correct server type and click **Set Defaults** again to reset the default values.
• If you typed in your base distinguished name, click **Fetch DNs** to retrieve all the available base distinguished names on the server, and select the name from the list.

• If you are using any filters, access attributes, or advanced settings, check that each is valid and typed correctly.

• If you are using any filters, access attributes, or advanced settings, try removing each setting and testing the object without it.

• If you are using a base filter or a shell access filter, make sure that the filter is enclosed in parentheses and that you are using a valid comparison operator.

• To test a more restricted base filter, try setting it to the base distinguished name for the user to retrieve just that user.

• If you are using an encrypted connection:
  • Check that the name of the LDAP server in the certificate matches the host name that you use to connect.
  • Check that you have not used an IPv6 address with an encrypted server connection.

• If you are using a test user, make sure that the user name and password are typed correctly.

• If you are using a test user, remove the user credentials and test the object.

• Test the query you are using by connecting to the LDAP server via the command line on the appliance you want to connect from using this syntax:

```bash
ldapsearch -x -b 'base_distinguished_name'
-h LDAPserver_ip_address -p port -v -D
'user_distinguished_name' -W 'base_filter'
```

For example, if you are trying to connect to the security domain on `myrtle.example.com` using the `domainadmin@myrtle.example.com` user and a base filter of `(cn=*)`, you could test the connection using this statement:

```bash
ldapsearch -x -b 'CN=security,DC=myrtle,DC=example,DC=com'
-h myrtle.example.com -p 389 -v -D
'domainadmin@myrtle.example.com' -W '(cn=*)'
```

If you can test your connection successfully but authentication does not work after you deploy a platform settings policy, check that authentication and the object you want to use are both enabled in the platform settings policy that is applied to the appliance.

If you connect successfully but want to adjust the list of users retrieved by your connection, you can add or change a base filter or shell access filter or use a more restrictive or less restrictive base DN.

### RADIUS Authentication

The Remote Authentication Dial In User Service (RADIUS) is an authentication protocol used to authenticate, authorize, and account for user access to network resources. You can create an authentication object for any RADIUS server that conforms to RFC 2865.
When a user authenticated on a RADIUS server logs in for the first time, the user receives the roles specified for that user in the authentication object. If the user is not listed for any of the user roles, they receive the default access role you selected in the authentication object. If no default access role is selected in the authentication object, they receive the default access role set in the platform settings policy. You can modify a user’s roles, if needed, unless the settings are granted through the user lists in the authentication object. Note that when a user authenticated on a RADIUS server using attribute matching attempts to log in for the first time, the login is rejected as the user account is created. The user must log in a second time.

---

**Note**

Before enabling external authentication on 7000 or 8000 Series devices, remove any internally-authenticated CLI users that have the same user name as externally-authenticated users included in your shell access filter.

The Firepower System implementation of RADIUS supports the use of SecurID® tokens. When you configure authentication by a server using SecurID, users authenticated against that server append the SecurID token to the end of their SecurID PIN and use that as their password when they log into a Cisco system. As long as SecurID is configured correctly to authenticate users outside the Firepower System, those users can log into a Firepower Management Center or 7000 or 8000 Series device using their PIN plus the SecurID token without any additional configuration.

### Creating RADIUS Authentication Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you create a RADIUS authentication object, you define settings that let you connect to an authentication server. You also grant user roles to specific and default users. If your RADIUS server returns custom attributes for any users you plan to authenticate, you must define those custom attributes. Optionally, you can also configure CLI or shell access authentication.

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.

**Before you begin**

- Confirm that you have TCP/IP access from your local appliance to the authentication server where you want to connect.

**Procedure**

1. Choose System > Users.
2. Click the External Authentication tab.
3. Click Add External Authentication Object.
4. Choose RADIUS from the Authentication Method drop-down list.
5. Identify the authentication server as described in Configuring RADIUS Connection Settings, on page 100.
6. Configure user roles as described in Configuring RADIUS User Roles, on page 102.
7. Optionally, configure shell access as described in Configuring RADIUS Shell Access, on page 103.
Step 8
Optionally, define custom attributes as described in Defining Custom RADIUS Attributes, on page 104.

Step 9
Test your configuration as described in Testing RADIUS Authentication Connections, on page 105.

Example

The following figure illustrates a sample RADIUS login authentication object for a server running FreeRADIUS with an IP address of 10.10.10.98. Note that the connection uses port 1812 for access, and note that connections to the server time out after 30 seconds of disuse, then retry three times before attempting to connect to a backup authentication server.

This example illustrates important aspects of RADIUS user role configuration:

Users ewharton and gsand are granted administrative access to appliances where this authentication object is enabled.

The user cbronte is granted Maintenance User access to appliances where this authentication object is enabled.

The user jausten is granted Security Analyst access to appliances where this authentication object is enabled.

The user ewharton can log into the appliance using a shell account.

The following graphic depicts the role configuration for the example:
You can use an attribute-value pair to identify users who should receive a particular user role. If the attribute you use is a custom attribute, you must define the custom attribute.

The following figure illustrates the role configuration and custom attribute definition in a sample RADIUS login authentication object for the same FreeRADIUS server as in the previous example.

In this example, however, the **MS-RAS-Version** custom attribute is returned for one or more of the users because a Microsoft remote access server is in use. Note the **MS-RAS-Version** custom attribute is a string. In this example, all users logging in to RADIUS through a Microsoft v. 5.00 remote access server should receive the Security Analyst (Read Only) role, so you enter the attribute-value pair of **MS-RAS-Version=MSRASV5.00** in the Security Analyst (Read Only) field.

---

### Configuring RADIUS Connection Settings

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>
When you create a RADIUS authentication object, you first specify the primary and backup server and server port where you want the local appliance (managed device or Firepower Management Center) to connect for authentication.

**Note**  
For RADIUS to function correctly, you must open its authentication and accounting ports (by default, 1812 and 1813) on your firewall.

If you specify a backup authentication server, you can set a timeout for the connection attempt to the primary server. If the number of seconds indicated in the **Timeout** field (or the timeout on the LDAP server) elapses without a response from the primary authentication server, the appliance then re-queries the primary server.

After the appliance re-queries the primary authentication server the number of times indicated by the **Retries** field and the number of seconds indicated in the **Timeout** field again elapses without a response from the primary authentication server, the appliance then rolls over to the backup server.

If, for example, the primary server has RADIUS disabled, the appliance queries the backup server. If RADIUS is running on the port of the primary RADIUS server and for some reason refuses to service the request (due to misconfiguration or other issues), however, the failover to the backup server does not occur.

**Procedure**

**Step 1**  
Choose **System > Users**.

**Step 2**  
Click the **External Authentication** tab.

**Step 3**  
Click **Create External > Authentication Object**.

**Step 4**  
Choose **RADIUS** from the **Authentication Method** drop-down list.

**Step 5**  
Enter a **Name** and **Description** for the authentication server.

**Step 6**  
Enter the IP address or host name for the primary RADIUS server where you want to obtain authentication data in the **Primary Server Host Name/IP Address** field.

**Note**  
IPv6 addresses are not supported for shell authentication. To allow shell authentication when using an IPv6 address for your primary RADIUS server, set up an authentication object using an IPv4 address for the server and use that IPv4 object as the first authentication object on the Firepower Management Center.

**Step 7**  
Optionally, modify the port used by the primary RADIUS authentication server in the **Primary Server Port** field.

**Note**  
If your authentication port and accounting port numbers are not sequential, leave this field blank. The system then determines RADIUS port numbers from the `radius` and `radacct` data in your appliance’s `/etc/services` file.

**Step 8**  
Enter the **RADIUS Secret Key** for the primary RADIUS authentication server.

**Step 9**  
Optionally, enter the IP address or host name for the backup RADIUS authentication server where you want to obtain authentication data in the **Backup Server Host Name/IP Address** field.

**Step 10**  
If you set a backup server, modify the **Backup Server Port**, **RADIUS Secret Key**, and **Timeout** and enter the number of times the primary server connection should be tried before rolling over to the backup connection in the **Retries** field.
If your authentication port and accounting port numbers are not sequential, leave this field blank. The system then determines RADIUS port numbers from the `radius` and `radacct` data in your appliance’s `/etc/services` file.

---

**Note**

---

**What to do next**

- Continue creating your RADIUS authentication object as described in Creating RADIUS Authentication Objects, on page 98.

### Configuring RADIUS User Roles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When a user logs in, the Firepower System checks the RADIUS server and grants access rights depending on the RADIUS configuration:

- If specific access rights are not configured for a user and a default access role is not specified, when a new user logs in, the Firepower System authenticates the user against the RADIUS server and then grants user rights based on the default access role (or roles) set in the platform settings policy.
- If a new user is not specified on any lists and default access roles are specified in the Default User Role list of the authentication object, the user is assigned those access roles.
- If you add a user to the list for one or more specific role, that user receives all assigned access roles.

You can also use attribute-value pairs, rather than user names, to identify users who should receive a particular user role. For example, if you know all users who should be Security Analysts have the value `Analyst` for their `User-Category` attribute, you can enter `User-Category=Analyst` in the Security Analyst List field to grant that role to those users.

You can assign a default user role (or roles) to be assigned to any users that are authenticated externally but not listed for a specific role. You can specify multiple roles in the Default User Role list.

You cannot remove the minimum access rights for users assigned an access role because of RADIUS user list membership through the Firepower System user management page. You can, however, assign additional rights.

---

**Caution**

If you want to change the minimum access setting for a user, you must not only move the user from one list to another in the RADIUS Specific Parameters section or change the user’s attribute on the RADIUS server, you must redeploy the configuration to the managed device and remove the assigned user right on the user management page.

---

**Before you begin**

- Define custom attributes if you plan to use them to set user role membership, as described in Defining Custom RADIUS Attributes, on page 104.
Procedure

Step 1
On the Create External Authentication Object page, in the fields that correspond to Firepower System user roles, enter the name of each user or identifying attribute-value pair that should be assigned to those roles. Separate usernames and attribute-value pairs with commas.

Example:
For example, to grant the Administrator role to the users jsmith and jdoe, enter jsmith, jdoe in the Administrator field. As another example, to grant the Maintenance User role to all users with a User-Category value of Maintenance, enter User-Category=Maintenance in the Maintenance User field.

Step 2
Choose the default minimum access role for users that do not belong to any of the specified groups from the Default User Role list.

What to do next
• Continue creating your RADIUS authentication object as described in Creating RADIUS Authentication Objects, on page 98.

Configuring RADIUS Shell Access

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can also use the RADIUS server to authenticate accounts for CLI or shell access on your local appliance (managed device or Firepower Management Center). Specify user names for users you want to grant CLI or shell access.

Note

IPv6 addresses are not supported for shell authentication. If you configure a primary RADIUS server with an IPv6 address and also configure administrative shell access, the shell access settings are ignored. To allow shell authentication when using an IPv6 address for your primary RADIUS server, set up another authentication object using an IPv4 address for the server and use that object as the first authentication object on the Firepower Management Center.

With the exception of the admin account, the shell access list you set on the RADIUS authentication object entirely controls CLI or shell access on the appliance. CLI or shell users are configured as local users on the appliance when you deploy the platform settings policy. Note that when a user authenticated on a RADIUS server using attribute matching attempts to log in for the first time, the login is rejected as the user account is created. The user must log in a second time.

Note that a home directory for each CLI or shell user is created on login, and when an RADIUS shell access user account is disabled (by disabling the RADIUS connection), the directory remains, but the user shell is set to /bin/false in /etc/password to disable the shell. If the user then is re-enabled, the shell is reset, using the same home directory.

CLI or shell users can log in using user names with lowercase, uppercase, or mixed case letters. Login authentication for the CLI or shell is case sensitive.
Caution

On all appliances, users with shell access (whether obtained through external authentication or through using the CLI `expert` command) have `sudoers` privileges in the shell, which can present a security risk. If you establish external authentication, make sure that you restrict the list of users with shell access appropriately. Similarly, when granting CLI access privileges, restrict the list of users with `Configuration` level access. Cisco strongly recommends that you do not establish additional shell users on the Firepower Management Center.

Procedure

On the Create External Authentication Object page, enter the user names, separated by commas, in the **Administrator Shell Access User List** field.

**Note** If you choose not to specify a shell access filter, a warning displays when you save the authentication object to confirm that you meant to leave the filter blank.

What to do next

- Continue creating your RADIUS authentication object as described in Creating RADIUS Authentication Objects, on page 98.

Defining Custom RADIUS Attributes

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If your RADIUS server returns values for attributes not included in the `dictionary` file in `/etc/radiusclient/` and you plan to use those attributes to set user roles for users with those attributes, you need to define those attributes in the login authentication object. You can locate the attributes returned for a user by looking at the user’s profile on your RADIUS server.

When you define an attribute, you provide the name of the attribute, which consists of alphanumeric characters. Note that words in an attribute name should be separated by dashes rather than spaces. You also provide the attribute ID, which should be an integer and should not conflict with any existing attribute IDs in the `etc/radiusclient/dictionary` file. You also specify the type of attribute: string, IP address, integer, or date.

When you create a RADIUS authentication object, a new dictionary file for that object is created on the appliance in the `/var/sf/userauth` directory. Any custom attributes you add to the authentication object are added to the dictionary file.

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.
Procedure

Step 1 On the Add External Authentication Object page, click the arrow to expand the Define Custom RADIUS Attributes section.

Step 2 Enter an attribute name in the Attribute Name field.

Step 3 Enter the attribute ID, in integer form, in the Attribute ID field.

Step 4 Choose the type of attribute from the Attribute Type drop-down list.

Step 5 Click Add to add the custom attribute to the authentication object.

Tip You can remove a custom attribute from an authentication object by clicking Delete next to the attribute.

Example

If a RADIUS server is used on a network with a Cisco router, you might want to use the Ascend-Assign-IP-Pool attribute to grant a specific role to all users logging in from a specific IP address pool. Ascend-Assign-IP-Pool is an integer attribute that defines the address pool where the user is allowed to log in, with the integer indicating the number of the assigned IP address pool.

To declare that custom attribute, you create a custom attribute with an attribute name of Ascend-IP-Pool-Definition, an attribute ID of 218, and an attribute type of integer.

You could then enter Ascend-Assign-IP-Pool=2 in the Security Analyst (Read Only) field to grant read-only security analyst rights to all users with an Ascend-IP-Pool-Definition attribute value of 2.

What to do next

- Continue creating your RADIUS authentication object as described in Creating RADIUS Authentication Objects, on page 98.

Testing RADIUS Authentication Connections

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

After you configure RADIUS connection, user role, and custom attribute settings, you can specify user credentials for a user who should be able to authenticate to test those settings.

For the user name, you can enter the user name for the user you want to test with.

Note that testing the connection to servers with more than 1000 users only returns 1000 users because of UI page size limitations.
If you mistype the name or password of the test user, the test fails even if the server configuration is correct. To verify that the server configuration is correct, click **Test** without entering user information in the **Additional Test Parameters** field first. If that succeeds, supply a user name and password to test with the specific user.

**Procedure**

**Step 1**  
On the Add External Authentication Object page, in the **User Name** and **Password** fields, enter the user name and password for the user whose credentials should be used to validate access to the RADIUS server.

**Example:**  
For example, to test to see if you can retrieve the **jsmith** user credentials at our example company, enter **jsmith**.

**Step 2**  
Choose **Show Details**, and click **Test**.

**Step 3**  
If the test succeeds, click **Save**.

### Single Sign-on (SSO)

Single sign-on (SSO) enables integration between Cisco Security Manager (CSM) Version 4.7 or higher and the Firepower Management Center, which allows you to access the Firepower Management Center from CSM without additional authentication to log in. When managing an ASA FirePOWER module, you may want to modify the policies deployed to the module. You can select the managing Firepower Management Center in CSM and launch it in a web browser.

If you have access based on your user role, the system navigates you to the Device tab of the Device Management page for the device you cross-launched from in CSM. Otherwise, the system navigates you to the Summary Dashboard page (**Overview** > **Dashboards**), except for user accounts with no dashboard access, which use the Welcome page.

**Note**  
You cannot login with single sign-on if your organization uses CACs for authentication.

### Related Topics

- Security Certifications Compliance

### Configuring SSO

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>ASA FirePOWER</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You must set up a one-way, encrypted authentication path from CSM to the Firepower Management Center before you configure Single sign-on.
In NAT environments, the Firepower Management Center and CSM must reside on the same side of the NAT boundary. You must provide specific criteria to enable communications between CSM and the Firepower Management Center.

**Note**
You cannot login with single sign-on if your organization uses CACs for authentication.

**Procedure**

**Step 1**  
From CSM, generate an SSO shared encryption key that identifies the connection. See your CSM documentation for more information.

**Step 2**  
From the Firepower Management Center, choose **System > Users**.

**Step 3**  
Choose **CSM Single Sign-on**.

**Step 4**  
Enter the **CSM hostname** or **IP address** and the server **Port**.

**Step 5**  
Enter the **Shared key** that you generated from CSM.

**Step 6**  
Optionally, if you want to use the Firepower Management Center’s proxy server to communicate with CSM, choose the **Use Proxy For Connection** check box.

**Step 7**  
Click **Submit**.

**Step 8**  
Click **Confirm Certificate** to save the Certificate.  
You can now log in from CSM to the Firepower Management Center without an additional login.
Configuring SSO
Licensing the Firepower System

The Licensing chapter of the Firepower Management Center Configuration Guide provides in-depth information about the different license types, service subscriptions, licensing requirements and more. The chapter also provides procedures and requirements for deploying Smart and classic licenses and licensing for air-gapped solutions.

The following topics explain how to license the Firepower System.

- About Firepower Licenses, on page 109
- License Requirements for Firepower Management Center, on page 110
- Evaluation License Caveats, on page 110
- Smart vs. Classic Licenses, on page 110
- License Firepower Threat Defense Devices (FTD), on page 111
- License Classic Devices (Firepower 7000/8000 Series, ASA FirePOWER, and NGIPSv), on page 128
- How to Convert a Classic License for Use on an FTD Device, on page 137
- Assign Licenses to Managed Devices from the Device Management Page, on page 138
- License Expiration, on page 140
- Additional Information about Firepower Licensing, on page 142

About Firepower Licenses

Your Firepower products (Firepower Management Center and managed devices) include licenses for basic operation, but some features require separate licensing or service subscriptions, as described in this chapter.

A "right-to-use" license does not expire, but service subscriptions require periodic renewal.

The type of license your products require (Smart or Classic) depends on the software you use, not on the hardware it runs on.

Note

"NGFW" means different things to different people, so this documentation does not use this term.
License Requirements for Firepower Management Center

Firepower Management Center allows you to assign licenses to managed devices and manage licenses for the system.

A single Firepower Management Center can manage both devices that require Classic licenses and devices that require Smart Licenses.

**Hardware FMC**

A hardware Firepower Management Center does not require purchase of additional licenses or service subscriptions in order to manage devices.

**Virtual FMC**

Firepower Management Center Virtual has additional licensing requirements. See Firepower Management Center Virtual Licenses, on page 110.

Firepower Management Center Virtual Licenses

Generally, Firepower Management Center Virtual requires a license entitlement for each device that it will manage.

If an FMCv manages Firepower Threat Defense devices that are configured in a high availability pair, you still need one entitlement for each device (*not* one entitlement for the pair.)

This entitlement appears in Cisco Smart Software Manager as **Firepower MCv Device License** with different numbers of entitlements.

Evaluation License Caveats

Not all functionality is available with an evaluation license, functionality under an evaluation license may be partial, and transition from evaluation licensing to standard licensing may not be seamless.

For example, if you have Firepower Threat Defense devices configured in a cluster, and you switch from an evaluation license to Smart Licensing, service will be interrupted when you deploy the change.

Review information about evaluation license caveats in information about particular features in this Licensing chapter and in the chapters related to deploying each feature.

Smart vs. Classic Licenses

For managed devices, the licenses you need (Smart or Classic) depend on the software that runs on the device.

Any FMC can simultaneously manage devices with Smart and Classic licenses. You must configure each type of licensing separately.
### License Firepower Threat Defense Devices (FTD)

Firepower Threat Defense devices require Smart Licensing.

Cisco Smart Licensing lets you purchase and manage a pool of licenses centrally. Unlike product authorization key (PAK) licenses, Smart Licenses are not tied to a specific serial number or license key. Smart Licensing lets you assess your license usage and needs at a glance.

In addition, Smart Licensing does not prevent you from using product features that you have not yet purchased. You can start using a license immediately, as long as you are registered with the Cisco Smart Software Manager, and purchase the license later. This allows you to deploy and use a feature, and avoid delays due to purchase order approval.

### Smart Software Manager (CSSM)

When you purchase one or more Smart Licenses for Firepower features, you manage them in the Cisco Smart Software Manager: [http://www.cisco.com/web/ordering/smart-software-manager/index.html](http://www.cisco.com/web/ordering/smart-software-manager/index.html). The Smart Software Manager lets you create a master account for your organization.

By default, your licenses are assigned to the Default Virtual Account under your master account. As the account administrator, you can create additional virtual accounts; for example, for regions, departments, or subsidiaries. Multiple virtual accounts help you manage large numbers of licenses and appliances.

You manage licenses and appliances by virtual account. Only that virtual account’s appliances can use the licenses assigned to the account. If you need additional licenses, you can transfer an unused license from another virtual account. You can also transfer appliances between virtual accounts.
For each virtual account, you can create a Product Instance Registration Token. Enter this token ID when you deploy each Firepower Management Center, or when you register an existing FMC. You can create a new token if an existing token expires. An expired token does not affect a registered FMC that used this token for registration, but you cannot use an expired token to register a FMC. Also, a registered FMC becomes associated with a virtual account based on the token you use.

For more information about the Cisco Smart Software Manager, see Cisco Smart Software Manager User Guide or https://www.cisco.com/c/en/us/buy/smart-accounts/software-manager.html or the online help in CSSM, also available from: https://www.cisco.com/web/fw/softwareworkspace/smartlicensing/SSMCompiledHelps/.

Periodic Communication with the License Authority

In order to maintain your product license entitlement, your product must communicate periodically with the Cisco License Authority.

When you use a Product Instance Registration Token to register a Firepower Management Center, the appliance registers with the Cisco License Authority. The License Authority issues an ID certificate for communication between the Firepower Management Center and the License Authority. This certificate is valid for one year, although it will be renewed every six months. If an ID certificate expires (usually in nine months or a year with no communication), the Firepower Management Center reverts to a deregistered state and licensed features usage become suspended.

The Firepower Management Center communicates with the License Authority on a periodic basis. If you make changes in the Smart Software Manager, you can refresh the authorization on the Firepower Management Center so the changes immediately take effect. You also can wait for the appliance to communicate as scheduled.

Your Firepower Management Center must have either direct Internet access to the License Authority through the Cisco Smart Software Manager or access through the Smart Software Satellite Server at scheduled time periods. Normal license communication occurs every 30 days, but with the grace period, your appliance will operate for up to 90 days without calling home. You must contact the License Authority before 90 days have passed.

Optionally, you can configure a Smart Software Satellite Server to serve as a proxy for communicating with the License Authority. For information, see Smart Software Satellite Server Overview, on page 121.

Service Subscriptions for FTD Features

Some features require a service subscription.

A service subscription enables a specific Firepower feature on a managed device for a set length of time. Service subscriptions can be purchased in one-, three-, or five-year terms. If a subscription expires, Cisco notifies you that you must renew the subscription. If a subscription expires for a Firepower Threat Defense device, you can continue to use the related features.

</table>
Your purchase of a managed device that uses Smart Licenses automatically includes a Base license. This license is perpetual and enables system updates. All service subscriptions are optional for Firepower Threat Defense devices.

### FTD License Types and Restrictions

This section describes the types of Smart Licenses available in a Firepower System deployment. The Firepower Management Center requires Smart Licenses to manage Firepower Threat Defense devices.

The following table summarizes Firepower System Smart Licenses:

<table>
<thead>
<tr>
<th>License You Assign in Firepower System</th>
<th>Subscription You Purchase</th>
<th>Duration</th>
<th>Granted Capabilities</th>
</tr>
</thead>
</table>
| Base                                   | No subscription required (license is included with device) | Perpetual | User and application control
Switching and routing
NAT
For details, see [Base Licenses](#), on page 114. |
| Threat                                 | • T
• TC (Threat + URL)
• TMC (Threat + Malware + URL) | Term-based | Intrusion detection and prevention
File control
Security Intelligence filtering
For details, see [Threat Licenses](#), on page 115 |
| Malware                                | • TM (Threat + Malware)
• TMC (Threat + Malware + URL)
• AMP | Term-based | AMP for Networks (network-based Advanced Malware Protection)
Cisco Threat Grid
File storage
For details, see [Malware Licenses for Firepower Threat Defense Devices](#), on page 114 and [License Requirements for File and Malware Policies](#), on page 1324. |
<table>
<thead>

<td></td>
<td></td>
<td>For details, see Firepower Management Center Virtual Licenses, on page 110.</td>
</tr>
<tr>
<td>Export-Controlled Features</td>
<td>No subscription required.</td>
<td>Perpetual</td>
<td>Features that are subject to national security, foreign policy, and anti-terrorism laws and regulations; see Licensing for Export-Controlled Functionality, on page 116.</td>
</tr>
</tbody>
</table>

**Base Licenses**

A base license is automatically included with every purchase of a Firepower Threat Defense or Firepower Threat Defense Virtual device.

The Base license allows you to:

- configure your FTD devices to perform switching and routing (including DHCP relay and NAT)
- configure FTD devices as a high availability pair
- configure security modules as a cluster within a Firepower 9300 chassis (intra-chassis clustering)
- configure Firepower 9300 or Firepower 4100 series devices running Firepower Threat Defense as a cluster (inter-chassis clustering)
- implement user and application control by adding user and application conditions to access control rules

Threat and malware detection and URL filtering features require additional, optional licenses.

Base licenses are automatically added to the Firepower Management Center for every Firepower Threat Defense device you register.

**Malware Licenses for Firepower Threat Defense Devices**

A Malware license for Firepower Threat Defense devices allows you to perform Cisco Advanced Malware Protection (AMP) with AMP for Networks and Cisco Threat Grid. With this feature, you can use Firepower Threat Defense devices to detect and block malware in files transmitted over your network. To support this feature license, you can purchase the Malware (AMP) service subscription as a stand-alone subscription or in combination with Threat (TM) or Threat and URL Filtering (TMC) subscriptions.
Firepower Threat Defense managed devices with Malware licenses enabled periodically attempt to connect to the AMP cloud even if you have not configured dynamic analysis. Because of this, the device’s Interface Traffic dashboard widget shows transmitted traffic; this is expected behavior.

You configure AMP for Networks as part of a file policy, which you then associate with one or more access control rules. File policies can detect your users uploading or downloading files of specific types over specific application protocols. AMP for Networks allows you to use local malware analysis and file preclassification to inspect a restricted set of those file types for malware. You can also download and submit specific file types to the Cisco Threat Grid cloud for dynamic and Spero analysis to determine whether they contain malware. For these files, you can view the network file trajectory, which details the path the file has taken through your network. The Malware license also allows you to add specific files to a file list and enable the file list within a file policy, allowing those files to be automatically allowed or blocked on detection.

If you disable all your Malware licenses, the system stops querying the AMP cloud, and also stops acknowledging retrospective events sent from the AMP cloud. You cannot re-deploy existing access control policies if they include AMP for Networks configurations. Note that for a very brief time after a Malware license is disabled, the system can use existing cached file dispositions. After the time window expires, the system assigns a disposition of Unavailable to those files.

Note that a Malware license is required only if you deploy AMP for Networks and Cisco Threat Grid. Without a Malware license, the Firepower Management Center can receive AMP for Endpoints malware events and indications of compromise (IOC) from the AMP cloud.

See also important information at License Requirements for File and Malware Policies, on page 1324.

### Threat Licenses

A Threat license allows you to perform intrusion detection and prevention, file control, and Security Intelligence filtering:

- **Intrusion detection and prevention** allows you to analyze network traffic for intrusions and exploits and, optionally, drop offending packets.

- **File control** allows you to detect and, optionally, block users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols. **AMP for Networks**, which requires a Malware license, allows you to inspect and block a restricted set of those file types based on their dispositions.

- **Security Intelligence filtering** allows you to blacklist—deny traffic to and from—specific IP addresses, URLs, and DNS domain names, before the traffic is subjected to analysis by access control rules. Dynamic feeds allow you to immediately blacklist connections based on the latest intelligence. Optionally, you can use a “monitor-only” setting for Security Intelligence filtering.

You can purchase a Threat license as a stand-alone subscription (T) or in combination with URL Filtering (TC), Malware (TM), or both (TMC).

If you disable Threat on managed devices, the Firepower Management Center stops acknowledging intrusion and file events from the affected devices. As a consequence, correlation rules that use those events as a trigger criteria stop firing. Additionally, the Firepower Management Center will not contact the internet for either Cisco-provided or third-party Security Intelligence information. You cannot re-deploy existing intrusion policies until you re-enable Threat.
URL Filtering Licenses for Firepower Threat Defense Devices

The URL Filtering license allows you to write access control rules that determine the traffic that can traverse your network based on URLs requested by monitored hosts, correlated with information about those URLs. To support this feature license, you can purchase the URL Filtering (URL) service subscription as a stand-alone subscription or in combination with Threat (TC) or Threat and Malware (TMC) subscriptions.

Without a URL Filtering license, you can specify individual URLs or groups of URLs to allow or block. This gives you granular, custom control over web traffic, but does not allow you to use URL category and reputation data to filter network traffic.

Although you can add category and reputation-based URL conditions to access control rules without a URL Filtering license, the Firepower Management Center will not download URL information. You cannot deploy the access control policy until you first add a URL Filtering license to the Firepower Management Center, then enable it on the devices targeted by the policy.

If you disable the URL Filtering license on managed devices, you may lose access to URL filtering. If your license expires or if you disable it, access control rules with URL conditions immediately stop filtering URLs, and your Firepower Management Center can no longer download updates to URL data. You cannot re-deploy existing access control policies if they include rules with category and reputation-based URL conditions.

Licensing for Export-Controlled Functionality

Features that require export-controlled functionality

Certain software features are subject to national security, foreign policy, and anti-terrorism laws and regulations. These export-controlled features include:

- Site to Site VPN with strong encryption
- SSH platform policy with strong encryption
- SSL policy with strong encryption
- Functionality such as SNMPv3 with strong encryption

How to determine whether export-controlled functionality is currently enabled for your system

To determine whether export-controlled functionality is currently enabled for your system: Go to System > Licenses > Smart Licenses and see if Export-Controlled Features displays Enabled.

About enabling export-controlled functionality

If Export-Controlled Features shows Disabled and you want to use features that require strong encryption:

- If there is no option to enable export-controlled functionality when you generate a new Product Instance Registration Token in Cisco Smart Software Manager (CSSM):
  
  Your Smart Account is not authorized to use this functionality.

- If the option to use export-controlled functionality appears when you generate a new Product Instance Registration Token in Cisco Smart Software Manager:
In order to use export-controlled functionality, your Smart Account must be enabled for this functionality before you license your Firepower Management Center.

After export-controlled functionality is enabled for your Smart Account in Cisco Smart Software Manager (CSSM), you must re-register your Firepower Management Center using a new Product Instance Registration Token.

When you create the new Product Instance Registration Token, you must select the option “Allow export-controlled functionality on the products registered with this token.” This option is enabled by default if this functionality is permitted for your Smart Account.

After you install a token with export-controlled functionality on your Firepower Management Center and assign the relevant licenses to managed Firepower Threat Defense devices:

- Reboot each device to make the newly-enabled features available.
- In a high availability deployment, the active and standby devices must be rebooted together to avoid an Active-Active condition.

More Information

Licensing for FTD Clusters
In addition to information in this Licensing chapter, see:

- Licenses for Clustering, on page 651
- FMC: Add a Cluster, on page 657.

Create a Smart Account to Hold Your Licenses
A Smart Account is required for Smart Licenses and can also hold Classic licenses.
You should set up this account before you purchase Smart Licenses.

Before you begin
Your account representative or reseller may have set up a Smart Account on your behalf. If so, obtain the necessary information to access the account from that person instead of using this procedure, then verify that you can access the account.

For general information about Smart Accounts, see http://www.cisco.com/go/smartaccounts.

Procedure

Step 1 Request a Smart Account:
For additional information, see https://communities.cisco.com/docs/DOC-57261.

**Step 2** Wait for an email telling you that your Smart Account is ready to set up. When it arrives, click the link it contains, as directed.

**Step 3** Set up your Smart Account:

**Step 4** Verify that you can access the account in the Cisco Smart Software Manager (CSSM).
- Go to https://software.cisco.com/#module/SmartLicensing and sign in.

## How to Configure Smart Licensing with Direct Internet Access

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat</td>
<td>Global only</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Defense</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Procedure

**Step 1** Obtain a token from the Cisco Smart Software Manager licensing portal.
See Obtain a Product License Registration Token for Smart Licensing, on page 119.

**Step 2** Register your Firepower Management Center with the Smart licensing portal.
See Register Smart Licenses, on page 120. Be sure to address the prerequisites in this topic.

**Step 3** Verify that your FMC registered successfully with the Smart licensing portal.
In the Firepower Management Center web interface, go to **System > Licenses > Smart Licenses**. **Product Registration** should show a green checkmark.

**Step 4** If you have not yet done so, add devices to your FMC.
See Add Devices to the Firepower Management Center, on page 228.

**Step 5** Assign licenses to the devices that are managed by your FMC.
See Assign Licenses to Multiple Managed Devices, on page 123.

**Step 6** Verify that licenses are successfully installed.
See View FTD Licenses and License Status, on page 124.
What to do next

If applicable, set up licensing for high-availability and clustered deployments.

Obtain a Product License Registration Token for Smart Licensing

Before you begin

• Create a Smart Account, if you have not already done so: Visit https://software.cisco.com/smartaccounts/setup#accountcreation-account. For information, see https://www.cisco.com/c/en/us/buy/smart-accounts.html.

• Ensure that you have purchased the type and number of licenses you require.

• Verify that the licenses you need appear in your Smart Account.

  If your licenses do not appear in your Smart Account, ask the person who ordered them (for example, your Cisco sales representative or authorized reseller) to transfer those licenses to your Smart Account.

• Ideally, check the prerequisites for Register Smart Licenses, on page 120 to ensure that your registration process goes smoothly.

• Make sure you have your credentials to sign in to the Cisco Smart Software Manager.

Procedure

Step 1 Go to https://software.cisco.com.
Step 2 Click Smart Software Licensing (in the License section.)
Step 3 Sign in to the Cisco Smart Software Manager.
Step 4 Click Inventory.
Step 5 Click General.
Step 6 Click New Token.
Step 7 For Description, enter a name that uniquely and clearly identifies the Firepower Management Center for which you will use this token.
Step 8 Enter an expiration time within 365 days.

  This determines how much time you have to register the token to a Firepower Management Center. (Your license entitlement term is independent of this setting but may start to count down even if you have not yet registered your token.)

Step 9 If you see an option to enable export-controlled functionality, and you plan to use features that require strong encryption, select this option.

  Important If you see this option, you must select it now if you plan to use this functionality. You cannot enable export-controlled functionality later.

  If you do not see this option but you expect to, cancel out of this procedure now and contact your Cisco account representative.

Step 10 Click Create Token.
Step 11 Locate your new token in the list and click Actions, then choose Copy or Download.
### Step 12
If necessary, save your token in a safe place until you are ready to enter it into your Firepower Management Center.

#### What to do next
Continue with the steps in Register Smart Licenses, on page 120.

## Register Smart Licenses

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Register the Firepower Management Center with the Cisco Smart Software Manager.

### Before you begin
- If you are using a Smart Software Satellite Server, do not use this procedure. Instead, see Configure the Connection to a Smart Software Satellite Server, on page 122.
- Ensure that the Firepower Management Center can reach the Cisco Smart Software Manager (CSSM) server at tools.cisco.com:443.
- Make sure the NTP daemon is running on your Firepower Management Center. During registration, a key exchange occurs between the NTP server and the Cisco Smart Software Manager, so time must be in sync for proper registration.
  
  If you are deploying FTD on a Firepower 4100/9300 chassis, you must configure NTP on the Firepower chassis using the same NTP server for the chassis as for the Firepower Management Center.
- If your organization has multiple Firepower Management Center appliances, make sure each FMC has a unique name that clearly identifies and distinguishes it from other Firepower Management Center appliances that may be registered to the same virtual account. This name is critical for managing your Smart License entitlements and ambiguous names will lead to problems later.
- Generate the necessary product license registration token from the Cisco Smart Software Manager. See Obtain a Product License Registration Token for Smart Licensing, on page 119, including all prerequisites. Make sure the token is accessible from the machine from which you will access your Firepower Management Center.

### Procedure

1. **Step 1** Choose System > Licenses > Smart Licenses.
2. **Step 2** Click Register.
3. **Step 3** Paste the token you generated from Cisco Smart Software Manager into the Product Instance Registration Token field.

Make sure there are no empty spaces or blank lines at the beginning or end of the text.
Step 4  
Click Apply Changes.

What to do next

- Add your Firepower Threat Defense devices to the Firepower Management Center; see Add Devices to the Firepower Management Center, on page 228.
- Assign licenses to your Firepower Threat Defense devices; see Assign Licenses to Multiple Managed Devices, on page 123.

**Smart Software Satellite Server Overview**

As described in Periodic Communication with the License Authority, on page 112, your system must communicate regularly with Cisco to maintain your license entitlement. If you have one of the following situations, you might want to use a Smart Software Satellite Server as a proxy for connections to the License Authority:

- Your Firepower Management Center is offline or otherwise has limited or no connectivity (in other words, is deployed in an air-gapped network.)
- Your Firepower Management Center has permanent connectivity, but you want to manage your Smart Licenses via a single connection from your network.

The Smart Software Satellite Server allows you to schedule synchronization or manually synchronize Smart License authorization with the Smart Software Manager.

**How to Deploy a Smart Software Satellite Server**

**Procedure**

**Step 1**  
Deploy and set up a Smart Software Satellite Server.

**Step 2**  
Connect the Firepower Management Center to the satellite, obtain a registration token, and register the management center to the satellite.
See Configure the Connection to a Smart Software Satellite Server, on page 122.

**Step 3**  
Add devices to be managed.
See Add Devices to the Firepower Management Center, on page 228.

**Step 4**  
Assign licenses to managed devices
See Assign Licenses to Multiple Managed Devices, on page 123

**Step 5**  
Synchronize the satellite to the Cisco Smart Software Management Server (CSSM).
See the Smart Software Manager Satellite User Guide you used above.

**Step 6** Schedule ongoing synchronization times.

---

### Configure the Connection to a Smart Software Satellite Server

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Before you begin**

- Set up a Smart Software Satellite Server. For information, see [How to Deploy a Smart Software Satellite Server](#), on page 121.

- Make a note of the CN of the TLS/SSL certificate on your Satellite server.

- Verify that your FMC can reach your Smart Software Satellite Server. For example, verify that the FQDN configured as the satellite server call-home URL can be resolved by your internal DNS server.

- Go to [http://www.cisco.com/security/pki/certs/clrca.cer](http://www.cisco.com/security/pki/certs/clrca.cer) and copy the entire body of the TLS/SSL certificate (from "-----BEGIN CERTIFICATE-----" to "-----END CERTIFICATE-----") into a place you can access during configuration.

**Procedure**

**Step 1** Choose **System > Integration**.

**Step 2** Click **Smart Software Satellite**.

**Step 3** Select **Connect to Cisco Smart Software Satellite Server**.

**Step 4** Enter the **URL** of your Smart Software Satellite Server, using the CN value you collected in the prerequisites of this procedure, in the following format:

```
https://FQDN_or_hostname_of_Satellite/Transportgateway/services/DeviceRequestHandler
```

The FQDN or hostname must match the CN value of the certificate presented by the satellite.

**Step 5** Add a new **SSL Certificate** and paste the certificate text that you copied in the prerequisites for this procedure.

**Step 6** Click **Apply**.

**Step 7** Select **System > Licenses > Smart Licenses** and click **Register**.

**Step 8** Create a new token on the Smart Satellite Server.

**Step 9** Copy the token.

**Step 10** Paste the token into the form on the management center page.

**Step 11** Click **Apply Changes**.

The management center is now registered to the Smart Software Satellite Server.
Assign Licenses to Multiple Managed Devices

<table>
<thead>
<tr>
<th>License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smart: Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Global only</td>
<td>Admin</td>
</tr>
<tr>
<td>Specific: Any</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Devices managed by a Firepower Management Center obtain their licenses via the Firepower Management Center, not directly from the Cisco Smart Software Manager.

Use this procedure to enable licensing on multiple Firepower Threat Defense devices at once.

**Before you begin**

- If you have not yet done so, register your devices with the Firepower Management Center. See Add Devices to the Firepower Management Center, on page 228.
- Prepare licenses for distribution to managed devices: See Register Smart Licenses, on page 120

**Procedure**

**Step 1** Choose **System > Licenses > Smart Licenses**.

**Step 2** Click **Edit Licenses**.

**Step 3** For each type of license you want to add to a device:

a) Click the tab for that type of license.
b) Click a device in the list on the left.
c) Click **Add** to move that device to the list on the right.
d) Repeat for each device to receive that type of license.

For now, don't worry about whether you have licenses for all of the devices you want to add.

e) Repeat this subprocedure for each type of license you want to add.
f) Click **Apply**.

**What to do next**

- Verify that your licenses are correctly installed. Follow the procedure in View FTD Licenses and License Status, on page 124.
• If export-controlled functionality is newly enabled, reboot each device. If devices are configured in a high-availability pair, reboot both devices at the same time to avoid an Active-Active condition.

• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

View FTD Licenses and License Status

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

To view the license status for a Firepower Management Center and its managed Firepower Threat Defense devices, use the Smart Licenses page in FMC.

For each type of license in your deployment, the page lists the total number of licenses consumed, whether the license is in compliance or out of compliance, the device type, and the domain and group where the device is deployed. You can also view the Firepower Management Center's Smart License Status.

Other than the Smart Licenses page, there are a few other ways you can view licenses:

• The Product Licensing dashboard widget provides an at-a-glance overview of your licenses.
  
  See Adding Widgets to a Dashboard, on page 265 and Dashboard Widget Availability by User Role, on page 253 and The Product Licensing Widget, on page 262.

• The Device Management page (Devices > Device Management) lists the licenses applied to each of your managed devices.

• The Smart License Monitor health module communicates license status when used in a health policy.

Procedure

**Step 1** Choose System > Licenses > Smart Licenses.

**Step 2** In the Smart Licenses table, click the arrow at the left side of each License Type folder to expand that folder.

**Step 3** In each folder, verify that each device has a green circle with a check mark in it ( Disorder) in the License Status column.

**Note** If you see duplicate Firepower Management Center Virtual licenses, each represents one managed device.

If all devices show a green circle with a check mark ( Disorder), your devices are properly licensed and ready to use.

If you see any License Status other than a green circle with a check mark ( Disorder), hover over the status icon to view the message.
What to do next

- If you had any devices that did NOT have a green circle with a check mark (✔️), you may need to purchase more licenses.

FTD License Status

Smart Licensing

The Smart License Status section of the System > Licenses > Smart Licenses page provides an overview of license usage on the Firepower Management Center, as described below.

Usage Authorization

Possible status values are:

- ✔️— All licenses assigned to managed devices are in compliance and the Firepower Management Center is communicating successfully with the Cisco licensing authority.
- ✗— Device licenses are in compliance, but the Firepower Management Center is not able to communicate with the Cisco licensing authority.
- ✗— One or more managed devices is using a license that is out of compliance, or the Firepower Management Center has not communicated with the Cisco licensing authority in more than 90 days.

Product Registration

Specifies the last date when the Firepower Management Center contacted the License Authority and registered.

Assigned Virtual Account

Specifies the Virtual Account under the Smart Account that you used to generate the Product Instance Registration Token and register the Firepower Management Center. If this deployment is not associated with a particular virtual account within your Smart Account, this information is not displayed.

Export-Controlled Features

If this option is enabled, you can deploy restricted features. For details, see Licensing for Export-Controlled Functionality, on page 116.

Move or Remove Licenses from FTD Devices

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Use this procedure to manage licenses for Firepower Threat Defense devices managed by an Firepower Management Center.

For example, you can move a license from one FTD device to another device registered to the same FMC, or to remove a license from a device.
If you remove (disable) a license for a device, you cannot use the features associated with that license on that device.

**Important**
If you need to move a license to a device managed by a different Firepower Management Center, see Transfer FTD Licenses to a Different Firepower Management Center, on page 126.

**Procedure**

**Step 1** Choose System > Licenses > Smart Licenses.

**Step 2** Click Edit Licenses.

**Step 3** Click either the Malware, Threat, or URL Filtering.

**Step 4** Choose the devices you want to license, then click Add, and/or click each device from which you want to remove a license and click the delete icon (🗑).

**Step 5** Click Apply.

**What to do next**
Deploy the changes to the managed devices.

**Transfer FTD Licenses to a Different Firepower Management Center**

When you register a Smart License to a Firepower Management Center, your virtual account allocates the license to the FMC. If you need to transfer your Smart Licenses to another Firepower Management Center, you must deregister the currently licensed FMC. This removes it from your virtual account and frees your existing licenses, so you can register the licenses to the new FMC. Otherwise, you cannot reuse these licenses, and you may receive an Out-of-Compliance notification because your virtual account does not have enough free licenses. For instructions, see Deregister a Firepower Management Center from the Cisco Smart Software Manager, on page 127.

Then you can register the licenses to the destination Firepower Management Center.

**If FTD License Status is Out of Compliance**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If the Usage Authorization status on the Smart Licenses page (System > Licenses > Smart Licenses) shows Out of Compliance, you must take action.
**Procedure**

**Step 1** Look at the Smart Licenses section at the bottom of the page to determine which licenses are needed.

**Step 2** Purchase the required licenses through your usual channels.

**Step 3** In Cisco Smart Software Manager (https://software.cisco.com/#SmartLicensing-Inventory), verify that the licenses appear in your virtual account.

If the expected licenses are not present, see Troubleshoot FTD Licensing, on page 128.

**Step 4** In Firepower Management Center, select System > Licenses > Smart Licenses.

**Step 5** Click Re-Authorize.

---

**Deregister a Firepower Management Center from the Cisco Smart Software Manager**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Deregister (unregister) your Firepower Management Center from the Cisco Smart Software Manager before you reinstall (reimage) the appliance, or if you need to release all of the license entitlements back to your Smart Account for any reason.

Deregistering removes the FMC from your virtual account. All license entitlements associated with the Firepower Management Center release back to your virtual account. After deregistration, the Firepower Management Center enters Enforcement mode where no update or changes on licensed features are allowed.

If you need to remove the licenses from a subset of managed Firepower Threat Defense devices, see Assign Licenses to Multiple Managed Devices, on page 123 or Assign Licenses to Managed Devices from the Device Management Page, on page 138.

**Procedure**

**Step 1** Choose System > Licenses > Smart Licenses.

**Step 2** Click deregister (●).
If you make changes in the Cisco Smart Software Manager, you can refresh the authorization on the Firepower Management Center so the changes immediately take effect.

**Procedure**

**Step 1** Choose **System > Licenses > Smart Licenses**.

**Step 2** Click refresh ( ![refresh icon](image)).

---

**Troubleshoot FTD Licensing**

**Expected Licenses Do Not Appear in My Smart Account**

If the licenses you expect to see are not in your Smart Account, try the following:

- Make sure they are not in a different Virtual Account. Your organization's license administrator may need to assist you with this.

- Check with the person who sold you the licenses to be sure that transfer to your account is complete.

**Unable to Connect to Smart License Server**

Check the obvious causes first. For example, make sure your Firepower system has outside connectivity. See *Internet Access Requirements*, on page 2358.

**Unexpected Out-of-Compliance Notification or Other Error**

- If a device is already registered to a different FMC, you need to deregister the original FMC before you can license the device under a new FMC. See *Deregister a Firepower Management Center from the Cisco Smart Software Manager*, on page 127.

- Try synchronizing: *Synchronize a Firepower Management Center with the Cisco Smart Software Manager*, on page 127.

---

**License Classic Devices (Firepower 7000/8000 Series, ASA FirePOWER, and NGIPSv)**

7000 and 8000 Series and NGIPSv devices and ASA FirePOWER modules require Classic licenses. These devices are frequently referred to in this documentation as Classic devices.

---

**Important**

If you are running Firepower hardware but not Firepower software, see licensing information for the software product you are using. This documentation is not applicable.

Classic licenses require a product authorization key (PAK) to activate and are device-specific. Classic licensing is sometimes also referred to as "traditional licensing."
Product License Registration Portal

When you purchase one or more Classic licenses for Firepower features, you manage them in the Cisco Product License Registration Portal:

https://cisco.com/go/license

For more information on using this portal, see:

https://slexui.cloudapps.cisco.com/SWIFT/LicensingUI/Quickstart

You will need your account credentials in order to access these links.

Service Subscriptions for Firepower Features (Classic Licensing)

Some features require a service subscription.

A service subscription enables a specific Firepower feature on a managed device for a set length of time. Service subscriptions can be purchased in one-, three-, or five-year terms. If a subscription expires, Cisco notifies you that you must renew the subscription. If a subscription expires for a Classic device, you might not be able to use the related features, depending on the feature type.

<table>
<thead>
<tr>
<th>Subscription You Purchase</th>
<th>Classic Licenses You Assign in Firepower System</th>
</tr>
</thead>
<tbody>
<tr>
<td>TA</td>
<td>Control + Protection (a.k.a. &quot;Threat &amp; Apps,&quot; required for system updates)</td>
</tr>
<tr>
<td>TAC</td>
<td>Control + Protection + URL Filtering</td>
</tr>
<tr>
<td>TAM</td>
<td>Control + Protection + Malware</td>
</tr>
<tr>
<td>TAMC</td>
<td>Control + Protection + URL Filtering + Malware</td>
</tr>
<tr>
<td>URL</td>
<td>URL Filtering (add-on where TA is already present)</td>
</tr>
<tr>
<td>AMP</td>
<td>Malware (add-on where TA is already present)</td>
</tr>
</tbody>
</table>

Your purchase of a managed device that uses Classic licenses automatically includes Control and Protection licenses. These licenses are perpetual, but you must also purchase a TA service subscription to enable system updates. Service subscriptions for additional features are optional.

Classic License Types and Restrictions

This section describes the types of Classic licenses available in a Firepower System deployment. The licenses you can enable on a device depend on its model, version, and the other licenses enabled.

Licenses are model-specific for 7000 and 8000 Series and NGIPSv devices and for ASA FirePOWER modules. You cannot enable a license on a managed device unless the license exactly matches the device’s model. For example, you cannot use a Firepower 8250 Malware license (FP8250-TAM-LIC=) to enable Malware capabilities on an 8140 device; you must purchase a Firepower 8140 Malware license (FP8140-TAM-LIC=).
For NGIPSv or ASA FirePOWER, the Control license allows you to perform user and application control, but these devices do not support switching, routing, stacking, or 7000 and 8000 Series device high availability.

There are a few ways you may lose access to licensed features in the Firepower System:

- You can remove Classic licenses from the Firepower Management Center, which affects all of its managed devices.
- You can disable licensed capabilities on specific managed devices.

Though there are some exceptions, you cannot use the features associated with an expired or deleted license.

The following table summarizes Classic licenses in the Firepower System.

**Table 16: Firepower System Classic Licenses**

<table>
<thead>
<tr>
<th>License You Assign in Firepower System</th>

</tr>
</tbody>
</table>
### Protection Licenses

A Protection license allows you to perform intrusion detection and prevention, file control, and Security Intelligence filtering:

- **Intrusion detection and prevention** allows you to analyze network traffic for intrusions and exploits and, optionally, drop offending packets.

- **File control** allows you to detect and, optionally, block users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols. **AMP for Networks**, which requires a Malware license, allows you to inspect and block a restricted set of those file types based on their dispositions.

- **Security Intelligence filtering** allows you to blacklist—deny traffic to and from—specific IP addresses, URLs, and DNS domain names, before the traffic is subjected to analysis by access control rules. Dynamic feeds allow you to immediately blacklist connections based on the latest intelligence. Optionally, you can use a “monitor-only” setting for Security Intelligence filtering.

A Protection license (along with a Control license) is automatically included in the purchase of any Classic managed device. This license is perpetual, but you must also purchase a TA subscription to enable system updates.

Although you can configure an access control policy to perform Protection-related inspection without a license, you cannot deploy the policy until you first add a Protection license to the Firepower Management Center, then enable it on the devices targeted by the policy.

If you delete your Protection license from the Firepower Management Center or disable Protection on managed devices, the Firepower Management Center stops acknowledging intrusion and file events from the affected devices. As a consequence, correlation rules that use those events as a trigger criteria stop firing. Additionally, the Firepower Management Center will not contact the internet for either Cisco-provided or third-party Security Intelligence information. You cannot re-deploy existing policies until you re-enable Protection.

Because a Protection license is required for URL Filtering, Malware, and Control licenses, deleting or disabling a Protection license has the same effect as deleting or disabling your URL Filtering, Malware, or Control license.

### Control Licenses

A Control license allows you to implement user and application control by adding user and application conditions to access control rules. For 7000 and 8000 Series devices only, this license also allows you to configure switching and routing (including DHCP relay and NAT) and device high-availability pairs.
enable a Control license on a managed device, you must also enable a Protection license. A Control license is automatically included (along with a Protection license) in the purchase of any Classic managed device. This license is perpetual, but you must also purchase a TA subscription to enable system updates.

If you do not enable a Control license for a Classic managed device, you can add user and application conditions to rules in an access control policy, but you cannot deploy the policy to the device. If you do not enable a Control license for 7000 or 8000 Series devices specifically, you also cannot:

• create switched, routed, or hybrid interfaces
• create NAT entries
• configure DHCP relay for virtual routers
• deploy a device configuration that includes switch or routing to the device
• establish high availability between devices

Note

Although you can create virtual switches and routers without a Control license, they are not useful without switched and routed interfaces to populate them.

If you delete a Control license from the Firepower Management Center or disable Control on individual devices:

• The affected devices do not stop performing switching or routing, nor do device high-availability pairs break.
• You can continue to edit and delete existing configurations, but you cannot deploy those changes to the affected devices.
• You cannot add new switched, routed, or hybrid interfaces, nor can you add new NAT entries, configure DHCP relay, or establish 7000 or 8000 Series device high-availability.
• You cannot re-deploy existing access control policies if they include rules with user or application conditions.

URL Filtering Licenses for Classic Devices

URL filtering allows you to write access control rules that determine the traffic that can traverse your network based on URLs requested by monitored hosts, correlated with information about those URLs. To enable a URL Filtering license, you must also enable a Protection license. You can purchase a URL Filtering license for Classic devices as a services subscription combined with Threat & Apps (TAC) or Threat & Apps and Malware (TAMC) subscriptions, or as an add-on subscription (URL) for a system where Threat & Apps (TA) is already enabled.

Tip

Without a URL Filtering license, you can specify individual URLs or groups of URLs to allow or block. This gives you granular, custom control over web traffic, but does not allow you to use URL category and reputation data to filter network traffic.

Although you can add category and reputation-based URL conditions to access control rules without a URL Filtering license, the Firepower Management Center will not download URL information. You cannot deploy
the access control policy until you first add a URL Filtering license to the Firepower Management Center, then enable it on the devices targeted by the policy.

You may lose access to URL filtering if you delete the license from the Firepower Management Center or disable URL Filtering on managed devices. Also, URL Filtering licenses may expire. If your license expires or if you delete or disable it, access control rules with URL conditions immediately stop filtering URLs, and your Firepower Management Center can no longer download updates to URL data. You cannot re-deploy existing access control policies if they include rules with category and reputation-based URL conditions.

**Malware Licenses for Classic Devices**

A Malware license allows you to perform Cisco Advanced Malware Protection (AMP) with AMP for Networks and Cisco Threat Grid. You can use managed devices to detect and block malware in files transmitted over your network. To enable a Malware license, you must also enable Protection. You can purchase a Malware license as a subscription combined with Threat & Apps (TAM) or Threat & Apps and URL Filtering (TAMC) subscriptions, or as an add-on subscription (AMP) for a system where Threat & Apps (TA) is already enabled.

You configure AMP for Networks as part of a file policy, which you then associate with one or more access control rules. File policies can detect your users uploading or downloading files of specific types over specific application protocols. AMP for Networks allows you to use local malware analysis and file preclassification to inspect a restricted set of those file types for malware. You can also download and submit specific file types to the Cisco Threat Grid cloud for dynamic and Spero analysis to determine whether they contain malware. For these files, you can view the network file trajectory, which details the path the file has taken through your network. The Malware license also allows you to add specific files to a file list and enable the file list within a file policy, allowing those files to be automatically allowed or blocked on detection.

Before you can deploy an access control policy that includes AMP for Networks configurations, you **must** add a Malware license, then enable it on the devices targeted by the policy. If you later disable the license on the devices, you cannot re-deploy the existing access control policy to those devices.

If you delete all your Malware licenses or they all expire, the system stops querying the AMP cloud, and also stops acknowledging retrospective events sent from the AMP cloud. You cannot re-deploy existing access control policies if they include AMP for Networks configurations. Note that for a very brief time after a Malware license expires or is deleted, the system can use existing cached file dispositions. After the time window expires, the system assigns a disposition of **Unavailable** to those files.

A Malware license is required only if you deploy AMP for Networks and Cisco Threat Grid. Without a Malware license, the Firepower Management Center can receive AMP for Endpoints malware events and indications of compromise (IOC) from the AMP cloud.

See also important information at License Requirements for File and Malware Policies, on page 1324.

**VPN Licenses for 7000 and 8000 Series Devices**

VPN allows you to establish secure tunnels between endpoints via a public source, such as the Internet or other network. You can configure the Firepower System to build secure VPN tunnels between the virtual routers of 7000 and 8000 Series devices. To enable VPN, you must also enable Protection and Control licenses. To purchase a VPN license, contact Sales.
Without a VPN license, you cannot configure a VPN deployment with your 7000 and 8000 Series devices. Although you can create deployments, they are not useful without at least one VPN-enabled routed interface to populate them.

If you delete your VPN license from the Firepower Management Center or disable VPN on individual devices, the affected devices do not break the current VPN deployments. Although you can edit and delete existing deployments, you cannot deploy your changes to the affected devices.

**Classic Licenses in Device Stacks and High-Availability Pairs**

Individual devices must have equivalent licenses before they can be stacked or configured into 7000 or 8000 Series device high-availability pairs. After you stack devices, you can change the licenses for the entire stack. However, you cannot change the enabled licenses on a 7000 or 8000 Series device high-availability pair.

See also About Device Stacks, on page 513 and Device High Availability Requirements, on page 498.

**View Your Classic Licenses**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>Classic</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

Do one of the following, depending on your needs:

<table>
<thead>
<tr>
<th>To View</th>
<th>Do This</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Classic licenses that you have added to the Firepower Management Center and details including their type, status, usage, expiration dates, and the managed devices to which they are applied.</td>
<td>Choose <strong>System &gt; Licenses &gt; Classic Licenses</strong>. The summary shows the number of licenses you have purchased, followed by the number of licenses that are in used in parentheses.</td>
</tr>
<tr>
<td>The licenses applied to each of your managed devices</td>
<td>Choose <strong>Devices &gt; Device Management</strong>.</td>
</tr>
<tr>
<td>License status in the Health Monitor</td>
<td>Use the Classic License Monitor health module in a health policy. For information, see Health Monitoring, on page 273, including Health Modules, on page 274 and Creating Health Policies, on page 281.</td>
</tr>
<tr>
<td>An overview of your licenses in the Dashboard</td>
<td>Add the Product Licensing widget to the dashboard of your choice. For instructions, see The Product Licensing Widget, on page 262 and Adding Widgets to a Dashboard, on page 265 and Dashboard Widget Availability by User Role, on page 253.</td>
</tr>
</tbody>
</table>
Identify the License Key

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>Classic</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

The license key uniquely identifies the Firepower Management Center in the Cisco License Registration Portal. It is composed of a product code (for example, 66) and the MAC address of the management port (eth0) of the Firepower Management Center; for example, 66:00:00:77:FF:CC:88.

You will use the license key in the Cisco License Registration Portal to obtain the license text required to add licenses to the Firepower Management Center.

Procedure

Step 1
Choose System > Licenses > Classic Licenses.

Step 2
Click Add New License.

Step 3
Note the value in the License Key field at the top of the Add Feature License dialog.

What to do next

• Add a license to the Firepower Management Center; see Generate a Classic License and Add It to the Firepower Management Center, on page 135.

This procedure includes the process of generating the actual license text using the license key.

Generate a Classic License and Add It to the Firepower Management Center

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>Classic</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Note
If you add licenses after a backup has completed, these licenses will not be removed or overwritten if this backup is restored. To prevent a conflict on restore, remove those licenses before restoring the backup, noting where the licenses were used, and add and reconfigure them after restoring the backup. If a conflict occurs, contact Support.

Tip
You can also request licenses on the Licenses tab after you log into the Support Site.

Before you begin

• Make sure you have the product activation key (PAK) from the Software Claim Certificate that Cisco provided when you purchased the license. If you have a legacy, pre-Cisco license, contact Support.
• Identify the license key for the Firepower Management Center; see Identify the License Key, on page 135.

• You will need your account credentials to complete this procedure.

Procedure

Step 1  Choose System > Licenses > Classic Licenses.
Step 2  Click Add New License.
Step 3  Continue as appropriate:
  • If you have already obtained the license text, skip to Step 8.
  • If you still need to obtain the license text, go to the next step.
Step 4  Click Get License to open the Cisco License Registration Portal.

Note  If you cannot access the Internet using your current computer, switch to a computer that can, and browse to http://cisco.com/go/license.

Step 5  Generate a license from the PAK in the License Registration Portal.
This step requires the PAK you received during the purchase process, as well as the license key for the Firepower Management Center.

For information, see Product License Registration Portal, on page 129.

Step 6  Copy the license text from either the License Registration Portal display, or the email the License Registration Portal sends you.

Important  The licensing text block in the portal or email message may include more than one license. Each license is bounded by a BEGIN LICENSE line and an END LICENSE line. Make sure that you copy and paste only one license at a time.

Step 7  Return to the Add Feature License page in the Firepower Management Center’s web interface.
Step 8  Paste the license text into the License field.
Step 9  Click Verify License.

If the license is invalid, make sure that you correctly copied the license text.

Step 10  Click Submit License.

What to do next

• Assign the license to a managed device; see Assign Licenses to Managed Devices from the Device Management Page, on page 138. You must assign licenses to your managed devices before you can use licensed features on those devices.
How to Convert a Classic License for Use on an FTD Device

You can convert licenses using either the License Registration Portal (LRP) or the Cisco Smart Software Manager (CSSM), and you can convert an unused Product Authorization Key (PAK) or a Classic license that has already been assigned to a device.

Important

You cannot undo this process. You cannot convert a Smart License to a Classic license, even if the license was originally a Classic license.

In documentation on Cisco.com, Classic licenses may also be referred to as "traditional" licenses.

Before you begin

• It is easiest to convert a Classic license to a Smart License when it is still an unused PAK that has not yet been assigned to a product instance.

• You must have a Smart Account. If you do not have one, create one. See Create a Smart Account to Hold Your Licenses, on page 117.

• The PAKs or licenses that you want to convert must appear in your Smart Account.

• If you convert using the License Registration Portal instead of the Cisco Smart Software Manager, you must have your Smart Account credentials in order to initiate the conversion process.

Procedure

Step 1

The conversion process you will follow depends on whether or not the license has been consumed:

• If the PAK that you want to convert has never been used, follow instructions for converting a PAK.

• If the PAK you want to convert has already been assigned to a device, follow instructions for converting a Classic license.

Make sure your existing classic license is still registered to your device.

Step 2

See instructions for your type of conversion (PAK or installed Classic license) in the following documentation:

• To convert PAKs or licenses using the LRP:
  • To view a video that steps you through the License Registration Portal part of the conversion process, click https://salesconnect.cisco.com/#/content-detail/7da52358-0fc1-4d85-8920-14a1b7721780.
  • Search for "Convert" in the following document: https://cisco.app.box.com/s/mds3ab3fctk6pzonq5meukvcpjizt7wu.

There are three conversion procedures. Choose the conversion procedure applicable to your situation.
• Sign in to the License Registration Portal (LRP) at https://tools.cisco.com/SWIFT/LicensingUI/Home and follow the instructions in the documentation above.

• To convert PAKs or licenses using CSSM:
  - Converting Hybrid Licenses to Smart Software Licenses QRG:
  - Sign in to CSSM at https://software.cisco.com/#SmartLicensing-LicenseConversion and follow the instructions for your type of conversion (PAK or installed Classic license) in the documentation above.

**Step 3**  
Freshly install Firepower Threat Defense on your hardware.  

**Step 4**  
If you will use Firepower Device Manager to manage this device as a standalone device:  
Skip the rest of this procedure.

**Step 5**  
If you have already deployed Smart Licensing on your Firepower Management Center:  
a) Set up Smart Licensing on your new Firepower Threat Defense device.  
   See Assign Licenses to Multiple Managed Devices, on page 123.
   b) Verify that the new Smart License has been successfully applied to the device.  
   See View FTD Licenses and License Status, on page 124.

**Step 6**  
If you have not yet deployed Smart Licensing on your Firepower Management Center:  
See Register Smart Licenses, on page 120.

---

**Assign Licenses to Managed Devices from the Device Management Page**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

Although there are some exceptions, you cannot use the features associated with a license if you disable it on a managed device.
For an FTD cluster, you apply the licenses to the cluster as a whole; note that each unit in the cluster consumes a separate license per feature.

Before you begin
- Add your devices to the Firepower Management Center. See Add Devices to the Firepower Management Center, on page 228.
- If you will assign Smart Licenses:
  - If you need to apply Smart Licenses to many devices at one time, use the Smart Licenses page instead of following this procedure. See Assign Licenses to Multiple Managed Devices, on page 123
  - Prepare Smart Licenses for distribution to managed devices: See Register Smart Licenses, on page 120

Procedure

Step 1 Choose Devices > Device Management.

Step 2 Next to the device where you want to assign or disable a license, click edit (📝).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click Device.

Step 4 Next to the License section, click edit (✏️).

Step 5 Check or clear the appropriate check boxes to assign or disable licenses for the device.

Step 6 Click Save.

What to do next
- If you assigned Smart Licenses, verify license status:

  Go to System > Licenses > Smart Licenses, enter the hostname or IP address of the device into the filter at the top of the Smart Licenses table, and verify that only a green circle with a check mark (✔️) appears for each device, for each license type. If you see any other icon, hover over the icon for more information.

- Deploy configuration changes; see Deploy Configuration Changes, on page 337.

- If you are licensing Firepower Threat Defense devices and you applied a Base license with export-controlled functionality enabled, reboot each device. For devices configured in a high-availability pair, reboot both devices at the same time to avoid an Active-Active condition.
License Expiration

- License Expiration vs. Service Subscription Expiration
- Smart Licensing
- Classic Licensing
- Subscription Renewals

License Expiration vs. Service Subscription Expiration

Q. Do Firepower feature licenses expire?

Smart Licensing

Q. Can a Product Instance Registration Token expire?
A. A token can expire if it is not used to register a product within the specified validity period. You set the number of days that the token is valid when you create the token in the Cisco Smart Software Manager. If the token expires before you use it to register a Firepower Management Center, you must create a new token.

After you use the token to register a Firepower Management Center, the token expiration date is no longer relevant. When the token expiration date elapses, there is no impact on the Firepower Management Center that you used the token to register.

Token expiration dates do not affect subscription expiration dates.

For more information, see the Cisco Smart Software Manager User Guide.

Q. How can I tell if my Smart Licenses/service subscriptions are expired or about to expire?
A. To determine when a service subscription will expire (or when it expired), review your entitlements in the Cisco Smart Software Manager.

On the Firepower Management Center, you can determine whether a service subscription for a feature license is currently in compliance by choosing System > Licenses > Smart Licenses. On this page, a table summarizes the Smart License entitlements associated with this Firepower Management Center via its product registration token. You can determine whether the service subscription for the license is currently in compliance based on the License Status field.

On Firepower Device Manager, use the Smart License page to view the current license status for the system: Click Device, then click View Configuration in the Smart License summary.
In addition, the Cisco Smart Software Manager will send you a notification 3 months before a license expires.

**Q.** What happens if my Smart License/subscription expires?

**A.** If a purchased service subscription expires, you can see in Firepower Management Center and in your Smart Account that your account is out of compliance. Cisco notifies you that you must renew the subscription; see Subscription Renewals. There is no other impact.

### Classic Licensing

**Q.** How can I tell if my Classic licenses/service subscriptions are expired or about to expire?

**A.** On the Firepower Management Center, choose **System > Licenses > Classic Licenses**.

On this page, a table summarizes the Classic licenses you have added to this Firepower Management Center.

You can determine whether the service subscription for the license is currently in compliance based on the **Status** field.

You can determine when the service subscription will expire (or when it expired) by the date in the **Expires** field.

You can also obtain this information by reviewing your license information in the Cisco Product License Registration Portal.

**Q.** What does this mean: 'IPS Term Subscription is still required for IPS'?

**A.** This message merely informs you that Protect and Control functionality requires not only a right-to-use license (which never expires), but also one or more associated service subscriptions, which must be renewed periodically. If the service subscriptions you want to use are current and will not expire soon, no action is required.

**Q.** What happens if my Classic license/subscription expires?

**A.** If a service subscription supporting a Classic license expires, Cisco notifies you that you must renew the subscription; see Subscription Renewals.

You might not be able to use the related features, depending on the feature type:

**Table 17: Expiration Impact for Classic Licenses/Subscriptions**

<table>

</thead>
</table>
| URL Filtering   | URL, TAC, TAMC                    | • Access control rules with URL conditions immediately stop filtering URLs.  
|                 |                                   | • Other policies (such as SSL policies) that filter traffic based on URL category and reputation immediately stop doing so.  
|                 |                                   | • The Firepower Management Center can no longer download updates to URL data.  
|                 |                                   | • You cannot re-deploy existing policies that perform URL category and reputation filtering.  
| Malware         | AMP, TAM, TAMC                    | • For a very brief time, the system can use existing cached file dispositions. After the time window expires, the system assigns a disposition of Unavailable to those files.  
|                 |                                   | • The system stops querying the AMP cloud, and stops acknowledging retrospective events sent from the AMP cloud.  
|                 |                                   | • You cannot re-deploy existing access control policies if they include AMP for Firepower configurations.  

#### Subscription Renewals

**Q.** How do I renew an expiring Classic license?  
**A.** To renew an expiring Classic license, simply purchase a new PAK key and follow the same process as for implementing a new subscription.

**Q.** Can I renew a Firepower service subscription from the Firepower Management Center?  
**A.** No. To renew a Firepower service subscription (Classic or Smart), purchase a new subscription using either the Cisco Commerce Workspace or the Cisco Service Contract Center.

#### Additional Information about Firepower Licensing

For additional information to help resolve common licensing questions, see the following documents:

- The *Frequently Asked Questions (FAQ) about Firepower Licensing* document at:  

- The *Cisco Firepower System Feature Licenses* document at:  
System Software Updates

The following topics explain how to update Firepower deployments:

- About Firepower Updates, on page 143
- Guidelines and Limitations for Firepower Updates, on page 144
- Upgrade Firepower System Software, on page 144
- Update the Vulnerability Database (VDB) Manually, on page 145
- Update the Geolocation Database (GeoDB), on page 146
- Update Intrusion Rules, on page 149
- Maintain Your Air-Gapped Deployment, on page 159

About Firepower Updates

Cisco distributes several types of upgrades and updates for Firepower deployments. Unless otherwise documented in the release notes or advisory text, updating does not modify configurations. Note that you cannot uninstall major upgrades, nor can you return to previous versions of the VDB, GeoDB, or SRU.

Table 18: Firepower Upgrades and Updates

<table>
<thead>
<tr>
<th>Update Type</th>
<th>Description</th>
<th>Domain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Major upgrade</td>
<td>Includes new features and functionality, and may entail large-scale changes to the product. Can be <em>freshly</em> installed or restored, but not <em>un</em>installed. For devices where you upgrade the operating system separately, likely to have a companion operating system upgrade. May require you to re-accept the Cisco End User License Agreement (EULA)</td>
<td>Global only</td>
</tr>
<tr>
<td>Minor upgrade (patch)</td>
<td>Contains a limited range of fixes. Can be <em>un</em>installed, but not <em>freshly</em> installed or restored. You must restore to a major version, then upgrade to the minor version.</td>
<td>Global only</td>
</tr>
<tr>
<td>Vulnerability Database (VDB)</td>
<td>Updates detection of vulnerabilities, operating systems, applications, clients, and file types eligible for dynamic analysis.</td>
<td>Global only</td>
</tr>
</tbody>
</table>
### Guidelines and Limitations for Firepower Updates

#### Before You Update

Before you update any component of your Firepower deployment (including the VDB, GeoDB, or SRU) you must read the release notes or advisory text that accompanies the update. These provide critical and release-specific information, including compatibility, prerequisites, new capabilities, behavior changes, and warnings.

For details on how to prepare for and complete a successful system software upgrade of a Firepower Management Center deployment, see the [Cisco Firepower Management Center Upgrade Guide](https://www.cisco.com/c/en/us/support/docs/security/firepower-management-center/212043-Guidelines-for-Downloading-Data-from-the.html).

Updates configured using this feature are scheduled in UTC, which means when they occur locally depends on the date and your specific location. Also, because updates are scheduled in UTC, they do not adjust for Daylight Saving Time, summer time, or any such seasonal adjustments that you may observe in your location. If you are affected, scheduled updates occur one hour "later" in the summer than in the winter, according to local time.

---

**Important**

We strongly recommend you review scheduled updates to be sure they occur when you intend.

---

#### Bandwidth Guidelines

### Upgrade Firepower System Software

Upgrading a Firepower Management Center deployment can be complex process. Careful planning and preparation can help you avoid missteps. You should consider planning and preparation as much a part of the upgrade process as actually performing the mechanical steps that invoke the upgrade scripts.
The first step in the process is to assess your deployment and create an upgrade path—a detailed plan for which appliances you will upgrade, what components you will upgrade, and in what order. Your upgrade path should:

- Maintain manager-device compatibility.
- Include operating system and hosting environment upgrades where necessary.
- Include other tasks such as backups, package downloads, readiness checks, bandwidth and disk space checks, pre- and post-upgrade configuration changes, and so on.
- Identify potential interruptions in traffic flow and inspection.

For details on how to prepare for and complete a successful upgrade of a Firepower Management Center deployment, see Cisco Firepower Management Center Upgrade Guide.

## Update the Vulnerability Database (VDB) Manually

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

The Cisco vulnerability database (VDB) is a database of known vulnerabilities to which hosts may be susceptible, as well as fingerprints for operating systems, clients, and applications. The system uses the VDB to help determine whether a particular host increases your risk of compromise.

Cisco issues periodic updates to the VDB. The time it takes to update the VDB and its associated mappings on the Firepower Management Center depends on the number of hosts in your network map. As a rule of thumb, divide the number of hosts by 1000 to determine the approximate number of minutes to perform the update.

If the Firepower Management Center cannot access the internet, or you want to manually upload the VDB update to the Firepower Management Center, use this procedure. To automate VDB updates, use task scheduling (System > Tools > Scheduling). For details, see Vulnerability Database Update Automation, on page 196.

---

**Important**
If you do not schedule automatic VDB updates, you should regularly check for these updates. Updates occur no more than once daily and are posted to the appropriate child pages of https://www.cisco.com/go/firepower-software.

---

**Caution**
Installing a vulnerability database (VDB) update immediately restarts the Snort process on all managed devices. Additionally, the first deploy after installing the VDB might cause a Snort restart depending on the VDB content. In either scenario, the restart interrupts traffic inspection. Whether traffic drops during the interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 for more information.

**Before you begin**

Consider the update's effect on traffic flow and inspection due to Snort restarts. We recommend performing updates in a maintenance window.

**Procedure**

**Step 1** Choose System > Updates, then click Product Updates.

**Step 2** Choose how you want to upload the VDB update to the Firepower Management Center.

- Download directly from Cisco.com—Click Download Updates. If it can access the Cisco Support & Download site, the Firepower Management Center downloads the latest VDB. Note that the Firepower Management Center also downloads a package for each patch and hotfix (but not major release) associated with the version your appliances are currently running.
- Upload manually—Click Upload Update, then Choose File. Browse to the update you downloaded earlier, and click Upload.

VDB updates appear on the same page as Firepower software upgrade and uninstaller packages.

**Step 3** Install the update.

a) Click Install next to the Vulnerability and Fingerprint Database update.

b) Choose the Firepower Management Center.

c) Click Install.

**Step 4** (Optional) Monitor update progress in the Message Center.

Do not perform tasks related to mapped vulnerabilities until the update completes. Even if the Message Center shows no progress for several minutes or indicates that the update has failed, do not restart the update. Instead, contact Cisco TAC.

After the update completes and Snort restarts, the system uses the new vulnerability information. However, you must deploy before updated application detectors and operating system fingerprints can take effect.

**Step 5** (Optional) Monitor update progress in the Message Center.

Do not perform tasks related to mapped vulnerabilities until the update completes. Even if the Message Center shows no progress for several minutes or indicates that the update has failed, do not restart the update. Instead, contact Cisco TAC.

After the update completes and Snort restarts, the system uses the new vulnerability information. However, you must deploy before updated application detectors and operating system fingerprints can take effect.

**Step 6** Verify update success.

Choose Help > About to view the current VDB version.

**What to do next**

Deploy configuration changes; see Deploy Configuration Changes, on page 337.

---

**Update the Geolocation Database (GeoDB)**

The Cisco Geolocation Database (GeoDB) is a database of geographical data (such as country, city, coordinates) and connection-related data (such as Internet service provider, domain name, connection type) associated with
routable IP addresses. When your system detects GeoDB information that matches a detected IP address, you can view the geolocation information associated with that IP address. You must install the GeoDB on your system to view any geolocation details other than country or continent. Cisco issues periodic updates to the GeoDB.

To update the GeoDB, use the Geolocation Updates page (System > Updates > Geolocation Updates) on the Firepower Management Center. When you upload GeoDB updates you obtained from Support or from your appliance, they appear on this page.

---

**Note**

Download the update directly from the Support Site, either manually or by clicking **Download and install geolocation update from the Support Site** on the Geolocation Updates page. If you transfer an update file by email, it may become corrupted.

Time needed to update the GeoDB depends on your appliance; the installation usually takes 30 to 40 minutes. Although a GeoDB update does not interrupt any other system functions (including the ongoing collection of geolocation information), the update does consume system resources while it completes. Consider this when planning your updates.

The GeoDB update overrides any previous versions of the GeoDB and is effective immediately. When you update the GeoDB, the Firepower Management Center automatically updates the related data on its managed devices. It may take a few minutes for a GeoDB update to take effect throughout your deployment. You do not need to re-deploy after you update.

---

**Manually Update the GeoDB (Internet Connection)**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can import a new GeoDB update by automatically connecting to the Support Site only if the appliance has Internet access.

**Procedure**

1. **Step 1** Choose **System > Updates**.
2. **Step 2** Click **Geolocation Updates**.
3. **Step 3** Choose **Download and install geolocation update from the Support Site**.
4. **Step 4** Click **Import**.
The system queues a Geolocation Update task, which checks for the latest updates on the Cisco Support Site ([http://www.cisco.com/cisco/web/support/index.html](http://www.cisco.com/cisco/web/support/index.html)).
5. **Step 5** Optionally, monitor the task status; see Viewing Task Messages, on page 317.
6. **Step 6** After the update finishes, return to the Geolocation Updates page or choose **Help > About** to confirm that the GeoDB build number matches the update you installed.
Manually Update the GeoDB (No Internet Connection)

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If your Firepower Management Center does not have Internet access, you can download the GeoDB update from the Cisco Support Site to a local machine on your network, then manually upload it to your Firepower Management Center.

**Procedure**

Step 1
Manually download the update from the Cisco Support Site ([http://www.cisco.com/cisco/web/support/index.html](http://www.cisco.com/cisco/web/support/index.html)).

Step 2
Choose System > Updates.

Step 3
Click Geolocation Updates.

Step 4
Choose Upload and install geolocation update.

Step 5
Browse to the update you downloaded, and click Upload.

Step 6
Click Import.

Step 7
Optionally, monitor the task status; see Viewing Task Messages, on page 317.

Step 8
After the update finishes, return to the Geolocation Updates page or choose Help > About to confirm that the GeoDB build number matches the update you installed.

Schedule GeoDB Updates

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If the Firepower Management Center has internet access, we recommend you schedule weekly GeoDB updates.

**Before you begin**

Make sure the Firepower Management Center can access the internet.

**Procedure**

Step 1
Choose System > Updates, then click Geolocation Updates.

Step 2
Under Recurring Geolocation Updates, check Enable Recurring Weekly Updates from the Support Site.

Step 3
Specify the Update Start Time.

Step 4
Click Save.
Update Intrusion Rules

As new vulnerabilities become known, the Cisco Talos Intelligence Group (Talos) releases intrusion rule updates that you can import onto your Firepower Management Center, and then implement by deploying the changed configuration to your managed devices. These updates affect intrusion rules, preprocessor rules, and the policies that use the rules.

Intrusion rule updates are cumulative, and Cisco recommends you always import the latest update. You cannot import an intrusion rule update that either matches or predates the version of the currently installed rules.

An intrusion rule update may provide the following:

- **New and modified rules and rule states**—Rule updates provide new and updated intrusion and preprocessor rules. For new rules, the rule state may be different in each system-provided intrusion policy. For example, a new rule may be enabled in the Security over Connectivity intrusion policy and disabled in the Connectivity over Security intrusion policy. Rule updates may also change the default state of existing rules, or delete existing rules entirely.

- **New rule categories**—Rule updates may include new rule categories, which are always added.

- **Modified preprocessor and advanced settings**—Rule updates may change the advanced settings in the system-provided intrusion policies and the preprocessor settings in system-provided network analysis policies. They can also update default values for the advanced preprocessing and performance options in your access control policies.

- **New and modified variables**—Rule updates may modify default values for existing default variables, but do not override your changes. New variables are always added.

In a multidomain deployment, you can import local intrusion rules in any domain, but you can import intrusion rule updates from Talos in the Global domain only.

---

**Caution**

The first deploy after importing an intrusion rule update restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during the interruption or passes without further inspection depends on how the target device handles traffic. For more information, see Snort® Restart Traffic Behavior, on page 340.

---

**Understanding When Intrusion Rule Updates Modify Policies**

Intrusion rule updates can affect both system-provided and custom network analysis policies, as well as all access control policies:

- **system provided**—Changes to system-provided network analysis and intrusion policies, as well as any changes to advanced access control settings, automatically take effect when you re-deploy the policies after the update.

- **custom**—Because every custom network analysis and intrusion policy uses a system-provided policy as its base, or as the eventual base in a policy chain, rule updates can affect custom network analysis and intrusion policies. However, you can prevent rule updates from automatically making those changes. This allows you to update system-provided base policies manually, on a schedule independent of rule update imports. Regardless of your choice (implemented on a per-custom-policy basis), updates to system-provided policies do not override any settings you customized.
Note that importing a rule update discards all cached changes to network analysis and intrusion policies. For your convenience, the Rule Updates page lists policies with cached changes and the users who made those changes.

**Deploying Intrusion Rule Updates**

For changes made by an intrusion rule update to take effect, you must redeploy configurations. When importing a rule update, you can configure the system to automatically redeploy to affected devices. This approach is especially useful if you allow the intrusion rule update to modify system-provided base intrusion policies.

**Recurring Intrusion Rule Updates**

You can import rule updates on a daily, weekly, or monthly basis, using the Rule Updates page.

If your deployment includes a high availability pair of Firepower Management Centers, import the update on the primary only. The secondary Firepower Management Center receives the rule update as part of the regular synchronization process.

Applicable subtasks in the intrusion rule update import occur in the following order: download, install, base policy update, and configuration deploy. When one subtask completes, the next subtask begins.

At the scheduled time, the system installs the rule update and deploys the changed configuration as you specified in the previous step. You can log off or use the web interface to perform other tasks before or during the import. When accessed during an import, the Rule Update Log displays a red status icon ( ), and you can view messages as they occur in the Rule Update Log detailed view. Depending on the rule update size and content, several minutes may pass before status messages appear.

As a part of initial configuration the FMC configures a daily automatic intrusion rule update from the Cisco support site. (The FMC deploys automatic intrusion rule updates to affected managed devices when it next deploys affected policies.) You can observe the status of this update using the web interface Message Center. If configuring the update fails and your FMC has internet access, we recommend you configure regular intrusion rule updates as described in Configure Recurring Intrusion Rule Updates, on page 152.

**Importing Local Intrusion Rules**

A local intrusion rule is a custom standard text rule that you import from a local machine as a plain text file with ASCII or UTF-8 encoding. You can create local rules using the instructions in the Snort users manual, which is available at http://www.snort.org.

In a multidomain deployment, you can import local intrusion rules in any domain. You can view local intrusion rules imported in the current domain and ancestor domains.

**Update Intrusion Rules One-Time Manually**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Import a new intrusion rule update manually if your Firepower Management Center does not have Internet access.
The first deploy after importing an intrusion rule update restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during the interruption or passes without further inspection depends on how the target device handles traffic. For more information, see Snort® Restart Traffic Behavior, on page 340.

Procedure

Step 1 Manually download the update from the Cisco Support Site (http://www.cisco.com/cisco/web/support/index.html).

Step 2 Choose System > Updates, then click Rule Updates.

Step 3 If you want to move all user-defined rules that you have created or imported to the deleted folder, you must click Delete All Local Rules in the toolbar, then click OK.

Step 4 Choose Rule Update or text rule file to upload and install and click Browse to navigate to and choose the rule update file.

Step 5 If you want to automatically re-deploy policies to your managed devices after the update completes, choose Reapply all policies after the rule update import completes.

Step 6 Click Import. The system installs the rule update and displays the Rule Update Log detailed view.

Note Contact Support if you receive an error message while installing the rule update.

Update Intrusion Rules One-Time Automatically

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

To import a new intrusion rule update automatically, your appliance must have Internet access to connect to the Support Site.

The first deploy after importing an intrusion rule update restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during the interruption or passes without further inspection depends on how the target device handles traffic. For more information, see Snort® Restart Traffic Behavior, on page 340.

Before you begin

- Ensure the Firepower Management Center has internet access; see Security, Internet Access, and Communication Ports, on page 2357.

Procedure

Step 1 Choose System > Updates.
Configure Recurring Intrusion Rule Updates

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Caution: The first deploy after importing an intrusion rule update restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during the interruption or passes without further inspection depends on how the target device handles traffic. For more information, see Snort® Restart Traffic Behavior, on page 340.

Procedure

Step 1 Choose System > Updates.
Step 2 Click Rule Updates.
Step 3 If you want to move all user-defined rules that you have created or imported to the deleted folder, click Delete All Local Rules in the toolbar, then click OK.
Step 4 Check Enable Recurring Rule Update Imports from the Support Site check box.
Step 5 In the Import Frequency field, specify:
  - The frequency of the update (Daily, Weekly, or Monthly)
  - The day of the week or month you want the update to occur
  - The time you want the update to start
Step 6 If you want to automatically re-deploy the changed configuration to your managed devices after the update completes, check the Deploy updated policies to targeted devices after rule update completes check box.
Step 7 Click Save.

Caution: Contact Support if you receive an error message while installing the intrusion rule update.
The status message under the Recurring Rule Update Imports section heading changes to indicate that the rule update has not yet run.

Best Practices for Importing Local Intrusion Rules

Observe the following guidelines when importing a local rule file:

- The rules importer requires that all custom rules are imported in a plain text file encoded in ASCII or UTF-8.

- The text file name can include alphanumeric characters, spaces, and no special characters other than underscore (_), period (.), and dash (-).

- The system imports local rules preceded with a single pound character (#), but they are flagged as deleted.

- The system imports local rules preceded with a single pound character (#), and does not import local rules preceded with two pound characters (##).

- Rules cannot contain any escape characters.

- You do not have to specify a Generator ID (GID) when importing a local rule. If you do, specify only GID 1 for a standard text rule.

- When importing a rule for the first time, do not specify a Snort ID (SID) or revision number. This avoids collisions with SIDs of other rules, including deleted rules. The system will automatically assign the rule the next available custom rule SID of 1000000 or greater, and a revision number of 1.

  If you must import rules with SIDs, the SIDs must be unique numbers between 1,000,000 and 9,999,999.

  In a multidomain deployment, the system assigns SIDs to imported rules from a shared pool used by all domains on the Firepower Management Center. If multiple administrators are importing local rules at the same time, SIDs within an individual domain might appear to be non-sequential, because the system assigned the intervening numbers in the sequence to another domain.

- When importing an updated version of a local rule you have previously imported, or when reinstating a local rule you have deleted, you must include the SID assigned by the system and a revision number greater than the current revision number. You can determine the revision number for a current or deleted rule by editing the rule.

  The system automatically increments the revision number when you delete a local rule; this is a device that allows you to reinstate local rules. All deleted local rules are moved from the local rule category to the deleted rule category.

- Import local rules on the primary Firepower Management Center in a high availability pair to avoid SID numbering issues.

- The import fails if a rule contains any of the following:
  
  - A SID greater than 2147483647.
  
  - A list of source or destination ports that is longer than 64 characters.
Policy validation fails if you enable an imported local rule that uses the deprecated `threshold` keyword in combination with the intrusion event thresholding feature in an intrusion policy.

All imported local rules are automatically saved in the local rule category.

The system always sets local rules that you import to the disabled rule state. You must manually set the state of local rules before you can use them in your intrusion policy.

### Import Local Intrusion Rules

- Make sure your local rule file follows the guidelines described in Best Practices for Importing Local Intrusion Rules, on page 153.
- Make sure your process for importing local intrusion rules complies with your security policies.
- Consider the import's effect on traffic flow and inspection due to bandwidth constraints and Snort restarts. We recommend scheduling rule updates during maintenance windows.

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Use this procedure to import local intrusion rules. Imported intrusion rules appear in the local rule category in a disabled state.

### Procedure

**Step 1** Choose System > Updates, then click Rule Updates.

**Step 2** (Optional) Delete existing local rules.
Click Delete All Local Rules, then confirm that you want to move all created and imported intrusion rules to the deleted folder.

**Step 3** Under One-Time Rule Update/Rules Import, choose Rule update or text rule file to upload and install, then click Choose File and browse to your local rule file.

**Step 4** Click Import.

**Step 5** Monitor import progress in the Message Center.
To display the Message Center, click System Status on the menu bar. Even if the Message Center shows no progress for several minutes or indicates that the import has failed, do not restart the import. Instead, contact Cisco TAC.

### What to do next

- Edit intrusion policies and enable the rules you imported.
- Deploy configuration changes; see Deploy Configuration Changes, on page 337.
Rule Update Log

The Firepower Management Center generates a record for each rule update and local rule file that you import. Each record includes a time stamp, the name of the user who imported the file, and a status icon indicating whether the import succeeded or failed. You can maintain a list of all rule updates and local rule files that you import, delete any record from the list, and access detailed records for all imported rules and rule update components.

The Rule Update Import Log detailed view lists a detailed record for each object imported in a rule update or local rule file. You can also create a custom workflow or report from the records listed that includes only the information that matches your specific needs.

Intrusion Rule Update Log Table

Table 19: Intrusion Rule Update Log Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Summary</td>
<td>The name of the import file. If the import fails, a brief statement of the reason for the failure appears under the file name.</td>
</tr>
<tr>
<td>Time</td>
<td>The time and date that the import started.</td>
</tr>
<tr>
<td>User ID</td>
<td>The user name of the user that triggered the import.</td>
</tr>
<tr>
<td>Status</td>
<td>Whether the import:</td>
</tr>
<tr>
<td></td>
<td>• succeeded (✔)</td>
</tr>
<tr>
<td></td>
<td>• failed or is currently in progress (⚠️)</td>
</tr>
</tbody>
</table>

The red status icon indicating an unsuccessful or incomplete import appears on the Rule Update Log page during the import and is replaced by the green icon only when the import has successfully completed.

Tip
You can view import details as they appear while an intrusion rule update import is in progress.

Viewing the Intrusion Rule Update Log

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.
**Procedure**

**Step 1** Choose System > Updates.

*Tip* You can also click Import Rules on the intrusion rules editor page (Objects > Intrusion Rules).

**Step 2** Click Rule Updates.

**Step 3** Click Rule Update Log.

**Step 4** You have two options:

- **View** — To view details for each object imported in a rule update or local rule file, click view ( ) next to the file you want to view; see Viewing Details of the Intrusion Rule Update Import Log, on page 158.
- **Delete** — To delete an import file record from the import log, including detailed records for all objects included with the file, click delete ( ) next to the import file name.

*Note* Deleting the file from the log does not delete any object imported in the import file, but only deletes the import log records.

---

**Fields in an Intrusion Rule Update Log**

*Tip* You search the entire Rule Update Import Log database even when you initiate a search by clicking Search on the toolbar from the Rule Update Import Log detailed view with only the records for a single import file displayed. Make sure you set your time constraints to include all objects you want to include in the search.
## Table 20: Rule Update Import Log Detailed View Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>An indication that one of the following has occurred for the object type:</td>
</tr>
<tr>
<td></td>
<td>• new (for a rule, this is the first time the rule has been stored on this appliance)</td>
</tr>
<tr>
<td></td>
<td>• changed (for a rule update component or rule, the rule update component has been modified, or the rule has a higher revision number and the same GID and SID)</td>
</tr>
<tr>
<td></td>
<td>• collision (for a rule update component or rule, import was skipped because its revision conflicts with an existing component or rule on the appliance)</td>
</tr>
<tr>
<td></td>
<td>• deleted (for rules, the rule has been deleted from the rule update)</td>
</tr>
<tr>
<td></td>
<td>• enabled (for a rule update edit, a preprocessor, rule, or other feature has been enabled in a default policy provided with the system)</td>
</tr>
<tr>
<td></td>
<td>• disabled (for rules, the rule has been disabled in a default policy provided with the system)</td>
</tr>
<tr>
<td></td>
<td>• drop (for rules, the rule has been set to Drop and Generate Events in a default policy provided with the system)</td>
</tr>
<tr>
<td></td>
<td>• error (for a rule update or local rule file, the import failed)</td>
</tr>
<tr>
<td></td>
<td>• apply (the <strong>Reapply all policies after the rule update import completes</strong> option was enabled for the import)</td>
</tr>
<tr>
<td>Default Action</td>
<td>The default action defined by the rule update. When the imported object type is rule, the default action is Pass, Alert, or Drop. For all other imported object types, there is no default action.</td>
</tr>
<tr>
<td>Details</td>
<td>A string unique to the component or rule. For rules, the GID, SID, and previous revision number for a changed rule, displayed as <strong>previously (GID:SID:Rev)</strong>. This field is blank for a rule that has not changed.</td>
</tr>
<tr>
<td>Domain</td>
<td>The domain whose intrusion policies can use the updated rule. Intrusion policies in descendant domains can also use the rule. This field is only present in a multidomain deployment.</td>
</tr>
<tr>
<td>GID</td>
<td>The generator ID for a rule. For example, 1 (standard text rule) or 3 (shared object rule).</td>
</tr>
<tr>
<td>Name</td>
<td>The name of the imported object, which for rules corresponds to the rule Message field, and for rule update components is the component name.</td>
</tr>
<tr>
<td>Policy</td>
<td>For imported rules, this field displays <strong>All</strong>. This means that the rule was imported successfully, and can be enabled in all appropriate default intrusion policies. For other types of imported objects, this field is blank.</td>
</tr>
<tr>
<td>Rev</td>
<td>The revision number for a rule.</td>
</tr>
<tr>
<td>Rule Update</td>
<td>The rule update file name.</td>
</tr>
<tr>
<td>SID</td>
<td>The SID for a rule.</td>
</tr>
<tr>
<td>Time</td>
<td>The time and date the import began.</td>
</tr>
</tbody>
</table>
### Field Description

**Type**
The type of imported object, which can be one of the following:

- **rule update component** (an imported component such as a rule pack or policy pack)
- **rule** (for rules, a new or updated rule; note that in Version 5.0.1 this value replaced the update value, which is deprecated)
- **policy apply** (the Reapply all policies after the rule update import completes option was enabled for the import)

**Count**
The count (1) for each record. The Count field appears in a table view when the table is constrained, and the Rule Update Log detailed view is constrained by default to rule update records. This field is not searchable.

### Viewing Details of the Intrusion Rule Update Import Log

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

### Procedure

**Step 1** Choose System > Updates.

**Step 2** Click Rule Updates.

**Step 3** Click Rule Update Log.

**Step 4** Click view ( ) next to the file whose detailed records you want to view.

**Step 5** You can take any of the following actions:

- **Bookmark** — To bookmark the current page, click Bookmark This Page.
- **Edit Search** — To open a search page prepopulated with the current single constraint, choose Edit Search or Save Search next to Search Constraints.
- **Manage bookmarks** To navigate to the bookmark management page, click Report Designer.
- **Report** — To generate a report based on the data in the current view, click Report Designer.
- **Search** — To search the entire Rule Update Import Log database for rule update import records, click Search.
- **Sort** — To sort and constain records on the current workflow page, see Using Drill-Down Pages, on page 2081 for more information.
- **Switch workflows** — To temporarily use a different workflow, click (switch workflows).
Maintain Your Air-Gapped Deployment

If your Firepower system is not connected to the internet, essential updates will not occur automatically. You must manually obtain and install these updates. See the following information:

- Update the Vulnerability Database (VDB) Manually, on page 145
- Update Intrusion Rules One-Time Manually, on page 150
- Manually Update the GeoDB (No Internet Connection), on page 148
Backup and Restore

- About Backup and Restore, on page 161
- Requirements for Backup and Restore, on page 162
- Guidelines and Limitations for Backup and Restore, on page 163
- Best Practices for Backup and Restore, on page 164
- Backing Up Firepower Appliances, on page 166
- Restoring Firepower Appliances, on page 172
- Manage Backups and Remote Storage, on page 174

About Backup and Restore

The ability to recover from a disaster is an essential part of any system maintenance plan. As part of your disaster recovery plan, we recommend that you perform periodic backups to a secure remote location.

On-Demand Backups

You can perform on-demand backups for the FMC and 7000/8000 series devices from the FMC. You can also use the local web interface on a 7000/8000 series device to perform on-demand backups. Local backup management on 7000/8000 series devices is slightly different and has fewer options than backup management on the FMC, but in general works in the same way. Note that you can use the FMC to back up these devices remotely.

For more information, see Backing Up Firepower Appliances, on page 166.

Scheduled Backups

You can use the scheduler on an FMC or 7000/8000 series device to automate backups. You cannot schedule remote device backups from the FMC.

For more information, see Scheduled Backups, on page 185.

Storing Backup Files

You can store backups locally. However, we recommend you back up Firepower appliances to a secure remote location by mounting an NFS, SMB, or SSHFS network volume as remote storage. After you do this, all subsequent backups are copied to that volume, but you can still use the FMC to manage them.
For more information, see Remote Storage Management, on page 813 and Manage Backups and Remote Storage, on page 174.

Restoring Firepower Appliances
You restore the FMC and 7000/8000 series devices from the local Backup Management page.
For more information, see Restoring Firepower Appliances, on page 172.

What Is Backed Up?
FMC backups can include:

- Configurations.
  All configurations you can set on the FMC web interface are included in a configuration backup, with the exception of remote storage and audit log server certificate settings. In a multidomain deployment, you must back up configurations. You cannot back up events or only.

- Events.
  Event backups include all events in the FMC database. However, FMC event backups do not include intrusion event review status. Restored intrusion events do not appear on Reviewed Events pages.

7000/8000 series device backups are always configuration-only.

What Is Restored?
Restoring configurations overwrites all backed-up configurations, with very few exceptions. On the FMC, restoring events overwrites all existing events, with the exception of intrusion events.

Make sure you understand and plan for the following:

- You cannot restore what is not backed up.
  FMC configuration backups do not include remote storage and audit log server certificate settings, so you must reconfigure these after restore. Also, because FMC event backups do not include intrusion event review status, restored intrusion events do not appear on Reviewed Events pages.

- Restoring to a configured FMC — instead of factory-fresh or reimaged — merges intrusion events and file lists.
  The FMC event restore process does not overwrite intrusion events. Instead, the intrusion events in the backup are added to the database. To avoid duplicates, delete existing intrusion events before you restore.
  The FMC configuration restore process does not overwrite clean and custom detection file lists used by AMP for Networks. Instead, it merges existing file lists with the file lists in the backup. To replace file lists, delete existing file lists before you restore.

Requirements for Backup and Restore
Backup and restore has the following requirements.

Model Requirements: Backup
You can back up:
• FMCs
• 7000/8000 series devices

Backup is not supported for:
• Firepower Threat Defense
• NGIPSv
• ASA FirePOWER

If you need to replace a device where backup and restore is not supported, you must manually recreate device-specific configurations. However, backing up the FMC does back up policies and other configurations that you deploy to managed devices, as well as events already transmitted from the devices to the FMC.

Model Requirements: Restore
A replacement appliance must be the same model as the one you are replacing. Replacement managed devices should have the same number of network modules and same type and number of physical interfaces.

Version Requirements
As the first step in any backup, note the patch level. To restore a backup, the old and the new appliance must be running the same Firepower version, including patches.
For FMC backups, you must also have the same VDB. You are not required to have the same SRU.

License Requirements
Address licensing or orphan entitlements concerns as described in the best practices and procedures. If you notice licensing conflicts, contact Cisco TAC.

Domain Requirements
To:
• Back up or restore the FMC: Global only.
• Back up a device from the FMC: Global only.
• Restore a device: None. Restore devices locally.

In a multidomain deployment you cannot back up only events. You must also back up configurations.

Guidelines and Limitations for Backup and Restore
Backup and restore has the following guidelines and limitations.

Backup and Restore is for Disaster Recovery/RMA
Backup and restore is primarily intended for RMA scenarios. Before you begin the restore process of a faulty or failed physical appliance, contact Cisco TAC for replacement hardware.
Backup and Restore is not Configuration Import/Export

A backup file contains information that uniquely identifies an appliance, and cannot be shared. Do not use the backup and restore process to copy configurations between appliances or devices, or as a way to save configurations while testing new ones. Instead, use the import/export feature.

Restore is Individual and Local

You restore to Firepower appliances individually and locally. This means:

- You cannot batch-restore to high availability (HA) FMCs or devices. The restore procedures in this guide explain how to restore in an HA environment.
- You cannot use the FMC to restore a device. For the FMC and 7000/8000 series devices, you can use the local web interface to restore.
- You cannot use an FMC user account to log into and restore one of its managed devices. Firepower appliances maintain their own user accounts.

Best Practices for Backup and Restore

Backup and restore has the following best practices.

When to Back Up

We recommend backing up during a maintenance window or other time of low use.

While the system collects backup data, there may be a temporary pause in data correlation (FMC only), and you may be prevented from changing configurations related to the backup.

You should back up in the following situations:

- Regular scheduled backups.
  As part of your disaster recovery plan, we recommend that you perform periodic backups. To automate this process, see Scheduled Backups, on page 185.
- Before upgrade or reimage.
  If an upgrade fails catastrophically, you may have to reimage and restore. Reimaging returns most settings to factory defaults, including the system password. If you have a recent backup, you can return to normal operations more quickly.
- After upgrade.
  Back up after you upgrade, so you have a snapshot of your freshly upgraded deployment. We recommend you back up the FMC after you upgrade its managed devices, so your new FMC backup file 'knows' that its devices have been upgraded.

Maintaining Backup File Security

Backups are stored as unencrypted archive (.tar) files.

Private keys in PKI objects—which represent the public key certificates and paired private keys required to support your deployment—are decrypted before they are backed up. The keys are reencrypted with a randomly generated key when you restore the backup.
We recommend you back up Firepower appliances to a secure remote location and verify transfer success. Backups left on an appliance may be deleted, either manually or by the upgrade process, which purges locally stored backups.

Especially because backup files are unencrypted, do not allow unauthorized access. If backup files are modified, the restore process will fail. Keep in mind that anyone with the Admin/Maint role can access the Backup Management page, where they can move and delete files from remote storage.

In the FMC’s system configuration, you can mount an NFS, SMB, or SSHFS network volume as remote storage. After you do this, all subsequent backups are copied to that volume, but you can still use the FMC to manage them. For more information, see Remote Storage Management, on page 813 and Manage Backups and Remote Storage, on page 174.

Note that only the FMC mounts the network volume. Managed device backup files are routed through the FMC. Make sure you have the bandwidth to perform a large data transfer between the FMC and its devices. For more information, see Guidelines for Downloading Data from the Firepower Management Center to Managed Devices (Troubleshooting TechNote).

**Backup and Restore in FMC High Availability Deployments**

In an FMC high availability deployment, backing up one FMC does not back up the other. You should regularly back up both peers. Do not restore one HA peer with the backup file from the other. A backup file contains information that uniquely identifies an appliance, and cannot be shared.

Note that you can replace an HA FMC without a successful backup. For more information on replacing HA FMCs, both with and without successful backups, see Replacing FMCs in a High Availability Pair, on page 218.

**Before Backup**

Before you back up, you should:

- Update the VDB and SRU on the FMC.
  
  We always recommend you use the latest vulnerability database (VDB) and intrusion rules (SRU). Before you back up an FMC, check the Cisco Support & Download site for newer versions.

  This is especially important for the VDB, because the VDB versions must match to restore a backup.

  Because you cannot downgrade the VDB, you do not want a situation where your replacement FMC has a newer VDB than the backed up FMC.

- Check Disk Space.

  Before you begin a backup, make sure you have enough disk space on the appliance or on your remote storage server. The space available is displayed on the Backup Management page.

  Backups can fail if there is not enough space. Especially if you schedule backups, make sure you regularly prune backup files or allocate more disk space to the remote storage location.

**Before Restore**

Before restore, you should:

- Revert licensing changes.
Revert any licensing changes made since you took the backup.

Otherwise, you may have license conflicts or orphan entitlements after the restore. However, do not unregister from Cisco Smart Software Manager (CSSM). If you unregister from CSSM, you must unregister again after you restore, then re-register.

After the restore completes, reconfigure licensing. If you notice licensing conflicts or orphan entitlements, contact Cisco TAC.

- Disconnect faulty appliances.

Disconnect the management interface, and for devices, the data interfaces.

Note that restoring an FMC or 7000/8000 series device does not change the management IP address. You must set that manually on the replacement — just make sure you disconnect the old appliance from the network before you do.

- Do not unregister managed devices.

Whether you are restoring an FMC or managed device, do not unregister devices from the FMC, even if you physically disconnect an appliance from the network.

If you unregister, you will need to redo some device configurations, such as security zone to interface mappings. After you restore, the FMC and devices should begin communicating normally.

- Reimage.

In an RMA scenario, the replacement appliance will arrive configured with factory defaults. However, if the replacement appliance is already configured, we recommend you reimage. Reimaging returns most settings to factory defaults, including the system password. You can only reimage to major versions, so you may need to patch after you reimage.

If you do not reimage, keep in mind that FMC intrusion events and file lists are merged rather than overwritten.

**After Restore**

After restore, you should:

- Reconfigure anything that was not restored.

  This can include reconfiguring licensing, remote storage, and audit log server certificate settings.

- Update the VDB and SRU on the FMC.

  We always recommend you use the latest vulnerability database (VDB) and intrusion rules (SRU).

- Deploy.

  After you restore an FMC, deploy to all managed devices. After you restore a device, deploy to that device. You must deploy. If the a device or devices are not marked out of date, force deploy from the Device Management page: Redeploy Existing Configurations to a Device, on page 338.

**Backing Up Firepower Appliances**

You can perform on-demand or scheduled backups for supported appliances.
You do not need a backup profile to back up 7000/8000 series devices from the FMC. However, FMC backups require backup profiles, as do local backups on 7000/8000 series devices. The on-demand backup process allows you to create a new backup profile.

For more information, see:
- Back up the FMC, on page 167
- Back up a Device from the FMC, on page 168
- Back up a 7000/8000 Series Device Locally, on page 169
- Create a Backup Profile, on page 170
- Scheduled Backups, on page 185

## Back up the FMC

Use this procedure to perform an on-demand FMC backup. To back up a 7000/8000 series device from its local web interface, see Back up a 7000/8000 Series Device Locally, on page 169.

### Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- Requirements for Backup and Restore, on page 162
- Guidelines and Limitations for Backup and Restore, on page 163
- Best Practices for Backup and Restore, on page 164

### Procedure

#### Step 1

Select System > Tools > Backup/Restore.

The Backup Management page lists all locally and remotely stored backups. It also lists how much disk space you have available to store backups. Backups can fail if there is not enough space.

#### Step 2

Choose whether to use an existing backup profile or start fresh.

FMC backups require that you use or create a backup profile.

- Click Backup Profiles to use an existing backup profile.
  
  Next to the profile you want to use, click the edit icon. You can then click Start Backup to begin the backup right now. Or, if you want to edit the profile, go on to the next step.

- Click Firepower Management Backup to start fresh and create a new backup profile.
  
  Enter a Name for the backup profile.

#### Step 3

Choose what to back up:

- Back Up Configuration
**Back Up Events**

In a multidomain deployment, you must back up configurations. You cannot back up events or only. For details on what is and what is not backed up for each of these choices, see About Backup and Restore, on page 161.

**Step 4**  
Note the **Storage Location** for FMC backup files. This will either be local storage in `/var/sf/backup/`, or a remote network volume. For more information, see Manage Backups and Remote Storage, on page 174.

**Step 5**  
(Optional) Enable **Copy when complete** to copy completed FMC backups to a remote server. Provide a hostname or IP address, the path to the remote directory, and a username and password. To use an SSH public key instead of a password, copy the contents of the **SSH Public Key** field to the specified user's `authorized_keys` file on the remote server.  
**Note**  
This option is useful if you want to store backups locally and also SCP them to a remote location. If you configured SSH remote storage, do **not** copy backup files to the same directory using **Copy when complete**.

**Step 6**  
(Optional) Enable **Email** and enter an email address to be notified when the backup completes. To receive email notifications, you must configure the FMC to connect to a mail server: Configuring a Mail Relay Host and Notification Address, on page 830.

**Step 7**  
Click **Start Backup** to start the on-demand backup. If you are not using an existing backup profile, the system automatically creates one and uses it. If you decide not to run the backup now, you can click **Save** or **Save As New** to save the profile. In either case, you can use the newly created profile to configure scheduled backups.

**Step 8**  
Monitor progress in the Message Center.  
While the system collects backup data, there may be a temporary pause in data correlation, and you may be prevented from changing configurations related to the backup. If you configured remote storage or enabled **Copy when complete**, the FMC may write temporary files to the remote server. These files are cleaned up at the end of the backup process.

---

**What to do next**  
If you configured remote storage or enabled **Copy when complete**, verify transfer success of the backup file.

---

**Back up a Device from the FMC**

Use this procedure to perform an on-demand backup of a 7000/8000 series device from the FMC. At this time, backup and restore is not supported for Firepower Threat Defense.

**Before you begin**

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- **Requirements for Backup and Restore**, on page 162
Procedure

Step 1  Select System > Tools > Backup/Restore, then click Managed Device Backup.

Step 2  Select one or more Managed Devices.

Step 3  To back up event data that has not yet been sent to the FMC, select Include All Unified Files.

Step 4  Note the Storage Location for device backup files.

This will either be local storage in /var/sf/remote-backup/, or a remote network volume. For more information, see Manage Backups and Remote Storage, on page 174.

Step 5  If you did not configure remote storage, choose whether you want to Retrieve to Management Center.

- Enabled: Saves the backup to the FMC in /var/sf/remote-backup/.
- Disabled (default): Saves the backup to the device in /var/sf/backup.

If you configured remote backup storage, backup files are saved remotely and this option has no effect.

Step 6  Click Start Backup to start the on-demand backup.

Step 7  Monitor progress in the Message Center.

What to do next

If you configured remote storage, verify transfer success of the backup file.

Back up a 7000/8000 Series Device Locally

Use this procedure to perform a local, on-demand backup for a 7000/8000 series device. Device backups are always configuration-only.

Note that local backup management on 7000/8000 series devices is slightly different and has fewer options than backup management on the FMC, but in general works in the same way. Unless you have a specific need (such as scheduling backups), we recommend you use the FMC to back up these devices remotely.

Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- Requirements for Backup and Restore, on page 162
- Guidelines and Limitations for Backup and Restore, on page 163
- Best Practices for Backup and Restore, on page 164
**Create a Backup Profile**

A backup profile is a saved set of preferences—what to back up, where to store the backup file, and so on.

---

**Create a Backup Profile**

A backup profile is a saved set of preferences—what to back up, where to store the backup file, and so on.
FMC backups and 7000/8000 series local backups require backup profiles. Backup profiles are not required to back up a device from the FMC.

When you perform an on-demand FMC or 7000/8000 series local backup, if you do not pick an existing backup profile, the system automatically creates one and uses it. You can then use the newly created profile to configure scheduled backups. Note that you cannot schedule 7000/8000 series device backups from the FMC.

The following procedure explains how to create a backup profile without performing an on-demand backup.

**Procedure**

**Step 1** Select System > Tools > Backup/Restore, then click Backup Profiles.

**Step 2** Click Create Profile and enter a Name.

**Step 3** (FMC only) Choose what to back up.

7000/8000 series backups are always configuration-only.

- Back Up Configuration
- Back Up Events

In a multidomain deployment, you must back up configurations. You cannot back up events or only. For details on what is and what is not backed up for each of these choices, see About Backup and Restore, on page 161.

**Step 4** Note the Storage Location for backup files.

For FMC backup profiles, this will either be local storage in /var/sf/backup/, or a remote network volume. For 7000/8000 local backup profiles, this is always /var/sf/backup/. For more information, see Manage Backups and Remote Storage, on page 174.

**Step 5** (Optional) Enable Copy when complete to copy completed FMC backups to a remote server.

Provide a hostname or IP address, the path to the remote directory, and a username and password. To use an SSH public key instead of a password, copy the contents of the SSH Public Key field to the specified user's authorized_keys file on the remote server.

**Note** This option is useful if you want to store backups locally and also SCP them to a remote location. If you configured SSHFS remote storage, do **not** copy backup files to the same directory using Copy when complete.

**Step 6** (Optional) Enable Email and enter an email address to be notified when the backup completes.

To receive email notifications, you must configure the FMC to connect to a mail server: Configuring a Mail Relay Host and Notification Address, on page 830.

**Step 7** Click Save.
Restoring Firepower Appliances

For the FMC and 7000/8000 series devices, you use the local web interface to restore from backup. You cannot use the FMC to restore a device.

The following sections explain how to restore Firepower appliances.

- Restore an FMC from Backup, on page 172
- Replacing FMCs in a High Availability Pair, on page 218
- Restore a 7000/8000 Series Device from Backup, on page 173

Restore an FMC from Backup

When you restore an FMC backup, you can choose to restore any or all of the components included in the backup file (events, configurations).

Note

Restoring configurations overwrites all configurations, with very few exceptions. It also reboots the FMC. Restoring events overwrites all existing events, with the exception of intrusion events. Make sure you are ready.

Use this procedure to restore an FMC from backup. For more information on backup and restore in an FMC HA deployment, see Replacing FMCs in a High Availability Pair, on page 218. To restore a 7000/8000 series device, see Restore a 7000/8000 Series Device from Backup, on page 173.

Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- Requirements for Backup and Restore, on page 162
- Guidelines and Limitations for Backup and Restore, on page 163
- Best Practices for Backup and Restore, on page 164

Procedure

Step 1
Log into the FMC you want to restore.

Step 2
Select System > Tools > Backup/Restore.

The Backup Management page lists all locally and remotely stored backup files. You can click a backup file to view its contents.

If the backup file is not in the list and you have it saved on your local computer, click Upload Backup; see Manage Backups and Remote Storage, on page 174.

Step 3
Select the backup file you want to restore and click Restore.
Step 4  Select from the available components to restore, then click Restore again to begin.

Step 5  Monitor progress in the Message Center.

If you are restoring configurations, you can log back in after the FMC reboots.

What to do next

• If necessary, reconfigure any licensing settings that you reverted before the restore. If you notice licensing conflicts or orphan entitlements, contact Cisco TAC.

• If necessary, reconfigure remote storage and audit log server certificate settings. These settings are not included in backups.

• (Optional) Update the SRU and VDB. If the SRU or the VDB available on the Cisco Support & Download site is newer than the version currently running, we recommend you install the newer version.

• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Restore a 7000/8000 Series Device from Backup

This procedure explains how to use the 7000/8000 series local web interface to restore from backup. Restoring overwrites all configurations, with very few exceptions. It also reboots the device.

Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

• Requirements for Backup and Restore, on page 162

• Guidelines and Limitations for Backup and Restore, on page 163

• Best Practices for Backup and Restore, on page 164

Procedure

Step 1  Log into the device you want to restore.

Step 2  Select System > Tools > Backup/Restore.

The Backup Management page lists all locally stored backup files. You can click a backup file to view its contents.

If the backup file is not in the list and you have it saved on your local computer, click Upload Backup; see Manage Backups and Remote Storage, on page 174.

Step 3  Select the backup file you want to restore and click Restore.

Step 4  Make sure Replace Configuration Data is enabled, then click Restore again to begin.

Device backups are always configuration-only.
Manage Backups and Remote Storage

Backups are stored as unencrypted archive (.tar) files. The file name includes identifying information that can include:

- The name of the backup profile or scheduled task associated with the backup.
- The display name or IP address of the backed-up appliance.
- The appliance's role, such as a member of an HA pair.

We recommend you back up Firepower appliances to a secure remote location and verify transfer success. Backups left on an appliance may be deleted, either manually or by the upgrade process; upgrades purge locally stored backups. For more information on your options, see Backup Storage Locations, on page 175.

Caution

Especially because backup files are unencrypted, do not allow unauthorized access. If backup files are modified, the restore process will fail. Keep in mind that anyone with the Admin/Maint role can access the Backup Management page, where they can move and delete files from remote storage.

The following procedure describes how to manage backup files.

Procedure

Step 1
Select System > Tools > Backup/Restore.

The Backup Management page lists available backups. It also lists how much disk space you have available to store backups. Backups can fail if there is not enough space.

Step 2
Do one of the following:

Table 21: Remote Storage and Backup File Management

<table>
<thead>
<tr>
<th>To</th>
<th>Do This</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable or disable remote storage for backups without having to edit the FMC system configuration.</td>
<td>Click Enable Remote Storage for Backups. This option appears only after you configure remote storage. Toggling it here also toggles it in the system configuration (System &gt; Configuration &gt; Remote Storage Device).</td>
</tr>
<tr>
<td>Tip</td>
<td>To quickly access your remote storage configuration, click Remote Storage at the upper right of the Backup Management page.</td>
</tr>
</tbody>
</table>
Move a file between the FMC and the remote storage location.

Click **Move**.

You can move a file back and forth as many times as you want. This will delete—not copy—the file from the current location.

When you move a backup file from remote storage to the FMC, where it is stored on the FMC depends on the kind of backup:

- **FMC backups**: `/var/sf/backup`
- **Device backups**: `/var/sf/remote-backup`

View the contents of the backup.

Click the backup file.

Delete a backup file.

Choose a backup file and click **Delete**.

You can delete both locally and remotely stored backup files.

Upload a backup file from your computer.

Click **Upload Backup**, choose a backup file, and click **Upload Backup** again.

Download a backup to your computer.

Choose a backup file and click **Download**.

Unlike moving a backup file, this does not delete the backup from the FMC.

---

**Backup Storage Locations**

The following table describes backup storage options for Firepower appliances.

*Table 22: Backup Storage Locations*

<table>
<thead>
<tr>
<th>Location</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote, by mounting a network volume (NFS, SMB, SSHFS).</td>
<td>In the FMC's system configuration, you can mount an NFS, SMB, or SSHFS network volume as remote storage for FMC and device backups; see Remote Storage Management, on page 813.) After you do this, all subsequent FMC backups and <strong>FMC-initiated device backups</strong> are copied to that volume, but you can still use the FMC to manage them (restore, download, upload, delete, move). Note that only the FMC mounts the network volume. Managed device backup files are routed through the FMC. Make sure you have the bandwidth to perform a large data transfer between the FMC and its devices. For more information, see Guidelines for Downloading Data from the Firepower Management Center to Managed Devices (Troubleshooting TechNote).</td>
</tr>
</tbody>
</table>
For the FMC and for 7000/8000 series local backups, you can use a **Copy when complete** option to securely copy (SCP) completed backups to a remote server.

Compared with remote storage by mounting a network volume, **Copy when complete** cannot copy to NFS or SMB volumes. You cannot provide CLI options or set a disk space threshold, and it does not affect remote storage of reports. You also cannot manage backup files after they are copied out.

This option is useful if you want to store backups locally and SCP them to a remote location. It is also your only option for remote storage for 7000/8000 series local backups.

**Note** If you configure SSHFS remote storage in the FMC system configuration, do not copy backup files to the same directory using **Copy when complete**.

<table>
<thead>
<tr>
<th>Location</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote, by copying (SCP).</td>
<td>For the FMC and for 7000/8000 series local backups, you can use a <strong>Copy when complete</strong> option to securely copy (SCP) completed backups to a remote server. Compared with remote storage by mounting a network volume, <strong>Copy when complete</strong> cannot copy to NFS or SMB volumes. You cannot provide CLI options or set a disk space threshold, and it does not affect remote storage of reports. You also cannot manage backup files after they are copied out. This option is useful if you want to store backups locally and SCP them to a remote location. It is also your only option for remote storage for 7000/8000 series local backups. <strong>Note</strong> If you configure SSHFS remote storage in the FMC system configuration, do not copy backup files to the same directory using <strong>Copy when complete</strong>.</td>
</tr>
<tr>
<td>Local, on the FMC.</td>
<td>If you do not configure remote storage by mounting a network volume, you can save backup files on the FMC: • FMC backups are saved to /var/sf/backup. • Device backups are saved to /var/sf/remote-backup on the FMC if you enable the <strong>Retrieve to Management Center</strong> option when you perform the backup. Note that you cannot save 7000/8000 series local backups to the FMC.</td>
</tr>
<tr>
<td>Local, on the device.</td>
<td>Device backup files are saved to /var/sf/backup on the device if you: • Do not configure remote storage by mounting a network volume. • Do not enable <strong>Retrieve to Management Center</strong>.</td>
</tr>
</tbody>
</table>
Configuration Import and Export

The following topics explain how to use the Import/Export feature:

- About Configuration Import/Export, on page 177
- Exporting Configurations, on page 179
- Importing Configurations, on page 180

About Configuration Import/Export

You can use the Import/Export feature to copy configurations between appliances. Import/Export is not a backup tool, but can simplify the process of adding new appliances to your deployment.

You can export a single configuration, or you can export a set of configurations (of the same type or of different types) with a single action. When you later import the package onto another appliance, you can choose which configurations in the package to import.

An exported package contains revision information for that configuration, which determines whether you can import that configuration onto another appliance. When the appliances are compatible but the package includes a duplicate configuration, the system offers resolution options.

Note

The importing and exporting appliances must be running the same version of the Firepower System. For access control and its subpolicies (including intrusion policies), the intrusion rule update version must also match. If the versions do not match, the import fails. You cannot use the Import/Export feature to update intrusion rules. Instead, download and apply the latest rule update version.

Configurations that Support Import/Export

Import/Export is supported for the following configurations:

- Access control policies and the policies they invoke: prefilter, network analysis, intrusion, SSL, file
- Intrusion policies, independently of access control
- NAT policies (Firepower Threat Defense only)
- Platform settings
- Health policies
• Alert responses
• Application detectors (both user-defined and those provided by Cisco Professional Services)
• Dashboards
• Custom tables
• Custom workflows
• Saved searches
• Custom user roles
• Report templates
• Third-party product and vulnerability mappings

Special Considerations for Configuration Import/Export

When you export a configuration, the system also exports other required configurations. For example, exporting an access control policy also exports any subpolicies it invokes, objects and object groups it uses, ancestor policies (in a multidomain deployment), and so on. As another example, if you export a platform settings policy with external authentication enabled, the authentication object is exported as well. There are some exceptions, however:

• System-provided databases and feeds—The system does not export URL filtering category and reputation data, Cisco Intelligence Feed data, or the geolocation database (GeoDB). Make sure all the appliances in your deployment obtain up-to-date information from Cisco.

• Global Security Intelligence lists—The system exports Global Security Intelligence blacklists and whitelists associated with exported configurations. (In a multidomain deployment, this occurs regardless of your current domain. The system does **not** export descendant domain lists.) The import process converts these blacklists and whitelists to user-created lists, then uses those new lists in the imported configurations. This ensures that imported lists do not conflict with existing Global blacklists and whitelists. To use Global lists on the importing Firepower Management Center in your imported configurations, add them manually.

• Intrusion policy shared layers—The export process breaks intrusion policy shared layers. The previously shared layer is included in the package, and imported intrusion policies do not contain shared layers.

• Intrusion policy default variable set—The export package includes a default variable set with custom variables and system-provided variables with user-defined values. The import process updates the default variable set on the importing Firepower Management Center with the imported values. However, the import process does **not** delete custom variables not present in the export package. The import process also does not revert user-defined values on the importing Firepower Management Center, for values not set in the export package. Therefore, an imported intrusion policy may behave differently than expected if the importing Firepower Management Center has differently configured default variables.

• Custom user objects—If you have created custom user groups or objects in your Firepower Management Center and if such a custom user object is a part of any rule in your access control policy, note that the export file (.sfo) does not carry the user object information and therefore while importing such a policy, any reference to such custom user objects will be removed and will not be imported to the destination Firepower Management Center. To avoid detection issues due to the missing user group, add the
customized user objects manually to the new Firepower Management Center and re-configure the access control policy after import.

When you import objects and object groups:

- The import process imports objects and groups as new. You cannot replace existing objects and groups.
- If the names of imported objects match existing objects on the importing Firepower Management Center, the system appends autogenerated numbers to the imported object and group names to make them unique.
- You must map any security zones and interface groups used in the imported configurations to matching-type zones and groups managed by the importing Firepower Management Center.
- If you export a configuration that uses PKI objects containing private keys, the system decrypts the private keys before export. On import, the system encrypts the keys with a randomly generated key.

### Exporting Configurations

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Depending on the number of configurations being exported and the number of objects those configurations reference, the export process may take several minutes.

---

**Tip**

Many list pages in the Firepower System include an export icon ( gauche ) next to list items. Where this icon is present, you can use it as a quick alternative to the export procedure that follows.

---

**Before you begin**

- Confirm that the importing and exporting appliances are running the same version of the Firepower System. For access control and its subpolicies (including intrusion policies), the intrusion rule update version must also match.

---

**Procedure**

1. Choose **System > Tools > Import/Export**.
2. Click collapse ( gauche ) and expand ( gauche ) to collapse and expand the list of available configurations.
3. Check the configurations you want to export and click **Export**.
4. Follow your web browser’s prompts to save the exported package to your computer.
Importing Configurations

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Depending on the number of configurations being imported and the number of objects those configurations reference, the import process may take several minutes.

Before you begin

- Confirm that the importing and exporting appliances are running the same version of the Firepower System. For access control and its subpolicies (including intrusion policies), the intrusion rule update version must also match.

Procedure

**Step 1**
On the importing appliance, choose **System > Tools > Import/Export**.

**Step 2**
Click **Upload Package**.

**Step 3**
Enter the path to the exported package or browse to its location, then click **Upload**.

**Step 4**
If there are no version mismatches or other issues, choose the configurations you want to import, then click **Import**.

If you do not need to perform any conflict resolution or interface object mapping, the import completes and a success message appears. Skip the rest of this procedure.

**Step 5**
If prompted, on the Import Conflict Resolution page, map interface objects used in the imported configurations to zones and groups with matching interface types managed by the importing Firepower Management Center.

Interface object type (security zone or interface group) and interface type (passive, inline, routed, and so on) of source and destination objects must match. For information, see Interface Objects: Interface Groups and Security Zones, on page 403.

If the configurations you are importing reference security zones or interface groups that do not already exist, you can map them to existing interface objects, or create new ones.

**Step 6**
Click **Import**.

**Step 7**
If prompted, on the Import Resolution page, expand each configuration and choose the appropriate option as described in Import Conflict Resolution, on page 181.

**Step 8**
Click **Import**.

What to do next

- Optionally, view a report summarizing the imported configurations; see Viewing Task Messages, on page 317.
Import Conflict Resolution

When you attempt to import a configuration, the system determines whether a configuration of the same name and type already exists on the appliance. In a multidomain deployment, the system also determines whether a configuration is a duplicate of a configuration defined in the current domain or any of its ancestor or descendant domains. (You cannot view configurations in descendant domains, but if a configuration with a duplicate name exists in a descendant domain, the system notifies you of the conflict.) When an import includes a duplicate configuration, the system offers resolution options suitable to your deployment from among the following:

- **Keep existing**
  The system does not import that configuration.

- **Replace existing**
  The system overwrites the current configuration with the configuration selected for import.

- **Keep newest**
  The system imports the selected configuration only if its timestamp is more recent than the timestamp on the current configuration on the appliance.

- **Import as new**
  The system imports the selected duplicate configuration, appending a system-generated number to the name to make it unique. (You can change this name before completing the import process.) The original configuration on the appliance remains unchanged.

The resolution options the system offers depends on whether your deployment uses domains, and whether the imported configuration is a duplicate of a configuration defined in the current domain, or a configuration defined in an ancestor or descendant of the current domain. The following table lists when the system does or does not present a resolution option.

<table>
<thead>
<tr>
<th>Resolution Option</th>
<th>Firepower Management Center</th>
<th>Managed Device</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Duplicate in current domain</td>
<td>Duplicate in ancestor or descendant domain</td>
</tr>
<tr>
<td>Keep existing</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Replace existing</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Keep newest</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Import as new</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

When you import an access control policy with a file policy that uses clean or custom detection file lists and a file list presents a duplicate name conflict, the system offers conflict resolution options as described in the table above, but the action the system performs on the policies and file lists varies as described in the table below:
<table>
<thead>
<tr>
<th>Resolution Option</th>
<th>System Action</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Access control policy and its associated file policy are imported as new and the file lists are merged</td>
<td>Existing access control policy and its associated file policy and file lists remain unchanged</td>
</tr>
<tr>
<td>Keep existing</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Replace existing</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Import as new</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Keep newest</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Keep newest and access control policy being imported is the newest</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Keep newest and existing access control policy is the newest</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

If you modify an imported configuration on an appliance, and later re-import that configuration to the same appliance, you must choose which version of the configuration to keep.
Task Scheduling

The following topics explain how to schedule tasks:

- About Task Scheduling, on page 183
- Configuring a Recurring Task, on page 183
- Scheduled Task Review, on page 199

About Task Scheduling

You can schedule many different types of administrative tasks to run at designated times, either once or on a recurring basis.

Tasks configured using this feature are scheduled in UTC, which means when they occur locally depends on the date and your specific location. Also, because tasks are scheduled in UTC, they do not adjust for Daylight Saving Time, summer time, or any such seasonal adjustments that you may observe in your location. If you are affected, scheduled tasks occur one hour "later" in the summer than in the winter, according to local time.

We **strongly** recommend you review scheduled tasks to be sure they occur when you intend.

Some tasks (such as those involving automated software updates or that require pushing updates to managed devices) may place a significant load on networks with low bandwidths. You should schedule tasks like these to run during periods of low network use.

Configuring a Recurring Task

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Task dependent</td>
<td>Task dependent</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

You set the frequency for a recurring task using the same process for all types of tasks.
Note that the time displayed on most pages on the web interface is the local time, which is determined by using the time zone you specify in your local configuration. Further, the Firepower Management Center automatically adjusts its local time display for daylight saving time (DST), where appropriate. However, recurring tasks that span the transition dates from DST to standard time and back do not adjust for the transition. That is, if you create a task scheduled for 2:00 AM during standard time, it will run at 3:00 AM during DST. Similarly, if you create a task scheduled for 2:00 AM during DST, it will run at 1:00 AM during standard time.

**Procedure**

**Step 1** Select **System > Tools > Scheduling**.

**Step 2** Click **Add Task**.

**Step 3** From the **Job Type** drop-down list, select the type of task that you want to schedule.

**Step 4** Click **Recurring** next to the **Schedule task to run** option.

**Step 5** In the **Start On** field, specify the date when you want to start your recurring task.

**Step 6** In the **Repeat Every** field, specify how often you want the task to recur. You can either type a number or click up (▲) and down (▼) to specify the interval. For example, type 2 and click **Days** to run the task every two days.

**Step 7** In the **Run At** field, specify the time when you want to start your recurring task.

**Step 8** For a task to be run on a weekly or monthly basis, select the days when you want to run the task in the **Repeat On** field.

**Step 9** Select the remaining options for the type of task you are creating:

- **Backup** - Schedule backup jobs as described in Schedule FMC Backups, on page 185.
- **Download CRL** - Schedule certificate revocation list downloads as described in Configuring Certificate Revocation List Downloads, on page 186.
- **Deploy Policies** - Schedule policy deployment as described in Automating Policy Deployment, on page 187.
- **Nmap Scan** - Schedule Nmap scans as described in Scheduling an Nmap Scan, on page 188.
- **Report** - Schedule report generation as described in Automating Report Generation, on page 190
- **Firepower Recommended Rules** - Schedule automatic update of Firepower recommended rules as described in Automating Firepower Recommendations, on page 191
- **Download Latest Update** - Schedule software or VDB update downloads as described in Automating Software Downloads, on page 193 or Automating VDB Update Downloads, on page 196.
- **Install Latest Update** - Schedule installation of software or VDB updates on a Firepower Management Center or managed device as described in Automating Software Installs, on page 195 or Automating VDB Update Installs, on page 197
- **Push Latest Update** - Schedule push of software updates to managed devices as described in Automating Software Pushes, on page 194.
- **Update URL Filtering Database** - Scheduling automatic update of URL filtering data as described in Automating URL Filtering Updates Using a Scheduled Task, on page 198.
Scheduled Backups

You can use the scheduler on a Firepower Management Center or a 7000/8000 series device to automate its own backups. For more information on backups, see Backup and Restore, on page 161.

You cannot schedule device backups from the FMC.

Schedule FMC Backups

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

You can use the scheduler on the Firepower Management Center to automate its own backups. You cannot schedule a device backup from the FMC.

Before you begin

Create a backup profile that specifies your backup preferences: Create a Backup Profile, on page 170.

Procedure

Step 1 Choose System > Tools > Scheduling.
Step 2 From the Job Type list, select Backup.
Step 3 Specify whether you want to back up Once or Recurring.
   • For one-time tasks, use the drop-down lists to specify the start date and time.
   • For recurring tasks, see Configuring a Recurring Task, on page 183.
Step 4 Enter a Job Name.
Step 5 Choose a Backup Profile.
Step 6 (Optional) Enter a Comment.
   Keep comments brief. They will appear in the Task Details section of the schedule calendar page.
Step 7 (Optional) Enter an email address, or a comma-separated list of email addresses, in the Email Status To: field.
   For information on setting up an email relay server to send task status messages, see Configuring a Mail Relay Host and Notification Address, on page 830.
Step 8 Click Save.
Schedule Local 7000 & 8000 Series Device Backups

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>7000 &amp; 8000 Series</td>
<td>N/A</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

You can use the scheduler on a 7000 or 8000 Series device to automate its own backups. You cannot schedule any kind of device backup from the FMC.

**Before you begin**

Create a backup profile that specifies your backup preferences: Create a Backup Profile, on page 170.

**Procedure**

**Step 1** On the device’s web interface, choose System > Tools > Scheduling.

**Step 2** From the Job Type list, select Backup.

**Step 3** Specify whether you want to back up Once or Recurring.

  • For one-time tasks, use the drop-down lists to specify the start date and time.
  
  • For recurring tasks, see Configuring a Recurring Task, on page 183.

**Step 4** Enter a Job Name.

**Step 5** Choose a Backup Profile.

**Step 6** (Optional) Enter a Comment.

Keep comments brief. They will appear in the Task Details section of the schedule calendar page.

**Step 7** (Optional) Enter an email address, or a comma-separated list of email addresses, in the Email Status To: field.

For information on setting up an email relay server to send task status messages, see Configuring a Mail Relay Host and Notification Address, on page 830.

**Step 8** Click Save.

---

Configuring Certificate Revocation List Downloads

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Device dependent</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

You must perform this procedure using the local web interface for the Firepower Management Center or the 7000 or 8000 Series device. In a multidomain deployment, this task is only supported in the Global domain for the Firepower Management Center.

The system automatically creates the Download CRL task when you enable downloading a certificate revocation list (CRL) in the local configuration on an appliance where you enable user certificates or audit log certificates for the appliance. You can use the scheduler to edit the task to set the frequency of the update.
Before you begin

• Enable and configure user certificates or audit log certificates and set one or more CRL download URLs. See Requiring Valid HTTPS Client Certificates, on page 794 and Require Valid Audit Log Server Certificates, on page 827 for more information.

Procedure

- **Step 1** Select System > Tools > Scheduling.
- **Step 2** Click Add Task.
- **Step 3** From Job Type, select Download CRL.
- **Step 4** Specify how you want to schedule the CRL download, Once or Recurring:
  - For one-time tasks, use the drop-down lists to specify the start date and time.
  - For recurring tasks, see Configuring a Recurring Task, on page 183 for details.
- **Step 5** Type a name in the Job Name field.
- **Step 6** If you want to comment on the task, type a comment in the Comment field.
  The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.
- **Step 7** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the Email Status To: field. You must have a valid email relay server configured on the Firepower Management Center to send status messages.
- **Step 8** Click Save.

Related Topics

- Configuring a Mail Relay Host and Notification Address, on page 830

Automating Policy Deployment

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

After modifying configuration settings in the FMC, you must deploy those changes to the affected devices. In a multidomain deployment, you can schedule policy deployments only for your current domain.

Caution

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 and Configurations that Restart the Snort Process When Deployed or Activated, on page 342.
Procedure

Step 1  Select System > Tools > Scheduling.
Step 2  Click Add Task.
Step 3  From Job Type, select Deploy Policies.
Step 4  Specify how you want to schedule the task, Once or Recurring:
  • For one-time tasks, use the drop-down lists to specify the start date and time.
  • For recurring tasks, see Configuring a Recurring Task, on page 183 for details.
Step 5  Type a name in the Job Name field.
Step 6  In the Device field, select a device where you want to deploy policies.
Step 7  If you want to comment on the task, type a comment in the Comment field.
The comment field displays in the Tasks Details section of the schedule calendar page; keep comments brief.
Step 8  If you want to email task status messages, type an email address (or multiple email addresses separated by
  commas) in the Email Status To: field. You must have a valid email relay server configured to send status
  messages.
Step 9  Click Save.

Out-of-Date Policies, on page 347

Nmap Scan Automation

You can schedule regular Nmap scans of targets on your network. Automated scans allow you to refresh
information previously supplied by an Nmap scan. Because the Firepower System cannot update Nmap-supplied
data, you need to rescans periodically to keep that data up to date. You can also schedule scans to automatically
test for unidentified applications or servers on hosts in your network.

Note that a Discovery Administrator can also use an Nmap scan as a remediation. For example, when an
operating system conflict occurs on a host, that conflict may trigger an Nmap scan. Running the scan obtains
updated operating system information for the host, which resolves the conflict.

If you have not used the Nmap scanning capability before, you configure Nmap scanning before defining a
scheduled scan.

Related Topics

Nmap Scanning, on page 1771

Scheduling an Nmap Scan

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>
After Nmap replaces a host’s operating system, applications, or servers detected by the system with the results from an Nmap scan, the system no longer updates the information replaced by Nmap for the host. Nmap-supplied service and operating system data remains static until you run another Nmap scan. If you plan to scan a host using Nmap, you may want to set up regularly scheduled scans to keep Nmap-supplied operating systems, applications, or servers up to date. If the host is deleted from the network map and re-added, any Nmap scan results are discarded and the system resumes monitoring of all operating system and service data for the host.

In a multidomain deployment:

- You can schedule scans only for your current domain
- The remediation and Nmap targets you select must exist at your current domain or an ancestor domain.
- Choosing to perform an Nmap scan on a non-leaf domain scans the same targets in each descendant of that domain.

**Procedure**

**Step 1** Select **System > Tools > Scheduling**.

**Step 2** Click **Add Task**.

**Step 3** From **Job Type**, select **Nmap Scan**.

**Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see **Configuring a Recurring Task**, on page 183 for details.

**Step 5** Type a name in the **Job Name** field.

**Step 6** In the **Nmap Remediation** field, select an Nmap remediation.

**Step 7** In the **Nmap Target** field, select the scan target.

**Step 8** In the **Domain** field, select the domain whose network map you want to augment.

**Step 9** If you want to comment on the task, type a comment in the **Comment** field.

**Tip** The comment field appears in the Task Details section of the calendar schedule page; keep comments brief.

**Step 10** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.

**Step 11** Click **Save**.

You can automate reports so that they run at regular intervals.

In a multidomain deployment, you can schedule reports only for your current domain.

**Before you begin**

- For reports other than risk reports: Create a report template. See Report Templates, on page 1973 for more information.
- If you want to distribute email reports using the scheduler, configure a mail relay host and specify report recipients and message information. See Configuring a Mail Relay Host and Notification Address, on page 830 and (for reports other than risk reports) Distributing Reports by Email at Generation Time, on page 1995 or (for risk reports) Generating, Viewing, and Printing Risk Reports, on page 1971.
- (Optional) Set or change the file name, output format, time window, or email distribution settings of the scheduled report. See Specify Report Generation Settings for a Scheduled Report, on page 191.

**Procedure**

**Step 1** Select System > Tools > Scheduling.

**Step 2** Click Add Task.

**Step 3** From the Job Type list, select Report.

**Step 4** Specify how you want to schedule the task, Once or Recurring:

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see Configuring a Recurring Task, on page 183 for details.

**Step 5** Type a name in the Job Name field.

**Step 6** In the Report Template field, select a risk report or report template.

**Step 7** If you want to comment on the task, type a comment in the Comment field.

The comment field appears in the Tasks Details section of the schedule calendar page; keep comments brief.

**Step 8** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the Email Status To: field. You must have a valid email relay server configured to send status messages.

**Note** Configuring this option does not distribute the reports.

**Step 9** If you do not want to receive report email attachments when reports have no data (for example, when no events of a certain type occurred during the report period), select the If report is empty, still attach to email check box.
Step 10  Click Save.

Specify Report Generation Settings for a Scheduled Report

<table>
<thead>
<tr>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst</td>
</tr>
</tbody>
</table>

To specify or change the file name, output format, time window, or email distribution settings of a scheduled report:

Procedure

Step 1  Select Overview > Reporting > Report Templates.
Step 2  Click Edit for the report template to change.
Step 3  Click Generate.

Note  If you want to change report generation settings without generating the report now, you must click Generate from the template configuration page. Changes will not be saved if you click Generate from the template list view unless you generate the report.

Step 4  Modify settings.
Step 5  To save the new settings without generating the report, click Cancel.
To save the new settings and generate the report, click Generate and skip the rest of the steps in this procedure.
Step 6  Click Save.
Step 7  If you see a prompt to save even though you haven't made changes, click OK.

Automating Firepower Recommendations

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

You can automatically generate rule state recommendations based on network discovery data for your network using the most recently saved configuration settings in a custom intrusion policy.

Note  If the system automatically generates scheduled recommendations for an intrusion policy with unsaved changes, you must discard your changes in that policy and commit the policy if you want the policy to reflect the automatically generated recommendations.
When the task runs, the system automatically generates recommended rule states, and modifies the states of intrusion rules based on the configuration of your policy. Modified rule states take effect the next time you deploy your intrusion policy.

In a multidomain deployment, you can automate recommendations for intrusion policies at the current domain level. The system builds a separate network map for each leaf domain. In a multidomain deployment, if you enable this feature in an intrusion policy in an ancestor domain, the system generates recommendations using data from all descendant leaf domains. This can enable intrusion rules tailored to assets that may not exist in all leaf domains, which can affect performance.

**Before you begin**

- Configure Firepower recommended rules in an intrusion policy as described in [Generating and Applying Firepower Recommendations, on page 1442](#).
- If you want to email task status messages, configure a valid email relay server.

**Procedure**

**Step 1** Choose **System > Tools > Scheduling**.

**Step 2** Click **Add Task**.

**Step 3** From **Job Type**, choose **Firepower Recommended Rules**.

**Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see [Configuring a Recurring Task, on page 183](#) for details.

**Step 5** Enter a name in the **Job Name** field.

**Step 6** Next to **Policies**, choose one or more intrusion policies where you want to generate recommendations. Check **All Policies** check box to choose all intrusion policies.

**Step 7** (Optional) Enter a comment in the **Comment** field.

Keep comments brief. Comments appear in the Task Details section of the schedule calendar page.

**Step 8** (Optional) To email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To**: field.

**Step 9** Click **Save**.

**Related Topics**

**Software Update Automation**

You can automatically download and apply most patches and feature releases to the Firepower System.
The tasks you must schedule to install software updates vary depending on whether you are updating the FMC or are using a FMC to update managed devices.

Note Cisco strongly recommends that you use your FMCs to update the devices they manage.

- To update the FMC, schedule the software installation using the Install Latest Update task.
- To use a FMC to automate software updates for its managed devices, you must schedule two tasks:
  - Push (copy) the update to managed devices using the Push Latest Update task.
  - Install the update on managed devices using the Install Latest Update task.

When scheduling updates to managed devices, schedule the push and install tasks to happen in succession; you must first push the update to the device before you can install it. To automate software updates on a device group, you must select all the devices within the group. Allow enough time between tasks for the process to complete; schedule tasks at least 30 minutes apart. If you schedule a task to install an update and the update has not finished copying from the FMC to the device, the installation task will not succeed. However, if the scheduled installation task repeats daily, it will install the pushed update when it runs the next day.

Note You must manually upload and install updates in two situations. First, you cannot schedule major updates to the Firepower System. Second, you cannot schedule updates for or pushes from FMC that cannot access the Support Site. If your FMC is not directly connected to the Internet, you should use management interfaces configuration to set up a proxy to allow it to download updates from the Support Site.

Note that a task scheduled to install an update on a device group will install the pushed update to each device within the device group simultaneously. Allow enough time for the scheduled task to complete for each device within the device group.

If you want to have more control over this process, you can use the Once option to download and install updates during off-peak hours after you learn that an update has been released.

## Automating Software Downloads

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Global only</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

You can create a scheduled task that automatically downloads the latest software updates from Cisco. You can use this task to schedule download of updates you plan to install manually.
Procedure

Step 1  Select System > Tools > Scheduling.
Step 2  Click Add Task.
Step 3  From the Job Type list, select Download Latest Update.
Step 4  Specify how you want to schedule the task, Once or Recurring:
  - For one-time tasks, use the drop-down lists to specify the start date and time.
  - For recurring tasks, see Configuring a Recurring Task, on page 183 for details.

Step 5  Type a name in the Job Name field.
Step 6  Next to Update Items, check Software check box.
Step 7  If you want to comment on the task, type a comment in the Comment field.
The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.
Step 8  If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the Email Status To: field. You must have a valid email relay server configured to send status messages.
Step 9  Click Save.

</tr>
</tbody>
</table>

If you want to automate the installation of software updates on managed devices, you must push the updates to the devices before installing.

When you create the task to push software updates to managed devices, make sure you allow enough time between the push task and a scheduled install task for the updates to be copied to the device.

Procedure

Step 1  Select System > Tools > Scheduling.
Step 2  Click Add Task.
Step 3  From the Job Type list, select Push Latest Update.
Step 4  Specify how you want to schedule the task, Once or Recurring:
  - For one-time tasks, use the drop-down lists to specify the start date and time.
  - For recurring tasks, see Configuring a Recurring Task, on page 183 for details.
Step 5  Type a name in the Job Name field.
Step 6 From the **Device** drop-down list, select the device that you want to update.

Step 7 If you want to comment on the task, type a comment in the **Comment** field.

The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.

Step 8 If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.

Step 9 Click **Save**.

</tr>
</tbody>
</table>

Make sure you allow enough time between the task that pushes the update to a managed device and the task that installs the update.

---

**Caution**

Depending on the update being installed, the appliance may reboot after the software is installed.

---

### Procedure

**Step 1** Select **System > Tools > Scheduling**.

**Step 2** Click **Add Task**.

**Step 3** From the **Job Type** list, select **Install Latest Update**.

**Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see **Configuring a Recurring Task**, on page 183 for details.

**Step 5** Type a name in the **Job Name** field.

**Step 6** From the **Device** drop-down list, select the appliance (including the Firepower Management Center) where you want to install the update.

**Step 7** Next to **Update Items**, check the **Software** check box.

**Step 8** If you want to comment on the task, type a comment in the **Comment** field.

The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.

**Step 9** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.
Vulnerability Database Update Automation

Cisco uses vulnerability database (VDB) updates to expand the list of network assets, traffic, and vulnerabilities that the Firepower System recognizes. You can use the scheduling feature to update the VDB, thereby ensuring that you are using the most up-to-date information to evaluate the hosts on your network.

When automating VDB updates, you must automate two separate steps:

- Downloading the VDB update.
- Installing the VDB update.

⚠️ Caution: Installing a vulnerability database (VDB) update immediately restarts the Snort process on all managed devices. Additionally, the first deploy after installing the VDB might cause a Snort restart depending on the VDB content. In either scenario, the restart interrupts traffic inspection. Whether traffic drops during the interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 for more information.

Allow enough time between tasks for the process to complete. For example, if you schedule a task to install an update and the update has not fully downloaded, the installation task will not succeed. However, if the scheduled installation task repeats daily, it will install the downloaded VDB update when the task runs the next day.

Note:

- You cannot schedule updates for appliances that cannot access the Support Site. If your FMC is not directly connected to the Internet, you should use management interfaces configuration to set up a proxy to allow it to download updates from the Support Site.
- If you want to have more control over this process, you can use the Once option to download and install VDB updates during off-peak hours after you learn that an update has been released.
- In multidomain deployments, you can only schedule VDB updates for the Global domain. The changes take effect when you redeploy policies.

Automating URL Filtering Updates Using a Scheduled Task

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL Filtering</td>
<td>URL Filtering</td>
<td>Any</td>
<td>Global only</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

In order to ensure that threat data for URL filtering is current, the system must obtain data updates from the Cisco Collective Security Intelligence (CSI) cloud.

By default, when you enable URL filtering, automatic updates are enabled. However, if you need to control when these updates occur, use the procedure described in this topic instead of the default update mechanism.

Although daily updates tend to be small, if it has been more than five days since your last update, new URL filtering data may take up to 20 minutes to download, depending on your bandwidth. Then, it may take up to 30 minutes to perform the update itself.

Before you begin

• Ensure the Firepower Management Center has internet access; see Security, Internet Access, and Communication Ports, on page 2357.

• Ensure that URL filtering is enabled. See Enable URL Filtering Using Category and Reputation, on page 1166 for more information.

• Verify that Enable Automatic Updates is not selected on the Cisco CSI under the System > Integration menu.
**Procedure**

Step 1 Select **System > Tools > Scheduling**.

Step 2 Click **Add Task**.

Step 3 From the **Job Type** list, select **Update URL Filtering Database**.

Step 4 Specify how you want to schedule the update, **Once** or **Recurring**:  
  - For one-time tasks, use the drop-down lists to specify the start date and time.
  - For recurring tasks, see **Configuring a Recurring Task, on page 183** for details.

Step 5 Type a name in the **Job Name** field.

Step 6 If you want to comment on the task, type a comment in the **Comment** field.

The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.

Step 7 If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To**: field. You must have a valid email relay server configured to send status messages.

Step 8 Click **Save**.

**Scheduled Task Review**

After adding scheduled tasks, you can view them and evaluate their status. The View Options section of the page allows you to view scheduled tasks using a calendar and a list of scheduled tasks.

The Calendar view option allows you to view which scheduled tasks occur on which day.

The Task List shows a list of tasks along with their status. The task list appears below the calendar when you open the calendar. In addition, you can view it by selecting a date or task from the calendar.

You can edit a scheduled task that you previously created. This feature is especially useful if you want to test a scheduled task once to make sure that the parameters are correct. Later, after the task completes successfully, you can change it to a recurring task.

There are two types of deletions you can perform from the Schedule View page. You can delete a specific one-time task that has not yet run or you can delete every instance of a recurring task. If you delete an instance of a recurring task, all instances of the task are deleted. If you delete a task that is scheduled to run once, only that task is deleted.

</tr>
</tbody>
</table>

In a multidomain deployment, you can view scheduled tasks only for your current domain.
### Procedure

**Step 1** Select System > Tools > Scheduling.

**Step 2** You can perform the following tasks using the calendar view:

- Click double left arrow (<<) to move back one year.
- Click single left arrow (Left Arrow) to move back one month.
- Click single right arrow (Right Arrow) to move forward one month.
- Click double right arrow (>>) to move forward one year.
- Click Today to return to the current month and year.
- Click Add Task to schedule a new task.
- Click a date to view all scheduled tasks for the specific date in a task list table below the calendar.
- Click a specific task on a date to view the task in a task list table below the calendar.

### Editing Scheduled Tasks

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can edit scheduled tasks only for your current domain.

**Procedure**

**Step 1** Select System > Tools > Scheduling.

**Step 2** On the calendar, click either the task that you want to edit or the day on which the task appears.

**Step 3** In the Task Details table, click edit (Edit) next to the task you want to edit.

**Step 4** Edit the task.

**Step 5** Click Save.

### Deleting Scheduled Tasks

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can delete scheduled tasks only for your current domain.
Procedure

**Step 1**  Select System > Tools > Scheduling.

**Step 2**  In the calendar, click the task you want to delete. For a recurring task, click an instance of the task.

**Step 3**  In the Task Details table, click delete (Trash), then confirm your choice.
The following topic describes how to purge discovery data from the FMC:

- Purging Data from the FMC Database, on page 203

## Purging Data from the FMC Database

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Global only</td>
<td>Admin/Security Analyst</td>
</tr>
</tbody>
</table>

You can use the database purge page to purge discovery, identity, connection, and Security Intelligence data files from the FMC databases. Note that when you purge a database, the appropriate process is restarted.

**Caution**

Purging a database removes the data you specify from the Firepower Management Center. After the data is deleted, it *cannot* be recovered.

### Procedure

**Step 1**

Choose System > Tools > Data Purge.

**Step 2**

Under Discovery and Identity, perform any or all of the following:

- Check the Network Discovery Events check box to remove all network discovery events from the database.
- Check the Hosts check box to remove all hosts and Indications of Compromise flags from the database.
- Check the User Activity check box to remove all user activity events from the database.
- Check the User Identities check box to remove all user login and user history data from the database.

**Step 3**

Under Connections, perform any or all of the following:

- Check the Connection Events check box to remove all connection data from the database.
• Check the **Connection Summary Events** check box to remove all connection summary data from the database.

• Check the **Security Intelligence Events** check box to remove all Security Intelligence data from the database.

**Note**  
Checking the **Connection Events** check box does not remove Security Intelligence events. Connections with Security Intelligence data will still appear in the Security Intelligence event page (available under the Analysis > Connections menu). Correspondingly, checking the **Security Intelligence Events** check box does not remove connection events with associated Security Intelligence data.

**Step 4**  
Click **Purge Selected Events**.  
The items are purged and the appropriate processes are restarted.
CHAPTER 11

Firepower Management Center High Availability

The following topics describe how to configure Active/Standby high availability of Cisco Firepower Management Centers:

- About Firepower Management Center High Availability, on page 205
- Establishing Firepower Management Center High Availability, on page 211
- Viewing Firepower Management Center High Availability Status, on page 213
- Configurations Synced on Firepower Management Center High Availability Pairs, on page 214
- Using CLI to Resolve Device Registration in Firepower Management Center High Availability, on page 214
- Switching Peers in a Firepower Management Center High Availability Pair, on page 215
- Pausing Communication Between Paired Firepower Management Centers, on page 216
- Restarting Communication Between Paired Firepower Management Centers, on page 216
- Changing the IP address of a Firepower Management Center in a High Availability Pair, on page 217
- Disabling Firepower Management Center High Availability, on page 218
- Replacing FMCs in a High Availability Pair, on page 218

About Firepower Management Center High Availability

To ensure the continuity of operations, the high availability feature allows you to designate redundant Firepower Management Centers to manage devices. Firepower Management Centers support Active/Standby high availability where one appliance is the active unit and manages devices. The standby unit does not actively manage devices. The active unit writes configuration data into a data store and replicates data for both units, using synchronization where necessary to share some information with the standby unit.

Active/Standby high availability lets you configure a secondary Firepower Management Center to take over the functionality of a primary Firepower Management Center if the primary fails. When the primary Firepower Management Center fails, you must promote the secondary Firepower Management Center to become the active unit.

Event data streams from managed devices to both Firepower Management Centers in the high availability pair. If one Firepower Management Center fails, you can monitor your network without interruption using the other Firepower Management Center.

Note that Firepower Management Centers configured as a high availability pair do not need to be on the same trusted management network, nor do they have to be in the same geographic location.
Because the system restricts some functionality to the active Firepower Management Center, if that appliance fails, you must promote the standby Firepower Management Center to active.

Caution

System Requirements Firepower Management Center High Availability

This section describes the hardware, software, and license requirements for Firepower Management Centers in a high availability configuration.

Hardware Requirements

• The two Firepower Management Centers in a high availability configuration must be the same model.
• The primary Firepower Management Center backup must not be restored to the secondary Firepower Management Center.

Bandwidth Requirements: There must be at least a 5Mbps network bandwidth between two Firepower Management Centers to setup a high availability configuration between them.

Software Requirements

Access the Appliance Information widget to verify the software version, the intrusion rule update version and the vulnerability database update. By default, the widget appears on the Status tab of the Detailed Dashboard and the Summary Dashboard. For more information, see The Appliance Information Widget, on page 254

• The two Firepower Management Centers in a high availability configuration must have the same major (first number), minor (second number), and maintenance (third number) software version.
• The two Firepower Management Centers in a high availability configuration must have the same version of the intrusion rule update installed.
• The two Firepower Management Centers in a high availability configuration must have the same version of the vulnerability database update installed.

Warning

If the software versions, intrusion rule update versions and vulnerability database update versions are not identical on both Firepower Management Centers, you cannot establish high availability.

License Requirements

All Licensing Types

No special license is required for Firepower Management Center appliances in a high availability pair.

A device managed with Firepower Management Center appliances in a high availability configuration requires the same number of feature licenses and subscriptions as a device managed by a single Firepower Management Center.
The system automatically replicates all feature licenses from active to standby Firepower Management Center when the high-availability pair is formed, and updates license changes during ongoing data synchronization, so the licenses are available on failover.

**Smart Licensing**

Example: If you want to enable advanced malware protection for two Firepower Threat Defense devices managed by a Firepower Management Center pair, buy two Malware licenses and two TM subscriptions, register the active Firepower Management Center with the Cisco Smart Software Manager, then assign the licenses to the two Firepower Threat Defense devices on the active Firepower Management Center.

Only the active Firepower Management Center is registered with Cisco Smart Software Manager. When failover occurs, the system communicates with Cisco Smart Software Manager to release the Smart License entitlements from the originally-active Firepower Management Center and assign them to the newly-active Firepower Management Center.

**Classic Licensing**

Example: If you want to enable advanced malware protection for two devices managed by a Firepower Management Center pair, buy two Malware licenses and two TAM subscriptions, add those licenses to the Firepower Management Center, then assign the licenses to the two devices on the active Firepower Management Center.

---

**Roles v. Status in Firepower Management Center High Availability**

**Primary/Secondary Roles**

When setting up Firepower Management Centers in a high availability pair, you configure one Firepower Management Center to be primary and the other as secondary. During configuration, the primary unit's policies are synchronized to the secondary unit. After this synchronization, the primary Firepower Management Center becomes the active peer, while the secondary Firepower Management Center becomes the standby peer, and the two units act as a single appliance for managed device and policy configuration.

**Active/Standby Status**

The main differences between the two Firepower Management Centers in a high availability pair are related to which peer is active and which peer is standby. The active Firepower Management Center remains fully functional, where you can manage devices and policies. On the standby Firepower Management Center, functionality is hidden; you cannot make any configuration changes.

**Prerequisites to Establish Firepower Management Center High Availability**

Before establishing a Firepower Management Center high availability pair:

- Export required policies from the intended secondary Firepower Management Center to the intended primary Firepower Management Center. For more information, see Exporting Configurations, on page 179.

- Make sure that the intended secondary Firepower Management Center does not have any devices added to it. Delete devices from the intended secondary Firepower Management Center and register these devices to the intended primary Firepower Management Center. For more information see Deleting...
Devices from the Firepower Management Center, on page 230 and Add Devices to the Firepower Management Center, on page 228.

• Import the policies into the intended primary Firepower Management Center. For more information, see Importing Configurations, on page 180.

• On the intended primary Firepower Management Center, verify the imported policies, edit them as needed and deploy them to the appropriate device. For more information, see Deploy Configuration Changes, on page 337.

• On the intended primary Firepower Management Center, associate the appropriate licenses to the newly added devices. For more information see Assign Licenses to Managed Devices from the Device Management Page, on page 138.

You can now proceed to establish high availability. For more information, see Establishing Firepower Management Center High Availability, on page 211.

Event Processing on Firepower Management Center High Availability Pairs

Since both Firepower Management Centers in a high availability pair receive events from managed devices, the management IP addresses for the appliances are not shared. This means that you do not need to intervene to ensure continuous processing of events if a Firepower Management Center fails.

AMP Cloud Connections and Malware Information

Although they share file policies and related configurations, Firepower Management Centers in a high availability pair share neither Cisco AMP cloud connections nor malware dispositions. To ensure continuity of operations, and to ensure that detected files’ malware dispositions are the same on both Firepower Management Centers, both primary and secondary Firepower Management Centers must have access to the AMP cloud.

URL Filtering and Security Intelligence

URL filtering and Security Intelligence configurations and information are synchronized between Firepower Management Centers in a high availability deployment. However, only the primary Firepower Management Center downloads URL category and reputation data for updates to Security Intelligence feeds.

If the primary Firepower Management Center fails, not only must you make sure that the secondary Firepower Management Center can access the internet to update threat intelligence data, but you must also use the web interface on the secondary Firepower Management Center to promote it to active.

User Data Processing During Firepower Management Center Failover

If the primary Firepower Management Center fails, the Secondary Firepower Management Center propagates to managed devices user-to-IP mappings from the user agent identity source; and propagates SGT mappings from the ISE identity source. Users not yet seen by identity sources are identified as Unknown.

After the downtime, the Unknown users are re identified and processed according to the rules in your identity policy.
Configuration Management on Firepower Management Center High Availability Pairs

In a high availability deployment, only the active Firepower Management Center can manage devices and apply policies. Both Firepower Management Centers remain in a state of continuous synchronization.

If the active Firepower Management Center fails, the high availability pair enters a degraded state until you manually promote the standby appliance to the active state. Once the promotion is complete, the appliances leave maintenance mode.

Firepower Management Center High Availability Behavior During a Backup

When you perform a Backup on a Firepower Management Center high availability pair, the Backup operation pauses synchronization between the peers. During this operation, you may continue using the active Firepower Management Center, but not the standby peer.

After Backup is completed, synchronization resumes, which briefly disables processes on the active peer. During this pause, the High Availability page briefly displays a holding page until all processes resume.

Firepower Management Center High Availability Split-Brain

If the active Firepower Management Center in a high-availability pair goes down (due to power issues, network/connectivity issues), you can promote the standby Firepower Management Center to an active state. When the original active peer comes up, both peers can assume they are active. This state is defined as 'split-brain'. When this situation occurs, the system prompts you to choose an active appliance, which demotes the other appliance to standby.

If the active Firepower Management Center goes down (or disconnects due to a network failure), you may either break high availability or switch roles. The standby Firepower Management Center enters a degraded state.

Note

Whenever appliance you use as the secondary loses all of its device registrations and policy configurations when you resolve split-brain. For example, you would lose modifications to any policies that existed on the secondary but not on the primary. If the Firepower Management Center is in a high availability split-brain scenario where both appliances are active, and you register managed devices and deploy policies before you resolve split-brain, you must export any policies and unregister any managed devices from the intended standby Firepower Management Center before re-establishing high availability. You may then register the managed devices and import the policies to the intended active Firepower Management Center.

Upgrading Firepower Management Centers in a High Availability Pair

Cisco electronically distributes several different types of updates periodically. These include major and minor upgrades to the system software. You may need to install these updates on Firepower Management Centers in a high availability setup.

Warning

Make sure that there is at least one operational Firepower Management Center during an upgrade.
**Before you begin**

Read the release notes or advisory text that accompanies the upgrade. The release notes provide important information, including supported platforms, compatibility, prerequisites, warnings, and specific installation and uninstallation instructions.

**Procedure**

**Step 1** Access the web interface of the active Firepower Management Center and pause data synchronization; see Pausing Communication Between Paired Firepower Management Centers, on page 216.

**Step 2** Upgrade the standby Firepower Management Center; see Update Software on a Firepower Management Center.

When the upgrade completes, the standby unit becomes active. When both peers are active, the high availability pair is in a degraded state (split-brain).

**Step 3** Upgrade the other Firepower Management Center.

**Step 4** Decide which Firepower Management Center you want to use as the standby. Any additional devices or policies added to the standby after pausing synchronization are not synced to the active Firepower Management Center. Unregister only those additional devices and export any configurations you want to preserve.

When you choose a new active Firepower Management Center, the Firepower Management Center you designate as secondary will lose device registrations and deployed policy configurations, which are not synced.

**Step 5** Resolve split-brain by choosing the new active Firepower Management Center which has all the latest required configurations for policies and devices.

---

**Troubleshooting Firepower Management Center High Availability**

This section lists troubleshooting information for some common Firepower Management Center high availability operation errors.

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>500 Internal</td>
<td>May appear when attempting to access the web interface while performing critical Firepower Management Center high availability operations, including switching peer roles or pausing and resuming synchronization.</td>
<td>Wait until the operation completes before using the web interface.</td>
</tr>
</tbody>
</table>
1. Access the Firepower Management Center shell and use the manage_hadc.pl command to access the Firepower Management Center high availability configuration utility. Run the utility as a root user, using `sudo`.

2. Pause mirroring operations by using option 5. Reload the Firepower Management Center web interface.

3. Use the web interface to resume synchronization. Choose System > Integration, then click the High Availability tab and choose Resume Synchronization.

### Establishing Firepower Management Center High Availability

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Management Centers</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>MC1500, MC2000, MC3500, MC4000</td>
<td>Global</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Establishing high availability can take a significant amount of time, even several hours, depending on the bandwidth between the peers and the number of policies. It also depends on the number of devices registered to the active Firepower Management Center, which need to be synced to the standby Firepower Management Center. You can view the High Availability page to check the status of the high availability peers.

**Before you begin**

- Confirm that both the Firepower Management Centers adhere to the high availability system requirements. For more information, see System Requirements Firepower Management Center High Availability, on page 206.

- Confirm that you completed the prerequisites for establishing high availability. For more information, see Prerequisites to Establish Firepower Management Center High Availability, on page 207.

**Procedure**

**Step 1** Log into the Firepower Management Center that you want to designate as the secondary.
Step 2  Choose **System > Integration**.

Step 3  Choose **High Availability**.

Step 4  Under Role for this Firepower Management Center, choose **Secondary**.

Step 5  Enter the hostname or IP address of the primary Firepower Management Center in the **Primary Firepower Management Center Host** text box.

You can leave this empty if the primary Firepower Management Center does not have a routable address. In this case, use both the **Registration Key** and the **Unique NAT ID** fields. You also need to specify the secondary IP address on the primary unit; you need to specify the IP address of at least one unit.

Step 6  Enter a one-time-use registration key in the **Registration Key** text box.

The registration key is any user-defined alphanumeric value up to 37 characters in length. This registration key will be used to register both the secondary and the primary Firepower Management Centers.

Step 7  If you did not specify the primary IP address, or if you do not plan to specify the secondary IP address on the primary Firepower Management Center, then in the **Unique NAT ID** field, enter a unique alphanumeric ID. See **NAT Environments**, on page 225 for more information.

Step 8  Click **Register**.

Step 9  Using an account with Admin access, log into the Firepower Management Center that you want to designate as the primary.

Step 10 Choose **System > Integration**.

Step 11 Choose **High Availability**.

Step 12 Under Role for this Firepower Management Center, choose **Primary**.

Step 13 Enter the hostname or IP address of the secondary Firepower Management Center in the **Secondary Firepower Management Center Host** text box.

You can leave this empty if the secondary Firepower Management Center does not have a routable address. In this case, use both the **Registration Key** and the **Unique NAT ID** fields. You also need to specify the primary IP address on the secondary unit; you need to specify the IP address of at least one unit.

Step 14 Enter the same one-time-use registration key in the **Registration Key** text box you used in step 6.

Step 15 If required, enter the same NAT ID that you used in step 7 in the **Unique NAT ID** text box.

Step 16 Click **Register**.

---

**What to do next**

After establishing a Firepower Management Center high availability pair, devices registered to the active Firepower Management Center are automatically registered to the standby Firepower Management Center.

---

**Note**

When a registered device has a NAT IP address, automatic device registration fails and the secondary Firepower Management Center High Availability page lists the device as local, pending. You can then assign a different NAT IP address to the device on the standby Firepower Management Center High Availability page. If automatic registration otherwise fails on the standby Firepower Management Center, but the device appears to be registered to the active Firepower Management Center, see **Using CLI to Resolve Device Registration in Firepower Management Center High Availability**, on page 214.
Viewing Firepower Management Center High Availability Status

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Management Centers</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>MC1500, MC2000, MC3500, MC4000</td>
<td>Global</td>
<td>Admin</td>
</tr>
</tbody>
</table>

After you identify your active and standby Firepower Management Centers, you can view information about the local Firepower Management Center and its peer.

**Note**

In this context, Local Peer refers to the appliance where you are viewing the system status. Remote Peer refers to the other appliance, regardless of active or standby status.

**Procedure**

**Step 1** Log into one of the Firepower Management Centers that you paired using high availability.

**Step 2** Choose System > Integration.

**Step 3** Choose High Availability.

You can view:

**Summary Information**

- The health status of the high availability pair
- The current synchronization status of the high availability pair
- The IP address of the active peer and the last time it was synchronized
- The IP address of the standby peer and the last time it was synchronized

**System Status**

- The IP addresses for both peers
- The operating system for both peers
- The software version for both peers
- The appliance model of both peers
Configurations Synced on Firepower Management Center High Availability Pairs

When you establish high availability between two Firepower Management Centers, the following configuration data is synced between them:

- License entitlements
- Access control policies
- Intrusion rules
- Malware and file policies
- DNS policies
- Identity policies
- SSL policies
- Prefilter policies
- Network discovery rules
- Application detectors
- Correlation policy rules
- Alerts
- Scanners
- Response groups

- Remediation settings, although you must install custom modules on both Firepower Management Centers. For more information on remediation settings, see Managing Remediation Modules, on page 1966.

Using CLI to Resolve Device Registration in Firepower Management Center High Availability

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Management Centers</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>MC1500, MC2000, MC3500, MC4000</td>
<td>Global</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If automatic device registration fails on the standby Firepower Management Center, but appears to be registered to the active Firepower Management Center, complete the following steps:
Procedure

**Step 1**  Unregister the device from the active Firepower Management Center.
**Step 2**  Log into the CLI for the affected device.
**Step 3**  Run the CLI command: `configure manager delete`.
This command disables and removes the current Firepower Management Center.
**Step 4**  Run the CLI command: `configure manager add`.
This command configures the device to initiate a connection to a Firepower Management Center.

**Tip**  Configure remote management on the device, only for the active Firepower Management Center. When high availability is established, devices are automatically added to be managed by the standby Firepower Management Center.

**Step 5**  Log into the active Firepower Management Center and register the device.

---

### Switching Peers in a Firepower Management Center High Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Management Centers</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>MC1500, MC2000, MC3500, MC4000</td>
<td>Global</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Because the system restricts some functionality to the active Firepower Management Center, if that appliance fails, you must promote the standby Firepower Management Center to active:

**Procedure**

**Step 1**  Log into one of the Firepower Management Centers that you paired using high availability.
**Step 2**  Choose **System > Integration**.
**Step 3**  Choose **High Availability**.
**Step 4**  Choose **Switch Peer Roles** to change the local role from Active to Standby, or Standby to Active. With the Primary or Secondary designation unchanged, the roles are switched between the two peers.
Pausing Communication Between Paired Firepower Management Centers

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Management Centers</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>MC1500, MC2000, MC3500, MC4000</td>
<td>Global</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If you want to temporarily disable high availability, you can disable the communications channel between the Firepower Management Centers. If you pause synchronization on the active peer, you can resume synchronization on either the standby or active peer. However, if you pause synchronization on the standby peer, you only can resume synchronization on the standby peer.

**Procedure**

**Step 1** Log into one of the Firepower Management Centers that you paired using high availability.

**Step 2** Choose System > Integration.

**Step 3** Choose High Availability.

**Step 4** Choose Pause Synchronization.

Restarting Communication Between Paired Firepower Management Centers

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Management Centers</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>MC1500, MC2000, MC3500, MC4000</td>
<td>Global</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If you temporarily disable high availability, you can restart high availability by enabling the communications channel between the Firepower Management Centers. If you paused synchronization on the active unit, you can resume synchronization on either the standby or active unit. However, if you paused synchronization on the standby unit, you only can resume synchronization on the standby unit.

**Procedure**

**Step 1** Log into one of the Firepower Management Centers that you paired using high availability.

**Step 2** Choose System > Integration.
**Step 3** Choose **High Availability**.

**Step 4** Choose **Resume Synchronization**.

---

# Changing the IP address of a Firepower Management Center in a High Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Management Centers</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>MC1500, MC2000, MC3500, MC4000</td>
<td>Global</td>
<td>Admin</td>
</tr>
</tbody>
</table>

---

**Note**

If you landed on this topic while trying to edit remote management on a 7000 and 8000 Series managed device, see *Editing Remote Management on a Managed Device, on page 472.*

If the IP address for one of the high availability peers changes, high availability enters a degraded state. To recover high availability, you must manually change the IP address.

**Procedure**

**Step 1** Log into one of the Firepower Management Centers that you paired using high availability.

**Step 2** Choose **System > Integration**.

**Step 3** Choose **High Availability**.

**Step 4** Choose **Peer Manager**.

**Step 5** Choose **edit**.

**Step 6** Enter the display name of the appliance, which is used only within the context of the Firepower System. Entering a different display name does not change the host name for the appliance.

**Step 7** Enter the fully qualified domain name or the name that resolves through the local DNS to a valid IP address (that is, the host name), or the host IP address.

**Step 8** Click **Save**.
Disabling Firepower Management Center High Availability

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Management Centers</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>MC1500, MC2000, MC3500, MC4000</td>
<td>Global</td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Log into one of the Firepower Management Centers in the high availability pair.

**Step 2** Choose **System > Integration**.

**Step 3** Choose **High Availability**.

**Step 4** Choose **Break High Availability**.

**Step 5** Choose one of the following options for handling managed devices:

- To control all managed devices with this Firepower Management Center, choose **Manage registered devices from this console**. All devices will be unregistered from the peer.

- To control all managed devices with the other Firepower Management Center, choose **Manage registered devices from peer console**. All devices will be unregistered from this Firepower Management Center.

- To stop managing devices altogether, choose **Stop managing registered devices from both consoles**. All devices will be unregistered from both Firepower Management Centers.

**Note** If you choose to manage the registered devices from the secondary Firepower Management Center, the devices will be unregistered from the primary Firepower Management Center. The devices are now registered to be managed by the secondary Firepower Management Center. However the licenses that were applied to these devices are deregistered on account of the high availability break operation. You must now proceed to re-register (enable) the licenses on the devices from the secondary Firepower Management Center. For more information see Move or Remove Licenses from FTD Devices, on page 125.

**Step 6** Click **OK**.

Replacing FMCs in a High Availability Pair

If you need to replace a failed unit in a Firepower Management Center high availability pair, you must follow one of the procedures listed below. The table lists four possible failure scenarios and their corresponding replacement procedures.
Before you begin

Verify that the data backup from the failed primary Firepower Management Center is successful.

Procedure

Step 1 Contact Support to request a replacement for a failed Firepower Management Center - FMC1.

Step 2 When the primary Firepower Management Center - FMC1 fails, access the web interface of the secondary Firepower Management Center - FMC2 and switch peers. For more information, see Switching Peers in a Firepower Management Center High Availability Pair, on page 215.

This promotes the secondary Firepower Management Center - FMC2 to active.

You can use FMC2 as the active Firepower Management Center until the primary Firepower Management Center - FMC1 is replaced.

Warning Do not break Firepower Management Center High Availability from FMC2, since licenses that were synced to FMC2 from FMC1 (before failure), will be removed from FMC2 and you will be unable to perform any deploy actions from FMC2.

Step 3 Reimage the replacement Firepower Management Center with the same software version as FMC1.

Step 4 Restore the data backup retrieved from FMC1 to the new Firepower Management Center.

Step 5 Install required Firepower Management Center patches, geolocation database (GeoDB) updates, vulnerability database (VDB) updates and system software updates to match FMC2.

The new Firepower Management Center and FMC2 will now both be active peers, resulting in a high availability split-brain.

Step 6 When the Firepower Management Center web interface prompts you to choose an active appliance, select FMC2 as active.

This syncs the latest configuration from FMC2 to the new Firepower Management Center - FMC1.
Step 7 When the configuration syncs successfully, access the web interface of the secondary Firepower Management Center - FMC2 and switch roles to make the primary Firepower Management Center - FMC1 active. For more information, see Switching Peers in a Firepower Management Center High Availability Pair, on page 215.

Step 8 Apply Classic licenses received with the new Firepower Management Center - FMC1 and delete the old licenses. For more information, see Generate a Classic License and Add It to the Firepower Management Center, on page 135.

Smart licenses work seamlessly.

---

**What to do next**

High availability has now been re-established and the primary and the secondary Firepower Management Centers will now work as expected.

Replace a Failed Primary FMC (Unsuccessful Backup)

Two Firepower Management Centers - FMC1 and FMC2 are part of a high availability pair. FMC1 is the primary and FMC2 is the secondary. This task describes the steps to replace a failed primary Firepower Management Center - FMC1 when data backup from the primary is unsuccessful.

**Procedure**

**Step 1** Contact Support to request a replacement for a failed Firepower Management Center - FMC1.

**Step 2** When the primary Firepower Management Center - FMC1 fails, access the web interface of the secondary Firepower Management Center - FMC2 and switch peers. For more information, see Switching Peers in a Firepower Management Center High Availability Pair, on page 215.

This promotes the secondary Firepower Management Center - FMC2 to active.

You can use FMC2 as the active Firepower Management Center until the primary Firepower Management Center - FMC1 is replaced.

**Warning** Do not break Firepower Management Center High Availability from FMC2, since classic and smart licenses that were synced to FMC2 from FMC1 (before failure), will be removed from FMC2 and you will be unable to perform any deploy actions from FMC2.

**Step 3** Reimage the replacement Firepower Management Center with the same software version as FMC1.

**Step 4** Install required Firepower Management Center patches, geolocation database (GeoDB) updates, vulnerability database (VDB) updates and system software updates to match FMC2.

**Step 5** Deregister the Firepower Management Center - FMC2 from the Cisco Smart Software Manager. For more information, see Deregister a Firepower Management Center from the Cisco Smart Software Manager, on page 127.

Deregistering a Firepower Management Center from the Cisco Smart Software Manager removes the Management Center from your virtual account. All license entitlements associated with the Firepower Management Center release back to your virtual account. After deregistration, the Firepower Management Center enters Enforcement mode where no update or changes on licensed features are allowed.

**Step 6** Access the web interface of the secondary Firepower Management Center - FMC2 and break Firepower Management Center high availability. For more information, see Disabling Firepower Management Center...
When prompted to select an option for handling managed devices, choose **Manage registered devices from this console.**

As a result, classic and smart licenses that were synced to the secondary Firepower Management Center - FMC2, will be removed and you cannot perform deployment activities from FMC2.

**Step 7** Re-establish Firepower Management Center high availability, by setting up the Firepower Management Center - FMC2 as the primary and Firepower Management Center - FMC1 as the secondary. For more information, see **Establishing Firepower Management Center High Availability, on page 211.**

**Step 8** Apply Classic licenses received with the new Firepower Management Center - FMC1 and delete the old licenses. For more information, see **Generate a Classic License and Add It to the Firepower Management Center, on page 135.**

**Step 9** Register a Smart License to the primary Firepower Management Center - FMC2. For more information see **Register Smart Licenses, on page 120.**

---

**What to do next**

High availability has now been re-established and the primary and the secondary Firepower Management Centers will now work as expected.

---

**Replace a Failed Secondary FMC (Successful Backup)**

Two Firepower Management Centers - FMC1 and FMC2 are part of a high availability pair. FMC1 is the primary and FMC2 is the secondary. This task describes the steps to replace a failed secondary Firepower Management Center - FMC2 when data backup from the secondary is successful.

**Before you begin**

Verify that the data backup from the failed secondary Firepower Management Center is successful.

**Procedure**

**Step 1** Contact Support to request a replacement for a failed Firepower Management Center - FMC2.

**Step 2** Continue to use the primary Firepower Management Center - FMC1 as the active Firepower Management Center.

**Step 3** Reimage the replacement Firepower Management Center with the same software version as FMC2.

**Step 4** Restore the data backup from FMC2 to the new Firepower Management Center.

**Step 5** Install required Firepower Management Center patches, geolocation database (GeoDB) updates, vulnerability database (VDB) updates and system software updates to match FMC1.

**Step 6** Resume data synchronization (if paused) from the web interface of the new Firepower Management Center - FMC2, to synchronize the latest configuration from the primary Firepower Management Center - FMC1. For more information, see **Restarting Communication Between Paired Firepower Management Centers, on page 216.**

Classic and Smart Licenses work seamlessly.
Replace a Failed Secondary FMC (Unsuccessful Backup)

Two Firepower Management Centers - FMC1 and FMC2 are part of a high availability pair. FMC1 is the primary and FMC2 is the secondary. This task describes the steps to replace a failed secondary Firepower Management Center - FMC2 when data backup from the secondary is unsuccessful.

Procedure

**Step 1**
Contact Support to request a replacement for a failed Firepower Management Center - FMC2.

**Step 2**
Continue to use the primary Firepower Management Center - FMC1 as the active Firepower Management Center.

**Step 3**
Reimage the replacement Firepower Management Center with the same software version as FMC2.

**Step 4**
Install required Firepower Management Center patches, geolocation database (GeoDB) updates, vulnerability database (VDB) updates and system software updates to match FMC1.

**Step 5**
Access the web interface of the primary Firepower Management Center - FMC1 and break Firepower Management Center high availability. For more information, see Disabling Firepower Management Center High Availability, on page 218. When prompted to select an option for handling managed devices, choose Manage registered devices from this console.

**Step 6**
Re-establish Firepower Management Center high availability, by setting up the Firepower Management Center - FMC1 as the primary and Firepower Management Center - FMC2 as the secondary. For more information, see Establishing Firepower Management Center High Availability, on page 211.

- When high availability is successfully established, the latest configuration from the primary Firepower Management Center - FMC1 is synchronized to the secondary Firepower Management Center - FMC2.
- Classic and Smart Licenses work seamlessly.

What to do next

High availability has now been re-established and the primary and the secondary Firepower Management Centers will now work as expected.
Device Management Basics

The following topics describe how to manage devices in the Firepower System:

• About Device Management, on page 223
• The Device Management Page, on page 227
• Add Devices to the Firepower Management Center, on page 228
• Deleting Devices from the Firepower Management Center, on page 230
• Change the Manager for the Device, on page 231
• Device Configuration Settings, on page 235
• The Interfaces Table View, on page 244
• Device Group Management, on page 246

About Device Management

Use the Firepower Management Center to manage your devices.

About the Firepower Management Center

You can use the Firepower Management Center to manage the full range of devices that are a part of the Firepower System. When you manage a device, you set up a two-way, SSL-encrypted communication channel between the Firepower Management Center and the device. The Firepower Management Center uses this channel to send information to the device about how you want to analyze and manage your network traffic to the device. As the device evaluates the traffic, it generates events and sends them to the Firepower Management Center using the same channel.

By using the Firepower Management Center to manage devices, you can:

• configure policies for all your devices from a single location, making it easier to change configurations
• install various types of software updates on devices
• push health policies to your managed devices and monitor their health status from the Firepower Management Center

The Firepower Management Center aggregates and correlates intrusion events, network discovery information, and device performance data, allowing you to monitor the information that your devices are reporting in relation to one another, and to assess the overall activity occurring on your network.
You can use a Firepower Management Center to manage nearly every aspect of a device’s behavior.

Although a Firepower Management Center can manage devices running certain previous releases as specified in the compatibility matrix available at http://www.cisco.com/c/en/us/support/security/defense-center/products-device-support-tables-list.html, new features are not available to these previous-release devices.

What Can Be Managed by a Firepower Management Center?

You can use the Firepower Management Center as a central management point in a Firepower System deployment to manage the following devices:

- 7000 and 8000 Series devices
- ASA FirePOWER modules
- NGIPSv devices
- Firepower Threat Defense (physical hardware and virtual)

When you manage a device, information is transmitted between the Firepower Management Center and the device over a secure, SSL-encrypted TCP tunnel.

The following illustration lists what is transmitted between a Firepower Management Center and its managed devices. Note that the types of events and policies that are sent between the appliances are based on the device type.

Beyond Policies and Events

In addition to deploying policies to devices and receiving events from them, you can also perform other device-related tasks on the Firepower Management Center.

Backing Up a Device

You cannot create or restore backup files for NGIPSv devices or ASA FirePOWER modules.

When you perform a backup of a physical managed device from the device itself, you back up the device configuration only. To back up configuration data and, optionally, unified files, perform a backup of the device using the managing Firepower Management Center.

To back up event data, perform a backup of the managing Firepower Management Center.
Updating Devices

From time to time, Cisco releases updates to the Firepower System, including:

- intrusion rule updates, which may contain new and updated intrusion rules
- vulnerability database (VDB) updates
- geolocation updates
- software patches and updates

You can use the Firepower Management Center to install an update on the devices it manages.

NAT Environments

Network address translation (NAT) is a method of transmitting and receiving network traffic through a router that involves reassigning the source or destination IP address. The most common use for NAT is to allow private networks to communicate with the internet. Static NAT performs a 1:1 translation, which does not pose a problem for FMC communication with devices, but port address translation (PAT) is more common. PAT lets you use a single public IP address and unique ports to access the public network; these ports are dynamically assigned as needed, so you cannot initiate a connection to a device behind a PAT router.

Normally, you need both IP addresses (along with a registration key) for both routing purposes and for authentication: the FMC specifies the device IP address when you add a device (see Add Devices to the Firepower Management Center, on page 228), and the device specifies the FMC IP address (see the getting started guide for your model; or see Management Interfaces, on page 799 to change settings after initial setup). However, if you only know one of the IP addresses, which is the minimum requirement for routing purposes, then you must also specify a unique NAT ID on both sides of the connection to establish trust for the initial communication and to look up the correct registration key. The FMC and device use the registration key and NAT ID (instead of IP addresses) to authenticate and authorize for initial registration.

For example, you add a device to the FMC, and you do not know the device IP address (for example, the device is behind a PAT router), so you specify only the NAT ID and the registration key on the FMC; leave the IP address blank. On the device, you specify the FMC IP address, the same NAT ID, and the same registration key. The device registers to the FMC’s IP address. At this point, the FMC uses the NAT ID instead of IP address to authenticate the device.

Although the use of a NAT ID is most common for NAT environments, you might choose to use the NAT ID to simplify adding many devices to the FMC. On the FMC, specify a unique NAT ID for each device you want to add while leaving the IP address blank, and then on each device, specify both the FMC IP address and the NAT ID. Note: The NAT ID must be unique per device.

The following example shows three devices behind a PAT IP address. In this case, specify a unique NAT ID per device on both the FMC and the devices, and specify the FMC IP address on the devices.
The following example shows the FMC behind a PAT IP address. In this case, specify a unique NAT ID per device on both the FMC and the devices, and specify the device IP addresses on the FMC.
The Device Management Page

The Device Management page provides you with a range of information and options that you can use to manage your registered devices, 7000 and 8000 Series device high availability pairs, and device groups. The page displays a list of all the devices currently registered on the Firepower Management Center.

You can use the View by drop-down list to sort and view the device list by any of the following categories: group, license, model, or access control policy. In a multidomain deployment, you can also sort and view by domain, which is the default display category in that deployment. Devices must belong to a leaf domain.

You can expand and collapse the list of devices in any of the device categories. By default, the device list is expanded.

See the following table for more information about the device list.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The display name used for the device in Firepower Management Center. The status icon to the left of the name indicates its current health status.</td>
</tr>
<tr>
<td>Group</td>
<td>The group to which you assigned the managed devices.</td>
</tr>
<tr>
<td>Model</td>
<td>The model of the managed devices.</td>
</tr>
<tr>
<td>License Type</td>
<td>The licenses that are enabled on the managed device.</td>
</tr>
<tr>
<td>Access Control Policy</td>

When your Firepower Management Center manages a large volume of devices, you can narrow the results on the Device Management page to make it easier find a particular device.
Add Devices to the Firepower Management Center

Use this procedure to add a single device to the Firepower Management Center. If you plan to link devices for redundancy or performance, you must still use this procedure, keeping in mind the following points:

- 8000 Series stacks—Use this procedure to add each device to the Firepower Management Center, then establish the stack; see Establishing Device Stacks, on page 516.

- 7000 and 8000 Series high availability—Use this procedure to add each device to the Firepower Management Center, then establish high availability; see Establishing Firepower 7000/8000 Series High Availability, on page 501. For high availability stacks, first stack the devices, then establish high availability between the stacks.

- FTD high availability—Use this procedure to add each device to the Firepower Management Center, then establish high availability; see Add a Firepower Threat Defense High Availability Pair, on page 635.

- FTD clusters—Make sure cluster units are in a successfully formed cluster on FXOS, then use this procedure to add each unit to the Firepower Management Center as a separate managed device. Finally, cluster the units on the Firepower Management Center. For more information, see FMC: Add a Cluster, on page 657.

Note

If you have established or will establish Firepower Management Center high availability, add devices only to the active (or intended active) Firepower Management Center. When you establish high availability, devices registered to the active Firepower Management Center are automatically registered to the standby.

Before you begin

- Set up the device to be managed by the Firepower Management Center. For 7000 and 8000 Series devices, see Configuring Remote Management on a Managed Device, on page 472. For information on configuring remote management for other models, see the appropriate quick start guide.

- If you are adding an FTD device, the FMC must be registered to the Smart Licensing server (CSSM). A valid evaluation license is sufficient.
• If you registered a Firepower Management Center and a device using IPv4 and want to convert them to IPv6, you must delete and reregister the device.

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** From the Add drop-down menu, choose Device.

**Step 3** In the Host field, enter the IP address or the hostname of the device you want to add.

The hostname of the device is the fully qualified domain name or the name that resolves through the local DNS to a valid IP address. Use a hostname rather than an IP address if your network uses DHCP to assign IP addresses.

In a NAT environment, you may not need to specify the IP address or hostname of the device, if you already specified the IP address or hostname of the Firepower Management Center when you configured the device to be managed by the Firepower Management Center. For more information, see NAT Environments, on page 225.

**Step 4** In the Display Name field, enter a name for the device as you want it to display in the Firepower Management Center.

**Step 5** In the Registration Key field, enter the same registration key that you used when you configured the device to be managed by the Firepower Management Center. The registration key is a one-time-use shared secret.

**Step 6** In a multidomain deployment, regardless of your current domain, assign the device to a leaf Domain.

If your current domain is a leaf domain, the device is automatically added to the current domain. If your current domain is not a leaf domain, post-registration, you must switch to the leaf domain to configure the device.

**Step 7** (Optional) Add the device to a device Group.

**Step 8** Choose an initial Access Control Policy to deploy to the device upon registration, or create a new policy.

If the device is incompatible with the policy you choose, deploying will fail. This incompatibility could occur for multiple reasons, including licensing mismatches, model restrictions, passive vs inline issues, and other misconfigurations. After you resolve the issue that caused the failure, manually deploy configurations to the device.

**Step 9** Choose licenses to apply to the device.

For Classic devices, note that:

- Control, Malware, and URL Filtering licenses require a Protection license.
- VPN licenses require a 7000 or 8000 Series device.
- Control licenses are supported on NGIPSv and ASA FirePOWER devices, but do not allow you to configure 8000 Series fastpath rules, switching, routing, stacking, or device high availability.

**Step 10** If you used a NAT ID during device setup, expand in the Advanced section and enter the same NAT ID in the Unique NAT ID field.

**Step 11** Check the Transfer Packets check box to allow the device to transfer packets to the Firepower Management Center.
This option is enabled by default. When events like IPS or Snort are triggered with this option enabled, the device sends event metadata information and packet data to the Firepower Management Center for inspection. If you disable it, only event information will be sent to the Firepower Management Center but packet data is not sent.

**Step 12** Click **Register**.

It may take up to two minutes for the Firepower Management Center to verify the device’s heartbeat and establish communication.

---

**Deleting Devices from the Firepower Management Center**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

If you no longer want to manage a device, you can delete it from the Firepower Management Center. Deleting a device:

- Severs all communication between the Firepower Management Center and the device.
- Removes the device from the Device Management page.
- Returns the device to local time management if the device is configured via the platform settings policy to receive time from the Firepower Management Center via NTP.

To manage the device later, re-add it to the Firepower Management Center.

---

**Note**

When a device is deleted and then re-added, the Firepower Management Center web interface prompts you to re-apply your access control policies. However, there is no option to re-apply the NAT and VPN policies during registration. Any previously applied NAT or VPN configuration will be removed during registration and must be re-applied after registration is complete.

**Procedure**

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device you want to delete, click delete (GraphNodeIcon).

**Step 3** Confirm that you want to delete the device.
Change the Manager for the Device

You might need to set or change the manager on a device in the following circumstances:

- Change the existing FMC IP address—If you change the FMC IP address, then see the following behavior for device management connectivity depending on how you added the device to the FMC:
  - Added by IP address—If you originally added the device to the FMC using the device IP address (and not only the NAT ID), then the management connection will be reestablished automatically because you only need a valid IP address on one side of the connection. **You do not need to do anything.**
  - Added with NAT ID only—If you added the device using only the NAT ID, then neither the FMC nor the device can reestablish the connection. In this case, you must **delete the device and re-add it** as a new device; you cannot reconfigure the FMC IP address at the device CLI and successfully reconnect.

- Identify a New FMC, on page 231—After you delete the device from the old FMC, if present, you can configure the device for the new FMC, and then add it to the FMC.

- Switch from Firepower Device Manager to FMC, on page 232—You cannot use both FDM and FMC at the same time for the same device. If you change from FDM to FMC, the FTD configuration will be erased, and you will need to start over.

- Switch from FMC to Firepower Device Manager, on page 233—You cannot use both FDM and FMC at the same time for the same device. If you change from FMC to FDM, the FTD configuration will be erased, and you will need to start over.

### Identify a New FMC

This procedure shows how to identify a new FMC for the managed device.

**Procedure**

**Step 1**

On the old FMC, if present, delete the managed device. See Deleting Devices from the Firepower Management Center, on page 230.

You cannot change the FMC IP address if you have an active connection with an FMC.

**Step 2**

Connect to the device CLI, for example using SSH.

**Step 3**

Configure the new FMC.

```
configure manager add {hostname | IPv4_address | IPv6_address | DONTRESOLVE } regkey [nat_id]
```

- `{hostname | IPv4_address | IPv6_address}`—Sets the FMC hostname, IPv4 address, or IPv6 address.

- **DONTRESOLVE**—If the FMC is not directly addressable, use **DONTRESOLVE** instead of a hostname or IP address. If you use **DONTRESOLVE**, then a `nat_id` is required. When you add this device to the FMC, make sure that you specify both the device IP address and the `nat_id`; one side of the connection needs to specify an IP address, and both sides need to specify the same, unique NAT ID.
• **regkey**—Make up a registration key to be shared between the FMC and the device during registration. You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the FTD.

• **nat_id**—Make up an alphanumeric string from 1 to 37 characters used only during the registration process between the FMC and the device when one side does not specify an IP address. This NAT ID is a one-time password used only during registration. Make sure the NAT ID is unique, and not used by any other devices awaiting registration. Specify the same NAT ID on the FMC when you add the FTD.

Example:

```
> configure manager add DONTRESOLVE abc123 efg456
Manager successfully configured.
Please make note of reg_key as this will be required while adding Device in FMC.
>
```

**Step 4** Add the device to the FMC. See Add Devices to the Firepower Management Center, on page 228.

---

**Switch from Firepower Device Manager to FMC**

This procedure describes how to change your manager from Firepower Device Manager (FDM), a local device manager, to FMC. You can switch between FDM and FMC without reinstalling the software. You cannot use both FDM and FMC at the same time for the same device. If you change from FDM to FMC, the FTD configuration will be erased, and you will need to start over.

⚠️ **Caution** Changing the manager resets the FTD configuration to the factory default. However, the management bootstrap configuration is maintained.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>In FDM, for High Availability, break the high availability configuration. Ideally, break HA from the active unit.</td>
</tr>
<tr>
<td>Step 2</td>
<td>In FDM, unregister the device from the Smart Licensing server.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Connect to the device CLI, for example using SSH.</td>
</tr>
</tbody>
</table>
| Step 4 | Remove the current management setting.  
`configure manager delete` |

**Caution** Deleting the local manager resets the FTD configuration to the factory default. However, the management bootstrap configuration is maintained.

**Example:**

```
> configure manager delete
```

If you enabled any feature licenses, you must disable them in
Firepower Device Manager before deleting the local manager. Otherwise, those licenses remain assigned to the device in Cisco Smart Software Manager.
Do you want to continue [yes/no]: yes

DHCP Server Disabled

Step 5 Configure the new FMC.

```
configure manager add {hostname | IPv4_address | IPv6_address | DONTRESOLVE } regkey [nat_id]
```

- `{hostname | IPv4_address | IPv6_address}`—Sets the FMC hostname, IPv4 address, or IPv6 address.
- **DONTRESOLVE**—If the FMC is not directly addressable, use DONTRESOLVE instead of a hostname or IP address. If you use DONTRESOLVE, then a `nat_id` is required. When you add this device to the FMC, make sure that you specify both the device IP address and the `nat_id`; one side of the connection needs to specify an IP address, and both sides need to specify the same, unique NAT ID.
- `regkey`—Make up a registration key to be shared between the FMC and the device during registration. You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the FTD.
- `nat_id`—Make up an alphanumeric string from 1 to 37 characters used only during the registration process between the FMC and the device when one side does not specify an IP address. This NAT ID is a one-time password used only during registration. Make sure the NAT ID is unique, and not used by any other devices awaiting registration. Specify the same NAT ID on the FMC when you add the FTD.

Example:

```
> configure manager add DONTRESOLVE abc123 efg456
Manager successfully configured.
Please make note of reg_key as this will be required while adding Device in FMC.
```

Step 6 Add the device to the FMC. See Add Devices to the Firepower Management Center, on page 228.

---

**Switch from FMC to Firepower Device Manager**

This procedure describes how to change your manager from FMC to Firepower Device Manager (FDM), a local device manager. You can switch between FDM and FMC without reinstalling the software. You cannot use both FDM and FMC at the same time for the same device. If you change from FMC to FDM, the FTD configuration will be erased, and you will need to start over.

**Caution** Changing the manager resets the FTD configuration to the factory default. However, the management bootstrap configuration is maintained.
## Procedure

### Step 1
In FMC, for High Availability, break the high availability configuration. Ideally, break HA from the active unit. See [Separate Units in a High Availability Pair](#) on page 642.

### Step 2
In FMC, delete the managed device. See [Deleting Devices from the Firepower Management Center](#) on page 230.

You cannot change the manager if you have an active connection with an FMC.

### Step 3
Connect to the device CLI, for example using SSH.

### Step 4
Remove the current management setting.

```
configure manager delete
```

**Caution**
Deleting the local manager resets the FTD configuration to the factory default. However, the management bootstrap configuration is maintained.

### Example:

```
> configure manager delete

If you enabled any feature licenses, you must disable them in Firepower Device Manager before deleting the local manager. Otherwise, those licenses remain assigned to the device in Cisco Smart Software Manager.

Do you want to continue[yes/no]: yes

DHCP Server Disabled
```

### Step 5
Configure the new FMC.

```
configure manager add {hostname | IPv4_address | IPv6_address | DONTRESOLVE} regkey [nat_id]
```

- `{hostname | IPv4_address | IPv6_address}`—Sets the FMC hostname, IPv4 address, or IPv6 address.

- **DONTRESOLVE**—If the FMC is not directly addressable, use **DONTRESOLVE** instead of a hostname or IP address. If you use **DONTRESOLVE**, then a `nat_id` is required. When you add this device to the FMC, make sure that you specify both the device IP address and the `nat_id`; one side of the connection needs to specify an IP address, and both sides need to specify the same, unique NAT ID.

- `regkey`—Make up a registration key to be shared between the FMC and the device during registration. You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the FTD.

- `nat_id`—Make up an alphanumeric string from 1 to 37 characters used only during the registration process between the FMC and the device when one side does not specify an IP address. This NAT ID is a one-time password used only during registration. Make sure the NAT ID is unique, and not used by any other devices awaiting registration. Specify the same NAT ID on the FMC when you add the FTD.

### Example:

```
> configure manager add DONTRESOLVE abc123 efg456
Manager successfully configured.

Please make note of reg_key as this will be required while adding Device in FMC.
```
Device Configuration Settings

The Device page of the appliance editor displays detailed device configuration and information. It also allows you to make changes to some parts of device configuration, such as enabling and disabling licenses, shutting down and restarting a device, modifying management, and configuring advanced options.

General Device Settings

The General section of the Device tab displays the settings described in the table below.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The display name of the device on the Firepower Management Center.</td>
</tr>
<tr>
<td>Transfer Packets</td>
<td>This displays whether or not the managed device sends packet data with the events to the Firepower Management Center.</td>
</tr>
<tr>
<td>Mode</td>
<td>The displays the mode of the management interface for the device: routed or transparent.</td>
</tr>
<tr>
<td>Compliance Mode</td>
<td>This displays the security certifications compliance for a device. Valid values are CC, UCAPL and None.</td>
</tr>
</tbody>
</table>

Device License Settings

The License section of the Device tab displays the licenses enabled for the device.

Related Topics

Device System Settings

The System section of the Device tab displays a read-only table of system information, as described in the following table.
### Table 26: System Section Table Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>The model name and number for the managed device.</td>
</tr>
<tr>
<td>Serial</td>
<td>The serial number of the chassis of the managed device.</td>
</tr>
<tr>
<td>Time</td>
<td>The current system time of the device. This is always in UTC.</td>
</tr>
<tr>
<td>Version</td>
<td>The version of the software currently installed on the managed device.</td>
</tr>
<tr>
<td>Policy</td>
<td>A link to the platform settings policy currently deployed to the managed device.</td>
</tr>
</tbody>
</table>

You can also shut down or restart the device.

### Device Health Settings

The Health section of the Device tab displays the information described in the table below.

### Table 27: Health Section Table Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>An icon that represents the current health status of the device. Clicking the icon displays the Health Monitor for the appliance.</td>
</tr>
<tr>
<td>Policy</td>
<td>A link to a read-only version of the health policy currently deployed at the device.</td>
</tr>
<tr>
<td>Blacklist</td>
<td>A link to the Health Blacklist page, where you can enable and disable health blacklist modules.</td>
</tr>
</tbody>
</table>

</tbody>
</table>

In a multidomain deployment, ancestor domains can view information about all devices in descendant domains. You must be in a leaf domain to edit a device.

#### Procedure

**Step 1** Choose Devices > Device Management.
Step 2 Click edit (📝) next to the device you want to view.

In a multidomain deployment, if you are in an ancestor domain, you can click view (🔍) to view a device from a descendant domain in read-only mode.

Step 3 Click Device.

Step 4 You can view the following information:

- General — Displays general settings for the device; see General Device Settings, on page 235.
- License — Displays license information for the device; see Device License Settings, on page 235.
- System — Displays system information about the device; see Device System Settings, on page 235.
- Health — Displays information about the current health status of the device; see Device Health Settings, on page 236.
- Management — Displays information about the communication channel between the Firepower Management Center and the device; see Device Management Settings, on page 236.
- Advanced — Displays information about advanced feature configuration; see Advanced Device Settings, on page 237.

Editing Device Management Settings

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

If you edit the hostname or IP address of a device after you added it to the FMC (using the device’s CLI, for example), you need to use the procedure below to manually update the hostname or IP address on the managing FMC.

To change the device management IP address on the device, see Configure Management Interfaces, on page 804.

Procedure

Step 1 Choose Devices > Device Management.

Step 2 Next to the device where you want to modify management options, click edit icon (📝).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click Device, and view the Management area.

Tip For stacked devices, you modify management options on an individual device on the Device page of the appliance editor.

Step 4 Disable management temporarily by clicking the slider (.setCancelable).

You are prompted to proceed with disabling management; click Yes.
Disabling management blocks the connection between the Firepower Management Center and the device, but does not delete the device from the Firepower Management Center.

**Step 5**

Edit the **Host** IP address or hostname by clicking edit icon (✏).

<table>
<thead>
<tr>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Host:</strong></td>
</tr>
<tr>
<td><strong>Status:</strong></td>
</tr>
</tbody>
</table>

In the **Management** dialog box, modify the name or IP address in the **Host** field, and click **Save**.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 337.

---

**Editing General Device Settings**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose **Device Management**.

**Step 2** Next to the device you want to modify, click edit (✏).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click **Device**.

**Step 4** In the **General** section, click edit (✏).

**Step 5** Enter a **Name** for the managed device.

**Tip**

For stacked devices, you edit the assigned device name for the stack on the Stack page of the appliance editor. You can edit the assigned device name for an individual device on the Devices page of the appliance editor.

**Step 6** Change the **Transfer Packets** setting:

- Check the check box to allow packet data to be stored with events on the Firepower Management Center.
- Clear the check box to prevent the managed device from sending packet data with the events.

**Step 7** Click **Force Deploy** to force deployment of current policies and device configuration to the device.
Step 8  
Click Deploy.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Enabling and Disabling Device Licenses

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can enable licenses on your device if you have available licenses on your Firepower Management Center.

Procedure

Step 1  
Choose Devices > Device Management.

Step 2  
Next to the device where you want to enable or disable licenses, click edit ( ).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  
Click Device.

Tip  
For stacked devices, you enable or disable the licenses for the stack on the Stack page of the appliance editor.

Step 4  
In the License section, click edit ( ).

Step 5  
Check or clear the check box next to the license you want to enable or disable for the managed device.

Step 6  
Click Save.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

About Firepower Licenses, on page 109

Editing Advanced Device Settings

The following topics explain how to edit the advanced device settings.
Configuring Automatic Application Bypass

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>7000 &amp; 8000 Series NGIPSv ASA FirePOWER</td>
<td>Leaf only</td>
<td>Admin Network Admin</td>
</tr>
</tbody>
</table>

Automatic Application Bypass (AAB) allows packets to bypass detection if Snort is down or if a packet takes too long to process. AAB causes Snort to restart within ten minutes of the failure, and generates troubleshooting data that can be analyzed to investigate the cause of the Snort failure.

⚠️ Caution

AAB activation partially restarts the Snort process, which temporarily interrupts the inspection of a few packets. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 for more information.

AAB limits the time allowed to process packets through an interface. You balance packet processing delays with your network’s tolerance for packet latency.

The feature functions with any deployment; however, it is most valuable in inline deployments.

Typically, you use Rule Latency Thresholding in the intrusion policy to fast-path packets after the latency threshold value is exceeded. Rule Latency Thresholding does not shut down the engine or generate troubleshooting data.

If detection is bypassed, the device generates a health monitoring alert.

By default the AAB is disabled; to enable AAB follow the steps described.

Procedure

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device where you want to edit advanced device settings, click edit (✏️).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click Device (or Stack for stacked devices), then click edit (✏️) in the Advanced section.

**Step 4** Check Automatic Application Bypass.

**Step 5** Enter a Bypass Threshold from 250 ms to 60,000 ms. The default setting is 3000 milliseconds (ms).

**Step 6** Click Save.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 337.
Inspecting Local Router Traffic

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

If locally-bound traffic matches a Monitor rule in a Layer 3 deployment, that traffic may bypass inspection. To ensure inspection of the traffic, enable Inspect Local Router Traffic.

**Procedure**

**Step 1**  
Choose **Devices > Device Management**.

**Step 2**  
Next to the device where you want to edit advanced device settings, click edit (✏️).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3**  
Click **Device** (or **Stack** for stacked devices), then click edit (✏️) in the **Advanced Settings** section.

**Step 4**  
Check **Inspect Local Router Traffic** to inspect exception traffic when a 7000 or 8000 Series device is deployed as a router.

**Step 5**  
Click **Save**.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 337.

**Configure Fastpath Rules (8000 Series)**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

As a form of early traffic handling, 8000 Series fastpath rules can send traffic directly through an 8000 Series device without further inspection or logging. (In a passive deployment, 8000 Series fastpath rules simply stop analysis.) Each 8000 Series fastpath rule applies to a specific security zone or inline interface set. Because 8000 Series fastpath rules function at the hardware level, you can use only the following simple, outer-header criteria to fastpath traffic:

- Initiator and responder IP address or address block
- Protocol, and for TCP and UDP, initiator and responder port
- VLAN ID

By default, 8000 Series fastpath rules affect connections from specified initiators to specified responders. To fastpath all connections that meets the rule's criteria, regardless of which host is the initiator and which is the responder, you can make the rule bidirectional.
Although they perform a similar function, 8000 Series fastpath rules are not related to the Fastpath tunnel or prefilter rules that you configure in prefilter policies.

Note When you specify a port other than Any for TCP or UDP traffic, only the first fragment in matching fragmented traffic is fastpathed. All other fragments are forwarded for further inspection. This is because the 8000 Series only fastpaths fragmented traffic when the IP header in each fragment contains all the IP header information needed to match the fastpath rule, and subsequent fragments do not contain the field that identifies the port.

Procedure

Step 1 Choose Devices > Device Management.

Step 2 Next to the 8000 Series device where you want to configure the rule, click edit ( ).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click Device (or Stack for stacked devices), then click edit ( ) in the Advanced Settings section.

Step 4 Click New IPv4 Rule or New IPv6 Rule.

Step 5 From the Domain drop-down list, choose an inline set or passive security zone.

Step 6 Configure the traffic you want to fastpath. Traffic must meet all the conditions to be fastpathed.

- Initiator and Responder (required): Enter IP addresses or address blocks for initiators and responders.
- Protocol: Choose a protocol, or choose All.
- Initiator Port and Responder Port: For TCP and UDP traffic, enter initiator and responder ports. Leave the fields blank or enter Any to match all TCP or UDP traffic. You can enter a comma-separated list of ports, but you cannot enter port ranges.
- VLAN: Enter a VLAN ID. Leave the field blank or enter Any to match all traffic regardless of VLAN tag.

Step 7 (Optional) Make the rule Bidirectional.

Step 8 Click Save, then Save again.

What to do next

Deploy configuration changes; see Deploy Configuration Changes, on page 337.

### Managing System Shut Down

<table>
<thead>

</tbody>
</table>
You cannot shut down or restart the ASA FirePOWER with the Firepower System user interface. See the ASA documentation for more information on how to shut down the respective devices.

**Procedure**

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device that you want to restart, click edit (篡改). In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click **Device**.

**Tip** For stacked devices, you shut down or restart an individual device on the Devices page of the appliance editor.

**Step 4** To shut down the device, click shut down device (渋) in the **System** section.

**Step 5** When prompted, confirm that you want to shut down the device.

**Step 6** To restart the device, click restart device (渋).

**Step 7** When prompted, confirm that you want to restart the device.

---

**The Interfaces Table View**

The interfaces table view is located below the hardware view and lists all the available interfaces you have on a device. The table includes an expandable navigation tree you can use to view all configured interfaces. You can click the arrow icon next to an interface to collapse or expand the interface to hide or view its subcomponents. The interfaces table view also provides summarized information about each interface.
### Table 30: Classic Device Interfaces

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Name           | Each interface type is represented by a unique icon that indicates its type and link state (if applicable). You can hover your pointer over the name or the icon to view a tooltip with additional information. The interface icons are described in Interface Icons, on page 474. The icons use a badging convention to indicate the current link state of the interface, which may be one of three states:  
  - Error (️)  
  - Fault (️)  
  - Not available (️)  

Logical interfaces have the same link state as their parent physical interface. ASA FirePOWER modules do not display link state. Note that disabled interfaces are represented by semi-transparent icons.  

Interface names, which appear to the right of the icons, are auto-generated with the exception of hybrid and ASA FirePOWER interfaces, which are user-defined. Note that for ASA FirePOWER interfaces, the system displays only interfaces that are enabled, named, and have link.  

Physical interfaces display the name of the physical interface. Logical interfaces display the name of the physical interface and the assigned VLAN tag.  

ASA FirePOWER interfaces display the name of the security context and the name of the interface if there are multiple security contexts. If there is only one security context, the system displays only the name of the interface.  

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Zone</td>
<td>The security zone where the interface is assigned. To add or edit a security zone, click the edit icon (️).</td>
</tr>
<tr>
<td>Used by</td>
<td>The inline set, virtual switch, or virtual router where the interface is assigned.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>The MAC address displayed for the interface when it is enabled for switched and routed features.</td>
</tr>
<tr>
<td></td>
<td>For NGIPSv devices, the MAC address is displayed so that you can match the network adapters configured on your device to the interfaces that appear on the Interfaces page.</td>
</tr>
</tbody>
</table>
| IP Addresses   | IP addresses assigned to the interface. Hover your pointer over an IP address to view whether it is active. Inactive IP addresses are also grayed out.  
(7000/8000 series only) |

### Table 31: FTD Interfaces

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface IDs. For the failover link or cluster control link interface, the interface settings are view-only.</td>
</tr>
</tbody>
</table>
### Device Group Management

The Firepower Management Center allows you to group devices so you can easily deploy policies and install updates on multiple devices. You can expand and collapse the list of devices in the group. The list appears collapsed by default.

In a multidomain deployment, you can create device groups within a leaf domain only. When you configure a Firepower Management Center for multitenancy, existing device groups are removed; you can re-add them at the leaf domain level.

### Adding Device Groups

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Device groups enable you to easily assign policies and install updates on multiple devices.

If you add the primary device in a stack or a high-availability pair to a group, both devices are added to the group. If you unstack the devices or break the high-availability pair, both devices remain in that group.

**Procedure**

- **Step 1** Choose Devices > Device Management.
- **Step 2** From the Add drop-down menu, choose Add Group.
- **Step 3** Enter a Name.
- **Step 4** Under Available Devices, choose one or more devices to add to the device group. Use Ctrl or Shift while clicking to choose multiple devices.
- **Step 5** Click Add to include the devices you chose in the device group.
- **Step 6** Click OK to add the device group.
Editing Device Groups

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can change the set of devices that reside in any device group. You must remove an appliance from its current group before you can add it to a new group.

Moving an appliance to a new group does not change its policy to the policy previously assigned to the group. You must assign the group's policy to the new device.

If you add the primary device in a stack or a device high-availability pair to a group, both devices are added to the group. If you unstack the devices or break the high-availability pair, both devices remain in that group.

In a multidomain deployment, you can only edit device groups in the domain where they were created.

**Procedure**

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device group you want to edit, click edit (-pencil).

**Step 3** Optionally, in the **Name** field, enter a new name for the group.

**Step 4** Under **Available Devices**, choose one or more devices to add to the device group. Use Ctrl or Shift while clicking to choose multiple devices.

**Step 5** Click **Add** to include the devices you chose in the device group.

**Step 6** Optionally, to remove a device from the device group, click delete (-trashcan) next to the device you want to remove.

**Step 7** Click **OK** to save the changes to the device group.
PART III

System Monitoring and Troubleshooting

• Dashboards, on page 251
• Health Monitoring, on page 273
• Monitoring the System, on page 301
• Troubleshooting the System, on page 311
CHAPTER 13

Dashboards

The following topics describe how to use dashboards in the Firepower System:

- About Dashboards, on page 251
- Firepower System Dashboard Widgets, on page 252
- Managing Dashboards, on page 264

About Dashboards

Firepower System dashboards provide you with at-a-glance views of current system status, including data about the events collected and generated by the system. You can also use dashboards to see information about the status and overall health of the appliances in your deployment. Keep in mind that the information the dashboard provides depends on how you license, configure, and deploy the system.

The dashboard is a complex, highly customizable monitoring feature that provides exhaustive data. For a broad, brief, and colorful picture of your monitored network, use the Context Explorer.

Dashboards are available on the Firepower Management Center and 7000 & 8000 Series devices.

Tip

The dashboard is a complex, highly customizable monitoring feature that provides exhaustive data. For a broad, brief, and colorful picture of your monitored network, use the Context Explorer.

A dashboard uses tabs to display widgets: small, self-contained components that provide insight into different aspects of the system. For example, the predefined Appliance Information widget tells you the appliance name, model, and currently running version of the Firepower System software. The system constrains widgets by the dashboard time range, which you can change to reflect a period as short as the last hour or as long as the last year.

The system is delivered with several predefined dashboards, which you can use and modify. If your user role has access to dashboards (Administrator, Maintenance User, Security Analyst, Security Analyst [Read Only], and custom roles with the Dashboards permission), by default your home page is the predefined Summary Dashboard. However, you can configure a different default home page, including non-dashboards. You can also change the default dashboard. Note that if your user role cannot access dashboards, your default home page is relevant to the role; for example, a Discovery Admin sees the Network Discovery page.

You can also use predefined dashboards as the base for custom dashboards, which you can either share or restrict as private. Unless you have Administrator access, you cannot view or modify private dashboards created by other users.
Some drill-down pages and table views of events include a **Dashboard** toolbar link that you can click to view a relevant predefined dashboard. If you delete a predefined dashboard or tab, the associated toolbar links do not function.

In a multidomain deployment, you cannot view dashboards from ancestor domains; however, you can create new dashboards that are copies of the higher-level dashboards.

## Firepower System Dashboard Widgets

A dashboard has one or more tabs, each of which can display one or more widgets in a three-column layout. The Firepower System is delivered with many predefined dashboard widgets, each of which provides insight into a different aspect of the Firepower System. Widgets are grouped into three categories:

- **Analysis & Reporting widgets** display data about the events collected and generated by the Firepower System.
- **Miscellaneous widgets** display neither event data nor operations data. Currently, the only widget in this category displays an RSS feed.
- **Operations widgets** display information about the status and overall health of the Firepower System.

The dashboard widgets that you can view depend on:

- the type of appliance you are using
- your user role
- your current domain (in a multidomain deployment)

In addition, each dashboard has a set of preferences that determines its behavior.

You can minimize and maximize widgets, add and remove widgets from tabs, as well as rearrange the widgets on a tab.

For widgets that display event counts over a time range, the total number of events may not reflect the number of events for which detailed data is available in the tables on pages under the Analysis menu. This occurs because the system sometimes prunes older event details to manage disk space usage. To minimize the occurrence of event detail pruning, you can fine-tune event logging to log only those events most important to your deployment.

## Widget Availability

The dashboard widgets that you can view depend on the type of appliance you are using, your user role, and your current domain (in a multidomain deployment).

In a multidomain deployment, if you do not see a widget that you expect to see, switch to the Global domain. See **Switching Domains on the Firepower Management Center**, on page 12.
Note that:

- An invalid widget is one that you cannot view because you are using the wrong type of appliance.
- An unauthorized widget is one that you cannot view because your user account does not have the necessary privileges.

For example, the Appliance Status widget is available only on the FMC for users with Administrator, Maintenance User, Security Analyst, or Security Analyst (Read Only) account privileges.

Although you cannot add an unauthorized or invalid widget to a dashboard, an imported dashboard may contain unauthorized or invalid widgets. For example, such widgets can be present if the imported dashboard:

- Was created by a user with different access privileges, or
- Belongs to an ancestor domain.

Unavailable widgets are disabled and display error messages that indicate why you cannot view them.

Individual widgets also display error messages when those widgets have timed out or are otherwise experiencing problems.

---

**Note**

You can delete or minimize unauthorized and invalid widgets, as well as widgets that display no data, keeping in mind that modifying a widget on a shared dashboard modifies it for all users of the appliance.

---

**Dashboard Widget Availability by User Role**

The following table lists the user account privileges required to view each widget. Only user accounts with Administrator, Maintenance User, Security Analyst, or Security Analyst (Read Only) access can use dashboards.

Users with custom roles may have access to any combination of widgets, or none at all, as their user roles permit.

**Table 32: User Roles and Dashboard Widget Availability**

**Predefined Dashboard Widgets**

The Firepower System is delivered with several predefined widgets that, when used on dashboards, can provide you with at-a-glance views of current system status. These views include:

- data about the events collected and generated by the system
- information about the status and overall health of the appliances in your deployment

*Note*

The dashboard widgets you can view depend on the type of appliance you are using, your user role, and your current domain in a multidomain deployment.

**The Appliance Information Widget**

The Appliance Information widget provides a snapshot of the appliance. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard. The widget provides:

- the name, IPv4 address, IPv6 address, and model of the appliance
- the versions of the Firepower System software, operating system, Snort, rule update, rule pack, module pack, vulnerability database (VDB), and geolocation update installed on the appliances with dashboards, except for virtual Firepower Management Centers
- for managed appliances, the name and status of the communications link with the managing appliance

You can configure the widget to display more or less information by modifying the widget preferences to display a simple or an advanced view; the preferences also control how often the widget updates.
The Appliance Status Widget

The Appliance Status widget indicates the health of the appliance and of any appliances it is managing. Note that because the Firepower Management Center does not automatically apply a health policy to managed devices, you must manually apply a health policy to devices or their status appears as Disabled. This widget appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

You can configure the widget to display appliance status as a pie chart or in a table by modifying the widget preferences.

The preferences also control how often the widget updates.

You can click a section on the pie chart or one of the numbers on the appliance status table to go to the Health Monitor page and view the compiled health status of the appliance and of any appliances it is managing.

The Correlation Events Widget

The Correlation Events widget shows the average number of correlation events per second, by priority, over the dashboard time range. It appears by default on the Correlation tab of the Detailed Dashboard.

You can configure the widget to display correlation events of different priorities by modifying the widget preferences, as well as to choose a linear (incremental) or logarithmic (factor of ten) scale.

Check one or more Priorities check boxes to display separate graphs for events of specific priorities, including events that do not have a priority. Choose Show All to display an additional graph for all correlation events, regardless of priority. The preferences also control how often the widget updates.

You can click a graph to view correlation events of a specific priority, or click the All graph to view all correlation events. In either case, the events are constrained by the dashboard time range; accessing correlation events via the dashboard changes the events (or global) time window for the appliance.

The Current Interface Status Widget

The Current Interface Status widget shows the status of all interfaces on the appliance, enabled or unused. On a Firepower Management Center, you can display the management (eth0, eth1, and so on) interfaces. On a managed device, you can choose to show only sensing (s1p1 and so on) interfaces or both management and sensing interfaces. Interfaces are grouped by type: management, inline, passive, switched, routed, stacked, and unused.

For each interface, the widget provides:

• the name of the interface

• the link state of the interface

• the link mode (for example, 100Mb full duplex, or 10Mb half duplex) of the interface

• the type of interface, that is, copper or fiber

• the amount of data received (Rx) and transmitted (Tx) by the interface

The color of the ball representing link state indicates the current status, as follows:

• green: link is up and at full speed

• yellow: link is up but not at full speed

• red: link is not up
• gray: link is administratively disabled
• blue: link state information is not available (for example, ASA)

The widget preferences control how often the widget updates.

The Current Sessions Widget

The Current Sessions widget shows which users are currently logged into the appliance, the IP address associated with the machine where the session originated, and the last time each user accessed a page on the appliance (based on the local time for the appliance). The user that represents you, that is, the user currently viewing the widget, is marked with a user icon (👤) and rendered in bold type. Sessions are pruned from this widget’s data within one hour of logoff or inactivity. This widget appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

On the Current Sessions widget, you can:
• click any user name to manage user accounts on the User Management page.
• click the host icon (🖥️) or compromised host icon ( предостережение) next to any IP address to view the host profile for the associated machine.
• click any IP address or access time to view the audit log constrained by that IP address and by the time that the user associated with that IP address logged on to the web interface.

The widget preferences control how often the widget updates.

The Custom Analysis Widget

The Custom Analysis widget is a highly customizable widget that allows you to display detailed information on the events collected and generated by the Firepower System.

The widget is delivered with multiple presets that provide quick access to information about your deployment. The predefined dashboards make extensive use of these presets. You can use these presets or create a custom configuration. At a minimum, a custom configuration specifies the data you are interested in (table and field), and an aggregation method for that data. You can also set other display-related preferences, including whether you want to show events as relative occurrences (bar graph) or over time (line graph).

The widget displays the last time it updated, based on local time. The widget updates with a frequency that depends on the dashboard time range. For example, if you set the dashboard time range to an hour, the widget updates every five minutes. On the other hand, if you set the dashboard time range to a year, the widget updates once a week. To determine when the dashboard will update next, hover your pointer over the Last updated notice in the bottom left corner of the widget.

Note

A red-shaded Custom Analysis widget indicates that its use is harming system performance. If the widget continues to stay red over time, remove the widget. You can also disable all Custom Analysis widgets from the Dashboard settings in your system configuration (System > Configuration > Dashboard)
Displaying Relative Occurrences of Events (Bar Graphs)

For bar graphs in the Custom Analysis widget, the colored bars in the widget background show the relative number of occurrences of each event. Read the bars from right to left.

The direction icon (▼) indicates and controls the sort order of the display. A downward-pointing icon indicates descending order; an upward-pointing icon indicates ascending order. To change the sort order, click the icon.

Next to each event, the widget can display one of three icons to indicate any changes from the most recent results:

- The new event icon (pearance appears next to the event.
- The up arrow icon (▲) indicates that the event has moved up in the standings since the last time the widget updated. A number indicating how many places the event has moved up appears next to the icon.
- The down arrow icon (▼) indicates that the event has moved down in the standings since the last time the widget updated. A number indicating how many places the event has moved down appears next to the icon.

Displaying Events Over Time (Line Graphs)

If you want information on events or other collected data over time, you can configure the Custom Analysis widget to display a line graph, such as one that displays the total number of intrusion events generated in your deployment over time.

Limitations to the Custom Analysis Widget

A Custom Analysis widget may indicate that you are unauthorized to view the data that is configured to display. For example, Maintenance Users are not authorized to view discovery events. As another example, the widget does not display information related to unlicensed features. However, you (and any other users who share the dashboard) can modify the widget preferences to display data that you can see, or even delete the widget. If you want to make sure that this does not happen, save the dashboard as private.

When viewing user data, the system displays only authoritative users.

When viewing URL category information, the system does not display uncategorized URLs.

When viewing intrusion events aggregated by Count, the count includes reviewed events for intrusion events; if you view the count in tables on pages under the Analysis menus, the count will not include reviewed events.

Note

In a multidomain deployment, the system builds a separate network map for each leaf domain. As a result, a leaf domain can contain an IP address that is unique within its network, but identical to an IP address in another leaf domain. When you view Custom Analysis widgets in an ancestor domain, multiple instances of that repeated IP address can be displayed. At first glance, they might appear to be duplicate entries. However, if you drill down to the host profile information for each IP address, the system shows that they belong to different leaf domains.
Example: Custom Configuration

You can configure the Custom Analysis widget to display a list of recent intrusion events by configuring the widget to display data from the **Intrusion Events** table. Choosing the **Classification** field and aggregating this data by **Count** tells you how many events of each type were generated.

On the other hand, aggregating by **Unique Events** tells you how many unique intrusion events of each type have occurred (for example, how many detections of network trojans, potential violations of corporate policy, attempted denial-of-service attacks, and so on).

You can further constrain the widget using a saved search, either one of the predefined searches delivered with your appliance or a custom search that you created. For example, constraining the first example (intrusion events using the **Classification** field, aggregated by **Count**) using the **Dropped Events** search tells you how many intrusion events of each type were dropped.

Related Topics
- [Modifying Dashboard Time Settings](#), on page 269

**Custom Analysis Widget Preferences**

The following table describes the preferences you can set in the Custom Analysis widget.

Different preferences appear depending on how you configure the widget. For example, a different set of preferences appears if you configure the widget to show relative occurrences of events (a bar graph) vs a graph over time (a line graph). Some preferences, such as Filter, only appear if you choose a specific table from which to display data.

<table>
<thead>
<tr>
<th>Preference</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Title</strong></td>
<td>If you do not specify a title for the widget, the system uses the configured event type as the title.</td>
</tr>
<tr>
<td><strong>Preset</strong></td>
<td>Custom Analysis presets provide quick access to information about your deployment. The predefined dashboards make extensive use of these presets. You can use these presets or you can create a custom configuration.</td>
</tr>
<tr>
<td><strong>Table (required)</strong></td>
<td>The table of events or assets that contains the data the widget displays.</td>
</tr>
<tr>
<td><strong>Field (required)</strong></td>
<td>The specific field of the event type you want to display. To show data over time (line graphs), choose <strong>Time</strong>. To show relative occurrences of events (bar graphs), choose another option.</td>
</tr>
<tr>
<td><strong>Aggregate (required)</strong></td>
<td>The aggregation method configures how the widget groups the data it displays. For most event types, the default option is <strong>Count</strong>.</td>
</tr>
<tr>
<td><strong>Filter</strong></td>
<td>You can use application filters to constrain data from the Application Statistics and Intrusion Event Statistics by Application tables.</td>
</tr>
</tbody>
</table>
### Preference | Details
--- | ---
Search | You can use a saved search to constrain the data that the widget displays. You do not have to specify a search, although some presets use predefined searches.

Only you can access searches that you have saved as private. If you configure the widget on a shared dashboard and constrain its events using a private search, the widget resets to not using the search when another user logs in. This affects your view of the widget as well. If you want to make sure that this does not happen, save the dashboard as private.

Only fields that constrain connection summaries can constrain Custom Analysis dashboard widgets based on connection events. Invalid saved searches are dimmed.

If you constrain a Custom Analysis widget using a saved search, then edit the search, the widget does not reflect your changes until the next time it updates.

Show | Choose whether you want to display the most (Top) or the least (Bottom) frequently occurring events.

Results | Choose the number of result rows to display.

Show Movers | Choose whether you want to display the icons that indicate changes from the most recent results.

Time Zone | Choose the time zone you want to use to display results.

Color | You can change the color of the bars in the widget's bar graph.

</tr>
</tbody>
</table>

From a Custom Analysis widget, you can invoke an event view (workflow) that provides detailed information about the events displayed in the widget. The events appear in the default workflow for that event type, constrained by the dashboard time range. This also changes the appropriate time window on the Firepower Management Center, depending on how many time windows you configured and on the event type.

For example:

- If you configure multiple time windows, then access health events from a Custom Analysis widget, the events appear in the default health events workflow, and the health monitoring time window changes to the dashboard time range.
• If you configure a single time window and then access any type of event from the Custom Analysis widget, the events appear in the default workflow for that event type, and the global time window changes to the dashboard time range.

Procedure

You have the following choices:

• On any Custom Analysis widget, click view all ( ) in the lower right corner of the widget to view all associated events, constrained by the widget preferences.
• On a Custom Analysis widget showing relative occurrences of events (bar graph), click any event to view associated events constrained by the widget preferences, as well as by that event.

The Disk Usage Widget

The Disk Usage widget displays the percentage of space used on the hard drive, based on disk usage category. It also indicates the percentage of space used on and capacity of each partition of the appliance’s hard drive. The Disk Usage widget displays the same information for the malware storage pack if installed in the device, or if the Firepower Management Center manages a device containing a malware storage pack. This widget appears by default on the Status tabs of the Default Dashboard and the Summary Dashboard.

The By Category stacked bar displays each disk usage category as a proportion of the total available disk space used. The following table describes the available categories.

<table>
<thead>
<tr>
<th>Disk Usage Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Events</td>
<td>all events logged by the system</td>
</tr>
<tr>
<td>Files</td>
<td>all files stored by the system</td>
</tr>
<tr>
<td>Backups</td>
<td>all backup files</td>
</tr>
<tr>
<td>Updates</td>
<td>all files related to updates, such as rule updates and system updates</td>
</tr>
<tr>
<td>Other</td>
<td>system troubleshooting files and other miscellaneous files</td>
</tr>
<tr>
<td>Free</td>
<td>free space remaining on the appliance</td>
</tr>
</tbody>
</table>

You can hover your pointer over a disk usage category in the By Category stacked bar to view the percentage of available disk space used by that category, the actual storage space on the disk, and the total disk space available for that category. Note that if you have a malware storage pack installed, the total disk space available for the Files category is the available disk space on the malware storage pack.

You can configure the widget to display only the By Category stacked bar, or you can show the stacked bar plus the admin (/), /Volume, and /boot partition usage, as well as the /var/storage partition if the malware storage pack is installed, by modifying the widget preferences.
The widget preferences also control how often the widget updates, as well as whether it displays the current 
disk usage or collected disk usage statistics over the dashboard time range.

The Interface Traffic Widget

The Interface Traffic widget shows the rate of traffic received (Rx) and transmitted (Tx) on the appliance’s 
management interface. For 7000 & 8000 Series devices, the widget also shows information on the sensing 
interfaces. The widget does not appear by default on any of the predefined dashboards.

Devices with Malware licenses enabled periodically attempt to connect to the AMP cloud even if you have 
not configured dynamic analysis. Because of this, these devices show transmitted traffic; this is expected 
behavior. Outbound (transmitted) traffic includes flow control packets. Because of this, passive sensing 
interfaces on 7000 & 8000 Series devices may show transmitted traffic; this is also expected behavior.

The widget preferences control how often the widget updates. On 7000 & 8000 Series devices, the preferences 
also control whether the widget displays the traffic rate for unused interfaces (by default, the widget only 
displays the traffic rate for active interfaces).

The Intrusion Events Widget

The Intrusion Events widget shows the intrusion events that occurred over the dashboard time range, organized 
by priority. This includes statistics on intrusion events with dropped packets and different impacts. This widget 
appears by default on the Intrusion Events tab of the Summary Dashboard.

In the widget preferences, you can choose:

• **Event Flags** to display separate graphs for events with dropped packets, would have dropped packets, 
or specific impacts. Choose **All** to display an additional graph for all intrusion events, regardless of impact 
or rule state.

  For explanations of the icons, see **Working with Intrusion Events, on page 2177**. The arrow (if any) that 
appears above the impact level numbers describes the inline result and is defined as follows:

  **Table 35: Inline Result Field Contents in Workflow and Table Views**

<table>
<thead>
<tr>
<th>This Icon</th>
<th>Indicates</th>
</tr>
</thead>
<tbody>
<tr>
<td>A black down arrow</td>
<td>The system dropped the packet that triggered the rule</td>
</tr>
</tbody>
</table>
| A gray down arrow      | IPS would have dropped the packet if you enabled the **Drop when Inline** 
                        | intrusion policy option (in an inline deployment), or if a Drop and Generate 
                        | rule generated the event while the system was pruning                       |
| No icon (blank)        | The triggered rule was not set to Drop and Generate Events                 |

In a passive deployment, the system does not drop packets, including when an inline interface is in tap 
mode, regardless of the rule state or the inline drop behavior of the intrusion policy.

• **Show** to specify **Average Events Per Second (EPS)** or **Total Events**.

• **Vertical Scale** to specify **Linear** (incremental) or **Logarithmic** (factor of ten) scale.

• How often the widget updates.

On the widget, you can:
• Click a graph corresponding to dropped packets, to would have dropped packets, or to a specific impact
to view intrusion events of that type.

• Click the graph corresponding to dropped events to view dropped events.

• Click the graph corresponding to would have dropped events to view would have dropped events.

• Click the All graph to view all intrusion events.

The resulting event view is constrained by the dashboard time range; accessing intrusion events via the
dashboard changes the events (or global) time window for the appliance. Note that packets in a passive
deployment are not dropped, regardless of intrusion rule state or the inline drop behavior of the intrusion
policy.

The Network Compliance Widget

The Network Compliance widget summarizes your hosts’ compliance with the white lists you configured. By
default, the widget displays a pie chart that shows the number of hosts that are compliant, non-compliant, and
that have not been evaluated, for all compliance white lists in active correlation policies. This widget appears
by default on the Correlation tab of the Detailed Dashboard.

You can configure the widget to display network compliance either for all white lists or for a specific white
list by modifying the widget preferences.

If you choose to display network compliance for all white lists, the widget considers a host to be non-compliant
if it is not compliant with any white list in an active correlation policy.

You can also use the widget preferences to specify which of three different styles you want to use to display
network compliance.

The **Network Compliance** style (the default) displays a pie chart that shows the number of hosts that are
compliant, non-compliant, and that have not been evaluated. You can click the pie chart to view the host
violation count, which lists the hosts that violate at least one white list.

The **Network Compliance over Time (%)** style displays a stacked area graph showing the relative proportion
of hosts that are compliant, non-compliant, and that have not yet been evaluated, over the dashboard time
range.

The **Network Compliance over Time** style displays a line graph that shows the number of hosts that are
compliant, non-compliant, and that have not yet been evaluated, over the dashboard time range.

The preferences control how often the widget updates. You can check the **Show Not Evaluated** box to hide
events which have not been evaluated.

The Product Licensing Widget

The Product Licensing widget shows the device and feature licenses currently installed on the Firepower
Management Center. It also indicates the number of items licensed and the number of remaining licensed
items allowed. It does not appear by default on any of the predefined dashboards.

The top section of the widget displays all device and feature licenses installed on the Firepower Management
Center, including temporary licenses, while the Expiring Licenses section displays only temporary and expired
licenses.

The bars in the widget background show the percentage of each type of license that is being used; you should
read the bars from right to left. Expired licenses are marked with a strikethrough.
You can configure the widget to display either the features that are currently licensed, or all the features that you can license, by modifying the widget preferences. The preferences also control how often the widget updates.

You can click any of the license types to go to the License page of the local configuration and add or delete feature licenses.

**The Product Updates Widget**

The Product Updates widget provides you with a summary of the software currently installed on the appliance as well as information on updates that you have downloaded, but not yet installed. This widget appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

Because the widget uses scheduled tasks to determine the latest version, it displays *Unknown* until you configure a scheduled task to download, push or install updates.

You can configure the widget to hide the latest versions by modifying the widget preferences. The preferences also control how often the widget updates.

The widget also provides you with links to pages where you can update the software. You can:

- Manually update an appliance by clicking the current version.
- Create a scheduled task to download an update by clicking the latest version.

**The RSS Feed Widget**

The RSS Feed widget adds an RSS feed to a dashboard. By default, the widget shows a feed of Cisco security news. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

You can also configure the widget to display a preconfigured feed of company news, the Snort.org blog, or the Cisco Threat Research blog, or you can create a custom connection to any other RSS feed by specifying its URL in the widget preferences.

Feeds update every 24 hours (although you can manually update the feed), and the widget displays the last time the feed was updated based on the local time of the appliance. Keep in mind that the appliance must have access to the web site (for the two preconfigured feeds) or to any custom feed you configure.

When you configure the widget, you can also choose how many stories from the feed you want to show in the widget, as well as whether you want to show descriptions of the stories along with the headlines; keep in mind that not all RSS feeds use descriptions.

On the RSS Feed widget, you can:

- click one of the stories in the feed to view the story
- click the **more** link to go to the feed’s web site
- click the update icon (>Loading</i>) to manually update the feed

**The System Load Widget**

The System Load widget shows the CPU usage (for each CPU), memory (RAM) usage, and system load (also called the load average, measured by the number of processes waiting to execute) on the appliance, both currently and over the dashboard time range. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.
You can configure the widget to show or hide the load average by modifying the widget preferences. The preferences also control how often the widget updates.

**The System Time Widget**

The System Time widget shows the local system time, uptime, and boot time for the appliance. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

You can configure the widget to hide the boot time by modifying the widget preferences. The preferences also control how often the widget synchronizes with the appliance’s clock.

**The White List Events Widget**

The White List Events widget shows the average events per second by priority, over the dashboard time range. It appears by default on the Correlation tab of the Default Dashboard.

You can configure the widget to display white list events of different priorities by modifying the widget preferences.

In the widget preferences, you can:

- choose one or more **Priorities** check boxes to display separate graphs for events of specific priorities, including events that do not have a priority
- choose **Show All** to display an additional graph for all white list events, regardless of priority
- choose **Vertical Scale** to choose **Linear** (incremental) or **Logarithmic** (factor of ten) scale

The preferences also control how often the widget updates.

You can click a graph to view white list events of a specific priority, or click the **All** graph to view all white list events. In either case, the events are constrained by the dashboard time range; accessing white list events via the dashboard changes the events (or global) time window for the Firepower Management Center.

**Managing Dashboards**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst/Maint</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose **Overview > Dashboards**, and then choose the dashboard you want to modify from the menu.

**Step 2** Manage your dashboards:

- Create Dashboards — Create a custom dashboard; see Creating Custom Dashboards, on page 267.
- Delete Dashboards — To delete a dashboard, click delete ( ) next to the dashboard you want to delete. If you delete your default dashboard, you must define a new default or the appliance prompts you to choose a dashboard every time you attempt to view a dashboard.
- Edit Options — Edit custom dashboard options; see Editing Dashboards Options, on page 269.
- Modify Time Constraints — Modify the time display or pause/unpause the dashboard as described in Modifying Dashboard Time Settings, on page 269.

**Step 3**

Add (see Adding a Dashboard, on page 265), Delete (click close (🗑️)), and Rename (see Renaming a Dashboard, on page 270) dashboards.

**Note** You cannot change the order of dashboards.

**Step 4**

Manage dashboard widgets:

- Add Widgets — Add widgets to a dashboard; see Adding Widgets to a Dashboard, on page 265.
- Configure Preferences — Configure widget preferences; see Configuring Widget Preferences, on page 266.
- Customize Display — Customize the widget display; see Customizing the Widget Display, on page 268.
- View Events — View associated events from the Custom Analysis Widget; see Viewing Associated Events from the Custom Analysis Widget, on page 259.

**Tip** Every configuration of the Custom Analysis widget in the Cisco predefined dashboards corresponds to a system preset for that widget. If you change or delete one of these widgets, you can restore it by creating a new Custom Analysis widget based on the appropriate preset.

---

### Adding a Dashboard

<table>
<thead>
<tr>
<th>Access</th>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Supported Devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin/Any Security Analyst/Maint</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
</tr>
</tbody>
</table>

#### Procedure

**Step 1** View the dashboard you want to modify; see Viewing Dashboards, on page 271.

**Step 2** Click add (➕).

**Step 3** Enter a name.

**Step 4** Click OK.

---

### Adding Widgets to a Dashboard

<table>
<thead>
<tr>
<th>Access</th>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Supported Devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin/Any Security Analyst/Maint</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
</tr>
</tbody>
</table>

Each tab can display one or more widgets in a three-column layout. When adding a widget to a dashboard, you choose the tab to which you want to add the widget. The system automatically adds it to the column with
the fewest widgets. If all columns have an equal number of widgets, the new widget is added to the leftmost column. You can add a maximum of 15 widgets to a dashboard tab.

**Tip**

After you add widgets, you can move them to any location on the tab. You cannot, however, move widgets from tab to tab.

The dashboard widgets you can view depend on the type of appliance you are using, your user role, and your current domain (in a multidomain deployment). Keep in mind that because not all user roles have access to all dashboard widgets, users with fewer permissions viewing a dashboard created by a user with more permissions may not be able to use all of the widgets on the dashboard. Although the unauthorized widgets still appear on the dashboard, they are disabled.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>View the dashboard where you want to add a widget; see Viewing Dashboards, on page 271.</td>
</tr>
<tr>
<td>2</td>
<td>Click the tab where you want to add the widget.</td>
</tr>
<tr>
<td>3</td>
<td>Click Add Widgets. You can view the widgets in each category by clicking on the category name, or you can view all widgets by clicking All Categories.</td>
</tr>
<tr>
<td>4</td>
<td>Click Add next to the widgets you want to add. The Add Widgets page indicates how many widgets of each type are on the tab, including the widget you want to add. <strong>Tip</strong> To add multiple widgets of the same type (for example, you may want to add multiple RSS Feed widgets, or multiple Custom Analysis widgets), click Add again.</td>
</tr>
<tr>
<td>5</td>
<td>When you are finished adding widgets, click Done to return to the dashboard.</td>
</tr>
</tbody>
</table>

**What to do next**

- If you added a Custom Analysis widget, configure the widget preferences; see Configuring Widget Preferences, on page 266.

**Related Topics**

- Widget Availability, on page 252

### Configuring Widget Preferences

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst/Maint</td>
</tr>
</tbody>
</table>

Each widget has a set of preferences that determines its behavior.
Procedure

Step 1  On the title bar of the widget whose preferences you want to change, click show preferences (^
).  
Step 2  Make changes as needed.  
Step 3  On the widget title bar, click hide preferences (^) to hide the preferences section.

Creating Custom Dashboards

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst/Maint</td>
</tr>
</tbody>
</table>

Tip

Instead of creating a new dashboard, you can export a dashboard from another appliance, then import it onto your appliance. You can then edit the imported dashboard to suit your needs.

Procedure

Step 1  Choose Overview > Dashboards > Management.  
Step 2  Click Create Dashboard.  
Step 3  Modify the custom dashboard options as described in Custom Dashboard Options, on page 267.  
Step 4  Click Save.

Custom Dashboard Options

The table below describes options you can use when creating or editing custom dashboards.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy Dashboard</td>
<td>When you create a custom dashboard, you can choose to base it on any existing dashboard, whether user-created or system-defined. This option makes a copy of the preexisting dashboard, which you can modify to suit your needs. Optionally, you can create a blank new dashboard by choosing None. This option is available only when you create a new dashboard. In a multidomain deployment, you can copy any non-private dashboards from ancestor domains.</td>
</tr>
<tr>
<td>Name</td>
<td>A unique name for the custom dashboard.</td>
</tr>
</tbody>
</table>
**Option** | **Description**
---|---
Description | A brief description of the custom dashboard.
Change Tabs Every | Specifies (in minutes) how often the dashboard should cycle through its tabs. Unless you pause the dashboard or your dashboard has only one tab, this setting advances your view to the next tab at the interval you specify. To disable tab cycling, enter 0 in the **Change Tabs Every** field.
Refresh Page Every | Determines how often the entire dashboard page automatically refreshes.
Refresh Page Every | Refreshing the entire dashboard allows you to see any preference or layout changes that were made to a shared dashboard by another user, or that you made to a private dashboard on another computer, since the last time the dashboard refreshed. A frequent refresh can be useful, for example, in a networks operations center (NOC) where a dashboard is displayed at all times. If you make changes to the dashboard at a local computer, the dashboard in the NOC automatically refreshes at the interval you specify, and no manual refresh is required.
Refresh Page Every | This refresh does not update the data, and you do not need to refresh the entire dashboard to see data updates; individual widgets update according to their preferences.
Refresh Page Every | This value must be greater than the **Change Tabs Every** setting.
Save As Private | Determines whether the custom dashboard can be viewed and modified by all users of the appliance or is associated with your user account and reserved solely for your own use. Keep in mind that any user with dashboard access, regardless of role, can modify shared dashboards. If you want to make sure that only you can modify a particular dashboard, save it as private.

**Customizing the Widget Display**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst/Maint</td>
</tr>
</tbody>
</table>
You can minimize and maximize widgets, as well as rearrange the widgets on a tab.

**Procedure**

**Step 1**  
View a dashboard; see Viewing Dashboards, on page 271.

**Step 2**  
Customize the widget display:

- To rearrange a widget on a tab, click the title bar of the widget you want to move, then drag it to its new location.

**Note**  
You cannot move widgets from tab to tab. If you want a widget to appear on a different tab, you must delete it from the existing tab and add it to the new tab.

- To minimize or maximize a widget on the dashboard, click minimize (−) or maximize (+) in a widget’s title bar.
- To delete a widget if you no longer want to view it on a tab, click close (×) in the title bar of the widget.

**Editing Dashboards Options**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst/Maint</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**  
View the dashboard you want to edit; see Viewing Dashboards, on page 271.

**Step 2**  
Click edit (✎).

**Step 3**  
Change the options as described in Custom Dashboard Options, on page 267.

**Step 4**  
Click Save.

**Modifying Dashboard Time Settings**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Any Security Analyst/Maint</td>
</tr>
</tbody>
</table>

You can change the time range to reflect a period as short as the last hour (the default) or as long as the last year. When you change the time range, the widgets that can be constrained by time automatically update to reflect the new time range.
Note that not all widgets can be constrained by time. For example, the dashboard time range has no effect on the Appliance Information widget, which provides information that includes the appliance name, model, and current version of the Firepower System software.

Keep in mind that for enterprise deployments of the Firepower System, changing the time range to a long period may not be useful for widgets like the Custom Analysis widget, depending on how often newer events replace older events.

You can also pause a dashboard, which allows you to examine the data provided by the widgets without the display changing and interrupting your analysis. Pausing a dashboard has the following effects:

- Individual widgets stop updating, regardless of any Update Every widget preference.
- Dashboard tabs stop cycling, regardless of the Cycle Tabs Every setting in the dashboard properties.
- Dashboard pages stop refreshing, regardless of the Refresh Page Every setting in the dashboard properties.
- Changing the time range has no effect.

When you are finished with your analysis, you can unpause the dashboard. Unpausing the dashboard causes all appropriate widgets on the page to update to reflect the current time range. In addition, dashboard tabs resume cycling and the dashboard page resumes refreshing according to the settings you specified in the dashboard properties.

If you experience connectivity problems or other issues that interrupt the flow of system information to the dashboard, the dashboard automatically pauses and an error notice appears until the problem is resolved.

**Note**

Your session normally logs you out after 1 hour of inactivity (or another configured interval), regardless of whether the dashboard is paused. If you plan to passively monitor the dashboard for long periods of time, consider exempting some users from session timeout, or changing the system timeout settings.

**Procedure**

**Step 1** View the dashboard where you want to add a widget; see Viewing Dashboards, on page 271.

**Step 2** Optionally, to change the dashboard time range, choose a time range from the Show the Last drop-down list.

**Step 3** Optionally, pause or unpause the dashboard on the time range control, using pause (IBAction) or play (IBAction).

### Renaming a Dashboard

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

</tbody>
</table>

By default, the home page for your appliance displays the default dashboard. If you do not have a default dashboard defined, the home page shows the Dashboard Management page, where you can choose a dashboard to view.

Procedure

At any time, you can do one of the following:

- To view the default dashboard for your appliance, choose Overview > Dashboards.
- To view a specific dashboard, choose Overview > Dashboards, and choose the dashboard from the menu.
- To view all available dashboards, choose Overview > Dashboards > Management. You can then choose view (اظ) next to an individual dashboard to view it.
Health Monitoring

The following topics describe how to use health monitoring in the Firepower System:

- About Health Monitoring, on page 273
- Health Policies, on page 280
- The Health Monitor Blacklist, on page 284
- Health Monitor Alerts, on page 286
- Using the Health Monitor, on page 289
- Viewing Appliance Health Monitors, on page 291
- Health Event Views, on page 293
- History for Health Monitoring, on page 299

About Health Monitoring

The health monitor on the Firepower Management Center tracks a variety of health indicators to ensure that the hardware and software in the Firepower System are working correctly. You can use the health monitor to check the status of critical functionality across your Firepower System deployment.

You can use the health monitor to create a collection of tests, referred to as a health policy, and apply the health policy to one or more appliances. The tests, referred to as health modules, are scripts that test for criteria you specify. You can modify a health policy by enabling or disabling tests or by changing test settings, and you can delete health policies that you no longer need. You can also suppress messages from selected appliances by blacklisting them.

The tests in a health policy run automatically at the interval you configure. You can also run all tests, or a specific test, on demand. The health monitor collects health events based on the test conditions configured.
All Appliances automatically report their hardware status via the Hardware Alarms health module. The Firepower Management Center also automatically reports status using the modules configured in the default health policy. Some health modules, such as the Appliance Heartbeat module, run on the Firepower Management Center and report the status of the Firepower Management Center's managed devices. Some health modules do not provide managed device status unless you apply a health policy configured with those modules to a device.

You can use the health monitor to access health status information for the entire system, for a particular appliance, or, in a multidomain deployment, a particular domain. Pie charts and status tables on the Health Monitor page provide a visual summary of the status of all appliances on your network, including the Firepower Management Center. Individual appliance health monitors let you drill down into health details for a specific appliance.

Fully customizable event views allow you to quickly and easily analyze the health status events gathered by the health monitor. These event views allow you to search and view event data and to access other information that may be related to the events you are investigating. For example, if you want to see all the occurrences of CPU usage with a certain percentage, you can search for the CPU usage module and enter the percentage value.

You can also configure email, SNMP, or syslog alerting in response to health events. A health alert is an association between a standard alert and a health status level. For example, if you need to make sure an appliance never fails due to hardware overload, you can set up an email alert. You can then create a health alert that triggers that email alert whenever CPU, disk, or memory usage reaches the Warning level you configure in the health policy applied to that appliance. You can set alerting thresholds to minimize the number of repeating alerts you receive.

You can also generate troubleshooting files for an appliance if you are asked to do so by Support.

Because health monitoring is an administrative activity, only users with administrator user role privileges can access system health data.

### Health Modules

*Health modules, or health tests, test for the criteria you specify in a health policy.*

#### Table 37: Health Modules

<table>
<thead>
<tr>
<th>Module</th>
<th>Appliances</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMP for Endpoints Status</td>
<td>FMC</td>
<td>The module alerts if the FMC cannot connect to the AMP cloud or Cisco AMP Private Cloud after an initial successful connection, or if the private cloud cannot contact the public AMP cloud. It also alerts if you deregister an AMP cloud connection using the AMP for Endpoints management console.</td>
</tr>
<tr>
<td>Module</td>

<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>AMP for Firepower Status</strong></td>
<td>FMC</td>
<td>This module alerts if:</td>
</tr>
<tr>
<td>(AMP for Networks Status)</td>
<td></td>
<td>- The FMC cannot contact the AMP cloud (public or private) or the Cisco Threat Grid public cloud or on-premises appliance, or the AMP private cloud cannot contact the public AMP cloud.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- The encryption keys used for the connection are invalid.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- A device cannot contact the Cisco Threat Grid cloud or an Cisco Threat Grid on-premises appliance to submit files for dynamic analysis.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- An excessive number of files are detected in network traffic based on the file policy configuration.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If your FMC loses connectivity to the Internet, the system may take up to 30 minutes to generate a health alert.</td>
</tr>
<tr>
<td><strong>Appliance Heartbeat</strong></td>
<td>Any</td>
<td>This module determines if an appliance heartbeat is being heard from the appliance and alerts based on the appliance heartbeat status.</td>
</tr>
<tr>
<td><strong>Automatic Application</strong></td>
<td>7000 &amp; 8000 Series</td>
<td>This module determines if an appliance has been bypassed because it did not respond within the number of seconds set in the bypass threshold, and alerts when a bypass occurs.</td>
</tr>
<tr>
<td><strong>Bypass Status</strong></td>
<td>FMC</td>
<td>This module displays an alert if the backlog of event data awaiting transmission from the device to the FMC has grown continuously for more than 30 minutes.</td>
</tr>
<tr>
<td><strong>Backlog Status</strong></td>
<td>FMC</td>
<td>To reduce the backlog, evaluate your bandwidth and consider logging fewer events.</td>
</tr>
<tr>
<td><strong>Classic License Monitor</strong></td>
<td>FMC</td>
<td>This module determines if sufficient Classic licenses remain. It also alerts when devices in a stack have mismatched license sets. It alerts based on a warning level automatically configured for the module. You cannot change the configuration of this module.</td>
</tr>
<tr>
<td><strong>CPU Usage</strong></td>
<td>Any</td>
<td>This module checks that the CPU on the appliance is not overloaded and alerts when CPU usage exceeds the percentages configured for the module.</td>
</tr>
<tr>
<td><strong>Card Reset</strong></td>
<td>Any</td>
<td>This module checks for network cards which have restarted due to hardware failure and alerts when a reset occurs.</td>
</tr>
<tr>
<td><strong>Cluster Status</strong></td>
<td>Threat Defense</td>
<td>This module monitors the status of device clusters. The module alerts if:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- A new primary unit is elected to a cluster.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- A new secondary unit joins a cluster.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- A primary or secondary unit leaves a cluster.</td>
</tr>
</tbody>
</table>
### Health Modules

<table>
<thead>
<tr>
<th>Module</th>
<th>Appliances</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disk Status</td>
<td>Any</td>
<td>This module examines performance of the hard disk, and malware storage pack (if installed) on the appliance. This module generates a Warning (yellow) health alert when the hard disk and RAID controller (if installed) are in danger of failing, or if an additional hard drive is installed that is not a malware storage pack. This module generates an Alert (red) health alert when an installed malware storage pack cannot be detected.</td>
</tr>
<tr>
<td>Disk Usage</td>
<td>Any</td>
<td>This module compares disk usage on the appliance’s hard drive and malware storage pack to the limits configured for the module and alerts when usage exceeds the percentages configured for the module. This module also alerts when the system excessively deletes files in monitored disk usage categories, or when disk usage excluding those categories reaches excessive levels, based on module thresholds. Use the Disk Usage health status module to monitor disk usage for the <code>/</code> and <code>/volume</code> partitions on the appliance and track draining frequency. Although the disk usage module lists the <code>/boot</code> partition as a monitored partition, the size of the partition is static so the module does not alert on the boot partition.</td>
</tr>
<tr>
<td>Host Limit</td>
<td>FMC</td>
<td>This module determines if the number of hosts the FMC can monitor is approaching the limit and alerts based on the warning level configured for the module. For more information, see Firepower System Host Limit, on page 1748.</td>
</tr>
<tr>
<td>Hardware Alarms</td>
<td>7000 &amp; 8000 Series Threat Defense (physical)</td>
<td>This module determines if hardware needs to be replaced on a physical managed device and alerts based on the hardware status. The module also reports on the status of hardware-related daemons and on the status of 7000 and 8000 Series devices in high-availability deployments.</td>
</tr>
<tr>
<td>HA Status</td>
<td>FMC</td>
<td>This module monitors and alerts on the high availability status of the FMC. If you have not established FMC high availability, the HA Status is Not in HA. This module does not monitor or alert on the high availability status of managed devices, regardless of whether they are paired. The HA Status for a managed device is always Not in HA. Use the device management page Devices &gt; Device Management to monitor devices in high availability pairs.</td>
</tr>
<tr>
<td>Health Monitor Process</td>
<td>Any</td>
<td>This module monitors the status of the health monitor itself and alerts if the number of minutes since the last health event received by the FMC exceeds the Warning or Critical limits.</td>
</tr>
<tr>
<td>Inline Link Mismatch Alarms</td>
<td>Any managed device except ASA FirePOWER</td>
<td>This module monitors the ports associated with inline sets and alerts if the two interfaces of an inline pair negotiate different speeds.</td>
</tr>
<tr>
<td>Module</td>
<td>Appliances</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Intrusion and File Event Rate | Any managed device                      | This module compares the number of intrusion events per second to the limits configured for this module and alerts if the limits are exceeded. If the Intrusion and File Event Rate is zero, the intrusion process may be down or the managed device may not be sending events. Select **Analysis > Intrusions > Events** to check if events are being received from the device. Typically, the event rate for a network segment averages 20 events per second. For a network segment with this average rate, Events per second (Critical) should be set to 50 and Events per second (Warning) should be set to 30. To determine limits for your system, find the Events/Sec value on the Statistics page for your device (**System > Monitoring > Statistics**), then calculate the limits using these formulas:  
- Events per second (Critical) = Events/Sec * 2.5  
- Events per second (Warning) = Events/Sec * 1.5  
The maximum number of events you can set for either limit is 999, and the Critical limit must be higher than the Warning limit. |
| Interface Status        | Any                                     | This module determines if the device currently collects traffic and alerts based on the traffic status of physical interfaces and aggregate interfaces. For physical interfaces, the information includes interface name, link state, and bandwidth. For aggregate interfaces, the information includes interface name, number of active links, and total aggregate bandwidth. For ASA FirePOWER, interfaces labeled DataPlaneInterfacex, where x is a numerical value, are internal interfaces (not user-defined) and involve packet flow within the system. |
| Link State Propagation  | Any except NGIPSv, ASA FirePOWER, Firepower 9300, Firepower 4100 series | This module determines when a link in a paired inline set fails and triggers the link state propagation mode. If a link state propagates to the pair, the status classification for that module changes to Critical and the state reads:  
Module Link State Propagation: ethx_ethy is Triggered  
where x and y are the paired interface numbers. |
<p>| Local Malware Analysis  | Any                                     | This module alerts if a device is configured for local malware analysis and fails to download local malware analysis engine signature updates from the AMP cloud. |</p>

<tr>
<th>Module</th>
<th>Appliances</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory Usage</td>
<td>Any</td>
<td>This module compares memory usage on the appliance to the limits configured for the module and alerts when usage exceeds the levels configured for the module. This includes appliances with more than 4 GB of memory. For appliances with more than 4 GB of memory, the preset alert thresholds are based on a formula that accounts for proportions of available memory likely to cause system problems. On &gt;4 GB appliances, because the interval between Warning and Critical thresholds may be very narrow, Cisco recommends that you manually set the Warning Threshold % value to 50. This will further ensure that you receive memory alerts for your appliance in time to address the issue. See Memory Usage Thresholds for Health Monitor Alerts, on page 319 for additional information about how thresholds are calculated. Complex access control policies and rules can command significant resources and negatively affect performance. Some lower-end ASA devices with FirePOWER Services Software may generate intermittent memory usage warnings, as the device’s memory allocation is being used to the fullest extent possible.</td>
</tr>
<tr>
<td>Power Supply</td>
<td>Physical FMCs 7000 &amp; 8000 Series</td>

<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

Procedure

**Step 1**
Determine which health modules you want to monitor as discussed in Health Modules, on page 274.

You can set up specific policies for each kind of appliance you have in your Firepower System, enabling only the appropriate tests for that appliance.

**Tip** To quickly enable health monitoring without customizing the monitoring behavior, you can apply the default policy provided for that purpose.

**Step 2**
Apply a health policy to each appliance where you want to track health status as discussed in Creating Health Policies, on page 281.

**Step 3** (Optional.) Configure health monitor alerts as discussed in Creating Health Monitor Alerts, on page 287.

You can set up email, syslog, or SNMP alerts that trigger when the health status level reaches a particular severity level for specific health modules.

Health Policies

A health policy contains configured health test criteria for several modules. You can control which health modules run against each of your appliances and configure the specific limits used in the tests run by each module.

When you configure a health policy, you decide whether to enable each health module for that policy. You also select the criteria that control which health status each enabled module reports each time it assesses the health of a process.

You can create one health policy that can be applied to every appliance in your system, customize each health policy to the specific appliance where you plan to apply it, or use the default health policy provided for you. In a multidomain deployment, administrators in ancestor domains can apply health policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

Default Health Policy

The health monitor on the Firepower Management Center provides a default health policy to allow you to quickly implement health monitoring for your appliances. In the default health policy, most of the health modules available on the running platform are automatically enabled. The default health policy is automatically applied to the Firepower Management Center. Additionally, the default health policy is applied to a managed device when you add the device to the Firepower Management Center. You cannot edit the default health policy, but you can copy it to create custom policies based on its configuration.
Creating Health Policies

If you want to customize a health policy to use with your appliances, you can create a new policy. The settings in the policy initially populate with the settings from the health policy you choose as a basis for the new policy. You can enable or disable modules within the policy and change the alerting criteria for each module as needed.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain. Administrators in ancestor domains can apply health policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

**Procedure**

**Step 1** Choose System > Health > Policy.

**Step 2** Click New Policy.

**Step 3** Choose the existing policy that you want to use as the basis for the new policy from the Copy Policy drop-down list.

**Step 4** Enter a name for the policy.

**Step 5** Enter a description for the policy.

**Step 6** Choose Save to save the policy information.

**Step 7** Choose the module you want to use.

**Step 8** Choose On for the Enabled option to enable use of the module for health status testing.

**Step 9** Where appropriate, set the Critical and Warning criteria.

**Step 10** Configure any additional settings for the module. Repeat steps 7-10 for each module.

**Step 11** You have three choices:

- To save your changes to this module and return to the Health Policy page, click Save Policy and Exit.
- To return to the Health Policy page without saving any of your settings for this module, click Cancel.
- To temporarily save your changes to this module and switch to another module’s settings to modify, choose the other module from the list at the left of the page. If you click Save Policy and Exit when you are done, all changes you made will be saved; if you click Cancel, you discard all changes.

**What to do next**

- Apply the health policy to each appliance as described in Applying Health Policies, on page 282. This applies your changes and updates the policy status for all affected policies.
Applying Health Policies

When you apply a health policy to an appliance, the health tests for all the modules you enabled in the policy automatically monitor the health of the processes and hardware on the appliance. Health tests then continue to run at the intervals you configured in the policy, collecting health data for the appliance and forwarding that data to the Firepower Management Center.

If you enable a module in a health policy and then apply the policy to an appliance that does not require that health test, the health monitor reports the status for that health module as disabled.

If you apply a policy with all modules disabled to an appliance, it removes all applied health policies from the appliance so no health policy is applied.

When you apply a different policy to an appliance that already has a policy applied, expect some latency in the display of new data based on the newly applied tests.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain. Administrators in ancestor domains can apply health policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

Procedure

Step 1 Choose System > Health > Policy.

Step 2 Click apply (✓) next to the policy you want to apply.

Tip The status (✓) next to the Health Policy column indicates the current health status for the appliance.

Step 3 Choose the appliances where you want to apply the health policy.

Step 4 Click Apply to apply the policy to the appliances you chose.

What to do next

• Optionally, monitor the task status; see Viewing Task Messages, on page 317.

Monitoring of the appliance starts as soon as the policy is successfully applied.

Editing Health Policies

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created
in a lower domain, switch to that domain. Administrators in ancestor domains can apply health policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

**Procedure**

**Step 1** Choose System > Health > Policy.

**Step 2** Click edit (✍️) next to the policy you want to modify.

**Step 3** Edit the Policy Name or Policy Description fields as desired.

**Step 4** Click the health module you want to modify.

**Step 5** Modify settings as described in Health Modules, on page 274.

**Step 6** You have three options:

- To save your changes to this module and return to the Health Policy page, click Save Policy and Exit.
- To return to the Health Policy page without saving any of your settings for this module, click Cancel.
- To temporarily save your changes to this module and switch to another module’s settings to modify, choose the other module from the list at the left of the page. If you click Save Policy and Exit when you are done, all changes you made will be saved; if you click Cancel, you discard all changes.

**What to do next**

- Reapply the health policy as described in Applying Health Policies, on page 282. This applies your changes and updates the policy status for all affected policies.

### Deleting Health Policies

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

You can delete health policies that you no longer need. If you delete a policy that is still applied to an appliance, the policy settings remain in effect until you apply a different policy. In addition, if you delete a health policy that is applied to a device, any health monitoring alerts in effect for the device remain active until you disable the underlying associated alert response.

In a multidomain deployment, you can only delete health policies created in the current domain.

**Tip**

To stop health monitoring for an appliance, create a health policy with all modules disabled and apply it to the appliance.

**Procedure**

**Step 1** Choose System > Health > Policy.
Step 2  Click delete (🗑️) next to the policy you want to delete.  
A message appears, indicating if the deletion was successful.

---

The Health Monitor Blacklist

In the course of normal network maintenance, you disable appliances or make them temporarily unavailable. Because those outages are deliberate, you do not want the health status from those appliances to affect the summary health status on your Firepower Management Center.

You can use the health monitor blacklist feature to disable health monitoring status reporting on an appliance or module. For example, if you know that a segment of your network will be unavailable, you can temporarily disable health monitoring for a managed device on that segment to prevent the health status on the Firepower Management Center from displaying a warning or critical state because of the lapsed connection to the device.

When you disable health monitoring status, health events are still generated, but they have a disabled status and do not affect the health status for the health monitor. If you remove the appliance or module from the blacklist, the events that were generated during the blacklisting continue to show a status of disabled.

To temporarily disable health events from an appliance, go to the blacklist configuration page and add an appliance to the blacklist. After the setting takes effect, the system no longer includes the blacklisted appliance when calculating the overall health status. The Health Monitor Appliance Status Summary lists the appliance as disabled.

At times it may be more practical to just blacklist an individual health monitoring module on an appliance. For example, when you reach the host limit on a Firepower Management Center, you can blacklist the Host Limit status messages.

Note that on the main Health Monitor page you can distinguish between appliances that are blacklisted if you expand to view the list of appliances with a particular status by clicking the arrow in that status row.

A blacklist icon (blocking) and a notation are visible after you expand the view for a blacklisted or partially blacklisted appliance.

---

On a Firepower Management Center, Health Monitor blacklist settings are local configuration settings. Therefore, if you blacklist a device, then delete it and later re-register it with the Firepower Management Center, the blacklist settings remain persistent. The newly re-registered device remains blacklisted.

In a multidomain deployment, administrators in ancestor domains can blacklist an appliance or health module in descendant domains. However, administrators in the descendant domains can override the ancestor configuration and clear the blacklist for devices in their domain.

---

Blacklisting Appliances

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

You can blacklist appliances individually or by group, model, or associated health policy.
After the blacklist settings take effect, the appliance shows as disabled in the Health Monitor Appliance Module Summary and Device Management page. Health events for the appliance have a status of disabled.

If you need to set the events and health status for an individual appliance to disabled, you can blacklist the appliance. After the blacklist settings take effect, the appliance shows as disabled in the Health Monitor Appliance Module Summary, and health events for the appliance have a status of disabled.

In a multidomain deployment, blacklisting an appliance in an ancestor domain blacklists it for all descendant domains. Descendant domains can override this inherited configuration and clear the blacklisting. You can only blacklist the Firepower Management Center at the Global level.

**Procedure**

**Step 1** Choose System > Health > Blacklist.

**Step 2** Use the drop-down list on the right to sort the list by group, model, or by health policy.

**Tip** The status icon next to the Health Policy column ( ), indicates the current health status for the appliance. The status icon next to the System Policy column ( ) indicates the communication status between the Firepower Management Center and the device.

**Step 3** You have two choices:

- To blacklist all appliances in a group, model, or policy category, check the check box for the category, then click **Blacklist Selected Devices**.
- To clear blacklisting from all appliances in a group, model, or policy category, check the check box for the category, then click **Clear Blacklist on Selected Devices**.

### Blacklisting Health Policy Modules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint</td>
</tr>
</tbody>
</table>

You can blacklist individual health policy modules on appliances. You may want to do this to prevent events from the module from changing the status for the appliance to warning or critical.

After the blacklist settings take effect, the appliance shows as **Partially Blacklisted** or **All Modules Blacklisted** on the Blacklist page and in the Appliance Health Monitor Module Status Summary, but only in expanded views on the main Appliance Status Summary page.

**Tip** Make sure that you keep track of individually blacklisted modules so you can reactivate them when you need them. You may miss necessary warning or critical messages if you accidentally leave a module disabled.

In a multidomain deployment, administrators in ancestor domains can blacklist health modules in descendant domains. However, administrators in descendant domains can override this ancestor configuration and clear the blacklisting for policies applied in their domains. You can only blacklist Firepower Management Center health modules at the Global level.
Procedure

**Step 1**  Choose System > Health > Blacklist.

**Step 2**  Click edit (✏️) next to the appliance you want to modify.

**Step 3**  Check the check boxes next to the health policy modules you want to blacklist. Certain modules are applicable to specific devices only; for more information, see Health Modules, on page 274.

**Step 4**  Click Save.

---

**Health Monitor Alerts**

You can set up alerts to notify you through email, through SNMP, or through the system log when the status changes for the modules in a health policy. You can associate an existing alert response with health event levels to trigger and alert when health events of a particular level occur.

For example, if you are concerned that your appliances may run out of hard disk space, you can automatically send an email to a system administrator when the remaining disk space reaches the warning level. If the hard drive continues to fill, you can send a second email when the hard drive reaches the critical level.

In a multidomain deployment, you can view and modify health monitor alerts created in the current domain only.

**Health Monitor Alert Information**

The alerts generated by the health monitor contain the following information:

- Severity, which indicates the severity level of the alert.
- Module, which specifies the health module whose test results triggered the alert.
- Description, which includes the health test results that triggered the alert.

The table below describes these severity levels.

<table>
<thead>
<tr>
<th>Severity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical</td>
<td>The health test results met the criteria to trigger a Critical alert status.</td>
</tr>
<tr>
<td>Warning</td>
<td>The health test results met the criteria to trigger a Warning alert status.</td>
</tr>
<tr>
<td>Normal</td>
<td>The health test results met the criteria to trigger a Normal alert status.</td>
</tr>
<tr>
<td>Error</td>
<td>The health test did not run.</td>
</tr>
</tbody>
</table>
The health test results met the criteria to return to a normal alert status, following a Critical or Warning alert status.

### Creating Health Monitor Alerts

<table>
<thead>
<tr>
<th>Severity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recovered</td>
<td>The health test results met the criteria to return to a normal alert status, following a Critical or Warning alert status.</td>
</tr>
</tbody>
</table>

#### Smart License | Classic License | Supported Devices | Supported Domains | Access |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you create a health monitor alert, you create an association between a severity level, a health module, and an alert response. You can use an existing alert or configure a new one specifically to report on system health. When the severity level occurs for the selected module, the alert triggers.

If you create or update a threshold in a way that duplicates an existing threshold, you are notified of the conflict. When duplicate thresholds exist, the health monitor uses the threshold that generates the fewest alerts and ignores the others. The timeout value for the threshold must be between 5 and 4,294,967,295 minutes.

In a multidomain deployment, you can view and modify health monitor alerts created in the current domain only.

**Before you begin**

- Configure an alert response that governs the Firepower Management Center's communication with the SNMP, syslog, or email server where you send the health alert; see Firepower Management Center Alert Responses, on page 2001.

**Procedure**

**Step 1** Choose System > Health > Monitor Alerts.

**Step 2** Enter a name for the health alert in the Health Alert Name field.

**Step 3** From the Severity list, choose the severity level you want to use to trigger the alert.

**Step 4** From the Module list, choose the health policy modules for which you want the alert to apply.

**Step 5** From the Alert list, choose the alert response that you want to trigger when the specified severity level is reached.

**Step 6** Optionally, in the Threshold Timeout field, enter the number of minutes that should elapse before each threshold period ends and the threshold count resets.

Even if the policy run time interval value is less than the threshold timeout value, the interval between two reported health events from a given module is always greater. For example, if you change the threshold timeout to 8 minutes and the policy run time interval is 5 minutes, there is a 10-minute interval (5 x 2) between reported events.

**Step 7** Click Save to save the health alert.
Editing Health Monitor Alerts

You can edit existing health monitor alerts to change the severity level, health module, or alert response associated with the health monitor alert.

In a multidomain deployment, you can view and modify health monitor alerts created in the current domain only.

Procedure

Step 1 Choose System > Health > Monitor Alerts.
Step 2 Choose the alert you want to modify from the Active Health Alerts list.
Step 3 Click Load to load the configured settings for the alert you chose.
Step 4 Modify settings as needed.
Step 5 Click Save to save the modified health alert.
A message indicates if the alert configuration was successfully saved.

Deleting Health Monitor Alerts

In a multidomain deployment, you can view and modify health monitor alerts created in the current domain only.

Procedure

Step 1 Choose System > Health > Monitor Alerts.
Step 2 Choose the active health alerts you want to delete, then click Delete.

What to do next

- Disable or delete the underlying alert response to ensure that alerting does not continue; see Firepower Management Center Alert Responses, on page 2001.
Using the Health Monitor

The health monitor provides the compiled health status for all devices managed by the Firepower Management Center, plus the Firepower Management Center. The health monitor is composed of:

- The status table — Provides a count of the managed appliances for this Firepower Management Center by overall health status.
- The pie chart — Indicates the percentage of appliances currently in each health status category.
- The appliance list — Provides details on the health of the managed devices.

In a multidomain deployment, the health monitor in an ancestor domain displays data from all descendant domains. In the descendant domains, it displays data from the current domain only.

**Procedure**

**Step 1** Choose **System > Health > Monitor**.

**Step 2** Choose the appropriate status in the **Status** column of the table or the appropriate portion of the pie chart to the list appliances with that status.

**Tip** If the arrow in the row for a status level points down, the appliance list for that status shows in the lower table. If the arrow points right, the appliance list is hidden.

**Step 3** You have the following choices:

- View appliance health monitors; see **Viewing Appliance Health Monitors**, on page 291.
- Create health policies; see **Creating Health Policies**, on page 281.
- Create health monitor alerts; see **Creating Health Monitor Alerts**, on page 287.

**Health Monitor Status Categories**

Available status categories are listed by severity in the table below.
### Table 39: Health Status Indicator

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The Appliance Health Monitor provides a detailed view of the health status of an appliance.

In a multidomain deployment, you can view the health status of appliances in descendant domains.

**Tip**
Your session normally logs you out after 1 hour of inactivity (or another configured interval). If you plan to passively monitor health status for long periods of time, consider exempting some users from session timeout, or changing the system timeout settings. See User Account Login Options, on page 67 and Configure Session Timeouts, on page 842 for more information.

## Procedure

**Step 1** Choose System > Health > Monitor.

**Step 2** Expand the appliance list. To show appliances with a particular status, click the arrow in that status row. Alternatively, in the Appliance Status Summary graph, click the color for the appliance status category you want to view.

**Tip** If the arrow in the row for a status level points down, the appliance list for that status shows in the lower table. If the arrow points right, the appliance list is hidden.

**Step 3** In the Appliance column of the appliance list, click the name of the appliance for which you want to view details.

**Tip** In the Module Status Summary graph, click the color for an event status category to toggle display of Alert Details for that status category.

## What to do next

- If you want to run all health modules for the appliance, see Running All Modules for an Appliance, on page 292
- If you want to run a specific health module for an appliance, see Running a Specific Health Module, on page 292
- If you want to generate health module alert graphs for the appliance, see Generating Health Module Alert Graphs, on page 293
- If you want to produce troubleshooting files for the appliance, see Downloading Advanced Troubleshooting Files, on page 322

</table>

Health module tests run automatically at the policy run time interval you configure when you create a health policy. However, you can also run all health module tests on demand to collect up-to-date health information for the appliance.

In a multidomain deployment, you can run health module tests for appliances in the current domain and in any descendant domains.

Procedure

**Step 1** View the health monitor for the appliance; see Viewing Appliance Health Monitors, on page 291.

**Step 2** Click Run All Modules. The status bar indicates the progress of the tests, then the Health Monitor Appliance page refreshes.

**Note** When you manually run health modules, the first refresh that automatically occurs may not reflect the data from the manually run tests. If the value has not changed for a module that you just ran manually, wait a few seconds, then refresh the page by clicking the device name. You can also wait for the page to refresh again automatically.

Running a Specific Health Module

Health module tests run automatically at the policy run time interval you configure when you create a health policy. However, you can also run a health module test on demand to collect up-to-date health information for that module.

In a multidomain deployment, you can run health module tests for appliances in the current domain and in any descendant domains.
Procedure

Step 1  View the health monitor for the appliance; see Viewing Appliance Health Monitors, on page 291.
Step 2  In the Module Status Summary graph, click the color for the health alert status category you want to view.
Step 3  In the Alert Detail row for the alert for which you want to view a list of events, click Run.

The status bar indicates the progress of the test, then the Health Monitor Appliance page refreshes.

Note  When you manually run health modules, the first refresh that automatically occurs may not reflect the data from the manually run tests. If the value has not changed for a module that you just manually ran, wait a few seconds, then refresh the page by clicking the device name. You can also wait for the page to refresh automatically again.

</table>

You can graph the results over a period of time of a particular health test for a specific appliance.

Procedure

Step 1  View the health monitor for the appliance; see Viewing Appliance Health Monitors, on page 291.
Step 2  In the Module Status Summary graph of the Health Monitor Appliance page, click the color for the health alert status category you want to view.
Step 3  In the Alert Detail row for the alert for which you want to view a list of events, click Graph.

Tip  If no events appear, you may need to adjust the time range.

Health Event Views

The Health Event View page allows you to view health events logged by the health monitor on the Firepower Management Center logs health events. The fully customizable event views allow you to quickly and easily analyze the health status events gathered by the health monitor. You can search event data to easily access other information that may be related to the events you are investigating. If you understand what conditions each health module tests for, you can more effectively configure alerting for health events.

You can perform many of the standard event view functions on the health event view pages.

The Table View of Health Events page provides a list of all health events on the specified appliance.

When you access health events from the Health Monitor page on your Firepower Management Center, you retrieve all health events for all managed appliances.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Tip**

You can bookmark this view to allow you to return to the page in the health events workflow containing the Health Events table of events. The bookmarked view retrieves events within the time range you are currently viewing, but you can then modify the time range to update the table with more recent information if needed.

**Procedure**

Choose **System > Health > Events**.

**Tip**

If you are using a custom workflow that does not include the table view of health events, click **(switch workflow)**. On the Select Workflow page, click **Health Events**.

**Note**

If no events appear, you may need to adjust the time range.

Viewing Health Events by Module and Appliance

</tr>
<tr>
<td>Security Analyst</td>
<td></td>
<td></td>
<td></td>
<td>Security Analyst</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**

View the health monitor for the appliance; see Viewing Appliance Health Monitors, on page 291.

**Step 2**

In the **Module Status Summary** graph, click the color for the event status category you want to view.

The Alert Detail list toggles the display to show or hide events.

**Step 3**

In the **Alert Detail** row for the alert for which you want to view a list of events, click **Events**.

The Health Events page appears, containing results for a query with the name of the appliance and the name of the specified health alert module as constraints. If no events appear, you may need to adjust the time range.
Step 4 If you want to view all health events for the specified appliance, expand Search Constraints, and click the Module Name constraint to remove it.

Viewing the Health Events Table

</tr>
</tbody>
</table>

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

Step 1 Choose System > Health > Events.

Step 2 You have the following choices:

- Bookmark — To bookmark the current page so that you can quickly return to it, click Bookmark This Page, provide a name for the bookmark, and click Save.
- Change Workflow — To choose another health events workflow, click (switch workflow).
- Delete Events — To delete health events, check the check box next to the events you want to delete, and click Delete. To delete all the events in the current constrained view, click Delete All, then confirm you want to delete all the events.
- Generate Reports — Generate a report based on data in the table view — click Report Designer.
- Modify — Modify the time and date range for events listed in the Health table view. Note that events that were generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.
- Navigate — Navigate through event view pages.
- Navigate Bookmark — To navigate to the bookmark management page, click View Bookmarks from any event view.
- Navigate Other — Navigate to other event tables to view associated events.
- Sort — Sort the events that appear, change what columns display in the table of events, or constrain the events that appear.
- View All — To view event details for all events in the view, click View All.
- View Details — To view the details associated with a single health event, click the down arrow link on the left side of the event.
- View Multiple — To view event details for multiple health events, choose the check box next to the rows that correspond with the events you want to view details for and then click View.
- View Status — To view all events of a particular status, click status in the Status column for an event with that status.
Hardware Alert Details for 7000 and 8000 Series Devices

Note

The 8350 hardware platform has six fans, which display as FAN2 through FAN7. This is expected behavior. If you receive a hardware alert related to FAN1 or fan numbering in general on the 8350 platform, you can disregard the alert.

Table 40: Conditions Monitored for 7000 and 8000 Series Devices

<table>
<thead>
<tr>
<th>Condition Monitored</th>
<th>Causes of Yellow or Red Error Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device high availability status</td>
<td>If 7000 or 8000 Series devices in a high-availability pair are no longer communicating with each other (due, for example, to a cabling problem), the Hardware Alarms module changes to red.</td>
</tr>
<tr>
<td>ftwo daemon status</td>
<td>If the ftwo daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon.</td>
</tr>
<tr>
<td>NFE cards detected</td>
<td>Indicates the number of NFE cards detected on the system. If this value does not match the appliance’s expected NFE count, the Hardware Alarms module changes to red.</td>
</tr>
<tr>
<td>NFE hardware status</td>
<td>If one or more NFE cards are not communicating, the Hardware Alarms module changes to red and the applicable card appears in the message details.</td>
</tr>
<tr>
<td>NFE heartbeat</td>
<td>If the system detects no NFE heartbeat, the Hardware Alarms module changes to red and message details include a reference to the relevant card(s).</td>
</tr>
<tr>
<td>NFE internal link status</td>
<td>If the link between the NMSB and NFE card(s) goes down, the Hardware Alarms module changes to red and message details include a reference to the relevant ports.</td>
</tr>
<tr>
<td>NFE Message daemon</td>
<td>If the NFE Message daemon goes down, health status for the Hardware Alarms module changes to red and the message details include a reference to the daemon (and, if applicable, the NFE card number).</td>
</tr>
<tr>
<td>Condition Monitored</td>
<td>Causes of Yellow or Red Error Conditions</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| NFE temperature                 | If NFE temperature exceeds 97 degrees Celsius, health status for the Hardware Alarms module changes to yellow and message details include a reference to the NFE temperature (and, if applicable, the NFE card number).  
If NFE temperature exceeds 102 degrees Celsius, health status for the Hardware Alarms module changes to red and message details include a reference to the NFE temperature. (and, if applicable, the NFE card number). |
| NFE temperature status          | Indicates the current temperature status of the given NFE card. The Hardware Alarms module indicates green for OK, yellow for Warning, and red for Critical (and, if applicable, the NFE card number).                               |
| NFE TCAM daemon                 | If the NFE TCAM daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon (and, if applicable, the NFE card number).                          |
| nfm_ipfragd (host frag) daemon  | If the nfm_ipfragd daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon (and, if applicable, the NFE card number).                      |
| NFE Platform daemon             | If the NFE Platform daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon (and, if applicable, the NFE card number).                                      |
| NMSB communications             | If the Media assembly is not present or not communicating, health status for the Hardware Alarms module changes to red and message details include a reference to the NFE temperature (and, if applicable, the NFE card number).     |
| psls daemon status              | If the psls daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon.                                                                 |
| Rulesd (host rules) daemon      | If the Rulesd daemon goes down, health status for the Hardware Alarms module changes to yellow and message details include a reference to the daemon (and, if applicable, the NFE card number).                             |
| scmd daemon status              | If the scmd daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon.                                                                 |
The Health Events Table

The Health Monitor modules you choose to enable in your health policy run various tests to determine appliance health status. When the health status meets criteria that you specify, a health event is generated. The table below describes the fields that can be viewed and searched in the health events table.

### Table 41: Health Event Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module Name</td>
<td>Specify the name of the module which generated the health events you want to view. For example, to view events that measure CPU performance, type <code>CPU</code>. The search should retrieve applicable CPU Usage and CPU temperature events.</td>
</tr>
<tr>
<td>Test Name</td>
<td>The name of the health module that generated the event.</td>
</tr>
<tr>
<td>Time</td>
<td>The timestamp for the health event.</td>
</tr>
<tr>
<td>Description</td>
<td>The description of the health module that generated the event. For example, health events generated when a process was unable to execute are labeled <code>Unable to Execute</code>.</td>
</tr>
<tr>
<td>Value</td>
<td>The value (number of units) of the result obtained by the health test that generated the event. For example, if the Firepower Management Center generates a health event whenever a device it is monitoring is using 80 percent or more of its CPU resources, the value could be a number from 80 to 100.</td>
</tr>
<tr>
<td>Units</td>
<td>The units descriptor for the result. You can use the asterisk (*) to create wildcard searches. For example, if the Firepower Management Center generates a health event when a device it is monitoring is using 80 percent or more of its CPU resources, the units descriptor is a percentage sign (%).</td>
</tr>
<tr>
<td>Status</td>
<td>The status (Critical, Yellow, Green, or Disabled) reported for the appliance.</td>
</tr>
<tr>
<td>Domain</td>
<td>For health events reported by managed devices, the domain of the device that reported the health event. For health events reported by the Firepower Management Center, <code>Global</code>. This field is only present in a multidomain deployment.</td>
</tr>
</tbody>
</table>

Monitoring the System

The following topics describe how to monitor the Firepower System:

• About System Statistics, on page 301
• The Host Statistics Section, on page 301
• The Disk Usage Section, on page 302
• The Processes Section, on page 302
• The SFDataCorrelator Process Statistics Section, on page 308
• The Intrusion Event Information Section, on page 309
• Viewing System Statistics, on page 310

About System Statistics

You can view system statistics for the Firepower Management Center and 7000 & 8000 Series devices.

The Statistics page lists the current status of general appliance statistics, including disk usage and system processes, Data Correlator statistics (FMC only), and intrusion event information (FMC only).

The Host Statistics Section

The following table describes the host statistics listed on the Statistics page.

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time</td>
<td>The current time on the system.</td>
</tr>
<tr>
<td>Uptime</td>
<td>The number of days (if applicable), hours, and minutes since the system was last started.</td>
</tr>
<tr>
<td>Memory Usage</td>
<td>The percentage of system memory that is being used.</td>
</tr>
<tr>
<td>Load Average</td>
<td>The average number of processes in the CPU queue for the past 1 minute, 5 minutes, and 15 minutes.</td>
</tr>
</tbody>
</table>
The Disk Usage Section

The Disk Usage section of the Statistics page provides a quick synopsis of disk usage, both by category and by partition status. If you have a malware storage pack installed on a device, you can also check its partition status. You can monitor this page from time to time to ensure that enough disk space is available for system processes and the database.

Tip
On the Firepower Management Center, you can also use the health monitor to monitor disk usage and alert on low disk space conditions.

The Processes Section

The Processes section of the Statistics page allows you to see the processes that are currently running on an appliance. It provides general process information and specific information for each running process. You can use the Firepower Management Center’s web interface to view the process status for any managed device.

Note that there are two different types of processes that run on an appliance: daemons and executable files. Daemons always run, and executable files are run when required.

Process Status Fields

When you expand the Processes section of the Statistics page, you can also view the following:

Cpu(s)

Lists the following CPU usage information:

• user process usage percentage
• system process usage percentage
• nice usage percentage (CPU usage of processes that have a negative nice value, indicating a higher priority). Nice values indicate the scheduled priority for system processes and can range between -20 (highest priority) and 19 (lowest priority).
• idle usage percentage

Mem

Lists the following memory usage information:
• total number of kilobytes in memory
• total number of used kilobytes in memory
• total number of free kilobytes in memory
• total number of buffered kilobytes in memory

Swap
Lists the following swap usage information:
• total number of kilobytes in swap
• total number of used kilobytes in swap
• total number of free kilobytes in swap
• total number of cached kilobytes in swap

The following table describes each column that appears in the Processes section.

Table 43: Process List Columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pid</td>
<td>The process ID number</td>
</tr>
<tr>
<td>Username</td>
<td>The name of the user or group running the process</td>
</tr>
<tr>
<td>Pri</td>
<td>The process priority</td>
</tr>
<tr>
<td>Nice</td>
<td>The nice value, which is a value that indicates the scheduling priority of a process. Values range between -20 (highest priority) and 19 (lowest priority)</td>
</tr>
<tr>
<td>Size</td>
<td>The memory size used by the process (in kilobytes unless the value is followed by m, which indicates megabytes)</td>
</tr>
<tr>
<td>Res</td>
<td>The amount of resident paging files in memory (in kilobytes unless the value is followed by m, which indicates megabytes)</td>
</tr>
</tbody>
</table>
The process state:

- **D** — process is in uninterruptible sleep (usually Input/Output)
- **N** — process has a positive nice value
- **R** — process is runnable (on queue to run)
- **S** — process is in sleep mode
- **T** — process is being traced or stopped
- **W** — process is paging
- **X** — process is dead
- **Z** — process is defunct
- **<** — process has a negative nice value

The amount of time (in hours:minutes:seconds) that the process has been running

The percentage of CPU that the process is using

The executable name of the process

System Daemons

Daemons continually run on an appliance. They ensure that services are available and spawn processes when required. The following table lists daemons that you may see on the Process Status page and provides a brief description of their functionality.

**Note**

The table below is not an exhaustive list of all processes that may run on an appliance.

**Table 44: System Daemons**

<table>
<thead>
<tr>
<th>Daemon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crond</td>
<td>Manages the execution of scheduled commands (cron jobs)</td>
</tr>
<tr>
<td>dhclient</td>
<td>Manages dynamic host IP addressing</td>
</tr>
<tr>
<td>Daemon</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>fpcollect</td>
<td>Manages the collection of client and server fingerprints</td>
</tr>
<tr>
<td>httpd</td>
<td>Manages the HTTP (Apache web server) process</td>
</tr>
<tr>
<td>httpsd</td>
<td>Manages the HTTPS (Apache web server with SSL) service, and checks for working SSL and valid certificate authentication; runs in the background to provide secure web access to the appliance</td>
</tr>
<tr>
<td>keventd</td>
<td>Manages Linux kernel event notification messages</td>
</tr>
<tr>
<td>klogd</td>
<td>Manages the interception and logging of Linux kernel messages</td>
</tr>
<tr>
<td>kswapd</td>
<td>Manages Linux kernel swap memory</td>
</tr>
<tr>
<td>kupdated</td>
<td>Manages the Linux kernel update process, which performs disk synchronization</td>
</tr>
<tr>
<td>mysqld</td>
<td>Manages database processes</td>
</tr>
<tr>
<td>ntdpd</td>
<td>Manages the Network Time Protocol (NTP) process</td>
</tr>
<tr>
<td>pm</td>
<td>Manages all Firepower System processes, starts required processes, restarts any process that fails unexpectedly</td>
</tr>
<tr>
<td>reportd</td>
<td>Manages reports</td>
</tr>
<tr>
<td>safe_mysqld</td>
<td>Manages safe mode operation of the database; restarts the database daemon if an error occurs and logs runtime information to a file</td>
</tr>
<tr>
<td>SFDataCorrelator</td>
<td>Manages data transmission</td>
</tr>
<tr>
<td>sfstreamer (FMC only)</td>
<td>Manages connections to third-party client applications that use the Event Streamer</td>
</tr>
<tr>
<td>sfmgr</td>
<td>Provides the RPC service for remotely managing and configuring an appliance using an sftunnel connection to the appliance</td>
</tr>
<tr>
<td>SFRemediateD (FMC only)</td>
<td>Manages remediation responses</td>
</tr>
<tr>
<td>sftimeserviced (FMC only)</td>
<td>Forwards time synchronization messages to managed devices</td>
</tr>
<tr>
<td>Daemon</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sfmbservice</td>
<td>Provides access to the sfmb message broker process running on a remote appliance, using an sftunnel connection to the appliance. Currently used only by health monitoring to send health events and alerts from a managed device to a Firepower Management Center.</td>
</tr>
<tr>
<td>sftroughd</td>
<td>Listens for connections on incoming sockets and then invokes the correct executable (typically the Cisco message broker, sfmb) to handle the request.</td>
</tr>
<tr>
<td>sftunnel</td>
<td>Provides the secure communication channel for all processes requiring communication with a remote appliance.</td>
</tr>
<tr>
<td>sshd</td>
<td>Manages the Secure Shell (SSH) process; runs in the background to provide SSH access to the appliance.</td>
</tr>
<tr>
<td>syslogd</td>
<td>Manages the system logging (syslog) process.</td>
</tr>
</tbody>
</table>

## Executables and System Utilities

There are a number of executables on the system that run when executed by other processes or through user action. The following table describes the executables that you may see on the Process Status page.

### Table 45: System Executables and Utilities

<table>
<thead>
<tr>
<th>Executable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>awk</td>
<td>Utility that executes programs written in the awk programming language</td>
</tr>
<tr>
<td>bash</td>
<td>GNU Bourne-Again Shell</td>
</tr>
<tr>
<td>cat</td>
<td>Utility that reads files and writes content to standard output</td>
</tr>
<tr>
<td>chown</td>
<td>Utility that changes user and group file permissions</td>
</tr>
<tr>
<td>chsh</td>
<td>Utility that changes the default login shell</td>
</tr>
<tr>
<td>SFDataCorrelator (FMC only)</td>
<td>Analyzes binary files created by the system to generate events, connection data, and network maps</td>
</tr>
<tr>
<td>cp</td>
<td>Utility that copies files</td>
</tr>
<tr>
<td>df</td>
<td>Utility that lists the amount of free space on the appliance</td>
</tr>
<tr>
<td>echo</td>
<td>Utility that writes content to standard output</td>
</tr>
<tr>
<td>Executable</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>egrep</td>
<td>Utility that searches files and folders for specified input; supports extended set of regular expressions not supported in standard grep</td>
</tr>
<tr>
<td>find</td>
<td>Utility that recursively searches directories for specified input</td>
</tr>
<tr>
<td>grep</td>
<td>Utility that searches files and directories for specified input</td>
</tr>
<tr>
<td>halt</td>
<td>Utility that stops the server</td>
</tr>
<tr>
<td>httpsdctl</td>
<td>Handles secure Apache Web processes</td>
</tr>
<tr>
<td>hwclock</td>
<td>Utility that allows access to the hardware clock</td>
</tr>
<tr>
<td>ifconfig</td>
<td>Indicates the network configuration executable. Ensures that the MAC address stays constant</td>
</tr>
<tr>
<td>iptables</td>
<td>Handles access restriction based on changes made to the Access Configuration page.</td>
</tr>
<tr>
<td>iptables-restore</td>
<td>Handles iptables file restoration</td>
</tr>
<tr>
<td>iptables-save</td>
<td>Handles saved changes to the iptables</td>
</tr>
<tr>
<td>kill</td>
<td>Utility that can be used to end a session and process</td>
</tr>
<tr>
<td>killall</td>
<td>Utility that can be used to end all sessions and processes</td>
</tr>
<tr>
<td>ksh</td>
<td>Public domain version of the Korn shell</td>
</tr>
<tr>
<td>logger</td>
<td>Utility that provides a way to access the syslog daemon from the command line</td>
</tr>
<tr>
<td>md5sum</td>
<td>Utility that prints checksums and block counts for specified files</td>
</tr>
<tr>
<td>mv</td>
<td>Utility that moves (renames) files</td>
</tr>
<tr>
<td>myisamchk</td>
<td>Indicates database table checking and repairing</td>
</tr>
<tr>
<td>mysql</td>
<td>Indicates a database process; multiple instances may appear</td>
</tr>
<tr>
<td>openssl</td>
<td>Indicates authentication certificate creation</td>
</tr>
<tr>
<td>perl</td>
<td>Indicates a perl process</td>
</tr>
<tr>
<td>ps</td>
<td>Utility that writes process information to standard output</td>
</tr>
<tr>
<td>sed</td>
<td>Utility used to edit one or more text files</td>
</tr>
<tr>
<td>Executable</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>sfheartbeat</td>
<td>Identifies a heartbeat broadcast, indicating that the appliance is active; heartbeat used to maintain contact between a device and Firepower Management Center</td>
</tr>
<tr>
<td>sfmb</td>
<td>Indicates a message broker process; handles communication between Firepower Management Centers and device.</td>
</tr>
<tr>
<td>sh</td>
<td>Public domain version of the Korn shell</td>
</tr>
<tr>
<td>shutdown</td>
<td>Utility that shuts down the appliance</td>
</tr>
<tr>
<td>sleep</td>
<td>Utility that suspends a process for a specified number of seconds</td>
</tr>
<tr>
<td>smtpclient</td>
<td>Mail client that handles email transmission when email event notification functionality is enabled</td>
</tr>
<tr>
<td>snmptrap</td>
<td>Forwards SNMP trap data to the SNMP trap server specified when SNMP notification functionality is enabled</td>
</tr>
<tr>
<td>snort</td>
<td>Indicates that Snort is running</td>
</tr>
<tr>
<td>ssh</td>
<td>Indicates a Secure Shell (SSH) connection to the appliance</td>
</tr>
<tr>
<td>sudo</td>
<td>Indicates a sudo process, which allows users other than admin to run executables</td>
</tr>
<tr>
<td>top</td>
<td>Utility that displays information about the top CPU processes</td>
</tr>
<tr>
<td>touch</td>
<td>Utility that can be used to change the access and modification times of specified files</td>
</tr>
<tr>
<td>vim</td>
<td>Utility used to edit text files</td>
</tr>
<tr>
<td>wc</td>
<td>Utility that performs line, word, and byte counts on specified files</td>
</tr>
</tbody>
</table>

- Configure an Access List, on page 820

**The **SFDataCorrelator** Process Statistics Section**

On a Firepower Management Center, you can view statistics about the Data Correlator and network discovery processes for the current day. As the managed devices perform data acquisition, decoding, and analysis, the network discovery process correlates the data with the fingerprint and vulnerability databases, then produces
binary files that are processed by the Data Correlator running on the Firepower Management Center. The Data Correlator analyzes the information from the binary files, generates events, and creates network maps.

The statistics that appear for network discovery and the Data Correlator are averages for the current day, using statistics gathered between 12:00 AM and 11:59 PM for each device.

The following table describes the statistics displayed for the Data Correlator process.

Table 46: Data Correlator Process Statistics

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Events/Sec</td>
<td>Number of discovery events that the Data Correlator receives and processes per second</td>
</tr>
<tr>
<td>Connections/Sec</td>
<td>Number of connections that the Data Correlator receives and processes per second</td>
</tr>
<tr>
<td>CPU Usage — User (%)</td>

The Intrusion Event Information Section

On both the Firepower Management Center and managed devices, you can view summary information about intrusion events on the Statistics page. This information includes the date and time of the last intrusion event, the total number of events that have occurred in the past hour and the past day, and the total number of events in the database.

The information in the Intrusion Event Information section of the Statistics page is based on intrusion events stored on the managed device rather than those sent to the Firepower Management Center. No intrusion event information is listed on this page if the managed device cannot (or is configured not to) store intrusion events locally.

The following table describes the statistics displayed in the Intrusion Event Information section of the Statistics page.

Table 47: Intrusion Event Information

<table>
<thead>
<tr>
<th>Statistic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last Alert Was</td>
<td>The date and time that the last event occurred</td>
</tr>
</tbody>
</table>
### Viewing System Statistics

<table>
<thead>
<tr>
<th>Statistic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Events Last Hour</td>
<td>The total number of events that occurred in the past hour</td>
</tr>
<tr>
<td>Total Events Last Day</td>
<td>The total number of events that occurred in the past twenty-four hours</td>
</tr>
<tr>
<td>Total Events in Database</td>
<td>The total number of events in the events database</td>
</tr>
</tbody>
</table>

On the Firepower Management Center, the web interface displays statistics for the FMC and any devices it manages. On 7000 and 8000 Series devices, the system displays statistics for that device only.

#### Procedure

**Step 1**  
Choose **System > Monitoring > Statistics**.

**Step 2**  
(FMC only) Choose a device from the **Select Device(s)** list, and click **Select Devices**.

**Step 3**  
View available statistics.

**Step 4**  
In the Disk Usage section, you can:

- Hover your pointer over a disk usage category in the **By Category** stacked bar to view (in order):
  - the percentage of available disk space used by that category
  - the actual storage space on the disk
  - the total disk space available for that category

- Click the down arrow next to **By Partition** to expand it. If you have a malware storage pack installed, the `/var/storage` partition usage is displayed.

**Step 5**  
(Optional) Click the arrow next to **Processes** to view the information described in **Process Status Fields, on page 302**.
CHAPTER 16

Troubleshooting the System

The following topics describe ways to diagnose problems you may encounter with the Firepower System:

• First Steps for Troubleshooting, on page 311
• System Messages, on page 311
• View Basic System Information, on page 314
• Managing System Messages, on page 315
• Memory Usage Thresholds for Health Monitor Alerts, on page 319
• Health Monitor Reports for Troubleshooting, on page 320
• Using the FTD CLI from the Web Interface, on page 322
• Feature-Specific Troubleshooting, on page 323

First Steps for Troubleshooting

• Before you make changes to try to fix a problem, generate a troubleshooting file to capture the original problem. See Health Monitor Reports for Troubleshooting, on page 320 and its subsections.

You may need this troubleshooting file if you need to contact Cisco TAC for support.

• Start your investigation by looking at error and warning messages in the Message Center. See System Messages, on page 311

• Look for applicable Tech Notes and other troubleshooting resources under the "Troubleshoot and Alerts" heading on the product documentation page for your product. See Top-Level Documentation Listing Pages for FMC Deployments, on page 12.

System Messages

When you need to track down problems occurring in the Firepower System, the Message Center is the place to start your investigation. This feature allows you to view the messages that the Firepower System continually generates about system activities and status.

To open the Message Center, click on the System Status icon, located to the immediate right of the Deploy button in the main menu. This icon can take one of the following forms, depending on the system status:

• ❌ — Indicates one or more errors and any number of warnings are present on the system.
Message Types

The Message Center displays messages reporting system activities and status organized into three different tabs:

Deployments

This tab displays current status related to configuration deployment for each appliance in your system, grouped by domain. The Firepower System reports the following deployment status values on this tab:

- Running (spinning ⏳) — The configuration is in the process of deploying.
- Success (✔) — The configuration has successfully been deployed.
- Warning (⚠️) — Warning deployment statuses contribute to the message count displayed with the warning System Status icon (⚠️).
- Failure (❌) — The configuration has failed to deploy; see Out-of-Date Policies, on page 347. Failed deployments contribute to the message count displayed with the error System Status icon (❌).

Health

This tab displays current health status information for each appliance in your system, grouped by domain. Health status is generated by health modules as described in About Health Monitoring, on page 273. The Firepower System reports the following health status values on this tab:

- Warning (⚠️) — Indicates that warning limits have been exceeded for a health module on an appliance and the problem has not been corrected. The Health Monitoring page indicates these conditions with a yellow triangle icon (⚠️). Warning statuses contribute to the message count displayed with the warning System Status icon (⚠️).
• Critical (⚠) — Indicates that critical limits have been exceeded for a health module on an appliance and the problem has not been corrected. The Health Monitoring page indicates these conditions with a ⚠ icon. Critical statuses contribute to the message count displayed with the error System Status icon (⚠).

• Error (✗) — Indicates that a health monitoring module has failed on an appliance and has not been successfully re-run since the failure occurred. The Health Monitoring page indicates these conditions with a ✗ icon. Error statuses contribute to the message count displayed with the error System Status icon (✗).

You can click on links in the Health tab to view related detailed information on the Health Monitoring page. If there are no current health status conditions, the Health tab displays no messages.

Tasks

In the Firepower System, you can perform certain tasks (such as configuration backups or update installation) that can require some time to complete. This tab displays the status of these long-running tasks, and can include tasks initiated by you or, if you have appropriate access, other users of the system. The tab presents messages in reverse chronological order based on the most recent update time for each message. Some task status messages include links to more detailed information about the task in question. The Firepower System reports the following task status values on this tab:

• Waiting (_pausing) — Indicates a task that is waiting to run until another in-progress task is complete. This message type displays an updating progress bar.

• Running (spinning ⌧) — Indicates a task that is in-progress. This message type displays an updating progress bar.

• Retrying (⟳) — Indicates a task that is automatically retrying. Note that not all tasks are permitted to try again. This message type displays an updating progress bar.

• Success (✓) — Indicates a task that has completed successfully.

• Failure (𐄌) — Indicates a task that did not complete successfully. Failed tasks contribute to the message count displayed with the error System Status icon (⚠).

• Stopped or Suspended (>(),) — Indicates a task that was interrupted due to a system update. Stopped tasks cannot be resumed. After normal operations are restored, start the task again.

• Skipped — A process in progress prevented the task from starting. Try again to start the task.

New messages appear in this tab as new tasks are started. As tasks complete (status success, failure, or stopped), this tab continues to display messages with final status indicated until you remove them. Cisco recommends you remove messages to reduce clutter in the Tasks tab as well as the message database.

Message Management

From the Message Center you can:

• Configure pop-up notification behavior (choosing whether to display them).
• Display additional task status messages from the system database (if any are available that have not been removed).
• Remove individual task status messages. (This affects all users who can view the removed messages.)
• Remove task status messages in bulk. (This affects all users who can view the removed messages.)

Tip
Cisco recommends that you periodically remove accumulated task status messages from the Task tab to reduce clutter in the display as well the database. When the number of messages in the database approaches 100,000, the system automatically deletes task status messages that you have removed.

View Basic System Information

<table>

</table>

Note

This setting affects all pop-up notifications and persists between login sessions.

Procedure

Step 1  Click System Status to display the Message Center.
Memory Usage Thresholds for Health Monitor Alerts

The Memory Usage health module compares memory usage on an appliance to the limits configured for the module and alerts when usage exceeds the levels. The module monitors data from managed devices and from the FMC itself.

Two configurable thresholds for memory usage, Critical and Warning, can be set as a percentage of memory used. When these thresholds are exceeded, a health alarm is generated with the severity level specified. However, the health alarm system does not calculate these thresholds in an exact manner.

With high memory devices, certain processes are expected to use a larger percentage of total system memory than in a low memory footprint device. The design is to use as much of the physical memory as possible while leaving a small value of memory free for ancillary processes.

Compare two devices, one with 32 GB of memory and one with 4 GB of memory. In the device with 32 GB of memory, 5% of memory (1.6GB) is a much larger value of memory to leave for ancillary processes than in the device with 4 GB of memory (5% of 4GB = 200MB).

To account for the higher percentage use of system memory by certain processes, the FMC calculates the total memory to include both total physical memory and total swap memory. Thus the enforced memory threshold for the user-configured threshold input can result in a Health Event where the “Value” column of the event does not match the value that was entered to determine the exceeded threshold.

The following table shows examples of user-input thresholds and the enforced thresholds, depending on the installed system memory.

<table>
<thead>
<tr>
<th>User-input Threshold Value</th>
<th>Enforced Threshold Per Installed Memory (RAM)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>4 GB</td>
</tr>
<tr>
<td>10%</td>
<td>10%</td>
</tr>
<tr>
<td>20%</td>
<td>20%</td>
</tr>
<tr>
<td>30%</td>
<td>30%</td>
</tr>
<tr>
<td>40%</td>
<td>40%</td>
</tr>
</tbody>
</table>

The values in this table are examples. You can use this information to extrapolate thresholds for devices that do not match the installed RAM shown here, or you can contact Cisco TAC for more precise threshold calculations.
### Health Monitor Reports for Troubleshooting

In some cases, if you have a problem with your appliance, Support may ask you to supply troubleshooting files to help them diagnose the problem. The system can produce troubleshooting files with information targeted to specific functional areas, as well as advanced troubleshooting files you retrieve in cooperation with Support. You can select any of the options listed in the table below to customize the contents of a troubleshooting file for a specific function.

Note that some options overlap in terms of the data they report, but the troubleshooting files will not contain redundant copies, regardless of what options you select.

#### Table 49: Selectable Troubleshoot Options

<table>
<thead>

<td>Admin/Maint/Any Security Analyst</td>
</tr>
</tbody>
</table>

You can generate and download customized troubleshooting files that you can send to Support.

In a multidomain deployment, you can generate and download troubleshooting files for devices in descendant domains.

⚠️ **Caution**

Generating troubleshooting files for lower-memory devices can trigger Automatic Application Bypass (AAB) when AAB is enabled. At a minimum, triggering AAB restarts the Snort process, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 for more information. In some such cases, triggering AAB can render the device temporarily inoperable. If inoperability persists, contact Cisco Technical Assistance Center (TAC), who can propose a solution appropriate to your deployment. Susceptible devices include Firepower 7010, 7020, and 7030; ASA 5506-X, 5508-X, 5516-X, 5512-X, 5515-X, and 5525-X; NGIPSv.

---

**Procedure**

**Step 1**  Perform the steps in Viewing Appliance Health Monitors, on page 291.
**Step 2**  Click Generate Troubleshooting Files.
**Step 3**  Choose All Data to generate all possible troubleshooting date, or check individual boxes as described in Viewing Task Messages, on page 317.
**Step 4**  Click OK.
**Step 5**  View task messages in the Message Center; see Viewing Task Messages, on page 317.
**Step 6**  Find the task that corresponds to the troubleshooting files you generated.
**Step 7**  After the appliance generated the troubleshooting files and the task status changes to Completed, click Click to retrieve generated files.
**Step 8**  Follow your browser's prompts to download the file. (The troubleshooting files are downloaded in a single .tar.gz file.)
**Step 9**  Follow the directions from Support to send the troubleshooting files to Cisco.
Downloading Advanced Troubleshooting Files

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Maint/Any</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Security Analyst</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can generate and download troubleshooting files for devices in descendant domains. You can download files from the Firepower Management Center only from the Global domain.

**Procedure**

1. View the health monitor for the appliance; see Viewing Appliance Health Monitors, on page 291.
2. Click Advanced Troubleshooting.
3. In File Download, enter the file name supplied by Support.
4. Click Download.
5. Follow your browser’s prompts to download the file.

   **Note**  For managed devices, the system renames the file by prepending the device name to the file name.

6. Follow the directions from Support to send the troubleshooting files to Cisco.

Using the FTD CLI from the Web Interface

<table>
<thead>
<tr>

<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FTD</td>
<td>Any</td>
<td>Admin/Maint/Any</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Security Analyst</td>
</tr>
</tbody>
</table>

You can execute selected FTD command line interface (CLI) commands from the Firepower Management Center web interface. These commands are ping, packet-tracer, traceroute, and show (except for the show subcommands history and banner).

In a multidomain deployment, you can enter FTD CLI commands through the Firepower Management Center web interface for managed devices in descendant domains.

**Note**  In deployments using Firepower Management Center high availability, this feature is available only in the active Firepower Management Center.

For more information on the FTD CLI, see the Command Reference for Firepower Threat Defense.
Procedure

Step 1 View the health monitor for the appliance; see Viewing Appliance Health Monitors, on page 291.
Step 2 Click Advanced Troubleshooting.
Step 3 Click Threat Defense CLI.
Step 4 From the Command drop-down list, select a command.
Step 5 Optionally, enter command parameters in the Parameters text box.
Step 6 Click Execute to view the command output.

PART IV

Deployment Management

• Domain Management, on page 327
• Policy Management, on page 335
• Rule Management: Common Characteristics, on page 353
• Reusable Objects, on page 385
CHAPTER 17

Domain Management

The following topics describe how to manage multitenancy using domains:

- Introduction to Multitenancy Using Domains, on page 327
- Managing Domains, on page 330
- Creating New Domains, on page 331
- Moving Data Between Domains, on page 332
- Moving Devices Between Domains, on page 333

Introduction to Multitenancy Using Domains

The Firepower System allows you to implement multitenancy using domains. Domains segment user access to managed devices, configurations, and events. You can create up to 50 subdomains under a top-level Global domain, in two or three levels.

When you log into the Firepower Management Center, you log into a single domain, called the current domain. Depending on your user account, you may be able to switch to other domains.

In addition to any restrictions imposed by your user role, your current domain level can also limit your ability to modify various Firepower System configurations. The system limits most management tasks, like system software updates, to the Global domain.

The system limits other tasks to leaf domains, which are domains with no subdomains. For example, you must associate each managed device with a leaf domain, and perform device management tasks from the context of that leaf domain.

Tip

Each task topic in this guide has a Supported Domains value that indicates the domain levels where you can perform the task.

Each leaf domain builds its own network map, based on the discovery data collected by that leaf domain’s devices. Events reported by a managed device (connection, intrusion, malware, and so on) are also associated with the device’s leaf domain.
One Domain Level: Global

If you do not configure multitenancy, all devices, configurations, and events belong to the Global domain, which in this scenario is also a leaf domain. Except for domain management, the system hides domain-specific configurations and analysis options until you add subdomains.

Two Domain Levels: Global and Second-Level

In a two-level multidomain deployment, the Global domain has direct descendant domains only. For example, a managed security service provider (MSSP) can use a single Firepower Management Center to manage network security for multiple customers:

- Administrators at the MSSP can log into the Global domain to manage all customers’ deployments.
- Administrators for each customer can log into second-level named subdomains to manage only the devices, configurations, and events applicable to their organizations. These local administrators cannot view or affect the deployments of other customers of the MSSP.

Three Domain Levels: Global, Second-Level, and Third-Level

In a three-level multidomain deployment, the Global domain has subdomains, at least one of which has its own subdomain. To extend the previous example, consider a scenario where an MSSP customer—already restricted to a subdomain—wants to further segment its deployment. This customer wants to separately manage two classes of device: devices placed on network edges and devices placed internally:

- Administrators for the customer can log into a second-level subdomain to manage the customer’s entire deployment.
- Administrators for the customer’s edge network can log into a third-level (leaf) domain to manage only the devices, configurations, and events applicable to devices deployed on the network edge. Similarly, administrators for the customer’s internal network can log into a different third-level domain to manage internal devices, configurations, and events. Edge and internal administrators cannot view each other’s deployment.

Domains Terminology

This documentation uses the following terms when describing domains and multidomain deployments:

Global Domain

In a multidomain deployment, the top-level domain. If you do not configure multitenancy, all devices, configurations, and events belong to the Global domain. Administrators in the Global domain can manage the entire Firepower System deployment.

Subdomain

A second or third-level domain.

Second-level domain

A child of the Global domain. Second-level domains can be leaf domains, or they can have subdomains.

Third-level domain

A child of a second-level domain. Third-level domains are always leaf domains.
Leaf domain

A domain with no subdomains. Each device must belong to a leaf domain.

Descendant domain

A domain descending from the current domain in the hierarchy.

Child domain

A domain’s direct descendant.

Ancestor domain

A domain from which the current domain descends.

Parent domain

A domain’s direct ancestor.

Sibling domain

A domain with the same parent.

Current domain

The domain you are logged into now. The system displays the name of the current domain before your user name at the top right of the web interface. Unless your user role is restricted, you can edit configurations in the current domain.

Domain Properties

To modify a domain's properties, you must have Administrator access in that domain's parent domain.

Name and Description

Each domain must have a unique name within its hierarchy. A description is optional.

Parent Domain

Second- and third-level domains have a parent domain. You cannot change a domain's parent after you create the domain.

Devices

Only leaf domains may contain devices. In other words, a domain may contain subdomains or devices, but not both. You cannot save a deployment where a non-leaf domain directly controls a device.

In the domain editor, the web interface displays available and selected devices according to their current place in your domain hierarchy.

Host Limit

The number of hosts a Firepower Management Center can monitor, and therefore store in network maps, depends on its model. In a multidomain deployment, leaf domains share the available pool of monitored hosts, but have separate network maps.

To ensure that each leaf domain can populate its network map, you can set host limits at each subdomain level. If you set a domain's host limit to 0, the domain shares in the general pool.

Setting the host limit has a different effect at each domain level:
• Leaf — For a leaf domain, a host limit is a simple limit on the number of hosts the leaf domain can monitor.

• Second Level — For a second-level domain that manages third-level leaf domains, a host limit represents the total number of hosts that the leaf domains can monitor. The leaf domains share the pool of available hosts.

• Global — For the Global domain, the host limit is equal to the total number of hosts a Firepower Management Center can monitor. You cannot change it.

The sum of subdomains' host limits can add up to more than their parent domain's host limit. For example, if the Global domain host limit is 150,000, you can configure multiple subdomains each with a host limit of 100,000. Any of those domains, but not all, can monitor 100,000 hosts.

The network discovery policy controls what happens when you detect a new host after you reach the host limit; you can drop the new host, or replace the host that has been inactive for the longest time. Because each leaf domain has its own network discovery policy, each leaf domain governs its own behavior when the system discovers a new host.

If you reduce the host limit for a domain and its network map contains more hosts than the new limit, the system deletes the hosts that have been inactive the longest.

Managing Domains

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Device</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

To modify a domain's properties, you must have Administrator access in that domain's parent domain.

Procedure

Step 1 Choose System > Domains.

Step 2 Manage your domains:

• Add — Click Add Domain, or click Add Subdomain next to the parent domain; see Creating New Domains, on page 331.

• Edit — Click edit (✏️) next to the domain you want to modify; see Domain Properties, on page 329.

• Delete — Click delete (🗑️) next to the empty domain you want to delete, then confirm your choice. Move devices from domains you want to delete by editing their destination domain.

Step 3 When you are done making changes to the domain structure and all devices are associated with leaf domains, click Save to implement your changes.

Step 4 If prompted, make additional changes:
• If you changed a leaf domain to a parent domain, move or delete the old network map; see Moving Data Between Domains, on page 332.
• If you moved devices between domains and must assign new policies and security zones or interface groups, see Moving Devices Between Domains, on page 333.

What to do next
• Configure user roles and policies (access control, network discovery, and so on) for any new domains. Update device properties as needed.
• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Creating New Domains

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Device</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Global &amp; second-level</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can create up to 50 subdomains under a top-level Global domain, in two or three levels.

You must assign all devices to a leaf domain before you can implement the domain configuration. When you add a subdomain to a leaf domain, the domain stops being a leaf domain and you must reassign its devices.

Procedure

Step 1
In a Global or a second-level domain, choose System > Domains.

Step 2
Click Add Domain, or click Add Subdomain next to the parent domain.

Step 3
Enter a Name and Description.

Step 4
Choose a Parent Domain.

Step 5
On Devices, choose the Available Devices to add to the domain, then click Add to Domain or drag and drop into the list of Selected Devices.

Step 6
Optionally, click Advanced to limit the number of hosts the new domain may monitor; see Domain Properties, on page 329.

Step 7
Click Save to return to the domain management page.

Step 8
When you are done making changes to the domain structure and all devices are associated with leaf domains, click Save to implement your changes.

Step 9
If prompted, make additional changes:
• If you changed a leaf domain to a parent domain, move or delete the old network map; see Moving Data Between Domains, on page 332.
If you moved devices between domains and must assign new policies and security zones or interface groups, see Moving Devices Between Domains, on page 333.

What to do next

- Configure user roles and policies (access control, network discovery, and so on) for any new domains. Update device properties as needed.
- Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Moving Data Between Domains

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Device</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Because events and network maps are associated with leaf domains, when you change a leaf domain to a parent domain, you have two choices:

- Move the network map and associated events to a new leaf domain.
- Delete the network map but retain the events. In this case, the events remain associated with the parent domain until the system prunes events as needed or as configured. Or, you can delete old events manually.

Before you begin

Implement a domain configuration where a former leaf domain is now a parent domain; see Managing Domains, on page 330.

Procedure

**Step 1**

For each former leaf domain that is now a parent domain:

- Choose a new **Leaf Domain** to inherit the **Parent Domain**'s events and network map.
- Choose **None** to delete the parent domain's network map, but retain old events.

**Step 2**

Click **Save**.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 337.
Moving Devices Between Domains

### Moving Devices Between Domains

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Device</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Global &amp; second-level</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Moving a device between domains can affect the configurations and policies applied to the device. The system automatically keeps and updates what it can, and deletes what it cannot.

If you assign a Remote Access VPN policy to a device, you cannot move the same device from one domain to another domain.

Specifically:

- If the health policy applied to a moved device is inaccessible in the new domain, you can choose a new health policy.
- If the access control policy assigned to a moved device is not valid or accessible in the new domain, choose a new policy. Every device must have an assigned access control policy.
- If the interfaces on the moved device belong to a security zone that is inaccessible in the new domain, you can choose a new zone.
- Interfaces are removed from:
  - Security zones that are inaccessible in the new domain and not used in an access control policy.
  - All interface groups.

If devices require a policy update but you do not need to move interfaces between zones, the system displays a message stating that zone configurations are up to date. For example, if a device's interfaces belong to a security zone configured in a common ancestor domain, you do not need to update zone configurations when you move devices from subdomain to subdomain.

**Before you begin**

- Implement a domain configuration where you moved a device from domain to domain and now must assign new policies and security zones; see Managing Domains, on page 330.

**Procedure**

**Step 1**
In the Move Devices dialog box, under Select Device(s) to Configure, check the device you want to configure. Check multiple devices to assign the same health and access control policies.

**Step 2**
Choose an Access Control Policy to apply to the device, or choose New Policy to create a new policy.

**Step 3**
Choose a Health Policy to apply to the device, or choose None to leave the device without a health policy.

**Step 4**
If prompted to assign interfaces to new zones, choose a New Security Zone for each listed interface, or choose None to assign it later.

**Step 5**
After you configure all affected devices, click Save to save policy and zone assignments.
Step 6  Click **Save** to implement the domain configuration.

---

**What to do next**

- Update other configurations on the moved device that were affected by the move.
- Deploy configuration changes; see Deploy Configuration Changes, on page 337.
Policy Management

The following topics describe how to manage various policies on the Firepower Management Center:

• Policy Deployment, on page 335
• Policy Comparison, on page 344
• Policy Reports, on page 346
• Out-of-Date Policies, on page 347
• Performance Considerations for Limited Deployments, on page 348
• History for Policy Management, on page 350

Policy Deployment

After you configure your deployment, and any time you change that configuration, you must deploy the changes to affected devices. You can view deployment status in the Message Center.

Deploying updates the following components:

• Device and interface configurations
• Device-related policies: NAT, VPN, QoS, platform settings
• Access control and related policies: DNS, file, identity, intrusion, network analysis, prefilter, SSL
• Network discovery policy
• Intrusion rule updates
• Configurations and objects associated with any of these elements

You can configure the system to deploy automatically by scheduling a deploy task or by setting the system to deploy when importing intrusion rule updates. Automating policy deployment is especially useful if you allow intrusion rule updates to modify system-provided base policies for intrusion and network analysis. Intrusion rule updates can also modify default values for the advanced preprocessing and performance options in your access control policies.

In a multidomain deployment, you can deploy changes for any domain where your user account belongs:

• Switch to an ancestor domain to deploy changes to all subdomains at the same time.
• Switch to a leaf domain to deploy changes to only that domain.
Best Practices for Deploying Configuration Changes

The following are guidelines for deploying configuration changes.

**Inline vs Passive Deployments**

Do not apply inline configurations to devices deployed passively, and vice versa.

**Time to Deploy and Memory Limitations**

The time it takes to deploy depends on multiple factors, including (but not limited to):

- The configurations you send to the device. For example, if you dramatically increase the number of Security Intelligence entries you block, deploy can take longer.

- Device model and memory. On lower-memory devices, deploying can take longer. For example, it can take up to five minutes to deploy to a Firepower 7010, 7020, or 7030 device.

Do not exceed the capability of your devices. If you exceed the maximum number of rules or policies supported by a target device, the system displays a warning. The maximum depends on a number of factors—not only memory and the number of processors on the device, but also on policy and rule complexity. For information on optimizing policies and rules, see Best Practices for Access Control Rules, on page 1124.

**Interruptions to Traffic Flow and Inspection During Deploy**

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 and Configurations that Restart the Snort Process When Deployed or Activated, on page 342.

---

We strongly recommend you deploy in a maintenance window or at a time when interruptions will have the least impact.

**Auto-Enabling Application Detectors**

If you are performing application control but disable required detectors, the system automatically enables the appropriate system-provided detectors upon policy deploy. If none exist, the system enables the most recently modified user-defined detector for the application.

**Asset Rediscovery with Network Discovery Policy Changes**

When you deploy changes to a network discovery policy, the system deletes and then redisCOVERS MAC address, TTL, and hops information from the network map for the hosts in your monitored networks. Also, the affected managed devices discard any discovery data that has not yet been sent to the Firepower Management Center.

**Related Topics**

Snort® Restart Scenarios, on page 339
Deploy Configuration Changes

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Security Approver</td>
</tr>
</tbody>
</table>

After you change configurations, deploy them to the affected devices. We strongly recommend that you deploy in a maintenance window or at a time when any interruptions to traffic flow and inspection will have the least impact.

⚠️ Caution

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 and Configurations that Restart the Snort Process When Deployed or Activated, on page 342.

Before you begin

- Review the guidelines described in Best Practices for Deploying Configuration Changes, on page 336.
- Be sure all managed devices use the same revision of the Security Zones object. If you have edited security zone objects: Do not deploy configuration changes to any device until you edit the zone setting for interfaces on all devices you want to sync. You must deploy to all managed devices at the same time. See Synchronizing Security Zone Object Revisions, on page 480.

Procedure

Step 1
On the Firepower Management Center menu bar, click **Deploy**.

The Deploy Policies dialog lists devices with out-of-date configurations. The **Version** at the top of the dialog specifies when you last made configuration changes. The **Current Version** column in the device table specifies when you last deployed changes to each device.

Step 2
Identify and choose the devices where you want to deploy configuration changes.

- Sort—Sort the device list by clicking a column heading.
- Expand—Click plus (⊕) to expand a device listing to view the configuration changes to be deployed. The system marks out-of-date policies with an index ( ⊖).
- Filter—Filter the device list. Click the arrow in the upper-right corner of any column heading in the display, enter text in the **Filters** text box, and press Enter. Check or uncheck the check box to activate or deactivate the filter.
- Arrange—Place the mouse on a column heading to drag and drop the column in your preferred order.

Step 3
(Optional) Enable **Check for rule conflicts** to check for rule conflicts before deployment begins.

In policies that evaluate rules in a specific order, conflicts occur when a rule will never match traffic because an earlier rule always matches the traffic first. Although rule conflicts do not prevent deployment, properly
creating and ordering rules is essential to building an effective deployment. The deployment process can check for rule conflicts in access control policies. However, in complex deployments, checking for rule conflicts can take some time.

**Step 4**  Click **Deploy**.

**Step 5**  If the system identifies errors or warnings in the changes to be deployed, it displays them in the *Errors and Warnings for Requested Deployment* window.

You have the following choices:

- **Proceed**—Continue deploying without resolving warning conditions. If you enabled rule conflict checks, warnings include detected rule conflicts. You cannot proceed if the system identifies errors.
- **Cancel**—Exit without deploying. Resolve the error and warning conditions, and attempt to deploy the configuration again.

---

**What to do next**

- (Optional) Monitor deployment status; see Viewing Deployment Messages, on page 316.
- If deploy fails, see Best Practices for Deploying Configuration Changes, on page 336.

**Related Topics**

- Snort® Restart Scenarios, on page 339

### Redeploy Existing Configurations to a Device

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Security</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Approver</td>
</tr>
</tbody>
</table>

You can force-deploy existing (unchanged) configurations to a single managed device. We *strongly* recommend you deploy in a maintenance window or at a time when any interruptions to traffic flow and inspection will have the least impact.

---

**Caution**

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 and Configurations that Restart the Snort Process When Deployed or Activated, on page 342.

**Before you begin**

Review the guidelines described in Best Practices for Deploying Configuration Changes, on page 336.
Procedure

Step 1  Choose Devices > Device Management.
Step 2  Click edit (✏️) next to the device where you want to force deployment. 
        In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Step 3  Click Device.
Step 4  Click edit (✏️) next to the General section heading.
Step 5  Click Force Deploy (✔️).
Step 6  Click Deploy.
        The system identifies any errors or warnings with the configurations you are deploying. You can click Proceed 
        to continue without resolving warning conditions. However, you cannot proceed if the system identifies an 
        error.

What to do next

• (Optional) Monitor deployment status; see Viewing Deployment Messages, on page 316.
• If deploy fails, see Best Practices for Deploying Configuration Changes, on page 336.

Related Topics

Snort® Restart Scenarios, on page 339

Snort® Restart Scenarios

When the traffic inspection engine referred to as the Snort process on a managed device restarts, inspection 
is interrupted until the process resumes. Whether traffic drops during this interruption or passes without further 
inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 
340 for more information. Additionally, resource demands may result in a small number of packets dropping 
without inspection when you deploy, regardless of whether the Snort process restarts.

Any of the scenarios in the following table cause the Snort process to restart.

Table 51: Snort Restart Scenarios

<table>
<thead>
<tr>
<th>Restart Scenario</th>

</tr>
<tr>
<td>Traffic-activation of the currently deployed Automatic Application Bypass (AAB)</td>
<td>Configuring Automatic Application Bypass, on page 241</td>
</tr>
</tbody>
</table>
Inspect Traffic During Policy Apply

Inspect traffic during policy apply is an advanced access control policy general setting that allows managed devices to inspect traffic while deploying configuration changes; this is the case unless a configuration that you deploy requires the Snort process to restart. You can configure this option as follows:

• Enabled — Traffic is inspected during the deployment unless certain configurations require the Snort process to restart.

When the configurations you deploy do not require a Snort restart, the system initially uses the currently deployed access control policy to inspect traffic, and switches during deployment to the access control policy you are deploying.

• Disabled — Traffic is not inspected during the deployment. The Snort process always restarts when you deploy.

The following graphic illustrates how Snort restarts can occur when you enable or disable Inspect traffic during policy apply.

Caution

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 and Configurations that Restart the Snort Process When Deployed or Activated, on page 342.

Snort® Restart Traffic Behavior

The following tables explain how different devices handle traffic when the Snort process restarts.
Table 52: FTD and FTD Virtual Restart Traffic Effects

<table>
<thead>
<tr>
<th>Interface Configuration</th>
<th>Restart Traffic Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>inline: <strong>Failsafe</strong> enabled or disabled</td>
<td>passed without inspection</td>
</tr>
<tr>
<td></td>
<td>A few packets might drop if <strong>Failsafe</strong> is disabled and Snort is busy but not down.</td>
</tr>
<tr>
<td>inline: tap mode</td>
<td>egress packet immediately, copy bypasses Snort</td>
</tr>
<tr>
<td>passive</td>
<td>uninterrupted, not inspected</td>
</tr>
<tr>
<td>routed, transparent (including EtherChannel, redundant, transparent)</td>
<td>dropped</td>
</tr>
</tbody>
</table>

Table 53: 7000 and 8000, NGIPSv Restart Traffic Effects

<table>
<thead>
<tr>
<th>Interface Configuration</th>
<th>Restart Traffic Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>inline: <strong>Failsafe</strong> enabled or disabled</td>
<td>passed without inspection</td>
</tr>
<tr>
<td></td>
<td>A few packets might drop if <strong>Failsafe</strong> is disabled and Snort is busy but not down.</td>
</tr>
<tr>
<td>inline: tap mode</td>
<td>egress packet immediately, copy bypasses Snort</td>
</tr>
<tr>
<td>passive</td>
<td>uninterrupted, not inspected</td>
</tr>
<tr>
<td>routed, switched (7000 and 8000 Series only)</td>
<td>dropped</td>
</tr>
</tbody>
</table>

Table 54: ASA FirePOWER Restart Traffic Effects

<table>
<thead>
<tr>
<th>Interface Configuration</th>
<th>Restart Traffic Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>routed or transparent with fail-open</td>
<td>passed without inspection</td>
</tr>
<tr>
<td>routed or transparent with fail-close</td>
<td>dropped</td>
</tr>
</tbody>
</table>

In addition to traffic handling when the Snort process is down while it restarts, traffic can also pass without inspection or drop when the Snort process is busy, depending on the configuration of the Failsafe option. See **Inline Sets on the Firepower System**, on page 488.

Note
When the Snort process is busy but not down during configuration deployment, some packets may drop on routed, switched, or transparent interfaces if the total CPU load exceeds 50 percent.
Configurations that Restart the Snort Process When Deployed or Activated

Deploying any of the following configurations except AAB restarts the Snort process as described. Deploying AAB does not cause a restart, but excessive packet latency activates the currently deployed AAB configuration, causing a partial restart of the Snort process.

**Access Control Policy**
- Add the first or remove the last URL category/reputation condition in an access control rule.
- Change the total number of active intrusion policies by adding an intrusion policy that is not currently used, or by removing the last instance of an intrusion policy. You can use an intrusion policy in an access control rule, as the default action, or as the default intrusion policy.

**Access Control Policy Advanced Settings**
- Deploy when **Inspect Traffic During Policy Apply** is disabled.
- Configure a non-default value under Files and Malware Settings.
- Add or remove an SSL policy.
- Enable or disable adaptive profiles.
- Enable or disable the **Log Session/Protocol Distribution** troubleshooting option.

**Security Intelligence**
Add or delete multiple Security Intelligence whitelist or blacklist networks or network objects. Changes can be to custom or system-provided lists, and whether the Snort process restarts can vary by device, depending on the memory available for inspection.

**SSL Policy**
- Add the first or remove the last category/reputation condition in an SSL rule.

**File Policy**
Deploy the first or last of any one of the following configurations; note that while otherwise deploying these file policy configurations does not cause a restart, deploying non-file-policy configurations can cause restarts.
- Enable or disable **Inspect Archives**.
- Take either of the following actions:
  - Enable or disable **Inspect Archives** when the deployed access control policy includes at least one file policy.
  - Add the first or remove the last file policy rule when **Inspect Archives** is enabled (note that at least one rule is required for **Inspect Archives** to be meaningful).
- Select **Detect Files** or **Block Files** in a file rule.
- Enable or disable **Store files** in a **Detect Files** or **Block Files** rule.
• Add the first or remove the last active file rule that combines the Malware Cloud Lookup or Block Malware rule action with an analysis option (Spero Analysis or MSEXE, Dynamic Analysis, or Local Malware Analysis) or a store files option (Malware, Unknown, Clean, or Custom).

Note that access control rules that deploy these file policy configurations to security zones or tunnel zones cause a restart only when your configuration meets the following conditions:

• Source or destination security zones in your access control rule must match the security zones associated with interfaces on the target devices.

• Unless the destination zone in your access control rule is any, a source tunnel zone in the rule must match a tunnel zone assigned to a tunnel rule in the prefilter policy.

Identity Policy
• When SSL decryption is disabled (that is, when the access control policy does not include an SSL policy), add the first or remove the last active authentication rule.

An active authentication rule has either an Active Authentication rule action, or a Passive Authentication rule action with Use active authentication if passive authentication cannot identify user selected.

Network Analysis Policy
• Change the total number of network analysis policies by adding a network analysis policy that is not currently used, or by removing the last instance of a network analysis policy. You can use a network analysis policy with network analysis rules or as the default network analysis policy.

• Change the value for the IMAP, POP, or SMTP preprocessor Base64 Decoding Depth, 7-Bit/8-Bit/Binary Decoding Depth, Quoted-Printable Decoding Depth, or Unix-to-Unix Decoding Depth.

Network Discovery
• Enable or disable non-authoritative, traffic-based user detection over the HTTP, FTP, or MDNS protocols, using the network discovery policy.

Device Management
• Routing: Add a routed interface pair or virtual router to a 7000 or 8000 Series device.

• VPN: Add or remove a VPN on a 7000 or 8000 Series device.

Caution
The system does not warn you that the Snort process restarts when you add or remove a VPN on a 7000 or 8000 Series device.

• MTU: Change the highest MTU value among all non-management interfaces on a device.

• 7000/8000 series high availability: Change a high-availability state sharing option.

• Automatic Application Bypass (AAB): The currently deployed AAB configuration activates when a malfunction of the Snort process or a device misconfiguration causes a single packet to use an excessive amount of processing time. The result is a partial restart of the Snort process to alleviate extremely high
latency or prevent a complete traffic stall. This partial restart causes a few packets to pass without inspection, or drop, depending on how the device handles traffic.

**Updates**

- **System update**: Deploy configurations the first time after a software update that includes a new version of the Snort binary or data acquisition library (DAQ).
- **VDB**: Deploy configurations the first time after installing a vulnerability database (VDB).
- **Intrusion rule update**: Deploying configurations the first time after importing an intrusion rule update (also known as a Snort Rule Update or SRU).

⚠️ **Caution**: Intrusion rule updates are cumulative. Any shared object rule that is added or modified since your last update causes a restart when you deploy, even if the current update has no shared object rule changes.

**Related Topics**

- [Deploy Configuration Changes](#), on page 337
- [Snort® Restart Scenarios](#), on page 339

### Changes that Immediately Restart the Snort Process

The following changes immediately restart the Snort process without going through the deploy process. How the restart affects traffic depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior](#), on page 340 for more information.

- Take any of the following actions involving applications or application detectors:
  - Activate or deactivate a system or custom application detector.
  - Delete an activated custom detector.
  - **Save and Reactivate** an activated custom detector.
  - Create a user-defined application.

The Snort process restarts on all managed devices.

- Create or break a Firepower Threat Defense high availability pair—Restarts the Snort process on the primary and secondary devices.
- Install a vulnerability database (VDB) update.
- Restart the Snort process in the 7000 or 8000 Series user interface (System > Configuration > Process)—The system prompts you for confirmation and allows you to cancel.

### Policy Comparison

To review policy changes for compliance with your organization's standards or to optimize system performance, you can examine the differences between two policies or between a saved policy and the running configuration.
You can compare the following policy types:

- DNS
- File
- Health
- Identity
- Intrusion
- Network Analysis
- SSL

The comparison view displays both policies in a side-by-side format. Differences between the two policies are highlighted:

- Blue indicates that the highlighted setting is different in the two policies, and the difference is noted in red text.
- Green indicates that the highlighted setting appears in one policy but not the other.

### Comparing Policies

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>feature dependent</td>
<td>feature dependent</td>
</tr>
</tbody>
</table>

#### Procedure

**Step 1** Access the management page for the policy you want to compare:

- DNS—**Policies** > **Access Control** > DNS
- File—**Policies** > **Access Control** > Malware & File
- Health—**System** > **Health** > Policy
- Identity—**Policies** > **Access Control** > Identity
- Intrusion—**Policies** > **Access Control** > Intrusion
- Network Analysis—**Policies** > **Access Control**, then click **Network Analysis Policy** or **Policies** > **Access Control** > Intrusion, then click **Network Analysis Policy**

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

- SSL—**Policies** > **Access Control** > SSL

**Step 2** Click **Compare Policies**.

**Step 3** From the **Compare Against** drop-down list, choose the type of comparison you want to make:

- To compare two different policies, choose **Other Policy**.
- To compare two revisions of the same policy, choose **Other Revision**.
- To compare another policy to the currently active policy, choose **Running Configuration**.
Policy Reports

For most policies, you can generate two kinds of reports. A report on a single policy provides details on the policy's current saved configuration, while a comparison report lists only the differences between two policies. You can generate a single-policy report for all policy types except health.

Intrusion policy reports combine the settings in the base policy with the settings of the policy layers, and make no distinction between which settings originated in the base policy or policy layer.

Generating Current Policy Reports

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature dependent</td>
<td>feature dependent</td>
<td>Any</td>
<td>feature dependent</td>
<td>feature dependent</td>
</tr>
</tbody>
</table>

Procedure

Step 1 Access the management page for the policy for which you want to generate a report:

- Access Control—Policies > Access Control
- DNS—Policies > Access Control > DNS
- File—Policies > Access Control > Malware & File
- Health—System > Health > Policy
- Identity—Policies > Access Control > Identity
- Intrusion—Policies > Access Control > Intrusion
- NAT for 7000 & 8000 Series devices—Devices > NAT
- Network Analysis—Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy

Step 4 Depending on the comparison type you choose, you have the following choices:

- If you are comparing two different policies, choose the policies you want to compare from the Policy A and Policy B drop-down lists.
- If you are comparing the running configuration to another policy, choose the second policy from the Policy B drop-down list.

Step 5 Click OK.

Step 6 Review the comparison results:

- Comparison Viewer—To use the comparison viewer to navigate individually through policy differences, click Previous or Next above the title bar.
- Comparison Report—To generate a PDF report that lists the differences between the two policies, click Comparison Report.
Note: If your custom user role limits access to the first path listed here, use the second path to access the policy.

- SSL — Policies > Access Control > SSL

Step 2: Click report ( ) next to the policy for which you want to generate a report.

---

**Out-of-Date Policies**

The Firepower System marks out-of-date policies with red status text that indicates how many of its targeted devices need a policy update. To clear this status, you must re-deploy the policy to the devices.

Configuration changes that require a policy re-deploy include:

- Modifying an access control policy: any changes to access control rules, the default action, policy targets, Security Intelligence filtering, advanced options including preprocessing, and so on.
- Modifying any of the policies that the access control policy invokes: the SSL policy, network analysis policies, intrusion policies, file policies, identity policies, or DNS policies.
- Changing any reusable object or configuration used in an access control policy or policies it invokes:
  - network, port, VLAN tag, URL, and geolocation objects
  - Security Intelligence lists and feeds
  - application filters or detectors
  - intrusion policy variable sets
  - file lists
  - decryption-related objects and security zones
- Updating the system software, intrusion rules, or the vulnerability database (VDB).

Keep in mind that you can change some of these configurations from multiple places in the web interface. For example, you can modify security zones using the object manager (Objects > Object Management), but modifying an interface type in a device’s configuration (Devices > Device Management) can also change a zone and require a policy re-deploy.

Note that the following updates do not require policy re-deploy:

- automatic updates to Security Intelligence feeds and additions to the Security Intelligence global blacklist or whitelist using the context menu
- automatic updates to URL filtering data
- scheduled geolocation database (GeoDB) updates
Performance Considerations for Limited Deployments

Host, application, and user discovery data allow the system to create a complete, up-to-the-minute profile of your network. The system can also act as an intrusion detection and prevention system (IPS), analyzing network traffic for intrusions and exploits and, optionally, dropping offending packets.

Combining discovery and IPS gives context to your network activity and allows you to take advantage of many features, including:

- impact flags and indications of compromise, which can tell you which of your hosts are vulnerable to a particular exploit, attack, or piece of malware
- adaptive profile updates and Firepower recommendations, which allow you to examine traffic differently depending on the destination host
- correlation, which allows you to respond to intrusions (and other events) differently depending on the affected host

However, if your organization is interested in performing only IPS, or only discovery, there are a few configurations that can optimize the performance of the system.

Discovery Without Intrusion Prevention

The discovery feature allows you to monitor network traffic and determine the number and types of hosts (including network devices) on your network, as well as the operating systems, active applications, and open ports on those hosts. You can also configure managed devices to monitor user activity on your network. You can use discovery data to perform traffic profiling, assess network compliance, and respond to policy violations.

In a basic deployment (discovery and simple, network-based access control only), you can improve a device’s performance by following a few important guidelines when configuring its access control policy.

**Note**

You must use an access control policy, even if it simply allows all traffic. The network discovery policy can only examine traffic that the access control policy allows to pass.

First, make sure your access control policy does not require complex processing and uses only simple, network-based criteria to handle network traffic. You must implement all of the following guidelines; misconfiguring any one of these options eliminates the performance benefit:

- Do not use the Security Intelligence feature. Remove any populated global whitelist or blacklist from the policy’s Security Intelligence configuration.
- Do not include access control rules with Monitor or Interactive Block actions. Use only Allow, Trust, and Block rules. Keep in mind that allowed traffic can be inspected by discovery; trusted and blocked traffic cannot.
- Do not include access control rules with application, user, URL, ISE attribute, or geolocation-based network conditions. Use only simple network-based conditions: zone, IP address, VLAN tag, and port.
- Do not include access control rules that perform file, malware, or intrusion inspection. In other words, do not associate a file policy or intrusion policy with any access control rule.
• In the Advanced settings for the access control policy, make sure that **Intrusion Policy used before Access Control rule is determined** is set to **No Rules Active**.

• Select **Network Discovery Only** as the policy’s default action. Do **not** choose a default action for the policy that performs intrusion inspection.

In conjunction with the access control policy, you can configure and deploy the network discovery policy, which specifies the network segments, ports, and zones that the system examines for discovery data, as well as whether hosts, applications, and users are discovered on the segments, ports, and zones.

**Related Topics**

[Inspection of Packets That Pass Before Traffic Is Identified](#), on page 1591

**Intrusion Prevention Without Discovery**

Disabling discovery if you don't need it (for example, in an IPS-only deployment) can improve performance. To disable discovery you must implement **all** of these changes:

• Delete **all** rules from your network discovery policy.

• Use **only** simple network-based conditions to perform access control: zone, IP address, VLAN tag, and port.

  Do **not** perform any kind of, application, user, URL, or geolocation control. Although you can disable storage of discovery data, the system still must collect and examine it to implement those features.

After you deploy, new discovery halts on target devices. The system gradually deletes information in the network map according to your timeout preferences. Or, you can purge all discovery data immediately.
## History for Policy Management

<table>
<thead>
<tr>
<th>Feature</th>
<th>Version</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revamp of the deploy section in the Firepower Management Center.</td>
<td>6.6</td>
<td></td>
</tr>
</tbody>
</table>
The **Deploy** button on the FMC menu bar is changed to **Deploy** menu. There are two new sub-menu options under it. These are **Deployment** and **Deployment History**. The Deployment page has undergone an improvement along with newly added features, and the new Deployment History page provides a legend of all the previous deployments.

The Deployment page has the following newly added features:

- Deployment status - On the Deployment page, the Status column provides the deployment status for each device.

- Deployment estimate - The **Estimate** link is available on the Deployment page after you select a device, a policy, or a configuration. The **Estimate** link provides an estimate of the deployment duration once clicked.

- Deployment preview - Preview provides a snapshot of all the policy and object changes to be deployed on the device. The policy changes include the new policies, changes in the existing policies, and the deleted policies. The object changes include the added and modified objects which are used in policies.

- Selective policy deployment - FMC allows you to select a specific policy within the list of all the changes on the device that are due for deployment and deploy only the selected policy.

Supported platforms: Firepower

Chapter 19

Rule Management: Common Characteristics

The following topics describe how to manage common characteristics of rules in various policies on the Firepower Management Center:

• Introduction to Rules, on page 353
• Rule Condition Types, on page 354
• Searching for Rules, on page 382
• Filtering Rules by Device, on page 383
• Rule and Other Policy Warnings, on page 383

Introduction to Rules

Rules in various policies exert granular control over network traffic. The system evaluates traffic against rules in the order that you specify, using a first-match algorithm.

Although these rules may include other configurations that are not consistent across policies, they share many basic characteristics and configuration mechanics, including:

• Conditions: Rule conditions specify the traffic that each rule handles. You can configure each rule with multiple conditions. Traffic must match all conditions to match the rule.

• Action: A rule's action determines how the system handles matching traffic. Note that even if a rule does not have an Action list you can choose from, the rule still has an associated action. For example, a custom network analysis rule uses a network analysis policy as its "action." As another example, QoS rules do not have an explicit action because all QoS rules do the same thing: rate limit traffic.

• Position: A rule's position determines its evaluation order. When using a policy to evaluate traffic, the system matches traffic to rules in the order you specify. Usually, the system handles traffic according to the first rule where all the rule's conditions match the traffic. (Monitor rules, which are designed to track and log, are an exception.) Proper rule order reduces the resources required to process network traffic, and prevents rule preemption.

• Category: To organize some rule types, you can create custom rule categories in each parent policy.

• Logging: For many rules, logging settings govern whether and how the system logs connections handled by the rule. Some rules (such as identity and network analysis rules) do not include logging settings because the rules neither determine the final disposition of connections, nor are they specifically designed to log connections. As another example, QoS rules do not include logging settings; you cannot log a connection simply because it was rate limited.
• Comments: For some rule types, each time you save changes, you can add comments. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change.

Tip
A right-click menu in many policy editors provides shortcuts to many rule management options, including editing, deleting, moving, enabling, and disabling.

Rules with Shared Characteristics
This chapter documents many common aspects of the following rules and configurations. For information on non-shared configurations, see:

• Access control rules: Access Control Rules, on page 1147
• Prefilter rules: Tunnel and Prefilter Rule Components, on page 1205
• Tunnel rules: Tunnel and Prefilter Rule Components, on page 1205
• SSL rules: Creating and Modifying TLS/SSL Rules, on page 1272
• DNS rules: Creating and Editing DNS Rules, on page 1191
• Identity rules: Create an Identity Rule, on page 1879
• Network analysis rules: Configuring Network Analysis Rules, on page 1595
• QoS rules: Configuring QoS Rules, on page 616
• Intelligent Application Bypass (IAB): Intelligent Application Bypass, on page 1211
• Application filters: Application Filters, on page 399

Rules without Shared Characteristics
Rules whose configurations are not documented in this chapter include:

• Intrusion rules: Tuning Intrusion Policies Using Rules, on page 1411
• File and malware rules: File Rules, on page 1345
• Correlation rules: Configuring Correlation Rules, on page 1909
• NAT rules (Classic): NAT for 7000 and 8000 Series Devices, on page 915
• NAT rules (Firepower Threat Defense): Network Address Translation (NAT) for Firepower Threat Defense, on page 933
• 8000 Series fastpath rules: Configure Fastpath Rules (8000 Series), on page 242

Rule Condition Types
The following table describes the common rule conditions documented in this chapter, and lists the configurations where they are used.

**Rule Condition Mechanics**

Rule conditions specify the traffic that each rule handles. You can configure each rule with multiple conditions, and traffic must match all conditions to match the rule. The available condition types depend on the rule type.

In rule editors, each condition type has its own tab page. Build conditions by choosing the traffic characteristics you want to match. In general, choose criteria from one or two lists of available items on the left, then add or combine those criteria into one or two lists of selected items on the right. For example, in URL conditions in access control rules, you can combine URL category and reputation criteria to create a single group of websites to block.

To help you build conditions, you can match traffic using various system-provided and custom configurations, including realms, ISE attributes, and various types of objects and object groups. Often, you can manually specify rule criteria.

Leave matching criteria empty whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against every combination of the contents of the criteria you specify.
Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use specific conditions (such as networks and IP addresses) should be ordered before rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this Wikipedia article.

Caution

Source and Destination Criteria
Where a rule involves source and destination criteria (zones, networks, ports), usually you can use either or both criteria as constraints. If you use both, matching traffic must originate from one of the specified source zones, networks, or ports and leave through one of the destination zones, networks, or ports.

Items per Condition
You can add up to 50 items to each condition. For rules with source and destination criteria, you can use up to 50 of each. Traffic that matches any of the selected items matches the condition.

Simple Rule Mechanics
In rule editors, you have the following general choices. For detailed instructions on building conditions, see the topics for each condition type.

- Choose Item—Click an item or check its check box. Often you can use Ctrl or Shift to choose multiple items, or right-click to Select All.

- Search—Enter criteria in the search field. The list updates as you type. The system searches item names and, for objects and object groups, their values. Click reload (↻) or clear (✗) to clear the search.

- Add Predefined Item—After you choose one or more available items, click an Add button or drag and drop. The system prevents you from adding invalid items: duplicates, invalid combinations, and so on.

- Add Manual Item—Click the field under the Selected items list, enter a valid value, and click Add. When you add ports, you may also choose a protocol from the drop-down list.

- Create Object—Click the add icon (✚) to create a new, reusable object that you can immediately use in the condition you are building, then manage in the object manager. When using this method to add application filters on the fly, you cannot save a filter that includes another user-created filter.

- Delete—Click the delete icon (✂) for an item, or choose one or more items and right-click to Delete Selected.

Interface Conditions
Interface rule conditions control traffic by its source and destination interfaces.
Depending on the rule type and the devices in your deployment, you can use predefined *interface objects* called *security zones* or *interface groups* to build interface conditions. Interface objects segment your network to help you manage and classify traffic flow by grouping interfaces across multiple devices; see Interface Objects: Interface Groups and Security Zones, on page 403.

**Tip**
Constraining rules by interface is one of the best ways to improve system performance. If a rule excludes all of a device’s interfaces, that rule does not affect that device's performance.

Just as all interfaces in an interface object must be of the same type (all inline, passive, switched, routed, or ASA FirePOWER), all interface objects used in an interface condition must be of the same type. Because devices deployed passively do not transmit traffic, in passive deployments you cannot constrain rules by destination interface.

**Tunnel Zones vs Security Zones**
In some configurations, you can use tunnel zones instead of security zones to constrain interface conditions. Tunnel zones allow you to use prefiltering to tailor subsequent traffic handling to certain types of encapsulated connections.

**Note**
If a configuration supports tunnel zone constraints, a rezoned connection—a connection with an assigned tunnel zone—does **not** match security zone constraints. For more information, see Tunnel Zones and Prefiltering, on page 1207.

### Rules with Interface Conditions

<table>
<thead>

<td>no</td>
<td>yes</td>
</tr>
</tbody>
</table>
**Example: Access Control Using Security Zones**

Consider a deployment where you want hosts to have unrestricted access to the internet, but you nevertheless want to protect them by inspecting incoming traffic for intrusions and malware.

First, create two security zones: Internal and External. Then, assign interface pairs on one or more devices to those zones, with one interface in each pair in the Internal zone and one in the External zone. Hosts connected to the network on the Internal side represent your protected assets.

Note

You are not required to group all internal (or external) interfaces into a single zone. Choose the grouping that makes sense for your deployment and security policies.

Then, configure an access control rule with a destination zone condition set to Internal. This simple rule matches traffic that leaves the device from any interface in the Internal zone. To inspect matching traffic for intrusions and malware, choose a rule action of **Allow**, then associate the rule with an intrusion and a file policy.

---

**Configuring Interface Conditions**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Before you begin**

- (Access control only) If you want to constrain traffic by tunnel zones instead of security zones, make sure the associated prefilter policy assigns those zones; see Associating Other Policies with Access Control, on page 1145.

**Procedure**

**Step 1**

In the rule editor, click the following for interface conditions:

- Interface groups and security zones (tunnel, prefilter, QoS)—Click **Interface Objects**.
- Security zones (access control, SSL, DNS, identity, network analysis)—Click **Zones**.
- Tunnel zones (access control)—Click **Zones**.

**Step 2**

Find and choose the interfaces you want to add from the **Available Interface Objects** or **Available Zones** list.

(ACCESS CONTROL only) To match connections in rezoned tunnels, choose tunnel zones instead of security zones. You cannot use tunnel and security zones in the same rule. For more information, see Tunnel Zones and Prefiltering, on page 1207.

**Step 3**

Click **Add to Source** or **Add to Destination**, or drag and drop.
Step 4  
Save or continue editing the rule.

What to do next

- (Access control only) If you rezoned tunnels during prefiltering, configure additional rules if necessary to ensure complete coverage. Connections in rezoned tunnels do not match rules with security zone constraints. For more information, see Using Tunnel Zones, on page 1208.
- Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Network Conditions

Network rule conditions control traffic by its source and destination IP address, using inner headers. Tunnel rules, which use outer headers, have tunnel endpoint conditions instead of network conditions.

You can use predefined objects to build network conditions, or manually specify individual IP addresses or address blocks.

Note

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Leave matching criteria empty whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against every combination of the contents of the criteria you specify.

Geolocation in Network Conditions

Some rules can match traffic using the geographical location of the source or destination. If a rule type supports geolocation, you can mix network and geolocation criteria. To ensure you are using up-to-date geolocation data to filter your traffic, Cisco strongly recommends you regularly update the geolocation database (GeoDB).

Original Client in Network Conditions (Filtering Proxied Traffic)

For some rules, you can handle proxied traffic based on the originating client. Use a source network condition to specify proxy servers, then add an original client constraint to specify original client IP addresses. The system uses a packet's X-Forwarded-For (XFF), True-Client-IP, or custom-defined HTTP header field to determine original client IP.

Traffic matches the rule if the proxy's IP address matches the rule's source network constraint, and the original client's IP address matches the rule's original client constraint. For example, to allow traffic from a specific original client address, but only if it uses a specific proxy, create three access control rules:

Access Control Rule 1: Blocks non-proxied traffic from a specific IP address (209.165.201.1)

Source Networks: 209.165.201.1
Original Client Networks: none/any
Action: Block
Access Control Rule 2: Allows proxied traffic from the same IP address, but only if the proxy server for that traffic is one you choose (209.165.200.225 or 209.165.200.238)

Source Networks: 209.165.200.225 and 209.165.200.238
Original Client Networks: 209.165.201.1
Action: Allow

Access Control Rule 3: Blocks proxied traffic from the same IP address if it uses any other proxy server.

Source Networks: any
Original Client Networks: 209.165.201.1
Action: Block

Rules with Network Conditions

<table>
<thead>
<tr>
<th>Rule Type</th>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** In the rule editor, click Networks.

**Step 2** Find and choose the predefined networks you want to add from the Available Networks list.

If the rule supports geolocation, you can mix network and geolocation criteria in the same rule:

- Networks—Click Networks to choose networks.
- Geolocation—Click Geolocation to choose geolocation objects.

**Step 3** (Optional) If the rule supports original client constraints, under Source Networks, configure the rule to handle proxied traffic based on its original client:
• Source/Proxy—Click **Source** to specify proxy servers.
• Original Client—Click **Original Client** to add a network as an original client constraint. In proxied connections, the original client’s IP address must match one of these networks to match the rule.

**Step 4**  
Click **Add to Source**, **Add to Original Client**, or **Add to Destination**, or drag and drop.

**Step 5**  
Add networks that you want to specify manually. Enter a source, original client, or destination IP address or address block, then click **Add**.

**Note**  
The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

**Step 6**  
Save or continue editing the rule.

---

**Example: Network Condition in an Access Control Rule**

The following graphic shows the network condition for an access control rule that blocks connections originating from your internal network and attempting to access resources either in North Korea or on 93.184.216.119 (example.com).

In this example, a network object group called Private Networks (that comprises the IPv4 and IPv6 Private Networks network objects, not shown) represents your internal networks. The example also manually specifies the example.com IP address, and uses a system-provided North Korea geolocation object to represent North Korea IP addresses.

**What to do next**

• Deploy configuration changes; see **Deploy Configuration Changes**, on page 337.

---

**Tunnel Endpoint Conditions**

Tunnel endpoint conditions are specific to tunnel rules. They are similar to the network conditions for other rule types.

Tunnel endpoint conditions control certain types of plaintext, passthrough tunnels (see **Encapsulation Conditions**, on page 366) by their source and destination IP address, using outer encapsulation headers. These are the IP addresses of the tunnel endpoints—the routed interfaces of the network devices on either side of the tunnel.

Tunnel rules are bidirectional by default, and handle all matching tunnels between any of the source endpoints and any of the destination endpoints. However, you can configure unidirectional tunnel rules that match source-to-destination traffic only; see **Tunnel and Prefilter Rule Components**, on page 1205.

You can use predefined network objects to build tunnel endpoint conditions, or manually specify individual IP addresses or address blocks.
The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

### Configuring Tunnel Endpoint Conditions

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** In the rule editor, click **Tunnel Endpoints**.

**Step 2** Find and choose the predefined networks you want to add from the **Available Tunnel Endpoints** list.

Because tunnel endpoints are simply the IP addresses of the routed interfaces of the network devices on either side of the tunnel, you can use network objects to build tunnel endpoint conditions.

**Step 3** Click **Add to Source** or **Add to Destination**, or drag and drop.

Tunnel rules are bidirectional by default so they can handle all traffic between the two endpoints. However, if you choose to **Match tunnels only from source**, the tunnel rule matches source-to-destination traffic only.

**Step 4** Add endpoints that you want to specify manually. Enter a source or destination IP address or address block, then click **Add**.

**Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

**Step 5** Save or continue editing the rule.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 337.

### VLAN Conditions

VLAN rule conditions control VLAN-tagged traffic, including Q-in-Q (stacked VLAN) traffic. The system uses the innermost VLAN tag to filter VLAN traffic, with the exception of the prefilter policy, which uses the outermost VLAN tag in its rules.

**Note** the following Q-in-Q support:
• NGIPSv, Firepower 7000, Firepower 8000—Supports Q-in-Q for all interface types.
• ASA FirePOWER module—Does not support Q-in-Q (supports only one VLAN tag).
• FTD on Firepower 4100/9300—Does not support Q-in-Q (supports only one VLAN tag).
• FTD on all other models:
  • Inline sets and passive interfaces—Supports Q-in-Q, up to 2 VLAN tags.
  • Firewall interfaces—Does not support Q-in-Q (supports only one VLAN tag).

You can use predefined objects to build VLAN conditions, or manually enter any VLAN tag from 1 to 4094. Use a hyphen to specify a range of VLAN tags.

You can specify a maximum of 50 VLAN conditions.

---

**Note**

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal VLAN tags to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

---

**Rules with VLAN Conditions**

The following rule types support VLAN conditions:

• Access control
• Tunnel and prefilter (uses outermost VLAN tag)
• SSL
• DNS
• Identity
• Network analysis

---

**Port and ICMP Code Conditions**

Port conditions allow you to control traffic by its source and destination ports. Depending on the rule type, “port” can represent any of the following:

• TCP and UDP—You can control TCP and UDP traffic based on the transport layer protocol. The system represents this configuration using the protocol number in parentheses, plus an optional associated port or port range. For example: TCP(6)/22.

• ICMP—You can control ICMP and ICMPv6 (IPv6-ICMP) traffic based on its internet layer protocol plus an optional type and code. For example: ICMP(1):3:3.

• No port—You can control traffic using other protocols that do not use ports.

Leave matching criteria empty whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against every combination of the contents of the criteria you specify.
Using Source and Destination Port Constraints

If you add both source and destination port constraints, you can only add ports that share a single transport protocol (TCP or UDP). For example, if you add DNS over TCP as a source port, you can add Yahoo Messenger Voice Chat (TCP) as a destination port but not Yahoo Messenger Voice Chat (UDP).

If you add only source ports or only destination ports, you can add ports that use different transport protocols. For example, you can add both DNS over TCP and DNS over UDP as source port conditions in a single access control rule.

Matching Non-TCP Traffic with Port Conditions

Although you can configure port conditions to match non-TCP traffic, there are some restrictions:

- Access control rules—For Classic devices, you can match GRE-encapsulated traffic with an access control rule by using the GRE (47) protocol as a destination port condition. To a GRE-constrained rule, you can add only network-based conditions: zone, IP address, port, and VLAN tag. Also, the system uses outer headers to match all traffic in access control policies with GRE-constrained rules. For Firepower Threat Defense devices, use tunnel rules in the prefilter policy to control GRE-encapsulated traffic.

- SSL rules—SSL rules support TCP port conditions only.

- Identity rules—The system cannot enforce active authentication on non-TCP traffic. If an identity rule action is Active Authentication or if you check the option to **Use active authentication if passive authentication cannot identify user**, use TCP ports constraints only. If the identity rule action is Passive Authentication or No Authentication, you can create port conditions based on non-TCP traffic.

**Caution**

Adding the first or removing the last active authentication rule when SSL decryption is disabled (that is, when the access control policy does not include an SSL policy) restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 340](#) for more information.

Note that an active authentication rule has either an **Active Authentication** rule action, or a **Passive Authentication** rule action with **Use active authentication if passive authentication cannot identify user** selected.

- IMCP echo—A destination ICMP port with the type set to 0 or a destination ICMPv6 port with the type set to 129 only matches unsolicited echo replies. ICMP echo replies sent in response to ICMP echo requests are ignored. For a rule to match on any ICMP echo, use ICMP type 8 or ICMPv6 type 128.

Rules with Port Conditions

The following rules support port conditions:

- Access control
- Prefilter
- SSL (supports TCP traffic only)
- Identity (active authentication supports TCP traffic only)
• QoS

## Configuring Port Conditions

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

### Procedure

**Step 1**  
In the rule editor, click **Ports**.

**Step 2**  
Find and choose the predefined ports you want to add from the **Available Ports** list.

**Step 3**  
Click **Add to Source** or **Add to Destination**, or drag and drop.

**Step 4**  
Add any source or destination ports that you want to specify manually:

- **Source**—Choose a **Protocol**, enter a single **Port** from 0 to 65535, and click **Add**.
- **Destination (non-ICMP)**—Choose or enter a **Protocol**. If you do not want to specify a protocol, or if you choose **TCP** or **UDP**, enter a single **Port** from 0 to 65535. Click **Add**.
- **Destination (ICMP)**—Choose **ICMP** or **IPv6-ICMP** from the **Protocol** drop down list, then choose a **Type** and related **Code** in the pop-up window that appears. For more information on ICMP types and codes, see the Internet Assigned Numbers Authority (IANA) website.

**Step 5**  
Save or continue editing the rule.

### What to do next

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 337.

## Encapsulation Conditions

Encapsulation conditions are specific to tunnel rules.

These conditions control certain types of plaintext, passthrough tunnels by their encapsulation protocol. You must choose at least one protocol to match before you can save the rule. You can choose:

- **GRE** (47)
- **IP-in-IP** (4)
- **IPv6-in-IP** (41)
- **Teredo** (UDP (17)/3455)
Application Conditions (Application Control)

When the system analyzes IP traffic, it can identify and classify the commonly used applications on your network. This discovery-based application awareness is the basis for application control—the ability to control application traffic.

System-provided application filters help you perform application control by organizing applications according to basic characteristics: type, risk, business relevance, category, and tags. You can create reusable user-defined filters based on combinations of the system-provided filters, or on custom combinations of applications.

At least one detector must be enabled for each application rule condition in the policy. If no detector is enabled for an application, the system automatically enables all system-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application. For more information about application detectors, see Application Detector Fundamentals, on page 1796.

You can use both application filters and individually specified applications to ensure complete coverage. However, understand the following note before you order your access control rules.

As part of application control, you can also use access control rules to enforce content restriction (such as Safe Search and YouTube EDU).

⚠️ Caution

Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use specific conditions (such as networks and IP addresses) should be ordered before rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this Wikipedia article.

Benefits of Application Filters

Application filters help you quickly configure application control. For example, you can easily use system-provided filters to create an access control rule that identifies and blocks all high risk, low business relevance applications. If a user attempts to use one of those applications, the system blocks the session.

Using application filters simplifies policy creation and administration. It assures you that the system controls application traffic as expected. Because Cisco frequently updates and adds application detectors via system and vulnerability database (VDB) updates, you can ensure that the system uses up-to-date detectors to monitor application traffic. You can also create your own detectors and assign characteristics to the applications they detect, automatically adding them to existing filters.

Configurations with Application Conditions

The configurations in the following table help you perform application control. The table also shows how you can constrain application control, depending on the configuration.
### Configuring Application Conditions and Filters

**Configuring Application Conditions and Filters**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

To build an application condition or filter, choose the applications whose traffic you want to control from a list of available applications. Optionally (and recommended), constrain the available applications using filters. You can use filters and individually specified applications in the same condition.

**Before you begin**

- Adaptive profiling **must** be enabled (its default state) as described in Configuring Adaptive Profiles, on page 1733 for access control rules to perform application control.

**Procedure**

**Step 1**

Invoke the rule or configuration editor:
• Access control, SSL, QoS rule condition—In the rule editor, click **Applications**.
• Identity rule condition—In the rule editor, click **Realms & Settings** and enable active authentication; see **Create an Identity Rule**, on page 1879.
• Application filter—On the Application Filters page of the object manager, add or edit an application filter. Provide a unique **Name** for the filter.
• Intelligent Application Bypass (IAB)—In the access control policy editor, click **Advanced**, edit IAB settings, then click **Bypassable Applications and Filters**.

**Step 2** (Optional) For an access control rule, enable content restriction features by clicking dimmed for Safe Search (Safe Search) or YouTube EDU (YouTube EDU) and setting related options.

For additional configuration requirements, see **Using Access Control Rules to Enforce Content Restriction**, on page 1220.

In most cases, enabling content restriction populates the condition's **Selected Applications and Filters** list with the appropriate values. The system does not automatically populate the list if applications or filters related to content restriction are already present in the list when you enable content restriction.

Continue with the procedure to refine your application and filter selections, or skip to saving the rule.

**Step 3** Find and choose the applications you want to add from the **Available Applications** list.

To constrain the applications displayed in **Available Applications**, choose one or more **Application Filters** or search for individual applications.

**Tip** Click information (information) next to an application to display summary information and internet search links. Unlock (unlock) marks applications that the system can identify only in decrypted traffic.

When you choose filters, singly or in combination, the Available Applications list updates to display only the applications that meet your criteria. You can choose system-provided filters in combination, but not user-defined filters.

• Multiple filters for the same characteristic (risk, business relevance, and so on)—Application traffic must match only one of the filters. For example, if you choose both the medium and high-risk filters, the Available Applications list displays all medium and high-risk applications.

• Filters for different application characteristics—Application traffic must match both filter types. For example, if you choose both the high-risk and low business relevance filters, the Available Applications list displays only applications that meet both criteria.

**Step 4** Click **Add to Rule**, or drag and drop.

**Tip** Before you add more filters and applications, click **Clear Filters** to clear your current choices.

The web interface lists filters added to a condition above and separately from individually added applications.

**Step 5** Save or continue editing the rule or configuration.

---

**Example: Application Condition in an Access Control Rule**

The following graphic shows the application condition for an access control rule that blocks a user-defined application filter for MyCompany, all applications with high risk and low business relevance, gaming applications, and some individually selected applications.
What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Application Characteristics

The system characterizes each application that it detects using the criteria described in the following table. Use these characteristics as application filters.

Table 55: Application Characteristics

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Application protocols represent communications between hosts. Clients represent software running on a host. Web applications represent the content or requested URL for HTTP traffic.</td>
<td>HTTP and SSH are application protocols. Web browsers and email clients are clients. MPEG video and Facebook are web applications.</td>
</tr>
<tr>
<td>Risk</td>
<td>The likelihood that the application is being used for purposes that might be against your organization’s security policy.</td>
<td>Peer-to-peer applications tend to have a very high risk.</td>
</tr>
<tr>
<td>Business Relevance</td>
<td>The likelihood that the application is being used within the context of your organization’s business operations, as opposed to recreationally.</td>
<td>Gaming applications tend to have a very low business relevance.</td>
</tr>
<tr>
<td>Category</td>
<td>A general classification for the application that describes its most essential function. Each application belongs to at least one category.</td>
<td>Facebook is in the social networking category.</td>
</tr>
<tr>
<td>Tag</td>
<td>Additional information about the application. Applications can have any number of tags, including none.</td>
<td>Video streaming web applications often are tagged high bandwidth and displays ads.</td>
</tr>
</tbody>
</table>
**Best Practices for Application Control**

Keep in mind the following guidelines and limitations for application control:

**Ensuring that Adaptive Profiling is Enabled**

If adaptive profiling is not enabled (its default state), access control rules cannot perform application control.

**Automatically Enabling Application Detectors**

If no detector is enabled for an application you want to detect, the system automatically enables all system-provided detectors for the application. If none exist, the system enables the most recently modified user-defined detector for the application.

**Configure Your Policy to Examine the Packets That Must Pass Before an Application Is Identified**

The system cannot perform application control, including Intelligent Application Bypass (IAB) and rate limiting, before both of the following occur:

- A monitored connection is established between a client and server
- The system identifies the application in the session

This identification should occur in 3 to 5 packets, or after the server certificate exchange in the SSL handshake if the traffic is encrypted.

**Important!** To ensure that your system examines these initial packets, see Specify a Policy to Handle Packets That Pass Before Traffic Identification, on page 1592.

If early traffic matches all other criteria but application identification is incomplete, the system allows the packet to pass and the connection to be established (or the SSL handshake to complete). After the system completes its identification, the system applies the appropriate action to the remaining session traffic.

**Create Separate Rules for URL and Application Filtering**

Create separate rules for URL and application filtering whenever possible, because combining application and URL criteria can lead to unexpected results, especially for encrypted traffic.

Rules that include both application and URL criteria should come after application-only or URL-only rules, unless the application+URL rule is acting as an exception to a more general application-only or URL-only rule.

**URL Rules Before Application and Other Rules**

For the most effective URL matching, place rules that include URL conditions before other rules, particularly if the URL rules are block rules and the other rules meet both of the following criteria:

- They include application conditions.
- The traffic to be inspected is encrypted.

**Application Control for Encrypted and Decrypted Traffic**

The system can identify and filter encrypted and decrypted traffic:
• Encrypted traffic—The system can detect application traffic encrypted with StartTLS, including SMTPS, POPS, FTPS, TelnetS, and IMAPS. In addition, it can identify certain encrypted applications based on the Server Name Indication in the TLS ClientHello message, or the subject distinguished name value from the server certificate. These applications are tagged SSL Protocol; in an SSL rule, you can choose only these applications. Applications without this tag can only be detected in unencrypted or decrypted traffic.

• Decrypted traffic—The system assigns the decrypted traffic tag to applications that the system can detect in decrypted traffic only, not encrypted or unencrypted.

Exempting Applications from Active Authorization
In an identity policy, you can exempt certain applications from active authentication, allowing traffic to continue to access control. These applications are tagged User-Agent Exclusion. In an identity rule, you can choose only these applications.

Handling Application Traffic Packets Without Payloads
When performing access control, the system applies the default policy action to packets that do not have a payload in a connection where an application is identified.

Handling Referred Application Traffic
To handle traffic referred by a web server, such as advertisement traffic, match the referred application rather than the referring application.

Controlling Application Traffic That Uses Multiple Protocols (Skype, Zoho)
Some applications use multiple protocols. To control their traffic, make sure your access control policy covers all relevant options. For example:

• Skype—To control Skype traffic, choose the Skype tag from the Application Filters list rather than selecting individual applications. This ensures that the system can detect and control all Skype traffic the same way.

• Zoho—To control Zoho mail, choose both Zoho and Zoho mail from the Available Application list.

Search Engines Supported for Content Restriction Features
The system supports Safe Search filtering for specific search engines only. The system assigns the safesearch supported tag to application traffic from these search engines.

Controlling Evasive Application Traffic
See Application-Specific Notes and Limitations, on page 374.

Additional Guidelines for Rule Ordering for Application Control
For guidelines about rule ordering for application control, see Best Practices for Configuring Application Control, on page 373.

Related Topics
Inspection of Packets That Pass Before Traffic Is Identified, on page 1591
Best Practices for Configuring Application Control

We recommend controlling applications’ access to the network as follows:

- To allow or block application access from a less secure network to a more secure network: Use **Port** (Selected Destination Port) conditions on the access control rule
  
  For example, allow ICMP traffic from the internet (less secure) to an internal network (more secure.)

- To allow or block applications being accessed by user groups: Use **Application** conditions on the access control rule
  
  For example, block Facebook from being accessed by members of the Contractors group

---

**Caution**

Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use specific conditions (such as networks and IP addresses) should be ordered before rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this Wikipedia article.

The following table provides an example of how to set up your access control rules:

<table>
<thead>
<tr>
<th>Type of control</th>
<th>Action</th>
<th>Zones, Networks, VLAN Tags</th>
<th>Users</th>
<th>Applications</th>
<th>Ports</th>
<th>URLs</th>
<th>SGT/ISE Attributes</th>
<th>Inspection, Logging, Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application from more secure to less secure network when application uses a port (for example, SSH)</td>
<td>Your choice (Allow in this example)</td>
<td>Destination zones or networks using the outside interface</td>
<td>Any</td>
<td>Do not set</td>
<td>Available Ports: SSH Add to Selected Destination Ports</td>
<td>Any</td>
<td>Use only with ISE.</td>
<td>Any</td>
</tr>
<tr>
<td>Application from more secure to less secure network when application does not use a port (for example, ICMP)</td>
<td>Your choice (Allow in this example)</td>
<td>Destination zones or networks using the outside interface</td>
<td>Any</td>
<td>Do not set</td>
<td>Selected Destination Ports Protocol: ICMP Type: Any</td>
<td>Do not set</td>
<td>Use only with ISE.</td>
<td>Any</td>
</tr>
</tbody>
</table>
### Application-Specific Notes and Limitations

- **Office 365 Admin Portal:**
  
  Limitation: If the access policy has logging enabled at the beginning as well as at the end, the first packet will be detected as Office 365 and the end of connection will be detected as Office 365 Admin Portal. This should not affect blocking.

- **Skype:**
  
  See [Best Practices for Application Control, on page 371](#).

- **GoToMeeting**
  
  In order to fully detect GoToMeeting, your rule must include all of the following applications:
  
  - GoToMeeting
  - Citrix Online
  - Citrix GoToMeeting Platform
  - LogMeIn
  - STUN

- **Zoho:**
  
  See [Best Practices for Application Control, on page 371](#).

- **Evasive applications such as Bittorrent, Tor, Psiphon, and Ultrasurf:**
  
  For evasive applications, only the highest-confidence scenarios are detected by default. If you need to take action on this traffic (such as block or implement QoS), it may be necessary to configure more aggressive detection with better effectiveness. To do this, contact TAC to review your configurations as these changes may result in false positives.

- **WeChat:**
  
  It is not possible to selectively block WeChat Media if you allow WeChat.

### Troubleshoot Application Control Rules

If your application control rules don't function as you expect, use the guidelines discussed in this section.

We recommend controlling applications' access to the network as follows:
• To allow or block application access from a less secure network to a more secure network: Use **Port** (Selected Destination Port) conditions on the access control rule

For example, allow ICMP traffic from the internet (less secure) to an internal network (more secure.)

• To allow or block applications being accessed by user groups: Use **Application** conditions on the access control rule

For example, block Facebook from being accessed by members of the Contractors group

---

**Caution**

Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use **specific** conditions (such as networks and IP addresses) should be ordered **before** rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this [Wikipedia article](https://en.wikipedia.org/wiki/Open_Systems_Interconnection).

The following table provides an example of how to set up your access control rules:

<table>
<thead>
<tr>
<th>Type of control</th>
<th>Action</th>
<th>Zones, Networks, VLAN Tags</th>
<th>Users</th>
<th>Applications</th>
<th>Ports</th>
<th>URLs</th>
<th>SGT/ISE Attributes</th>
<th>Inspection, Logging, Comments</th>

   Best Practices for Ordering Rules, on page 1124

URL Conditions (URL Filtering)

Use URL conditions to control the websites that users on your network can access.

For complete information, see URL Filtering, on page 1161.

User, Realm, and ISE Attribute Conditions (User Control)

You can perform user control with the authoritative user identity data collected by the Firepower System. Identity sources monitor users as they log in and out, or as they authenticate using Microsoft Active Directory (AD) or LDAP credentials. You can then configure rules that use this collected identity data to handle traffic based on the logged-in authoritative user associated with a monitored host. A user remains associated with a host until the user logs off (as reported by an identity source), a realm times out the session, or you delete the user data from the system's database.

For information on the authoritative user identity sources supported in your version of the Firepower System, see About User Identity Sources, on page 1815.

You can use the following rule conditions to perform user control:

- User and realm conditions—Match traffic based on the logged-in authoritative user of a host. You can control traffic based on realms, individual users, or the groups those users belong to.

- ISE attribute conditions—Match traffic based on a user's ISE-assigned Security Group Tag (SGT), Device Type (also referred to as Endpoint Profile), or Location IP (also referred to as Endpoint Location). Requires that you configure ISE as an identity source.

Note

In some rules, custom SGT conditions can match traffic tagged with SGT attributes that were not assigned by ISE. This is not considered user control, and only works if you are not using ISE as an identity source; see Custom SGT Conditions, on page 380.

Rules with User Conditions

   The User Agent Identity Source, on page 1817
User Control Prerequisites

Configure Identity Sources/Authentication Methods

Configure identity sources for the types of authentication you want to perform. For more information, see About User Identity Sources, on page 1815.

If you configure a User Agent, TS Agent, or ISE device to monitor a large number of user groups, or if you have a very large number of users mapped to hosts on your network, the system may drop user mappings based on groups, due to your Firepower Management Center user limit. As a result, rules with realm, user, or user group conditions may not match traffic as expected.

Configure Realms

Configure a realm for each AD or LDAP server you want to monitor, including your ISE, User Agent, and TS Agent servers, and perform a user download. For more information, see Create a Realm, on page 1872.

When you configure a realm, you specify the users and user groups whose activity you want to monitor. Including a user group automatically includes all of that group’s members, including members of any secondary groups. However, if you want to use the secondary group as a rule criterion, you must explicitly include the secondary group in the realm configuration.

For each realm, you can enable automatic download of user data to refresh authoritative data for users and user groups.

Create Identity Policies

Create an identity policy to associate the realm with an authentication method, and associate that policy with access control. For more information, see Create an Identity Policy, on page 1878.

Policies that perform user control on a device (access control, SSL, QoS) share an identity policy. That identity policy determines the realms, users, and groups that you can use in rules affecting traffic on those devices.

Before you configure a user condition in a QoS rule, you must make sure the devices targeted by the QoS policy are using the correct identity policy, as defined in the access control policy deployed to the devices. Because the QoS policy and access control policy deployed to the same device are not explicitly linked, the QoS rule editor can allow you to choose invalid realms, users, and groups. These invalid elements are those from identity policies that exist on the Firepower Management Center, but that are not applied to the QoS-targeted devices. If you use these elements, the system cannot determine that you made an invalid choice until deploy-time.

Configuring User and Realm Conditions

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can constrain a rule by realm, or by users and user groups within that realm.
Before you begin

- Fulfill the user control prerequisites described in User, Realm, and ISE Attribute Conditions (User Control), on page 376.

Procedure

| Step 1 | In the rule editor, click Users. |
| Step 2 | (Optional) Find and choose the realm you want to use from the Available Realms. |
| Step 3 | (Optional) Further constrain the rule by choosing users and groups from the Available Users list. |
| Step 4 | Click Add to Rule, or drag and drop. |
| Step 5 | Save or continue editing the rule. |

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Configuring ISE Attribute Conditions

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

Before you begin

- Fulfill the user control prerequisites described in User, Realm, and ISE Attribute Conditions (User Control), on page 376.

Procedure

| Step 1 | In the rule editor, click the following for ISE attribute conditions: |
|        | • Access control—Click SGT/ISE Attributes. |
|        | You can use ISE-assigned Security Group Tags (SGTs) to constrain ISE attribute conditions. To use custom SGTs in access control rules, see Custom SGT Conditions, on page 380. |
| Step 2 | Find and choose the ISE attributes you want to use from the Available Attributes list: |
|        | • Security Group Tag (SGT) |
|        | • Device Type (also referred to as Endpoint Profile) |
|        | • QoS—Click ISE Attributes. |
|        | • Location IP (also referred to as Endpoint Location) |
Step 3  Further constrain the rule by choosing attribute metadata from the Available Metadata list. Or, keep the default: any.

Step 4  Click Add to Rule, or drag and drop.

Step 5  (Optional) Constrain the rule with an IP address in the Add a Location IP Address field, then click Add.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

Step 6  Save or continue editing the rule.

What to do next
• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Troubleshoot User Control

If you notice unexpected user rule behavior, consider tuning your rule, identity source, or realm configurations. For other related troubleshooting information, see:
• Troubleshoot the User Agent Identity Source, on page 1819
• Troubleshoot the ISE Identity Source, on page 1823
• Troubleshoot the TS Agent Identity Source, on page 1825
• Troubleshoot the Captive Portal Identity Source, on page 1837
• Troubleshoot Realms and User Downloads, on page 1869

Rules targeting realms, users, or user groups are not matching traffic
If you configure a User Agent, TS Agent, or ISE device to monitor a large number of user groups, or if you have a very large number of users mapped to hosts on your network, the system may drop user records due to your Firepower Management Center user limit. As a result, rules with user conditions may not match traffic as expected.

Rules targeting user groups or users within user groups are not matching traffic as expected
If you configure a rule with a user group condition, your LDAP or Active Directory server must have user groups configured. The system cannot perform user group control if the server organizes the users in basic object hierarchy.

Rules targeting users in secondary groups are not matching traffic as expected
If you configure a rule with a user group condition that includes or excludes users who are members of a secondary group on your Active Directory server, your server may be limiting the number of users it reports.

By default, Active Directory servers limit the number of users they report from secondary groups. You must customize this limit so that all of the users in your secondary groups are reported to the Firepower Management Center and eligible for use in rules with user conditions.
Rules are not matching users when seen for the first time

After the system detects activity from a previously-unseen user, the system retrieves information about them from the server. Until the system successfully retrieves this information, activity seen by this user is **not** handled by matching rules. Instead, the user session is handled by the next rule it matches (or the policy's default action, if applicable).

For example, this might explain when:

- Users who are members of user groups are not matching rules with user group conditions.
- Users who were reported by a User Agent or ISE device are not matching rules, when the server used for user data retrieval is an Active Directory server.

Note that this might also cause the system to delay the display of user data in event views and analysis tools.

Rules are not matching all ISE users

This is expected behavior. You can perform user control on ISE users who were authenticated by an Active Directory domain controller. You cannot perform user control on ISE users who were authenticated by an LDAP, RADIUS, or RSA domain controller.

Custom SGT Conditions

If you do not configure Cisco ISE as an identity source, you can control traffic using Security Group Tags (SGTs) that were **not** assigned by ISE. SGTs specify the privileges of traffic sources within a trusted network.

*Custom SGT rule conditions use manually created SGT objects to filter traffic, rather than ISE SGTs obtained from the system's connection to an ISE server. These manually created SGT objects correspond to the SGT attributes on the traffic you want to control. Controlling traffic using custom SGTs is not considered user control.*

Rules with Custom SGT Conditions

Only access control rules support custom SGT conditions.

ISE SGT vs Custom SGT Rule Conditions

Some rules allow you to control traffic based on assigned SGT. Depending on the rule type and your identity source configuration, you can use either ISE-assigned SGTs or custom SGTs to match traffic with assigned SGT attributes.

If you use ISE SGTs to match traffic, even if a packet does not have an assigned SGT attribute, the packet still matches an ISE SGT rule if the SGT associated with the packet's source IP address is known in ISE.

<table>
<thead>
<tr>
<th>Condition Type</th>
<th>Requires</th>
<th>SGTs Listed in Rule Editor</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISE SGT</td>
<td>ISE identity source</td>
<td>SGTs obtained by querying the ISE server, with automatically updated metadata</td>
</tr>
<tr>
<td>Custom SGT</td>
<td>No ISE identity source</td>
<td>Static SGT objects you create</td>
</tr>
</tbody>
</table>
Autotransition from Custom SGTs to ISE SGTs

If you create rules that match custom SGTs, then configure ISE as an identity source, the system:

- Disables Security Group Tag options in the object manager. Although the system retains existing SGT objects, you cannot modify them or add new ones.
- Retains existing rules with custom SGT conditions. However, these rules do not match traffic. You also cannot add additional custom SGT criteria to existing rules, or create new rules with custom SGT conditions.

If you configure ISE, Cisco recommends that you delete or disable existing rules with custom SGT conditions. Instead, use ISE attribute conditions to match traffic with SGT attributes.

Configuring Custom SGT Conditions

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

The following procedure describes how to filter traffic tagged with SGT attributes that were not assigned by ISE. This is not considered user control, and only works if you are not using ISE as an identity source; see ISE SGT vs Custom SGT Rule Conditions, on page 380.

Before you begin

- Disable ISE connections. Custom SGT matching does not work if you use ISE as an identity source.
- Configure Security Group Tag objects that correspond with the SGTs you want to match; see Creating Security Group Tag Objects, on page 400.

Procedure

**Step 1** In the rule editor, click SGT/ISE Attributes.

**Step 2** Choose Security Group Tag from the Available Attributes list.

**Step 3** In the Available Metadata list, find and choose a custom SGT object.

If you choose Any, the rule matches all traffic with an SGT attribute. For example, you might choose this value if you want an access control rule to block traffic from hosts that are not configured for TrustSec.

**Step 4** Click Add to Rule, or drag and drop.

**Step 5** Save or continue editing the rule.
What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Troubleshooting Custom SGT Conditions

If you notice unexpected rule behavior, consider tuning your custom SGT object configuration.

Security Group Tag objects unavailable

Custom SGT objects are only available if you do not configure ISE as an identity source. For more information, see Autotransition from Custom SGTs to ISE SGTs, on page 381.

Searching for Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

In many policies, you can search for and within rules. The system matches your input to rule names and condition values, including objects and object groups.

You cannot search for values in a Security Intelligence or URL list or feed.

Procedure

**Step 1**
In the policy editor, click Rules.

**Step 2**
Click Search Rules, enter a complete or partial search string, then press Enter.
The column for matching values is highlighted for each matching rule. A status message displays the current match and the total number of matches.

**Step 3**
View the rules you are interested in.

To navigate between matching rules, click next-match (✓) or previous-match (⌫).

What to do next

• Before you begin a new search, click clear (⌫) to clear the search and any highlighting.
Filtering Rules by Device

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>feature dependent</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Some policy editors allow you to filter your rule view by affected devices.

Filter by device only works for rules that use zones or interface groups. (Otherwise a rule applies to all devices.)

The system uses a rule's interface constraints to determine if the rule affects a device. If you constrain a rule by interface (security zone or interface group condition), the device where that interface is located is affected by that rule. Rules with no interface constraint apply to any interface, and therefore every device.

QoS rules are always constrained by interface.

Procedure

**Step 1** In the policy editor, click **Rules**, then click **Filter by Device**.

A list of targeted devices and device groups appears.

**Step 2** Check one or more check boxes to display only the rules that apply to those devices or groups. Or, check **All** to reset and display all of the rules.

**Tip** Hover your pointer over a rule criterion to see its value. If the criterion represents an object with device-specific overrides, the system displays the override value when you filter the rules list by only that device. If the criterion represents an object with domain-specific overrides, the system displays the override value when you filter the rules list by devices in that domain.

**Step 3** Click **OK**.

Rule and Other Policy Warnings

Policy and rule editors use icons to mark configurations that could adversely affect traffic analysis and flow. Depending on the issue, the system may warn you when you deploy or prevent you from deploying entirely.

**Tip** Hover your pointer over an icon to read the warning, error, or informational text.
Table 56: Policy Error Icons

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>🔄 error</td>
<td>If a rule or configuration has an error, you cannot deploy until you correct the issue, even if you disable any affected rules.</td>
<td>A rule that performs category and reputation-based URL filtering is valid until you target a device that does not have a URL Filtering license. At that point, an error icon appears next to the rule, and you cannot deploy until you edit or delete the rule, retarget the policy, or enable the license.</td>
</tr>
<tr>
<td>🚸 warning</td>
<td>You can deploy a policy that displays rule or other warnings. However, misconfigurations marked with warnings have no effect. If you disable a rule with a warning, the warning icon disappears. It reappears if you enable the rule without correcting the underlying issue.</td>
<td>Preempted rules or rules that cannot match traffic due to misconfiguration have no effect. This includes conditions using empty object groups, application filters that match no applications, excluded LDAP users, invalid ports, and so on. However, if a warning icon marks a licensing error or model mismatch, you cannot deploy until you correct the issue.</td>
</tr>
<tr>
<td>🔄 information</td>
<td>Information icons convey helpful information about configurations that may affect the flow of traffic. These issues do not prevent you from deploying.</td>
<td>With application control, the system might skip matching the first few packets of a connection against some rules, until the system identifies the application or web traffic in that connection. This allows connections to be established so that applications and HTTP requests can be identified.</td>
</tr>
</tbody>
</table>

Introduction to Reusable Objects

For increased flexibility and web interface ease-of-use, the Firepower System uses named objects, which are reusable configurations that associate a name with a value. When you want to use that value, use the named object instead. The system supports object use in various places in the web interface, including many policies
and rules, event searches, reports, dashboards, and so on. The system provides many predefined objects that represent frequently used configurations.

Use the object manager to create and manage objects. Many configurations that use objects also allow you to create objects on the fly, as needed. You can also use the object manager to:

- View the policies, settings, and other objects where a network, port, VLAN, or URL object is used; see Viewing Objects and Their Usage, on page 389.
- Group objects to reference multiple objects with a single configuration; see Object Groups, on page 391.
- Override object values for selected devices or, in a multidomain deployment, selected domains; see Object Overrides, on page 392.

After you edit an object used in an active policy, you must redeploy the changed configuration for your changes to take effect. You cannot delete an object that is in use by an active policy.

An object is configured on a managed device if, and only if, the object is used in a policy that is assigned to that device. If you remove an object from all policies assigned to a given device, the object is also removed from the device configuration on the next deployment, and subsequent changes to the object are not reflected in the device configuration.

### Object Types

The following table lists the objects you can create in the Firepower System, and indicates whether each object type can be grouped or configured to allow overrides.

<table>
<thead>

**Objects and Multitenancy**

In a multidomain deployment, you can create objects in Global and descendant domains with the exception of Security Group Tag (SGT) objects, which you can create only in the Global domain. The system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which you cannot edit, with the exception of security zones and interface groups.

**Note**

Object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

For objects that support grouping, you can group objects in the current domain with objects inherited from ancestor domains.

Object overrides allow you to define device-specific or domain-specific values for certain types of object, including network, port, VLAN tag, and URL. In a multidomain deployment, you can define a default value...
for an object in an ancestor domain, but allow administrators in descendant domains to add override values for that object.

The Object Manager

You can use the object manager to create and manage objects and object groups.

The object manager displays 20 objects or groups per page. If you have more than 20 of any type of object or group, use the navigation links at the bottom of the page to view additional pages. You can also go to a specific page or click the refresh icon ( ) to refresh your view.

By default, the page lists objects and groups alphabetically by name. However, you can sort each type of object or group by any column in the display. You can also filter the objects on the page by name or value.

Editing Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

Step 1  Choose Objects > Object Management.
Step 2  Choose an object type from the list; see Introduction to Reusable Objects, on page 385.
Step 3  Click edit ( ) next to the object you want to edit.

If a view icon ( ) appears instead, the object belongs to an ancestor domain and has been configured not to allow overrides, or you do not have permission to modify the object.

Step 4  Modify the object settings as desired.
Step 5  If you are editing a variable set, manage the variables in the set; see Managing Variables, on page 418.
Step 6  For objects that can be configured to allow overrides:

  • If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 394. You can change this setting only for objects that belong to the current domain.
  • If you want to add override values to this object, expand the Override section and click Add; see Adding Object Overrides, on page 394.

Step 7  Click Save.
Step 8

If you are editing a variable set, and that set is in use by an access control policy, click Yes to confirm that you want to save your changes.

What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Viewing Objects and Their Usage

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

On the Object Management page, the network, port, VLAN, and URL objects have an additional option using which you can view where these objects are used.

Note

In a multidomain deployment, you can view objects from any other domain. However, to find usage of objects in a descendant domain, switch to that domain.

Procedure

Step 1
Choose Objects > Object Management.

Step 2
Choose one of the following object types:
- Network
- Port
- VLAN Tag
- URL

Step 3
Click Find Usage ( ) next to your preferred object.

The Object Usage window displays a list of all the policies, objects, and other settings where the chosen object is in use. Click any of the listed items to know more about the object usage. For policies and some other settings where the object is used, you can click the corresponding links to visit the respective UI pages.

Step 4
Click Close.
Filtering Objects or Object Groups

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays objects created in the current and ancestor domains, which you can filter.

**Procedure**

**Step 1** Choose Objects > Object Management.

**Step 2** Enter your filter criteria in the Filter field.

The page updates as you type to display matching items.

You can use the following metacharacters:

- The asterisk [*] matches zero or more occurrences of a character.
- The caret (^) matches content at the beginning of a string.
- The dollar sign ($) matches content at the end of a string.

---

Sorting Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

**Procedure**

**Step 1** Choose Objects > Object Management.

**Step 2** Click a column heading. To sort in the opposite direction, click the heading again.
Object Groups

Grouping objects allows you to reference multiple objects with a single configuration. The system allows you to use objects and object groups interchangeably in the web interface. For example, anywhere you would use a port object, you can also use a port object group.

You can group network, port, VLAN tag, URL, and PKI objects. Network object groups can be nested, that is, you can add a network object group to another network object group up to 10 levels.

Objects and object groups of the same type cannot have the same name. In a multidomain deployment, the names of object groups must be unique within the domain hierarchy. Note that the system may identify a conflict with the name of an object group you cannot view in your current domain.

When you edit an object group used in a policy (for example, a network object group used in an access control policy), you must re-deploy the changed configuration for your changes to take effect.

Deleting a group does not delete the objects in the group, just their association with each other. Additionally, you cannot delete a group that is in use in an active policy. For example, you cannot delete a VLAN tag group that you are using in a VLAN condition in a saved access control policy.

Grouping Reusable Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

You can group objects in the current domain with objects inherited from ancestor domains.

Procedure

**Step 1**  Choose **Objects > Object Management**.

**Step 2**  If the object type you want to group is **Network**, **Port**, **URL**, or **VLAN Tag**:

a)  Choose the object type from the list of object types.
b)  Choose **Add Group** from the **Add [Object Type]** drop-down list.

**Step 3**  If the object type you want to group is **Distinguished Name**:

a)  Expand the **Distinguished Name** node.
b)  Choose **Object Groups**.
c)  Click **Add Distinguished Name Group**.

**Step 4**  If the object type you want to group is **PKI**:

a)  Expand the **PKI** node.
b)  Choose one of the following:

  * **Internal CA Groups**
  * **Trusted CA Groups**
• Internal Cert Groups
• External Cert Groups

c) Click Add [Object Type] Group.

Step 5 Enter a unique Name.

Step 6 Choose one or more objects from the list, and click Add.

You can also:

• Use the filter field to search for existing objects to include, which updates as you type to display matching items. Click reload above the search field or click clear (X) in the search field to clear the search string.

• Click add ( ) to create objects on the fly if no existing objects meet your needs.

Step 7 Optionally for Network, Port, URL, and VLAN Tag groups:

• Enter a Description.

• Check the Allow Overrides check box to allow overrides for this object group; see Allowing Object Overrides, on page 394.

Step 8 Click Save.

What to do next

• If an active policy references your object group, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Object Overrides

An object override allows you to define an alternate value for an object, which the system uses for the devices you specify.

You can create an object whose definition works for most devices, and then use overrides to specify modifications to the object for the few devices that need different definitions. You can also create an object that needs to be overridden for all devices, but its use allows you to create a single policy for all devices. Object overrides allow you to create a smaller set of shared policies for use across devices without giving up the ability to alter policies when needed for individual devices.

For example, you might want to deny ICMP traffic to the different departments in your company, each of which is connected to a different network. You can do this by defining an access control policy with a rule that includes a network object called Departmental Network. By allowing overrides for this object, you can then create overrides on each relevant device that specifies the actual network where that device is connected.

In a multidomain deployment, you can define a default value for an object in an ancestor domain and allow administrators in descendant domains to add override values for that object. For example, a managed security service provider (MSSP) might use a single Firepower Management Center to manage network security for multiple customers. Administrators at the MSSP can define an object in the Global domain for use in all customers' deployments. Administrators for each customer can log into descendant domains to override that
object for their organizations. These local administrators cannot view or affect the override values of other customers of the MSSP.

You can target an object override to a specific domain. In this case, the system uses the object override value for all devices in the targeted domain unless you override it at the device level.

From the object manager, you can choose an object that can be overridden and define a list of device-level or domain-level overrides for that object.

You can use object overrides with the following object types only:

- Network
- Port
- VLAN tag
- URL
- SLA Monitor
- Prefix List
- Route Map
- Access List
- AS Path
- Community List
- Policy List

If you can override an object, the **Override** column appears for the object type in the object manager. Possible values for this column include:

- Green checkmark — indicates that you can create overrides for the object and no overrides have been added yet
- Red X — indicates that you cannot create overrides for the object
- Number — represents a count of the overrides that have been added to that object (for example, "2" indicates two overrides have been added)

### Managing Object Overrides

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose **Objects > Object Management**.

**Step 2** Choose from the list of object types; see **Introduction to Reusable Objects**, on page 385.
Step 3  Click edit (📝) next to the object you want to edit.

If a view icon (👁️) appears instead, the object belongs to an ancestor domain and has been configured not to allow overrides, or you do not have permission to modify the object.

Step 4  Manage the object overrides:

• Add—Add object overrides; see Adding Object Overrides, on page 394.
• Allow—Allow object overrides; see Allowing Object Overrides, on page 394.
• Delete—In the object editor, click delete (🗑️) next to the override you want to remove.
• Edit—Edit object overrides; see Editing Object Overrides, on page 395.

Allowing Object Overrides

<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1  In the object editor, check the Allow Overrides check box.

Step 2  Click Save.

What to do next

Add object override values; see Adding Object Overrides, on page 394.

Adding Object Overrides

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Before you begin

Allow object overrides; see Allowing Object Overrides, on page 394.

Procedure

Step 1  In the object editor, expand the Override section.
Step 2  Click Add.

Step 3  On Targets, choose domains or devices in the Available Devices and Domains list and click Add.

Step 4  On the Override tab, enter a Name.

Step 5  Optionally, enter a Description.

Step 6  Enter an override value.

Example:
For a network object, enter a network value.

Step 7  Click Add.

Step 8  Click Save.

What to do next
• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Editing Object Overrides

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can modify the description and the value of an existing override, but you cannot modify the existing target list. Instead, you must add a new override with new targets, which replaces the existing override.

Procedure

Step 1  In the object editor, expand the Override section.

Step 2  Click edit (-pencil) next to the override you want to modify.

Step 3  Optionally, modify the Description.

Step 4  Modify the override value.

Step 5  Click Save to save the override.

Step 6  Click Save to save the object.

What to do next
• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.
Network Objects

A network object represents one or more IP addresses. You can use network objects and groups in various places in the system’s web interface, including access control policies, network variables, identity rules, network discovery rules, event searches, reports, and so on.

When you configure an option that requires a network object, the list is automatically filtered to show only those objects that are valid for the option. For example, some options require host objects, while other options require subnets.

A network object can be one of the following types:

**Host**

A single IP address.

IPv4 example:

209.165.200.225

IPv6 example:

2001:DB8::0DB8:800:200C:417A or 2001:DB8:0:0:0DB8:800:200C:417A

**Range**

A range of IP addresses.

IPv4 example:

209.165.200.225-209.165.200.250

IPv6 example:

2001:db8:0:cd30::1-2001:db8:0:cd30::1000

**Network**

An address block, also known as a subnet.

IPv4 example:

209.165.200.224/27

IPv6 example:

2001:DB8:0:CD30::/60

**Group**

A group of network objects or other network object groups.

For example:

209.165.200.225
209.165.201.1
209.165.202.129

You can create nested groups by adding one network object group to another network object group. You can nest up to 10 levels of groups.
Creating Network Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Procedure

**Step 1**  Choose Objects > Object Management.
**Step 2**  Choose Network from the list of object types.
**Step 3**  Choose Add Object from the Add Network drop-down menu.
**Step 4**  Enter a Name.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

**Step 5**  Optionally, enter a Description.
**Step 6**  In the Network field, select the required option and enter an appropriate value; see Network Objects, on page 396.
**Step 7**  Manage overrides for the object:
  - If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 394.
  - If you want to add override values to this object, expand the Override section and click Add; see Adding Object Overrides, on page 394.

**Step 8**  Click Save.

What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Port Objects

Port objects represent different protocols in slightly different ways:

**TCP and UDP**

A port object represents the transport layer protocol, with the protocol number in parentheses, plus an optional associated port or port range. For example: TCP (6) / 22.

**ICMP and ICMPv6 (IPv6-ICMP)**

A port object represents the Internet layer protocol plus an optional type and code. For example: ICMP (1) : 3:3.
You can restrict an ICMP or IPV6-ICMP port object by type and, if applicable, code. For more information on ICMP types and codes, see:

- http://www.iana.org/assignments/icmp-parameters/icmp-parameters.xml
- http://www.iana.org/assignments/icmpv6-parameters/icmpv6-parameters.xml

Other

A port object can represent other protocols that do not use ports.

The Firepower System provides default port objects for well-known ports. You cannot modify or delete these default objects. You can create custom port objects in addition to the default objects.

You can use port objects and groups in various places in the system’s web interface, including access control policies, identity rules, network discovery rules, port variables, and event searches. For example, if your organization uses a custom client that uses a specific range of ports and causes the system to generate excessive and misleading events, you can configure your network discovery policy to exclude monitoring those ports.

When using port objects, observe the following guidelines:

- You cannot add any protocol other than TCP or UDP for source port conditions in access control rules. Also, you cannot mix transport protocols when setting both source and destination port conditions in a rule.
- If you add an unsupported protocol to a port object group used in a source port condition, the rule where it is used does not take affect on the managed device when the configuration is deployed.
- If you create a port object containing both TCP and UDP ports, then add it as a source port condition in a rule, you cannot add a destination port, and vice versa.

Creating Port Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** Choose Objects > Object Management.

**Step 2** Choose Port from the list of object types.

**Step 3** Choose Add Object from the Add Port drop-down list.

**Step 4** Enter a Name.

**Step 5** Choose a Protocol.

**Step 6** Depending on the protocol you chose, constrain by Port, or choose an ICMP Type and Code.

You can enter ports from 1 to 65535. Use a hyphen to specify a port range. You must constrain the object by port if you chose to match All protocols, using the Other drop-down list.

**Step 7** Manage overrides for the object:
• If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 394.
• If you want to add override values to this object, expand the Override section and click Add; see Adding Object Overrides, on page 394.

Step 8  
Click Save.

What to do next
• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Tunnel Zones

A tunnel zone represents certain types of plaintext, passthrough tunnels that you explicitly tag for special analysis. A tunnel zone is not an interface object, even though you can use it as an interface constraint in some configurations.

For detailed information, see Tunnel Zones and Prefiltering, on page 1207.

Application Filters

System-provided application filters help you perform application control by organizing applications according to basic characteristics: type, risk, business relevance, category, and tags. In the object manager, you can create and manage reusable user-defined application filters based on combinations of the system-provided filters, or on custom combinations of applications. For detailed information, see Application Conditions (Application Control), on page 367.

VLAN Tag Objects

Each VLAN tag object you configure represents a VLAN tag or range of tags.

You can group VLAN tag objects. Groups represent multiple objects; using a range of VLAN tags in a single object is not considered a group in this sense.

You can use VLAN tag objects and groups in various places in the system’s web interface, including rules and event searches. For example, you could write an access control rule that applies only to a specific VLAN.

Creating VLAN Tag Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin Network</td>
</tr>
</tbody>
</table>
Security Group Tag Objects

A Security Group Tag (SGT) object specifies a single SGT value. You can use SGT objects in rules to control traffic with SGT attributes that were not assigned by Cisco ISE. You cannot group or override SGT objects.

Related Topics
- Autotransition from Custom SGTs to ISE SGTs, on page 381

Creating Security Group Tag Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>Any</td>
<td>Global only</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

Before you begin
- Disable ISE connections. You cannot create custom SGT objects if you use ISE as an identity source.
Procedure

Step 1  Choose Objects > Object Management.
Step 2  Choose Security Group Tag from the list of object types.
Step 3  Click Add Security Group Tag.
Step 4  Enter a Name.
Step 5  Optionally, enter a Description.
Step 6  In the Tag field, enter a single SGT.
Step 7  Click Save.

What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Related Topics

    Autotransition from Custom SGTs to ISE SGTs, on page 381
    Custom SGT Conditions, on page 380
    ISE SGT vs Custom SGT Rule Conditions, on page 380

URL Objects

Each URL object you configure represents a single URL or IP address. You can use URL objects and groups in various places in the system’s web interface, including access control policies and event searches. For example, you could write an access control rule that blocks a specific website.

When creating URL objects, especially if you do not configure SSL inspection to decrypt or block encrypted traffic, keep the following points in mind:

• If you plan to use a URL object to match HTTPS traffic in an access control rule, create the object using the subject common name in the public key certificate used to encrypt the traffic. Also, the system disregards subdomains within the subject common name, so do not include subdomain information. For example, use example.com rather than www.example.com.

• When matching web traffic using access control rules with URL conditions, the system disregards the encryption protocol (HTTP vs HTTPS). In other words, if you block a website, both HTTP and HTTPS traffic to that website is blocked, unless you use an application condition to refine the rule. When creating a URL object, you do not need to specify the protocol when creating an object. For example, use example.com rather than http://example.com/.
Creating URL Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose Objects > Object Management.

**Step 2** Choose URL from the list of object types.

**Step 3** Choose Add Object from the Add URL drop-down list.

**Step 4** Enter a Name.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

**Step 5** Optionally, enter a Description.

**Step 6** Enter the URL or IP address.

**Step 7** Manage overrides for the object:

- If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 394.
- If you want to add override values to this object, expand the Override section and click Add; see Adding Object Overrides, on page 394.

**Step 8** Click Save.

**What to do next**

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Geolocation Objects

Each geolocation object you configure represents one or more countries or continents that the system has identified as the source or destination of traffic on your monitored network. You can use geolocation objects in various places in the system’s web interface, including access control policies, SSL policies, and event searches. For example, you could write an access control rule that blocks traffic to or from certain countries.

To ensure that you are using up-to-date information to filter your network traffic, Cisco strongly recommends that you regularly update your Geolocation Database (GeoDB).
Creating Geolocation Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Procedure

**Step 1**  Choose Objects > Object Management.

**Step 2**  Choose Geolocation from the list of object types.

**Step 3**  Click Add Geolocation.

**Step 4**  Enter a Name.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

**Step 5**  Check the check boxes for the countries and continents you want to include in your geolocation object. Checking a continent chooses all countries within that continent, as well as any countries that GeoDB updates may add under that continent in the future. Unchecking any country under a continent unchecks the continent. You can choose any combination of countries and continents.

**Step 6**  Click Save.

What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Interface Objects: Interface Groups and Security Zones

Interface objects segment your network to help you manage and classify traffic flow. An interface object simply groups interfaces. These groups may span multiple devices; you can also configure multiple interface objects on a single device.

There are two types of interface objects:

- Security zones—An interface can belong to only one security zone.

- Interface groups—An interface can belong to multiple interface groups (and to one security zone).

You can use interface groups in Firepower Threat Defense NAT policies, prefilter policies, and QoS policies.

Although tunnel zones are not interface objects, you can use them in place of security zones in certain configurations; see Tunnel Zones and Prefiltering, on page 1207.
All interfaces in an interface object must be of the same type: all inline, passive, switched, routed, or ASA FirePOWER. After you create an interface object, you cannot change the type of interfaces it contains.

The Interface Objects page of the object manager lists the security zones and interface groups configured on your managed devices. The page also displays the type of interfaces in each interface object, and you can expand each interface object to view which interfaces on which devices belong to each object.

---

**Note**
Create inline sets before you add security zones for the interfaces in the inline set; otherwise security zones are removed and you must add them again.

---

**Model-Specific Notes and Warnings**

During initial configuration of a 7000 or 8000 Series device, the system creates security zones based on the detection mode you selected for the device. For example, the system creates a Passive zone in passive deployments, while in inline deployments the system creates External and Internal zones. When you register the device to the Firepower Management Center, those security zones are added to the FMC.

If you modify ASA FirePOWER security contexts, switching from single context mode to multi-context mode or vice versa, the system removes all the device's interfaces from their assigned security zones.

**Interface Objects and Multitenancy**

In a multidomain deployment, you can create interface objects at any level. An interface object created in an ancestor domain can contain interfaces that reside on devices in different domains. In this situation, subdomain users viewing the ancestor interface object configuration in the object manager can see only the interfaces in their domain.

Unless restricted by role, subdomain users can view and edit interface objects created in ancestor domains. Subdomain users can add and delete interfaces from these interface objects. They cannot, however, delete or rename the interface objects. You can neither view nor edit interface objects created in descendant domains.

---

**Creating Security Zone and Interface Group Objects**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
</table>

**Tip**

You can create empty interface objects and add interfaces to them later. To add an interface, the interface must have a name. You can also create security zones (but not interface groups) while configuring interfaces in **Devices > Device Management**.
Before you begin

• Understand the usage requirements and restrictions for each type of interface object. See Interface Objects: Interface Groups and Security Zones, on page 403.

• Carefully determine the interface objects you need. You cannot change an existing security zone to an interface group or vice-versa; instead you must create a new interface object.

Procedure

Step 1  Choose Objects > Object Management.
Step 2  Choose Interface from the list of object types.
Step 3  Click Add > Security Zone or Add > Interface Group.
Step 4  Enter a Name.
Step 5  Choose an Interface Type.
Step 6  From the Device > Interfaces drop-down list, choose a device that contains interfaces you want to add.
Step 7  Choose one or more interfaces.
Step 8  Click Add to add the interfaces you chose, grouped by device.
Step 9  Click Save.

What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Variable Sets

Variables represent values commonly used in intrusion rules to identify source and destination IP addresses and ports. You can also use variables in intrusion policies to represent IP addresses in rule suppressions, adaptive profile updates, and dynamic rule states.

Tip

Preprocessor rules can trigger events regardless of the hosts defined by network variables used in intrusion rules.

You use variable sets to manage, customize, and group your variables. You can use the default variable set provided by the system or create your own custom sets. Within any set you can modify predefined default variables and add and modify user-defined variables.

Most of the shared object rules and standard text rules that the Firepower System provides use predefined default variables to define networks and port numbers. For example, the majority of the rules use the variable $HOME_NET to specify the protected network and the variable $EXTERNAL_NET to specify the unprotected (or outside) network. In addition, specialized rules often use other predefined variables. For example, rules that detect exploits against web servers use the $HTTP_SERVERS and $HTTP_PORTS variables.
Rules are more effective when variables more accurately reflect your network environment. At a minimum, you should modify default variables in the default set. By ensuring that a variable such as $HOME_NET correctly defines your network and $HTTP_SERVERS includes all web servers on your network, processing is optimized and all relevant systems are monitored for suspicious activity.

To use your variables, you link variable sets to intrusion policies associated with access control rules or with the default action of an access control policy. By default, the default variable set is linked to all intrusion policies used by access control policies.

Adding a variable to any set adds it to all sets; that is, each variable set is a collection of all variables currently configured on your system. Within any variable set, you can add user-defined variables and customize the value of any variable.

Initially, the Firepower System provides a single, default variable set comprised of predefined default values. Each variable in the default set is initially set to its default value, which for a predefined variable is the value set by the Cisco Talos Intelligence Group (Talos) and provided in rule updates.

Although you can leave predefined default variables configured to their default values, Cisco recommends that you modify a subset of predefined variables.

You could work with variables only in the default set, but in many cases you can benefit most by adding one or more custom sets, configuring different variable values in different sets, and perhaps even adding new variables.

When using multiple sets, it is important to remember that the current value of any variable in the default set determines the default value of the variable in all other sets.

When you select Variable Sets on the Object Manager page, the object manager lists the default variable set and any custom sets you created.

On a freshly installed system, the default variable set is comprised only of the default variables predefined by Cisco.

Each variable set includes the default variables provided by the system and all custom variables you have added from any variable set. Note that you can edit the default set, but you cannot rename or delete the default set.

In a multidomain deployment, the system generates a default variable set for each subdomain.

⚠️ **Caution**

Importing an access control or an intrusion policy overwrites existing default variables in the default variable set with the imported default variables. If your existing default variable set contains a custom variable not present in the imported default variable set, the unique variable is preserved.

**Related Topics**

- Managing Variables, on page 418
- Managing Variable Sets, on page 416

**Variable Sets in Intrusion Policies**

By default, the Firepower System links the default variable set to all intrusion policies used in an access control policy. When you deploy an access control policy that uses an intrusion policy, intrusion rules that you have enabled in the intrusion policy use the variable values in the linked variable set.
When you modify a custom variable set used by an intrusion policy in an access control policy, the system reflects the status for that policy as out-of-date on the Access Control Policy page. You must re-deploy the access control policy to implement changes in your variable set. When you modify the default set, the system reflects the status of all access control policies that use intrusion policies as out-of-date, and you must re-deploy all access control policies to implement your changes.

Variables

Variables belong to one of the following categories:

**Default Variables**

Variables provided by the Firepower System. You cannot rename or delete a default variable, and you cannot change its default value. However, you can create a customized version of a default variable.

**Customized Variables**

Variables you create. These variables can include:

- *customized default variables*

  When you edit the value for a default variable, the system moves the variable from the Default Variables area to the Customized Variables area. Because variable values in the default set determine the default values of variables in custom sets, customizing a default variable in the default set modifies the default value of the variable in all other sets.

- *user-defined variables*

  You can add and delete your own variables, customize their values within different variable sets, and reset customized variables to their default values. When you reset a user-defined variable, it remains in the Customized Variables area.

User-defined variables can be one of the following types:

- *network* variables specify the IP addresses of hosts in your network traffic.

- *port* variables specify TCP or UDP ports in network traffic, including the value *any* for either type.

For example, if you create custom standard text rules, you might also want to add your own user-defined variables to more accurately reflect your traffic or as shortcuts to simplify the rule creation process. Alternatively, if you create a rule that you want to inspect traffic in the “demilitarized zone” (or DMZ) only, you can create a variable named $DMZ whose value lists the server IP addresses that are exposed. You can then use the $DMZ variable in any rule written for this zone.

**Advanced Variables**

Variables provided by the Firepower System under specific conditions. These variables have a very limited deployment.

**Predefined Default Variables**

By default, the Firepower System provides a single default variable set, which is comprised of predefined default variables. The Cisco Talos Intelligence Group (Talos) uses rule updates to provide new and updated intrusion rules and other intrusion policy elements, including default variables.
Because many intrusion rules provided by the system use predefined default variables, you should set appropriate values for these variables. Depending on how you use variable sets to identify traffic on your network, you can modify the values for these default variables in any or all variable sets.

⚠️ Caution

Importing an access control or an intrusion policy overwrites existing default variables in the default variable set with the imported default variables. If your existing default variable set contains a custom variable not present in the imported default variable set, the unique variable is preserved.

The following table describes the variables provided by the system and indicates which variables you typically would modify. For assistance determining how to tailor variables to your network, contact Professional Services or Support.

**Table 57: System-Provided Variables**

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Description</th>
<th>Modify?</th>
</tr>
</thead>
<tbody>
<tr>
<td>$AIM_SERVERS</td>
<td>Defines known AOL Instant Messenger (AIM) servers, and is used in chat-based rules and rules that look for AIM exploits.</td>
<td>Not required.</td>
</tr>
<tr>
<td>$DNS_SERVERS</td>
<td>Defines Domain Name Service (DNS) servers. If you create a rule that affects DNS servers specifically, you can use the $DNS_SERVERS variable as a destination or source IP address.</td>
<td>Not required in current rule set.</td>
</tr>
<tr>
<td>$EXTERNAL_NET</td>
<td>Defines the network that the Firepower System views as the unprotected network, and is used in many rules to define the external network.</td>
<td>Yes, you should adequately define $HOME_NET and then exclude $HOME_NET as the value for $EXTERNAL_NET.</td>
</tr>
<tr>
<td>$FILE_DATA_PORTS</td>
<td>Defines non-encrypted ports used in intrusion rules that detect files in a network stream.</td>

<td>Yes, if you run SSH servers, you should use ports other than the default port (you can view the default ports in the web interface).</td>
</tr>
<tr>
<td>$SSH_SERVERS</td>
<td>Defines SSH servers on your network, and is used in rules that address SSH-targeted exploits.</td>
<td>Yes, if you run SSH servers, you should adequately define $HOME_NET and then include $HOME_NET as the value for $SSH_SERVERS.</td>
</tr>
<tr>
<td>$TELNET_SERVERS</td>
<td>Defines known Telnet servers on your network, and is used in rules that address Telnet server-targeted exploits.</td>
<td>Yes, if you run Telnet servers.</td>
</tr>
</tbody>
</table>
### Network Variables

Network variables represent IP addresses you can use in intrusion rules that you enable in an intrusion policy and in intrusion policy rule suppressions, dynamic rule states, and adaptive profile updates. Network variables differ from network objects and network object groups in that network variables are specific to intrusion policies and intrusion rules, whereas you can use network objects and groups to represent IP addresses in various places in the system’s web interface, including access control policies, network variables, intrusion rules, network discovery rules, event searches, reports, and so on.

You can use network variables in the following configurations to specify the IP addresses of hosts on your network:

- **intrusion rules**—Intrusion rule **Source IPs** and **Destination IPs** header fields allow you to restrict packet inspection to the packets originating from or destined to specific IP addresses.
- **suppressions**—The Network field in source or destination intrusion rule suppressions allows you to suppress intrusion event notifications when a specific IP address or range of IP addresses triggers an intrusion rule or preprocessor.
- **dynamic rule states**—The Network field in source or destination dynamic rule states allows you to detect when too many matches for an intrusion rule or preprocessor rule occur in a given time period.
- **adaptive profile updates**—When you enable adaptive profile updates, the adaptive profiles Networks field identifies hosts where you want to improve reassembly of packet fragments and TCP streams in passive deployments.

When you use variables in the fields identified in this section, the variable set you link to an intrusion policy determines the variable values in the network traffic handled by an access control policy that uses the intrusion policy.

You can add any combination of the following network configurations to a variable:

- any combination of network variables, network objects, and network object groups that you select from the list of available networks
- individual network objects that you add from the New Variable or Edit Variable page, and can then add to your variable and to other existing and future variables
- literal, single IP addresses or address blocks

You can list multiple literal IP addresses and address blocks by adding each individually. You can list IPv4 and IPv6 addresses and address blocks alone or in any combination. When specifying IPv6 addresses, you can use any addressing convention defined in RFC 4291.

The default value for included networks in any variable you add is the word any, which indicates any IPv4 or IPv6 address. The default value for excluded networks is none, which indicates no network. You can also
specify the address :: in a literal value to indicate any IPv6 address in the list of included networks, or no IPv6 addresses in the list of exclusions.

Adding networks to the excluded list negates the specified addresses and address blocks. That is, you can match any IP address with the exception of the excluded IP address or address blocks.

For example, excluding the literal address 192.168.1.1 specifies any IP address other than 192.168.1.1, and excluding 2001:db8:ca2e::fa4c specifies any IP address other than 2001:db8:ca2e::fa4c.

You can exclude any combination of networks using literal or available networks. For example, excluding the literal values 192.168.1.1 and 192.168.1.5 includes any IP address other than 192.168.1.1 or 192.168.1.5. That is, the system interprets this as “not 192.168.1.1 and not 192.168.1.5,” which matches any IP address other than those listed between brackets.

Note the following points when adding or editing network variables:

• You cannot logically exclude the value any which, if excluded, would indicate no address. For example, you cannot add a variable with the value any to the list of excluded networks.

• Network variables identify traffic for the specified intrusion rule and intrusion policy features. Note that preprocess or rules can trigger events regardless of the hosts defined by network variables used in intrusion rules.

• Excluded values must resolve to a subset of included values. For example, you cannot include the address block 192.168.5.0/24 and exclude 192.168.6.0/24.

**Port Variables**

Port variables represent TCP and UDP ports you can use in the Source Port and Destination Port header fields in intrusion rules that you enable in an intrusion policy. Port variables differ from port objects and port object groups in that port variables are specific to intrusion rules. You can create port objects for protocols other than TCP and UDP, and you can use port objects in various places in the system’s web interface, including port variables, access control policies, network discovery rules, and event searches.

You can use port variables in the intrusion rule Source Port and Destination Port header fields to restrict packet inspection to packets originating from or destined to specific TCP or UDP ports.

When you use variables in these fields, the variable set you link to the intrusion policy associated with an access control rule or policy determines the values for these variables in the network traffic where you deploy the access control policy.

You can add any combination of the following port configurations to a variable:

• any combination of port variables and port objects that you select from the list of available ports

  Note that the list of available ports does not display port object groups, and you cannot add these to variables.

• individual port objects that you add from the New Variable or Edit Variable page, and can then add to your variable and to other existing and future variables

  Only TCP and UDP ports, including the value any for either type, are valid variable values. If you use the new or edit variables page to add a valid port object that is not a valid variable value, the object is added to the system but is not displayed in the list of available objects. When you use the object manager to edit a port object that is used in a variable, you can only change its value to a valid variable value.

• single, literal port values and port ranges
You must separate port ranges with a dash (-). Port ranges indicated with a colon (:) are supported for backward compatibility, but you cannot use a colon in port variables that you create.

You can list multiple literal port values and ranges by adding each individually in any combination.

Note the following points when adding or editing port variables:

• The default value for included ports in any variable you add is the word any, which indicates any port or port range. The default value for excluded ports is none, which indicates no ports.

Tip
To create a variable with the value any, name and save the variable without adding a specific value.

• You cannot logically exclude the value any which, if excluded, would indicate no ports. For example, you cannot save a variable set when you add a variable with the value any to the list of excluded ports.

• Adding ports to the excluded list negates the specified ports and port ranges. That is, you can match any port with the exception of the excluded ports or port ranges.

• Excluded values must resolve to a subset of included values. For example, you cannot include the port range 10-50 and exclude port 60.

Advanced Variables

Advanced variables allow you to configure features that you cannot otherwise configure via the web interface. The Firepower System currently provides only one advanced variable, the USER_CONF variable.

**USER_CONF**

USER_CONF provides a general tool that allows you to configure one or more features not otherwise available via the web interface.

**Caution**

Do not use the advanced variable USER_CONF to configure an intrusion policy feature unless you are instructed to do so in the feature description or by Support. Conflicting or duplicate configurations will halt the system.

When editing USER_CONF, you can type up to 4096 total characters on a single line; the line wraps automatically. You can include any number of valid instructions or lines until you reach the 8192 maximum character length for a variable or a physical limit such as disk space. Use the backslash (\) line continuation character after any complete argument in a command directive.

Resetting USER_CONF empties it.

**Variable Reset**

You can reset a variable to its default value on the variable set new or edit variables page. The following table summarizes the basic principles of resetting variables.
Table 58: Variable Reset Values

<table>
<thead>
<tr>
<th>Resetting this variable type...</th>
<th>In this set type...</th>
<th>Resets it to...</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>default</td>
<td>the rule update value</td>
</tr>
<tr>
<td>user-defined</td>
<td>default</td>
<td>any</td>
</tr>
<tr>
<td>default or user-defined</td>
<td>custom</td>
<td>the current default set value (modified or unmodified)</td>
</tr>
</tbody>
</table>

Resetting a variable in a custom set simply resets it to the current value for that variable in the default set.

Conversely, resetting or modifying the value of a variable in the default set always updates the default value of that variable in all custom sets. When the reset icon is grayed out, indicating that you cannot reset the variable, this means that the variable has no customized value in that set. Unless you have customized the value for a variable in a custom set, a change to the variable in the default set updates the value used in any intrusion policy where you have linked the variable set.

It is good practice when you modify a variable in the default set to assess how the change affects any intrusion policy that uses the variable in a linked custom set, especially when you have not customized the variable value in the custom set.

You can hover your pointer over the reset icon ( RequestOptions ) in a variable set to see the reset value. When the customized value and the reset value are the same, this indicates one of the following:

- you are in the custom or default set where you added the variable with the value any
- you are in the custom set where you added the variable with an explicit value and elected to use the configured value as the default value

Adding Variables to Sets

Adding a variable to a variable set adds it to all other sets. When you add a variable from a custom set, you must choose whether to use the configured value as the customized value in the default set:

- **If you use the configured value** (for example, 192.168.0.0/16), the variable is added to the default set using the configured value as a customized value with a default value of any. Because the current value in the default set determines the default value in other sets, the initial, default value in other custom sets is the configured value (which in the example is 192.168.0.0/16).

- **If you do not use the configured value**, the variable is added to the default set using only the default value any and, consequently, the initial, default value in other custom sets is any.

Example: Adding User-Defined Variables to Default Sets

The following diagram illustrates set interactions when you add the user-defined variable Var1 to the default set with the value 192.168.1.0/24.
You can customize the value of Var1 in any set. In Custom Set 2 where Var1 has not been customized, its value is 192.168.1.0/24. In Custom Set 1 the customized value 192.168.2.0/24 of Var1 overrides the default value. Resetting a user-defined variable in the default set resets its default value to any in all sets.

It is important to note in this example that, if you do not update Var1 in Custom Set 2, further customizing or resetting Var1 in the default set consequently updates the current, default value of Var1 in Custom Set 2, thereby affecting any intrusion policy linked to the variable set.

Although not shown in the example, note that interactions between sets are the same for user-defined variables and default variables except that resetting a default variable in the default set resets it to the value configured by Cisco in the current rule update.

Example: Adding User-Defined Variables to Custom Sets

The next two examples illustrate variable set interactions when you add a user-defined variable to a custom set. When you save the new variable, you are prompted whether to use the configured value as the default value for other sets. In the following example, you elect to use the configured value.

Note that, except for the origin of Var1 from Custom Set 1, this example is identical to the example above where you added Var1 to the default set. Adding the customized value 192.168.1.0/24 for Var1 to Custom Set 1 copies the value to the default set as a customized value with a default value of any. Thereafter, Var1 values and interactions are the same as if you had added Var1 to the default set. As with the previous example, keep in mind that further customizing or resetting Var1 in the default set consequently updates the current, default value of Var1 in Custom Set 2, thereby affecting any intrusion policy linked to the variable set.

In the next example, you add Var1 with the value 192.168.1.0/24 to Custom Set 1 as in the previous example, but you elect not to use the configured value of Var1 as the default value in other sets.

This approach adds Var1 to all sets with a default value of any. After adding Var1, you can customize its value in any set. An advantage of this approach is that, by not initially customizing Var1 in the default set,
you decrease your risk of customizing the value in the default set and thus inadvertently changing the current value in a set such as Custom Set 2 where you have not customized Var1.

**Nesting Variables**

You can nest variables so long as the nesting is not circular. Nested, negated variables are not supported.

**Valid Nested Variables**

In this example, SMTP_SERVERS, HTTP_SERVERS, and OTHER_SERVERS are valid nested variables.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Included Networks</th>
<th>Excluded Networks</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMTP_SERVERS</td>
<td>customized default</td>
<td>10.1.1.1</td>
<td></td>
</tr>
<tr>
<td>HTTP_SERVERS</td>
<td>customized default</td>
<td>10.1.1.2</td>
<td></td>
</tr>
<tr>
<td>OTHER_SERVERS</td>
<td>user-defined</td>
<td>10.2.2.0/24</td>
<td></td>
</tr>
<tr>
<td>HOME_NET</td>
<td>customized default</td>
<td>10.1.1.0/24</td>
<td>SMTP_SERVERS, HTTP_SERVERS</td>
</tr>
</tbody>
</table>

**An Invalid Nested Variable**

In this example, HOME_NET is an invalid nested variable because the nesting of HOME_NET is circular; that is, the definition of OTHER_SERVERS includes HOME_NET, so you would be nesting HOME_NET in itself.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Included Networks</th>
<th>Excluded Networks</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMTP_SERVERS</td>
<td>customized default</td>
<td>10.1.1.1</td>
<td></td>
</tr>
<tr>
<td>HTTP_SERVERS</td>
<td>customized default</td>
<td>10.1.1.2</td>
<td></td>
</tr>
<tr>
<td>OTHER_SERVERS</td>
<td>user-defined</td>
<td>10.2.2.0/24 HOME_NET</td>
<td></td>
</tr>
<tr>
<td>HOME_NET</td>
<td>customized default</td>
<td>10.1.1.0/24 OTHER_SERVERS</td>
<td>SMTP_SERVERS, HTTP_SERVERS</td>
</tr>
</tbody>
</table>

**An Unsupported Nested, Negated Variable**

Because nested, negated variables are not supported, you cannot use the variable NONCORE_NET as shown in this example to represent IP addresses that are outside of your protected networks.
### Alternative to an Unsupported Nested, Negated Variable

As an alternative to the example above, you could represent IP addresses that are outside of your protected networks by creating the variable NONCORE_NET as shown in this example.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Included Networks</th>
<th>Excluded Networks</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOME_NET</td>
<td>customized default</td>
<td>10.1.0.0/16</td>
<td>—</td>
</tr>
<tr>
<td></td>
<td></td>
<td>10.2.0.0/16</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>10.3.0.0/16</td>
<td></td>
</tr>
<tr>
<td>EXTERNAL_NET</td>
<td>customized default</td>
<td>—</td>
<td>HOME_NET</td>
</tr>
<tr>
<td>DMZ_NET</td>
<td>user-defined</td>
<td>10.4.0.0/16</td>
<td>—</td>
</tr>
<tr>
<td>NOT_DMZ_NET</td>
<td>user-defined</td>
<td>—</td>
<td>DMZ_NET</td>
</tr>
<tr>
<td>NONCORE_NET</td>
<td>user-defined</td>
<td>EXTERNAL_NET</td>
<td>—</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NOT_DMZ_NET</td>
<td></td>
</tr>
</tbody>
</table>

### Managing Variable Sets

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.
Procedure

Step 1 Choose Objects > Object Management.

Step 2 Choose Variable Set from the list of object types.

Step 3 Manage your variable sets:

- Add — If you want to add a custom variable set, click Add Variable Set; see Creating Variable Sets, on page 417.
- Delete — If you want to delete a custom variable set, click delete (trash can) next to the variable set, then click Yes. You cannot delete the default variable set or variable sets belonging to ancestor domains.

  Note Variables created in a variable set you delete are not deleted or otherwise affected in other sets.

- Edit — If you want to edit a variable set, click edit (pencil) next to the variable set you want to modify; see Editing Objects, on page 388.
- Filter — If you want to filter variable sets by name, begin entering a name; as you type, the page refreshes to display matching names. If you want to clear name filtering, click clear (X) in the filter field.
- Manage Variables — To manage the variables included in variable sets, see Managing Variables, on page 418.

Creating Variable Sets

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1 Choose Objects > Object Management.

Step 2 Choose Variable Set from the list of object types.

Step 3 Click Add Variable Set.

Step 4 Enter a Name.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

Step 5 Optionally, enter a Description.

Step 6 Manage the variables in the set; see Managing Variables, on page 418.

Step 7 Click Save.
What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Managing Variables

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

**Step 1** Choose **Objects > Object Management**.

**Step 2** Choose **Variable Set** from the list of object types.

**Step 3** Click edit (✏️) next to the variable set you want to edit.

If a view icon (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4** Manage your variables:

- Display — If you want to display the complete value for a variable, hover your pointer over the value in the **Value** column next to the variable.
- Add — If you want to add a variable, click **Add**; see Adding Variables, on page 419.
- Delete — Click delete (🗑️) next to the variable. If you have saved the variable set since adding the variable, click **Yes** to confirm that you want to delete the variable.

You *cannot* delete the following:

- default variables
- user-defined variables that are used by intrusion rules or other variables
- variables belonging to ancestor domains

- Edit — Click edit (✏️) next to the variable you want to edit; see Editing Variables, on page 420.
- Reset — If you want to reset a modified variable to its default value, click reset (🔄) next to a modified variable. If reset is dimmed, one of the following is true:
  - The current value is already the default value.
  - The configuration belongs to an ancestor domain.
Adding Variables

Step 1
In the variable set editor, click Add.

Step 2
Enter a unique variable Name.

Step 3
From the Type drop-down list, choose either Network or Port.

Step 4
Specify values for the variable:

• If you want to move items from the list of available networks or ports to the list of included or excluded items, you can choose one or more items and then drag and drop, or click Include or Exclude.

Tip
If addresses or ports in the included and excluded lists for a network or port variable overlap, excluded addresses or ports take precedence.

• Enter a single literal value, then click Add. For network variables, you can enter a single IP address or address block. For port variables you can add a single port or port range, separating the upper and lower values with a hyphen (-). Repeat this step as needed to enter multiple literal values.

• If you want to remove an item from the included or excluded lists, click delete (🗑) next to the item.

Note
The list of items to include or exclude can be comprised of any combination of literal strings and existing variables, objects, and network object groups in the case of network variables.

Step 5
Click Save to save the variable. If you are adding a new variable from a custom set, you have the following options:

Hover your pointer over an active reset to display the default value.

Step 5
Click Save to save the variable set. If the variable set is in use by an access control policy, click Yes to confirm that you want to save your changes.

Because the current value in the default set determines the default value in all other sets, modifying or resetting a variable in the default set changes the current value in other sets where you have not customized the default value.

What to do next
- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.
• Click **Yes** to add the variable using the configured value as the customized value in the default set and, consequently, the default value in other custom sets.

• Click **No** to add the variable as the default value of *any* in the default set and, consequently, in other custom sets.

**Step 6**
Click **Save** to save the variable set. Your changes are saved, and any access control policy the variable set is linked to displays an out-of-date status.

**What to do next**
• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

**Editing Variables**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

You can edit both custom and default variables.

You cannot change the **Name** or **Type** values in an existing variable.

**Procedure**

**Step 1**
In the variable set editor, click edit (✏) next to the variable you want to modify.

If a view icon (👀) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

**Step 2**
Modify the variable:

• If you want to move items from the list of available networks or ports to the list of included or excluded items, you can select one or more items and then drag and drop, or click **Include** or **Exclude**.

  **Tip**
  If addresses or ports in the included and excluded lists for a network or port variable overlap, excluded addresses or ports take precedence.

• Enter a single literal value, then click **Add**. For network variables, you can enter a single IP address or address block. For port variables you can add a single port or port range, separating the upper and lower values with a hyphen (-). Repeat this step as needed to enter multiple literal values.

• If you want to remove an item from the included or excluded lists, click delete (🗑️) next to the item.
The list of items to include or exclude can be comprised of any combination of literal strings and existing variables, objects, and network object groups in the case of network variables.

**Step 3**
Click **Save** to save the variable.

**Step 4**
Click **Save** to save the variable set. If the variable set is in use by an access control policy, click **Yes** to confirm that you want to save your changes. Your changes are saved, and any access control policy the variable set is linked to displays an out-of-date status.

**What to do next**
- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

## Security Intelligence Lists and Feeds

Security Intelligence **lists** and **feeds** help you quickly filter traffic by collecting:

- IP address and address blocks—Use in access control policies to blacklist and whitelist as part of Security Intelligence.

- Domain Names—Use in DNS policies to blacklist and whitelist as part of Security Intelligence.

- URLs—Use in access control policies to blacklist and whitelist as part of Security Intelligence. You can also use URL lists in access control and QoS rules, whose analysis and traffic handling phases occur after Security Intelligence.

### Lists

A list is a static collection that you manage manually.

By default, access control and DNS policies use Global blacklists and whitelists as part of Security Intelligence. **Whitelist Now** and **Blacklist Now** actions allow you to build and implement these lists; see Blacklist Now, Whitelist Now, and Global Lists, on page 423.

Custom lists can augment and fine-tune feeds and the Global lists.

### Feeds

A feed is a dynamic collection that updates on an interval over HTTP or HTTPS.

The regularly updated Cisco Intelligence Feed allows you to filter network traffic based on the latest threat intelligence from Talos. You can also use third-party feeds. Or, with a custom internal feed, you could easily maintain an enterprise-wide blacklist in a large deployment with multiple Firepower Management Center appliances.

If you want strict control over when the system updates a feed from the Internet, you can disable automatic updates for that feed. However, automatic updates ensure the most up-to-date, relevant data.
The system does not perform peer SSL certificate verification when downloading custom feeds, nor does the system support the use of certificate bundles or self-signed certificates to verify the remote peer.

List and Feed Formatting

Each list or feed must be a simple text file no larger than 500MB. List files must have the .txt extension. Include one entry or comment per line: one IP address, one URL, one domain name.

Tip

The number of entries you can include is limited by the maximum size of the file. For example, a URL list with no comments and an average URL length of 100 characters (including Punycode or percent Unicode representations and newlines) can contain more than 5.24 million entries.

In a DNS list entry, you can specify an asterisk (*) wildcard character for a domain label. All labels match the wildcard. For example, an entry of www.example.* matches both www.example.com and www.example.co.

If you add comment lines within the source file, they must start with the pound (#) character. If you upload a source file with comments, the system removes your comments during upload. Source files you download contain all your entries without your comments.

List and Feed Updates

List and feed updates replace the existing list or feed file with the contents of the new file. Contents of existing and new files are not merged.

If the system downloads a corrupt feed or a feed with no recognizable entries, the system continues using the old feed data (unless it is the first download). However, if the system can recognize even one entry in the feed, it uses the entries it can recognize.

Security Intelligence Object Quick Reference

<table>
<thead>
<tr>
<th>Object Type</th>

<td>Delete entries using the object manager.</td>
<td>Yes after deleting entries.</td>
</tr>
<tr>
<td>Custom whitelists and blacklists</td>
<td>Upload new and replacement lists using the object manager.</td>
<td>Yes</td>
</tr>
<tr>
<td>System-provided Intelligence Feeds</td>
<td>Disable or change update frequency using the object manager.</td>
<td>No</td>
</tr>
<tr>
<td>Custom feeds</td>
<td>Fully modify using the object manager.</td>
<td>No</td>
</tr>
<tr>
<td>Sinkhole</td>
<td>Fully modify using the object manager.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Blacklist Now, Whitelist Now, and Global Lists

The Firepower Management Center context menu (see The Context Menu, on page 10) allows you to quickly blacklist and whitelist with Security Intelligence. For example, if you notice a set of routable IP addresses in intrusion events associated with exploit attempts, you can immediately blacklist those IP addresses. Although it may take a few minutes for your changes to propagate, you do not have to redeploy.

**Blacklist Now** and **Whitelist Now** context-menu options are available on IP address, URL, and DNS request hotspots. Blacklisting or whitelisting with the context menu adds the chosen item to the appropriate default Global list. By default, Access control and DNS policies use these Global lists, which apply to all security zones. You can opt not to use these lists on a per-policy basis.

---

**Note**

These options apply to Security Intelligence only. Security Intelligence cannot blacklist traffic that has already been fastpathed. Similarly, Security Intelligence whitelisting does not automatically trust or fastpath matching traffic. For more information, see About Security Intelligence, on page 1177.

<table>
<thead>
<tr>
<th>Context Menu Option</th>
<th>Target Item</th>
<th>Affected Global Lists</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blacklist Now</td>
<td>An IP address</td>
<td>Global Blacklist</td>
</tr>
<tr>
<td>Whitelist Now</td>
<td></td>
<td>Global Whitelist</td>
</tr>
<tr>
<td>Blacklist HTTP/S Connections to URL Now</td>
<td>A URL</td>
<td>Global Blacklist for URL</td>
</tr>
<tr>
<td>Whitelist HTTP/S Connections to URL Now</td>
<td></td>
<td>Global Whitelist for URL</td>
</tr>
<tr>
<td>Blacklist HTTP/S Connections to Domain Now</td>
<td>An entire domain</td>
<td>Global Blacklist for URL</td>
</tr>
<tr>
<td>Whitelist HTTP/S Connections to Domain Now</td>
<td></td>
<td>Global Whitelist for URL</td>
</tr>
<tr>
<td>Blacklist DNS Requests to Domain Now</td>
<td>DNS requests for an entire domain</td>
<td>Global Blacklist for DNS</td>
</tr>
<tr>
<td>Whitelist DNS Requests to Domain Now</td>
<td></td>
<td>Global Whitelist for DNS</td>
</tr>
</tbody>
</table>

In a multidomain deployment, you can choose the Firepower System domains where you want to enforce the blacklisting or whitelisting by adding items to Domain lists as well as the Global lists; see Security Intelligence Lists and Multitenancy, on page 424.

Because adding an entry to a Security Intelligence list affects access control, you must have one of:

- Administrator access
- A combination of default roles: Network Admin or Access Admin, plus Security Analyst and Security Approver
- A custom role with both Modify Access Control Policy and Deploy Configuration to Devices permissions
Security Intelligence Lists and Multitenancy

In a multidomain deployment, the Global domain owns the Global blacklists and whitelists. Only Global administrators can add to or remove items from the Global lists. So that subdomain users can whitelist and blacklist networks, domain names, and URLs, multitenancy adds:

- Domain lists—Whitelists or blacklists whose contents apply to a particular subdomain only. The Global lists are Domain lists for the Global domain.
- Descendant Domain lists—Whitelists or blacklists that aggregate the Domain lists of the current domain’s descendants.

Domain Lists

In addition to being able to access (but not edit) the Global lists, each subdomain has its own named lists, the contents of which apply only to that subdomain. For example, a subdomain named Company A owns:

- Domain Blacklist - Company A and Domain Whitelist - Company A
- Domain Blacklist for DNS - Company A, Domain Whitelist for DNS - Company A
- Domain Blacklist for URL - Company A, Domain Whitelist for URL - Company A

Any administrator at or above the current domain can populate these lists. You can use the context menu to whitelist or blacklist an item in the current and all descendant domains. However, only an administrator in the associated domain can remove an item from a Domain list.

For example, a Global administrator could choose to blacklist the same IP address in the Global domain and Company A’s domain, but not blacklist it in Company B’s domain. This action would add the same IP address to:

- Global Blacklist (where it can be removed only by Global administrators)
- Domain Blacklist - Company A (where it can be removed only by Company A administrators)

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

Descendant Domain Lists

A Descendant Domain list is a whitelist or blacklist that aggregates the Domain lists of the current domain’s descendants. Leaf domains do not have Descendant Domain lists.

Descendant Domain lists are useful because a higher-level domain administrator can enforce general Security Intelligence settings, while still allowing subdomain users to blacklist and whitelist items in their own deployment.

For example, the Global domain has the following Descendant Domain lists:

- Descendant Blacklists - Global, Descendant Whitelists - Global
- Descendant Blacklists for URL - Global, Descendant Whitelists for URL - Global
- Descendant Blacklists for URL - Global, Descendant Whitelists for URL - Global
Descendant Domain lists do not appear in the object manager because they are symbolic aggregations, not hand-populated lists. They appear where you can use them: in access control and DNS policies.

### Changing the Update Frequency for Security Intelligence Feeds

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

By default, each feed updates the Management Center every two hours. You cannot delete the system-provided feeds, but you can change the frequency of (or disable) their updates.

In a multidomain deployment, the system-provided feeds belong to the Global domain and can be modified only by an administrator in that domain. You can modify the update frequency for custom feeds belonging to your domain.

The Management Center pushes Security Intelligence updates to managed devices every 30 minutes. You cannot modify this frequency.

#### Procedure

1. **Step 1** Choose Objects > Object Management.
2. **Step 2** Expand the Security Intelligence node, then choose the feed type whose frequency you want to change.
3. **Step 3** Next to the feed you want to update, click edit ( ).
   
   If a view icon ( ) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.
4. **Step 4** Edit the Update Frequency.
5. **Step 5** Click Save.

### Custom Security Intelligence Feeds

Custom or third-party Security Intelligence feeds allow you to augment the system-provided Intelligence Feeds with other regularly-updated reputable whitelists and blacklists on the Internet. You can also set up an internal feed, which is useful if you want to update multiple Firepower Management Centers in your deployment using one source list.
You cannot whitelist or blacklist address blocks using a /0 netmask in a Security Intelligence feed. If you want to monitor or block all traffic targeted by a policy, use an access control rule with the Monitor or Block rule action, respectively, and a default value of any for the Source Networks and Destination Networks.

When you configure a feed, you specify its location using a URL; the URL cannot be Punycode-encoded. By default, the system downloads the entire feed source on the interval you configure, then automatically updates its managed devices.

You also can configure the system to use an md5 checksum to determine whether to download an updated feed. If the checksum has not changed since the last time the system downloaded the feed, the system does not need to re-download it. You may want to use md5 checksums for internal feeds, especially if they are large. The md5 checksum must be stored in a simple text file with only the checksum. Comments are not supported.

Manually updating Security Intelligence feeds updates all feeds, including the Intelligence Feeds.

Creating Security Intelligence Feeds

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1  Choose Objects > Object Management.
Step 2  Expand the Security Intelligence node, then choose a feed type you want to add.
Step 3  Click the option appropriate to the feed type you chose above:
   • Add Network Lists and Feeds (for IP addresses)
   • Add DNS Lists and Feeds
   • Add URL Lists and Feeds
Step 4  Enter a Name for the feed.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

Step 5  Choose Feed from the Type drop-down list.
Step 6  Enter a Feed URL.
Step 7  Optionally, enter an MD5 URL.
Step 8  Choose an Update Frequency.
Step 9  Click Save.

Unless you disabled feed updates, the system attempts to download and verify the feed.
Manually Updating Security Intelligence Feeds

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat (Security Intelligence)</td>
<td>Protection (Security Intelligence)</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Before you begin

At least one device must already be added to the management center.

Procedure

Step 1 Choose Objects > Object Management.
Step 2 Expand the Security Intelligence node, then choose a feed type.
Step 3 Click Update Feeds, then confirm.
Step 4 Click OK.

After the Firepower Management Center downloads and verifies the feed updates, it communicates any changes to its managed devices. Your deployment begins filtering traffic using the updated feeds.

Custom Security Intelligence Lists

Security Intelligence lists are simple static lists of IP addresses and address blocks, URLs, or domain names that you manually upload to the system. Custom lists are useful if you want to augment and fine-tune feeds or one of the global lists, for a single Firepower Management Center’s managed devices.

For example, if a reputable feed improperly blocks your access to vital resources but is overall useful to your organization, you can create a custom whitelist that contains only the improperly classified IP addresses, rather than removing the IP address feed object from the access control policy’s blacklist.

Note

You cannot whitelist or blacklist address blocks using a /0 netmask in a Security Intelligence list. If you want to monitor or block all traffic targeted by a policy, use an access control rule with the Monitor or Block rule action, respectively, and a default value of any for the Source Networks and Destination Networks.

Regarding list entry formatting, note the following:

- Netmasks for address blocks can be integers from 0 to 32 or 0 to 128, for IPv4 and IPv6, respectively.
- Unicode in domain names must be encoded in Punycode format, and are case insensitive.
- Characters in domain names are case-insensitive.
- Unicode in URLs should be encoded in percent-encoding format.
- Characters in URL subdirectories are case-sensitive.
• List entries that start with the pound sign (#) are treated as comments.

Regarding matching list entries, note the following:

• The system matches sub-level domains if a higher-level domain exists in a URL or DNS list. For example, if you add example.com to a DNS list, the system matches both www.example.com and test.example.com.

• The system does not perform DNS lookups (forward or reverse) on DNS or URL list entries. For example, if you add http://192.168.0.2 to a URL list, and it resolves to http://www.example.com, the system only matches http://192.168.0.2, not http://www.example.com.

• If you add a URL ending in a forward slash (/) character to a URL list, only exact URLs match that entry.

• If you add a URL that does not end in a forward slash to a URL or DNS list, any URL that shares the same common prefix matches that entry. For example, if you add www.example.com to a URL list, the system matches both www.example.com and www.example.com/example.

### Uploading New Security Intelligence Lists to the Firepower Management Center

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

To modify a Security Intelligence list, you must make your changes to the source file and upload a new copy. You cannot modify the file’s contents using the web interface. If you do not have access to the source file, download a copy from the system.

**Procedure**

**Step 1** Choose **Objects > Object Management**.

**Step 2** Expand the **Security Intelligence** node, then choose a list type.

**Step 3** Click the option appropriate to the list you chose above:

- Add Network Lists and Feeds (for IP addresses)
- Add DNS Lists and Feeds
- Add URL Lists and Feeds

**Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

**Step 5** From the **Type** drop-down list, choose **List**.

**Step 6** Click **Browse** to browse to the list .txt file, then click **Upload**.

**Step 7** Click **Save**.
What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Updating Security Intelligence Lists

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access/Admin/Network/Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

**Step 1** Choose Objects > Object Management.

**Step 2** Expand the Security Intelligence node, then choose a list type.

**Step 3** Next to the list you want to update, click edit (📝).

If a view icon (👀) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4** If you need a copy of the list to edit, click Download, then follow your browser’s prompts to save the list as a text file.

**Step 5** Make changes to the list as necessary.

**Step 6** On the Security Intelligence pop-up window, click Browse to browse to the modified list, then click Upload.

**Step 7** Click Save.

What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Sinkhole Objects

A sinkhole object represents either a DNS server that gives non-routeable addresses for all domain names within the sinkhole, or an IP address that does not resolve to a server. You can reference the sinkhole object within a DNS policy rule to redirect matching traffic to the sinkhole. You must assign the object both an IPv4 address and an IPv6 address.
Creating Sinkhole Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1 Choose Objects > Object Management.
Step 2 Choose Sinkhole from the list of object types.
Step 3 Click Add Sinkhole.
Step 4 Enter a Name.
   In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
Step 5 Enter the IPv4 Address and IPv6 Address of your sinkhole.
Step 6 You have the following options:
   • If you want to redirect traffic to a sinkhole server, choose Log Connections to Sinkhole.
   • If you want to redirect traffic to a non-resolving IP address, choose Block and Log Connections to Sinkhole.
Step 7 If you want to assign an Indication of Compromise (IoC) type to your sinkhole, choose one from the Type drop-down.
Step 8 Click Save.

File Lists

If you use AMP for Networks, and the AMP cloud incorrectly identifies a file’s disposition, you can add the file to a file list to better detect the file in the future. These files are specified using SHA-256 hash values. Each file list can contain up to 10000 unique SHA-256 values.

There are two predefined categories of file lists:

Clean List

If you add a file to this list, the system treats it as if the AMP cloud assigned a clean disposition.

Custom Detection List

If you add a file to this list, the system treats it as if the AMP cloud assigned a malware disposition.

In a multidomain deployment, a clean list and custom detection list is present for each domain. In lower-level domains, you can view but not modify ancestor’s lists.
Because you manually specify the blocking behavior for the files included in these lists, the system does not query the AMP cloud for these files’ dispositions. You must configure a rule in the file policy with either a **Malware Cloud Lookup** or **Block Malware** action and a matching file type to calculate a file’s SHA value.

---

**Caution**

Do **not** include malware on the clean list. The clean list overrides both the AMP cloud and the custom detection list.

---

## Source Files for File Lists

You can add multiple SHA-256 values to a file list by uploading a comma-separated value (CSV) source file containing a list of SHA-256 values and descriptions. The Firepower Management Center validates the contents and populates the file list with valid SHA-256 values.

The source file must be a simple text file with a `.csv` file name extension. Any header must start with a pound sign (`#`); it is treated as a comment and not uploaded. Each entry should contain a single SHA-256 value followed by a description and end with either the `LF` or `CR+LF` Newline character. The system ignores any additional information in the entry.

Note the following:

- Deleting a source file from the file list also removes all associated SHA-256 hashes from the file list.

- You cannot upload multiple files to a file list if the successful source file upload results in the file list containing more than 10000 distinct SHA-256 values.

- The system truncates descriptions exceeding 256 characters to the first 256 characters on upload. If the description contains commas, you must use an escape character (`\`). If no description is included, the source file name is used instead.

- All non-duplicate SHA-256 values are added to the file list. If a file list contains a SHA-256 value, and you upload a source file containing that value, the newly uploaded value does not modify the existing SHA-256 value. When viewing captured files, file events, or malware events related to the SHA-256 value, any threat name or description is derived from the individual SHA-256 value.

- The system does not upload invalid SHA-256 values in a source file.

- If multiple uploaded source files contain an entry for the same SHA-256 value, the system uses the most recent value.

- If a source file contains multiple entries for the same SHA-256 value, the system uses the last one.

- You cannot directly edit a source file within the object manager. To make changes, you must first modify your source file directly, delete the copy on the system, then upload the modified source file.

- The number of entries associated with a source file refers to the number of distinct SHA-256 values. If you delete a source file from a file list, the total number of SHA-256 entries the file list contains decreases by the number of valid entries in the source file.
Adding Individual SHA-256 Values to File Lists

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Malware</td>
<td>Malware</td>
<td>Firepower</td>
<td>Any</td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Access</td>
</tr>
</tbody>
</table>

You can submit a file’s SHA-256 value to add it to a file list. You cannot add duplicate SHA-256 values.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

**Before you begin**

- Right-click a file or malware event from the event view, choose Show Full Text in the context menu, and copy the full SHA-256 value for pasting into the file list.

**Procedure**

**Step 1** Choose Objects > Object Management.

**Step 2** Choose File List from the list of object types.

**Step 3** Click edit ( ) next to the clean list or custom detection list where you want to add a file.

If a view icon ( ) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

**Step 4** Choose Enter SHA Value from the Add by drop-down list.

**Step 5** Enter a description of the source file in the Description field.

**Step 6** Enter or paste the file’s entire value in the SHA-256 field. The system does not support matching partial values.

**Step 7** Click Add.

**Step 8** Click Save.

**What to do next**

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

**Note**

After configuration changes are deployed, the system no longer queries the AMP cloud for files on the list.
Uploading Individual Files to File Lists

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Malware</td>
<td>Malware</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

If you have a copy of the file you want to add to a file list, you can upload the file to the Firepower Management Center for analysis; the system calculates the file’s SHA-256 value and adds the file to the list. The system does not enforce a limit on the size of files for SHA-256 calculation.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

Step 1 Choose **Objects > Object Management**.
Step 2 Choose **File List** from the list of object types.
Step 3 Click edit (하겠습니다) next to the clean list or custom detection list where you want to add a file.

If a view icon (보기) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

Step 4 From the **Add by** drop-down list, choose **Calculate SHA**.
Step 5 Optionally, enter a description of the file in the **Description** field. If you do not enter a description, the file name is used for the description on upload.

Step 6 Click **Browse**, and choose a file to upload.
Step 7 Click **Calculate and Add SHA**.
Step 8 Click **Save**.

What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Note

After you deploy configuration changes, the system no longer queries the AMP cloud for files on the list.
Uploading Source Files to File Lists

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

**Procedure**

**Step 1** Choose Objects > Object Management.

**Step 2** Click File List.

**Step 3** Click edit (>Edit) next to the file list where you want to add values from a source file.

If a view icon (<View>) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

**Step 4** In the Add by drop-down list, choose List of SHAs.

**Step 5** Optionally, enter a description of the source file in the Description field. If you do not enter a description, the system uses the file name.

**Step 6** Click Browse to browse to the source file, then click Upload and Add List.

**Step 7** Click Save.

**What to do next**

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

**Note**

After you deploy the policies, the system no longer queries the AMP cloud for files on the list.

### Editing SHA-256 Values in File Lists

<table>
<thead>
<tr>

<td>Admin/Network/Admin</td>
</tr>
</tbody>
</table>

| Firepower Management Center Configuration Guide, Version 6.1 | | | | | |
You can edit or delete individual SHA-256 values on a file list. Note that you cannot directly edit a source file within the object manager. To make changes, you must first modify your source file directly, delete the copy on the system, then upload the modified source file.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

**Procedure**

**Step 1** Choose **Objects > Object Management**.

**Step 2** Click **File List**.

**Step 3** Click edit (¶) next to the clean list or custom detection list where you want to modify a file.

If a view icon (≠) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

**Step 4** You can:

- Click edit (¶) next to the SHA-256 value you want to change, and modify the SHA-256 or Description values as desired.
- Click delete (🗑️) next to the SHA-256 value you want to delete.

**Step 5** Click **Save** to update the file entry in the list.

**Step 6** Click **Save** to save the file list.

**What to do next**

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

**Note**

After configuration changes are deployed, the system no longer queries the AMP cloud for files on the list.

### Downloading Source Files from File Lists

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Malware</td>
<td>Malware</td>
<td>Any</td>

<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.
Cipher Suite Lists

A cipher suite list is an object comprised of several cipher suites. Each predefined cipher suite value represents a cipher suite used to negotiate an SSL- or TLS-encrypted session. You can use cipher suites and cipher suite lists in SSL rules to control encrypted traffic based on whether the client and server negotiated the SSL session using that cipher suite. If you add a cipher suite list to an SSL rule, SSL sessions negotiated with any of the cipher suites in the list match the rule.

Although you can use cipher suites in the web interface in the same places as cipher suite lists, you cannot add, modify, or delete cipher suites.

Creating Cipher Suite Lists

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1: Choose Objects > Object Management.
Step 2: Choose Cipher Suite List from the list of object types.
Step 3: Click Add Cipher Suites.
Step 4: Enter a Name.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
Step 5 Choose one or more cipher suites from the Available Ciphers list.
Step 6 Click Add.
Step 7 Optionally, click delete ( ) next to any cipher suites in the Selected Ciphers list that you want to remove.
Step 8 Click Save.

What to do next
• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Distinguished Name Objects

Each distinguished name object represents the distinguished name listed for a public key certificate’s subject or issuer. You can use distinguished name objects and groups in SSL rules to control encrypted traffic based on whether the client and server negotiated the SSL session using a server certificate with the distinguished name as subject or issuer.

Your distinguished name object can contain the common name attribute (CN). If you add a common name without “CN=” then the system prepends “CN=” before saving the object.

You can also add a distinguished name with one of each attribute listed in the following table, separated by commas.

Table 59: Distinguished Name Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
<th>Allowed Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>Country Code</td>
<td>two alphabetic characters</td>
</tr>
<tr>
<td>CN</td>
<td>Common Name</td>
<td>up to 64 alphanumeric, backslash (/), hyphen (-), quotation (“”), or asterisk (*) characters, or spaces</td>
</tr>
<tr>
<td>O</td>
<td>Organization</td>
<td>up to 64 alphanumeric, backslash (/), hyphen (-), quotation (“”), or asterisk (*) characters, or spaces</td>
</tr>
<tr>
<td>OU</td>
<td>Organizational Unit</td>
<td>up to 64 alphanumeric, backslash (/), hyphen (-), quotation (“”), or asterisk (*) characters, or spaces</td>
</tr>
</tbody>
</table>

You can define one or more asterisks (*) as wild cards in an attribute. In a common name attribute, you can define one or more asterisks per domain name label. Wild cards match only within that label, though you can define multiple labels with wild cards. See the following table for examples.
Table 60: Common Name Attribute Wild Card Examples

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Matches</th>
<th>Does Not Match</th>
</tr>
</thead>
<tbody>
<tr>
<td>CN=&quot;*ample.com&quot;</td>
<td>example.com</td>
<td>mail.example.com, example.text.com, ampleexam.com</td>
</tr>
<tr>
<td>CN=&quot;exam*.com&quot;</td>
<td>example.com</td>
<td>mail.example.com, example.text.com, ampleexam.com</td>
</tr>
<tr>
<td>CN=&quot;<em>xamp</em>.com&quot;</td>
<td>example.com</td>
<td>mail.example.com, example.text.com, ampleexam.com</td>
</tr>
<tr>
<td>CN=&quot;*.example.com&quot;</td>
<td>mail.example.com</td>
<td>example.com, example.text.com, ampleexam.com</td>
</tr>
<tr>
<td>CN=&quot;*.com&quot;</td>
<td>example.com, ampleexam.com</td>
<td>mail.example.com, example.text.com</td>
</tr>
<tr>
<td>CN=&quot;<em>.</em>.com&quot;</td>
<td>mail.example.com, example.text.com</td>
<td>example.com, ampleexam.com</td>
</tr>
</tbody>
</table>

Creating Distinguished Name Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access, Admin/Network/Network Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1   Choose Objects > Object Management.
Step 2   Expand the Distinguished Name node, and choose Individual Objects.
Step 3   Click Add Distinguished Name.
Step 4   Enter a Name.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

Step 5   In the DN field, enter a value for the distinguished name or common name. You have the following options:
• If you add a distinguished name, you can include one of each attribute listed in *Distinguished Name Objects*, on page 437 separated by commas.
• If you add a common name, you can include multiple labels and wild cards.

**Step 6**

Click **Save**.

**What to do next**

• If an active policy references your object, deploy configuration changes; see *Deploy Configuration Changes*, on page 337.

---

**PKI Objects**

**PKI Objects for SSL Application**

PKI objects represent the public key certificates and paired private keys required to support your deployment. Internal and trusted CA objects consist of certificate authority (CA) certificates; internal CA objects also contain the private key paired with the certificate. Internal and external certificate objects consist of server certificates; internal certificate objects also contain the private key paired with the certificate.

If you use trusted certificate authority objects and internal certificate objects to configure a connection to ISE, you can use ISE as an identity source.

If you use internal certificate objects to configure captive portal, the system can authenticate the identity of your captive portal device when connecting to users' web browsers.

If you use trusted certificate authority objects to configure realms, you can configure secure connections to LDAP or AD servers.

If you use PKI objects in SSL rules, you can match traffic encrypted with:

• the certificate in an external certificate object
• a certificate either signed by the CA in a trusted CA object, or within the CA's chain of trust

If you use PKI objects in SSL rules, you can decrypt:

• outgoing traffic by re-signing the server certificate with an internal CA object
• incoming traffic using the known private key in an internal certificate object

You can manually input certificate and key information, upload a file containing that information, or in some cases, generate a new CA certificate and private key.

When you view a list of PKI objects in the object manager, the system displays the certificate’s Subject distinguished name as the object value. Hover your pointer over the value to view the full certificate Subject distinguished name. To view other certificate details, edit the PKI object.
The Firepower Management Center and managed devices encrypt all private keys stored in internal CA objects and internal certificate objects with a randomly generated key before saving them. If you upload private keys that are password protected, the appliance decrypts the key using the user-supplied password, then reencrypts it with the randomly generated key before saving it.

### Internal Certificate Authority Objects

Each internal certificate authority (CA) object you configure represents the CA public key certificate of a CA your organization controls. The object consists of the object name, CA certificate, and paired private key. You can use internal CA objects and groups in SSL rules to decrypt outgoing encrypted traffic by re-signing the server certificate with the internal CA.

If you reference an internal CA object in a **Decrypt - Resign** SSL rule and the rule matches an encrypted session, the user’s browser may warn that the certificate is not trusted while negotiating the SSL handshake. To avoid this, add the internal CA object certificate to either the client or domain list of trusted root certificates.

You can create an internal CA object in the following ways:

- import an existing RSA-based or elliptic curve-based CA certificate and private key
- generate a new self-signed RSA-based CA certificate and private key
- generate an unsigned RSA-based CA certificate and private key. You must submit a certificate signing request (CSR) to another CA to sign the certificate before using the internal CA object.

After you create an internal CA object containing a signed certificate, you can download the CA certificate and private key. The system encrypts downloaded certificates and private keys with a user-provided password.

Whether system-generated or user-created, you can modify the internal CA object name, but cannot modify other object properties.

You cannot delete an internal CA object that is in use. Additionally, after you edit an internal CA object used in an SSL policy, the associated access control policy goes out-of-date. You must re-deploy the access control policy for your changes to take effect.

### CA Certificate and Private Key Import

You can configure an internal CA object by importing an X.509 v3 CA certificate and private key. You can upload files encoded in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

If the private key file is password-protected, you can supply the decryption password. If the certificate and key are encoded in the PEM format, you can also copy and paste the information.

You can upload only files that contain proper certificate or key information, and that are paired with each other. The system validates the pair before saving the object.
If you configure a rule with the Decrypt - Resign action, the rule matches traffic based on the referenced internal CA certificate’s encryption algorithm type, in addition to any configured rule conditions. You must upload an elliptic curve-based CA certificate to decrypt outgoing traffic encrypted with an elliptic curve-based algorithm, for example.

### Importing a CA Certificate and Private Key

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

### Procedure

**Step 1** Choose Objects > Object Management.

**Step 2** Expand the PKI node, and choose Internal CAs.

**Step 3** Click Import CA.

**Step 4** Enter a Name.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

**Step 5** Above the Certificate Data field, click Browse to upload a DER or PEM-encoded X.509 v3 CA certificate file.

**Step 6** Above the Key field, click Browse to upload a DER or PEM-encoded paired private key file.

**Step 7** If the uploaded file is password-protected, check the Encrypted, and the password is: check box, and enter the password.

**Step 8** Click Save.

### What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.
Generating a New CA Certificate and Private Key

You can configure an internal CA object by providing identification information to generate a self-signed RSA-based CA certificate and private key.

The generated CA certificate is valid for ten years. The Valid From date is a week before generation.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

**Step 1** Choose **Objects > Object Management**.

**Step 2** Expand the **PKI** node, and choose **Internal CAs**.

**Step 3** Click **Generate CA**.

**Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

**Step 5** Enter the identification attributes.

**Step 6** Click **Generate self-signed CA**.

New Signed Certificates

You can configure an internal CA object by obtaining a signed certificate from a CA. This involves two steps:

- Provide identification information to configure the internal CA object. This generates an unsigned certificate and paired private key, and creates a certificate signing request (CSR) to a CA you specify.
- After the CA issues the signed certificate, upload it to the internal CA object, replacing the unsigned certificate.

You can only reference an internal CA object in an SSL rule if it contains a signed certificate.

Creating an Unsigned CA Certificate and CSR

<table>
<thead>

</tr>
</tbody>
</table>

Firepower Management Center Configuration Guide, Version 6.1
### Procedure

**Step 1** Choose **Objects > Object Management**.

**Step 2** Expand the **PKI** node, and choose **Internal CAs**.

**Step 3** Click **Generate CA**.

**Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

**Step 5** Enter the identification attributes.

**Step 6** Click **Generate CSR**.

**Step 7** Copy the CSR to submit to a CA.

**Step 8** Click **OK**.

### What to do next

- You must upload a signed certificate issued by a CA as described in **Uploading a Signed Certificate Issued in Response to a CSR**, on page 443

### Uploading a Signed Certificate Issued in Response to a CSR

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>

</tr>
</tbody>
</table>

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Once uploaded, the signed certificate can be referenced in SSL rules.

### Procedure

**Step 1** Choose **Objects > Object Management**.

**Step 2** Expand the **PKI** node, and choose **Internal CAs**.

**Step 3** Click **Install Certificate**.

**Step 4** Click **Browse** to upload a DER or PEM-encoded X.509 v3 CA certificate file.

**Step 5** If the uploaded file is password protected, check the **Encrypted, and the password is:** check box, and enter the password.

**Step 6** Click **Save** to upload a signed certificate to the CA object.
What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

CA Certificate and Private Key Downloads

You can back up or transfer a CA certificate and paired private key by downloading a file containing the certificate and key information from an internal CA object.

---

**Caution**

Always store downloaded key information in a secure location.

The system encrypts the private key stored in an internal CA object with a randomly generated key before saving it to disk. If you download a certificate and private key from an internal CA object, the system first decrypts the information before creating a file containing the certificate and private key information. You must then provide a password the system uses to encrypt the downloaded file.

**Caution**

Private keys downloaded as part of a system backup are decrypted, then stored in the unencrypted backup file.

---

**Table: Downloading a CA Certificate and Private Key**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

You can download CA certificates for both the current domain and ancestor domains.

**Procedure**

**Step 1** Choose Objects > Object Management.

**Step 2** Expand the PKI node, and choose Internal CAs.

**Step 3** Next to the internal CA object whose certificate and private key you want to download, click edit (_fk).

In a multidomain deployment, click view (_fk) to download the certificate and private key for an object in an ancestor domain.

**Step 4** Click Download.

**Step 5** Enter an encryption password in the Password and Confirm Password fields.
Step 6

Click OK.

Trusted Certificate Authority Objects

Each trusted certificate authority (CA) object you configure represents a CA public key certificate belonging to a trusted CA. The object consists of the object name and CA public key certificate. You can use external CA objects and groups in:

- your SSL policy to control traffic encrypted with a certificate signed either by the trusted CA, or any CA within the chain of trust.
- your realm configurations to establish secure connections to LDAP or AD servers.
- your ISE connection. Select trusted certificate authority objects for the **pxGrid Server CA** and **MNT Server CA** fields.

After you create the trusted CA object, you can modify the name and add certificate revocation lists (CRL), but cannot modify other object properties. There is no limit on the number of CRLs you can add to an object. If you want to modify a CRL you have uploaded to an object, you must delete the object and recreate it.

**Note**

Adding a CRL to an object has no effect when the object is used in your ISE integration configuration.

You cannot delete a trusted CA object that is in use. Additionally, after you edit a trusted CA object that is in use, the associated access control policy goes out-of-date. You must re-deploy the access control policy for your changes to take effect.

Trusted CA Object

You can configure an external CA object by uploading an X.509 v3 CA certificate. You can upload a file encoded in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

If the file is password-protected, you must supply the decryption password. If the certificate is encoded in the PEM format, you can also copy and paste the information.

You can upload a CA certificate only if the file contains proper certificate information; the system validates the certificate before saving the object.

Adding a Trusted CA Object

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>
Procedure

**Step 1** Choose **Objects > Object Management**.

**Step 2** Expand the **PKI** node, and choose **Trusted CAs**.

**Step 3** Click **Add Trusted CAs**.

**Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

**Step 5** Click **Browse** to upload a DER or PEM-encoded X.509 v3 CA certificate file.

**Step 6** If the file is password-protected, check the **Encrypted, and the password is** check box, and enter the password.

**Step 7** Click **Save**.

What to do next

- If an active policy references your object, deploy configuration changes; see **Deploy Configuration Changes**, on page 337.

Certificate Revocation Lists in Trusted CA Objects

You can upload CRLs to a trusted CA object. If you reference that trusted CA object in an SSL policy, you can control encrypted traffic based on whether the CA that issued the session encryption certificate subsequently revoked the certificate. You can upload files encoded in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

After you add the CRL, you can view the list of revoked certificates. If you want to modify a CRL you have uploaded to an object, you must delete the object and recreate it.

You can upload only files that contain a proper CRL. There is no limit to the number of CRLs you can add to a trusted CA object. However, you must save the object each time you upload a CRL, before adding another CRL.

---

**Note**

Adding a CRL to an object has no effect when the object is used in your ISE integration configuration.

Adding a Certificate Revocation List to a Trusted CA Object

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>
In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Note
Adding a CRL to an object has no effect when the object is used in your ISE integration configuration.

Procedure

Step 1
Choose Objects > Object Management.

Step 2
Expand the PKI node, and choose Trusted CAs.

Step 3
Click edit (📝) next to a trusted CA object.

If a view icon (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 4
Click Add CRL to upload a DER or PEM-encoded CRL file.

Step 5
Click OK.

What to do next
• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

External Certificate Objects

Each external certificate object you configure represents a server public key certificate that does not belong to your organization. The object consists of the object name and certificate. You can use external certificate objects and groups in SSL rules to control traffic encrypted with the server certificate. For example, you can upload a self-signed server certificate that you trust, but cannot verify with a trusted CA certificate.

You can configure an external certificate object by uploading an X.509 v3 server certificate. You can upload a file in one of the following supported formats:

• Distinguished Encoding Rules (DER)

• Privacy-enhanced Electronic Mail (PEM)

You can upload only files that contains proper server certificate information; the system validates the file before saving the object. If the certificate is encoded in the PEM format, you can also copy and paste the information.
Adding External Certificate Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except NGIPSv</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** Choose Objects > Object Management.

**Step 2** Expand the PKI node, and choose External Certs.

**Step 3** Click Add External Cert.

**Step 4** Enter a Name.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

**Step 5** Above the Certificate Data field, click Browse to upload a DER or PEM-encoded X.509 v3 server certificate file.

**Step 6** Click Save.

What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 337.

Internal Certificate Objects

Each internal certificate object you configure represents a server public key certificate belonging to your organization. The object consists of the object name, public key certificate, and paired private key. You can use internal certificate objects and groups in:

- your SSL rules to decrypt traffic incoming to one of your organization’s servers using the known private key.
- your ISE connection. Select an internal certificate object for the MC Server Certificate field.
- your captive portal configuration to authenticate the identity of your captive portal device when connecting to users' web browsers. Select an internal certificate object for the Server Certificate field.

You can configure an internal certificate object by uploading an X.509 v3 RSA-based or elliptic curve-based server certificate and paired private key. You can upload a file in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)
If the file is password-protected, you must supply the decryption password. If the certificate and key are encoded in the PEM format, you can also copy and paste the information.

You can upload only files that contain proper certificate or key information, and that are paired with each other. The system validates the pair before saving the object.

After you create the internal certificate object, you can modify the name, but cannot modify other object properties.

You cannot delete an internal certificate object that is in use. Additionally, after you edit an internal certificate object that is in use, the associated access control policy goes out-of-date. You must re-deploy the access control policy for your changes to take effect.

### Adding Internal Certificate Objects

<table>
<thead>

<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose **Objects > Object Management**.
**Step 2** Expand the **PKI** node, and choose **Internal Certs**.
**Step 3** Click **Add Internal Cert**.
**Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

**Step 5** Above the **Certificate Data** field, click **Browse** to upload a DER or PEM-encoded X.509 v3 server certificate file.
**Step 6** Above the **Key** field, or click **Browse** to upload a DER or PEM-encoded paired private key file.
**Step 7** If the uploaded private key file is password-protected, check the **Encrypted, and the password is:** check box, and enter the password.
**Step 8** Click **Save**.

### SLA Monitor Objects

Each Internet Protocol Service Level Agreement (SLA) monitor defines a connectivity policy to a monitored address and tracks the availability of a route to the address. The route is periodically checked for availability by sending ICMP echo requests and waiting for the response. If the requests time out, the route is removed from the routing table and replaced with a backup route. SLA monitoring jobs start immediately after deployment and continue to run unless you remove the SLA monitor from the device configuration (that is, they do not age out). The Internet Protocol Service Level Agreement (SLA) Monitor Object is used in the
Route Tracking field of an IPv4 Static Route Policy. IPv6 routes do not have the option to use SLA monitor via route tracking.

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Select **Objects > Object Management** and choose **SLA Monitor** from the table of contents.

**Step 2** Click **Add SLA Monitor**.

**Step 3** Enter a name for the object in the **Name** field.

**Step 4** (Optional) Enter a description for the object in the **Description** field.

**Step 5** Enter the frequency of ICMP echo request transmissions, in seconds, in the **Frequency** field. Valid values range from 1 to 604800 seconds (7 days). The default is 60 seconds.

*Note* The frequency cannot be less than the timeout value; you must convert frequency to milliseconds to compare the values.

**Step 6** Enter the ID number of the SLA operation in the **SLA Monitor ID** field. Values range from 1 to 2147483647. You can create a maximum of 2000 SLA operations on a device. Each ID number must be unique to the policy and the device configuration.

**Step 7** Enter the amount of time that must pass after an ICMP echo request before a rising threshold is declared, in milliseconds, in the **Threshold** field. Valid values range from 0 to 2147483647 milliseconds. The default is 5000 milliseconds. The threshold value is used only to indicate events that exceed the defined value. You can use these events to evaluate the proper timeout value. It is not a direct indicator of the reachability of the monitored address.

*Note* The threshold value should not exceed the timeout value.

**Step 8** Enter the amount of time that the SLA operation waits for a response to the ICMP echo requests, in milliseconds, in the **Timeout** field. Values range from 0 to 604800000 milliseconds (7 days). The default is 5000 milliseconds. If a response is not received from the monitored address within the amount of time defined in this field, the static route is removed from the routing table and replaced by the backup route.

*Note* The timeout value cannot exceed the frequency value (adjust the frequency value to milliseconds to compare the numbers).

**Step 9** Enter the size of the ICMP request packet payload, in bytes, in the **Data Size** field. Values range from 0 to 16384 bytes. The default is 28 bytes, which creates a total ICMP packet of 64 bytes. Do not set this value higher than the maximum allowed by the protocol or the Path Maximum Transmission Unit (PMTU). For purposes of reachability, you might need to increase the default data size to detect PMTU changes between the source and the target. A low PMTU can affect session performance and, if detected, might indicate that the secondary path should be used.

**Step 10** Enter a value for type of service (ToS) defined in the IP header of the ICMP request packet in the **ToS** field. Values range from 0 to 255. The default is 0. This field contains information such as delay, precedence, reliability, and so on. It can be used by other devices on the network for policy routing and features such as committed access rate.
Step 11 Enter the number of packets that are sent in the **Number of Packets** field. Values range from 1 to 100. The default is 1 packet.

**Note** Increase the default number of packets if you are concerned that packet loss might falsely cause the Firepower Threat Defense device to believe that the monitored address cannot be reached.

Step 12 Enter the IP address that is being monitored for availability by the SLA operation, in the **Monitored Address** field.

Step 13 The **Available Zones** list displays both zones and interface groups. In the **Zones/Interfaces** list, add the zones or interface groups that contain the interfaces through which the device communicates with the management station. To specify a single interface, you need to create a zone or the interface groups for the interface; see Creating Security Zone and Interface Group Objects, on page 404. The host will be configured on a device only if the device includes the selected interfaces or zones.

Step 14 Click **Save**.

---

**Prefix Lists**

You can create prefix list objects for IPv4 and IPv6 to use when you are configuring route maps, policy maps, OSPF Filtering, or BGP Neighbor Filtering.

**Configure IPv6 Prefix List**

Use the Configure IPv6 Prefix list page to create, copy and edit prefix list objects. You can create prefix list objects to use when you are configuring route maps, policy maps, OSPF Filtering, or BGP Neighbor Filtering.

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

Step 1 Select **Objects > Object Management** and choose **Prefix Lists > IPv6 Prefix List** from the table of contents.

Step 2 Click **Add Prefix List**.

Step 3 Enter a name for the prefix list object in the **Name** field on the **New Prefix List Object** window.

Step 4 Click **Add** on the **New Prefix List Object** window.

Step 5 Select the appropriate action, Allow or Block from the **Action** drop-down list, to indicate the redistribution access.

Step 6 Enter a unique number that indicates the position a new prefix list entry will have in the list of prefix list entries already configured for this object, in the **Sequence No.** field. If left blank, the sequence number will default to five more than the largest sequence number currently in use.

Step 7 Specify the IPv6 address in the IP address/mask length format in the **IP address** field. The mask length must be a valid value between 1-128.
Step 8 Enter the minimum prefix length in the Minimum Prefix Length field. The value must be greater than the mask length and less than or equal to the Maximum Prefix Length, if specified.

Step 9 Enter the maximum prefix length in the Maximum Prefix Length field. The value must be greater than or equal to the Minimum Prefix Length, if present, or greater than the mask length if the Minimum Prefix Length is not specified.

Step 10 Click Add.

Step 11 If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 394.

Step 12 Click Save.

Configure IPv4 Prefix List

Use the Configure IPv4 Prefix list page to create, copy and edit prefix list objects. You can create prefix list objects to use when you are configuring route maps, policy maps, OSPF Filtering, or BGP Neighbor Filtering.

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1 Select Objects > Object Management and choose Prefix Lists > IPv4 Prefix List from the table of contents.

Step 2 Click Add Prefix List.

Step 3 Enter a name for the prefix list object in the Name field on the New Prefix List Object window.

Step 4 Click Add.

Step 5 Select the appropriate action, Allow or Block from the Action drop-down list, to indicate the redistribution access.

Step 6 Enter a unique number that indicates the position a new prefix list entry will have in the list of prefix list entries already configured for this object, in the Sequence No. field. If left blank, the sequence number will default to five more than the largest sequence number currently in use.

Step 7 Specify the IPv4 address in the IP address/mask length format in the IP address field. The mask length must be a valid value between 1 - 32.

Step 8 Enter the minimum prefix length in the Minimum Prefix Length field. The value must be greater than the mask length and less than or equal to the Maximum Prefix Length, if specified.

Step 9 Enter the maximum prefix length in the Maximum Prefix Length field. The value must be greater than or equal to the Minimum Prefix Length, if present, or greater than the mask length if the Minimum Prefix Length is not specified.

Step 10 Click Add.

Step 11 If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 394.
Route Maps

Route maps are used when redistributing routes into any routing process. They are also used when generating a default route into a routing process. A route map defines which of the routes from the specified routing protocol are allowed to be redistributed into the target routing process. Configure a route map, to create a new route map entry for a Route Map object or to edit an existing one.

<table>
<thead>
<tr>
<th>Smart License</th>

</table>

**Before you begin**

A Route Map may use one or more of these objects; it is not mandatory to add all these objects. Create and use any of these objects as required, to configure your route map.

- Add ACLs.
- Add Prefix Lists.
- Add AS Path.
- Add Community Lists.
- Add Policy Lists.

**Procedure**

**Step 1** Select **Objects > Object Management** and choose **Route Map** from the table of contents.

**Step 2** Click **Add Route Map**.

**Step 3** Click **Add** on the **New Route Map Object** window.

**Step 4** In the **Sequence No.** field, enter a number, between 0 and 65535, that indicates the position a new route map entry will have in the list of route maps entries already configured for this route map object.

**Note** We recommend that you number clauses in intervals of at least 10 to reserve numbering space in case you need to insert clauses in the future.

**Step 5** Select the appropriate action, Allow or Block from the **Redistribution** drop-down list, to indicate the redistribution access.

**Step 6** Click the **Match Clauses** tab to match (routes/traffic) based on the following criteria, which you select in the table of contents:

- **Security Zones** — Match traffic based on the (ingress/egress) interfaces. You can select zones and add them, or type in interface names and add them.
• IPv4 — Match IPv4 (routes/traffic) based on the following criteria; select the tab to define the criteria.
  a. Click the Address tab to match routes based on the route address. For IPv4 addresses, choose whether to use an Access list or Prefix list for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.
  b. Click the Next Hop tab to match routes based on the next hop address of a route. For IPv4 addresses, choose whether to use an access list or Prefix list for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.
  c. Click the Route Source tab to match routes based on the advertising source address of the route. For IPv4 addresses, choose whether to use an access list or Prefix list for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.

• IPv6 — Match IPv6 (routes/traffic) based on the route address, next-hop address or advertising source address of route.

• BGP — Match BGP (routes/traffic) based on the following criteria; select the tab to define the criteria.
  a. Click the AS Path tab to enable matching the BGP autonomous system path access list with the specified path access list. If you specify more than one path access list, then the route can match either path access list.
  b. Click the Community List tab to enable matching the BGP community with the specified community. If you specify more than one community, then the route can match either community. Any route that does not match at least one Match community will not be advertised for outbound route maps.
  c. Click the Policy List tab to configure a route map to evaluate and process a BGP policy. When multiple policy lists perform matching within a route map entry, all policy lists match on the incoming attribute only.

• Others — Match routes or traffic based on the following criteria.
  a. Enter the metric values to use for matching in the Metric Route Value field, to enable matching the metric of a route. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified metric. The metric values can range from 0 to 4294967295.
  b. Enter the tag values to use for matching in the Tag Values field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified security group tag. The tag values can range from 0 to 4294967295.
  c. Check the appropriate Route Type option to enable matching of the route type. Valid route types are External1, External2, Internal, Local, NSSA-External1, and NSSA-External2. You can choose more than one route type from the list.

**Step 7**

Click the Set Clauses tab to set routes/traffic based on the following criteria, which you select in the table of contents:

• Metric Values — Set either Bandwidth, all of the values or none of the values.
  a. Enter a metric value or bandwidth in Kbits per second in the Bandwidth field. Valid values are an integer value in the range from 0 to 4294967295.
  b. Select to specify the type of metric for the destination routing protocol, from the Metric Type drop-down list. Valid values are: internal, type-1, or type-2.
c. Enter the EIGRP route delay in tens of microseconds in the **Delay** field. Valid values range from 1 to 4294967295.

d. Enter the likelihood of successful packet transmission for EIGRP in the **Reliability** field. Valid values range from 0 to 255. The value 255 means 100 percent reliability; 0 means no reliability.

e. Enter the effective EIGRP bandwidth of a route in the **Effective** field. Valid values range from 1 to 255. The value 255 means 100 percent loading.

f. Enter the minimum MTU size of a route for EIGRP, in bytes in the **MTU** field. Valid values range from 1 to 4294967295.

• **BGP Clauses** — Set BGP routes based on the following criteria; select the tab to define the criteria.

a. Click the **AS Path** tab to modify an autonomous system path for BGP routes.

   1. Enter an AS path number in the **Prepend AS Path** field to prepend an arbitrary autonomous system path string to BGP routes. Usually the local AS number is prepended multiple times, increasing the autonomous system path length. If you specify more than one AS path number then the route can prepend either AS number.

   2. Enter an AS path number in the **Prepend Last AS to AS Path** field to prepend the AS path with the last AS number. Enter a value for the AS number from 1 to 10.

   3. Check the **Convert route tag into AS path** check box to convert the tag of a route into an autonomous system path.

b. Click the **Community List** tab to set the community attributes.

   1. Click the **None** radio button, to remove the community attribute from the prefixes that pass the route map.

   2. Click the **Specific Community** radio button, to enter a community number, if applicable. Valid values are from 1 to 4294967295.

   3. Check the **Add to existing communities** check box, to add the community to the already existing communities.

   4. Select the **Internet**, **No-Advertise**, or **No-Export** check-boxes to use one of the well-known communities.

c. Click the **Others** tab to set additional attributes.

   1. Check the **Set Automatic Tag** check-box to automatically compute the tag value.

   2. Enter a preference value for the autonomous system path in the **Set Local Preference** field. Enter a value between 0 and 4294967295.

   3. Enter a BGP weight for the routing table in the **Set Weight** field. Enter a value between 0 and 65535.

   4. Select to specify the BGP origin code. Valid values are **Local IGP** Local IGP and **Incomplete**.

   5. In the IPv4 Settings section, specify a next hop IPv4 address of the next hop to which packets are output. It need not be an adjacent router. If you specify more than one IPv4 address then the packets can output at either IP address.

      Select to specify an IPv4 prefix list in the **Prefix List** drop-down list.
6. In the IPv6 Settings section, specify a next hop IPv6 address of the next hop to which packets are output. It need not be an adjacent router. If you specify more than one IPv6 address then the packets can output at either IP address.

   Select to specify an IPv6 prefix in the **Prefix List** drop-down list.

**Step 8**

Click **Add**.

**Step 9**

If you want to allow overrides for this object, check the **Allow Overrides** check box; see Allowing Object Overrides, on page 394.

**Step 10**

Click **Save**.

---

### Access List

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

An access list object, also known as an access control list (ACL), selects the traffic to which a service will apply. You use these objects when configuring particular features, such as route maps. Traffic identified as allowed by the ACL is provided the service, whereas “blocked” traffic is excluded from the service. Excluding traffic from a service does not necessarily mean that it is dropped altogether.

You can configure the following types of ACL:

- Extended—Identifies traffic based on source and destination address and ports. Supports IPv4 and IPv6 addresses, which you can mix in a given rule.

- Standard—Identifies traffic based on destination address only. Supports IPv4 only.

An ACL is composed of one or more access control entry (ACE), or rule. The order of ACEs is important. When the ACL is evaluated to determine if a packet matches an “allowed” ACE, the packet is tested against each ACE in the order in which the entries are listed. After a match is found, no more ACEs are checked. For example, if you want to “allow” 10.100.10.1, but “block” the rest of 10.100.10.0/24, the allow entry must come before the block entry. In general, place more specific rules at the top of an ACL.

Packets that do not match an “allow” entry are considered to be blocked.

The following topics explain how to configure ACL objects.

### Configure Extended ACL Objects

Use extended ACL objects when you want to match traffic based on source and destination addresses, protocol and port, or if the traffic is IPv6.
Procedure

**Step 1** Select **Objects > Object Management** and choose **Access Control Lists > Extended** from the table of contents.

**Step 2** Do one of the following:

- Click **Add Extended ACL** to create a new object.
- Click the edit icon (🖋️) to edit an existing object.

**Step 3** In the Extended ACL Object dialog box, enter a name for the object (no spaces allowed), and configure the access control entries:

a) Do one of the following:

- Click **Add** to create a new entry.
- Click the edit icon (_PUT) to edit an existing entry.

The right-click menu also includes options to cut, copy, and paste entries, or to delete them.

b) Select the **Action**, whether to Allow (match) or Block (not match) the traffic criteria.

   **Note** The **Logging**, **Log Level**, and **Log Interval** options are used for access rules only (ACLs attached to interfaces or applied globally). Because ACL objects are not used for access rules, leave these values at their defaults.

c) Configure the source and destination addresses on the **Network** tab using any of the following techniques:

   - Select the desired network objects or groups from the Available list and click **Add to Source** or **Add to Destination**. You can create new objects by clicking the + button above the list. You can mix IPv4 and IPv6 addresses.
   - Type an address in the edit box below the source or destination list and click **Add**. You can specify a single host address (such as 10.100.10.5 or 2001:DB8::0DB8:800:200C:417A), or a subnet (in 10.100.10.0/24 or 10.100.10.0 255.255.255.0 format, or for IPv6, 2001:DB8::/60).

d) Click the **Port** tab and configure the service using any of the following techniques.

   - Select the desired port objects from the Available list and click **Add to Source** or **Add to Destination**. You can create new objects by clicking the + button above the list. The object can specify TCP/UDP ports, ICMP/ICMPv6 message types, or other protocols (including "any"). However, the source port, which you typically would leave empty, accepts TCP/UDP only. You cannot select port groups.
   - Type or select a port or protocol in the edit box below the source or destination list and click **Add**.

   **Note** To get an entry that applies to all IP traffic, select a destination port object that specifies “all” protocols.

e) Click **Add** to add the entry to the object.

f) If necessary, click and drag the entry to move it up or down in the rule order to the desired location.

Repeat the process to create or edit additional entries in the object.
Configure Standard ACL Objects

Use standard ACL objects when you want to match traffic based on destination IPv4 address only. Otherwise, use extended ACLs.

Procedure

Step 1 Select Objects > Object Management and choose Access Control Lists > Standard from the table of contents.

Step 2 Do one of the following:
- Click Add Standard ACL to create a new object.
- Click the edit icon (Edit) to edit an existing object.

Step 3 In the Standard ACL Object dialog box, enter a name for the object (no spaces allowed), and configure the access control entries:
  a) Do one of the following:
    - Click Add to create a new entry.
    - Click the edit icon (Edit) to edit an existing entry.
  The right-click menu also includes options to cut, copy, and paste entries, or to delete them.
  b) For each access control entry, configure the following properties:
    - Action—Whether to Allow (match) or Block (not match) the traffic criteria.
    - Network—Add the IPv4 network objects or groups that identify the destination of the traffic.
  c) Click Add to add the entry to the object.
  d) If necessary, click and drag the entry to move it up or down in the rule order to the desired location.
  Repeat the process to create or edit additional entries in the object.

Step 4 If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 394.

Step 5 Click Save.
AS Path Objects

An AS Path is a mandatory attribute to set up BGP. It is a sequence of AS numbers through which a network can be accessed. An AS-PATH is a sequence of intermediate AS numbers between source and destination routers that form a directed route for packets to travel. Neighboring autonomous systems (ASes) use BGP to exchange and update messages about how to reach different AS prefixes. After each router makes a new local decision on the best route to a destination, it will send that route, or path information, along with the accompanying distance metrics and path attributes, to each of its peers. As this information travels through the network, each router along the path prepends its unique AS number to a list of ASes in the BGP message. This list is the route's AS-PATH. An AS-PATH along with an AS prefix, provides a specific handle for a one-way transit route through the network. Use the Configure AS Path page to create, copy and edit autonomous system (AS) path policy objects. You can create AS path objects to use when you are configuring route maps, policy maps, or BGP Neighbor Filtering. An AS path filter allows you to filter the routing update message by using regular expressions.

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1 Select Objects > Object Management and choose AS Path from the table of contents.
Step 2 Click Add AS Path.
Step 3 Enter a name for the AS Path object in the Name field. Valid values are between 1 and 500.
Step 4 Click Add on the New AS Path Object window.
  a) Select the Allow or Block options from the Action drop-down list to indicate redistribution access.
  b) Specify the regular expression that defines the AS path filter in the Regular Expression field.
  c) Click Add.
Step 5 If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 394.
Step 6 Click Save.

Community Lists

A Community is an optional transitive BGP attribute. A community is a group of destinations that share some common attribute. It is used for route tagging. The BGP community attribute is a numerical value that can be assigned to a specific prefix and advertised to other neighbors. Communities can be used to mark a set of prefixes that share a common attribute. Upstream providers can use these markers to apply a common routing policy such as filtering or assigning a specific local preference or modifying other attributes. Use the Configure Community Lists page to create, copy and edit community list policy objects. You can create community list objects to use when you are configuring route maps or policy maps. You can use community lists to create...
groups of communities to use in a match clause of a route map. The community list is an ordered list of matching statements. Destinations are matched against the rules until a match is found.

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Select **Objects > Object Management** and choose **Community List** from the table of contents.

**Step 2** Click **Add Community List**.

**Step 3** In the **Name** field, specify a name for the community list object.

**Step 4** Click **Add** on the **New Community List Object** window.

**Step 5** Select the **Standard** radio button to indicate the community rule type.

Standard community lists are used to specify well-known communities and community numbers.

**Note** You cannot have entries using Standard and entries using Expanded community rule types in the same Community List object.

a) Select the Allow or Block options from the **Action** drop-down list to indicate redistribution access.

b) In the **Communities** field, specify a community number. Valid values can be from 1 to 4294967295 or from 0:1 to 65534:65535.

c) Select the appropriate **Route Type**.

- **Internet** — Select to specify the Internet well-known community. Routes with this community are advertised to all peers (internal and external).
- **No Advertise** — Select to specify the no-advertise well-known community. Routes with this community are not advertised to any peer (internal or external).
- **No Export** — Select to specify the no-export well-known community. Routes with this community are advertised to only peers in the same autonomous system or to only other sub-autonomous systems within a confederation. These routes are not advertised to external peers.

**Step 6** Select the **Expanded** radio button to indicate the community rule type.

Expanded community lists are used to filter communities using a regular expression. Regular expressions are used to specify patterns to match COMMUNITIES attributes.

a) Select the Allow or Block options from the **Action** drop-down list to indicate redistribution access.

b) Specify the regular expression in the **Expressions** field.

**Step 7** Click **Add**.

**Step 8** If you want to allow overrides for this object, check the **Allow Overrides** check box; see Allowing Object Overrides, on page 394.

**Step 9** Click **Save**.
Policy Lists

Use the Configure Policy List page to create, copy, and edit policy list policy objects. You can create policy list objects to use when you are configuring route maps. When a policy list is referenced within a route map, all of the match statements within the policy list are evaluated and processed. Two or more policy lists can be configured with a route map. A policy list can also coexist with any other preexisting match and set statements that are configured within the same route map but outside of the policy list. When multiple policy lists perform matching within a route map entry, all policy lists match on the incoming attribute only.

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** Select Objects > Object Management and choose Policy List from the table of contents.

**Step 2** Click Add Policy List.

**Step 3** Enter a name for the policy list object in the Name field. Object names are not case-sensitive.

**Step 4** Select whether to allow or block access for matching conditions from the Action drop-down list.

**Step 5** Click the Interface tab to distribute routes that have their next hop out of one of the interfaces specified.

In the Zones/Interfaces list, add the zones that contain the interfaces through which the device communicates with the management station. For interfaces not in a zone, you can type the interface name into the field below the Selected Zone/Interface list and click Add. The host will be configured on a device only if the device includes the selected interfaces or zones.

**Step 6** Click the Address tab to redistribute any routes that have a destination address that is permitted by a standard access list or prefix list.

Choose whether to use an Access List or Prefix List for matching and then enter or select the Standard Access List Objects or Prefix list objects you want to use for matching.

**Step 7** Click the Next Hop tab to redistribute any routes that have a next hop router address passed by one of the access lists or prefix lists specified.

Choose whether to use an Access List or Prefix List for matching and then enter or select the Standard Access List Objects or Prefix list objects you want to use for matching.

**Step 8** Click the Route Source tab to redistribute routes that have been advertised by routers and access servers at the address specified by the access lists or prefix list.

Choose whether to use an Access List or Prefix List for matching and then enter or select the Standard Access List Objects or Prefix list objects you want to use for matching.

**Step 9** Click the AS Path tab to match a BGP autonomous system path. If you specify more than one AS path, then the route can match either AS path.

**Step 10** Click the Community Rule tab to enable matching the BGP community with the specified community. If you specify more than one community, then the route can match either community. To enable matching the
BGP community exactly with the specified community, check the **Match the specified community exactly** check box.

**Step 11**

Click the **Metric & tag** tab to match the metric and security group tag of a route.

a) Enter the metric values to use for matching in the **Metric** field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified metric. The metric values can range from 0 to 4294967295.

b) Enter the tag values to use for matching in the **Tag** field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified security group tag. The tag values can range from 0 to 4294967295.

**Step 12**

If you want to allow overrides for this object, check the **Allow Overrides** check box; see Allowing Object Overrides, on page 394.

**Step 13**

Click **Save**.

---

**VPN Objects**

**FTD IKE Policies**

Internet Key Exchange (IKE) is a key management protocol that is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and automatically establish IPsec security associations (SAs). The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes SAs for other applications, such as IPsec. Both phases use proposals when they negotiate a connection. An IKE proposal is a set of algorithms that two peers use to secure the negotiation between them. IKE negotiation begins by each peer agreeing on a common (shared) IKE policy. This policy states which security parameters are used to protect subsequent IKE negotiations.

For IKEv1, IKE proposals contain a single set of algorithms and a modulus group. You can create multiple, prioritized policies to ensure that at least one policy matches a remote peer’s policy. Unlike IKEv1, in an IKEv2 proposal, you can select multiple algorithms and modulus groups in one policy. Since peers choose during the Phase 1 negotiation, this makes it possible to create a single IKE proposal, but consider multiple, different proposals to give higher priority to your most desired options. For IKEv2, the policy object does not specify authentication, other policies must define the authentication requirements.

An IKE policy is required when you configure a site-to-site IPsec VPN. For more information, see Firepower Threat Defense VPN, on page 757.

**Configure IKEv1 Policy Objects**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Export-Compliance</td>
<td>N/A</td>
<td>FTD</td>
<td>Leaf only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Use the IKEv1 Policy page to create, delete, or edit an IKEv1 policy object. These policy objects contain the parameters required for IKEv1 policies.
Procedure

Step 1
Choose **Objects > Object Management** and then **VPN > IKEv1 Policy** from the table of contents. Previously configured policies are listed including system defined defaults. Depending on your level of access, you may Edit ( ), View ( ), or Delete ( ) a proposal.

Step 2
(Optional) Choose **Add IKEv1 Policy** to create a new policy object.

Step 3
Enter a **Name** for this policy. A maximum of 128 characters is allowed.

Step 4
(Optional) Enter a **Description** for this proposal. A maximum of 1,024 characters is allowed.

Step 5
Enter the **Priority** value of the IKE policy.

The priority value determines the order of the IKE policy compared by the two negotiating peers when attempting to find a common security association (SA). If the remote IPsec peer does not support the parameters selected in your first priority policy, it tries to use the parameters defined in the next lowest priority. Valid values range from 1 to 65,535. The lower the number, the higher the priority. If you leave this field blank, Management Center assigns the lowest unassigned value starting with 1, then 5, then continuing in increments of 5.

Step 6
Choose the **Encryption** method.

When deciding which encryption and Hash Algorithms to use for the IKEv1 policy, your choice is limited to algorithms supported by the peer devices. For an extranet device in the VPN topology, you must choose the algorithm that matches both peers. For IKEv1, select one of the options. For a full explanation of the options, see Deciding Which Encryption Algorithm to Use, on page 762.

Step 7
Choose the **Hash** Algorithm that creates a Message Digest, which is used to ensure message integrity.

When deciding which encryption and Hash Algorithms to use for the IKEv1 proposal, your choice is limited to algorithms supported by the managed devices. For an extranet device in the VPN topology, you must choose the algorithm that matches both peers. For a full explanation of the options, see Deciding Which Hash Algorithms to Use, on page 763.

Step 8
Set the **DH Group**.

The Diffie-Hellman group to use for encryption. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. Select the group that you want to allow in the VPN. For a full explanation of the options, see Deciding Which Diffie-Hellman Modulus Group to Use, on page 764.

Step 9
Set the **Lifetime** of the security association (SA), in seconds. You can specify a value from 120 to 2,147,483,647 seconds. The default is 86400.

When the lifetime is exceeded, the SA expires and must be renegotiated between the two peers. Generally, the shorter the lifetime (up to a point), the more secure your IKE negotiations. However, with longer lifetimes, future IPsec security associations can be set up more quickly than with shorter lifetimes.

Step 10
Set the **Authentication Method** to use between the two peers.

Select Preshared Key. This is the only supported method, certificate authentication is not supported at this time. Preshared keys allow for a secret key to be shared between two peers and to be used by IKE during the authentication phase. If one of the participating peers is not configured with the same preshared key, the IKE SA cannot be established.
In a VPN topology that supports IKEv1, the Authentication Method specified in the chosen IKEv1 Policy object becomes the default in the IKEv1 Authentication Type setting. These values must match, otherwise, your configuration will error.

**Step 11**
Click Save
The new IKEv1 policy is added to the list.

### Configure IKEv2 Policy Objects

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Export-Compliance</td>
<td>N/A</td>
<td>FTD</td>
<td>Leaf only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Use the IKEv2 policy dialog box to create, delete, and edit an IKEv2 policy object. These policy objects contain the parameters required for IKEv2 policies.

**Procedure**

**Step 1**
Choose **Objects > Object Management** and then **VPN > IKEv2 Policy** from the table of contents. Previously configured policies are listed including system defined defaults. Depending on your level of access, you may Edit (✏️), View (👀), or Delete (🗑️) a policy.

**Step 2**
Choose ✪ Add IKEv2 Policy to create a new policy.

**Step 3**
Enter a **Name** for this policy.
The name of the policy object. A maximum of 128 characters is allowed.

**Step 4**
Enter a **Description** for this policy.
A description of the policy object. A maximum of 1024 characters is allowed.

**Step 5**
Enter the **Priority**.
The priority value of the IKE proposal. The priority value determines the order of the IKE proposals compared by the two negotiating peers when attempting to find a common security association (SA). If the remote IPsec peer does not support the parameters selected in your first priority policy, it tries to use the parameters defined in the next lowest priority policy. Valid values range from 1 to 65535. The lower the number, the higher the priority. If you leave this field blank, Management Center assigns the lowest unassigned value starting with 1, then 5, then continuing in increments of 5.

**Step 6**
Set the **Lifetime** of the security association (SA), in seconds. You can specify a value from 120 to 2,147,483,647 seconds. The default is 86400.
When the lifetime is exceeded, the SA expires and must be renegotiated between the two peers. Generally, the shorter the lifetime (up to a point), the more secure your IKE negotiations. However, with longer lifetimes, future IPsec security associations can be set up more quickly than with shorter lifetimes.

**Step 7**
Choose the **Integrity Algorithms** portion of the Hash Algorithm used in the IKE policy. The Hash Algorithm creates a Message Digest, which is used to ensure message integrity.
When deciding which encryption and Hash Algorithms to use for the IKEv2 proposal, your choice is limited to algorithms supported by the managed devices. For an extranet device in the VPN topology, you must choose the algorithm that matches both peers. Select all the algorithms that you want to allow in the VPN. For a full explanation of the options, see Deciding Which Hash Algorithms to Use, on page 763.

**Step 8** Choose the Encryption Algorithm used to establish the Phase 1 SA for protecting Phase 2 negotiations.

When deciding which encryption and Hash Algorithms to use for the IKEv2 proposal, your choice is limited to algorithms supported by the managed devices. For an extranet device in the VPN topology, you must choose the algorithm that matches both peers. Select all the algorithms that you want to allow in the VPN. For a full explanation of the options, see Deciding Which Encryption Algorithm to Use, on page 762.

**Step 9** Choose the PRF Algorithm.

The pseudorandom function (PRF) portion of the Hash Algorithm used in the IKE policy. In IKEv1, the Integrity and PRF algorithms are not separated, but in IKEv2, you can specify different algorithms for these elements. Select all of the algorithms that you want to allow in the VPN. For a full explanation of the options, see Deciding Which Hash Algorithms to Use, on page 763.

**Step 10** Select and Add a DH Group.

The Diffie-Hellman group used for encryption. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. Select the groups that you want to allow in the VPN. For a full explanation of the options, see Deciding Which Diffie-Hellman Modulus Group to Use, on page 764.

**Step 11** Click Save

If a valid combination of choices has been selected the new IKEv2 policy is added to the list. If not, errors are displayed and you must make changes accordingly to successfully save this policy.

---

**FTD IPsec Proposals**

IPsec Proposals (or Transform Sets) are used when configuring VPN topologies. During the IPsec security association negotiation with ISAKMP, the peers agree to use a particular proposal to protect a particular data flow. The proposal must be the same for both peers.

There are separate IPsec proposal objects based on the IKE version, IKEv1, or IKEv2:

- When you create an IKEv1 IPsec Proposal (Transform Set) object, you select the mode in which IPsec operates, and define the required encryption and authentication types. You can select single options for the algorithms. If you want to support multiple combinations in a VPN, create multiple IKEv1 IPsec Proposal objects.

- When you create an IKEv2 IPsec Proposal object, you can select all of the encryption and Hash Algorithms allowed in a VPN. During IKEv2 negotiations, the peers select the most appropriate options that each support.

The Encapsulating Security Protocol (ESP) is used for both IKEv1 and IKEv2 IPsec Proposals. It provides authentication, encryption, and antireplay services. ESP is IP protocol type 50.

**Note**

We recommend using both encryption and authentication on IPsec tunnels.
**Configure IKEv1 IPsec Proposal Objects**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Export-Compliance</td>
<td>N/A</td>
<td>FTD</td>
<td>Leaf only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose **Objects > Object Management** and then **VPN > IPsec IKEv1 Proposal** from the table of contents. Previously configured Proposals are listed including system defined defaults. Depending on your level of access, you may Edit (📝), View (👀), or Delete (🗑️) a Proposal.

**Step 2** Choose **Add IPsec IKEv1 Proposal** to create a new Proposal.

**Step 3** Enter a **Name** for this Proposal
The name of the policy object. A maximum of 128 characters is allowed.

**Step 4** Enter a **Description** for this Proposal.
A description of the policy object. A maximum of 1024 characters is allowed.

**Step 5** Choose the **ESP Encryption** method. The Encapsulating Security Protocol (ESP) encryption algorithm for this Proposal.
For IKEv1, select one of the options. When deciding which encryption and Hash Algorithms to use for the IPsec proposal, your choice is limited to algorithms supported by the devices in the VPN. For a full explanation of the options, see **Deciding Which Encryption Algorithm to Use, on page 762**.

**Step 6** Select an option for **ESP Hash**.
For a full explanation of the options, see **Deciding Which Hash Algorithms to Use, on page 763**.

**Step 7** Click **Save**
The new Proposal is added to the list.

---

**Configure IKEv2 IPsec Proposal Objects**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Export-Compliance</td>
<td>N/A</td>
<td>FTD</td>
<td>Leaf only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose **Objects > Object Management** and then **VPN > IKEv2 IPsec Proposal** from the table of contents. Previously configured Proposals are listed including system defined defaults. Depending on your level of access, you may Edit (📝), View (👀), or Delete (🗑️) a Proposal.
Step 2  Choose **Add IKEv2 IPsec Proposal** to create a new Proposal.

Step 3  Enter a **Name** for this Proposal
The name of the policy object. A maximum of 128 characters is allowed.

Step 4  Enter a **Description** for this Proposal.
A description of the policy object. A maximum of 1024 characters is allowed.

Step 5  Choose the **ESP Hash** method, the hash or integrity algorithm to use in the Proposal for authentication.
For IKEv2, select all the options you want to support for **ESP Hash**. For a full explanation of the options, see Deciding Which Hash Algorithms to Use, on page 763.

Step 6  Choose the **ESP Encryption** method. The Encapsulating Security Protocol (ESP) encryption algorithm for this Proposal.
For IKEv2, click Select to open a dialog box where you can select all of the options you want to support.
When deciding which encryption and Hash Algorithms to use for the IPsec proposal, your choice is limited to algorithms supported by the devices in the VPN. For a full explanation of the options, see Deciding Which Encryption Algorithm to Use, on page 762.

Step 7  Click **Save**
The new Proposal is added to the list.
PART V

Classic Device Configuration Basics

• Classic Device Management Basics, on page 471
• IPS Device Deployments and Configuration, on page 483
Classic Device Management Basics

The following topics describe how to manage Classic devices (7000 and 8000 Series/ASA with FirePOWER Services/NGIPSv) in the Firepower System:

- Remote Management Configuration (Classic Devices), on page 471
- Interface Configuration Settings, on page 474

Remote Management Configuration (Classic Devices)

All Devices Except 7000 and 8000 Series

For information on configuring remote management for devices that use Classic licenses, see the quick start guide for your device.

7000 and 8000 Series Devices

Configure remote management of a 7000 or 8000 Series device using its local web interface, before you register the device to the FMC.

Before you can manage a Firepower device, you must set up a two-way, SSL-encrypted communication channel between the device and the Firepower Management Center. The appliances use the channel to share configuration and event information. High availability peers also use the channel, which is by default on port 8305/tcp.

To enable communications between two appliances, you must provide a way for the appliances to recognize each other, as follows:

- The hostname or IP address of the appliance with which you are trying to establish communication.
  In NAT environments, even if the other appliance does not have a routable address, you must provide a hostname or an IP address either when you are configuring remote management, or when you are adding the managed appliance.
- A self-generated alphanumeric registration key up to 37 characters in length that identifies the connection.
- An optional unique alphanumeric NAT ID that can help establish communications in a NAT environment. The NAT ID must be unique among all NAT IDs used to register managed appliances.
**Configuring Remote Management on a Managed Device**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>7000 &amp; 8000 Series</td>
<td>N/A</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1**  
On the web interface for the device you want to manage, choose System > Integration > Remote Management.

**Step 2**  
Click Remote Management, if it is not already displaying.

**Step 3**  
Click Add Manager.

**Step 4**  
In the Management Host field, enter one of the following for the Firepower Management Center that you want to use to manage this appliance:

- The IP address
- The fully qualified domain name or the name that resolves through the local DNS to a valid IP address (that is, the host name)

**Caution**  
Use a host name rather than an IP address if your network uses DHCP to assign IP addresses.

In a NAT environment, you do not need to specify an IP address or host name here if you plan to specify it when you add the managed appliance. In this case, the Firepower System uses the NAT ID you will provide later to identify the remote manager on the managed appliance’s web interface.

**Step 5**  
In the Registration Key field, enter the registration key that you want to use to set up communications between appliances.

**Step 6**  
For NAT environments, in the Unique NAT ID field, enter a unique alphanumeric NAT ID that you want to use to set up communications between appliances.

**Step 7**  
Click Save.

**What to do next**

- Wait until the appliances confirm that they can communicate with each other and the Pending Registration status appears.

- Add this device to the Firepower Management Center; see Add Devices to the Firepower Management Center, on page 228.

**Editing Remote Management on a Managed Device**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>7000 &amp; 8000 Series</td>
<td>N/A</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

When editing a remote manager, note that:
• The Host field specifies the fully qualified domain name or the name that resolves through the local DNS to a valid IP address (that is, the host name).

• The Name field specifies the display name of the managing appliance, which is used only within the context of the Firepower System. Entering a different display name does not change the host name for the managing device.

Procedure

Step 1
On the web interface for the device, choose System > Integration.

Step 2
Click Remote Management, if it is not already displaying.

Step 3
You can:

• Disable remote management — Click the slider next to the manager to enable or disable it. Disabling management blocks the connection between the Firepower Management Center and the device, but does not delete the device from the Firepower Management Center. If you no longer want to manage a device, see Deleting Devices from the Firepower Management Center, on page 230.

• Edit manager information — Click edit (🔍) next to the manager you want to modify, modify the Name and Host fields, and click Save.

Changing the Management Port

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>7000 &amp; 8000 Series FMC</td>
<td>Global only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Appliances communicate using a two-way, SSL-encrypted communication channel, which by default is on port 8305.

Although Cisco strongly recommends that you keep the default setting, you can choose a different port if the management port conflicts with other communications on your network. Usually, changes to the management port are made during installation.

Caution
If you change the management port, you must change it for all appliances in your deployment that need to communicate with each other.

Procedure

Step 1
Choose System > Configuration.

Step 2
Click Management Interfaces.

Step 3
In the Shared Settings section, enter the port number that you want to use in the Remote Management Port field.
Step 4  Click Save.

What to do next
Repeat this procedure for every appliance in your deployment that must communicate with this appliance.

Interface Configuration Settings

The Interfaces page of the appliance editor displays detailed interface configuration information. The page is composed of the physical hardware view and the interfaces table view, which allow you to drill down to configuration details. You can add and edit interfaces from this page.

The Physical Hardware View

The top of the Interfaces page provides a graphical representation of the physical hardware view of a 7000 or 8000 Series device.

Use the physical hardware view to:

• view a network module’s type, part number, and serial number
• select an interface in the interfaces table view
• open an interface editor
• view the name of the interface, the type of interface, whether the interface has link, the interface’s speed setting, and whether the interface is currently in bypass mode
• view the details about an error or warning

Interface Icons

Table 61: Interface Icon Types and Descriptions

<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Click edit (🔗) next to the device you want to manage.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Use the graphical interface to:

- Choose — If you want to choose an interface, click interface. The system highlights the related entry in the interface table.
- Edit — If you want to open an interface editor, double-click interface.
• View error or warning information — If you want to view the details about an error or warning, hover your cursor over the affected port on the network module.
• View interface information — If you want to view the name of the interface, the type of interface, whether the interface has link, the interface’s speed setting, and whether the interface is currently in bypass mode, hover your cursor over the interface.
• View network module information — If you want to view a network module’s type, part number, and serial number, hover your cursor over the dark circle in the lower left corner of the network module.

### Configuring Sensing Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>Classic</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can configure the sensing interfaces of a managed device, according to your Firepower deployment, from the Interfaces page of the appliance editor. Note that you can only configure a total of 1024 interfaces on a managed device.

#### Note

The Firepower Management Center does not display ASA interfaces when the ASA FirePOWER is deployed in SPAN port mode.

#### Procedure

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device where you want to configure an interface, click edit (-pencil).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click edit (-pencil) next to the interface you want to configure.

**Step 4** Use the interface editor to configure the sensing interface:

- **HA Link** — If you want an interface configured on each member of a high-availability pair of 7000/8000 series devices to act as a redundant communications channel between the devices; also called a high availability link interface, click HA Link and proceed as described in Configuring HA Link Interfaces, on page 477.

- **Inline** — If you want an interface configured to handle traffic in an inline deployment, click Inline and proceed as described in Configuring Inline Interfaces, on page 487.

- **Passive** — If you want an interface configured to analyze traffic in a passive deployment, click Passive and proceed as described in Configuring Passive Interfaces, on page 484.

- **Routed** — If you want an interface configured to route traffic in a 7000/8000 series Layer 3 deployment, click Routed and proceed as described in Routed Interfaces, on page 1046.
• Switched — If you want an interface configured to switch traffic in a 7000/8000 series Layer 2 deployment, click Switched and proceed as described in Switched Interface Configuration, on page 1035.

**Step 5**  
Click Save.

---

**What to do next**  
Deploy configuration changes; see Deploy Configuration Changes, on page 337.

---

**Configuring HA Link Interfaces**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you establish a 7000 or 8000 Series device high-availability pair, you should configure a physical interface as a high availability (HA) link interface. This link acts as a redundant communications channel for sharing health information between the paired devices. When you configure an HA link interface on one device, you automatically configure an interface on the second device. You must configure both HA links on the same broadcast domain.

Dynamic NAT relies on dynamically allocating IP addresses and ports to map to other IP addresses and ports. Without an HA link, these mappings are lost in a failover, causing all translated connections to fail as they are routed through the now-active device in the high-availability pair.

Similarly, 7000 or 8000 Series devices with high-availability state sharing, dynamic NAT, or VPN require an HA link interface.

**Procedure**

**Step 1**  
Choose Devices > Device Management.

**Step 2**  
Next to the peer where you want to configure the HA link interface, click the edit icon ( ).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3**  
Next to the interface you want to configure as a HA link interface, click the edit icon ( ).

**Step 4**  
Click HA Link.

**Step 5**  
Check the Enabled check box.

If you clear the check box, the system administratively takes down the interface, disabling it.

**Step 6**  
From the Mode drop-down list, choose an option to designate the link mode, or choose Autonegotiation to specify that the interface is configured to autonegotiate speed and duplex settings.

**Step 7**  
From the MDI/MDIX drop-down list, choose an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.

Normally, MDI/MDIX is set to Auto-MDIX, which automatically handles switching between MDI and MDIX to attain link.

**Step 8**  
Enter a maximum transmission unit (MTU) in the MTU field.
The range of MTU values can vary depending on the model of the managed device and the interface type. See MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 479 for more information.

**Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 340 for more information.

**Step 9** Click **Save**.

---

**What to do next**

Deploy configuration changes; see Deploy Configuration Changes, on page 337.

**Related Topics**

Snort® Restart Scenarios, on page 339
MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 479

## Disabling Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>7000 &amp; 8000 Series NGIPSv</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can disable an interface by setting the interface type to **None**. Disabled interfaces appear grayed out in the interface list.

**Procedure**

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device where you want to disable the interface, click the edit icon (✏).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Next to the interface you want to disable, click the edit icon (✏).

**Step 4** Click **None**.

**Step 5** Click **Save**.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 337.
Managing Cisco ASA FirePOWER Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>ASA FirePOWER</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

When editing an ASA FirePOWER interface, you can configure only the interface’s security zone from the Firepower Management Center.

You fully configure ASA FirePOWER interfaces using the ASA-specific software and CLI. If you edit an ASA FirePOWER and switch from multiple context mode to single context mode (or visa versa), the ASA FirePOWER renames all of its interfaces. You must reconfigure all Firepower System security zones, correlation rules, and related configurations to use the updated ASA FirePOWER interface names. For more information about ASA FirePOWER interface configuration, see the ASA documentation.

---

**Note**

You cannot change the type of ASA FirePOWER interface, nor can you disable the interface from the Firepower Management Center.

**Procedure**

**Step 1**

Choose Devices > Device Management.

**Step 2**

Next to the device where you want to edit the interface, click edit ( ).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3**

Click Interfaces if it is not already displaying.

**Step 4**

Next to the interface you want to edit, click edit ( ).

**Step 5**

Choose an existing security zone from the Security Zone drop-down list, or choose New to add a new security zone.

**Step 6**

Click Save to configure the security zone.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 337.

**MTU Ranges for 7000 and 8000 Series Devices and NGIPSv**

Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 340 for more information.
The system trims 18 bytes from the configured MTU value. Do not set the IPv4 MTU lower than 594 or the IPv6 MTU lower than 1298.

<table>
<thead>
<tr>
<th>Platform</th>
<th>MTU Range</th>

<tr>
<td>NGIPSv</td>
<td>576-9018 (all interfaces, inline sets)</td>
</tr>
</tbody>
</table>

**Related Topics**

- [About the MTU](#), on page 587

### Synchronizing Security Zone Object Revisions

When you update a security zone object, the system saves a new revision of the object. As a result, if you have managed devices in the same security zone that have different revisions of the security zone object configured in the interfaces, you may log what appear to be duplicate connections.

If you notice duplicate connection reporting, you can update all managed devices to use the same revision of the object.

#### Procedure

**Step 1**  
Choose Devices > Device Management.

**Step 2**  
Next to the device where you want to update the security zone selection, click edit (edit).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3**  
For each interface logging duplicate connection events, change the Security Zone to another zone, click Save, then change it back to the desired zone, and click Save again.

**Step 4**  
Repeat steps 2 through 3 for each device logging duplicate events. You must edit all devices before you continue.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 337.
Caution

Do not deploy configuration changes to any device until you edit the zone setting for interfaces on all devices you want to sync. You must deploy to all managed devices at the same time.
IPS Device Deployments and Configuration

The following topics describe how to configure your device in an IPS deployment:

- Introduction to IPS Device Deployment and Configuration, on page 483
- Passive IPS Deployments, on page 483
- Inline IPS Deployments, on page 485

Introduction to IPS Device Deployment and Configuration

You can configure your device in either a passive or inline IPS deployment. In a passive deployment, you deploy the system out of band from the flow of network traffic. In an inline deployment, you configure the system transparently on a network segment by binding two ports together.

Passive IPS Deployments

In a passive IPS deployment, the Firepower System monitors traffic flowing across a network using a switch SPAN or mirror port. The SPAN or mirror port allows for traffic to be copied from other ports on the switch. This provides the system visibility within the network without being in the flow of network traffic. When configured in a passive deployment, the system cannot take certain actions such as blocking or shaping traffic. Passive interfaces receive all traffic unconditionally, and no traffic received on these interfaces is retransmitted.

**Note**

Passive Interfaces on the Firepower System

You can configure one or more physical ports on a managed device as passive interfaces.

When you enable a passive interface to monitor traffic, you designate mode and MDI/MDIX settings, which are available only for copper interfaces. Interfaces on 8000 Series appliances do not support half-duplex options.

When you disable a passive interface, users can no longer access it for security purposes.

The range of MTU values can vary depending on the model of the managed device and the interface type.
Caution
Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 340 for more information.

Configuring Passive Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>feature dependent</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

Procedure

Step 1  Choose Devices > Device Management.
Step 2  Click edit ( ) next to the device where you want to configure the passive interface.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Step 3  Click edit ( ) next to the interface you want to configure as a passive interface.
Step 4  Click Passive.
Step 5  If you want to associate the passive interface with a security zone, do one of the following:
• Choose an existing security zone from the Security Zone drop-down list.
• Choose New to add a new security zone; see Creating Security Zone and Interface Group Objects, on page 404.
Step 6  Check the Enabled check box.
If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.
Step 7  7000 & 8000 Series only: From the Mode drop-down list, designate the link mode, or choose Autonegotiation to specify that the interface is configured to automatically negotiate speed and duplex settings.
Mode settings are available only for copper interfaces.
Interfaces on 8000 Series appliances do not support half-duplex options.
Step 8  7000 & 8000 Series only: From the MDI/MDIX drop-down list, designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.
MDI/MDIX settings are available only for copper interfaces.
By default, MDI/MDIX is set to **Auto-MDIX**, which automatically handles switching between MDI and MDIX to attain link.

**Step 9**

Enter a maximum transmission unit (MTU) in the **MTU** field.

The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See **Snort® Restart Traffic Behavior, on page 340** for more information.

**Step 10**

Click **Save**.

---

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes, on page 337**.

---

**Inline IPS Deployments**

In an inline IPS deployment, you configure the Firepower System transparently on a network segment by binding two ports together. This allows the system to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of an inline set unless explicitly dropped.

**Note** For the system to affect traffic, you must deploy relevant configurations to managed devices using routed, switched, or transparent interfaces, or inline interface pairs.

You can configure the interfaces on your managed device to route traffic between a host on your network and external hosts through different inline interface pairs, depending on whether the device traffic is inbound or outbound. This is an **asynchronous routing** configuration. If you deploy asynchronous routing but you include only one interface pair in an inline set, the device might not correctly analyze your network traffic because it might see only half of the traffic.

Adding multiple inline interface pairs to the same inline interface set allows the system to identify the inbound and outbound traffic as part of the same traffic flow. For passive interfaces only, you can also achieve this by including the interface pairs in the same security zone.

When the system generates a connection event from traffic passing through an asynchronous routing configuration, the event may identify an ingress and egress interface from the same inline interface pair. The configuration in the following diagram, for example, would generate a connection event identifying `eth3` as the ingress interface and `eth2` as the egress interface. This is expected behavior in this configuration.
If you assign multiple interface pairs to a single inline interface set but you experience issues with duplicate traffic, reconfigure to help the system uniquely identify packets. For example, you could reassign your interface pairs to separate inline sets or modify your security zones.

Note:

For devices with inline sets, a software bridge is automatically set up to transport packets after the device restarts. If the device is restarting, there is no software bridge running anywhere. If you enable bypass mode on the inline set, it goes into hardware bypass while the device is restarting. In that case, you may lose a few seconds of packets as the system goes down and comes back up, due to renegotiation of link with the device. However, the system will pass traffic while Snort is restarting.

- Snort® Restart Scenarios, on page 339

**Inline Interfaces on the Firepower System**

You can configure one or more physical ports on a managed device as inline interfaces. You must assign a pair of inline interfaces to an inline set before they can handle traffic in an inline deployment.

Note:
The system warns you if you set the interfaces in an inline pair to different speeds or if the interfaces negotiate to different speeds.

If you configure an interface as an inline interface, the adjacent port on its NetMod automatically becomes an inline interface as well to complete the pair.

To configure inline interfaces on an NGIPSv device, you must create the inline pair using adjacent interfaces.

### Configuring Inline Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>feature dependent</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Click edit (✏) next to the device where you want to configure the interface.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click edit (✏) next to the interface you want to configure.

**Step 4** Click Inline.

**Step 5** If you want to associate the inline interface with a security zone, do one of the following:

- Choose an existing security zone from the Security Zone drop-down list.
- Choose New to add a new security zone; see Creating Security Zone and Interface Group Objects, on page 404.

**Step 6** Choose an existing inline set from the Inline Set drop-down list, or choose New to add a new inline set.

**Note** If you add a new inline set, you must configure it after you set up the inline interface; see Adding Inline Sets, on page 489.

**Step 7** Check the Enabled check box.

If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.

**Step 8** 7000 & 8000 Series only: From the Mode drop-down list, designate the link mode, or choose Autonegotiation to specify that the interface is configured to automatically negotiate speed and duplex settings.

Mode settings are available only for copper interfaces.

Interfaces on 8000 Series appliances do not support half-duplex options.

**Step 9** 7000 & 8000 Series only: From the MDI/MDIX drop-down list, designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.

MDI/MDIX settings are available only for copper interfaces.
By default, MDI/MDIX is set to **Auto-MDIX**, which automatically handles switching between MDI and MDIX to attain link.

**Step 10**  
Click **Save**.

---

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes, on page 337**.

---

**Inline Sets on the Firepower System**

Before you can use inline interfaces in an inline deployment, you must configure inline sets and assign inline interface pairs to them. An inline set is a grouping of one or more inline interface pairs on a device; an inline interface pair can belong to only one inline set at a time.

The **Inline Sets** tab of the Device Management page displays a list of all inline sets you have configured on a device.

You can add inline sets from the **Inline Sets** tab of the Device Management page or you can add inline sets as you configure inline interfaces.

You can assign **only** inline interface pairs to an inline set. If you want to create an inline set before you configure the inline interfaces on your managed devices, you can create an empty inline set and add interfaces to it later. You can use alphanumeric characters and spaces when you type a name for an inline set.

**Note**  
Create inline sets before you add security zones for the interfaces in the inline set; otherwise security zones are removed and you must add them again.

**Name**

The name of the inline set.

**Interfaces**

A list of all inline interface pairs assigned to the inline set. A pair is not available when you disable either interface in the pair from the Interfaces tab.

**MTU**

The maximum transmission unit for the inline set. The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution**

Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See **Snort® Restart Traffic Behavior, on page 340** for more information.
Failsafe

Allows traffic to bypass detection and continue through the device. Managed devices monitor internal traffic buffers and bypass detection if those buffers are full.

Bypass Mode

Firepower 7000 or 8000 Series only: The configured bypass mode of the inline set. This setting determines how the relays in the inline interfaces respond when an interface fails. The bypass mode allows traffic to continue to pass through the interfaces. The non-bypass mode blocks traffic.

Caution

In bypass mode, you may lose a few packets when you reboot the appliance. You cannot configure bypass mode for inline sets on 7000 or 8000 Series devices in a high-availability pair, for non-bypass NetMods on 8000 Series devices, or for SFP modules on Firepower 7115 or 7125 devices.

Viewing Inline Sets

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Any</td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

Procedure

Step 1  Choose Devices > Device Management.

Step 2  Click edit (📝) next to the device where you want to view the inline sets.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  Click Inline Sets.

Adding Inline Sets

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>feature dependent</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>
Procedure

Step 1  Choose Devices > Device Management.

Step 2  Click edit (✏️) next to the device where you want to add the inline set.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  Click Inline Sets.

Step 4  Click Add Inline Set.

Step 5  Enter a Name.

Step 6  Next to Interfaces, choose one or more inline interface pairs, then click add selected (➕). To add all interface pairs to the inline set, click add all (➕).

Tip  To remove inline interfaces from the inline set, choose one or more inline interface pairs and click remove selected (➖). To remove all interface pairs from the inline set, click remove all (➖). Disabling either interface in a pair from Interfaces also removes the pair.

Step 7  Enter a maximum transmission unit (MTU) in the MTU field.

The range of MTU values can vary depending on the model of the managed device and the interface type.

Caution  Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 340 for more information.

Step 8  If you want to specify that traffic is allowed to bypass detection and continue through the device, choose Failsafe.

Managed devices monitor internal traffic buffers and bypass detection if those buffers are full.

Enabling Failsafe on a device with inline sets greatly decreases the risk of dropped packets if the internal traffic buffers are full, but your device may still drop packets in certain conditions. In the worst case, the device may experience a temporary network outage.

Step 9  (7000/8000 series only) Specify the bypass mode.

• Click Bypass to allow traffic to continue to pass through the interfaces.

• Click Non-Bypass to block traffic.

Note  You cannot configure bypass mode for inline sets on 7000 or 8000 Series devices in high-availability pairs, inline sets on an NGIPSv device, for non-bypass NetMods on 8000 Series devices, or for SFP modules on Firepower 7115 or 7125 devices.

Step 10  Optionally, configure advanced settings; see Advanced Inline Set Options, on page 491.

Step 11  Click OK.
Advanced Inline Set Options

There are a number of advanced options you may consider as you configure inline sets.

Tap Mode

Tap mode is available on 7000 and 8000 Series devices when you create an inline or inline with fail-open interface set.

With tap mode, the device is deployed inline, but instead of the packet flow passing through the device, a copy of each packet is sent to the device and the network traffic flow is undisturbed. Because you are working with copies of packets rather than the packets themselves, rules that you set to drop and rules that use the replace keyword do not affect the packet stream. However, rules of these types do generate intrusion events when they are triggered, and the table view of intrusion events indicates that the triggering packets would have dropped in an inline deployment.

There are benefits to using tap mode with devices that are deployed inline. For example, you can set up the cabling between the device and the network as if the device were inline and analyze the kinds of intrusion events the device generates. Based on the results, you can modify your intrusion policy and add the drop rules that best protect your network without impacting its efficiency. When you are ready to deploy the device inline, you can disable tap mode and begin dropping suspicious traffic without having to reconfigure the cabling between the device and the network.

Note that you cannot enable this option and strict TCP enforcement on the same inline set.

Propagate Link State

Link state propagation is not supported on virtual devices. Only 7000 and 8000 Series devices support link state propagation.

Link state propagation is a feature for inline sets configured in bypass mode and non-bypass mode so both pairs of an inline set track state. Link state propagation is available for both copper and fiber configurable bypass interfaces.

Link state propagation automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down. When the downed interface comes back up, the second interface automatically comes back up, also. In other words, if the link state of one interface changes, the appliance senses the change and updates the link state of the other interface to match it. Note that appliances require up to 4 seconds to propagate link state changes.

Link state propagation is especially useful in resilient network environments where routers are configured to reroute traffic automatically around network devices that are in a failure state.

You cannot disable link state propagation for inline sets configured on 7000 and 8000 Series devices in high-availability pairs.
### Transparent Inline Mode

Transparent Inline Mode option allows the device to act as a “bump in the wire” and means that the device forwards all the network traffic it sees, regardless of its source and destination. You cannot disable this option on 7000 and 8000 Series devices.

### Strict TCP Enforcement

**Note**

Strict TCP enforcement is not supported on virtual devices. Only 7000 and 8000 Series devices support this option. In addition, you cannot enable this option and tap mode on the same inline set.

To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed. Strict enforcement also blocks:

- non-SYN TCP packets for connections where the three-way handshake was not completed
- non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK
- non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established
- SYN packets on an established TCP connection from either the initiator or the responder

### Configuring Advanced Inline Set Options

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>feature dependent</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

1. **Step 1** Choose **Devices > Device Management**.
2. **Step 2** Click edit (edit icon) next to the device where you want to edit the inline set.
   
   In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
3. **Step 3** Click **Inline Sets**.
4. **Step 4** Click edit (edit icon) next to the inline set you want to edit.
5. **Step 5** Click **Advanced**.
6. **Step 6** Configure options as described in Advanced Inline Set Options, on page 491.

**Note**

Link state propagation and strict TCP enforcement are not supported on virtual devices.

7. **Step 7** Click **OK**.
What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Deleting Inline Sets

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td>Protection</td>
<td>Any</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you delete an inline set, any inline interfaces assigned to the set become available for inclusion in another set. The interfaces are not deleted.

Procedure

Step 1  Choose Devices > Device Management.

Step 2  Next to the device where you want to delete the inline set, click edit ( Modi).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  Click Inline Sets.

Step 4  Next to the inline set you want to delete, click delete ( ).

Step 5  When prompted, confirm that you want to delete the inline set.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 337.
Deleting Inline Sets
PART VI

Classic Device High Availability and Scalability

• 7000 and 8000 Series Device High Availability, on page 497
• 8000 Series Device Stacking, on page 513
About 7000 and 8000 Series Device High Availability

With 7000 and 8000 Series device high availability, you can establish redundancy of networking functionality and configuration data between two peer devices or two peer device stacks. You achieve configuration redundancy by configuring two peer devices or two peer device stacks into a high-availability pair to act as a single logical system for policy deploys, system updates, and registration. The system automatically synchronizes other configuration data.

Note
Static routes, non-SFRP IP addresses, and routing priorities are not synchronized between the peer devices or peer device stacks. Each peer device or peer device stack maintains its own routing intelligence.

Related Topics
SFRP
Advanced Virtual Switch Settings, on page 1041
Device High Availability Requirements

Before you can configure a 7000 and 8000 Series device high-availability pair, the following must be true:

- You can only pair single devices with single devices or device stacks with device stacks.
- Both devices or device stacks must have normal health status, be running the same software, and have the same licenses. See Using the Health Monitor, on page 289 for more information. In particular, the devices cannot have hardware failures that would cause them to enter maintenance mode and trigger a failover.

Note

After you pair the devices, you cannot change the license options for individual paired devices, but you can change the license for the entire high-availability pair.

- Interfaces must be configured on each device or each primary device in a stack.
- Both devices or the primary members of the device stacks must be the same model and have identical copper or fiber interfaces.
- Device stacks must have identical hardware configurations, except for an installed malware storage pack. For example, you can pair a Firepower 8290 with another 8290. None, one, or all devices in either stack might have a malware storage pack.

Caution

Do not attempt to install a hard drive that was not supplied by Cisco in your device. Installing an unsupported hard drive may damage the device. Malware storage pack kits are available for purchase only from Cisco, and are for use only with 8000 Series devices. Contact Support if you require assistance with the malware storage pack. See the Firepower System Malware Storage Pack Guide for more information.

- If the devices are targeted by NAT policies, both peers must have the same NAT policy.
- In a multidomain deployment, you can only establish 7000 or 8000 Series device high-availability or device stacks within a leaf domain.

Note

After failover and recovery, SFRP preempts to the master node.

Device High Availability Failover and Maintenance Mode

With a 7000 and 8000 Series device high availability, the system fails over either manually or automatically. You manually trigger failover by placing one of the paired devices or stacks in maintenance mode.

Automatic failover occurs after the health of the active device or stack becomes compromised, during a system update, or after a user with Administrator privileges shuts down the device. Automatic failover also occurs after an active device or device stack experiences NMSB failure, NFE failure, hardware failure, firmware
failure, critical process failure, a disk full condition, or link failure between two stacked devices. If the health of the standby device or stack becomes similarly compromised, the system does not fail over and enters a degraded state. The system also does not fail over when one of the devices or device stacks is in maintenance mode. Note that disconnecting the stacking cable from an active stack sends that stack into maintenance mode. Shutting down the secondary device in an active stack also sends that stack into maintenance mode.

Note

If the active member of the high-availability pair goes into maintenance mode and the active role fails over to the other pair member, when the original active pair member is restored to normal operation it does not automatically reclaim the active role.

Configuration Deployment and Upgrade Behavior for High-Availability Pairs

This topic describes upgrade and deployment behavior for 7000 and 8000 Series devices (and stacks) in high availability pairs.

Behavior During Deploy

You deploy configuration changes to the members of a high availability pair at the same time. Deploy either succeeds or fails for both peers. The Firepower Management Center deploys to the active device; if that succeeds then changes are deployed to the standby.

Caution

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 and Configurations that Restart the Snort Process When Deployed or Activated, on page 342.

Behavior During Upgrade

You should not experience interruptions in traffic flow or inspection while upgrading devices (or device stacks) in high availability pairs. To ensure continuity of operations, they upgrade one at a time. Devices operate in maintenance mode while they upgrade.

Which peer upgrades first depends on your deployment:

- Routed or switched—Standby upgrades first. The devices switch roles, then the new standby upgrades. When the upgrade completes, the devices' roles remain switched. If you want to preserve the active/standby roles, manually switch the roles before you upgrade. That way, the upgrade process switches them back.

- Access control only—Active upgrades first. When the upgrade completes, the active and standby maintain their old roles.

Deployment Types and Device High Availability

You determine how to configure 7000 or 8000 Series device high availability depending on your Firepower System deployment: passive, inline, routed, or switched. You can also deploy your system in multiple roles at once. Of the four deployment types, only passive deployments require that you configure devices or stacks...
using high availability to provide redundancy. You can establish network redundancy for the other deployment types with or without device high availability. For a brief overview on high availability in each deployment type, see the sections below.

---

**Note**

You can achieve Layer 3 redundancy without using device high availability by using the Cisco Redundancy Protocol (SFRP). SFRP allows devices to act as redundant gateways for specified IP addresses. With network redundancy, you configure two devices or stacks to provide identical network connections, ensuring connectivity for other hosts on the network.

---

**Passive Deployment Redundancy**

Passive interfaces are generally connected to tap ports on central switches, which allows them to analyze all of the traffic flowing across the switch. If multiple devices are connected to the same tap feed, the system generates events from each of the devices. When configured in a high-availability pair, devices act as either active or standby, which allows the system to analyze traffic even in the event of a system failure while also preventing duplicate events.

**Inline Deployment Redundancy**

Because an inline set has no control over the routing of the packets being passed through it, it must always be active in a deployment. Therefore, redundancy relies on external systems to route traffic correctly. You can configure redundant inline sets with or without 7000 or 8000 Series device high availability.

To deploy redundant inline sets, you configure the network topology so that it allows traffic to pass through only one of the inline sets while preventing circular routing. If one of the inline sets fails, the surrounding network infrastructure detects the loss of connectivity to the gateway address and adjusts the routes to send traffic through the redundant set.

**Routed Deployment Redundancy**

Hosts in an IP network must use a well-known gateway address to send traffic to different networks. Establishing redundancy in a routed deployment requires that routed interfaces share the gateway addresses so that only one interface handles traffic for that address at any given time. To accomplish this, you must maintain an equal number of IP addresses on a virtual router. One interface advertises the address. If that interface goes down, the standby interface begins advertising the address.

In devices that are not members of a high-availability pair, you use SFRP to establish redundancy by configuring gateway IP addresses shared between multiple routed interfaces. You can configure SFRP with or without 7000 or 8000 Series device high availability. You can also establish redundancy using dynamic routing such as OSPF or RIP.

**Switched Deployment Redundancy**

You establish redundancy in a switched deployment using the Spanning Tree Protocol (STP), one of the advanced virtual switch settings. STP is a protocol that manages the topology of bridged networks. It is specifically designed to allow redundant links to provide automatic standby for switched interfaces without configuring standby links. Devices in a switched deployment rely on STP to manage traffic between redundant interfaces. Two devices connected to the same broadcast network receive traffic based on the topology calculated by STP.
Cisco strongly recommends that you enable STP when configuring a virtual switch that you plan to deploy in a 7000 or 8000 Series device high-availability pair.

### 7000/8000 Series High Availability Configuration

When establishing 7000 or 8000 Series device high availability, you designate one of the devices or stacks as active and the other as standby. The system applies a merged configuration to the paired devices. If there is a conflict, the system applies the configuration from the device or stack you designated as active.

After you pair the devices, you cannot change the license options for individual paired devices, but you can change the license for the entire high availability pair. If there are interface attributes that need to be set on switched interfaces or routed interfaces, the system establishes the high availability pair, but sets it to a pending status. After you configure the necessary attributes, the system completes the high availability pair and sets it to a normal status.

After you establish a high availability pair, the system treats the peer devices or stacks as a single device on the Device Management page. Device high availability pairs display the High Availability icon (🔒) in the appliance list. Any configuration changes you make are synchronized between the paired devices. The Device Management page displays which device or stack in the high availability pair is active, which changes after manual or automatic failover.

Removing registration of a device high availability pair from a Firepower Management Center removes registration from both devices or stacks. You remove a device high availability pair from the FMC as you would an individual managed device.

You can then register the high availability pair on another FMC. To register single devices from a high availability pair, you add remote management to the active device in the pair and then add that device to the FMC, which adds the whole pair. To register stacked devices in a high availability pair, you add remote management to the primary device of the either stack and then add that device to the FMC, which adds the whole pair.

After you establish a device high availability pair, you should configure a high-availability link interface.

---

**Note**

If you plan to set up dynamic NAT, HA state sharing, or VPN using the devices in the high availability pair, you must configure a high-availability link interface. For more information, see Configuring HA Link Interfaces, on page 477.

### Establishing Firepower 7000/8000 Series High Availability

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>
This procedure describes establishing a 7000 & 8000 Series device high-availability pair. For information on establishing Firepower Threat Defense high availability, see Add a Firepower Threat Defense High Availability Pair, on page 635.

When establishing a 7000 & 8000 Series device high-availability pair, you designate one of the devices or stacks as active and the other as standby. The system applies a merged configuration to the paired devices. If there is a conflict, the system applies the configuration from the device or stack you designated as active.

In a multidomain deployment, devices in a high-availability pair must belong to the same domain.

Before you begin

Confirm that all requirements are met; see Device High Availability Requirements, on page 498.

Procedure

Step 1 Choose Devices > Device Management.
Step 2 From the Add drop-down menu, choose Add High Availability.
Step 3 Enter a Name.
Step 4 Under Device Type, choose Firepower.
Step 5 Assign roles for the devices or stacks:
   a) Choose the Active Peer device or stack for the high-availability pair.
   b) Choose the Standby Peer device or stack for the high-availability pair.
Step 6 Click Add. The process takes a few minutes as the system synchronizes data.

What to do next

Create an HA Link interface on each of the devices in the high-availability pair if you plan to set up HA state sharing, dynamic NAT, or VPN with the devices. For more information on HA link interfaces, see Configuring HA Link Interfaces, on page 477.

Editing Device High Availability

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you establish a 7000 or 8000 Series device high-availability pair, most changes you make to the device configuration also change the configuration of the whole high-availability pair.

You can view the status of the high-availability pair by hovering your pointer over the status icon in the General section. You can also view which device or stack is the active peer and standby peer in the pair.
**Configuring Individual Devices in a High-Availability Pair**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you establish a 7000 or 8000 Series device high-availability pair, you can still configure some attributes for each device within the pair. You can make changes to a paired device just as you would to a single device.

**Procedure**

**Step 1** Choose *Devices > Device Management*.

**Step 2** Next to the device high availability pair where you want to edit the configuration, click the edit icon (✏️). In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Use the sections on the High Availability page to make changes to the high-availability pair configuration as you would a single device configuration.

---

**Configuring Individual Device Stacks in a High-Availability Pair**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>Firepower 8140, Firepower 8200 family, Firepower 8300 family</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you configure stacked 8000 Series devices into a high-availability pair, the system limits the stack attributes that you can edit. You can edit the name of a stack in a paired stack. In addition, you can edit the
network configuration of the stack, as described in Configuring Interfaces on a Device in a High-Availability Pair, on page 504.

**Procedure**

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device high-availability pair where you want to edit the configuration, click the edit icon (✏). In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the **Stacks** tab.

**Step 4** From the **Selected Device** drop-down list, choose the stack you want to modify.

**Step 5** Next to the **General** section, click the edit icon (✏).

**Step 6** Enter a **Name**.

**Step 7** Click **Save**.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 337.

---

### Configuring Interfaces on a Device in a High-Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can configure interfaces on individual devices in a 7000 or 8000 Series device high-availability pair. However, you must also configure an equivalent interface on the peer device in the pair. For paired stacks, you configure identical interfaces on the primary devices of the stacks. When you configure virtual routers, you select the stack where you want to configure the routers.

**Procedure**

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device high-availability pair where you want to configure interfaces, click the edit icon (✏). In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the **Interfaces** tab.

**Step 4** From the **Selected Device** drop-down list, choose the device you want to modify.

**Step 5** Configure interfaces as you would on an individual device.
Switching the Active Peer in a Device High-Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you establish a 7000 or 8000 Series device high-availability pair, you can manually switch the active and standby peer devices or stacks.

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device high-availability pair where you want to change the active peer, click the Switch Active Peer icon ().

**Step 3** You can:

- Click Yes to immediately make the standby peer the active peer in the high-availability pair.
- Click No to cancel and return to the Device Management page.

Placing a High-Availability Peer into Maintenance Mode

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you establish a 7000 or 8000 Series device high-availability pair, you can manually trigger failover by placing one of the peers into maintenance mode to perform maintenance on the devices. In maintenance mode, the system administratively takes down all interfaces except for the management interface. After maintenance is completed, you can re-enable the peer to resume normal operation.

**Note**

You should not place both peers in a high-availability pair into maintenance mode at the same time. Doing so will prevent that pair from inspecting traffic.

**Procedure**

**Step 1** Choose Devices > Device Management.
Replacing a Device in a Stack in a High-Availability Pair

**Step 2**  
Next to the peer you want to place in maintenance mode, click the toggle maintenance mode icon (投放).

**Step 3**  
Click Yes to confirm maintenance mode.

---

**What to do next**

- When maintenance is complete, click the toggle maintenance mode icon (投放) again to bring the peer out of maintenance mode.

### Replacing a Device in a Stack in a High-Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>Firepower 8140, 8200 family, 8300 family</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you place a stack that is a member of a high-availability pair into maintenance mode, you can replace a secondary device in the stack for another device. You can only select devices that are not currently stacked or paired. The new device must follow the same guidelines for establishing a device stack.

**Procedure**

**Step 1**  
Choose Devices > Device Management.

**Step 2**  
Next to the stack member you want to place into maintenance mode, click the toggle maintenance mode icon (投放).

**Step 3**  
Click Yes to confirm maintenance mode.

**Step 4**  
Click the replace device icon (投放).

**Step 5**  
Choose the Replacement Device from the drop-down list.

**Step 6**  
Click Replace to replace the device.

**Step 7**  
Click the toggle maintenance mode icon (投放) again to bring the stack immediately out of maintenance mode.

**Note**  
You do not need to re-deploy the device configuration.

---

**Device High Availability State Sharing**

Device high availability state sharing allows devices or stacks in high-availability pairs to synchronize as much state as necessary, so that if either device or stack fails, the other peer can take over with no interruption to traffic flow. Without state sharing, the following features may not fail over properly:

- Strict TCP enforcement
- Unidirectional access control rules
- Blocking persistence

Note, however, that enabling state sharing slows system performance.

You must configure and enable HA link interfaces on both devices or the primary stacked devices in the high-availability pair before you can configure high availability state sharing. Firepower 82xx Family and 83xx Family devices require a 10G HA link, while other model devices require a 1G HA link.

You must disable state sharing before you can modify the HA link interfaces.

---

**Note**

If paired devices fail over, the system terminates all existing SSL-encrypted sessions on the active device. Even if you establish high availability state sharing, these sessions must be renegotiated on the standby device. If the server establishing the SSL session supports session reuse and the standby device does not have the SSL session ID, it cannot renegotiate the session.

---

**Strict TCP Enforcement**

When you enable strict TCP enforcement for a domain, the system drops any packets that are out of order on TCP sessions. For example, the system drops non-SYN packets received on an unestablished connection. With state sharing, devices in the high-availability pair allow TCP sessions to continue after failover without having to reestablish the connection, even if strict TCP enforcement is enabled. You can enable strict TCP enforcement on inline sets, virtual routers, and virtual switches.

**Unidirectional Access Control Rules**

If you have configured unidirectional access control rules, network traffic may match a different access control rule than intended when the system reevaluates a connection midstream after failover. For example, consider if you have a policy containing the following two access control rules:

Rule 1: Allow from 192.168.1.0/24 to 192.168.2.0/24  
Rule 2: Block all

Without state sharing, if an allowed connection from 192.168.1.1 to 192.168.2.1 is still active following a failover and the next packet is seen as a response packet, the system denies the connection. With state sharing, a midstream pickup would match the existing connection and continue to be allowed.

**Blocking Persistence**

While many connections are blocked on the first packet based on access control rules or other factors, there are cases where the system allows some number of packets through before determining that the connection should be blocked. With state sharing, the system immediately blocks the connection on the peer device or stack as well.

When establishing state sharing for a high-availability pair, you can configure the following options:

**Enabled**

Click the check box to enable state sharing. Clear the check box to disable state sharing.
Minimum Flow Lifetime
Specify the minimum time (in milliseconds) for a session before the system sends any synchronization messages for it. You can use any integer from 0 to 65535. The system does not synchronize any sessions that have not met the minimum flow lifetime, and the system synchronizes only when a packet is received for the connection.

Minimum Sync. Interval
Specify the minimum time (in milliseconds) between update messages for a session. You can use any integer from 0 to 65535. The minimum synchronization interval prevents synchronization messages for a given connection from being sent more frequently than the configured value after the connection reaches the minimum lifetime.

Maximum HTTP URL Length
Specify the maximum characters for the URL the system synchronizes between the paired devices. You may use any integer from 0 to 225.

Establishing Device High-Availability State Sharing

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

Device high-availability state sharing allows 7000 or 8000 Series devices or stacks in high-availability pairs to synchronize as much state as necessary, so that if either device or stack fails, the other peer can take over with no interruption to traffic flow.

Caution
Modifying a high-availability state sharing option on a 7000 or 8000 Series device restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 for more information.

Procedure

Step 1 Configure HA link interfaces for each device in the device high-availability pair; see Configuring HA Link Interfaces, on page 477.
Step 2 Choose Devices > Device Management.
Step 3 Next to the device high-availability pair you want to edit, click the edit icon (✍).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Step 4 In the State Sharing section, click the edit icon (✍).
Step 5  Decrease the state sharing values to improve paired peer readiness, or increase the values to allow better performance. We recommend you use the default values, unless your deployment presents a good reason to change them.

Step 6  Click OK.

What to do next
Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Device High Availability State Sharing Statistics for Troubleshooting

The sections below describe the statistics you can view for each device and how you can use them to troubleshoot your state sharing configuration for 7000 and 8000 Series device high-availability pairs.

Messages Received (Unicast)
Messages received are the number of high availability synchronization messages received from the paired peer.

The value should be close to the number of messages sent by the peer. During active use, the values may not match, but should be close. If traffic stops, the values should become stable and the messages received will match the messages sent.

For troubleshooting, you should view both the messages received and the messages sent, compare the rate of increase, and make sure the values are close. The sent value on each peer should be incrementing at approximately the same rate as the received value on the opposite peer.

Contact Support if the received messages stop incrementing or increment slower than the messages sent by the peer.

Packets Received
The system batches multiple messages into single packets in order to decrease overhead. The Packets Received counter displays the total number of these data packets, as well as other control packets that have been received by a device.

The value should be close to the number of packets sent by the peer device. During active use, the values may not match, but should be close. Because the number of messages received should be close and incrementing at the same rate as the number of messages sent by the peer, the number of packets received should have the same behavior.

For troubleshooting, you should view both the packets received and the messages sent, compare the rate of increase, and make sure the values are increasing at the same rate. If the sent value on the paired peer is incrementing, the received value on the device should also increase at the same rate.
Contact Support if the received packets stop incrementing or increment slower than the messages sent by the peer.

**Total Bytes Received**

Total bytes received are the number of bytes that make up the packets received by the peer.

The value should be close to the number of bytes sent by the other peer. During active use, the values may not match, but should be close.

For troubleshooting, you should view both the total bytes received and the messages sent, compare the rate of increase, and make sure the values are increasing at the same rate. If the sent value on the paired peer is incrementing, the received value on the device should also increase at the same rate.

Contact Support if the received bytes stop incrementing or increment slower than the messages sent by the peer.

**Protocol Bytes Received**

Protocol bytes received are the number of bytes of protocol overhead received, which includes everything but the payload of session state synchronization messages.

The value should be close to the number of bytes sent by the peer. During active use, the values may not match, but should be close.

For troubleshooting, you should view the total bytes received to discover how much actual state data is being shared in comparison to protocol data. If the protocol data is a large percentage of the data being sent, you can adjust the minimum sync interval.

Contact Support if the protocol bytes received increment at a similar rate to the total bytes received. Protocol bytes received should be minimal in relation to the total bytes received.

**Messages Sent**

Messages sent are the number of high availability synchronization messages sent to the paired peer.

This data is useful in comparison to the number of messages received. During active use, the values may not match, but should be close.

For troubleshooting, you should view both the messages received and the messages sent, compare the rate of increase, and make sure the values are close.

Contact Support if the messages sent increment at a similar rate to the total bytes received.

**Bytes Sent**

Bytes sent are the total number of bytes sent that make up the high availability synchronization messages sent to the peer.

This data are useful in comparison to the number of messages received. During active use, the values may not match, but should be close. The number of bytes received on the peer should be close to, but not more than this value.

Contact Support if the total bytes received is not incrementing at about the same rate as the bytes sent.
Tx Errors
Tx errors are the number of memory allocation failures the system encounters when trying to allocate space for messages to be sent to the paired peer.
This value should be zero at all times on both peers. Contact Support if this number is not zero or if the number steadily increases, which indicates the system has encountered an error where it cannot allocate memory.

Tx Overruns
Tx overruns are the number of times the system attempts and fails to place a message into the transit queue.
This value should be zero at all times on both peers. When the value is not zero or is steadily increasing, it indicates that the system is sharing too much data across the HA link that cannot be sent quickly enough.
You should increase the HA link MTU if it was previously set below the default value (9918 or 9922). You can change the minimum flow lifetime and minimum synchronization interval settings to reduce the amount of data shared across the HA link to prevent the number from incrementing.
Contact Support if this value persists or continues to increase.

Recent Logs
The system log displays the most recent high availability synchronization messages. The log should not display any ERROR or WARN messages. It should remain comparable between the peers, such as the same number of sockets being connected.
However, the data displayed may be opposite in some instances, for example, one peer reports that it received a connection from the other peer and references different IP addresses. The log provides a comprehensive view of the high availability state sharing connection, and any errors within the connection.
Contact Support if the log displays an ERROR or WARN message, or any message that does not appear to be purely informational.

Viewing Device High Availability State Sharing Statistics

<table>

<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you establish state sharing, you can view the following information about the configuration in the State Sharing section of the High Availability page:
- The HA link interface that is being used and its current link state
- Detailed synchronization statistics for troubleshooting issues

The state sharing statistics are primarily counters for different aspects of the high availability synchronization traffic sent and received, along with some other error counters. In addition, you can view the latest system logs for each device in the high-availability pair.
Separating Device High-Availability Pairs

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device high-availability pair you want to edit, click the edit icon (-pencil).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** In the State Sharing section, click the view statistics icon (-eye).

**Step 4** Choose a Device to view if your high-availability pair is composed of device stacks.

**Step 5** You can:

- Click Refresh to update the statistics.
- Click View to view the latest data log for each device in the high-availability pair.

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

When you separate, or "break," a 7000 or 8000 Series device high-availability pair:

- The active peer (device or stack) retains full deployment functionality
- The standby peer (device or stack) loses its interface configurations and fails over to the active peer, unless you choose to leave the interface configurations active, in which case the standby peer resumes normal operation.
- The standby peer always loses the configuration of passive interfaces.
- Any peer in maintenance mode resumes normal operation.

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the high-availability pair you want to break, click the Break HA icon (-chain-break).

**Step 3** Optionally, check the check box to remove the interface configurations on the standby peer.

This step administratively takes down all interfaces except for the management interface.

**Step 4** Click Yes.
CHAPTER 24

8000 Series Device Stacking

The following topics describe how to work with Firepower 8000 Series device stacks in the Firepower System:

- About Device Stacks, on page 513
- Device Stack Configuration, on page 515
- Establishing Device Stacks, on page 516
- Editing Device Stacks, on page 517
- Replacing a Device in a Stack, on page 517
- Replacing a Device in a Stack in a High-Availability Pair, on page 518
- Configuring Individual Devices in a Stack, on page 519
- Configuring Interfaces on a Stacked Device, on page 519
- Separating Stacked Devices, on page 520
- Replacing a Device in a Stack, on page 521

About Device Stacks

You can increase the amount of traffic inspected on a network segment by using devices in a stacked configuration. For each stacked configuration, all devices in the stack must have the same hardware. However, none, some, or all devices might have an installed malware storage pack. The devices must also be from the same device family based on the following stacked configurations:

The stacked configuration is supported for Firepower 8140, Firepower 8200 family, Firepower 8300 family devices.

For the 81xx Family:

- two Firepower 8140s

For the 82xx Family:

- up to four Firepower 8250s
- a Firepower 8260 (a primary device and a secondary device)
- a Firepower 8270 (a primary device with 40G capacity and two secondary devices)
- a Firepower 8290 (a primary device with 40G capacity and three secondary devices)
For the 83xx Family:

- up to four Firepower 8350s
- up to four AMP8350s
- a Firepower 8360 (a primary device with 40G capacity and a secondary device)
- an AMP8360 (a primary device with 40G capacity and a secondary device)
- a Firepower 8370 (a primary device with 40G capacity and two secondary devices)
- an AMP8370 (a primary device with 40G capacity and two secondary devices)
- a Firepower 8390 (a primary device with 40G capacity and three secondary devices)
- an AMP8390 (a primary device with 40G capacity and three secondary devices)

For more information about stacked configurations, see the Cisco Firepower 8000 Series Getting Started Guide. For more information about the malware storage pack, see the Firepower System Malware Storage Pack Guide.

Caution

Do not attempt to install a hard drive that was not supplied by Cisco in your device. Installing an unsupported hard drive may damage the device. Malware storage pack kits are available for purchase only from Cisco, and are for use only with 8000 Series devices. Contact Support if you require assistance with the malware storage pack. See the Firepower System Malware Storage Pack Guide for more information.

When you establish a stacked configuration, you combine the resources of each stacked device into a single, shared configuration.

You designate one device as the primary device, where you configure the interfaces for the entire stack. You designate the other devices as secondary. Secondary devices must not be currently sensing any traffic and must not have link on any interface.

Connect the primary device to the network segment you want to analyze in the same way you would configure a single device. Connect the secondary devices to the primary device using the stacked device cabling instructions found in the Cisco Firepower 8000 Series Getting Started Guide.

All devices in the stacked configuration must have the same hardware, run the same software version, and have the same licenses. If the devices are targeted by NAT policies, both the primary and secondary device must have the same NAT policy. You must deploy updates to the entire stack from the Firepower Management Center. If an update fails on one or more devices in the stack, the stack enters a mixed-version state. You cannot deploy policies to or update a stack in a mixed-version state. To correct this state, you can break the stack or remove individual devices with different versions, update the individual devices, then reestablish the stacked configuration. After you stack the devices, you can change the licenses only for the entire stack at once.

After you establish the stacked configuration, the devices act like a single, shared configuration. If the primary device fails, no traffic is passed to the secondary devices. Health alerts are generated indicating that the stacking heartbeat has failed on the secondary devices.

If the secondary device in a stack fails, inline sets with configurable bypass enabled go into bypass mode on the primary device. For all other configurations, the system continues to load balance traffic to the failed secondary device. In either case, a health alert is generated to indicate loss of link.
You can use a device stack as you would a single device in your deployment, with a few exceptions. If you have 7000 or 8000 Series devices in a high-availability pair, you cannot stack a device high-availability pair or a device in a high-availability pair. You also cannot configure NAT on a device stack.

**Note**

If you use eStreamer to stream event data from stacked devices to an external client application, collect the data from each device and ensure that you configure each device identically. The eStreamer settings are not automatically synchronized between stacked devices.

In a multidomain deployment, you can only stack devices that belong to the same domain.

**Related Topics**

- [About Health Monitoring](#), on page 273

## Device Stack Configuration

You can increase the amount of traffic inspected on a network segment by stacking two Firepower 8140 devices, up to four Firepower 8250s, a Firepower 8260, a Firepower 8270, a Firepower 8290, up to four Firepower 8350s, a Firepower 8360, a Firepower 8370, or a Firepower 8390 and using their combined resources in a single, shared, configuration. If you have 7000 or 8000 Series devices in a high-availability pair, you cannot stack a device high-availability pair or a device in a high-availability pair. However, you can configure two device stacks into a high-availability pair.

After you establish a device stack, the system treats the devices as a single device on the Device Management page. Device stacks display the stack icon (확정) in the appliance list.

Removing registration of a device stack from a Firepower Management Center also removes registration from both devices. You delete stacked devices from the Firepower Management Center as you would a single managed device; you can then register the stack on another Firepower Management Center. You only need to register one of the stacked devices on the new Firepower Management Center for the entire stack to appear.

After you establish the device stack, you cannot change which devices are primary or secondary unless you break and reestablish the stack. However, you can:

- add secondary devices to an existing stack of two or three Firepower 8250s, a Firepower 8260, or a Firepower 8270 up to the limit of four Firepower 8250s in a stack
- add secondary devices to an existing stack of two or three Firepower 8350s, a Firepower 8360, or a Firepower 8370 up to the limit of four Firepower 8350s in a stack

For additional devices, the primary device in the stack must have the necessary stacking NetMods for additional cabled devices. For example, if you have a Firepower 8260 where the primary only has a single stacking NetMod, you cannot add another secondary device to this stack. You add secondary devices to an existing stack in the same manner that you initially establish a stacked device configuration.
Establishing Device Stacks

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

</tbody>
</table>

All devices in a stack must be of the same hardware model (for example, a Firepower 8140 with another 8140). You can stack a total of four devices (one primary device and up to three secondary devices) in the 8200 family and in the 8300 family.

In a multidomain deployment, all devices in the stack must belong to the same domain.

**Before you begin**

- Decide which unit will be the primary device.
- Confirm that the units are cabled properly before designating the primary/secondary relationship. For information about cabling, see the Cisco Firepower 8000 Series Getting Started Guide.

**Procedure**

<table>
<thead>
<tr>

After you establish a device stack, most changes you make to the device configuration also change the configuration of the entire stack. On the Stack page of the appliance editor, you can make changes to the stack configuration as on the Device page of a single device.

You can change the display name of the stack, enable and disable licenses, view system and health policies, and configure advanced settings.

Procedure

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the stacked device where you want to edit the configuration, click the edit icon ( Modiﬁed).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Use the sections on the Stack page to make changes to the stacked configuration as you would a single device configuration.

Replacing a Device in a Stack

<table>

</tbody>
</table>

If the Firepower Management Center cannot communicate with the device, you must connect to the device and use CLI commands to separate the stack and unregister the device. For more information, see stacking disable and delete CLI commands in the relevant chapter: Classic Device CLI Configuration Commands, on page 2396.

To replace a device within a stack:
Procedure

Step 1 Select the stack with the device to replace and break that stack. For more information, see Separating Stacked Devices, on page 520.

Step 2 Unregister the device from the Firepower Management Center. For more information, see Deleting Devices from the Firepower Management Center, on page 230.

Step 3 Register the replacement device to the Firepower Management Center. For more information, see Add Devices to the Firepower Management Center, on page 228.

Step 4 Create a device stack that includes the replacement device. For more information, see Establishing Device Stacks, on page 516.

Replacing a Device in a Stack in a High-Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>Firepower 8140, 8200 family, 8300 family</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you place a stack that is a member of a high-availability pair into maintenance mode, you can replace a secondary device in the stack for another device. You can only select devices that are not currently stacked or paired. The new device must follow the same guidelines for establishing a device stack.

Procedure

Step 1 Choose Devices > Device Management.

Step 2 Next to the stack member you want to place into maintenance mode, click the toggle maintenance mode icon (esture)."

Step 3 Click Yes to confirm maintenance mode.

Step 4 Click the replace device icon (esture)."

Step 5 Choose the Replacement Device from the drop-down list.

Step 6 Click Replace to replace the device.

Step 7 Click the toggle maintenance mode icon (esture) again to bring the stack immediately out of maintenance mode."

Note You do not need to re-deploy the device configuration.
Configuring Individual Devices in a Stack

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>Firepower 8140, Firepower 8200 family, Firepower 8300 family</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you establish a device stack, you can still configure some attributes for an individual device within the stack. You can make changes to a device configured in a stack as you would for a single device. You can change the display name of a device, view system settings, shut down or restart a device, view health information, and edit device management settings.

Procedure

1. Choose **Devices > Device Management**.
2. Next to the stacked device where you want to edit the configuration, click the edit icon (Edit).
   In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
3. Click the **Device** tab.
4. From the **Selected Device** drop-down list, choose the device you want to modify.
5. Use the sections on the Devices page to make changes to the individual stacked device as you would a single device.

Configuring Interfaces on a Stacked Device

<table>
<thead>
<tr>

<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>Firepower 8140, Firepower 8200 family, Firepower 8300 family</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

With the exception of the management interface, you configure stacked device interfaces on the Interfaces page of the primary device in the stack. You can choose any device in the stack to configure the management interface.

The Interfaces page of a Firepower stacked device includes the hardware and interfaces views that you find on an individual device.
Separating Stacked Devices

Procedure

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the primary stacked device, click the edit icon (✏).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the Interfaces tab.

**Step 4** From the Selected Device drop-down list, choose the device you want to modify.

**Step 5** Configure interfaces as you would on an individual device; see Configuring Sensing Interfaces, on page 476.

<td>N/A</td>
<td>Any</td>
<td>FirePOWER 8140, 8200 family, 8300 family</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

If you no longer need to use a stacked configuration for your devices, you can break the stack and separate the devices.

**Note**
If a stacked device fails, or if communication fails between member devices of a stack, you cannot separate the stacked devices using the Firepower Management Center web interface. In this case, use the auxiliary CLI command `configure stacking disable` to remove the stack configuration from each device individually.

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device stack you want to break, click the break stack icon (🚫).

**Tip** To remove a secondary device from a stack of three or more Firepower 8250 devices without breaking the stack, click the remove from stack icon (🚫). Removing the secondary device causes a brief disruption of traffic inspection, traffic flow, or link state as the system reconfigures the stack for operation without the extra device.

**Step 3** Click Yes to separate the device stack.
Replacing a Device in a Stack

</tbody>
</table>

If the Firepower Management Center cannot communicate with the device, you must connect to the device and use CLI commands to separate the stack and unregister the device. For more information, see **stacking disable** and **delete** CLI commands in the relevant chapter: *Classic Device CLI Configuration Commands*, on page 2396.

To replace a device within a stack:

**Procedure**

**Step 1** Select the stack with the device to replace and break that stack. For more information, see *Separating Stacked Devices*, on page 520.

**Step 2** Unregister the device from the Firepower Management Center. For more information, see *Deleting Devices from the Firepower Management Center*, on page 230.

**Step 3** Register the replacement device to the Firepower Management Center. For more information, see *Add Devices to the Firepower Management Center*, on page 228.

**Step 4** Create a device stack that includes the replacement device. For more information, see *Establishing Device Stacks*, on page 516.
PART VII

Firepower Threat Defense Getting Started

• Transparent or Routed Firewall Mode for Firepower Threat Defense, on page 525
• Logical Devices for the Firepower Threat Defense on the Firepower 4100/9300, on page 537
CHAPTER 25

Transparent or Routed Firewall Mode for Firepower Threat Defense

This chapter describes how to set the firewall mode to routed or transparent, as well as how the firewall works in each firewall mode.

Note

The firewall mode only affects regular firewall interfaces, and not IPS-only interfaces such as inline sets or passive interfaces. IPS-only interfaces can be used in both firewall modes. See Inline Sets and Passive Interfaces for Firepower Threat Defense, on page 597 for more information about IPS-only interfaces. Inline sets might be familiar to you as "transparent inline sets," but the inline interface type is unrelated to the transparent firewall mode described in this chapter or the firewall-type interfaces.

- About the Firewall Mode, on page 525
- Default Settings, on page 533
- Guidelines for Firewall Mode, on page 533
- Set the Firewall Mode, on page 534

About the Firewall Mode

The Firepower Threat Defense device supports two firewall modes for regular firewall interfaces: Routed Firewall mode and Transparent Firewall mode.

About Routed Firewall Mode

In routed mode, the Firepower Threat Defense device is considered to be a router hop in the network. Each interface that you want to route between is on a different subnet.

About Transparent Firewall Mode

Traditionally, a firewall is a routed hop and acts as a default gateway for hosts that connect to one of its screened subnets. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices. However, like any other firewall, access control between interfaces is controlled, and all of the usual firewall checks are in place.
Layer 2 connectivity is achieved by using a "bridge group" where you group together the inside and outside interfaces for a network, and the Firepower Threat Defense device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. You can have multiple bridge groups for multiple networks. In transparent mode, these bridge groups cannot communicate with each other.

Using the Transparent Firewall in Your Network

The Firepower Threat Defense device connects the same network between its interfaces. Because the firewall is not a routed hop, you can easily introduce a transparent firewall into an existing network.

The following figure shows a typical transparent firewall network where the outside devices are on the same subnet as the inside devices. The inside router and hosts appear to be directly connected to the outside router.

**Figure 3: Transparent Firewall Network**

**Diagnostic Interface**

In addition to each Bridge Virtual Interface (BVI) IP address, you can add a separate Diagnostic slot/port interface that is not part of any bridge group, and that allows only management traffic to the Firepower Threat Defense device.

**Passing Traffic For Routed-Mode Features**

For features that are not directly supported on the transparent firewall, you can allow traffic to pass through so that upstream and downstream routers can support the functionality. For example, by using an access rule, you can allow DHCP traffic (instead of the unsupported DHCP relay feature) or multicast traffic such as that created by IP/TV. You can also establish routing protocol adjacencies through a transparent firewall; you can allow OSPF, RIP, EIGRP, or BGP traffic through based on an access rule. Likewise, protocols like HSRP or VRRP can pass through the Firepower Threat Defense device.
About Bridge Groups

A bridge group is a group of interfaces that the Firepower Threat Defense device bridges instead of routes. Bridge groups are only supported in Transparent Firewall Mode. Like any other firewall interfaces, access control between interfaces is controlled, and all of the usual firewall checks are in place.

Bridge Virtual Interface (BVI)

Each bridge group includes a Bridge Virtual Interface (BVI). The Firepower Threat Defense device uses the BVI IP address as the source address for packets originating from the bridge group. The BVI IP address must be on the same subnet as the bridge group member interfaces. The BVI does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.

Only bridge group member interfaces are named and can be used with interface-based features.

Bridge Groups in Transparent Firewall Mode

Bridge group traffic is isolated from other bridge groups; traffic is not routed to another bridge group within the Firepower Threat Defense device, and traffic must exit the Firepower Threat Defense device before it is routed by an external router back to another bridge group in the Firepower Threat Defense device. Although the bridging functions are separate for each bridge group, many other functions are shared between all bridge groups. For example, all bridge groups share a syslog server or AAA server configuration.

You can include multiple interfaces per bridge group. See Guidelines for Firewall Mode, on page 533 for the exact number of bridge groups and interfaces supported. If you use more than 2 interfaces per bridge group, you can control communication between multiple segments on the same network, and not just between inside and outside. For example, if you have three inside segments that you do not want to communicate with each other, you can put each segment on a separate interface, and only allow them to communicate with the outside interface. Or you can customize the access rules between interfaces to allow only as much access as desired.

The following figure shows two networks connected to the Firepower Threat Defense device, which has two bridge groups.
Bridge Groups in Routed Firewall Mode

Bridge group traffic can be routed to other bridge groups or routed interfaces. You can choose to isolate bridge group traffic by not assigning a name to the BVI interface for the bridge group. If you name the BVI, then the BVI participates in routing like any other regular interface.

One use for a bridge group in routed mode is to use extra interfaces on the Firepower Threat Defense device instead of an external switch. For example, the default configuration for some devices include an outside interface as a regular interface, and then all other interfaces assigned to the inside bridge group. Because the purpose of this bridge group is to replace an external switch, you need to configure an access policy so all bridge group interfaces can freely communicate.
Allowing Layer 3 Traffic

- Unicast IPv4 and IPv6 traffic requires an access rule to be allowed through the bridge group.
- ARPs are allowed through the bridge group in both directions without an access rule. ARP traffic can be controlled by ARP inspection.
- IPv6 neighbor discovery and router solicitation packets can be passed using access rules.
- Broadcast and multicast traffic can be passed using access rules.

Allowed MAC Addresses

The following destination MAC addresses are allowed through the bridge group if allowed by your access policy (see Allowing Layer 3 Traffic, on page 529). Any MAC address not on this list is dropped.

- TRUE broadcast destination MAC address equal to FFFF.FFFF.FFFF
- IPv4 multicast MAC addresses from 0100.5E00.0000 to 0100.5EFE.FFFF
- IPv6 multicast MAC addresses from 3333.0000.0000 to 3333.FFFF.FFFF
- BPDU multicast address equal to 0100.0CCC.CCCD
BPDU Handling

To prevent loops using the Spanning Tree Protocol, BPDUs are passed by default.

MAC Address vs. Route Lookups

For traffic within a bridge group, the outgoing interface of a packet is determined by performing a destination MAC address lookup instead of a route lookup.

Route lookups, however, are necessary for the following situations:

- Traffic originating on the Firepower Threat Defense device—Add a default/static route on the Firepower Threat Defense device for traffic destined for a remote network where a syslog server, for example, is located.
- Voice over IP (VoIP) and TFTP traffic, and the endpoint is at least one hop away—Add a static route on the Firepower Threat Defense device for traffic destined for the remote endpoint so that secondary connections are successful. The Firepower Threat Defense device creates a temporary "pinhole" in the access control policy to allow the secondary connection; and because the connection might use a different set of IP addresses than the primary connection, the Firepower Threat Defense device needs to perform a route lookup to install the pinhole on the correct interface.

Affected applications include:

- H.323
- RTSP
- SIP
- Skinny (SCCP)
- SQL*Net
- SunRPC
- TFTP

- Traffic at least one hop away for which the Firepower Threat Defense device performs NAT—Configure a static route on the Firepower Threat Defense device for traffic destined for the remote network. You also need a static route on the upstream router for traffic destined for the mapped addresses to be sent to the Firepower Threat Defense device.

This routing requirement is also true for embedded IP addresses for VoIP and DNS with NAT enabled, and the embedded IP addresses are at least one hop away. The Firepower Threat Defense device needs to identify the correct egress interface so it can perform the translation.
Unsupported Features for Bridge Groups in Transparent Mode

The following table lists the features are not supported in bridge groups in transparent mode.

**Table 62: Unsupported Features in Transparent Mode**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic DNS</td>
<td></td>
</tr>
<tr>
<td>DHCP relay</td>
<td>The transparent firewall can act as a DHCPv4 server, but it does not support DHCP relay. DHCP relay is not required because you can allow DHCP traffic to pass through using two access rules: one that allows DCHP requests from the inside interface to the outside, and one that allows the replies from the server in the other direction.</td>
</tr>
</tbody>
</table>
### Unsupported Features for Bridge Groups in Routed Mode

The following table lists the features are not supported in bridge groups in routed mode.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EtherChannel member interfaces</td>
<td>Only physical interfaces, redundant interfaces, and subinterfaces are supported as bridge group member interfaces. Diagnostic interfaces are also not supported.</td>
</tr>
<tr>
<td>Clustering</td>
<td>Bridge groups are not supported in clustering.</td>
</tr>
<tr>
<td>Dynamic DNS</td>
<td></td>
</tr>
<tr>
<td>DHCP relay</td>
<td>The routed firewall can act as a DHCPv4 server, but it does not support DHCP relay on BVIs or bridge group member interfaces.</td>
</tr>
<tr>
<td>Dynamic routing protocols</td>
<td>You can, however, add static routes for BVIs. You can also allow dynamic routing protocols through the Firepower Threat Defense device using an access rule. Non-bridge group interfaces support dynamic routing.</td>
</tr>
<tr>
<td>Multicast IP routing</td>
<td>You can allow multicast traffic through the Firepower Threat Defense device by allowing it in an access rule. Non-bridge group interfaces support multicast routing.</td>
</tr>
<tr>
<td>QoS</td>
<td>Non-bridge group interfaces support QoS.</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>VPN termination for through traffic</td>
<td>You cannot terminate a VPN connection on the BVI. Non-bridge group interfaces support VPN. Bridge group member interfaces support site-to-site VPN tunnels for management connections only. It does not terminate VPN connections for traffic through the Firepower Threat Defense device. You can pass VPN traffic through the bridge group using an access rule, but it does not terminate non-management connections.</td>
</tr>
</tbody>
</table>

**Default Settings**

**Bridge Group Defaults**

By default, all ARP packets are passed within the bridge group.

**Guidelines for Firewall Mode**

**Bridge Group Guidelines (Transparent Mode)**

- You can create up to 250 bridge groups, with 4 interfaces per bridge group.
- Each directly-connected network must be on the same subnet.
- The Firepower Threat Defense device does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.
- For IPv4, an IP address for the BVI is required for each bridge group for both management traffic and for traffic to pass through the Firepower Threat Defense device. IPv6 addresses are supported, but not required for the BVI.
- You can only configure IPv6 addresses manually.
- The BVI IP address must be on the same subnet as the connected network. You cannot set the subnet to a host subnet (255.255.255.255).
- Management interfaces are not supported as bridge group members.
- In transparent mode, you must use at least 1 bridge group; data interfaces must belong to a bridge group.
- In transparent mode, do not specify the BVI IP address as the default gateway for connected devices; devices need to specify the router on the other side of the Firepower Threat Defense device as the default gateway.
- In transparent mode, the default route, which is required to provide a return path for management traffic, is only applied to management traffic from one bridge group network. This is because the default route specifies an interface in the bridge group as well as the router IP address on the bridge group network, and you can only define one default route. If you have management traffic from more than one bridge network, you must create additional bridge groups for each network to route traffic.
group network, you need to specify a regular static route that identifies the network from which you expect management traffic.

- In transparent mode, PPPoE is not supported for the Diagnostic interface.
- Bidirectional Forwarding Detection (BFD) echo packets are not allowed through the FTD when using bridge group members. If there are two neighbors on either side of the FTD running BFD, then the FTD will drop BFD echo packets because they have the same source and destination IP address and appear to be part of a LAND attack.

## Set the Firewall Mode

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

You can set the firewall mode when you perform the initial system setup at the CLI. We recommend setting the firewall mode during setup because changing the firewall mode erases your configuration to ensure you do not have incompatible settings. If you need to change the firewall mode later, you must do so from the CLI.

### Procedure

**Step 1**
Deregister the FTD device from the FMC.
You cannot change the mode until you deregister the device.

a) Choose Devices > Device Management.
b) Select the device from the list of managed devices.
c) Delete the device (click Trash can), confirm, and wait for system to remove the device.

**Step 2**
Access the FTD device CLI, preferably from the console port.
If you use SSH to the diagnostic interface, then changing the mode erases your interface configuration and you will be disconnected. You should instead connect to the management interface.

**Step 3**
Change the firewall mode:
```
configure firewall [routed | transparent]
```

**Example:**
```
> configure firewall transparent
This will destroy the current interface configurations, are you sure that you want to proceed? [y/N] y
The firewall mode was changed successfully.
```

**Step 4**
Re-register with the FMC:
```
configure manager add {hostname | ip_address | DONTRESOLVE} reg_key [nat_id]
```
where:

- `{hostname | ip_address | DONTRESOLVE}` specifies either the fully qualified host name or IP address of the FMC. If the FMC is not directly addressable, use DONTRESOLVE.

- `reg_key` is the unique alphanumeric registration key required to register a device to the FMC.

- `nat_id` is an optional alphanumeric string used during the registration process between the FMC and the device. It is required if the hostname is set to DONTRESOLVE.
Set the Firewall Mode
CHAPTER 26

Logical Devices for the Firepower Threat Defense on the Firepower 4100/9300

The Firepower 4100/9300 is a flexible security platform on which you can install one or more logical devices. Before you can add the FTD to the FMC, you must configure chassis interfaces, add a logical device, and assign interfaces to the device on the Firepower 4100/9300 chassis using the Firepower Chassis Manager or the FXOS CLI. This chapter describes basic interface configuration and how to add a standalone or High Availability logical device using the Firepower Chassis Manager. To add a clustered logical device, see Clustering for the Firepower Threat Defense, on page 647. To use the FXOS CLI, see the FXOS CLI configuration guide. For more advanced FXOS procedures and troubleshooting, see the FXOS configuration guide.

- About Firepower Interfaces, on page 537
- About Logical Devices, on page 539
- Requirements and Prerequisites for Logical Devices, on page 539
- Guidelines and Limitations for Logical Devices, on page 540
- Configure Interfaces, on page 541
- Configure Logical Devices, on page 544
- History for Firepower Threat Defense Logical Devices, on page 551

About Firepower Interfaces

The Firepower 4100/9300 chassis supports physical interfaces and EtherChannel (port-channel) interfaces. EtherChannel interfaces can include up to 16 member interfaces of the same type.

Chassis Management Interface

The chassis management interface is used for management of the FXOS Chassis by SSH or Firepower Chassis Manager. This interface appears at the top of the Interfaces tab as MGMT, and you can only enable or disable this interface on the Interfaces tab. This interface is separate from the mgmt-type interface that you assign to the logical devices for application management.

To configure parameters for this interface, you must configure them from the CLI. To view information about this interface in the FXOS CLI, connect to local management and show the management port:

Firepower # connect local-mgmt
Firepower(local-mgmt) # show mgmt-port
Note that the chassis management interface remains up even if the physical cable or SFP module are unplugged, or if the `mgmt-port shut` command is performed.

Interface Types

Each interface can be one of the following types:

- **Data**—Use for regular data. Data interfaces cannot be shared between logical devices, and logical devices cannot communicate over the backplane to other logical devices. For traffic on Data interfaces, all traffic must exit the chassis on one interface and return on another interface to reach another logical device.

- **Mgmt**—Use to manage application instances. These interfaces can be shared by one or more logical devices to access external hosts; logical devices cannot communicate over this interface with other logical devices that share the interface. You can only assign one management interface per logical device.

- **Firepower-eventing**—Use as a secondary management interface for FTD devices. To use this interface, you must configure its IP address and other parameters at the FTD CLI. For example, you can separate management traffic from events (such as web events). See Management Interfaces, on page 799.

  Firepower-eventing interfaces can be shared by one or more logical devices to access external hosts; logical devices cannot communicate over this interface with other logical devices that share the interface.

- **Cluster**—Use as the cluster control link for a clustered logical device. By default, the cluster control link is automatically created on Port-channel 48. The Cluster type is only supported on EtherChannel interfaces.

FXOS Interfaces vs. Application Interfaces

The Firepower 4100/9300 manages the basic Ethernet settings of physical interfaces and EtherChannel (port-channel) interfaces. Within the application, you configure higher level settings. For example, you can only create EtherChannels in FXOS; but you can assign an IP address to the EtherChannel within the application.

The following sections describe the interaction between FXOS and the application for interfaces.

**VLAN Subinterfaces**

For all logical devices, you can create VLAN subinterfaces within the application.

**Independent Interface States in the Chassis and in the Application**

You can administratively enable and disable interfaces in both the chassis and in the application. For an interface to be operational, the interface must be enabled in both operating systems. Because the interface state is controlled independently, you may have a mismatch between the chassis and application.

Inline Set Link State Propagation for the Firepower Threat Defense

An inline set acts like a bump on the wire, and binds two interfaces together to slot into an existing network. This function allows the system to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of an inline set unless explicitly dropped.

When you configure an inline set in the FTD application and enable link state propagation, the FTD sends inline set membership to the FXOS chassis. Link state propagation means that the chassis automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down.
When the downed interface comes back up, the second interface automatically comes back up, also. In other words, if the link state of one interface changes, the chassis senses the change and updates the link state of the other interface to match it. Note that the chassis requires up to 4 seconds to propagate link state changes. Link state propagation is especially useful in resilient network environments where routers are configured to reroute traffic automatically around network devices that are in a failure state.

About Logical Devices

A logical device lets you run one application instance (either ASA or Firepower Threat Defense) and also one optional decorator application (Radware DefensePro) to form a service chain. When you add a logical device, you also define the application instance type and version, assign interfaces, and configure bootstrap settings that are pushed to the application configuration.

Note

For the Firepower 9300, you must install the same application instance type (ASA or FTD) on all modules in the chassis; different types are not supported at this time. Note that modules can run different versions of an application instance type.

Standalone and Clustered Logical Devices

You can add the following logical device types:

- Standalone—A standalone logical device operates as a standalone unit or as a unit in a High Availability pair.
- Cluster—A clustered logical device lets you group multiple units together, providing all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices. Multiple module devices, like the Firepower 9300, support intra-chassis clustering. For the Firepower 9300, all three modules must participate in the cluster.

Requirements and Prerequisites for Logical Devices

See the following sections for requirements and prerequisites.

Requirements and Prerequisites for Hardware and Software Combinations

The Firepower 4100/9300 supports multiple models, security modules, application types, and high availability and scalability features. See the following requirements for allowed combinations.

Firepower 9300 Requirements

The Firepower 9300 includes 3 security module slots and multiple types of security modules. See the following requirements:

- Security Module Types—All modules in the Firepower 9300 must be the same type.
• Clustering—All security modules in the cluster, whether it is intra-chassis or inter-chassis, must be the same type. You can have different quantities of installed security modules in each chassis, although all modules present in the chassis must belong to the cluster including any empty slots. For example, you can install 2 SM-36s in chassis 1, and 3 SM-36s in chassis 2.

• High Availability—High Availability is only supported between same-type modules on the Firepower 9300.

• ASA and FTD application types—You can only install one application type on the chassis, ASA or FTD.

• ASA or FTD versions—You can run different versions of an application instance type on separate modules. For example, you can install FTD 6.3 on module 1, FTD 6.4 on module 2, and FTD 6.5 on module 3.

Firepower 4100 Requirements

The Firepower 4100 comes in multiple models. See the following requirements:

• Clustering—All chassis in the cluster must be the same model.

• High Availability—High Availability is only supported between same-type models.

• ASA and FTD application types—The Firepower 4100 can only run a single application type.

Requirements and Prerequisites for High Availability

• The two units in a High Availability Failover configuration must:
  • Be on a separate chassis; intra-chassis High Availability for the Firepower 9300 is not supported.
  • Be the same model.
  • Have the same interfaces assigned to the High Availability logical devices.
  • Have the same number and types of interfaces. All interfaces must be preconfigured in FXOS identically before you enable High Availability.

• For High Availability system requirements, see High Availability System Requirements, on page 621.

Guidelines and Limitations for Logical Devices

See the following sections for guidelines and limitations.

Guidelines and Limitations for Firepower Interfaces

Inline Sets for FTD

• Supported for physical interfaces only (both regular and breakout ports); EtherChannels are not supported.
• Link state propagation is supported.
Hardware Bypass

- Supported for the FTD; you can use them as regular interfaces for the ASA.
- The FTD only supports Hardware Bypass with inline sets.
- Hardware Bypass-capable interfaces cannot be configured for breakout ports.
- You cannot include Hardware Bypass interfaces in an EtherChannel and use them for Hardware Bypass; you can use them as regular interfaces in an EtherChannel.
- Hardware Bypass is not supported with High Availability.

Default MAC Addresses

Default MAC address assignments depend on the type of interface.

- Physical interfaces—The physical interface uses the burned-in MAC address.
- EtherChannels—For an EtherChannel, all interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. The port-channel interface uses a unique MAC address from a pool; interface membership does not affect the MAC address.

General Guidelines and Limitations

**Firewall Mode**

You can set the firewall mode to routed or transparent in the bootstrap configuration for the FTD.

**High Availability**

- Configure high availability within the application configuration.
- You can use any data interfaces as the failover and state links.

**Context Mode**

- Multiple context mode is only supported on the ASA.

Configure Interfaces

By default, physical interfaces are disabled. You can enable interfaces, add EtherChannels, and edit interface properties.

Enable or Disable an Interface

You can change the **Admin State** of each interface to be enabled or disabled. By default, physical interfaces are disabled.
Configure a Physical Interface

You can physically enable and disable interfaces, as well as set the interface speed and duplex. To use an interface, it must be physically enabled in FXOS and logically enabled in the application.

**Before you begin**
- Interfaces that are already a member of an EtherChannel cannot be modified individually. Be sure to configure settings before you add it to the EtherChannel.

**Procedure**

**Step 1** Choose **Interfaces** to open the Interfaces page.

The **All Interfaces** page shows a visual representation of the currently installed interfaces at the top of the page and provides a listing of the installed interfaces in the table below.

**Step 2** Click **Edit** in the row for the interface you want to edit to open the **Edit Interface** dialog box.

**Step 3** To enable the interface, check the **Enable** check box. To disable the interface, uncheck the **Enable** check box.

**Step 4** Choose the interface **Type**:
- **Data**
- **Mgmt**
- **Firepower-eventing**—For FTD only.
- **Cluster**—Do not choose the **Cluster** type; by default, the cluster control link is automatically created on Port-channel 48.

**Step 5** (Optional) Choose the speed of the interface from the **Speed** drop-down list.
Step 6 (Optional) If your interface supports Auto Negotiation, click the Yes or No radio button.
Step 7 (Optional) Choose the duplex of the interface from the Duplex drop-down list.
Step 8 Click OK.

Add an EtherChannel (Port Channel)

An EtherChannel (also known as a port channel) can include up to 16 member interfaces of the same type. The Link Aggregation Control Protocol (LACP) aggregates interfaces by exchanging the Link Aggregation Control Protocol Data Units (LACPDUs) between two network devices.

The Firepower 4100/9300 chassis only supports EtherChannels in Active LACP mode so that each member interface sends and receives LACP updates. An active EtherChannel can establish connectivity with either an active or a passive EtherChannel. You should use the active mode unless you need to minimize the amount of LACP traffic.

LACP coordinates the automatic addition and deletion of links to the EtherChannel without user intervention. It also handles misconfigurations and checks that both ends of member interfaces are connected to the correct channel group.

When the Firepower 4100/9300 chassis creates an EtherChannel, the EtherChannel stays in a Suspended state until you assign it to a logical device, even if the physical link is up. The EtherChannel will be brought out of this Suspended state in the following situations:

- The EtherChannel is added as a data or management interface for a standalone logical device
- The EtherChannel is added as a management interface or cluster control link for a logical device that is part of a cluster
- The EtherChannel is added as a data interface for a logical device that is part of a cluster and at least one unit has joined the cluster

Note that the EtherChannel does not come up until you assign it to a logical device. If the EtherChannel is removed from the logical device or the logical device is deleted, the EtherChannel will revert to a Suspended state.

Procedure

Step 1 Choose Interfaces to open the Interfaces page.

The All Interfaces page shows a visual representation of the currently installed interfaces at the top of the page and provides a listing of the installed interfaces in the table below.

Step 2 Click Add Port Channel above the interfaces table to open the Add Port Channel dialog box.

Step 3 Enter an ID for the port channel in the Port Channel ID field. Valid values are between 1 and 47.

Port-channel 48 is reserved for the cluster control link when you deploy a clustered logical device. If you do not want to use Port-channel 48 for the cluster control link, you can delete it and configure a Cluster type EtherChannel with a different ID. For intra-chassis clustering, do not assign any interfaces to the Cluster EtherChannel.
Step 4 To enable the port channel, check the Enable check box. To disable the port channel, uncheck the Enable check box.

Step 5 Choose the interface Type:

- Data
- Mgmt
- Firepower-eventing—For FTD only.
- Cluster

Step 6 Set the Admin Speed of the member interfaces from the drop-down list.

Step 7 Set the Admin Duplex, Full Duplex or Half Duplex.

Step 8 To add an interface to the port channel, select the interface in the Available Interface list and click Add Interface to move the interface to the Member ID list. You can add up to 16 interfaces of the same type and speed.

**Tip** You can add multiple interfaces at one time. To select multiple individual interfaces, click on the desired interfaces while holding down the Ctrl key. To select a range of interfaces, select the first interface in the range, and then, while holding down the Shift key, click to select the last interface in the range.

Step 9 To remove an interface from the port channel, click the Delete button to the right of the interface in the Member ID list.

Step 10 Click OK.

---

**Configure Logical Devices**

Add a standalone logical device or a High Availability pair on the Firepower 4100/9300 chassis. For clustering, see Clustering for the Firepower Threat Defense, on page 647.

**Add a Standalone Firepower Threat Defense**

Standalone logical devices work either alone or in a High Availability pair. On the Firepower 9300 with multiple security modules, you can deploy either a cluster or standalone devices. The cluster must use all modules, so you cannot mix and match a 2-module cluster plus a single standalone device, for example.

**Before you begin**

- Download the application image you want to use for the logical device from Cisco.com, and then upload that image to the Firepower 4100/9300 chassis.

**Note** For the Firepower 9300, you must install the same application instance type (ASA or FTD) on all modules in the chassis; different types are not supported at this time. Note that modules can run different versions of an application instance type.
• Configure a management interface to use with the logical device. The management interface is required. Note that this management interface is not the same as the chassis management port that is used only for chassis management (and that appears at the top of the Interfaces tab as MGMT).

• You must also configure at least one Data type interface. Optionally, you can also create a firepower-eventing interface to carry all event traffic (such as web events). See Interface Types, on page 538 for more information.

• Gather the following information:
  • Interface IDs for this device
  • Management interface IP address and network mask
  • Gateway IP address
  • FMC IP address and/or NAT ID of your choosing
  • DNS server IP address
  • FTD hostname and domain name

Procedure

Step 1 Choose Logical Devices.

Step 2 Click Add Device, and set the following parameters:
   a) Provide a Device Name. This name is used by the chassis supervisor to configure management settings and to assign interfaces; it is not the device name used in the application configuration.
   b) For the Template, choose Cisco Firepower Threat Defense.
   c) Choose the Image Version.
   d) For the Usage, click the Standalone radio button.
   e) Click OK.

   You see the Provisioning - device name window.

Step 3 Expand the Data Ports area, and click each interface that you want to assign to the device.

You can only assign data interfaces that you previously enabled on the Interfaces page. You will later enable and configure these interfaces in FMC, including setting the IP addresses.

Hardware Bypass-capable ports are shown with the following icon(3,512),(7,518). For certain interface modules, you can enable the Hardware Bypass feature for Inline Set interfaces only (see the FMC configuration guide). Hardware Bypass ensures that traffic continues to flow between an inline interface pair during a power outage. This feature can be used to maintain network connectivity in the case of software or hardware failures. If you do not assign both interfaces in a Hardware Bypass pair, you see a warning message to make sure your assignment is intentional. You do not need to use the Hardware Bypass feature, so you can assign single interfaces if you prefer.

Step 4 Click the device icon in the center of the screen.
A dialog box appears where you can configure initial bootstrap settings. These settings are meant for initial deployment only, or for disaster recovery. For normal operation, you can later change most values in the application CLI configuration.

**Step 5**

On the **General Information** page, complete the following:

a) (For the Firepower 9300) Under **Security Module Selection** click the security module that you want to use for this logical device.

b) Choose the **Management Interface**.

   This interface is used to manage the logical device. This interface is separate from the chassis management port.

c) Choose the management interface **Address Type**: **IPv4 only**, **IPv6 only**, or **IPv4 and IPv6**.

d) Configure the **Management IP** address.

   Set a unique IP address for this interface.

e) Enter a **Network Mask** or **Prefix Length**.

f) Enter a **Network Gateway** address.

**Step 6**

On the **Settings** tab, complete the following:

a) Enter the **Firepower Management Center IP** of the managing FMC.

b) Enter the **Search Domains** as a comma-separated list.

c) Choose the **Firewall Mode**: **Transparent** or **Routed**.

   In routed mode, the FTD is considered to be a router hop in the network. Each interface that you want to route between is on a different subnet. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices.

   The firewall mode is only set at initial deployment. If you re-apply the bootstrap settings, this setting is not used.

d) Enter the **DNS Servers** as a comma-separated list.

   The FTD uses DNS if you specify a hostname for the FMC, for example.

e) Enter the **Fully Qualified Hostname** for the FTD.

f) Enter a **Registration Key** to be shared between the FMC and the device during registration.

   You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the FTD.

g) Enter a **Password** for the FTD admin user for CLI access.

h) Choose the **Eventing Interface** on which Firepower events should be sent. If not specified, the management interface will be used.

   This interface must be defined as a Firepower-eventing interface.

**Step 7**

On the **Agreement** tab, read and accept the end user license agreement (EULA).

**Step 8**

Click **OK** to close the configuration dialog box.

**Step 9**

Click **Save**.

The chassis deploys the logical device by downloading the specified software version and pushing the bootstrap configuration and management interface settings to the application instance. Check the **Logical Devices** page for the status of the new logical device. When the logical device shows its **Status** as **online**, you can start configuring the security policy in the application.
Step 10  See the FMC configuration guide to add the FTD as a managed device and start configuring your security policy.

Add a High Availability Pair

FTD High Availability (also known as failover) is configured within the application, not in FXOS. However, to prepare your chassis for high availability, see the following steps.

Before you begin

See Requirements and Prerequisites for High Availability, on page 540.

Procedure

Step 1  Allocate the same interfaces to each logical device.

Step 2  Allocate 1 or 2 data interfaces for the failover and state link(s).

These interfaces exchange high availability traffic between the 2 chassis. We recommend that you use a 10 GB data interface for a combined failover and state link. If you have available interfaces, you can use separate failover and state links; the state link requires the most bandwidth. You cannot use the management-type interface for the failover or state link. We recommend that you use a switch between the chassis, with no other device on the same network segment as the failover interfaces.

Step 3  Enable High Availability on the logical devices. See High Availability for Firepower Threat Defense, on page 621.

Step 4  If you need to make interface changes after you enable High Availability, perform the changes on the standby unit first, and then perform the changes on the active unit.

Change an Interface on a Firepower Threat Defense Logical Device

You can allocate or unallocate an interface, or replace a management interface on the FTD logical device. You can then sync the interface configuration in FMC.
Adding a new interface, or deleting an unused interface has minimal impact on the FTD configuration. However, deleting an interface that is used in your security policy will impact the configuration. Interfaces can be referenced directly in many places in the FTD configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Policies that refer to security zones are not affected. You can also edit the membership of an allocated EtherChannel without affecting the logical device or requiring a sync on the FMC.

Deleting an interface will delete any configuration associated with that interface.

**Before you begin**

- Configure your interfaces, and add any EtherChannels according to Configure a Physical Interface, on page 542 and Add an EtherChannel (Port Channel), on page 543.

- If you want to add an already-allocated interface to an EtherChannel (for example, all interfaces are allocated by default to a cluster), you need to unallocate the interface from the logical device first, then add the interface to the EtherChannel. For a new EtherChannel, you can then allocate the EtherChannel to the device.

- If you want to replace the management or firepower eventing interface with a management EtherChannel, then you need to create the EtherChannel with at least 1 unallocated data member interface, and then replace the current management interface with the EtherChannel. After the FTD reboots (management interface changes cause a reboot), and you sync the configuration in FMC, you can add the (now unallocated) management interface to the EtherChannel as well.

- For clustering or High Availability, make sure you add or remove the interface on all units before you sync the configuration in the FMC. We recommend that you make the interface changes on the slave/standby unit(s) first, and then on the master/active unit. Note that new interfaces are added in an administratively down state, so they do not affect interface monitoring.

**Procedure**

**Step 1**  
In the Firepower Chassis Manager, choose Logical Devices.

**Step 2**  
Click the Edit icon at the top right to edit the logical device.

**Step 3**  
Allocate a new data interface by selecting the interface in the Data Ports area.

Do not delete any interfaces yet.
Step 4  Replace the management or eventing interface:

For these types of interfaces, the device reboots after you save your changes.

a) Click the device icon in the center of the page.
b) On the General or Cluster Information tab, choose the new Management Interface from the drop-down list.
c) On the Settings tab, choose the new Eventing Interface from the drop-down list.
d) Click OK.

If you change the IP address of the Management interface, then you must also change the IP address for the device in the Firepower Management Center: go to Devices > Device Management > Device/Cluster. In the Management area, set the IP address to match the bootstrap configuration address.

Step 5  Click Save.

Step 6  Sync the interfaces in FMC.

a) Log into the FMC.
b) Select Devices > Device Management and click the edit icon (edit) for your FTD device. The Interfaces page is selected by default.
c) Click the Sync Device button on the top left of the Interfaces page.
d) After the changes are detected, you will see a red banner on the Interfaces page indicating that the interface configuration has changed. Click the Click to know more link to view the interface changes.
e) If you plan to delete an interface, manually transfer any interface configuration from the old interface to the new interface.

Because you have not yet deleted any interfaces, you can refer to the existing configuration.
f) Click Save.
g) Select the devices and click Deploy to deploy the policy to the assigned devices. The changes are not active until you deploy them.

Step 7  In Firepower Chassis Manager, unallocate a data interface by de-selecting the interface in the Data Ports area.

Step 8  Click Save.

Step 9  Sync the interfaces again in FMC.
Connect to the Console of the Application

Use the following procedure to connect to the console of the application.

Procedure

Step 1
Connect to the module CLI.

`connect module slot_number console`

To connect to the security engine of a device that does not support multiple security modules, always use 1 as the `slot_number`.

Example:

```
Firepower# connect module 1 console
Telnet escape character is '~'.
Trying 127.5.1.1...
Connected to 127.5.1.1.
Escape character is '~'.

CISCO Serial Over LAN:
Close Network Connection to Exit

Firepower-module1>
```

Step 2
Connect to the application console.

`connect ftd`

Example:

```
Firepower-module1> connect ftd
Connecting to ftd(ftd-native) console... enter exit to return to bootCLI
[...]
>
```

Step 3
Exit the application console to the FXOS module CLI.

- FTD—Enter `Ctrl-a, d`

Step 4
Return to the supervisor level of the FXOS CLI.

a) Enter ~

You exit to the Telnet application.

b) To exit the Telnet application, enter:

`telnet>quit`

Firepower Threat Defense Interfaces and Device Settings

• Interface Overview for Firepower Threat Defense, on page 555
• Regular Firewall Interfaces for Firepower Threat Defense, on page 561
• Inline Sets and Passive Interfaces for Firepower Threat Defense, on page 597
• DHCP and DDNS Services for Threat Defense, on page 605
• Quality of Service (QoS) for Firepower Threat Defense, on page 613
CHAPTER 27

Interface Overview for Firepower Threat Defense

The FTD device includes data interfaces that you can configure in different modes, as well as a management/diagnostic interface.

- Management/Diagnostic Interface, on page 555
- Interface Mode and Types, on page 556
- Security Zones and Interface Groups, on page 557
- Auto-MDI/MDIX Feature, on page 557
- Default Settings for Interfaces, on page 557
- Enable the Physical Interface and Configure Ethernet Settings, on page 558
- Sync Interface Changes with the Firepower Management Center, on page 559

Management/Diagnostic Interface

The physical management interface is shared between the Diagnostic logical interface and the Management logical interface.

Management Interface

The Management logical interface is separate from the other interfaces on the device. It is used to set up and register the device to the Firepower Management Center. It uses its own IP address and static routing. You can configure its settings at the CLI using the `configure network` command. If you change the IP address at the CLI after you add it to the Firepower Management Center, you can match the IP address in the Firepower Management Center in the Devices > Device Management > Devices > Management area.

Diagnostic Interface

The Diagnostic logical interface can be configured along with the rest of the data interfaces on the Devices > Device Management > Interfaces screen. Using the Diagnostic interface is optional (see the routed and transparent mode deployments for scenarios). The Diagnostic interface only allows management traffic, and does not allow through traffic. It does not support SSH; you can SSH to data interfaces or to the Management interface only. The Diagnostic interface is useful for SNMP or syslog monitoring.
Interface Mode and Types

You can deploy FTD interfaces in two modes: Regular firewall mode and IPS-only mode. You can include both firewall and IPS-only interfaces on the same device.

Regular Firewall Mode

Firewall mode interfaces subject traffic to firewall functions such as maintaining flows, tracking flow states at both IP and TCP layers, IP defragmentation, and TCP normalization. You can also optionally configure IPS functions for this traffic according to your security policy.

The types of firewall interfaces you can configure depends on the firewall mode set for the device: routed or transparent mode. See Transparent or Routed Firewall Mode for Firepower Threat Defense, on page 525 for more information.

- Routed mode interfaces (routed firewall mode only)—Each interface that you want to route between is on a different subnet.
- Bridge group interfaces (transparent firewall mode only)—You can group together multiple interfaces on a network, and the Firepower Threat Defense device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. each bridge group is separate and cannot communicate with each other.

IPS-Only Mode

IPS-only mode interfaces bypass many firewall checks and only support IPS security policy. You might want to implement IPS-only interfaces if you have a separate firewall protecting these interfaces and do not want the overhead of firewall functions.

The firewall mode only affects regular firewall interfaces, and not IPS-only interfaces such as inline sets or passive interfaces. IPS-only interfaces can be used in both firewall modes.

IPS-only interfaces can be deployed as the following types:

- Inline Set, with optional Tap mode—An inline set acts like a bump on the wire, and binds two interfaces together to slot into an existing network. This function allows the system to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of an inline set unless explicitly dropped.

With tap mode, the device is deployed inline, but instead of the packet flow passing through the device, a copy of each packet is sent to the device and the network traffic flow is undisturbed. However, rules of these types do generate intrusion events when they are triggered, and the table view of intrusion events indicates that the triggering packets would have dropped in an inline deployment. There are benefits to using tap mode with devices that are deployed inline. For example, you can set up the cabling between the device and the network as if the device were inline and analyze the kinds of intrusion events the device generates. Based on the results, you can modify your intrusion policy and add the drop rules that best protect your network without impacting its efficiency. When you are ready to deploy the device inline, you can disable tap mode and begin dropping suspicious traffic without having to reconfigure the cabling between the device and the network.
Inline sets might be familiar to you as "transparent inline sets," but the inline interface type is unrelated to the transparent firewall mode or the firewall-type interfaces.

- Passive or ERSPAN Passive—Passive interfaces monitor traffic flowing across a network using a switch SPAN or mirror port. The SPAN or mirror port allows for traffic to be copied from other ports on the switch. This function provides the system visibility within the network without being in the flow of network traffic. When configured in a passive deployment, the system cannot take certain actions such as blocking or shaping traffic. Passive interfaces receive all traffic unconditionally and no traffic received on these interfaces is retransmitted. Encapsulated remote switched port analyzer (ERSPAN) interfaces allow you to monitor traffic from source ports distributed over multiple switches, and uses GRE to encapsulate the traffic. ERSPAN interfaces are only allowed when the device is in routed firewall mode.

Security Zones and Interface Groups

Each interface must be assigned to a security zone and/or interface group. You then apply your security policy based on zones or groups. For example, you can assign the inside interface to the inside zone; and the outside interface to the outside zone. You can configure your access control policy to enable traffic to go from inside to outside, but not from outside to inside, for example. Some policies only support security zones, while other policies support zones and groups. For specifics, see Interface Objects: Interface Groups and Security Zones, on page 403. You can create security zones and interface groups on the Objects page. You can also add a zone when you are configuring the interface. You can only add interfaces to the correct zone type for your interface, either Passive, Inline, Routed, or Switched zone types.

The Diagnostic/Management interface does not belong to a zone or interface group.

Auto-MDI/MDIX Feature

For RJ-45 interfaces, the default auto-negotiation setting also includes the Auto-MDI/MDIX feature. Auto-MDI/MDIX eliminates the need for crossover cabling by performing an internal crossover when a straight cable is detected during the auto-negotiation phase. Either the speed or duplex must be set to auto-negotiate to enable Auto-MDI/MDIX for the interface. If you explicitly set both the speed and duplex to a fixed value, thus disabling auto-negotiation for both settings, then Auto-MDI/MDIX is also disabled. For Gigabit Ethernet, when the speed and duplex are set to 1000 and full, then the interface always auto-negotiates; therefore Auto-MDI/MDIX is always enabled and you cannot disable it.

Default Settings for Interfaces

This section lists default settings for interfaces.

Default State of Interfaces

The default state of an interface depends on the type.

- Physical interfaces—Disabled. The exception is the Diagnostic interface that is enabled for initial setup.
• Redundant Interfaces—Enabled. However, for traffic to pass through the redundant interface, the member physical interfaces must also be enabled.

• VLAN subinterfaces—Enabled. However, for traffic to pass through the subinterface, the physical interface must also be enabled.

• EtherChannel port-channel interfaces (ASA models)—Enabled. However, for traffic to pass through the EtherChannel, the channel group physical interfaces must also be enabled.

• EtherChannel port-channel interfaces (Firepower models)—Disabled.

**Note**

For the Firepower 4100/9300, you can administratively enable and disable interfaces in both the chassis and in the FMC. For an interface to be operational, the interface must be enabled in both operating systems. Because the interface state is controlled independently, you may have a mismatch between the chassis and FMC.

**Default Speed and Duplex**

By default, the speed and duplex for copper (RJ-45) interfaces are set to auto-negotiate.

---

### Enable the Physical Interface and Configure Ethernet Settings

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

This section describes how to:

• Enable the physical interface. By default, physical interfaces are disabled (with the exception of the Diagnostic interface).

• Set a specific speed and duplex. By default, speed and duplex are set to Auto.

This procedure only covers a small subset of Interface settings. Refrain from setting other parameters at this point. For example, you cannot name an interface that you want to use as part of an EtherChannel or redundant interface.

**Note**

For the Firepower 4100/9300, you configure basic interface settings in FXOS. See Configure a Physical Interface, on page 542 for more information.

**Before you begin**

If you changed the physical interfaces on the device after you added it to the FMC, you need to refresh the interface listing by clicking **Sync Interfaces from device** on the top left of **Interfaces**.
**Procedure**

**Step 1** Select Devices > Device Management and click the edit icon (ู่) for your FTD device. The Interfaces tab is selected by default.

**Step 2** Click the edit icon (ู่) for the interface you want to edit.

**Step 3** Enable the interface by checking the Enabled check box.

**Step 4** (Optional) Add a description in the Description field. The description can be up to 200 characters on a single line, without carriage returns.

**Step 5** (Optional) Set the duplex and speed by clicking Hardware Configuration.
- **Duplex**—Choose Full, Half, or Auto. Auto is the default when the interface supports it.
- **Speed**—Choose 10, 100, 1000, or Auto. Auto is the default. The type of interface limits the options you can select.

**Step 6** In the Mode drop-down list, choose one of the following:
- **None**—Choose this setting for regular firewall interfaces and inline sets. The mode will automatically be changed to Routed, Switched, or Inline based on further configuration.
- **Passive**—Choose this setting for passive IPS-only interfaces.
- **Erspan**—Choose this setting for ERSPAN passive IPS-only interfaces.

**Step 7** Click OK.

**Step 8** Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

### Sync Interface Changes with the Firepower Management Center

<table>

<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

Interface configuration changes on the device can cause the FMC and the device to get out of sync. The FMC can detect interface changes by one of the following methods:

- Event sent from the device
- Sync when you deploy from the FMC

If the FMC detects interface changes when it attempts to deploy, the deploy will fail. You must first accept the interface changes.
• Manual sync

Adding a new interface, or deleting an unused interface has minimal impact on the FTD configuration. However, deleting an interface that is used in your security policy will impact the configuration. Interfaces can be referenced directly in many places in the FTD configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Deleting an interface will delete any configuration associated with that interface. Policies that refer to security zones are not affected. You can also edit the membership of an allocated EtherChannel without affecting the logical device or requiring a sync on the FMC.

This procedure describes how to manually sync device changes if required and how to save the detected changes. If device changes are temporary, you should not save the changes in the FMC; you should wait until the device is stable, and then re-sync.

Procedure

---

**Step 1** Select **Devices > Device Management** and click the edit icon (✍️) for your FTD device. The **Interfaces** tab is selected by default.

**Step 2** If required, click **Sync Device** on the top left of **Interfaces**.

**Step 3** After the changes are detected, you will see a red banner on **Interfaces** indicating that the interface configuration has changed. Click the **Click to know more** link to view the interface changes.

**Step 4** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---
Regular Firewall Interfaces for Firepower Threat Defense

This chapter includes regular firewall FTD interface configuration including EtherChannels, VLAN subinterfaces, IP addressing, and more.

**Note**
For initial interface configuration on the Firepower 4100/9300, see Configure Interfaces, on page 541.

- Configure EtherChannel and Redundant Interfaces, on page 561
- Configure VLAN Subinterfaces and 802.1Q Trunking, on page 569
- Configure Routed and Transparent Mode Interfaces, on page 571

### Configure EtherChannel and Redundant Interfaces

This section tells how to configure EtherChannels and redundant interfaces.

**Note**
For the Firepower 4100/9300, you configure EtherChannels in FXOS. See Add an EtherChannel (Port Channel), on page 543 for more information.

**Note**
Only ASA 5500-X models support redundant interfaces; Firepower models do not support them.

### About EtherChannels and Redundant Interfaces

This section describes EtherChannels and Redundant Interfaces.
About Redundant Interfaces (ASA Platform Only)

A logical redundant interface consists of a pair of physical interfaces: an active and a standby interface. When the active interface fails, the standby interface becomes active and starts passing traffic. You can configure a redundant interface to increase the Firepower Threat Defense device reliability.

You can configure up to 8 redundant interface pairs.

Redundant Interface MAC Address

The redundant interface uses the MAC address of the first physical interface that you add. If you change the order of the member interfaces in the configuration, then the MAC address changes to match the MAC address of the interface that is now listed first. Alternatively, you can assign a manual MAC address to the redundant interface, which is used regardless of the member interface MAC addresses. When the active interface fails over to the standby, the same MAC address is maintained so that traffic is not disrupted.

About EtherChannels

An 802.3ad EtherChannel is a logical interface (called a port-channel interface) consisting of a bundle of individual Ethernet links (a channel group) so that you increase the bandwidth for a single network. A port channel interface is used in the same way as a physical interface when you configure interface-related features.

You can configure up to 48 EtherChannels, depending on how many interfaces your model supports.

Channel Group Interfaces

Each channel group can have up to 16 active interfaces. For switches that support only 8 active interfaces, you can assign up to 16 interfaces to a channel group: while only 8 interfaces can be active, the remaining interfaces can act as standby links in case of interface failure. For 16 active interfaces, be sure that your switch supports the feature (for example, the Cisco Nexus 7000 with F2-Series 10 Gigabit Ethernet Module).

All interfaces in the channel group must be the same type and speed. The first interface added to the channel group determines the correct type and speed.

The EtherChannel aggregates the traffic across all the available active interfaces in the channel. The interface is selected using a proprietary hash algorithm, based on source or destination MAC addresses, IP addresses, TCP and UDP port numbers and VLAN numbers.

Connecting to an EtherChannel on Another Device

The device to which you connect the FTD EtherChannel must also support 802.3ad EtherChannels; for example, you can connect to the Catalyst 6500 switch or the Cisco Nexus 7000.

When the switch is part of a Virtual Switching System (VSS) or Virtual Port Channel (vPC), then you can connect FTD interfaces within the same EtherChannel to separate switches in the VSS/vPC. The switch interfaces are members of the same EtherChannel port-channel interface, because the separate switches act like a single switch.
If you use the FTD in an Active/Standby failover deployment, then you need to create separate EtherChannels on the switches in the VSS/vPC, one for each FTD. On each FTD, a single EtherChannel connects to both switches. Even if you could group all switch interfaces into a single EtherChannel connecting to both FTD (in this case, the EtherChannel will not be established because of the separate FTD system IDs), a single EtherChannel would not be desirable because you do not want traffic sent to the standby FTD.

Link Aggregation Control Protocol

The Link Aggregation Control Protocol (LACP) aggregates interfaces by exchanging the Link Aggregation Control Protocol Data Units (LACPDUs) between two network devices.

You can configure each physical interface in an EtherChannel to be:

- **Active**—Sends and receives LACP updates. An active EtherChannel can establish connectivity with either an active or a passive EtherChannel. You should use the active mode unless you need to minimize the amount of LACP traffic.
- **Passive**—Receives LACP updates. A passive EtherChannel can only establish connectivity with an active EtherChannel. Not supported on Firepower hardware models.
- **On**—The EtherChannel is always on, and LACP is not used. An “on” EtherChannel can only establish a connection with another “on” EtherChannel. Not supported on Firepower hardware models.
LACP coordinates the automatic addition and deletion of links to the EtherChannel without user intervention. It also handles misconfigurations and checks that both ends of member interfaces are connected to the correct channel group. “On” mode cannot use standby interfaces in the channel group when an interface goes down, and the connectivity and configurations are not checked.

**Load Balancing**

The FTD distributes packets to the interfaces in the EtherChannel by hashing the source and destination IP address of the packet (this criteria is configurable). The resulting hash is divided by the number of active links in a modulo operation where the resulting remainder determines which interface owns the flow. All packets with a `hash_value mod active_links` result of 0 go to the first interface in the EtherChannel, packets with a result of 1 go to the second interface, packets with a result of 2 go to the third interface, and so on. For example, if you have 15 active links, then the modulo operation provides values from 0 to 14. For 6 active links, the values are 0 to 5, and so on.

If an active interface goes down and is not replaced by a standby interface, then traffic is rebalanced between the remaining links. The failure is masked from both Spanning Tree at Layer 2 and the routing table at Layer 3, so the switchover is transparent to other network devices.

**EtherChannel MAC Address**

All interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links.

The port-channel interface uses the lowest numbered channel group interface MAC address as the port-channel MAC address. Alternatively, you can manually configure a MAC address for the port-channel interface. We recommend manually configuring a unique MAC address in case the group channel interface membership changes. If you remove the interface that was providing the port-channel MAC address, then the port-channel MAC address changes to the next lowest numbered interface, thus causing traffic disruption.

**Guidelines for EtherChannels and Redundant Interfaces**

**High Availability**

- When you use a redundant or EtherChannel interface as a High Availability link, it must be pre-configured on both units in the High Availability pair; you cannot configure it on the primary unit and expect it to replicate to the secondary unit because the High Availability link itself is required for replication.

- If you use a redundant or EtherChannel interface for the state link, no special configuration is required; the configuration can replicate from the primary unit as normal. For the Firepower 4100/9300 chassis, all interfaces, including EtherChannels, need to be pre-configured on both units.

- You can monitor redundant or EtherChannel interfaces for High Availability. When an active member interface fails over to a standby interface, this activity does not cause the redundant or EtherChannel interface to appear to be failed when being monitored for device-level High Availability. Only when all physical interfaces fail does the redundant or EtherChannel interface appear to be failed (for an EtherChannel interface, the number of member interfaces allowed to fail is configurable).

- If you use an EtherChannel interface for a High Availability or state link, then to prevent out-of-order packets, only one interface in the EtherChannel is used. If that interface fails, then the next interface in the EtherChannel is used. You cannot alter the EtherChannel configuration while it is in use as a High Availability link. To alter the configuration, you need to temporarily disable High Availability, which prevents High Availability from occurring for the duration.
Model Support

- You cannot add EtherChannels in FMC for the Firepower 4100/9300 or FTDv. The Firepower 4100/9300 supports EtherChannels, but you must perform all hardware configuration of EtherChannels in FXOS on the chassis.

- Redundant interfaces are only supported on the ASA 5500-X platform; they are not supported on the Firepower 4100/9300 chassis, FTDv.

General Redundant Interface Guidelines

- You can configure up to 8 redundant interface pairs.

- All FTD configuration refers to the logical redundant interface instead of the member physical interfaces.

- You cannot use a redundant interface as part of an EtherChannel, nor can you use an EtherChannel as part of a redundant interface. You cannot use the same physical interfaces in a redundant interface and an EtherChannel interface. You can, however, configure both types on the FTD if they do not use the same physical interfaces.

- If you shut down the active interface, then the standby interface becomes active.

- Redundant interfaces do not support Diagnostic slot/port interfaces as members. You can, however, set a redundant interface comprised of non-Diagnostic interfaces as management-only.

General EtherChannel Guidelines

- You can configure up to 48 EtherChannels, depending on how many interfaces are available on your model.

- Each channel group can have up to 16 active interfaces. For switches that support only 8 active interfaces, you can assign up to 16 interfaces to a channel group: while only 8 interfaces can be active, the remaining interfaces can act as standby links in case of interface failure. For 16 active interfaces, be sure that your switch supports the feature (for example, the Cisco Nexus 7000 with F2-Series 10 Gigabit Ethernet Module).

- All interfaces in the channel group must be the same type and speed. The first interface added to the channel group determines the correct type and speed.

- The device to which you connect the FTD EtherChannel must also support 802.3ad EtherChannels.

- The FTD does not support LACPDUs that are VLAN-tagged. If you enable native VLAN tagging on the neighboring switch using the Cisco IOS `vlan dot1Q tag native` command, then the FTD will drop the tagged LACPDUs. Be sure to disable native VLAN tagging on the neighboring switch.

- ASA 5500-X models do not support LACP rate fast; LACP always uses the normal rate. This setting is not configurable. Note that the Firepower 4100/9300, which configures EtherChannels in FXOS, has the LACP rate set to fast by default; on these platforms, the rate is configurable.

- In Cisco IOS software versions earlier than 15.1(1)S2, the FTD did not support connecting an EtherChannel to a switch stack. With default switch settings, if the FTD EtherChannel is connected cross stack, and if the master switch is powered down, then the EtherChannel connected to the remaining switch will not come up. To improve compatibility, set the `stack-mac persistent timer` command to a large enough value to account for reload time; for example, 8 minutes or 0 for indefinite. Or, you can upgrade to more a more stable switch software version, such as 15.1(1)S2.
Configure a Redundant Interface (ASA Platform Only)

A logical redundant interface consists of a pair of physical interfaces: an active and a standby interface. When the active interface fails, the standby interface becomes active and starts passing traffic. You can configure a redundant interface to increase the FTD reliability. By default, redundant interfaces are enabled.

- You can configure up to 8 redundant interface pairs.
- Both member interfaces must be of the same physical type. For example, both must be GigabitEthernet.

**Note**

Redundant interfaces are not supported on the Firepower platform; only ASA 5500-X models support redundant interfaces.

**Before you begin**

- You cannot add a physical interface to the redundant interface if you configured a name for it. You must first remove the name.

**Caution**

If you are using a physical interface already in your configuration, removing the name will clear any configuration that refers to the interface.

**Procedure**

**Step 1**
Select Devices > Device Management and click the edit icon (-pencil) for your FTD device. The Interfaces tab is selected by default.

**Step 2**
Enable the member interfaces according to Enable the Physical Interface and Configure Ethernet Settings, on page 558.

**Step 3**
Click Add Interfaces > Redundant Interface.

**Step 4**
On the General tab, set the following parameters:

a) **Redundant ID**—Set an integer between 1 and 8.
b) **Primary Interface**—Choose an interface from the drop-down list. After you add the interface, any configuration for it (such as an IP address) is removed.

c) **Secondary Interface**—The second interface must be the same physical type as the first interface.

**Step 5**  
Click **OK**.

**Step 6**  
Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

**Step 7**  
(Optional) Add a VLAN subinterface. See **Add a Subinterface**, on page 570.

**Step 8**  
Configure the routed or transparent mode interface parameters. See **Configure Routed Mode Interfaces**, on page 575 or **Configure Transparent Mode Bridge Group Interfaces**, on page 577.

</tr>
</tbody>
</table>

This section describes how to create an EtherChannel port-channel interface, assign interfaces to the EtherChannel, and customize the EtherChannel.

**Guidelines**

- You can configure up to 48 EtherChannels, depending on the number of interfaces for your model.
- Each channel group can have up to 16 active interfaces. For switches that support only 8 active interfaces, you can assign up to 16 interfaces to a channel group: while only 8 interfaces can be active, the remaining interfaces can act as standby links in case of interface failure.
- All interfaces in the channel group must be the same type, speed, and duplex. Half duplex is not supported.

**Note**  
For the Firepower 4100/9300, you configure EtherChannels in FXOS. See **Add an EtherChannel (Port Channel)**, on page 543 for more information.

**Before you begin**

- You cannot add a physical interface to the channel group if you configured a name for it. You must first remove the name.

**Note**  
If you are using a physical interface already in your configuration, removing the name will clear any configuration that refers to the interface.
## Configure an EtherChannel

**Procedure**

**Step 1**
Select **Devices > Device Management** and click the edit icon (📝) for your FTD device. The **Interfaces** tab is selected by default.

**Step 2**
Enable the member interfaces according to **Enable the Physical Interface and Configure Ethernet Settings**, on page 558.

**Step 3**
Click **Add Interfaces > Ether Channel Interface**.

**Step 4**
On the **General** tab, set the **Ether Channel ID** to a number between 1 and 48.

**Step 5**
In the **Available Interfaces** area, click an interface and then click **Add** to move it to the **Selected Interfaces** area. Repeat for all interfaces that you want to make members.

Make sure all interfaces are the same type and speed. The first interface you add determines the type and speed of the EtherChannel. Any non-matching interfaces you add will be put into a suspended state. The FMC does not prevent you from adding non-matching interfaces.

**Step 6**
(Optional) Click the **Advanced** tab to customize the EtherChannel. Set the following parameters on the **Information** sub-tab:

- **Load Balancing** — Select the criteria used to load balance the packets across the group channel interfaces. By default, the FTD device balances the packet load on interfaces according to the source and destination IP address of the packet. If you want to change the properties on which the packet is categorized, choose a different set of criteria. For example, if your traffic is biased heavily towards the same source and destination IP addresses, then the traffic assignment to interfaces in the EtherChannel will be unbalanced. Changing to a different algorithm can result in more evenly distributed traffic. For more information about load balancing, see **Load Balancing**, on page 564.

- **LACP Mode** — Choose Active, Passive, or On. We recommend using Active mode (the default).

- **Active Physical Interface: Range** — From the left drop-down list, choose the minimum number of active interfaces required for the EtherChannel to be active, between 1 and 16. The default is 1. From the right drop-down list, choose the maximum number of active interfaces allowed in the EtherChannel, between 1 and 16. The default is 16. If your switch does not support 16 active interfaces, be sure to set this command to 8 or fewer.

- **Active Mac Address** — Set a manual MAC address if desired. The mac_address is in H.H.H format, where H is a 16-bit hexadecimal digit. For example, the MAC address 00-0C-F1-42-4C-DE is entered as 000C.F142.4CDE.

**Step 7**
(Optional) Click the **Hardware Configuration** tab and set the Duplex and Speed to override these settings for all member interfaces. This method provides a shortcut to set these parameters because these parameters must match for all interfaces in the channel group.

**Step 8**
Click **OK**.

**Step 9**
Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

**Step 10**
(Optional) Add a VLAN subinterface. See **Add a Subinterface**, on page 570.
Step 11 Configure the routed or transparent mode interface parameters. See Configure Routed Mode Interfaces, on page 575 or Configure Transparent Mode Bridge Group Interfaces, on page 577.

Configure VLAN Subinterfaces and 802.1Q Trunking

VLAN subinterfaces let you divide a physical, redundant, or EtherChannel interface into multiple logical interfaces that are tagged with different VLAN IDs. An interface with one or more VLAN subinterfaces is automatically configured as an 802.1Q trunk. Because VLANs let you keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or devices.

Guidelines and Limitations for VLAN Subinterfaces

High Availability
You cannot use a subinterface for the failover or state link.

Additional Guidelines

- Preventing untagged packets on the physical interface—If you use subinterfaces, you typically do not also want the physical interface to pass traffic, because the physical interface passes untagged packets. This property is also true for the active physical interface in a redundant interface pair and for EtherChannel links. Because the physical, redundant, or EtherChannel interface must be enabled for the subinterface to pass traffic, ensure that the physical, redundant, or EtherChannel interface does not pass traffic by not configuring a name for the interface. If you want to let the physical, redundant, or EtherChannel interface pass untagged packets, you can configure the name as usual.

- You cannot configure subinterfaces on the Diagnostic interface.

- The FTD does not support the Dynamic Trunking Protocol (DTP), so you must configure the connected switch port to trunk unconditionally.

- You might want to assign unique MAC addresses to subinterfaces defined on the FTD, because they use the same burned-in MAC address of the parent interface. For example, your service provider might perform access control based on the MAC address. Also, because IPv6 link-local addresses are generated based on the MAC address, assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the FTD.

Maximum Number of VLAN Subinterfaces by Device Model

The device model limits the maximum number of VLAN subinterfaces that you can configure. Note that you can configure subinterfaces on data interfaces only, you cannot configure them on the management interface.

The following table explains the limits for each device model.

<table>
<thead>
<tr>
<th>Model</th>
<th>Maximum VLAN Subinterfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firepower 4100</td>

</tr>
</tbody>
</table>

Add one or more subinterfaces to a physical, redundant, or port-channel interface.

**Note**

The parent physical interface passes untagged packets. You may not want to pass untagged packets, so be sure not to include the parent interface in your security policy.

**Procedure**

**Step 1**  
Select Devices > Device Management and click the edit icon (edit icon) for your FTD device. The Interfaces tab is selected by default.

**Step 2**  
Enable the parent interface according to Enable the Physical Interface and Configure Ethernet Settings, on page 558.

**Step 3**  
Click Add Interfaces > Sub Interface.

**Step 4**  
On General, set the following parameters:
Configure Routed and Transparent Mode Interfaces

This section includes tasks to complete the regular interface configuration for all models in routed or transparent firewall mode.

About Routed and Transparent Mode Interfaces

The Firepower Threat Defense device supports two types of interfaces: routed and bridged. Each Layer 3 routed interface requires an IP address on a unique subnet.

Bridged interfaces belong to a bridge group, and all interfaces are on the same network. The bridge group is represented by a Bridge Virtual Interface (BVI) that has an IP address on the bridge network. Routed mode only supports routed interfaces. Transparent firewall mode only supports bridge group and BVI interfaces.

Routed Mode Deployment

We recommend that you do not configure an IP address for the Diagnostic interface if you do not have an inside router. The benefit to leaving the IP address off of the Diagnostic interface is that you can place the Management interface on the same network as any other data interfaces. If you configure the Diagnostic interface, its IP address is typically on the same network as the Management IP address, and it counts as a regular interface that cannot be on the same network as any other data interfaces. Because the Management interface requires Internet access for updates, putting Management on the same network as an inside interface means you can deploy the FTD device with only a switch on the inside and point to the inside interface as its gateway. See the following deployment that uses an inside switch:
To cable the above scenario on the ASA 5506-X, ASA 5508-X, or ASA 5516-X, see the following:

If you configure the Diagnostic IP address, then you need an inside router:
Transparent Mode Deployment

Like the routed mode deployment, you can choose to deploy the device with an inside switch, in which case you need to keep the Diagnostic interface without an IP address:

Or you can deploy with an inside router, in which case you can use the Diagnostic interface with an IP address for additional management access:

Dual IP Stack (IPv4 and IPv6)

The Firepower Threat Defense device supports both IPv6 and IPv4 addresses on an interface. Make sure you configure a default route for both IPv4 and IPv6.

Guidelines and Requirements for Routed and Transparent Mode Interfaces

High Availability

- Do not configure failover links with the procedures in this chapter. See the High Availability chapter for more information.
- When you use High Availability, you must set the IP address and standby address for data interfaces manually; DHCP and PPPoE are not supported. Set the standby IP addresses on the Devices > Device Management > High Availability tab in the Monitored Interfaces area. See the High Availability chapter for more information.
IPv6

- IPv6 is supported on all interfaces.
- You can only configure IPv6 addresses manually in transparent mode.
- The Firepower Threat Defense device does not support IPv6 anycast addresses.

Transparent Mode and Bridge Group Guidelines

- You can create up to 250 bridge groups, with 4 interfaces per bridge group.
- Each directly-connected network must be on the same subnet.
- The Firepower Threat Defense device does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.
- For IPv4, an IP address for the BVI is required for each bridge group for both management traffic and for traffic to pass through the Firepower Threat Defense device. IPv6 addresses are supported, but not required for the BVI.
- You can only configure IPv6 addresses manually.
- The BVI IP address must be on the same subnet as the connected network. You cannot set the subnet to a host subnet (255.255.255.255).
- Management interfaces are not supported as bridge group members.
- In transparent mode, you must use at least 1 bridge group; data interfaces must belong to a bridge group.
- In transparent mode, do not specify the BVI IP address as the default gateway for connected devices; devices need to specify the router on the other side of the Firepower Threat Defense device as the default gateway.
- In transparent mode, the default route, which is required to provide a return path for management traffic, is only applied to management traffic from one bridge group network. This is because the default route specifies an interface in the bridge group as well as the router IP address on the bridge group network, and you can only define one default route. If you have management traffic from more than one bridge group network, you need to specify a regular static route that identifies the network from which you expect management traffic.
- In transparent mode, PPPoE is not supported for the Diagnostic interface.
- Bidirectional Forwarding Detection (BFD) echo packets are not allowed through the FTD when using bridge group members. If there are two neighbors on either side of the FTD running BFD, then the FTD will drop BFD echo packets because they have the same source and destination IP address and appear to be part of a LAND attack.

Additional Guidelines and Requirements

- The FTD does not support more than one 802.1Q header in a packet (known as Q-in-Q support) for firewall interfaces. Note that for all models except for the Firepower 4100/9300, inline sets and passive interfaces support Q-in-Q, up to two VLAN tags; the Firepower 4100/9300 models do not support Q-in-Q for any type of interface.
Configure Routed Mode Interfaces

<table>
<thead>
<tr>

</tbody>
</table>

This procedure describes how to set the name, security zone, and IPv4 address.

**Before you begin**

- **Firepower 4100/9300**
  1. Configure a Physical Interface, on page 542
  2. (Optional) Configure any special interfaces.
     - Add an EtherChannel (Port Channel), on page 543
     - Add a Subinterface, on page 570 in FMC

- (Optional) **All other models:**
  - Configure a Redundant Interface (ASA Platform Only), on page 566
  - Configure an EtherChannel, on page 567
  - Add a Subinterface, on page 570

**Procedure**

**Step 1**  
Select Devices > Device Management and click the edit icon (📝) for your FTD device. The Interfaces tab is selected by default.

**Step 2**  
Click the edit icon (📝) for the interface you want to edit.

**Step 3**  
In the Name field, enter a name up to 48 characters in length.

**Step 4**  
Enable the interface by checking the Enabled check box.

**Step 5**  
(Optional) Set this interface to Management Only to limit traffic to management traffic; through-the-box traffic is not allowed.

**Step 6**  
(Optional) Add a description in the Description field.

The description can be up to 200 characters on a single line, without carriage returns.

**Step 7**  
In the Mode drop-down list, choose None.

Regular firewall interfaces have the mode set to None. The other modes are for IPS-only interface types.

**Step 8**  
From the Security Zone drop-down list, choose a security zone or add a new one by clicking New.

The routed interface is a Routed-type interface, and can only belong to Routed-type zones.

**Step 9**  
See Configure the MTU, on page 589 for information about the MTU.
**Step 10**

Click the IPv4 tab. To set the IP address, use one of the following options from the IP Type drop-down list. High Availability and clustering interfaces only support static IP address configuration; DHCP and PPPoE are not supported.

- **Use Static IP**—Enter the IP address and subnet mask. For High Availability, you can only use a static IP address. Set the standby IP address on the Devices > Device Management > High Availability tab in the Monitored Interfaces area. If you do not set the standby IP address, the active unit cannot monitor the standby interface using network tests; it can only track the link state.

- **Use DHCP**—Configure the following optional parameters:
  - **Obtain default route using DHCP**—Obtains the default route from the DHCP server.
  - **DHCP route metric**—Assigns an administrative distance to the learned route, between 1 and 255. The default administrative distance for the learned routes is 1.

- **Use PPPoE**—If the interface is connected to a DSL, cable modem, or other connection to your ISP, and your ISP uses PPPoE to provide your IP address, configure the following parameters:
  - **VPDN Group Name**—Specify a group name of your choice to represent this connection.
  - **PPPoE User Name**—Specify the username provided by your ISP.
  - **PPPoE Password/Confirm Password**—Specify and confirm the password provided by your ISP.
  - **PPP Authentication**—Choose PAP, CHAP, or MSCHAP.
    PAP passes a cleartext username and password during authentication and is not secure. With CHAP, the client returns the encrypted [challenge plus password], with a cleartext username in response to the server challenge. CHAP is more secure than PAP, but it does not encrypt data. MSCHAP is similar to CHAP but is more secure because the server stores and compares only encrypted passwords rather than cleartext passwords as in CHAP. MSCHAP also generates a key for data encryption by MPPE.
  - **PPPoE route metric**—Assign an administrative distance to the learned route. Valid values are from 1 to 255. By default, the administrative distance for the learned routes is 1.
  - **Store Username and Password in Flash**—Stores the username and password in flash memory. The FTD device stores the username and password in a special location of NVRAM.

**Step 11**

(Optional) See Configure IPv6 Addressing, on page 581 to configure IPv6 addressing on the IPv6 tab.

**Step 12**

(Optional) See Configure the MAC Address, on page 590 to manually configure the MAC address on the Advanced tab.

**Step 13**

(Optional) Set the duplex and speed by clicking the Hardware Configuration tab.

- **Duplex**—Choose Full, Half, or Auto. Auto is the default when the interface supports it.
- **Speed**—Choose 10, 100, 1000, or Auto. Auto is the default. The type of interface limits the options you can select.

**Step 14**

Click OK.

**Step 15**

Click Save.
You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

**Configure Transparent Mode Bridge Group Interfaces**

A bridge group is a group of interfaces that the Firepower Threat Defense device bridges instead of routes. Bridge groups are only supported in Transparent Firewall Mode. For more information about bridge groups, see [About Bridge Groups](#), on page 527.

To configure bridge groups and associated interfaces, perform these steps.

**Configure General Bridge Group Member Interface Parameters**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin Network</td>
</tr>
</tbody>
</table>

This procedure describes how to set the name and security zone for each bridge group member interface. The same bridge group can include different types of interfaces: physical interfaces, VLAN subinterfaces, EtherChannels, and redundant interfaces. The Diagnostic interface is not supported.

**Before you begin**

- **Firepower 4100/9300**
  1. Configure a Physical Interface, on page 542
  2. (Optional) Configure any special interfaces.
     - Add an EtherChannel (Port Channel), on page 543
     - Add a Subinterface, on page 570 in FMC

- (Optional) **All other models**:  
  - Configure a Redundant Interface (ASA Platform Only), on page 566
  - Configure an EtherChannel, on page 567
  - Add a Subinterface, on page 570

**Procedure**

**Step 1** Select **Devices > Device Management** and click the edit icon (📝) for your FTD device. The **Interfaces** tab is selected by default.

**Step 2** Click the edit icon (📝) for the interface you want to edit.
Configure the Bridge Virtual Interface (BVI)

Each bridge group requires a BVI for which you configure an IP address. The FTD uses this IP address as the source address for packets originating from the bridge group. The BVI IP address must be on the same subnet as the connected network. For IPv4 traffic, the BVI IP address is required to pass any traffic. For IPv6 traffic, you must, at a minimum, configure the link-local addresses to pass traffic, but a global management address is recommended for full functionality, including remote management and other management operations.

Note

For a separate Diagnostic interface, a non-configurable bridge group (ID 301) is automatically added to your configuration. This bridge group is not included in the bridge group limit.
Before you begin

You cannot add the BVI to a security zone; therefore, you cannot apply Access Control policies to the BVI. You must apply your policy to the bridge group member interfaces based on their zones.

Procedure

Step 1
Select Devices \( \rightarrow \) Device Management and click the edit icon (\( \square \)) for your FTD device. The Interfaces tab is selected by default.

Step 2
Choose Add Interfaces \( \rightarrow \) Bridge Group Interface.

Step 3
In the Bridge Group ID field, enter the bridge group ID between 1 and 250.

Step 4
In the Description field, enter a description for this bridge group.

Step 5
On the Interfaces tab, click an interface and then click Add to move it to the Selected Interfaces area. Repeat for all interfaces that you want to make members of the bridge group.

Step 6
Click the IPv4 tab. In the IP Address field, enter the IPv4 address and subnet mask.

Do not assign a host address (/32 or 255.255.255.255) to the BVI. Also, do not use other subnets that contain fewer than 3 host addresses (one each for the upstream router, downstream router, and transparent firewall) such as a /30 subnet (255.255.255.252). The FTD device drops all ARP packets to or from the first and last addresses in a subnet. For example, if you use a /30 subnet and assign a reserved address from that subnet to the upstream router, then the FTD device drops the ARP request from the downstream router to the upstream router.

For High Availability, set the standby IP address on the Devices \( \rightarrow \) Device Management \( \rightarrow \) High Availability tab in the Monitored Interfaces area. If you do not set the standby IP address, the active unit cannot monitor the standby interface using network tests; it can only track the link state.

Step 7
(Optional) See Configure IPv6 Addressing, on page 581 to configure IPv6 addressing.

Step 8
(Optional) See Add a Static ARP Entry, on page 591 and Add a Static MAC Address and Disable MAC Learning for a Transparent Mode Bridge Group, on page 592 (for transparent mode only) to configure the ARP and MAC settings.

Step 9
Click OK.

Step 10
Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure a Diagnostic (Management) Interface for Transparent Mode

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

In transparent firewall mode, all interfaces must belong to a bridge group. The only exception is the Diagnostic slot/port interface. For the Firepower 4100/9300 chassis, the diagnostic interface ID depends on the mgmt-type.
interface that you assigned to the FTD logical device. You cannot use any other interface types as diagnostic interfaces. You can configure one diagnostic interface.

**Before you begin**

Do not assign this interface to a bridge group; a non-configurable bridge group (ID 301) is automatically added to your configuration. This bridge group is not included in the bridge group limit.

**Procedure**

**Step 1**  
Select Devices > Device Management and click the edit icon (📝) for your FTD device. The Interfaces tab is selected by default.

**Step 2**  
Click the edit icon (📝) for the Diagnostic interface.

**Step 3**  
In the Name field, enter a name up to 48 characters in length.

**Step 4**  
Click the IPv4 tab. To set the IP address, use one of the following options from the IP Type drop-down list.

- Use Static IP—Enter the IP address and subnet mask.
- Use DHCP—Configure the following optional parameters:
  - Obtain default route using DHCP—Obtains the default route from the DHCP server.
  - DHCP route metric—Assigns an administrative distance to the learned route, between 1 and 255. The default administrative distance for the learned routes is 1.
- Use PPPoE—Configure the following parameters:
  - VPDN Group Name—Specify a group name.
  - PPPoE User Name—Specify the username provided by your ISP.
  - PPPoE Password/Confirm Password—Specify and confirm the password provided by your ISP.
  - PPP Authentication—Choose PAP, CHAP, or MSCHAP.
    PAP passes a cleartext username and password during authentication and is not secure. With CHAP, the client returns the encrypted [challenge plus password], with a cleartext username in response to the server challenge. CHAP is more secure than PAP, but it does not encrypt data. MSCHAP is similar to CHAP but is more secure because the server stores and compares only encrypted passwords rather than cleartext passwords as in CHAP. MSCHAP also generates a key for data encryption by MPPE.
  - PPPoE route metric—Assign an administrative distance to the learned route. Valid values are from 1 to 255. By default, the administrative distance for the learned routes is 1.
  - Enable Route Settings—To manually configure the PPPoE IP address, check this box and then enter the IP Address.
  - Store Username and Password in Flash—Stores the username and password in flash memory.
    The FTD device stores the username and password in a special location of NVRAM.

**Step 5**  
(Optional) See Configure IPv6 Addressing, on page 581 to configure IPv6 addressing.

**Step 6**  
(Optional) On the Advanced tab, configure optional settings.
Configure IPv6 Addressing

This section describes how to configure IPv6 addressing in routed and transparent mode.

About IPv6

This section includes information about IPv6.

IPv6 Addressing

You can configure two types of unicast addresses for IPv6:

- Global—The global address is a public address that you can use on the public network. For a bridge group, this address needs to be configured for the BVI, and not per member interface. You can also configure a global IPv6 address for the management interface in transparent mode.

- Link-local—The link-local address is a private address that you can only use on the directly-connected network. Routers do not forward packets using link-local addresses; they are only for communication on a particular physical network segment. They can be used for address configuration or for the Neighbor Discovery functions such as address resolution. In a bridge group, only member interfaces have link-local addresses; the BVI does not have a link-local address.

At a minimum, you need to configure a link-local address for IPv6 to operate. If you configure a global address, a link-local address is automatically configured on the interface, so you do not also need to specifically configure a link-local address. For bridge group member interfaces, when you configure the global address on the BVI, the Firepower Threat Defense device automatically generates link-local addresses for member interfaces. If you do not configure a global address, then you need to configure the link-local address, either automatically or manually.

Modified EUI-64 Interface IDs

RFC 3513: Internet Protocol Version 6 (IPv6) Addressing Architecture requires that the interface identifier portion of all unicast IPv6 addresses, except those that start with binary value 000, be 64 bits long and be constructed in Modified EUI-64 format. The Firepower Threat Defense device can enforce this requirement for hosts attached to the local link.

When this feature is enabled on an interface, the source addresses of IPv6 packets received on that interface are verified against the source MAC addresses to ensure that the interface identifiers use the Modified EUI-64 format. If the IPv6 packets do not use the Modified EUI-64 format for the interface identifier, the packets are dropped and the following system log message is generated:
The address format verification is only performed when a flow is created. Packets from an existing flow are not checked. Additionally, the address verification can only be performed for hosts on the local link.

**Configure a Global IPv6 Address**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>

<td>Admin</td>
</tr>
</tbody>
</table>

To configure a global IPv6 address for any routed mode interface and for the transparent mode BVI, perform the following steps.

**Procedure**

**Step 1** Select Devices > Device Management and click the edit icon (📝) for your FTD device. The Interfaces tab is selected by default.

**Step 2** Click the edit icon (📝) for the interface you want to edit.

**Step 3** Click the IPv6 tab.

For routed mode, the Basic tab is selected by default. For transparent mode, the Address tab is selected by default.

**Step 4** Configure the global IPv6 address using one of the following methods.

- (Routed interface) Stateless autoconfiguration—Check the Autoconfiguration check box.
  
  Enabling stateless autoconfiguration on the interface configures IPv6 addresses based upon prefixes received in Router Advertisement messages. A link-local address, based on the Modified EUI-64 interface ID, is automatically generated for the interface when stateless autoconfiguration is enabled.

  Although RFC 4862 specifies that hosts configured for stateless autoconfiguration do not send Router Advertisement messages, the FTD device does send Router Advertisement messages in this case. Uncheck the IPv6 > Settings > Enable RA check box to suppress messages.

- Manual configuration—To manually configure a global IPv6 address:
for Routed interfaces, you can optionally set the following values on the Basic tab:

- To automatically configure the link-local address when you do not configure the global address, check the Enable IPv6 check box.

  If you do not want to configure a global address, and only need to configure a link-local address, you have the option of generating the link-local addresses based on the interface MAC addresses (Modified EUI-64 format. Because MAC addresses use 48 bits, additional bits must be inserted to fill the 64 bits required for the interface ID.)

- To enforce the use of Modified EUI-64 format interface identifiers in IPv6 addresses on a local link, check the Enforce EUI-64 check box.

- To manually set the link-local address, enter an address in the Link-Local address field.

  A link-local address should start with FE8, FE9, FEA, or FEB, for example fe80::20d:88ff:fee6:6a82. If you do not want to configure a global address, and only need to configure a link-local address, you have the option of manually defining the link-local address. Note that we recommend automatically assigning the link-local address based on the Modified EUI-64 format. For example, if other devices enforce the use of the Modified EUI-64 format, then a manually-assigned link-local address may cause packets to be dropped.

- Check the Enable DHCP for address config check box to set the Managed Address Config flag in the IPv6 router advertisement packet.

  This flag in IPv6 router advertisements informs IPv6 autoconfiguration clients that they should use DHCPv6 to obtain addresses, in addition to the derived stateless autoconfiguration address.

- Check the Enable DHCP for non-address config check box to set the Other Address Config flag in the IPv6 router advertisement packet.

  This flag in IPv6 router advertisements informs IPv6 autoconfiguration clients that they should use DHCPv6 to obtain additional information from DHCPv6, such as the DNS server address.

For Routed interfaces, see Configure IPv6 Neighbor Discovery, on page 584 to configure settings on the Prefixes and Settings tabs. For BVI interfaces, see the following parameters on the Settings tab:

- **DAD attempts**—The maximum number of DAD attempts, between 1 and 600. Set the value to 0 to disable duplicate address detection (DAD) processing. This setting configures the number of consecutive neighbor solicitation messages that are sent on an interface while DAD is performed on IPv6 addresses. 1 attempt is the default.
• **NS Interval**—The interval between IPv6 neighbor solicitation retransmissions on an interface, between 1000 and 3600000 ms. The default value is 1000 ms.

• **Reachable Time**—The amount of time that a remote IPv6 node is considered reachable after a reachability confirmation event has occurred, between 0 and 3600000 ms. The default value is 0 ms. When 0 is used for the value, the reachable time is sent as undetermined. It is up to the receiving devices to set and track the reachable time value. The neighbor reachable time enables detecting unavailable neighbors. Shorter configured times enable detecting unavailable neighbors more quickly, however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.

> **Step 7** Click **OK**.

> **Step 8** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

**Configure IPv6 Neighbor Discovery**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>

<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

The IPv6 neighbor discovery process uses ICMPv6 messages and solicited-node multicast addresses to determine the link-layer address of a neighbor on the same network (local link), verify the readability of a neighbor, and keep track of neighboring routers.

Nodes (hosts) use neighbor discovery to determine the link-layer addresses for neighbors known to reside on attached links and to quickly purge cached values that become invalid. Hosts also use neighbor discovery to find neighboring routers that are willing to forward packets on their behalf. In addition, nodes use the protocol to actively keep track of which neighbors are reachable and which are not, and to detect changed link-layer addresses. When a router or the path to a router fails, a host actively searches for functioning alternates.

**Before you begin**

Supported in Routed mode only.

**Procedure**

> **Step 1** Select **Devices > Device Management** and click the edit icon (-pencil) for your FTD device. The **Interfaces** tab is selected by default.

> **Step 2** Click the edit icon (-pencil) for the interface you want to edit.

> **Step 3** Click **IPv6**, and then **Prefixes**.

> **Step 4** (Optional) To configure which IPv6 prefixes are included in IPv6 router advertisements, perform the following steps:
a) Click **Add Prefix**.

b) In the **Address** field, enter the IPv6 address with the prefix length or check the **Default** check box to use the default prefix.

c) (Optional) Uncheck the **Advertisement** check box to indicate that the IPv6 prefix is not advertised.

d) Check the **Off Link** check box to indicate that the specified prefix is assigned to the link. Nodes sending traffic to addresses that contain the specified prefix consider the destination to be locally reachable on the link. This prefix should not be used for on-link determination.

e) To use the specified prefix for autoconfiguration, check the **Autoconfiguration** check box.

f) For the **Prefix Lifetime**, click **Duration** or **Expiration Date**.

   - **Duration**—Enter a **Preferred Lifetime** for the prefix in seconds. This setting is the amount of time that the specified IPv6 prefix is advertised as being valid. The maximum value represents infinity. Valid values are from 0 to 4294967295. The default is 2592000 (30 days). Enter a **Valid Lifetime** for the prefix in seconds. This setting is the amount of time that the specified IPv6 prefix is advertised as being preferred. The maximum value represents infinity. Valid values are from 0 to 4294967295. The default setting is 604800 (seven days). Alternatively, check the **Infinite** checkbox to set an unlimited duration.

   - **Expiration Date**—Choose a **Valid** and **Preferred** date and time.

g) Click **OK**.

---

**Step 5**

Click **Settings**.

**Step 6**

(Optional) Set the maximum number of **DAD attempts**, between 1 and 600. 1 attempt is the default. Set the value to 0 to disable duplicate address detection (DAD) processing.

This setting configures the number of consecutive neighbor solicitation messages that are sent on an interface while DAD is performed on IPv6 addresses.

During the stateless autoconfiguration process, Duplicate Address Detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces.

When a duplicate address is identified, the state of the address is set to DUPLICATE, the address is not used, and the following error message is generated:

```
325002: Duplicate address ipv6_address/MAC_address on interface
```

If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface. If the duplicate address is a global address, the address is not used.

**Step 7**

(Optional) Configure the interval between IPv6 neighbor solicitation retransmissions in the **NS Interval** field, between 1000 and 3600000 ms.

The default value is 1000 ms.

Neighbor solicitation messages (ICMPv6 Type 135) are sent on the local link by nodes attempting to discover the link-layer addresses of other nodes on the local link. After receiving a neighbor solicitation message, the destination node replies by sending a neighbor advertisement message (ICPMv6 Type 136) on the local link.

After the source node receives the neighbor advertisement, the source node and destination node can communicate. Neighbor solicitation messages are also used to verify the reachability of a neighbor after the link-layer address of a neighbor is identified. When a node wants to verifying the reachability of a neighbor, the destination address in a neighbor solicitation message is the unicast address of the neighbor.
Neighbor advertisement messages are also sent when there is a change in the link-layer address of a node on a local link.

**Step 8**  
(Optional) Configure the amount of time that a remote IPv6 node is considered reachable after a reachability confirmation event has occurred in the **Reachable Time** field, between 0 and 3600000 ms.

The default value is 0 ms. When 0 is used for the value, the reachable time is sent as undetermined. It is up to the receiving devices to set and track the reachable time value.

The neighbor reachable time enables detecting unavailable neighbors. Shorter configured times enable detecting unavailable neighbors more quickly, however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.

**Step 9**  
(Optional) To suppress the router advertisement transmissions, uncheck the **Enable RA** check box. If you enable router advertisement transmissions, you can set the RA lifetime and interval.

Router advertisement messages (ICMPv6 Type 134) are automatically sent in response to router solicitation messages (ICMPv6 Type 133). Router solicitation messages are sent by hosts at system startup so that the host can immediately autoconfigure without needing to wait for the next scheduled router advertisement message.

You may want to disable these messages on any interface for which you do not want the Firepower Threat Defense device to supply the IPv6 prefix (for example, the outside interface).

- **RA Lifetime**—Configure the router lifetime value in IPv6 router advertisements, between 0 and 9000 seconds.
  
The default is 1800 seconds.

- **RA Interval**—Configure the interval between IPv6 router advertisement transmissions, between 3 and 1800 seconds.
  
The default is 200 seconds.

**Step 10**  
Click **OK**.

**Step 11**  
Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

### Configure Advanced Interface Settings

This section describes how to configure MAC addresses for regular firewall mode interfaces, how to set the maximum transmission unit (MTU), and how to set other advanced parameters.

### About Advanced Interface Configuration

This section describes advanced interface settings.
About MAC Addresses

You can manually assign MAC addresses to override the default.

---

**Note**

You might want to assign unique MAC addresses to subinterfaces defined on the FTD, because they use the same burned-in MAC address of the parent interface. For example, your service provider might perform access control based on the MAC address. Also, because IPv6 link-local addresses are generated based on the MAC address, assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the FTD.

Default MAC Addresses

Default MAC address assignments depend on the type of interface.

- **Physical interfaces**—The physical interface uses the burned-in MAC address.

- **Redundant interfaces**—A redundant interface uses the MAC address of the first physical interface that you add. If you change the order of the member interfaces in the configuration, then the MAC address changes to match the MAC address of the interface that is now listed first. If you assign a MAC address to the redundant interface, then it is used regardless of the member interface MAC addresses.

- **EtherChannels (Firepower Models)**—For an EtherChannel, all interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. The port-channel interface uses a unique MAC address from a pool; interface membership does not affect the MAC address.

- **EtherChannels (ASA Models)**—The port-channel interface uses the lowest-numbered channel group interface MAC address as the port-channel MAC address. Alternatively you can configure a MAC address for the port-channel interface. We recommend configuring a unique MAC address in case the group channel interface membership changes. If you remove the interface that was providing the port-channel MAC address, then the port-channel MAC address changes to the next lowest numbered interface, thus causing traffic disruption.

- **Subinterfaces**—All subinterfaces of a physical interface use the same burned-in MAC address. You might want to assign unique MAC addresses to subinterfaces. For example, your service provider might perform access control based on the MAC address. Also, because IPv6 link-local addresses are generated based on the MAC address, assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the FTD.

About the MTU

The MTU specifies the maximum frame **payload** size that the Firepower Threat Defense device can transmit on a given Ethernet interface. The MTU value is the frame size **without** Ethernet headers, VLAN tagging, or other overhead. For example, when you set the MTU to 1500, the expected frame size is 1518 bytes including the headers, or 1522 when using VLAN. Do not set the MTU value higher to accommodate these headers.

Path MTU Discovery

The Firepower Threat Defense device supports Path MTU Discovery (as defined in RFC 1191), which lets all devices in a network path between two hosts coordinate the MTU so they can standardize on the lowest MTU in the path.
Default MTU

The default MTU on the Firepower Threat Defense device is 1500 bytes. This value does not include the 18-22 bytes for the Ethernet header, VLAN tagging, or other overhead.

MTU and Fragmentation

For IPv4, if an outgoing IP packet is larger than the specified MTU, it is fragmented into 2 or more frames. Fragments are reassembled at the destination (and sometimes at intermediate hops), and fragmentation can cause performance degradation. For IPv6, packets are typically not allowed to be fragmented at all. Therefore, your IP packets should fit within the MTU size to avoid fragmentation.

For UDP or ICMP, the application should take the MTU into account to avoid fragmentation.

Note

The Firepower Threat Defense device can receive frames larger than the configured MTU as long as there is room in memory.

MTU and Jumbo Frames

A larger MTU lets you send larger packets. Larger packets might be more efficient for your network. See the following guidelines:

- Matching MTUs on the traffic path—We recommend that you set the MTU on all FTD interfaces and other device interfaces along the traffic path to be the same. Matching MTUs prevents intermediate devices from fragmenting the packets.

- Accommodating jumbo frames—You can set the MTU up to 9198 bytes. The maximum is 9000 for the Firepower Threat Defense Virtual and 9184 for the Firepower 4100/9300.

ARP Inspection for Bridge Group Traffic

By default, all ARP packets are allowed between bridge group members. You can control the flow of ARP packets by enabling ARP inspection.

ARP inspection prevents malicious users from impersonating other hosts or routers (known as ARP spoofing). ARP spoofing can enable a “man-in-the-middle” attack. For example, a host sends an ARP request to the gateway router; the gateway router responds with the gateway router MAC address. The attacker, however, sends another ARP response to the host with the attacker MAC address instead of the router MAC address. The attacker can now intercept all the host traffic before forwarding it on to the router.

ARP inspection ensures that an attacker cannot send an ARP response with the attacker MAC address, so long as the correct MAC address and the associated IP address are in the static ARP table.

When you enable ARP inspection, the Firepower Threat Defense device compares the MAC address, IP address, and source interface in all ARP packets to static entries in the ARP table, and takes the following actions:

- If the IP address, MAC address, and source interface match an ARP entry, the packet is passed through.
- If there is a mismatch between the MAC address, the IP address, or the interface, then the Firepower Threat Defense device drops the packet.
- If the ARP packet does not match any entries in the static ARP table, then you can set the Firepower Threat Defense device to either forward the packet out all interfaces (flood), or to drop the packet.
The dedicated Diagnostic interface never floods packets even if this parameter is set to flood.

**MAC Address Table**

When you use bridge groups, the FTD learns and builds a MAC address table in a similar way as a normal bridge or switch: when a device sends a packet through the bridge group, the FTD adds the MAC address to its table. The table associates the MAC address with the source interface so that the FTD knows to send any packets addressed to the device out the correct interface. Because traffic between bridge group members is subject to the FTD security policy, if the destination MAC address of a packet is not in the table, the FTD does not flood the original packet on all interfaces as a normal bridge does. Instead, it generates the following packets for directly-connected devices or for remote devices:

- **Packets for directly-connected devices**—The FTD generates an ARP request for the destination IP address, so that it can learn which interface receives the ARP response.
- **Packets for remote devices**—The FTD generates a ping to the destination IP address so that it can learn which interface receives the ping reply.

The original packet is dropped.

**Default Settings**

- If you enable ARP inspection, the default setting is to flood non-matching packets.
- The default timeout value for dynamic MAC address table entries is 5 minutes.
- By default, each interface automatically learns the MAC addresses of entering traffic, and the Firepower Threat Defense device adds corresponding entries to the MAC address table.

**Guidelines for ARP Inspection and the MAC Address Table**

- ARP inspection is only supported for bridge groups.
- MAC address table configuration is only supported for bridge groups.
- Bridge groups are only supported in transparent firewall mode.

**Configure the MTU**

<table>
<thead>
<tr>

<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

Customize the MTU on the interface, for example, to allow jumbo frames.
Changing the highest MTU value on the device for a non-management/diagnostic interface restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management/diagnostic interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 340 for more information.

Before you begin

- Changing the MTU above 1500 bytes automatically enables jumbo frames; for ASA models, you must reload the system before you can use jumbo frames.
- If you use an interface in an inline set, the MTU setting is not used. However, the jumbo frame setting is relevant to inline sets; jumbo frames enable the inline interfaces to receive packets up to 9000 bytes. To enable jumbo frames, you must set the MTU of any interface above 1500 bytes.

Procedure

Step 1 Select Devices > Device Management and click the edit icon ( ) for your FTD device. The Interfaces tab is selected by default.

Step 2 Click the edit icon ( ) for the interface you want to edit.

Step 3 On the General tab, set the MTU between 64 and 9198 bytes; the maximum is 9000 for the Firepower Threat Defense Virtual and 9184 for the FTD on the Firepower 4100/9300 chassis.

The default is 1500 bytes.

Step 4 Click OK.

Step 5 Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

Step 6 For ASA models, if you set the MTU above 1500 bytes, reload the system to enable jumbo frames.

Configure the MAC Address

<td>Network Admin</td>
</tr>
</tbody>
</table>

You might need to manually assign a MAC address. You can also set the Active and Standby MAC addresses on the Devices > Device Management > High Availability tab. If you set the MAC address for an interface on both screens, the addresses on the Interfaces > Advanced tab take precedence.
Procedure

Step 1  Select Devices > Device Management and click the edit icon (✏️) for your FTD device. The Interfaces tab is selected by default.

Step 2  Click the edit icon (✏️) for the interface you want to edit.

Step 3  Click the Advanced tab.
The Information tab is selected.

Step 4  In the Active MAC Address field, enter a MAC address in H.H.H format, where H is a 16-bit hexadecimal digit.

For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 000C.F142.4CDE. The MAC address must not have the multicast bit set, that is, the second hexadecimal digit from the left cannot be an odd number.

Step 5  In the Standby MAC Address field, enter a MAC address for use with High Availability.
If the active unit fails over and the standby unit becomes active, the new active unit starts using the active MAC addresses to minimize network disruption, while the old active unit uses the standby address.

Step 6  Click OK.
Step 7  Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

Add a Static ARP Entry

<table>
<thead>
<tr>

<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

By default, all ARP packets are allowed between bridge group members. You can control the flow of ARP packets by enabling ARP inspection (see Configure ARP Inspection, on page 875). ARP inspection compares ARP packets with static ARP entries in the ARP table.

For routed interfaces, you can enter static ARP entries, but normally dynamic entries are sufficient. For routed interfaces, the ARP table is used to deliver packets to directly-connected hosts. Although senders identify a packet destination by an IP address, the actual delivery of the packet on Ethernet relies on the Ethernet MAC address. When a router or host wants to deliver a packet on a directly connected network, it sends an ARP request asking for the MAC address associated with the IP address, and then delivers the packet to the MAC address according to the ARP response. The host or router keeps an ARP table so it does not have to send ARP requests for every packet it needs to deliver. The ARP table is dynamically updated whenever ARP responses are sent on the network, and if an entry is not used for a period of time, it times out. If an entry is incorrect (for example, the MAC address changes for a given IP address), the entry needs to time out before it can be updated with the new information.

For transparent mode, the FTD only uses dynamic ARP entries in the ARP table for traffic to and from the FTD device, such as management traffic.
Before you begin

This screen is only available for named interfaces.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Select Devices &gt; Device Management and click the edit icon for your FTD device. The Interfaces tab is selected by default.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click the edit icon for the interface you want to edit.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click the Advanced tab, and then click the ARP tab (called ARP and MAC for transparent mode).</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click Add ARP Config. The Add ARP Config dialog box appears.</td>
</tr>
<tr>
<td>Step 5</td>
<td>In the IP Address field, enter the IP address of the host.</td>
</tr>
<tr>
<td>Step 6</td>
<td>In the MAC Address field, enter the MAC address of the host; for example, 00e0.1e4e.3d8b.</td>
</tr>
<tr>
<td>Step 7</td>
<td>To perform proxy ARP for this address, check the Enable Alias check box.</td>
</tr>
</tbody>
</table>

If the FTD device receives an ARP request for the specified IP address, then it responds with the specified MAC address.

| Step 8 | Click OK, and then click OK again to exit the Advanced settings.      |
| Step 9 | Click Save.                                                           |

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

Add a Static MAC Address and Disable MAC Learning for a Transparent Mode Bridge Group

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

Normally, MAC addresses are added to the MAC address table dynamically as traffic from a particular MAC address enters an interface. You can disable MAC address learning; however, unless you statically add MAC addresses to the table, no traffic can pass through the FTD device. You can also add static MAC addresses to the MAC address table. One benefit to adding static entries is to guard against MAC spoofing. If a client with the same MAC address as a static entry attempts to send traffic to an interface that does not match the static entry, then the FTD device drops the traffic and generates a system message. When you add a static ARP entry (see Add a Static ARP Entry, on page 591), a static MAC address entry is automatically added to the MAC address table.

Before you begin

This screen is only available for named interfaces.
Procedure

**Step 1**  Select Devices > Device Management and click the edit icon (✏️) for your FTD device. The Interfaces tab is selected by default.

**Step 2**  Click the edit icon (✏️) for the interface you want to edit.

**Step 3**  Click the Advanced tab, and then click the ARP and MAC tab.

**Step 4**  (Optional) Disable MAC learning by unchecking the Enable MAC Learning check box.

**Step 5**  To add a static MAC address, click Add MAC Config. The Add MAC Config dialog box appears.

**Step 6**  In the MAC Address field, enter the MAC address of the host; for example, 00e0.1e4e.3d8b. Click OK.

**Step 7**  Click OK to exit the Advanced settings.

**Step 8**  Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

This section describes how to prevent IP spoofing, allow full fragment reassembly, and override the default fragment setting set for at the device level in Platform Settings.

**Anti-Spoofing**

This section lets you enable Unicast Reverse Path Forwarding on an interface. Unicast RPF guards against IP spoofing (a packet uses an incorrect source IP address to obscure its true source) by ensuring that all packets have a source IP address that matches the correct source interface according to the routing table.

Normally, the FTD device only looks at the destination address when determining where to forward the packet. Unicast RPF instructs the device to also look at the source address; this is why it is called Reverse Path Forwarding. For any traffic that you want to allow through the FTD device, the device routing table must include a route back to the source address. See RFC 2267 for more information.

For outside traffic, for example, the FTD device can use the default route to satisfy the Unicast RPF protection. If traffic enters from an outside interface, and the source address is not known to the routing table, the device uses the default route to correctly identify the outside interface as the source interface.

If traffic enters the outside interface from an address that is known to the routing table, but is associated with the inside interface, then the FTD device drops the packet. Similarly, if traffic enters the inside interface from an unknown source address, the device drops the packet because the matching route (the default route) indicates the outside interface.

Unicast RPF is implemented as follows:
• ICMP packets have no session, so each packet is checked.

• UDP and TCP have sessions, so the initial packet requires a reverse route lookup. Subsequent packets arriving during the session are checked using an existing state maintained as part of the session. Non-initial packets are checked to ensure they arrived on the same interface used by the initial packet.

Fragment per Packet

By default, the FTD device allows up to 24 fragments per IP packet, and up to 200 fragments awaiting reassembly. You might need to let fragments on your network if you have an application that routinely fragments packets, such as NFS over UDP. However, if you do not have an application that fragments traffic, we recommend that you do not allow fragments through the FTD device. Fragmented packets are often used as DoS attacks.

Fragment Reassembly

The FTD device performs the following fragment reassembly processes:

• IP fragments are collected until a fragment set is formed or until a timeout interval has elapsed.

• If a fragment set is formed, integrity checks are performed on the set. These checks include no overlapping, no tail overflow, and no chain overflow.

• IP fragments that terminate at the FTD device are always fully reassembled.

• If Full Fragment Reassembly is disabled (the default), the fragment set is forwarded to the transport layer for further processing.

• If Full Fragment Reassembly is enabled, the fragment set is first coalesced into a single IP packet. The single IP packet is then forwarded to the transport layer for further processing.

Before you begin

This screen is only available for named interfaces.

Procedure

| Step 1 | Select Devices > Device Management and click the edit icon (📝) for your FTD device. The Interfaces tab is selected by default. |
| Step 2 | Click the edit icon (📝) for the interface you want to edit. |
| Step 3 | Click the Advanced tab, and then click the Security Configuration tab. |
| Step 4 | To enable Unicast Reverse Path Forwarding, check the Anti-Spoofing check box. |
| Step 5 | To enable full fragment reassembly, check the Full Fragment Reassembly check box. |
| Step 6 | To change the number of fragments allowed per packet, check the Override Default Fragment Setting check box, and set the following values: |
|        | • Size—Set the maximum number of packets that can be in the IP reassembly database waiting for reassembly. The default is 200. Set this value to 1 to disable fragments. |
|        | • Chain—Set the maximum number of packets into which a full IP packet can be fragmented. The default is 24 packets. |
• **Timeout**—Set the maximum number of seconds to wait for an entire fragmented packet to arrive. The timer starts after the first fragment of a packet arrives. If all fragments of the packet do not arrive by the number of seconds specified, all fragments of the packet that were already received will be discarded. The default is 5 seconds.

**Step 7**  
Click OK.

**Step 8**  
Click Save.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
CHAPTER 29

Inline Sets and Passive Interfaces for Firepower Threat Defense

You can configure IPS-only passive interfaces, passive ERSPAN interfaces, and inline sets. IPS-only mode interfaces bypass many firewall checks and only support IPS security policy. You might want to implement IPS-only interfaces if you have a separate firewall protecting these interfaces and do not want the overhead of firewall functions.

- About Hardware Bypass for Inline Sets, on page 597
- Prerequisites for Inline Sets, on page 598
- Guidelines for Inline Sets and Passive Interfaces, on page 599
- Configure a Passive Interface, on page 600
- Configure an Inline Set, on page 601
- History for Inline Sets and Passive Interfaces for Firepower Threat Defense, on page 604

About Hardware Bypass for Inline Sets

For certain interface modules on the Firepower 9300 and 4100 series (see Prerequisites for Inline Sets, on page 598), you can enable the Hardware Bypass feature. Hardware Bypass ensures that traffic continues to flow between an inline interface pair during a power outage. This feature can be used to maintain network connectivity in the case of software or hardware failures.

Hardware Bypass Triggers

Hardware Bypass can be triggered in the following scenarios:

- FTD application crash
- FTD application reboot
- Security Module reboot
- Firepower chassis crash
- Firepower chassis reboot or upgrade
- Manual trigger
- Firepower chassis power loss
- Security Module power loss

**Hardware Bypass Switchover**

When switching from normal operation to hardware bypass or from hardware bypass back to normal operation, traffic may be interrupted for several seconds. A number of factors can affect the length of the interruption; for example, copper port auto-negotiation; behavior of the optical link partner such as how it handles link faults and de-bounce timing; spanning tree protocol convergence; dynamic routing protocol convergence; and so on. During this time, you may experience dropped connections.

You may also experience dropped connections due to application identification errors when analyzing connections midstream after the return to normal operations.

**Failsafe vs. Hardware Bypass**

Inline sets include a software failure setting called "failsafe." If a software failure in the IPS subsystem would prevent traffic from passing through the inline set, then the failsafe option allows the traffic to keep flowing. Failsafe is supported on any interface pair except those in tap mode, not just the ones supported for the Hardware Bypass feature.

The Hardware Bypass functionality allows traffic to flow during a hardware failure, including a complete power outage, and certain limited software failures. A software failure that triggers failsafe does not trigger a Hardware Bypass.

**Hardware Bypass Status**

If the system has power, then the Bypass LED indicates the Hardware Bypass status. See the Firepower chassis hardware installation guide for LED descriptions.

**Prerequisites for Inline Sets**

**Hardware Bypass Support**

The FTD supports Hardware Bypass for interface pairs on specific network modules on the following models:

- Firepower 9300
- Firepower 4100 series

The supported Hardware Bypass network modules for these models include:

- Firepower 6-port 1G SX FTW Network Module single-wide (FPR-NM-6X1SX-F)
- Firepower 6-port 10G SR FTW Network Module single-wide (FPR-NM-6X10SR-F)
- Firepower 6-port 10G LR FTW Network Module single-wide (FPR-NM-6X10LR-F)
- Firepower 2-port 40G SR FTW Network Module single-wide (FPR-NM-2X40G-F)

Hardware Bypass can only use the following port pairs:
Guidelines for Inline Sets and Passive Interfaces

Firewall Mode

- ERSPAN interfaces are only allowed when the device is in routed firewall mode.

General Guidelines

- Inline sets and passive interfaces support physical interfaces only, and cannot use EtherChannels, redundant interfaces, VLANs, and so on.
- Inline sets and passive interfaces are supported in intra-chassis and inter-chassis clustering.
- Bidirectional Forwarding Detection (BFD) echo packets are not allowed through the FTD when using inline sets. If there are two neighbors on either side of the FTD running BFD, then the FTD will drop BFD echo packets because they have the same source and destination IP address and appear to be part of a LAND attack.
- For all models except for the Firepower 4100/9300, the FTD supports no more than two 802.1Q headers in a packet (also known as Q-in-Q support) for inline sets and passive interfaces. Firewall interfaces do not support Q-in-Q, and the Firepower 4100/9300 models do not support Q-in-Q for any type of interface.

Hardware Bypass Guidelines

- Hardware Bypass ports are supported only for inline sets.
- Hardware Bypass ports cannot be part of an EtherChannel.
- Supported with intra-chassis clustering. Ports are placed in Hardware Bypass mode when the last unit in the chassis fails.
- If all units in the cluster fail, then Hardware Bypass is triggered on the final unit, and traffic continues to pass. When units come back up, Hardware Bypass returns to standby mode. However, when you use rules that match application traffic, those connections may be dropped and need to be reestablished. Connections are dropped because state information is not retained on the cluster unit, and the unit cannot identify the traffic as belonging to an allowed application. To avoid a traffic drop, use a port-based rule instead of an application-based rule, if appropriate for your deployment.
- Hardware Bypass is not supported in high availability mode.

Unsupported Firewall Features on IPS Interfaces

- DHCP server
- DHCP relay
• DHCP client
• TCP Intercept
• Routing
• NAT
• VPN
• Application inspection
• QoS
• NetFlow
• VXLAN

Configure a Passive Interface

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

This section describes how to:

• Enable the interface. By default, interfaces are disabled.

• Set the interface mode to Passive or ERSPAN. For ERSPAN interfaces, you will set the ERSPAN parameters and the IP address.

• Change the MTU. By default, the MTU is set to 1500 bytes. For more information about the MTU, see About the MTU, on page 587.

• Set a specific speed and duplex (if available). By default, speed and duplex are set to Auto.

Note

For the Firepower Threat Defense on the FXOS chassis, you configure basic interface settings on the Firepower 4100/9300 chassis. See Configure a Physical Interface, on page 542 for more information.

Procedure

**Step 1** Select Devices > Device Management and click the edit icon (📝) for your FTD device. The Interfaces tab is selected by default.

**Step 2** Click the edit icon (📝) for the interface you want to edit.

**Step 3** In the Mode drop-down list, choose Passive or Erspan.

**Step 4** Enable the interface by checking the Enabled check box.
**Step 5** In the **Name** field, enter a name up to 48 characters in length.

**Step 6** From the **Security Zone** drop-down list, choose a security zone or add a new one by clicking **New**.

**Step 7** (Optional) Add a description in the **Description** field.

The description can be up to 200 characters on a single line, without carriage returns.

**Step 8** (Optional) On **General**, set the **MTU** between 64 and 9198 bytes; for the Firepower Threat Defense Virtual and Firepower Threat Defense on the FXOS chassis, the maximum is 9000 bytes.

The default is 1500 bytes.

**Step 9** For ERSPAN interfaces, set the following parameters:

- **Flow Id**—Configure the ID used by the source and destination sessions to identify the ERSPAN traffic, between 1 and 1023. This ID must also be entered in the ERSPAN destination session configuration.

- **Source IP**—Configure the IP address used as the source of the ERSPAN traffic.

**Step 10** For ERSPAN interfaces, set the IPv4 address and mask on **IPv4**.

**Step 11** (Optional) Set the duplex and speed by clicking **Hardware Configuration**.

The exact speed and duplex options depend on your hardware.

- **Duplex**—Choose **Full**, **Half**, or **Auto**. Auto is the default.

- **Speed**—Choose **10**, **100**, **1000**, or **Auto**. Auto is the default.

**Step 12** Click **OK**.

**Step 13** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

### Configure an Inline Set

<td>Network Admin</td>
</tr>
</tbody>
</table>

This section enables and names two physical interfaces that you can add to an inline set. You can also optionally enable Hardware Bypass for supported interface pairs.

---

**Note**

For the Firepower Threat Defense on the FXOS chassis, you configure basic interface settings on the Firepower 4100/9300 chassis. See **Configure a Physical Interface**, on page 542 for more information.
Configure an Inline Set

Before you begin

- We recommend that you set STP PortFast for STP-enabled switches that connect to Firepower Threat Defense inline pair interfaces. This setting is especially useful for Hardware Bypass configurations and can reduce bypass times.

Procedure

Step 1
Select Devices > Device Management and click the edit icon (🔗) for your FTD device. The Interfaces tab is selected by default.

Step 2
Click the edit icon (🔗) for the interface you want to edit.

Step 3
In the Mode drop-down list, choose None.

After you add this interface to an inline set, this field will show Inline for the mode.

Step 4
Enable the interface by checking the Enabled check box.

Step 5
In the Name field, enter a name up to 48 characters in length.

Do not set the security zone yet; you must set it after you create the inline set later in this procedure.

Step 6
(Optional) Add a description in the Description field.

The description can be up to 200 characters on a single line, without carriage returns.

Step 7
(Optional) Set the duplex and speed by clicking Hardware Configuration.

The exact speed and duplex options depend on your hardware.

- Duplex—Choose Full, Half, or Auto. Auto is the default.
- Speed—Choose 10, 100, 1000, or Auto. Auto is the default.

Step 8
Click OK.

Do not set any other settings for this interface.

Step 9
Click edit (🔗) for the second interface you want to add to the inline set.

Step 10
Configure the settings as for the first interface.

Step 11
Click Inline Sets.

Step 12
Click Add Inline Set.

The Add Inline Set dialog box appears with General selected.

Step 13
In the Name field, enter a name for the set.

Step 14
(Optional) Change the MTU to enable jumbo frames.

For inline sets, the MTU setting is not used. However, the jumbo frame setting is relevant to inline sets; jumbo frames enable the inline interfaces to receive packets up to 9000 bytes. To enable jumbo frames, you must set the MTU of any interface on the device above 1500 bytes.

Step 15
(Optional) To specify that traffic is allowed to bypass detection and continue through the device in the case of a sensor failure, check the Failsafe check box.

Managed devices monitor internal traffic buffers and bypass detection if those buffers are full.
Step 16  (Optional) For the Bypass mode, choose one of the following options:

- **Disabled**—Set Hardware Bypass to disabled for interfaces where Hardware Bypass is supported, or use interfaces where Hardware Bypass is not supported.

- **Standby**—Set Hardware Bypass to the standby state on supported interfaces. Only pairs of Hardware Bypass interfaces are shown. In the standby state, the interfaces remain in normal operation until there is a trigger event.

- **Bypass-Force**—Manually forces the interface pair to go into a bypass state. Inline Sets shows Yes for any interface pairs that are in Bypass-Force mode.

Step 17  In the Available Interfaces Pairs area, click a pair and then click Add to move it to the Selected Interface Pair area.

All possible pairings between named and enabled interfaces with the mode set to None show in this area.

Step 18  (Optional) Click Advanced to set the following optional parameters:

- **Tap Mode**—Set to inline tap mode.
  
  Note that you cannot enable this option and strict TCP enforcement on the same inline set.

- **Propagate Link State**—Configure link state propagation.

  Link state propagation automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down. When the downed interface comes back up, the second interface automatically comes back up, also. In other words, if the link state of one interface changes, the device senses the change and updates the link state of the other interface to match it. Note that devices require up to 4 seconds to propagate link state changes. Link state propagation is especially useful in resilient network environments where routers are configured to reroute traffic automatically around network devices that are in a failure state.

- **Strict TCP Enforcement**—To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed.

  Strict enforcement also blocks:

  - Non-SYN TCP packets for connections where the three-way handshake was not completed
  - Non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK
  - Non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established
  - SYN packets on an established TCP connection from either the initiator or the responder

Step 19  Click Interfaces.

Step 20  Click edit (✏️) for one of the member interfaces.

Step 21  From the Security Zone drop-down list, choose a security zone or add a new one by clicking New.

You can only set the zone after you add the interface to the inline set; adding it to an inline set configures the mode to Inline and lets you choose inline-type security zones.

Step 22  Click OK.
Step 23  Set the security zone for the second interface.

Step 24  Click Save.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

CHAPTER 30

DHCP and DDNS Services for Threat Defense

The following topics explain DHCP and DDNS services and how to configure them on Threat Defense devices.

• About DHCP and DDNS Services, on page 605
• Guidelines for DHCP and DDNS Services, on page 607
• Configure the DHCP Server, on page 608
• Configure the DHCP Relay Agent, on page 610
• Configure DDNS, on page 611

About DHCP and DDNS Services

The following topics describe the DHCP server, DHCP relay agent, and DDNS update.

About the DHCPv4 Server

DHCP provides network configuration parameters, such as IP addresses, to DHCP clients. The Firepower Threat Defense device can provide a DHCP server to DHCP clients attached to Firepower Threat Defense device interfaces. The DHCP server provides network configuration parameters directly to DHCP clients.

An IPv4 DHCP client uses a broadcast rather than a multicast address to reach the server. The DHCP client listens for messages on UDP port 68; the DHCP server listens for messages on UDP port 67.

The DHCP server for IPv6 is not supported; you can, however, enable DHCP relay for IPv6 traffic.

DHCP Options

DHCP provides a framework for passing configuration information to hosts on a TCP/IP network. The configuration parameters are carried in tagged items that are stored in the Options field of the DHCP message and the data are also called options. Vendor information is also stored in Options, and all of the vendor information extensions can be used as DHCP options.

For example, Cisco IP Phones download their configuration from a TFTP server. When a Cisco IP Phone starts, if it does not have both the IP address and TFTP server IP address preconfigured, it sends a request with option 150 or 66 to the DHCP server to obtain this information.

• DHCP option 150 provides the IP addresses of a list of TFTP servers.
• DHCP option 66 gives the IP address or the hostname of a single TFTP server.
• DHCP option 3 sets the default route.
A single request might include both options 150 and 66. In this case, the ASA DHCP server provides values for both options in the response if they are already configured on the ASA.

You can use advanced DHCP options to provide DNS, WINS, and domain name parameters to DHCP clients; DHCP option 15 is used for the DNS domain suffix. You can also use the DHCP automatic configuration setting to obtain these values or define them manually. When you use more than one method to define this information, it is passed to DHCP clients in the following sequence:

1. Manually configured settings.
2. Advanced DHCP options settings.
3. DHCP automatic configuration settings.

For example, you can manually define the domain name that you want the DHCP clients to receive and then enable DHCP automatic configuration. Although DHCP automatic configuration discovers the domain together with the DNS and WINS servers, the manually defined domain name is passed to DHCP clients with the discovered DNS and WINS server names, because the domain name discovered by the DHCP automatic configuration process is superseded by the manually defined domain name.

**About the DHCP Relay Agent**

You can configure a DHCP relay agent to forward DHCP requests received on an interface to one or more DHCP servers. DHCP clients use UDP broadcasts to send their initial DHCPDISCOVER messages because they do not have information about the network to which they are attached. If the client is on a network segment that does not include a server, UDP broadcasts normally are not forwarded by the Firepower Threat Defense device because it does not forward broadcast traffic. The DHCP relay agent lets you configure the interface of the Firepower Threat Defense device that is receiving the broadcasts to forward DHCP requests to a DHCP server on another interface.

**About DDNS**

DDNS update integrates DNS with DHCP. The two protocols are complementary: DHCP centralizes and automates IP address allocation; DDNS update automatically records the association between assigned addresses and hostnames at predefined intervals. DDNS allows frequently changing address-hostname associations to be updated frequently. Mobile hosts, for example, can then move freely on a network without user or administrator intervention. DDNS provides the necessary dynamic update and synchronization of the name-to-address mapping and address-to-name mapping on the DNS server.

The DDNS name and address mapping is held on the DHCP server in two resource records (RRs): the A RR includes the name-to-IP address mapping, while the PTR RR maps addresses to names. Of the two methods for performing DDNS updates—the IETF standard defined by RFC 2136 and a generic HTTP method—the Firepower Threat Defense device supports the IETF method.

**Note**

DDNS is not supported on the BVI or bridge group member interfaces.

**DDNS Update Configurations**

The two most common DDNS update configurations are the following:

- The DHCP client updates the A RR, while the DHCP server updates the PTR RR.
• The DHCP server updates both the A RR and PTR RR.

In general, the DHCP server maintains DNS PTR RRs on behalf of clients. Clients may be configured to perform all desired DNS updates. The server may be configured to honor these updates or not. The DHCP server must know the fully qualified domain name (FQDN) of the client to update the PTR RR. The client provides an FQDN to the server using a DHCP option called Client FQDN.

UDP Packet Size

DDNS allows DNS requesters to advertise the size of their UDP packets and facilitates the transfer of packets larger than 512 octets. When a DNS server receives a request over UDP, it identifies the size of the UDP packet from the OPT RR and scales its response to contain as many resource records as are allowed in the maximum UDP packet size specified by the requester. The size of the DNS packets can be up to 4096 bytes for BIND or 1280 bytes for the Windows 2003 DNS Server.

Guidelines for DHCP and DDNS Services

This section includes guidelines and limitations that you should check before configuring DHCP and DDNS services.

Firewall Mode

• DHCP Relay is not supported in transparent firewall mode.
• DHCP Server is supported in transparent firewall mode on a bridge group member interface.
• DDNS is not supported in transparent firewall mode.

IPv6

Does not support IPv6 for DHCP server; IPv6 for DHCP relay is supported.

DHCPv4 Server

• The maximum available DHCP pool is 256 addresses.
• You can configure only one DHCP server on each interface. Each interface can have its own pool of addresses to use. However the other DHCP settings, such as DNS servers, domain name, options, ping timeout, and WINS servers, are configured globally and used by the DHCP server on all interfaces.
• You cannot configure a DHCP client or DHCP relay service on an interface on which the server is enabled. Additionally, DHCP clients must be directly connected to the interface on which the server is enabled.
• Firepower Threat Defense device does not support QIP DHCP servers for use with the DHCP proxy service.
• The relay agent cannot be enabled if the DHCP server is also enabled.
• The DHCP server does not support BOOTP requests.
DHCP Relay

- You can configure a maximum of 10 DHCPv4 relay servers, global and interface-specific servers combined, with a maximum of 4 servers per interface.
- You can configure a maximum of 10 DHCPv6 relay servers. Interface-specific servers for IPv6 are not supported.
- The relay agent cannot be enabled if the DHCP server feature is also enabled.
- DHCP relay services are not available in transparent firewall mode. You can, however, allow DHCP traffic through using an access rule. To allow DHCP requests and replies through the Firepower Threat Defense device, you need to configure two access rules, one that allows DHCP requests from the inside interface to the outside (UDP destination port 67), and one that allows the replies from the server in the other direction (UDP destination port 68).
- For IPv4, clients must be directly-connected to the Firepower Threat Defense device and cannot send requests through another relay agent or a router. For IPv6, the Firepower Threat Defense device supports packets from another relay server.
- The DHCP clients must be on different interfaces from the DHCP servers to which the Firepower Threat Defense device relays requests.
- You cannot enable DHCP Relay on an interface in a traffic zone.
- DHCP relay is not supported on Virtual Tunnel Interfaces (VTIs).

Configure the DHCP Server

### Configure the DHCP Server

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin, Access Admin, Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose Devices > Device Management, and edit the FTD device.

**Step 2** Select DHCP > DHCP Server.

**Step 3** Configure the following DHCP server options:

- **Ping Timeout**—The amount of time in milliseconds that Firepower Threat Defense device waits to time out a DHCP ping attempt. Valid values range from 10 to 10000 milliseconds. The default value is 50 milliseconds.

  To avoid address conflicts, the Firepower Threat Defense device sends two ICMP ping packets to an address before assigning that address to a DHCP client.

- **Lease Length**—The amount of time in seconds that the client may use its allocated IP address before the lease expires. Valid values range from 300 to 1048575 seconds. The default value is 3600 seconds (1 hour).
• (Routed mode) **Auto-configuration**—Enables DHCP auto configuration on the Firepower Threat Defense device. Auto-configuration enables the DHCP server to provide the DHCP clients with the DNS server, domain name, and WINS server information obtained from a DHCP client running on the specified interface. Otherwise, you can disable auto configuration and add the values yourself in Step 4.

• (Routed mode) **Interface**—Specifies the interface to be used for auto configuration.

**Step 4** To override auto-configured settings, do the following:

- Enter the domain name of the interface. For example, your device may be in the Your_Company domain.
- From the drop-down list, choose the DNS servers (primary and secondary) configured for the interface. To add a new DNS server, see Creating Network Objects, on page 397.
- From the drop-down list, choose the WINS servers (primary and secondary) configured for the interface. To add a new WINS server, see Creating Network Objects, on page 397.

**Step 5** Select **Server**, click **Add**, and configure the following options:

- **Interface**—Choose the interface from the drop-down list. In transparent mode, specify a named bridge group member interface.
- **Address Pool**—The range of IP addresses from lowest to highest that is used by the DHCP server. The range of IP addresses must be on the same subnet as the selected interface and cannot include the IP address of the interface itself.
- **Enable DHCP Server**—Enables the DHCP server on the selected interface.

**Step 6** Click **OK** to save the DHCP server configuration.

**Step 7** (Optional) Select **Advanced**, click **Add**, and specify the type of information you want the option to return to the DHCP client:

- **Option Code**—The Firepower Threat Defense device supports the DHCP options listed in RFC 2132, RFC 2562, and RFC 5510 to send information. All DHCP options (1 through 255) are supported except for 1, 12, 50–54, 58–59, 61, 67, and 82. See About the DHCPv4 Server, on page 605 for more information on DHCP option codes.

  **Note** The Firepower Threat Defense device does not verify that the option type and value that you provide match the expected type and value for the option code, as defined in RFC 2132. For more information about option codes and their associated types and expected values, see RFC 2132.

  - **Type**—DHCP option type. Available options include IP, ASCII, and HEX. If you chose IP, you must add IP addresses in the IP Address fields. If you chose ASCII, you must add the ASCII value in the ASCII field. If you chose HEX, you must add the HEX value in the HEX field.
  - **IP Address 1** and **IP Address 2**—The IP address(es) to be returned with this option code. To add a new IP address, see Creating Network Objects, on page 397.
  - **ASCII**—The ASCII value that is returned to the DHCP client. The string cannot include spaces.
  - **HEX**—The HEX value that is returned to the DHCP client. The string must have an even number of digits and no spaces. You do not need to use a 0x prefix.

**Step 8** Click **OK** to save the option code configuration.
Configure the DHCP Relay Agent

You can configure a DHCP relay agent to forward DHCP requests received on an interface to one or more DHCP servers. DHCP clients use UDP broadcasts to send their initial DHCPDISCOVER messages because they do not have information about the network to which they are attached. If the client is on a network segment that does not include a server, UDP broadcasts normally are not forwarded by the Firepower Threat Defense device because it does not forward broadcast traffic.

You can remedy this situation by configuring the interface of the Firepower Threat Defense device that is receiving the broadcasts to forward DHCP requests to a DHCP server on another interface.

Note

DHCP Relay is not supported in transparent firewall mode.

Procedure

Step 1
Choose Devices > Device Management, and edit the FTD device.

Step 2
Select DHCP > DHCP Relay.

Step 3
In the Timeout field, enter the amount of time in seconds that the Firepower Threat Defense device waits to time out the DHCP relay agent. Valid values range from 1 to 3600 seconds. The default value is 60 seconds.

Step 4
On DHCP Relay Agent, click Add, and configure the following options:

- **Interface**—The interface connected to the DHCP clients.
- **Enable IPv4 Relay**—Enables IPv4 DHCP Relay for this interface.
- **Set Route**—(For IPv4) Changes the default gateway address in the DHCP message from the server to that of the Firepower Threat Defense device interface that is closest to the DHCP client, which relayed the original DHCP request. This action allows the client to set its default route to point to the Firepower Threat Defense device even if the DHCP server specifies a different router. If there is no default router option in the packet, the Firepower Threat Defense device adds one containing the interface address.
- **Enable IPv6 Relay**—Enables IPv6 DHCP Relay for this interface.

Step 5
Click OK to save the DHCP relay agent changes.

Step 6
On DHCP Servers, click Add, and configure the following options:
Add the IPv4 and IPv6 server addresses as separate entries, even if they belong to the same server.

- **Server**—The IP address of the DHCP server. Chose an IP address from the drop-down list. To add a new one, see Creating Network Objects, on page 397
- **Interface**—The interface to which the specified DHCP server is attached. The DHCP Relay agent and the DHCP server cannot be configured on the same interface.

**Step 7** Click **OK** to save the DHCP server changes.

**Step 8** Click **Save** on the DHCP page to save your changes.

## Configure DDNS

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

Dynamic DNS (DDNS) update integrates DNS with DHCP. DDNS update automatically records the association between assigned addresses and hostnames, which allows frequently changing address-hostname associations to be updated efficiently.

**Before you begin**

- For overview information, see About DDNS, on page 606.
- DDNS is not supported in transparent firewall mode.

**Procedure**

**Step 1** Choose **Devices > Device Management**, and edit the FTD device.

**Step 2** Select **DHCP > DDNS**, and configure the following DDNS options:

- **DHCP Client Requests DHCP Server to update Records**—Configures the DHCP client to request that it update the specified records. Available options are **Not Selected, No Update, Only PTR**, and **Both A and PTR Records**. See About DDNS, on page 606 for a description of A and PTR records.

- **Enable DHCP Client Broadcast**—Enables the DHCP client to use a broadcast address to reach the DHCP server.

- **Dynamic DNS Update**—Which records to update for the DDNS updates for the DHCP server. Available options are **Not Selected, Only PTR**, and **Both A and PTR Records**.

- **Override DHCP Client Requests**—Specifies that the DHCP server actions should override any update actions requested by the DHCP client.

**Step 3** On **DHCP Client ID Interface**, choose the interface from the **Available Interfaces** list, and then click **Add** to move it to the **Selected Interfaces** list.
On **DDNS Interface Settings**, click **Add**, and configure the following options:

- **Interface**—Choose the interface from the drop-down list to add DDNS settings for each configured interface.
- **Method Name**—The DDNS update method assigned to the interface.
- **Host Name**—The host name of the DDNS client.
- **DHCP Client requests DHCP server to update requests**—Configures the DHCP client to request that it update the specified records. Available options are **Not Selected**, **No Update**, **Only PTR**, and **Both A and PTR Records**. See About DDNS, on page 606 for a description of A and PTR records.
- **Dynamic DNS Update**—Which records to update for the DDNS updates for the DHCP server. Available options are **Not Selected**, **Only PTR**, and **Both A and PTR Records**.
- **Override DHCP Client Requests**—Specifies that the DHCP server actions should override any update actions requested by the DHCP client.

Click **OK** to save the DDNS interface changes.

On **DDNS Update Methods**, click **Add**, and configure the following options:

- **Method Name**—The DDNS update method assigned to the interface.
- **Update Interval**—The update interval in whole numbers between DNS update attempts configured for the update method in days (0 to 364), hours (0 to 23), minutes (0 to 59), and seconds (0 to 59). These units are additive. That is, if you enter 0 days, 0 hours, 5 minutes and 15 seconds, the update method tries an update every 5 minutes and 15 seconds for as long as the method is active.
- **Update Records**—Stores server resource record updates that the DNS client updates. Available options are **Not Defined**, **Both A and PTR Records**, and **A Records**.

Click **OK** to save the DDNS update methods changes.

Click **Save** on the DHCP page to save your changes.
CHAPTER 31

Quality of Service (QoS) for Firepower Threat Defense

The following topics describe how to use the Quality of Service (QoS) feature to police network traffic using Firepower Threat Defense devices:

- Introduction to QoS, on page 613
- About QoS Policies, on page 613
- Rate Limiting with QoS Policies, on page 614

Introduction to QoS

Quality of Service, or QoS, rate limits (polices) network traffic that is allowed or trusted by access control. The system does not rate limit traffic that was fastpathed.

QoS is supported for routed interfaces on Firepower Threat Defense devices only.

Logging Rate-Limited Connections

There are no logging configurations for QoS. A connection can be rate limited without being logged, and you cannot log a connection simply because it was rate limited. To view QoS information in connection events, you must independently log the ends of the appropriate connections to the Firepower Management Center database; see Other Connections You Can Log, on page 2134.

Connection events for rate-limited connections contain information on how much traffic was dropped, and which QoS configurations limited the traffic. You can view this information in event views (workflows), dashboards, and reports.

About QoS Policies

QoS policies deployed to managed devices govern rate limiting. Each QoS policy can target multiple devices; each device can have one deployed QoS policy at a time.

In a QoS policy, a maximum of 32 QoS rules handle network traffic. The system matches traffic to QoS rules in the order you specify. The system rate limits traffic according to the first rule where all rule conditions match the traffic. Traffic that does not match any of the rules is not rate limited.
You must constrain QoS rules by source or destination (routed) interfaces. The system enforces rate limiting independently on each of those interfaces; you cannot specify an aggregate rate limit for a set of interfaces.

QoS rules can also rate limit traffic by other network characteristics, as well as contextual information such as application, URL, and user identity.

You can rate limit download and upload traffic independently. The system determines download and upload directions based on the connection initiator.

---

**Note**

QoS is not subordinate to a master access control configuration; you configure QoS independently. However, the access control and QoS policies deployed to the same device share identity configurations; see Associating Other Policies with Access Control, on page 1145.

---

**QoS Policies and Multitenancy**

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can deploy the same QoS policy to devices in different descendant domains. Administrators in those descendant domains can use this read-only ancestor-deployed QoS policy, or replace it with a local policy.

---

**Rate Limiting with QoS Policies**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin/Access Admin/Network Admin</td>
</tr>
</tbody>
</table>

To perform policy-based rate limiting, configure and deploy QoS policies to managed devices. Each QoS policy can target multiple devices; each device can have one deployed QoS policy at a time.

Only one person should edit a policy at a time, using a single browser window. If multiple users save the same policy, the last saved changes are retained. For your convenience, the system displays information on who (if anyone) is currently editing each policy. To protect the privacy of your session, a warning appears after 30 minutes of inactivity on the policy editor. After 60 minutes, the system discards your changes.

**Procedure**

**Step 1** Choose Devices > QoS.

**Step 2** Click New Policy to create a new QoS policy and, optionally, assign target devices; see Creating a QoS Policy, on page 615.

You can also copy (좌) or edit (편) an existing policy.
Step 3 Configure QoS rules; see Configuring QoS Rules, on page 616 and Rule Management: Common Characteristics, on page 353.

The Rules in the QoS policy editor lists each rule in evaluation order, and displays a summary of the rule conditions and rate limiting configurations. A right-click menu provides rule management options, including moving, enabling, and disabling.

Helpful in larger deployments, you can Filter by Device to display only the rules that affect a specific device or group of devices. You can also search for and within rules; the system matches text you enter in the Search Rules field to rule names and condition values, including objects and object groups.

Note Properly creating and ordering rules is a complex task, but one that is essential to building an effective deployment. If you do not plan carefully, rules can preempt other rules, require additional licenses, or contain invalid configurations. Icons represent comments, warnings, and errors. If issues exist, click Show Warnings to display a list. For more information, see Best Practices for Access Control Rules, on page 1124.

Step 4 Click Policy Assignments to identify the managed devices targeted by the policy; see Setting Target Devices for a QoS Policy, on page 616.

If you identified target devices during policy creation, verify your choices.

Step 5 Save the QoS policy.

Step 6 Because this feature must allow some packets to pass, you must configure your system to examine those packets. See Best Practices for Handling Packets That Pass Before Traffic Identification, on page 1591 and Specify a Policy to Handle Packets That Pass Before Traffic Identification, on page 1592.

Step 7 Deploy configuration changes; see Deploy Configuration Changes, on page 337.

---

Creating a QoS Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

A new QoS policy with no rules performs no rate limiting.

Procedure

Step 1 Choose Devices > QoS.
Step 2 Click New Policy.
Step 3 Enter a Name and, optionally, a Description.
Step 4 (Optional) Choose the Available Devices where you want to deploy the policy, then click Add to Policy, or drag and drop to the Selected Devices. To narrow the devices that appear, type a search string in the Search field.

You must assign devices before you deploy the policy.
Step 5  Click Save.

What to do next

• Configure and deploy the QoS policy; see Rate Limiting with QoS Policies, on page 614.

Setting Target Devices for a QoS Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin/Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

Each QoS policy can target multiple devices; each device can have one deployed QoS policy at a time.

Procedure

Step 1  In the QoS policy editor, click Policy Assignments.

Step 2  Build your target list:

• Add—Choose one or more Available Devices, then click Add to Policy or drag and drop into the list of Selected Devices.

• Delete—Click delete (🗑️) next to a single device, or choose multiple devices, right-click, then choose Delete Selected.

• Search—Enter a search string in the search field. Click clear (×) to clear the search.

Step 3  Click OK to save policy assignments.

Step 4  Click Save to save the policy.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Configuring QoS Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin/Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

When you create or edit a rule, use the upper portion of the rule editor to configure general rule properties. Use the lower portion of the rule editor to configure rule conditions and comments.
Procedure

**Step 1**
On Rules of the QoS policy editor:
- Add Rule—Click Add Rule.
- Edit Rule—Click edit (✏).

**Step 2**
Enter a Name.

**Step 3**
Configure rule components:
- Enabled—Specify whether the rule is Enabled.
- Apply QoS On—Choose the interfaces you want to rate limit, either Interfaces in Destination Interface Objects or Interfaces in Source Interface Objects. Your choice must correspond with a populated interface constraint (not any).
- Traffic Limit Per Interface—Enter a Download/Upload Limit in Mbits/sec. Click Advanced to enter different limits for download and upload traffic. The default value of Unlimited prevents matching traffic from being rate limited.
- Conditions—Click the corresponding condition you want to add. You must configure a source or destination interface condition, corresponding to your choice for Apply QoS On.
- Comments—Click Comments. To add a comment click New Comment, enter a comment, and click OK. You can edit or delete this comment until you save the rule.

For detailed information on rule components, see QoS Rule Components, on page 617.

**Step 4**
Save the rule.

**Step 5**
In the policy editor, set the rule position. Click and drag or use the right-click menu to cut and paste.

Rules are numbered starting at 1. The system matches traffic to rules in top-down order by ascending rule number. The first rule that traffic matches is the rule that handles that traffic. Proper rule order reduces the resources required to process network traffic and prevents rule preemption.

**Step 6**
Click Save to save the policy.

**What to do next**
- Deploy configuration changes; see Deploy Configuration Changes, on page 337.

**Related Topics**
- Best Practices for Access Control Rules, on page 1124

**QoS Rule Components**

**State (Enabled/Disabled)**
By default, rules are enabled. If you disable a rule, the system does not use it and stops generating warnings and errors for that rule.

**Interfaces (Apply QoS On)**
You cannot save a QoS rule that rate limits all traffic. For each QoS rule, you must apply QoS on either:
• Interfaces in Source Interface Objects—Rate limits traffic through the rule's source interfaces. If you choose this option, you must add at least one source interface constraint (cannot be any).

• Interfaces in Destination Interface Objects—Rate limits traffic through the rule's destination interfaces. If you choose this option, you must add at least one destination interface constraint (cannot be any).

Traffic Limit Per Interface

A QoS rule enforces rate limiting independently on each of the interfaces you specify with the Apply QoS On option. You cannot specify an aggregate rate limit for a set of interfaces.

You can rate limit traffic by Mbits per second. The default value of Unlimited prevents matching traffic from being rate limited.

Advanced settings allow you to rate limit download and upload traffic independently. The system determines download and upload directions based on the connection initiator.

If you specify a limit greater than the maximum throughput of an interface, the system does not rate limit matching traffic. Maximum throughput may be affected by an interface’s hardware configuration, which you specify in each device’s properties (Devices > Device Management).

Conditions

Conditions specify the specific traffic the rule handles. You can configure each rule with multiple conditions. Traffic must match all conditions to match the rule. Each condition type has its own tab in the rule editor.

You can rate limit traffic using:

• Interface Conditions, on page 357 (routed only; required)
• Network Conditions, on page 360
• Port and ICMP Code Conditions, on page 364
• Application Conditions (Application Control), on page 367
• URL Filtering, on page 1161
• User, Realm, and ISE Attribute Conditions (User Control), on page 376

Comments

Each time you save changes to a rule you can add comments. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change.

In the policy editor, the system displays how many comments a rule has. In the rule editor, use the Comments tab to view existing comments and add new ones.
PART IX

Firepower Threat Defense High Availability and Scalability

• High Availability for Firepower Threat Defense, on page 621
• Clustering for the Firepower Threat Defense, on page 647
CHAPTER 32

High Availability for Firepower Threat Defense

The following topics describe how to configure Active/Standby failover to accomplish high availability of the Cisco Firepower Threat Defense.

• About Firepower Threat Defense High Availability, on page 621
• Guidelines for High Availability, on page 634
• Add a Firepower Threat Defense High Availability Pair, on page 635
• Configure Optional High Availability Parameters, on page 636
• Manage High Availability, on page 639
• Monitoring High Availability, on page 644

About Firepower Threat Defense High Availability

Configuring high availability, also called failover, requires two identical Firepower Threat Defense devices connected to each other through a dedicated failover link and, optionally, a state link. Firepower Threat Defense supports Active/Standby failover, where one unit is the active unit and passes traffic. The standby unit does not actively pass traffic, but synchronizes configuration and other state information from the active unit. When a failover occurs, the active unit fails over to the standby unit, which then becomes active.

The health of the active unit (hardware, interfaces, software, and environmental status) is monitored to determine if specific failover conditions are met. If those conditions are met, failover occurs.

Note

High availability is not supported on Firepower Threat Defense Virtual running in the public cloud.

High Availability System Requirements

This section describes the hardware, software, and license requirements for Firepower Threat Defense devices in a High Availability configuration.

Hardware Requirements

The two units in a High Availability configuration must:

• Be the same model.

• Have the same number and types of interfaces.
For the Firepower 4100/9300 chassis, all interfaces must be preconfigured in FXOS identically before you enable High Availability. If you change the interfaces after you enable High Availability, make the interface changes in FXOS on the standby unit, and then make the same changes on the active unit.

If you are using units with different flash memory sizes in your High Availability configuration, make sure the unit with the smaller flash memory has enough space to accommodate the software image files and the configuration files. If it does not, configuration synchronization from the unit with the larger flash memory to the unit with the smaller flash memory will fail.

Software Requirements

The two units in a High Availability configuration must:

- Be in the same firewall mode (routed or transparent).
- Have the same software version.
- Be in the same domain or group on the Firepower Management Center.
- Have the same NTP configuration. See Configure NTP Time Synchronization for Threat Defense, on page 904.
- Be fully deployed on the Firepower Management Center with no uncommitted changes.
- Not have DHCP or PPPoE configured in any of their interfaces.
- (Firepower 4100/9300) Have the same flow offload mode, either both enabled or both disabled.

License Requirements for FTD Devices in a High Availability Pair

Firepower Threat Defense devices in a high availability configuration must have the same licenses.

High availability configurations require two Smart License entitlements; one for each device in the pair.

Before high availability is established, it does not matter which licenses are assigned to the secondary/standby device. During high availability configuration, the Firepower Management Center releases any unnecessary licenses assigned to the standby device and replaces them with identical licenses assigned to the primary/active device. For example, if the active device has a Base license and a Threat license, and the standby device has only a Base license, the Firepower Management Center communicates with the Cisco Smart Software Manager to obtain an available Threat license from your account for the standby device. If your Smart Licenses account does not include enough purchased entitlements, your account becomes Out-of-Compliance until you purchase the correct number of licenses.

Failover and Stateful Failover Links

The failover link and the optional stateful failover link are dedicated connections between the two units. Cisco recommends to use the same interface between two devices in a failover link or a stateful failover link. For example, in a failover link, if you have used eth0 in device 1, use the same interface (eth0) in device 2 as well.

Failover Link

The two units in a failover pair constantly communicate over a failover link to determine the operating status of each unit.
Failover Link Data

The following information is communicated over the failover link:

- The unit state (active or standby)
- Hello messages (keep-alives)
- Network link status
- MAC address exchange
- Configuration replication and synchronization

Interface for the Failover Link

You can use an unused data interface (physical, redundant, or EtherChannel) as the failover link; however, you cannot specify an interface that is currently configured with a name. You also cannot use a subinterface. The failover link interface is not configured as a normal networking interface; it exists for failover communication only. This interface can only be used for the failover link (and also for the state link).

The FTD does not support sharing interfaces between user data and the failover link.

Note

When using an EtherChannel or Redundant Interface as the failover or state link, you must confirm that the same EtherChannel or Redundant interface with the same member interfaces exists on both devices before establishing high availability.

For a redundant interface used as the failover link, see the following benefits for added redundancy:

- When a failover unit boots up, it alternates between the member interfaces to detect an active unit.
- If a failover unit stops receiving keepalive messages from its peer on one of the member interfaces, it switches to the other member interface.

For an EtherChannel used as the failover link, to prevent out-of-order packets, only one interface in the EtherChannel is used. If that interface fails, then the next interface in the EtherChannel is used. You cannot alter the EtherChannel configuration while it is in use as a failover link.

Connecting the Failover Link

Connect the failover link in one of the following two ways:

- Using a switch, with no other device on the same network segment (broadcast domain or VLAN) as the failover interfaces of the Firepower Threat Defense device.
- Using an Ethernet cable to connect the units directly, without the need for an external switch.

If you do not use a switch between the units, if the interface fails, the link is brought down on both peers. This condition may hamper troubleshooting efforts because you cannot easily determine which unit has the failed interface and caused the link to come down.

Stateful Failover Link

To use Stateful Failover, you must configure a Stateful Failover link (also known as the state link) to pass connection state information.
Cisco recommends that the bandwidth of the stateful failover link should at least match the bandwidth of the data interfaces.

**Shared with the Failover Link**

Sharing a failover link is the best way to conserve interfaces. However, you must consider a dedicated interface for the state link and failover link, if you have a large configuration and a high traffic network.

**Dedicated Interface for the Stateful Failover Link**

You can use a dedicated data interface (physical, redundant, or EtherChannel) for the state link. For an EtherChannel used as the state link, to prevent out-of-order packets, only one interface in the EtherChannel is used. If that interface fails, then the next interface in the EtherChannel is used.

Connect a dedicated state link in one of the following two ways:

- Using a switch, with no other device on the same network segment (broadcast domain or VLAN) as the failover interfaces of the Firepower Threat Defense device.

- Using an Ethernet cable to connect the appliances directly, without the need for an external switch.

  If you do not use a switch between the units, if the interface fails, the link is brought down on both peers. This condition may hamper troubleshooting efforts because you cannot easily determine which unit has the failed interface and caused the link to come down.

  The Firepower Threat Defense device supports Auto-MDI/MDIX on its copper Ethernet ports, so you can either use a crossover cable or a straight-through cable. If you use a straight-through cable, the interface automatically detects the cable and swaps one of the transmit/receive pairs to MDIX.

For optimum performance when using long distance failover, the latency for the state link should be less than 10 milliseconds and no more than 250 milliseconds. If latency is more than 10 milliseconds, some performance degradation occurs due to retransmission of failover messages.

**Avoiding Interrupted Failover and Data Links**

We recommend that failover links and data interfaces travel through different paths to decrease the chance that all interfaces fail at the same time. If the failover link is down, the Firepower Threat Defense device can use the data interfaces to determine if a failover is required. Subsequently, the failover operation is suspended until the health of the failover link is restored.

See the following connection scenarios to design a resilient failover network.

**Scenario 1—Not Recommended**

If a single switch or a set of switches are used to connect both failover and data interfaces between two Firepower Threat Defense devices, then when a switch or inter-switch-link is down, both Firepower Threat Defense devices become active. Therefore, the two connection methods shown in the following figures are not recommended.
Scenario 2—Recommended

We recommend that failover links not use the same switch as the data interfaces. Instead, use a different switch or use a direct cable to connect the failover link, as shown in the following figures.

Scenario 3—Recommended

If the Firepower Threat Defense data interfaces are connected to more than one set of switches, then a failover link can be connected to one of the switches, preferably the switch on the secure (inside) side of network, as shown in the following figure.

Scenario 4—Recommended

The most reliable failover configurations use a redundant interface on the failover link, as shown in the following figures.
MAC Addresses and IP Addresses in High Availability

When you configure your interfaces, you can specify an active IP address and a standby IP address on the same network. Generally, when a failover occurs, the new active unit takes over the active IP addresses and MAC addresses. Because network devices see no change in the MAC to IP address pairing, no ARP entries change or time out anywhere on the network.

Although recommended, the standby address is not required. Without a standby IP address, the active unit cannot perform network tests to check the standby interface health; it can only track the link state. You also cannot connect to the standby unit on that interface for management purposes.

The IP address and MAC address for the state link do not change at failover.
Active/Standby IP Addresses and MAC Addresses

For Active/Standby High Availability, see the following for IP address and MAC address usage during a failover event:

1. The active unit always uses the primary unit's IP addresses and MAC addresses.
2. When the active unit fails over, the standby unit assumes the IP addresses and MAC addresses of the failed unit and begins passing traffic.
3. When the failed unit comes back online, it is now in a standby state and takes over the standby IP addresses and MAC addresses.

However, if the secondary unit boots without detecting the primary unit, then the secondary unit becomes the active unit and uses its own MAC addresses, because it does not know the primary unit MAC addresses. When the primary unit becomes available, the secondary (active) unit changes the MAC addresses to those of the primary unit, which can cause an interruption in your network traffic. Similarly, if you swap out the primary unit with new hardware, a new MAC address is used.

Virtual MAC addresses guard against this disruption, because the active MAC addresses are known to the secondary unit at startup, and remain the same in the case of new primary unit hardware. If you do not configure virtual MAC addresses, you might need to clear the ARP tables on connected routers to restore traffic flow. The Firepower Threat Defense device does not send gratuitous ARPs for static NAT addresses when the MAC address changes, so connected routers do not learn of the MAC address change for these addresses.

Virtual MAC Addresses

The Firepower Threat Defense device has multiple methods to configure virtual MAC addresses. We recommend using only one method. If you set the MAC address using multiple methods, the MAC address used depends on many variables, and might not be predictable.

Stateful Failover

During Stateful Failover, the active unit continually passes per-connection state information to the standby unit. After a failover occurs, the same connection information is available at the new active unit. Supported end-user applications are not required to reconnect to keep the same communication session.

Supported Features

For Stateful Failover, the following state information is passed to the standby Firepower Threat Defense device:

- NAT translation table.
- TCP and UDP connections and states, including HTTP connection states. Other types of IP protocols, and ICMP, are not parsed by the active unit, because they get established on the new active unit when a new packet arrives.
- Snort connection states, inspection results, and pin hole information, including strict TCP enforcement.
- The ARP table
- The Layer 2 bridge table (for bridge groups)
- The ISAKMP and IPsec SA table
• GTP PDP connection database

• SIP signaling sessions and pin holes.

• Static and dynamic routing tables—Stateful Failover participates in dynamic routing protocols, like OSPF and EIGRP, so routes that are learned through dynamic routing protocols on the active unit are maintained in a Routing Information Base (RIB) table on the standby unit. Upon a failover event, packets travel normally with minimal disruption to traffic because the active secondary unit initially has rules that mirror the primary unit. Immediately after failover, the re-convergence timer starts on the newly active unit. Then the epoch number for the RIB table increments. During re-convergence, OSPF and EIGRP routes become updated with a new epoch number. Once the timer is expired, stale route entries (determined by the epoch number) are removed from the table. The RIB then contains the newest routing protocol forwarding information on the newly active unit.

Note
Routes are synchronized only for link-up or link-down events on an active unit. If the link goes up or down on the standby unit, dynamic routes sent from the active unit may be lost. This is normal, expected behavior.

• DHCP Server—DHCP address leases are not replicated. However, a DHCP server configured on an interface will send a ping to make sure an address is not being used before granting the address to a DHCP client, so there is no impact to the service. State information is not relevant for DHCP relay or DDNS.

• Access control policy decisions—Decisions related to traffic matching (including URL, URL category, geolocation, and so forth), intrusion detection, malware, and file type are preserved during failover. However, for connections being evaluated at the moment of failover, there are the following caveats:
  • AVC—App-ID verdicts are replicated, but not detection states. Proper synchronization occurs as long as the App-ID verdicts are complete and synchronized before failover occurs.
  • Intrusion detection state—Upon failover, once mid-flow pickup occurs, new inspections are completed, but old states are lost.
  • File malware blocking—The file disposition must become available before failover.
  • File type detection and blocking—The file type must be identified before failover. If failover occurs while the original active device is identifying the file, the file type is not synchronized. Even if your file policy blocks that file type, the new active device downloads the file.

• User identity decisions from the identity policy, including the user-to-IP address mappings gathered passively through the User Agent and ISE Session Directory, and active authentication through captive portal. Users who are actively authenticating at the moment of failover might be prompted to authenticate again.

• Network AMP—Cloud lookups are independent from each device, so failover does not affect this feature in general. Specifically:
  • Signature Lookup—If failover occurs in the middle of a file transmission, no file event is generated and no detection occurs.
  • File Storage—If failover occurs when the file is being stored, it is stored on the original active device. If the original active device went down while the file was being stored, the file does not get stored.
• File Pre-classification (Local Analysis)—If failover occurs in the middle of pre-classification, detection fails.
• File Dynamic Analysis (Connectivity to the cloud)—If failover occurs, the system might submit the file to the cloud.
• Archive File Support—If failover occurs in the middle of an analysis, the system loses visibility into the file/archive.
• Custom Blacklisting—If failover occurs, no events are generated.
• Security Intelligence decisions. However, DNS-based decisions that are in process at the moment of failover are not completed.

Unsupported Features

For Stateful Failover, the following state information is not passed to the standby Firepower Threat Defense device:

• Sessions inside plaintext tunnels such as GRE or IP-in-IP. Sessions inside tunnels are not replicated and the new active node will not be able to reuse existing inspection verdicts to match the correct policy rules.
• Decrypted TLS/SSL connections—The decryption states are not synchronized, and if the active unit fails, then decrypted connections will be reset. New connections will need to be established to the new active unit. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.
• Multicast routing.

Bridge Group Requirements for High Availability

There are special considerations for high availability when using bridge groups.

When the active unit fails over to the standby unit, the switch port running Spanning Tree Protocol (STP) can go into a blocking state for 30 to 50 seconds when it senses the topology change. To avoid traffic loss on the bridge group member interfaces while the port is in a blocking state, you can configure one of the following workarounds:

• Switch port is in Access mode—Enable the STP PortFast feature on the switch:

```
interface interface_id
spanning-tree portfast
```

The PortFast feature immediately transitions the port into STP forwarding mode upon linkup. The port still participates in STP. So if the port is to be a part of the loop, the port eventually transitions into STP blocking mode.

• If the switch port is in Trunk mode, or you cannot enable STP PortFast, then you can use one of the following less desirable workarounds that impacts failover functionality or STP stability:
  • Disable interface monitoring on the bridge group and member interfaces.
• Increase the interface hold time in the failover criteria to a high value that will allow STP to converge before the unit fails over.
• Decrease the STP timers on the switch to allow STP to converge faster than the interface hold time.

Failover Health Monitoring

The Firepower Threat Defense device monitors each unit for overall health and for interface health. This section includes information about how the Firepower Threat Defense device performs tests to determine the state of each unit.

Unit Health Monitoring

The Firepower Threat Defense device determines the health of the other unit by monitoring the failover link with hello messages. When a unit does not receive three consecutive hello messages on the failover link, the unit sends LANTEST messages on each data interface, including the failover link, to validate whether or not the peer is responsive. The action that the Firepower Threat Defense device takes depends on the response from the other unit. See the following possible actions:

• If the Firepower Threat Defense device receives a response on the failover link, then it does not fail over.
• If the Firepower Threat Defense device does not receive a response on the failover link, but it does receive a response on a data interface, then the unit does not failover. The failover link is marked as failed. You should restore the failover link as soon as possible because the unit cannot fail over to the standby while the failover link is down.
• If the Firepower Threat Defense device does not receive a response on any interface, then the standby unit switches to active mode and classifies the other unit as failed.

Interface Monitoring

When a unit does not receive hello messages on a monitored interface for 15 seconds, it runs interface tests. If one of the interface tests fails for an interface, but this same interface on the other unit continues to successfully pass traffic, then the interface is considered to be failed, and the device stops running tests.

If the threshold you define for the number of failed interfaces is met (see Devices > Device Management > High Availability > Failover Trigger Criteria), and the active unit has more failed interfaces than the standby unit, then a failover occurs. If an interface fails on both units, then both interfaces go into the “Unknown” state and do not count towards the failover limit defined by failover interface policy.

An interface becomes operational again if it receives any traffic. A failed device returns to standby mode if the interface failure threshold is no longer met.

If an interface has IPv4 and IPv6 addresses configured on it, the device uses the IPv4 addresses to perform the health monitoring. If an interface has only IPv6 addresses configured on it, then the device uses IPv6 neighbor discovery instead of ARP to perform the health monitoring tests. For the broadcast ping test, the device uses the IPv6 all nodes address (FE02::1).

Interface Tests

The Firepower Threat Defense device uses the following interface tests. The duration of each test is approximately 1.5 seconds.
1. **Link Up/Down test**—A test of the interface status. If the Link Up/Down test indicates that the interface is down, then the device considers it failed, and testing stops. If the status is Up, then the device performs the Network Activity test.

2. **Network Activity test**—A received network activity test. At the start of the test, each unit clears its received packet count for its interfaces. As soon as a unit receives any eligible packets during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then the device starts the ARP test.

3. **ARP test**—A test for successful ARP replies. Each unit sends a single ARP request for the IP address in the most recent entry in its ARP table. If the unit receives an ARP reply or other network traffic during the test, then the interface is considered operational. If the unit does not receive an ARP reply, then the device sends a single ARP request for the IP address in the next entry in the ARP table. If the unit receives an ARP reply or other network traffic during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic, and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then the device starts the Broadcast Ping test.

4. **Broadcast Ping test**—A test for successful ping replies. Each unit sends a broadcast ping, and then counts all received packets. If the unit receives any packets during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic, and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then testing starts over again with the ARP test. If both units continue to receive no traffic from the ARP and Broadcast Ping tests, then these tests will continue running in perpetuity.

### Interface Status

Monitored interfaces can have the following status:

- **Unknown**—Initial status. This status can also mean the status cannot be determined.
- **Normal**—The interface is receiving traffic.
- **Normal (Waiting)**—The interface is up, but has not yet received a hello packet from the corresponding interface on the peer unit.
- **Normal (Not-Monitored)**—The interface is up, but is not monitored by the failover process.
- **Testing**—Hello messages are not heard on the interface for five poll times.
- **Link Down**—The interface or VLAN is administratively down.
- **Link Down (Waiting)**—The interface or VLAN is administratively down and has not yet received a hello packet from the corresponding interface on the peer unit.
- **Link Down (Not-Monitored)**—The interface or VLAN is administratively down, but is not monitored by the failover process.
- **No Link**—The physical link for the interface is down.
- **No Link (Waiting)**—The physical link for the interface is down and has not yet received a hello packet from the corresponding interface on the peer unit.
- **No Link (Not-Monitored)**—The physical link for the interface is down, but is not monitored by the failover process.
• Failed—No traffic is received on the interface, yet traffic is heard on the peer interface.

**Failover Triggers and Detection Timing**

The following table shows the failover triggering events and associated failure detection timing. If failover occurs, you can view the reason for the failover in the Message Center, along with various operations pertaining to the high availability pair.

<table>
<thead>
<tr>

**About Active/Standby Failover**

Active/Standby failover lets you use a standby Firepower Threat Defense device to take over the functionality of a failed unit. When the active unit fails, the standby unit becomes the active unit.

**Primary/Secondary Roles and Active/Standby Status**

When setting up Active/Standby failover, you configure one unit to be primary and the other to be secondary. During configuration, the primary unit's policies are synchronized to the secondary unit. At this point, the two units act as a single device for device and policy configuration. However, for events, dashboards, reports and health monitoring, they continue to display as separate devices.

The main differences between the two units in a failover pair are related to which unit is active and which unit is standby, namely which IP addresses to use and which unit actively passes traffic.

However, a few differences exist between the units based on which unit is primary (as specified in the configuration) and which unit is secondary:

- The primary unit always becomes the active unit if both units start up at the same time (and are of equal operational health).
- The primary unit MAC addresses are always coupled with the active IP addresses. The exception to this rule occurs when the secondary unit becomes active and cannot obtain the primary unit MAC addresses over the failover link. In this case, the secondary unit MAC addresses are used.

**Active Unit Determination at Startup**

The active unit is determined by the following:

- If a unit boots and detects a peer already running as active, it becomes the standby unit.
• If a unit boots and does not detect a peer, it becomes the active unit.
• If both units boot simultaneously, then the primary unit becomes the active unit, and the secondary unit becomes the standby unit.

Failover Events

In Active/Standby failover, failover occurs on a unit basis.

The following table shows the failover action for each failure event. For each failure event, the table shows the failover policy (failover or no failover), the action taken by the active unit, the action taken by the standby unit, and any special notes about the failover condition and actions.

Table 65: Failover Events

### Guidelines for High Availability

#### Model Support

- **ASA 5506W-X**—You must disable interface monitoring for the internal GigabitEthernet 1/9 interface. These interfaces will not be able to communicate to perform the default interface monitoring checks, resulting in a switch from active to standby and back again because of expected interface communication failures.

- **Firepower 9300**—Intra-chassis High Availability is not supported.

- **The Firepower Threat Defense Virtual on public cloud networks such as Microsoft Azure and Amazon Web Services are not supported with High Availability because Layer 2 connectivity is required.**

#### Additional Guidelines

- When the active unit fails over to the standby unit, the connected switch port running Spanning Tree Protocol (STP) can go into a blocking state for 30 to 50 seconds when it senses the topology change. To avoid traffic loss while the port is in a blocking state, you can enable the STP PortFast feature on the switch:

  ```
  interface interface_id
  spanning-tree portfast
  ```

  This workaround applies to switches connected to both routed mode and bridge group interfaces. The PortFast feature immediately transitions the port into STP forwarding mode upon linkup. The port still participates in STP. So if the port is to be a part of the loop, the port eventually transitions into STP blocking mode.

- You cannot enable failover if a local CA server is configured. Remove the CA configuration using the `no crypto ca server` command.

- Configuring port security on the switch(es) connected to the Firepower Threat Defense failover pair can cause communication problems when a failover event occurs. This problem occurs when a secure MAC address configured or learned on one secure port moves to another secure port, a violation is flagged by the switch port security feature.

- For Active/Standby High Availability and a VPN IPSec tunnel, you cannot monitor both the active and standby units using SNMP over the VPN tunnel. The standby unit does not have an active VPN tunnel, and will drop traffic destined for the NMS. You can instead use SNMPv3 with encryption so the IPsec tunnel is not required.

---

<table>
<thead>
<tr>

<td>No action</td>
<td>Mark standby as failed</td>
<td>When the standby unit is marked as failed, then the active unit does not attempt to fail over even if the interface failure threshold is surpassed.</td>
</tr>
</tbody>
</table>
• Make sure each unit in the High Availability pair uses a unique hostname; the Firepower Management Center cannot add the secondary unit if it has the same name as the primary unit.

Add a Firepower Threat Defense High Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Admin/Norton Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Firepower Threat Defense Virtual</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When establishing an Active/Standby High Availability pair, you designate one of the devices as primary and the other as secondary. The system applies a merged configuration to the paired devices. If there is a conflict, the system applies the configuration from the device you designated as primary.

In a multidomain deployment, devices in a high availability pair must belong to the same domain.

Note
The system uses the failover link to sync configuration, while the stateful failover link is used to sync application content between peers. The failover link and the stateful failover link are in a private IP space and are only used for communication between peers in a high availability pair. After high availability is established, selected interface links and encryption settings cannot be modified without breaking the high availability pair and reconfiguring it.

Caution
Creating or breaking a Firepower Threat Defense high availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 for more information.

Before you begin
Confirm that both devices:

• Are the same model.
• Have the same number and type of interfaces.
• Are in the same domain and group.
• Have normal health status and are running the same software.
• Are either in routed or transparent mode.
• Have the same NTP configuration. See Configure NTP Time Synchronization for Threat Defense, on page 904.
• Are fully deployed with no uncommitted changes.
• Do not have DHCP or PPPoE configured in any of their interfaces.

Procedure

Step 1  Add both devices to the Firepower Management Center according to Add Devices to the Firepower Management Center, on page 228.

Step 2  Choose Devices > Device Management.

Step 3  From the Add drop-down menu, choose High Availability.

Step 4  Enter a display Name for the high availability pair.

Step 5  Under Device Type, choose Firepower Threat Defense.

Step 6  Choose the Primary Peer device for the high availability pair.

Step 7  Choose the Secondary Peer device for the high availability pair.

Step 8  Click Continue.

Step 9  Under LAN Failover Link, choose an Interface with enough bandwidth to reserve for failover communications.

Note  Only interfaces that do not have a logical name and do not belong to a security zone, will be listed in the Interface drop-down in the Add High Availability Pair dialog.

Step 10  Type any identifying Logical Name.

Step 11  Type a Primary IP address for the failover link on the active unit. This address should be on an unused subnet.

Note  169.254.0.0/16 and fd00:0:0:*::/64 are internally used subnets and cannot be used for the failover or state links.

Step 12  Optionally, choose Use IPv6 Address.

Step 13  Type a Secondary IP address for the failover link on the standby unit. This IP address must be in the same subnet as the primary IP address.

Step 14  If IPv4 addresses are used, type a Subnet Mask that applies to both the primary and secondary IP addresses.

Step 15  Optionally, under Stateful Failover Link, choose the same Interface, or choose a different interface and enter the high availability configuration information.

Note  169.254.0.0/16 and fd00:0:0:*::/64 are internally used subnets and cannot be used for the failover or state links.

Step 16  Optionally, choose Enabled and choose the Key Generation method for IPsec Encryption between the failover links.

Step 17  Click OK. This process takes a few minutes as the process synchronizes system data.

Configure Optional High Availability Parameters

You can view the initial High Availability Configuration on the Firepower Management Center. You cannot edit these settings without breaking the high availability pair and then re-establishing it.

You can edit the Failover Trigger Criteria to improve failover results. Interface Monitoring allows you to determine which interfaces are better suited for failover.
Configure Standby IP Addresses and Interface Monitoring

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>

<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Firepower Threat Defense Virtual</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For each interface, set a standby IP address. Although recommended, the standby address is not required. Without a standby IP address, the active unit cannot perform network tests to check the standby interface health; it can only track the link state.

By default, monitoring is enabled on all physical interfaces with logical names configured. You might want to exclude interfaces attached to less critical networks from affecting your failover policy.

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device high-availability pair you want to edit, click the edit icon (⟳).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the High Availability tab.

**Step 4** In the Monitored Interfaces area, click the edit icon (⟳) next to the interface you want to edit.

**Step 5** Check the Monitor this interface for failures check box.

**Step 6** On the IPv4 tab, enter the Standby IP Address.

This address must be a free address on the same network as the active IP address.

**Step 7** If you configured the IPv6 address manually, on the IPv6 tab, click the edit icon (⟳) next to the active IP address, enter the Standby IP Address, and click OK.

This address must be a free address on the same network as the active IP address. For autogenerated and Enforce EUI 64 addresses, the standby address is automatically generated.

**Step 8** Click OK.

**Edit High Availability Failover Criteria**

<table>

<td>Admin/Network Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Firepower Threat Defense Virtual</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can configure active and standby MAC addresses for failover in two places on the Firepower Management Center:

- The Advanced tab of the Edit Interface page during interface configuration; see Configure the MAC Address, on page 590.
- The Add Interface MAC Address page accessed from the High Availability page; see

If active and standby MAC addresses are configured in both locations, the addresses defined during interface configuration take preference for failover.

You can minimize loss of traffic during failover by designating active and standby mac addresses to the physical interface. This feature offers redundancy against IP address mapping for failover.

**Procedure**

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device high-availability pair you want to edit, click the edit icon (✏).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Choose High Availability.

**Step 4** Next to Failover Trigger Criteria, click the edit icon (✏).

**Step 5** Under Interface Failure Threshold, choose the number or percentage of interfaces that must fail before the device fails over.

**Step 6** Under Hello packet Intervals, choose how often hello packets are sent over the failover link.

**Note** If you use remote access VPN on the Firepower 2100, use the default hello packet intervals. Otherwise, you might see high CPU usage that can cause a failover to occur.

**Step 7** Click OK.
Step 3 Choose **High Availability**.
Step 4 Choose the add icon (.Timeout) next to Interface Mac Addresses.
Step 5 Choose a **Physical Interface**.
Step 6 Type an **Active Interface Mac Address**.
Step 7 Type a **Standby Interface Mac Address**.
Step 8 Click **OK**.

## Manage High Availability

This section describes how to manage High Availability units after you enable High Availability, including how to change the High Availability setup and how to force failover from one unit to another.

</tbody>
</table>

After you establish a Firepower Threat Defense high availability pair, you can manually switch the active and standby units, effectively forcing failover for reasons such as persistent fault or health events on the current active unit. Both units should be fully deployed before you complete this procedure.

**Procedure**

**Step 1** Choose **Devices > Device Management**.
**Step 2** Next to the high availability pair where you want to change the active peer, click the Switch Active Peer icon ( Timeout).
**Step 3** You can:
  - Click **Yes** to immediately make the standby device the active device in the high availability pair.
  - Click **No** to cancel and return to the Device Management page.

### Suspend and Resume High Availability

You can suspend a unit in a high availability pair. This is useful when:

- Both units are in an active-active situation and fixing the communication on the failover link does not correct the problem.
• You want to troubleshoot an active or standby unit and do not want the units to fail over during that time.

When you suspend high availability, you stop the pair of devices from behaving as a failover unit. The currently active device remains active, handling all user connections. However, failover criteria are no longer monitored, and the system will never fail over to the now pseudo-standby device. The standby device will retain its configuration, but it will remain inactive.

The key difference between suspending HA and breaking HA is that on a suspended HA device, the high availability configuration is retained. When you break HA, the configuration is erased. Thus, you have the option to resume HA on a suspended system, which enables the existing configuration and makes the two devices function as a failover pair again.

To suspend HA, use the `configure failover suspend` command.

If you suspend high availability from the active unit, the configuration is suspended on both the active and standby unit. If you suspend it from the standby unit, it is suspended on the standby unit only, but the active unit will not attempt to fail over to a suspended unit.

To resume failover, use the `configure failover resume` command.

You can resume a unit only if it is in Suspended state. The unit will negotiate active/standby status with the peer unit.

---

**Note**

Suspending high availability is a temporary state. If you reload a unit, it resumes the high-availability configuration automatically and negotiates the active/standby state with the peer.

---

**Replace a Unit in an FTD High Availability Pair**

You must break high availability before you replace a failed unit in a Firepower Threat Defense high availability pair. Then, register the replacement device to the Firepower Management Center and reestablish high availability. The process varies depending on whether the device is primary or secondary:

- **Replace a Primary FTD HA Unit**, on page 640
- **Replace a Secondary FTD HA Unit**, on page 641

**Replace a Primary FTD HA Unit**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense, Firepower Threat Defense Virtual</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Follow the steps below to replace a failed primary unit in a Firepower Threat Defense high availability pair. Failing to follow these steps can overwrite the existing high availability configuration.
Creating or breaking a Firepower Threat Defense high availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 for more information.

Procedure

Step 1 Choose **Force Break** to separate the high availability pair; see Separate Units in a High Availability Pair, on page 642.

**Note** The break operation removes all the configuration related to HA from Firepower Threat Defense and Firepower Management Center, and you need to recreate it manually later. To successfully configure the same HA pair, ensure that you save the IPs, MAC addresses, and monitoring configuration of all the interfaces/subinterfaces prior to executing the HA break operation.

Step 2 Unregister the failed primary Firepower Threat Defense device from the Firepower Management Center; see Deleting Devices from the Firepower Management Center, on page 230.

Step 3 Register the replacement Firepower Threat Defense to the Firepower Management Center; see Add Devices to the Firepower Management Center, on page 228.

Step 4 Configure high availability, using the existing secondary/active unit as the primary device and the replacement device as the secondary/standby device during registration; see Add a Firepower Threat Defense High Availability Pair, on page 635.

Replace a Secondary FTD HA Unit

<table>
<thead>

</tr>
<tr>
<td></td>
<td></td>
<td>Firepower Threat Defense Virtual</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Follow the steps below to replace a failed secondary unit in a Firepower Threat Defense high availability pair.

Creating or breaking a Firepower Threat Defense high availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 340 for more information.
Procedure

Step 1  Choose **Force Break** to separate the high availability pair; see **Separate Units in a High Availability Pair**, on page 642.

**Note**  The break operation removes all the configuration related to HA from Firepower Threat Defense and Firepower Management Center, and you need to recreate it manually later. To successfully configure the same HA pair, ensure that you save the IPs, MAC addresses, and monitoring configuration of all the interfaces/subinterfaces prior to executing the HA break operation.

Step 2  Unregister the secondary Firepower Threat Defense device from the Firepower Management Center; see **Deleting Devices from the Firepower Management Center**, on page 230.

Step 3  Register the replacement Firepower Threat Defense to the Firepower Management Center; see **Add Devices to the Firepower Management Center**, on page 228.

Step 4  Configure high availability, using the existing primary/active unit as the primary device and the replacement device as the secondary/standby device during registration; see **Add a Firepower Threat Defense High Availability Pair**, on page 635.

---

### Separate Units in a High Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>

</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Firepower Threat Defense Virtual</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When you break a high availability pair, the active device retains full deployed functionality. The standby device loses its failover and interface configurations, and becomes a standalone device. When you break a high availability pair, policies that were yet to be deployed to the active device, prior to the break operation are automatically deployed to the active device when the break operation is completed.

**Tip**  An exception to this is the flex-config policy. A flex-config policy deployed on the active device may show a deployment failure after the break HA operation. You must alter and re-deploy the flex-config policy on the active device.

**Note**  If you cannot reach the high availability pair using the Firepower Management Center, use the CLI command `configure high-availability disable` to remove the failover configuration from both devices.

---

**Procedure**

Step 1  Choose **Devices > Device Management**.
Step 2  Next to the high-availability pair you want to break, click the Break HA icon ().
Step 3  Optionally, check the check box to force break, if the standby peer does not respond.
Step 4  Click Yes. The device high-availability pair is separated.

The Break operation removes the failover configuration from the active and standby devices.

What to do next
(Optional) If you are using a flex-config policy on the active device, alter and re-deploy the flex-config policy to eliminate deployment errors.

Unregister a High Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>

<td>Firepower Threat Defense</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Firepower Threat Defense Virtual</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can delete the pair from the Firepower Management Center and disable High Availability on each unit using the CLI.

Before you begin
This procedure requires CLI access.

Procedure

Step 1  Choose Devices > Device Management.
Step 2  Next to the high-availability pair you want to unregister, click the Delete icon ().
Step 3  Click Yes. The device high availability pair is deleted.
Step 4  On each unit, access the Firepower Threat Defense CLI, and enter the following command:

configure high-availability disable

If you do not enter this command, you cannot re-register the units and form a new HA pair.

Note  Enter this command before you change the firewall mode; if you change the mode, the unit will not later let you enter the configure high-availability disable command, and the Firepower Management Center cannot re-form the HA pair without this command.
Monitoring High Availability

This section lets you monitor the High Availability status.

View Failover History

<table>

</tr>
<tr>
<td></td>
<td></td>
<td>Firepower Threat Defense Virtual</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can view the failover history of both high availability devices in a single view. The history displays in chronological order and includes the reason for any failover.

Procedure

Step 1  Choose Devices > Device Management.

Step 2  Next to the device high-availability pair you want to edit, click the edit icon (pectacular).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  Choose Summary.

Step 4  Under General, click the view icon (pectacular).

View Stateful Failover Statistics

<table>
<thead>

<td></td>
<td>Firepower Threat Defense Virtual</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can view the stateful failover link statistics of both the primary and secondary devices in the high availability pair.

Procedure

Step 1  Choose Devices > Device Management.

Step 2  Next to the device high-availability pair you want to edit, click the edit icon (pectacular).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3**  Choose **High Availability**.

**Step 4**  Under Stateful Failover Link, click the view icon (\(\square\)).

**Step 5**  Choose a device to view statistics.
Clustering for the Firepower Threat Defense

Clustering lets you group multiple FTD units together as a single logical device. Clustering is only supported for the FTD device on the Firepower 9300. A cluster provides all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices.

Note

The FTD device does not support a cluster across multiple chassis (inter-chassis); only intra-chassis clustering is supported.

Note

Some features are not supported when using clustering. See Unsupported Features with Clustering, on page 664.

• About Clustering on the Firepower 4100/9300 Chassis, on page 647
• Licenses for Clustering, on page 651

About Clustering on the Firepower 4100/9300 Chassis

The cluster consists of multiple devices acting as a single logical unit. When you deploy a cluster on the Firepower 4100/9300 chassis, it does the following:

• Creates a cluster-control link (by default, port-channel 48) for unit-to-unit communication.

  For intra-chassis clustering, this link utilizes the Firepower 9300 backplane for cluster communications.

• Creates the cluster bootstrap configuration within the application.
When you deploy the cluster, the chassis supervisor pushes a minimal bootstrap configuration to each unit that includes the cluster name, cluster control link interface, and other cluster settings.

- Assigns data interfaces to the cluster as *Spanned* interfaces.

For intra-chassis clustering, spanned interfaces are not limited to EtherChannels. The Firepower 9300 supervisor uses EtherChannel technology internally to load-balance traffic to multiple modules on a shared interface, so any data interface type works for Spanned mode.

---

**Note**

Individual interfaces are not supported, with the exception of a management interface.

- Assigns a management interface to all units in the cluster.

The following sections provide more detail about clustering concepts and implementation. See also Reference for Clustering, on page 664.

### Bootstrap Configuration

When you deploy the cluster, the Firepower 4100/9300 chassis supervisor pushes a minimal bootstrap configuration to each unit that includes the cluster name, cluster control link interface, and other cluster settings.

### Cluster Members

Cluster members work together to accomplish the sharing of the security policy and traffic flows.

One member of the cluster is the **master** unit. The master unit is determined automatically. All other members are **slave** units.

You must perform all configuration on the master unit only; the configuration is then replicated to the slave units.

Some features do not scale in a cluster, and the master unit handles all traffic for those features. See Centralized Features for Clustering, on page 664.

### Cluster Control Link

The cluster control link is automatically created using the Port-channel 48 interface.

For intra-chassis clustering, this interface has no member interfaces. This Cluster type EtherChannel utilizes the Firepower 9300 backplane for cluster communications for intra-chassis clustering. For inter-chassis clustering, you must add one or more interfaces to the EtherChannel.

For a 2-member inter-chassis cluster, do not directly connect the cluster control link from one chassis to the other chassis. If you directly connect the interfaces, then when one unit fails, the cluster control link fails, and thus the remaining healthy unit fails. If you connect the cluster control link through a switch, then the cluster control link remains up for the healthy unit.

Cluster control link traffic includes both control and data traffic.
Size the Cluster Control Link for Inter-Chassis Clustering

If possible, you should size the cluster control link to match the expected throughput of each chassis so the cluster-control link can handle the worst-case scenarios.

Cluster control link traffic is comprised mainly of state update and forwarded packets. The amount of traffic at any given time on the cluster control link varies. The amount of forwarded traffic depends on the load-balancing efficacy or whether there is a lot of traffic for centralized features. For example:

- NAT results in poor load balancing of connections, and the need to rebalance all returning traffic to the correct units.
- When membership changes, the cluster needs to rebalance a large number of connections, thus temporarily using a large amount of cluster control link bandwidth.

A higher-bandwidth cluster control link helps the cluster to converge faster when there are membership changes and prevents throughput bottlenecks.

---

**Note**

If your cluster has large amounts of asymmetric (rebalanced) traffic, then you should increase the cluster control link size.

Cluster Control Link Redundancy for Inter-Chassis Clustering

The following diagram shows how to use an EtherChannel as a cluster control link in a Virtual Switching System (VSS) or Virtual Port Channel (vPC) environment. All links in the EtherChannel are active. When the switch is part of a VSS or vPC, then you can connect Firepower 9300 chassis interfaces within the same EtherChannel to separate switches in the VSS or vPC. The switch interfaces are members of the same EtherChannel port-channel interface, because the separate switches act like a single switch. Note that this EtherChannel is device-local, not a Spanned EtherChannel.
Cluster Control Link Reliability for Inter-Chassis Clustering

To ensure cluster control link functionality, be sure the round-trip time (RTT) between units is less than 20 ms. This maximum latency enhances compatibility with cluster members installed at different geographical sites. To check your latency, perform a ping on the cluster control link between units.

The cluster control link must be reliable, with no out-of-order or dropped packets; for example, for inter-site deployment, you should use a dedicated link.

Cluster Control Link Network

The Firepower 4100/9300 chassis auto-generates the cluster control link interface IP address for each unit based on the chassis ID and slot ID: 127.2.chassis_id.slot_id. You cannot set this IP address manually, either in FXOS or within the application. The cluster control link network cannot include any routers between units; only Layer 2 switching is allowed.

Management Network

We recommend connecting all units to a single management network. This network is separate from the cluster control link.

Management Interface

You must assign a Management type interface to the cluster. This interface is a special individual interface as opposed to a Spanned interface. The management interface lets you connect directly to each unit. This Management logical interface is separate from the other interfaces on the device. It is used to set up and register the device to the Firepower Management Center. It uses its own local authentication, IP address, and static routing. Each cluster member uses a separate IP address on the management network that you set as part of the bootstrap configuration.

The management interface is shared between the Management logical interface and the Diagnostic logical interface. The Diagnostic logical interface is optional and is not configured as part of the bootstrap configuration. The Diagnostic interface can be configured along with the rest of the data interfaces. If you choose to configure the Diagnostic interface, configure a Main cluster IP address as a fixed address for the cluster that always belongs to the current master unit. You also configure a range of addresses so that each unit, including the current master, can use a Local address from the range. The Main cluster IP address provides consistent diagnostic access to an address; when a master unit changes, the Main cluster IP address moves to the new master unit, so access to the cluster continues seamlessly. For outbound management traffic such as TFTP or syslog, each unit, including the master unit, uses the Local IP address to connect to the server.

Cluster Interfaces

For intra-chassis clustering, you can assign both physical interfaces or EtherChannels (also known as port channels) to the cluster. Interfaces assigned to the cluster are Spanned interfaces that load-balance traffic across all members of the cluster.

Individual interfaces are not supported, with the exception of a management interface.
Spanned EtherChannels

You can group one or more interfaces per chassis into an EtherChannel that spans all chassis in the cluster. The EtherChannel aggregates the traffic across all the available active interfaces in the channel. A Spanned EtherChannel can be configured in both routed and transparent firewall modes. In routed mode, the EtherChannel is configured as a routed interface with a single IP address. In transparent mode, the IP address is assigned to the BVI, not to the bridge group member interface. The EtherChannel inherently provides load balancing as part of basic operation.

Connecting to a VSS or vPC

We recommend connecting EtherChannels to a VSS or vPC to provide redundancy for your interfaces.

Configuration Replication

All units in the cluster share a single configuration. You can only make configuration changes on the master unit, and changes are automatically synced to all other units in the cluster.

Licenses for Clustering

The FTD uses Smart Licensing. You assign licenses to the cluster as a whole, not to individual units. However, each unit of the cluster consumes a separate license for each feature.
When you add a cluster member to the FMC, you can specify the feature licenses you want to use for the cluster. If you choose different feature licenses for each device before you form them into a cluster in the FMC, then the licenses you chose for the master unit are used for the cluster. You can modify licenses for the cluster in the Devices > Device Management > Cluster > License area.

Note
If you add the cluster before the FMC is licensed (and running in Evaluation mode), then when you license the FMC, you can experience traffic disruption when you deploy policy changes to the cluster. Changing to licensed mode causes all slave units to leave the cluster and then rejoin.

Requirements and Prerequisites for Clustering

Cluster Model Support

- Firepower 9300—You must include all modules installed in the chassis for a maximum 3-unit, intra-chassis cluster.

Clustering Guidelines and Limitations

- When adding a unit to an existing cluster, or when reloading a unit, there will be a temporary, limited packet/connection drop; this is expected behavior. In some cases, the dropped packets can hang connections; for example, dropping a FIN/ACK packet for an FTP connection will make the FTP client hang. In this case, you need to reestablish the FTP connection.

- If you use a Windows 2003 server connected to a Spanned EtherChannel interface, when the syslog server port is down, and the server does not throttle ICMP error messages, then large numbers of ICMP messages are sent back to the cluster. These messages can result in some units of the cluster experiencing high CPU, which can affect performance. We recommend that you throttle ICMP error messages.

- We recommend connecting EtherChannels to a VSS or vPC for redundancy.

- Within a chassis, you cannot cluster some security modules and run other security modules in standalone mode; you must include all security modules in the cluster.

Defaults

- The cluster health check feature is enabled by default with the holdtime of 3 seconds. Interface health monitoring is enabled on all interfaces by default.

Configure Clustering

You can easily deploy the cluster from the Firepower 4100/9300 chassis supervisor. All initial configuration is automatically generated for each unit. You can then add the units to the FMC and group them into a cluster.
**FXOS: Add a Firepower Threat Defense Cluster**

You can add a single Firepower 9300 chassis as an intra-chassis cluster, or add multiple chassis for inter-chassis clustering.

For inter-chassis clustering, you must configure each chassis separately. Add the cluster on one chassis; you can then copy the bootstrap configuration from the first chassis to the next chassis for ease of deployment.

**Create a Firepower Threat Defense Cluster**

You can easily deploy the cluster from the Firepower 4100/9300 chassis supervisor. All initial configuration is automatically generated for each unit.

In a Firepower 9300 chassis, you must enable clustering for all 3 module slots, even if you do not have a module installed. If you do not configure all 3 modules, the cluster will not come up.

**Before you begin**

- Download the application image you want to use for the logical device from Cisco.com, and then upload that image to the Firepower 4100/9300 chassis.
- Gather the following information:
  - Management interface ID, IP addresses, and network mask
  - Gateway IP address
  - FMC IP address and/or NAT ID of your choosing
  - DNS server IP address
  - FTD hostname and domain name

**Procedure**

**Step 1** Configure interfaces.

**Step 2** Choose **Logical Devices**.

**Step 3** Click **Add > Cluster Add Device**, and set the following parameters:

a) Provide a **Device Name**.
   
   This name is used internally by the chassis supervisor to configure management settings and to assign interfaces; it is not the device name used in the application configuration.

b) For the **Template**, choose **Cisco Firepower Threat Defense**.

c) Choose the **Image Version**.

d) For the **Instance Type**.

e) Click **OK**.

   You see the Provisioning - device name window.

**Step 4** Choose the interfaces you want to assign to this cluster.

All valid interfaces are assigned by default.
Step 5
Click the device icon in the center of the screen.
A dialog box appears where you can configure initial bootstrap settings. These settings are meant for initial deployment only, or for disaster recovery. For normal operation, you can later change most values in the application CLI configuration.

Step 6
On the Cluster Information page, complete the following.

Figure 16:

<table>
<thead>
<tr>
<th>Cisco Firepower Threat Defense - Bootstrap Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cluster Information</strong></td>
</tr>
<tr>
<td><strong>Security Module</strong></td>
</tr>
<tr>
<td>Security Module-1, Security Module-2, Security Module-3</td>
</tr>
<tr>
<td><strong>Interface Information</strong></td>
</tr>
<tr>
<td>Chassis ID:</td>
</tr>
<tr>
<td>Site ID:</td>
</tr>
<tr>
<td>Cluster Key:</td>
</tr>
<tr>
<td>Confirm Cluster Key:</td>
</tr>
<tr>
<td>Cluster Group Name:</td>
</tr>
<tr>
<td>Management Interface:</td>
</tr>
<tr>
<td>CCL Subnet IP:</td>
</tr>
</tbody>
</table>

a) In the Cluster Key field, configure an authentication key for control traffic on the cluster control link.
   The shared secret is an ASCII string from 1 to 63 characters. The shared secret is used to generate the key. This option does not affect datapath traffic, including connection state update and forwarded packets, which are always sent in the clear.

b) Set the Cluster Group Name, which is the cluster group name in the logical device configuration.
   The name must be an ASCII string from 1 to 38 characters.

c) Choose the Management Interface.
   This interface is used to manage the logical device. This interface is separate from the chassis management port.
   If you assign a Hardware Bypass-capable interface as the Management interface, you see a warning message to make sure your assignment is intentional.

Step 7
On the Settings page, complete the following.
a) In the **Registration Key** field, enter the key to be shared between the Firepower Management Center and the cluster members during registration.

You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the FTD.

b) Enter a **Password** for the FTD admin user for CLI access.

c) In the **Firepower Management Center IP** field, enter the IP address of the managing Firepower Management Center.

d) (Optional) In the **Search Domains** field, enter a comma-separated list of search domains for the management network.

e) (Optional) From the **Firewall Mode** drop-down list, choose **Transparent** or **Routed**.

In routed mode, the FTD is considered to be a router hop in the network. Each interface that you want to route between is on a different subnet. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices.

The firewall mode is only set at initial deployment. If you re-apply the bootstrap settings, this setting is not used.

f) (Optional) In the **DNS Servers** field, enter a comma-separated list of DNS servers.

The FTD uses DNS if you specify a hostname for the FMC, for example.

g) (Optional) In the **Fully Qualified Hostname** field, enter a fully qualified name for the FTD device.

Valid characters are the letters from a to z, the digits from 0 to 9, the dot (.), and the hyphen (-); maximum number of characters is 253.
h) (Optional) From the Eventing Interface drop-down list, choose the interface on which Firepower events should be sent. If not specified, the management interface will be used.

To specify a separate interface to use for Firepower events, you must configure an interface as a *firepower-eventing* interface. If you assign a Hardware Bypass-capable interface as the Eventing interface, you see a warning message to make sure your assignment is intentional.

**Step 8**

On the Interface Information page, configure a management IP address for each security module in the cluster. Select the type of address from the Address Type drop-down list and then complete the following for each security module.

**Note** You must set the IP address for all 3 module slots in a chassis, even if you do not have a module installed. If you do not configure all 3 modules, the cluster will not come up.

![Cisco Firepower Threat Defense - Bootstrap Configuration](image)

a) In the Management IP field, configure an IP address.

Specify a unique IP address on the same network for each module.

b) Enter a Network Mask or Prefix Length.

c) Enter a Network Gateway address.

**Step 9**

On the Agreement tab, read and accept the end user license agreement (EULA).

**Step 10**

Click OK to close the configuration dialog box.

**Step 11**

Click Save.

The chassis deploys the logical device by downloading the specified software version and pushing the bootstrap configuration and management interface settings to the application instance. Check the Logical Devices page for the status of the new logical device. When the logical device shows its Status as online, you can start...
configuring the cluster in the application. You may see the "Security module not responding" status as part of the process; this status is normal and is temporary.

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD on the Firepower 4100 and 9300</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

Add the logical devices to the FMC, and then group them into a cluster.

**Before you begin**

- Refer to the Firepower Chassis Manager *Logical Devices* screen to see which unit is the master unit.
- All cluster units must be in a successfully formed cluster on FXOS prior to adding them to the FMC.

**Procedure**

**Step 1**
In the FMC, choose Devices > Device Management, and choose Add > Add Device to add each unit as a separate managed device using the management IP addresses you assigned when you deployed the cluster.

**Note**
If you use FMC High Availability, make sure the standby FMC also successfully registers each unit before you continue and form the cluster on the active FMC: Log into the standby FMC to check the registration status of each unit.

**Step 2**
Choose Add > Add Cluster to group the units into a cluster.

  a) Choose the Master device from the drop-down list.

    All other eligible members are added to the Slave Devices box.
b) Specify a **Name** for the cluster.

c) Click **OK**.

The cluster object is added to the **Devices** screen, with the member units underneath. The current master unit is indicated by "(master)" after the unit name.

**Note** If you add more units to the cluster later on the FXOS chassis, then you must add each unit to the FMC, and then add them as slave nodes of the cluster as soon as possible.

---

**Step 3** To configure device-specific settings, click edit (اظف) for the cluster; you can only configure the cluster as a whole, and not member units in the cluster.

**Step 4** On the **Devices > Device Management > Cluster**, you can see **General, License, and Health** settings. This is useful for setting license entitlements.

**Step 5** On the **Devices > Device Management > Devices**, you can choose each member in the cluster from the top right drop-down menu.

If you change the management IP address in the device configuration, you must match the new address in the FMC so that it can reach the device on the network; edit the **Host** address in the **Management** area.

---

### FMC: Configure Data and Diagnostic Interfaces

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense on the Firepower 4100 and 9300</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

This procedure configures basic parameters for each data interface that you assigned to the cluster when you deployed it in FXOS. For inter-chassis clustering, data interfaces are always Spanned EtherChannel interfaces. You can also configure the Diagnostic interface, which is the only interface that can run as an individual interface.

**Note** When using Spanned EtherChannels for inter-chassis clustering, the port-channel interface will not come up until clustering is fully enabled. This requirement prevents traffic from being forwarded to a unit that is not an active unit in the cluster.

---

**Procedure**

**Step 1** Choose **Devices > Device Management**, and click edit (اظف) next to the cluster.

**Step 2** Click **Interfaces**.

**Step 3** (Optional) Configure VLAN subinterfaces on the interface. The rest of this procedure applies to the subinterfaces.

**Step 4** Click edit icon (اظف) for the data interface.
**Step 5**

For inter-chassis clusters, set a manual global MAC address for the EtherChannel.

You must configure a MAC address for a Spanned EtherChannel to avoid potential network connectivity problems. With a manually-configured MAC address, the MAC address stays with the current master unit. If you do not configure a MAC address, then if the master unit changes, the new master unit uses a new MAC address for the interface, which can cause a temporary network outage.

a) Click **Advanced**.  
**Information** is selected.

b) In the **Active Mac Address** field, enter a MAC address in H.H.H format, where H is a 16-bit hexadecimal digit.

For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 000C.F142.4CDE. The MAC address must not have the multicast bit set, that is, the second hexadecimal digit from the left cannot be an odd number.

Do not set the **Standby Mac Address**; it is ignored.

**Step 6**

Configure the name, IP address, and other parameters.

**Step 7**

Click **OK**. Repeat the above steps for other data interfaces.

**Step 8**

(Optional) Configure the Diagnostic interface.

The Diagnostic interface is the only interface that can run in Individual interface mode. You can use this interface for syslog messages or SNMP, for example.

a) On **Devices** > **Device Management** > **Interfaces**, click edit icon ( altında) for the Diagnostic interface.

b) On the **IPv4**, enter the **IP Address** and mask. This IP address is a fixed address for the cluster, and always belongs to the current master unit.

c) For the **Start Address** and **End Address**, enter the start and end of an IP address pool, one of which will be assigned to each cluster unit for the interface.

Include at least as many addresses as there are units in the cluster. The Virtual IP address is not a part of this pool, but needs to be on the same network. You cannot determine the exact Local address assigned to each unit in advance.

d) For the **Mask**, enter the subnet mask for the cluster IP pool.

e) On the **IPv6**, under **Basic** > **Cluster IPv6 Pool** specify the `ipv6-address/prefix-length` for the **Address** and the number of addresses in the pool for the **Count**.

f) Configure other interface settings as normal.

**Step 9**

Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

**FXOS: Remove a Cluster Member**

The following sections describe how to remove members temporarily or permanently from the cluster.
Temporary Removal
A cluster member will be automatically removed from the cluster due to a hardware or network failure, for example. This removal is temporary until the conditions are rectified, and it can rejoin the cluster. You can also manually disable clustering.

To check whether a device is currently in the cluster, check the cluster status on the Firepower Chassis Manager Logical Devices page:

<table>
<thead>
<tr>
<th>Management Port</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet1/4</td>
<td>online</td>
</tr>
</tbody>
</table>

Attributes:
- Cluster Operational Status: not-in-cluster
- FIREPOWER-MGMT-IP: 10.89.5.20
- CLUSTER-ROLE: none
- CLUSTER-IP: 127.0.0.1
- MGMT-URL: https://10.89.6.35/
- UUID: 8e45f170-461d-11e9-8475-12f68c32630

For FTD using FMC, you should leave the device in the FMC device list so that it can resume full functionality after you reenable clustering.

- Disable clustering in the application—You can disable clustering using the application CLI. Enter the `cluster remove unit name` command to remove any unit other than the one you are logged into. The bootstrap configuration remains intact, as well as the last configuration synced from the master unit, so you can later re-add the unit without losing your configuration. If you enter this command on a slave unit to remove the master unit, a new master unit is elected.

  When a device becomes inactive, all data interfaces are shut down; only the Management interface can send and receive traffic. To resume traffic flow, re-enable clustering. The Management interface remains up using the IP address the unit received from the bootstrap configuration. However if you reload, and the unit is still inactive in the cluster, the Management interface is disabled.

  To reenable clustering, on the FTD enter `cluster enable`.

- Disable the application instance—In Firepower Chassis Manager on the Logical Devices page, click the Disable slider (●). You can later reenable it using the Enable slider (○).

- Shut down the security module/engine—In Firepower Chassis Manager on the Security Module/Engine page, click the Power off icon (●).

- Shut down the chassis—In Firepower Chassis Manager on the Overview page, click the Shut down icon (●).

Permanent Removal
You can permanently remove a cluster member using the following methods.

For FTD using FMC, be sure to remove the unit from the FMC device list after you disable clustering on the chassis.
• Delete the logical device—In Firepower Chassis Manager on the Logical Devices page, click the delete icon (>Delete). You can then deploy a standalone logical device, a new cluster, or even add a new logical device to the same cluster.

• Remove the chassis or security module from service—If you remove a device from service, you can add replacement hardware as a new member of the cluster.

FMC: Manage Cluster Members

After you deploy the cluster, you can change the configuration and manage cluster members.

Add or Replace a Cluster Member

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD on the Firepower 4100 and 9300</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

You can add a new cluster member to an existing cluster, for example, when you add an additional module to the Firepower 9300 device, or replace a unit. This procedure also applies to a unit that was reinitialized; in this case, although the hardware remains the same, it appears to be a new member.

Before you begin

• Add the units to the cluster on the FXOS chassis, and make sure they are in the FXOS cluster before you add them to the FMC. Make sure the interface configuration is the same as other chassis.

Procedure

Step 1  In the case of a replacement or a reinitialized unit, you must delete the old cluster member from the Firepower Management Center.

When you replace it with a new or reinitialized unit, it is considered to be a new device on the Firepower Management Center

a) In the FMC, choose Devices > Device Management, and click delete icon (>Delete) next to the slave unit.

b) Confirm that you want to delete the unit.

The unit is removed from the cluster and from the FMC devices list.

Step 2  Choose Devices > Device Management, and choose Add > Add Device to add the new logical device.

Step 3  Choose Add > Add Cluster.

Step 4  Choose the current Master device from the drop-down list.

When you choose a master device that is already in a cluster, then the existing cluster name is auto-filled, and all eligible slave devices are added to the Slave Devices box, including the new unit you just added to the FMC.
Step 5  Click Add, and then Deploy.
The cluster is updated to include the new member(s).

Delete a Slave Member

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD on the Firepower 4100 and 9300</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

If you need to permanently remove a cluster member (for example, if you remove a module on the Firepower 9300), then you should delete it from the FMC.

Before you begin
Do not delete the member if it is still a healthy part of the cluster, or if you only want to disable the member temporarily. To delete it permanently from the cluster in FXOS, see FXOS: Remove a Cluster Member, on page 659. If you remove it from the FMC, and it is still part of the cluster, it will continue to pass traffic, and could even become the master unit—a master unit that the FMC can no longer manage.

Procedure

Step 1  In the FMC, choose Devices > Device Management, and click delete icon ( ) next to the slave unit.
Step 2  Confirm that you want to delete the unit.
The unit is removed from the cluster and from the FMC devices list.

Deactivate a Member

To deactivate a member other than the unit you are logged into, perform the following steps at the FTD CLI. This procedure is meant to temporarily deactivate a member, and you should keep the unit in the FMC device list.

Note
When a unit becomes inactive, all data interfaces are shut down; only the Management interface can send and receive traffic. To resume traffic flow, reenable clustering. The Management interface remains up using the IP address the unit received from the bootstrap configuration. However if you reload, and the unit is still inactive in the cluster, the management interface is disabled. You must use the console for any further configuration.
Procedure

Step 1
Access the FTD CLI.

Step 2
Remove the unit from the cluster:

```
cluster remove unit unit_name
```

The bootstrap configuration remains intact, as well as the last configuration synched from the master unit, so that you can later re-add the unit without losing your configuration. If you enter this command on a slave unit to remove the master unit, a new master unit is elected.

To view member names, enter `cluster remove unit ?`, or enter the `show cluster info` command.

Example:

```
> cluster remove unit ?

Current active units in the cluster:
ftd1
ftd2
ftd3

> cluster remove unit ftd2

WARNING: Clustering will be disabled on unit ftd2. To bring it back to the cluster please logon to that unit and re-enable clustering
```

Step 3
To reenable clustering, see Rejoin the Cluster, on page 663.

Rejoin the Cluster

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>Firepower Threat Defense on the Firepower 4100 and 9300</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

If a unit was removed from the cluster, for example for a failed interface, you must manually rejoin the cluster by accessing the unit CLI. Make sure the failure is resolved before you try to rejoin the cluster. See Rejoining the Cluster, on page 670 for more information about why a unit can be removed from a cluster.

Procedure

Step 1
Access the CLI of the unit that needs to rejoin the cluster, either from the console port or using SSH to the Management interface. Log in with the username `admin` and the password you set during initial setup.

Step 2
Enable clustering:

```
cluster enable
```

FMC: Monitoring the Cluster

You can monitor the cluster in Firepower Management Center and at the FTD CLI.

- **Devices > Device Management > cluster_name.**
  When you expand the cluster on the devices listing page, you can see all member units, including the master unit shown with "(master)" next to the IP address.

- **show cluster {access-list [acl_name] | conn [count] | cpu [usage] | history | interface-mode | memory | resource usage | service-policy | traffic | xlate count}**
  To view aggregated data for the entire cluster or other information, use the `show cluster` command.

- **show cluster info [auto-join | clients | conn-distribution | flow-mobility counters | goid [options] | health | incompatible-config | loadbalance | old-members | packet-distribution | trace [options] | transport { asp | cp}]**
  To view cluster information, use the `show cluster info` command.

Reference for Clustering

This section includes more information about how clustering operates.

Firepower Threat Defense Features and Clustering

Some FTD features are not supported with clustering, and some are only supported on the master unit. Other features might have caveats for proper usage.

Unsupported Features with Clustering

These features cannot be configured with clustering enabled, and the commands will be rejected.

- Site-to-site VPN
- DHCP client, server, and proxy. DHCP relay is supported.
- High Availability

Centralized Features for Clustering

The following features are only supported on the master unit, and are not scaled for the cluster.
Traffic for centralized features is forwarded from member units to the master unit over the cluster control link.

If you use the rebalancing feature, traffic for centralized features may be rebalanced to non-master units before the traffic is classified as a centralized feature; if this occurs, the traffic is then sent back to the master unit.

For centralized features, if the master unit fails, all connections are dropped, and you have to re-establish the connections on the new master unit.

- Site-to-site VPN
- The following application inspections:
  - DCERPC
  - NetBIOS
  - RSH
  - SUNRPC
  - TFTP
  - XDMCP
- Dynamic routing
- Static route monitoring

**Dynamic Routing and Clustering**

The routing process only runs on the master unit, and routes are learned through the master unit and replicated to secondaries. If a routing packet arrives at a slave, it is redirected to the master unit.
After the slave members learn the routes from the master unit, each unit makes forwarding decisions independently.

The OSPF LSA database is not synchronized from the master unit to slave units. If there is a master unit switchover, the neighboring router will detect a restart; the switchover is not transparent. The OSPF process picks an IP address as its router ID. Although not required, you can assign a static router ID to ensure a consistent router ID is used across the cluster. See the OSPF Non-Stop Forwarding feature to address the interruption.

**FTP and Clustering**

- If FTP data channel and control channel flows are owned by different cluster members, then the data channel owner will periodically send idle timeout updates to the control channel owner and update the idle timeout value. However, if the control flow owner is reloaded, and the control flow is re-hosted, the parent/child flow relationship will not longer be maintained; the control flow idle timeout will not be updated.

**NAT and Clustering**

NAT can affect the overall throughput of the cluster. Inbound and outbound NAT packets can be sent to different Firepower Threat Defense devices in the cluster, because the load balancing algorithm relies on IP addresses and ports, and NAT causes inbound and outbound packets to have different IP addresses and/or ports. When a packet arrives at the Firepower Threat Defense device that is not the NAT owner, it is forwarded over the cluster control link to the owner, causing large amounts of traffic on the cluster control link. Note that the receiving unit does not create a forwarding flow to the owner, because the NAT owner may not end up creating a connection for the packet depending on the results of security and policy checks.

If you still want to use NAT in clustering, then consider the following guidelines:

- NAT pool address distribution for dynamic PAT—The master unit evenly pre-distributes addresses across the cluster. If a member receives a connection and they have no addresses left, then the connection is dropped even if other members still have addresses available. If a cluster member leaves the cluster (due
to failure), a backup member will get the PAT IP address, and if the backup exhausts its normal PAT IP address, it can make use of the new address. Make sure to include at least as many NAT addresses as there are units in the cluster, plus at least one extra address, to ensure that each unit receives an address, and that a failed unit can get a new address if its old address is in use by the member that took over the address.

- Reusing a PAT pool in multiple rules—To use the same PAT pool in multiple rules, you must be careful about the interface selection in the rules. You must either use specific interfaces in all rules, or "any" in all rules. You cannot mix specific interfaces and "any" across the rules, or the system might not be able to match return traffic to the right node in the cluster. Using unique PAT pools per rule is the most reliable option.

- No round-robin—Round-robin for a PAT pool is not supported with clustering.

- Dynamic NAT xlates managed by the master unit—The master unit maintains and replicates the xlate table to slave units. When a slave unit receives a connection that requires dynamic NAT, and the xlate is not in the table, it requests the xlate from the master unit. The slave unit owns the connection.

- No static PAT for the following inspections—
  - FTP
  - RSH
  - SQLNET
  - TFTP
  - XDMCP
  - SIP

**SIP Inspection and Clustering**

A control flow can be created on any unit (due to load balancing); its child data flows must reside on the same unit.

**SNMP and Clustering**

An SNMP agent polls each individual Firepower Threat Defense device by its Diagnostic interface Local IP address. You cannot poll consolidated data for the cluster.

You should always use the Local address, and not the Main cluster IP address for SNMP polling. If the SNMP agentpolls the Main cluster IP address, if a new master is elected, the poll to the new master unit will fail.

**Syslog and Clustering**

- Each unit in the cluster generates its own syslog messages. You can configure logging so that each unit uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all units in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all units look as if they come from a single unit. If you configure logging to use the local-unit name that is assigned in the cluster bootstrap configuration as the device ID, syslog messages look as if they come from different units.
TLS/SSL Connections and Clustering

The decryption states of TLS/SSL connections are not synchronized, and if the connection owner fails, then the decrypted connections will be reset. New connections will need to be established to a new unit. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.

Cisco TrustSec and Clustering

Only the master unit learns security group tag (SGT) information. The master unit then populates the SGT to slaves, and slaves can make a match decision for SGT based on the security policy.

Performance Scaling Factor

When you combine multiple units into a cluster, you can expect the total cluster performance to be approximately:

- 80% of the combined TCP or CPS throughput
- 90% of the combined UDP throughput
- 60% of the combined Ethernet MIX (EMIX) throughput, depending on the traffic mix.

For example, for TCP throughput, the Firepower 9300 with 3 modules can handle approximately 135 Gbps of real world firewall traffic when running alone. For 2 chassis, the maximum combined throughput will be approximately 80% of 270 Gbps (2 chassis x 135 Gbps): 216 Gbps.

Master Unit Election

Members of the cluster communicate over the cluster control link to elect a master unit as follows:

1. When you deploy the cluster, each unit broadcasts an election request every 3 seconds.
2. Any other units with a higher priority respond to the election request; the priority is set when you deploy the cluster and is not configurable.
3. If after 45 seconds, a unit does not receive a response from another unit with a higher priority, then it becomes master.
4. If a unit later joins the cluster with a higher priority, it does not automatically become the master unit; the existing master unit always remains as the master unless it stops responding, at which point a new master unit is elected.

Note

You can manually force a unit to become the master. For centralized features, if you force a master unit change, then all connections are dropped, and you have to re-establish the connections on the new master unit.

High Availability Within the Cluster

Clustering provides high availability by monitoring chassis, unit, and interface health and by replicating connection states between units.
Chassis-Application Monitoring

Chassis-application health monitoring is always enabled. The Firepower 4100/9300 chassis supervisor checks the Firepower Threat Defense application periodically (every second). If the Firepower Threat Defense device is up and cannot communicate with the Firepower 4100/9300 chassis supervisor for 3 seconds, the Firepower Threat Defense device generates a syslog message and leaves the cluster.

If the Firepower 4100/9300 chassis supervisor cannot communicate with the application after 45 seconds, it reloads the Firepower Threat Defense device. If the Firepower Threat Defense device cannot communicate with the supervisor, it removes itself from the cluster.

Unit Health Monitoring

The master unit monitors every slave unit by sending keepalive messages over the cluster control link periodically. Each slave unit monitors the master unit using the same mechanism. If the unit health check fails, the unit is removed from the cluster.

Interface Monitoring

Each unit monitors the link status of all hardware interfaces in use, and reports status changes to the master unit. All physical interfaces are monitored by default (including the main EtherChannel for EtherChannel interfaces). Only named interfaces that are in an Up state can be monitored. For example, all member ports of an EtherChannel must fail before a named EtherChannel is removed from the cluster.

If a monitored interface fails on a particular unit, but it is active on other units, then the unit is removed from the cluster. The amount of time before the Firepower Threat Defense device removes a member from the cluster depends on whether the unit is an established member or is joining the cluster. The Firepower Threat Defense device does not monitor interfaces for the first 90 seconds that a unit joins the cluster. Interface status changes during this time will not cause the Firepower Threat Defense device to be removed from the cluster. For an established member, the unit is removed after 500 ms.

Decorator Application Monitoring

When you install a decorator application on an interface, such as the Radware DefensePro application, then both the Firepower Threat Defense device and the decorator application must be operational to remain in the cluster. The unit does not join the cluster until both applications are operational. Once in the cluster, the unit monitors the decorator application health every 3 seconds. If the decorator application is down, the unit is removed from the cluster.

Status After Failure

When a unit in the cluster fails, the connections hosted by that unit are seamlessly transferred to other units; state information for traffic flows is shared over the control cluster link.

If the master unit fails, then another member of the cluster with the highest priority (lowest number) becomes the master unit.

The Firepower Threat Defense device automatically tries to rejoin the cluster, depending on the failure event.

Note

When the Firepower Threat Defense device becomes inactive and fails to automatically rejoin the cluster, all data interfaces are shut down; only the Management/Diagnostic interface can send and receive traffic.
Rejoining the Cluster

After a cluster member is removed from the cluster, how it can rejoin the cluster depends on why it was removed:

- Failed cluster control link—After you resolve the problem with the cluster control link, you must manually rejoin the cluster by re-enabling clustering.

- Failed data interface—The FTD application automatically tries to rejoin at 5 minutes, then at 10 minutes, and finally at 20 minutes. If the join is not successful after 20 minutes, then the FTD application disables clustering. After you resolve the problem with the data interface, you have to manually enable clustering.

- Failed unit—If the unit was removed from the cluster because of a unit health check failure, then rejoining the cluster depends on the source of the failure. For example, a temporary power failure means the unit will rejoin the cluster when it starts up again as long as the cluster control link is up. The FTD application attempts to rejoin the cluster every 5 seconds.

- Failed Chassis-Application Communication—When the FTD application detects that the chassis-application health has recovered, it tries to rejoin the cluster automatically.

- Internal error—Internal failures include: application sync timeout; inconsistent application statuses; and so on. After you resolve the problem, you must manually rejoin the cluster by re-enabling clustering.

Data Path Connection State Replication

Every connection has one owner and at least one backup owner in the cluster. The backup owner does not take over the connection in the event of a failure; instead, it stores TCP/UDP state information, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner is usually also the director.

Some traffic requires state information above the TCP or UDP layer. See the following table for clustering support or lack of support for this kind of traffic.

<table>
<thead>

</tbody>
</table>
How the Cluster Manages Connections

Connections can be load-balanced to multiple members of the cluster. Connection roles determine how connections are handled in both normal operation and in a high availability situation.

Connection Roles

See the following roles defined for each connection:

- **Owner**—Usually, the unit that initially receives the connection. The owner maintains the TCP state and processes packets. A connection has only one owner. If the original owner fails, then when new units receive packets from the connection, the director chooses a new owner from those units.

- **Backup owner**—The unit that stores TCP/UDP state information received from the owner, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner does not take over the connection in the event of a failure. If the owner becomes unavailable, then the first unit to receive packets from the connection (based on load balancing) contacts the backup owner for the relevant state information so it can become the new owner.

  As long as the director (see below) is not the same unit as the owner, then the director is also the backup owner. If the owner chooses itself as the director, then a separate backup owner is chosen.

- **Director**—The unit that handles owner lookup requests from forwarders. When the owner receives a new connection, it chooses a director based on a hash of the source/destination IP address and ports, and sends a message to the director to register the new connection. If packets arrive at any unit other than the owner, the unit queries the director about which unit is the owner so it can forward the packets. A connection has only one director. If a director fails, the owner chooses a new director.

  As long as the director is not the same unit as the owner, then the director is also the backup owner (see above). If the owner chooses itself as the director, then a separate backup owner is chosen.

- **Forwarder**—A unit that forwards packets to the owner. If a forwarder receives a packet for a connection it does not own, it queries the director for the owner, and then establishes a flow to the owner for any other packets it receives for this connection. The director can also be a forwarder. Note that if a forwarder receives the SYN-ACK packet, it can derive the owner directly from a SYN cookie in the packet, so it does not need to query the director. (If you disable TCP sequence randomization, the SYN cookie is not used; a query to the director is required.) For short-lived flows such as DNS and ICMP, instead of querying, the forwarder immediately sends the packet to the director, which then sends them to the owner. A connection can have multiple forwarders; the most efficient throughput is achieved by a good load-balancing method where there are no forwarders and all packets of a connection are received by the owner.

- **Fragment Owner**—For fragmented packets, cluster units that receive a fragment determine a fragment owner using a hash of the fragment source and destination IP addresses. All fragments are then forwarded to the fragment owner over the cluster control link. Fragments may be load-balanced to different cluster units, because only the first fragment includes the 5-tuple used in the switch load balance hash. Other fragments do not contain the source and destination ports and may be load-balanced to other cluster units. The fragment owner temporarily reassembles the packet so it can determine the director based on a hash of the source/destination IP address and ports. If it is a new connection, the fragment owner will register to be the connection owner. If it is an existing connection, the fragment owner forwards all fragments to the provided connection owner over the cluster control link. The connection owner will then reassemble all fragments.
New Connection Ownership

When a new connection is directed to a member of the cluster via load balancing, that unit owns both directions of the connection. If any connection packets arrive at a different unit, they are forwarded to the owner unit over the cluster control link. If a reverse flow arrives at a different unit, it is redirected back to the original unit.

Sample Data Flow

The following example shows the establishment of a new connection.

1. The SYN packet originates from the client and is delivered to one Firepower Threat Defense device (based on the load balancing method), which becomes the owner. The owner creates a flow, encodes owner information into a SYN cookie, and forwards the packet to the server.

2. The SYN-ACK packet originates from the server and is delivered to a different Firepower Threat Defense device (based on the load balancing method). This Firepower Threat Defense device is the forwarder.

3. Because the forwarder does not own the connection, it decodes owner information from the SYN cookie, creates a forwarding flow to the owner, and forwards the SYN-ACK to the owner.

4. The owner sends a state update to the director, and forwards the SYN-ACK to the client.

5. The director receives the state update from the owner, creates a flow to the owner, and records the TCP state information as well as the owner. The director acts as the backup owner for the connection.

6. Any subsequent packets delivered to the forwarder will be forwarded to the owner.

7. If packets are delivered to any additional units, it will query the director for the owner and establish a flow.

8. Any state change for the flow results in a state update from the owner to the director.

Routing Overview for Firepower Threat Defense

This chapter describes underlying concepts of how routing behaves within the Firepower Threat Defense.

- Path Determination, on page 677
- Supported Route Types, on page 678
- Supported Internet Protocols for Routing, on page 679
- Routing Table, on page 680
- Routing Table for Management Traffic, on page 683
- Equal-Cost Multi-Path (ECMP) Routing, on page 684
- About Route Maps, on page 684

Path Determination

Routing protocols use metrics to evaluate what path will be the best for a packet to travel. A metric is a standard of measurement, such as path bandwidth, that is used by routing algorithms to determine the optimal path to a destination. To aid the process of path determination, routing algorithms initialize and maintain routing tables, which include route information. Route information varies depending on the routing algorithm used.

Routing algorithms fill routing tables with a variety of information. Destination or next hop associations tell a router that a particular destination can be reached optimally by sending the packet to a particular router representing the next hop on the way to the final destination. When a router receives an incoming packet, it checks the destination address and attempts to associate this address with a next hop.

Routing tables also can include other information, such as data about the desirability of a path. Routers compare metrics to determine optimal routes, and these metrics differ depending on the design of the routing algorithm used.

Routers communicate with one another and maintain their routing tables through the transmission of a variety of messages. The routing update message is one such message that generally consists of all or a portion of a routing table. By analyzing routing updates from all other routers, a router can build a detailed picture of network topology. A link-state advertisement, another example of a message sent between routers, informs other routers of the state of the sender links. Link information also can be used to build a complete picture of network topology to enable routers to determine optimal routes to network destinations.
Supported Route Types

There are several route types that a router can use. The Firepower Threat Defense device uses the following route types:

- Static Versus Dynamic
- Single-Path Versus Multipath
- Flat Versus Hierarchical
- Link-State Versus Distance Vector

Static Versus Dynamic

Static routing algorithms are actually table mappings established by the network administrator. These mappings do not change unless the network administrator alters them. Algorithms that use static routes are simple to design and work well in environments where network traffic is relatively predictable and where network design is relatively simple.

Because static routing systems cannot react to network changes, they generally are considered unsuitable for large, constantly changing networks. Most of the dominant routing algorithms are dynamic routing algorithms, which adjust to changing network circumstances by analyzing incoming routing update messages. If the message indicates that a network change has occurred, the routing software recalculates routes and sends out new routing update messages. These messages permeate the network, stimulating routers to rerun their algorithms and change their routing tables accordingly.

Dynamic routing algorithms can be supplemented with static routes where appropriate. A router of last resort (a default route for a router to which all unroutable packets are sent), for example, can be designated to act as a repository for all unroutable packets, ensuring that all messages are at least handled in some way.

Single-Path Versus Multipath

Some sophisticated routing protocols support multiple paths to the same destination. Unlike single-path algorithms, these multipath algorithms permit traffic multiplexing over multiple lines. The advantages of multipath algorithms are substantially better throughput and reliability, which is generally called load sharing.

Flat Versus Hierarchical

Some routing algorithms operate in a flat space, while others use routing hierarchies. In a flat routing system, the routers are peers of all others. In a hierarchical routing system, some routers form what amounts to a routing backbone. Packets from non-backbone routers travel to the backbone routers, where they are sent through the backbone until they reach the general area of the destination. At this point, they travel from the last backbone router through one or more non-backbone routers to the final destination.

Routing systems often designate logical groups of nodes, called domains, autonomous systems, or areas. In hierarchical systems, some routers in a domain can communicate with routers in other domains, while others can communicate only with routers within their domain. In very large networks, additional hierarchical levels may exist, with routers at the highest hierarchical level forming the routing backbone.
The primary advantage of hierarchical routing is that it mimics the organization of most companies and therefore supports their traffic patterns well. Most network communication occurs within small company groups (domains). Because intradomain routers need to know only about other routers within their domain, their routing algorithms can be simplified, and, depending on the routing algorithm being used, routing update traffic can be reduced accordingly.

**Link-State Versus Distance Vector**

Link-state algorithms (also known as shortest path first algorithms) flood routing information to all nodes in the internetwork. Each router, however, sends only the portion of the routing table that describes the state of its own links. In link-state algorithms, each router builds a picture of the entire network in its routing tables. Distance vector algorithms (also known as Bellman-Ford algorithms) call for each router to send all or some portion of its routing table, but only to its neighbors. In essence, link-state algorithms send small updates everywhere, while distance vector algorithms send larger updates only to neighboring routers. Distance vector algorithms know only about their neighbors. Typically, link-state algorithms are used in conjunction with OSPF routing protocols.

**Supported Internet Protocols for Routing**

The Firepower Threat Defense device supports several Internet protocols for routing. Each protocol is briefly described in this section.

- **Enhanced Interior Gateway Routing Protocol (EIGRP)**

  EIGRP is a Cisco proprietary protocol that provides compatibility and seamless interoperation with IGRP routers. An automatic-redistribution mechanism allows IGRP routes to be imported into Enhanced IGRP, and vice versa, so it is possible to add Enhanced IGRP gradually into an existing IGRP network.

- **Open Shortest Path First (OSPF)**

  OSPF is a routing protocol developed for Internet Protocol (IP) networks by the interior gateway protocol (IGP) working group of the Internet Engineering Task Force (IETF). OSPF uses a link-state algorithm to build and calculate the shortest path to all known destinations. Each router in an OSPF area includes an identical link-state database, which is a list of each of the router usable interfaces and reachable neighbors.

- **Routing Information Protocol (RIP)**

  RIP is a distance-vector protocol that uses hop count as its metric. RIP is widely used for routing traffic in the global Internet and is an interior gateway protocol (IGP), which means that it performs routing within a single autonomous system.

- **Border Gateway Protocol (BGP)**

  BGP is an interautonomous system routing protocol. BGP is used to exchange routing information for the Internet and is the protocol used between Internet service providers (ISP). Customers connect to ISPs, and ISPs use BGP to exchange customer and ISP routes. When BGP is used between autonomous systems (AS), the protocol is referred to as External BGP (EBGP). If a service provider is using BGP to exchange routes within an AS, then the protocol is referred to as Interior BGP (IBGP).
Routing Table

The FTD uses separate routing tables for data traffic (through-the-device) and for management traffic (from-the-device). This section describes how the routing tables work. For information about the management routing table, see also Routing Table for Management Traffic, on page 683.

How the Routing Table Is Populated

The FTD routing table can be populated by statically defined routes, directly connected routes, and routes discovered by the dynamic routing protocols. Because the FTD can run multiple routing protocols in addition to having static and connected routes in the routing table, it is possible that the same route is discovered or entered in more than one manner. When two routes to the same destination are put into the routing table, the one that remains in the routing table is determined as follows:

• If the two routes have different network prefix lengths (network masks), then both routes are considered unique and are entered into the routing table. The packet forwarding logic then determines which of the two to use.

  For example, if the RIP and OSPF processes discovered the following routes:
  • RIP: 192.168.32.0/24
  • OSPF: 192.168.32.0/19

  Even though OSPF routes have the better administrative distance, both routes are installed in the routing table because each of these routes has a different prefix length (subnet mask). They are considered different destinations and the packet forwarding logic determines which route to use.

• If the FTD learns about multiple paths to the same destination from a single routing protocol, such as RIP, the route with the better metric (as determined by the routing protocol) is entered into the routing table.

  Metrics are values associated with specific routes, ranking them from most preferred to least preferred. The parameters used to determine the metrics differ for different routing protocols. The path with the lowest metric is selected as the optimal path and installed in the routing table. If there are multiple paths to the same destination with equal metrics, load balancing is done on these equal cost paths.

• If the FTD learns about a destination from more than one routing protocol, the administrative distances of the routes are compared, and the routes with lower administrative distance are entered into the routing table.

Administrative Distances for Routes

You can change the administrative distances for routes discovered by or redistributed into a routing protocol. If two routes from two different routing protocols have the same administrative distance, then the route with the lower default administrative distance is entered into the routing table. In the case of EIGRP and OSPF routes, if the EIGRP route and the OSPF route have the same administrative distance, then the EIGRP route is chosen by default.

Administrative distance is a route parameter that the Firepower Threat Defense device uses to select the best path when there are two or more different routes to the same destination from two different routing protocols. Because the routing protocols have metrics based on algorithms that are different from the other protocols, it
is not always possible to determine the best path for two routes to the same destination that were generated by different routing protocols.

Each routing protocol is prioritized using an administrative distance value. The following table shows the default administrative distance values for the routing protocols supported by the Firepower Threat Defense device.

**Table 67: Default Administrative Distance for Supported Routing Protocols**

<table>
<thead>
<tr>
<th>Route Source</th>
<th>Default Administrative Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connected interface</td>
<td>0</td>
</tr>
<tr>
<td>Static route</td>
<td>1</td>
</tr>
<tr>
<td>EIGRP Summary Route</td>
<td>5</td>
</tr>
<tr>
<td>External BGP</td>
<td>20</td>
</tr>
<tr>
<td>Internal EIGRP</td>
<td>90</td>
</tr>
<tr>
<td>OSPF</td>
<td>110</td>
</tr>
<tr>
<td>RIP</td>
<td>120</td>
</tr>
<tr>
<td>EIGRP external route</td>
<td>170</td>
</tr>
<tr>
<td>Internal and local BGP</td>
<td>200</td>
</tr>
<tr>
<td>Unknown</td>
<td>255</td>
</tr>
</tbody>
</table>

The smaller the administrative distance value, the more preference is given to the protocol. For example, if the Firepower Threat Defense device receives a route to a certain network from both an OSPF routing process (default administrative distance - 110) and a RIP routing process (default administrative distance - 120), the Firepower Threat Defense device chooses the OSPF route because OSPF has a higher preference. In this case, the router adds the OSPF version of the route to the routing table.

In this example, if the source of the OSPF-derived route was lost (for example, due to a power shutdown), the Firepower Threat Defense device would then use the RIP-derived route until the OSPF-derived route reappears.

The administrative distance is a local setting. For example, if you change the administrative distance of routes obtained through OSPF, that change would only affect the routing table for the Firepower Threat Defense device on which the command was entered. The administrative distance is not advertised in routing updates. Administrative distance does not affect the routing process. The routing processes only advertise the routes that have been discovered by the routing process or redistributed into the routing process. For example, the RIP routing process advertises RIP routes, even if routes discovered by the OSPF routing process are used in the routing table.

**Backup Dynamic and Floating Static Routes**

A backup route is registered when the initial attempt to install the route in the routing table fails because another route was installed instead. If the route that was installed in the routing table fails, the routing table maintenance process calls each routing protocol process that has registered a backup route and requests them
to reinstall the route in the routing table. If there are multiple protocols with registered backup routes for the failed route, the preferred route is chosen based on administrative distance.

Because of this process, you can create floating static routes that are installed in the routing table when the route discovered by a dynamic routing protocol fails. A floating static route is simply a static route configured with a greater administrative distance than the dynamic routing protocols running on the Firepower Threat Defense device. When the corresponding route discovered by a dynamic routing process fails, the static route is installed in the routing table.

**How Forwarding Decisions Are Made**

Forwarding decisions are made as follows:

- If the destination does not match an entry in the routing table, the packet is forwarded through the interface specified for the default route. If a default route has not been configured, the packet is discarded.
- If the destination matches a single entry in the routing table, the packet is forwarded through the interface associated with that route.
- If the destination matches more than one entry in the routing table, then the packet is forwarded out of the interface associated with the route that has the longer network prefix length.

For example, a packet destined for 192.168.32.1 arrives on an interface with the following routes in the routing table:

- 192.168.32.0/24 gateway 10.1.1.2
- 192.168.32.0/19 gateway 10.1.1.3

In this case, a packet destined to 192.168.32.1 is directed toward 10.1.1.2, because 192.168.32.1 falls within the 192.168.32.0/24 network. It also falls within the other route in the routing table, but 192.168.32.0/24 has the longest prefix within the routing table (24 bits versus 19 bits). Longer prefixes are always preferred over shorter ones when forwarding a packet.

---

**Note**

Existing connections continue to use their established interfaces even if a new similar connection would result in different behavior due to a change in routes.

**Dynamic Routing and High Availability**

Dynamic routes are synchronized on the standby unit when the routing table changes on the active unit. This means that all additions, deletions, or changes on the active unit are immediately propagated to the standby unit. If the standby unit becomes active in an active/standby ready High Availability pair, it will already have an identical routing table as that of the former active unit because routes are synchronized as a part of the High Availability bulk synchronization and continuous replication processes.

**Dynamic Routing in Clustering**

The routing process only runs on the master unit, and routes are learned through the master unit and replicated to slaves. If a routing packet arrives at a slave, it is redirected to the master unit.
After the slave members learn the routes from the master unit, each unit makes forwarding decisions independently.

The OSPF LSA database is not synchronized from the master unit to slave units. If there is a master unit switchover, the neighboring router will detect a restart; the switchover is not transparent. The OSPF process picks an IP address as its router ID. Although not required, you can assign a static router ID to ensure a consistent router ID is used across the cluster. See the OSPF Non-Stop Forwarding feature to address the interruption.

Routing Table for Management Traffic

As a standard security practice, it is often necessary to segregate and isolate Management traffic from data traffic. To achieve this isolation, the FTD uses a separate routing table for management-only traffic vs. data traffic. Separate routing tables means that you can create separate default routes for data and management as well.

Through-the-device traffic always uses the data routing table.

From-the-device traffic, depending on the type, uses either the management routing table or the data routing table by default. If a match is not found in the default routing table, it checks the other routing table.

Management table from-the-device traffic includes features that open a remote file using HTTP, SCP, TFTP, and so on.

Data table from-the-device traffic includes all other features like ping, DNS, DHCP, and so on.
If you need from-the-box traffic to go out an interface that isn't in its default routing table, then you might need to specify that interface when you configure it, rather than relying on the fall back to the other table. The FTD checks the correct routing table for routes for that interface. For example, if you need a ping to go out a management-only interface, then specify the interface in the ping function. Otherwise, if there is a default route in the data routing table, then it will match the default route and never fall back to the management routing table.

The management routing table supports dynamic routing separate from the data interface routing table. A given dynamic routing process must run on either the management-only interface or the data interface; you cannot mix both types.

Management-only interfaces include any Diagnostic x/x interfaces as well as any interfaces that you have configured to be management-only.

---

**Note**

This routing table does not affect the special FTD Management logical interface that it uses to communicate with the FMC; that interface has its own routing table. The Diagnostic logical interface, on the other hand, uses the management-only routing table described in this section.

---

**Equal-Cost Multi-Path (ECMP) Routing**

The Firepower Threat Defense device supports Equal-Cost Multi-Path (ECMP) routing.

You can have up to 8 equal cost static or dynamic routes per interface. For example, you can configure multiple default routes on the outside interface that specify different gateways.

```
route for 0.0.0.0 0.0.0.0 through outside to 10.1.1.2
route for 0.0.0.0 0.0.0.0 through outside to 10.1.1.3
route for 0.0.0.0 0.0.0.0 through outside to 10.1.1.4
```

In this case, traffic is load-balanced on the outside interface between 10.1.1.2, 10.1.1.3, and 10.1.1.4. Traffic is distributed among the specified gateways based on an algorithm that hashes the source and destination IP addresses, incoming interface, protocol, source and destination ports.

ECMP is not supported across multiple interfaces, so you cannot define a route to the same destination on a different interface. The following route is disallowed when configured with any of the routes above:

```
route for 0.0.0.0 0.0.0.0 through outside2 to 10.2.1.1
```

**About Route Maps**

Route maps are used when redistributing routes into an OSPF, RIP, EIGRP or BGP routing process. They are also used when generating a default route into an OSPF routing process. A route map defines which of the routes from the specified routing protocol are allowed to be redistributed into the target routing process.

Route maps have many features in common with widely known ACLs. These are some of the traits common to both:

- They are an ordered sequence of individual statements, and each has a permit or deny result. Evaluation of an ACL or a route map consists of a list scan, in a predetermined order, and an evaluation of the criteria of each statement that matches. A list scan is aborted once the first statement match is found and an action associated with the statement match is performed.
They are generic mechanisms. Criteria matches and match interpretation are dictated by the way that they are applied and the feature that uses them. The same route map applied to different features might be interpreted differently.

These are some of the differences between route maps and ACLs:

• Route maps are more flexible than ACLs and can verify routes based on criteria which ACLs cannot verify. For example, a route map can verify if the type of route is internal.

• Each ACL ends with an implicit deny statement, by design convention. If the end of a route map is reached during matching attempts, the result depends on the specific application of the route map. Route maps that are applied to redemption behave the same way as ACLs: if the route does not match any clause in a route map then the route redistribution is denied, as if the route map contained a deny statement at the end.

Permit and Deny Clauses

Route maps can have permit and deny clauses. The deny clause rejects route matches from redistribution. You can use an ACL as the matching criterion in the route map. Because ACLs also have permit and deny clauses, the following rules apply when a packet matches the ACL:

• ACL permit + route map permit: routes are redistributed.

• ACL permit + route map deny: routes are not redistributed.

• ACL deny + route map permit or deny: the route map clause is not matched, and the next route-map clause is evaluated.

Match and Set Clause Values

Each route map clause has two types of values:

• A match value selects routes to which this clause should be applied.

• A set value modifies information that will be redistributed into the target protocol.

For each route that is being redistributed, the router first evaluates the match criteria of a clause in the route map. If the match criteria succeeds, then the route is redistributed or rejected as dictated by the permit or deny clause, and some of its attributes might be modified by the values set from the set commands. If the match criteria fail, then this clause is not applicable to the route, and the software proceeds to evaluate the route against the next clause in the route map. Scanning of the route map continues until a clause is found that matches the route or until the end of the route map is reached.

A match or set value in each clause can be missed or repeated several times, if one of these conditions exists:

• If several match entries are present in a clause, all must succeed for a given route in order for that route to match the clause (in other words, the logical AND algorithm is applied for multiple match commands).

• If a match entry refers to several objects in one entry, either of them should match (the logical OR algorithm is applied).

• If a match entry is not present, all routes match the clause.
• If a set entry is not present in a route map permit clause, then the route is redistributed without modification of its current attributes.

**Note**

Do not configure a set entry in a route map deny clause because the deny clause prohibits route redistribution—there is no information to modify.

A route map clause without a match or set entry does perform an action. An empty permit clause allows a redistribution of the remaining routes without modification. An empty deny clause does not allow a redistribution of other routes (this is the default action if a route map is completely scanned, but no explicit match is found).
Static and Default Routes for Firepower Threat Defense

This chapter describes how to configure static and default routes on the FTD.

- About Static and Default Routes, on page 687
- Guidelines for Static and Default Routes, on page 689
- Add a Static Route, on page 689

About Static and Default Routes

To route traffic to a non-connected host or network, you must define a route to the host or network, either using static or dynamic routing. Generally, you must configure at least one static route: a default route for all traffic that is not routed by other means to a default network gateway, typically the next hop router.

Default Route

The simplest option is to configure a default static route to send all traffic to an upstream router, relying on the router to route the traffic for you. A default route identifies the gateway IP address to which the FTD device sends all IP packets for which it does not have a learned or static route. A default static route is simply a static route with 0.0.0.0/0 (IPv4) or ::/0 (IPv6) as the destination IP address.

You should always define a default route.

Because the FTD uses separate routing tables for data traffic and for management traffic, you can optionally configure a default route for data traffic and another default route for management traffic. Note that from-the-device traffic uses either the management or data routing table by default depending on the type (see Routing Table for Management Traffic, on page 683), but will fall back to the other routing table if a route is not found. Default routes will always match traffic, and will prevent a fall back to the other routing table. In this case, you must specify the interface you want to use for egress traffic if that interface is not in the default routing table.

Static Routes

You might want to use static routes in the following cases:

- Your networks use an unsupported router discovery protocol.
• Your network is small and you can easily manage static routes.

• You do not want the traffic or CPU overhead associated with routing protocols.

• In some cases, a default route is not enough. The default gateway might not be able to reach the destination network, so you must also configure more specific static routes. For example, if the default gateway is outside, then the default route cannot direct traffic to any inside networks that are not directly connected to the FTD device.

• You are using a feature that does not support dynamic routing protocols.

Route to null0 Interface to “Black Hole” Unwanted Traffic

Access rules let you filter packets based on the information contained in their headers. A static route to the null0 interface is a complementary solution to access rules. You can use a null0 route to forward unwanted or undesirable traffic into a “black hole” so the traffic is dropped.

Static null0 routes have a favorable performance profile. You can also use static null0 routes to prevent routing loops. BGP can leverage the static null0 route for Remotely Triggered Black Hole routing.

Route Priorities

• Routes that identify a specific destination take precedence over the default route.

• When multiple routes exist to the same destination (either static or dynamic), then the administrative distance for the route determines priority. Static routes are set to 1, so they typically are the highest priority routes.

• When you have multiple static routes to the same destination with the same administrative distance, see Equal-Cost Multi-Path (ECMP) Routing, on page 684.

• For traffic emerging from a tunnel with the Tunneled option, this route overrides any other configured or learned default routes.

Transparent Firewall Mode Routes

For traffic that originates on the Firepower Threat Defense device and is destined through a bridge group member interface for a non-directly connected network, you need to configure either a default route or static routes so the Firepower Threat Defense device knows out of which bridge group member interface to send traffic. Traffic that originates on the Firepower Threat Defense device might include communications to a syslog server or SNMP server. If you have servers that cannot all be reached through a single default route, then you must configure static routes. For transparent mode, you cannot specify the BVI as the gateway interface; only member interfaces can be used. See MAC Address vs. Route Lookups, on page 530 for more information.

Static Route Tracking

One of the problems with static routes is that there is no inherent mechanism for determining if the route is up or down. They remain in the routing table even if the next hop gateway becomes unavailable. Static routes are only removed from the routing table if the associated interface on the Firepower Threat Defense device goes down.
The static route tracking feature provides a method for tracking the availability of a static route and installing a backup route if the primary route should fail. For example, you can define a default route to an ISP gateway and a backup default route to a secondary ISP in case the primary ISP becomes unavailable.

The Firepower Threat Defense device implements static route tracking by associating a static route with a monitoring target host on the destination network that the Firepower Threat Defense device monitors using ICMP echo requests. If an echo reply is not received within a specified time period, the host is considered down, and the associated route is removed from the routing table. An untracked backup route with a higher metric is used in place of the removed route.

When selecting a monitoring target, you need to make sure that it can respond to ICMP echo requests. The target can be any network object that you choose, but you should consider using the following:

- The ISP gateway (for dual ISP support) address
- The next hop gateway address (if you are concerned about the availability of the gateway)
- A server on the target network, such as a syslog server, that the Firepower Threat Defense device needs to communicate with
- A persistent network object on the destination network

A PC that may be shut down at night is not a good choice.

You can configure static route tracking for statically defined routes or default routes obtained through DHCP or PPPoE. You can only enable PPPoE clients on multiple interfaces with route tracking configured.

**Guidelines for Static and Default Routes**

**Firewall Mode and Bridge Groups**

- In transparent mode, static routes must use the bridge group member interface as the gateway; you cannot specify the BVI.
- Static route tracking is not supported for bridge group member interfaces.

**IPv6**

- Static route tracking is not supported for IPv6.

**Clustering**

In clustering, static route monitoring is only supported on the primary unit.

**Add a Static Route**

A static route defines where to send traffic for specific destination networks. You should at a minimum define a default route. A default route is simply a static route with 0.0.0.0/0 as the destination IP address.
Procedure

Step 1 Choose Devices > Device Management, and edit the FTD device.
Step 2 Click Routing.
Step 3 Select Static Route.
Step 4 Click Add Routes.
Step 5 Click IPv4 or IPv6 depending on the type of static route that you are adding.
Step 6 Choose the Interface to which this static route applies.
   For transparent mode, choose a bridge group member interface name. To “black hole” unwanted traffic, choose the Null0 interface.
Step 7 In the Available Network list, choose the destination network.
   To define a default route, create an object with the address 0.0.0.0/0 and select it here.
Step 8 In the Gateway or IPv6 Gateway field, enter or choose the gateway router which is the next hop for this route. You can provide an IP address or a Networks/Hosts object.
Step 9 In the Metric field, enter the number of hops to the destination network. Valid values range from 1 to 255; the default value is 1. The metric is a measurement of the “expense” of a route, based on the number of hops (hop count) to the network on which a specific host resides. Hop count is the number of networks that a network packet must traverse, including the destination network, before it reaches its final destination. The metric is used to compare routes among different routing protocols. The default administrative distance for static routes is 1, giving it precedence over routes discovered by dynamic routing protocols but not directly connected routes. The default administrative distance for routes discovered by OSPF is 110. If a static route has the same administrative distance as a dynamic route, the static route takes precedence. Connected routes always take precedence over static or dynamically discovered routes.
Step 10 (Optional) For a default route, click the Tunneled checkbox to define a separate default route for VPN traffic.
   You can define a separate default route for VPN traffic if you want your VPN traffic to use a different default route than your non VPN traffic. For example, traffic incoming from VPN connections can be easily directed towards internal networks, while traffic from internal networks can be directed towards the outside. When you create a default route with the tunneled option, all traffic from a tunnel terminating on the device that cannot be routed using learned or static routes, is sent to this route. You can configure only one default tunneled gateway per device. ECMP for tunneled traffic is not supported.
Step 11 (IPv4 static route only) To monitor route availability, enter or choose the name of an SLA (service level agreement) Monitor object that defines the monitoring policy, in the Route Tracking field.
   See SLA Monitor Objects, on page 449.
Step 12 Click Ok.
This chapter describes how to configure the FTD to route data, perform authentication, and redistribute routing information using the Open Shortest Path First (OSPF) routing protocol.

### OSPF for Firepower Threat Defense

This chapter describes how to configure the FTD to route data, perform authentication, and redistribute routing information using the Open Shortest Path First (OSPF) routing protocol.

### About OSPF

OSPF is an interior gateway routing protocol that uses link states rather than distance vectors for path selection. OSPF propagates link-state advertisements rather than routing table updates. Because only LSAs are exchanged instead of the entire routing tables, OSPF networks converge more quickly than RIP networks.

OSPF uses a link-state algorithm to build and calculate the shortest path to all known destinations. Each router in an OSPF area contains an identical link-state database, which is a list of each of the router usable interfaces and reachable neighbors.

The advantages of OSPF over RIP include the following:

- OSPF link-state database updates are sent less frequently than RIP updates, and the link-state database is updated instantly, rather than gradually, as stale information is timed out.

- Routing decisions are based on cost, which is an indication of the overhead required to send packets across a certain interface. The Firepower Threat Defense device calculates the cost of an interface based on link bandwidth rather than the number of hops to the destination. The cost can be configured to specify preferred paths.

The disadvantage of shortest path first algorithms is that they require a lot of CPU cycles and memory.

The Firepower Threat Defense device can run two processes of OSPF protocol simultaneously on different sets of interfaces. You might want to run two processes if you have interfaces that use the same IP addresses (NAT allows these interfaces to coexist, but OSPF does not allow overlapping addresses). Or you might want
to run one process on the inside and another on the outside, and redistribute a subset of routes between the two processes. Similarly, you might need to segregate private addresses from public addresses.

You can redistribute routes into an OSPF routing process from another OSPF routing process, a RIP routing process, or from static and connected routes configured on OSPF-enabled interfaces.

The Firepower Threat Defense device supports the following OSPF features:

- Intra-area, inter-area, and external (Type I and Type II) routes.
- Virtual links.
- LSA flooding.
- Authentication to OSPF packets (both password and MD5 authentication).
- Configuring the Firepower Threat Defense device as a designated router or a designated backup router. The Firepower Threat Defense device also can be set up as an ABR.
- Stub areas and not-so-stubby areas.
- Area boundary router Type 3 LSA filtering.

OSPF supports MD5 and clear text neighbor authentication. Authentication should be used with all routing protocols when possible because route redistribution between OSPF and other protocols (such as RIP) can potentially be used by attackers to subvert routing information.

If NAT is used, if OSPF is operating on public and private areas, and if address filtering is required, then you need to run two OSPF processes—one process for the public areas and one for the private areas.

A router that has interfaces in multiple areas is called an Area Border Router (ABR). A router that acts as a gateway to redistribute traffic between routers using OSPF and routers using other routing protocols is called an Autonomous System Boundary Router (ASBR).

An ABR uses LSAs to send information about available routes to other OSPF routers. Using ABR Type 3 LSA filtering, you can have separate private and public areas with the ASA acting as an ABR. Type 3 LSAs (inter-area routes) can be filtered from one area to other, which allows you to use NAT and OSPF together without advertising private networks.

**Note**

Only Type 3 LSAs can be filtered. If you configure the Firepower Threat Defense device as an ASBR in a private network, it will send Type 5 LSAs describing private networks, which will get flooded to the entire AS, including public areas.

If NAT is employed but OSPF is only running in public areas, then routes to public networks can be redistributed inside the private network, either as default or Type 5 AS external LSAs. However, you need to configure static routes for the private networks protected by the Firepower Threat Defense device. Also, you should not mix public and private networks on the same Firepower Threat Defense device interface.

You can have two OSPF routing processes, one RIP routing process, and one EIGRP routing process running on the Firepower Threat Defense device at the same time.
OSPF Support for Fast Hello Packets

The OSPF Support for Fast Hello Packets feature provides a way to configure the sending of hello packets in intervals less than one second. Such a configuration would result in faster convergence in an Open Shortest Path First (OSPF) network.

Prerequisites for OSPF Support for Fast Hello Packets

OSPF must be configured in the network already or configured at the same time as the OSPF Support for Fast Hello Packets feature.

OSPF Hello Interval and Dead Interval

OSPF hello packets are packets that an OSPF process sends to its OSPF neighbors to maintain connectivity with those neighbors. The hello packets are sent at a configurable interval (in seconds). The defaults are 10 seconds for an Ethernet link and 30 seconds for a non broadcast link. Hello packets include a list of all neighbors for which a hello packet has been received within the dead interval. The dead interval is also a configurable interval (in seconds), and defaults to four times the value of the hello interval. The value of all hello intervals must be the same within a network. Likewise, the value of all dead intervals must be the same within a network.

These two intervals work together to maintain connectivity by indicating that the link is operational. If a router does not receive a hello packet from a neighbor within the dead interval, it will declare that neighbor to be down.

OSPF Fast Hello Packets

OSPF fast hello packets refer to hello packets being sent at intervals of less than 1 second. To understand fast hello packets, you should already understand the relationship between OSPF hello packets and the dead interval. See OSPF Hello Interval and Dead Interval, on page 693.

OSPF fast hello packets are achieved by using the ospf dead-interval command. The dead interval is set to 1 second, and the hello-multiplier value is set to the number of hello packets you want sent during that 1 second, thus providing subsecond or "fast" hello packets.

When fast hello packets are configured on the interface, the hello interval advertised in the hello packets that are sent out this interface is set to 0. The hello interval in the hello packets received over this interface is ignored.

The dead interval must be consistent on a segment, whether it is set to 1 second (for fast hello packets) or set to any other value. The hello multiplier need not be the same for the entire segment as long as at least one hello packet is sent within the dead interval.

Benefits of OSPF Fast Hello Packets

The benefit of the OSPF Fast Hello Packets feature is that your OSPF network will experience faster convergence time than it would without fast hello packets. This feature allows you to detect lost neighbors within 1 second. It is especially useful in LAN segments, where neighbor loss might not be detected by the Open System Interconnection (OSI) physical layer and data-link layer.
Implementation Differences Between OSPFv2 and OSPFv3

OSPFv3 is not backward compatible with OSPFv2. To use OSPF to route both IPv4 and IPv6 traffic, you must run both OSPFv2 and OSPFv3 at the same time. They coexist with each other, but do not interact with each other.

The additional features that OSPFv3 provides include the following:
- Protocol processing per link.
- Removal of addressing semantics.
- Addition of flooding scope.
- Support for multiple instances per link.
- Use of the IPv6 link-local address for neighbor discovery and other features.
- LSAs expressed as prefix and prefix length.
- Addition of two LSA types.
- Handling of unknown LSA types.
- Authentication support using the IPsec ESP standard for OSPFv3 routing protocol traffic, as specified by RFC-4552.

Guidelines for OSPF

Firewall Mode Guidelines
OSPF supports routed firewall mode only. OSPF does not support transparent firewall mode.

High Availability Guidelines
OSPFv2 and OSPFv3 support Stateful High Availability.

IPv6 Guidelines
- OSPFv2 does not support IPv6.
- OSPFv3 supports IPv6.
- OSPFv3 uses IPv6 for authentication.
- The Firepower Threat Defense device installs OSPFv3 routes into the IPv6 RIB, provided it is the best route.

Clustering Guidelines
- OSPFv3 encryption is not supported. An error message appears if you try to configure OSPFv3 encryption in a clustering environment.
- In Spanned interface mode, dynamic routing is not supported on management-only interfaces.
• When a master role change occurs in the cluster, the following behavior occurs:
  • In spanned interface mode, the router process is active only on the master unit and is in a suspended state on the slave units. Each cluster unit has the same router ID because the configuration has been synchronized from the master unit. As a result, a neighboring router does not notice any change in the router ID of the cluster during a role change.

Multifunction Label Switching (MPLS) and OSPF Guidelines

When a MPLS-configured router sends Link State (LS) update packets containing opaque Type-10 link-state advertisements (LSAs) that include an MPLS header, authentication fails and the appliance silently drops the update packets, rather than acknowledging them. Eventually the peer router will terminate the neighbor relationship because it has not received any acknowledgments.

Make sure that non-stop forwarding (NSF) is disabled on the appliance to ensure that the neighbor relationship remains stable:

• Navigate to the Non Stop Forwarding page in Firepower Management Center (Devices > Device Management (select the desired device) > Routing > OSPF > Advanced > Non Stop Forwarding).

Ensure the Non Stop Forwarding Capability boxes are not checked.

Additional Guidelines

• OSPFv2 and OSPFv3 support multiple instances on an interface.
• OSPFv3 supports encryption through ESP headers in a non-clustered environment.
• OSPFv3 supports Non-Payload Encryption.
• OSPFv3 supports Cisco NSF Graceful Restart and IETF NSF Graceful Restart mechanisms as defined in RFCs 4811, 4812 & 3623 respectively.
• OSPFv3 supports Graceful Restart mechanism as defined in RFC 5187.
• There is a limit to the number of intra area (type 1) routes that can be distributed. For these routes, a single type-1 LSA contains all prefixes. Because the system has a limit of 35 KB for packet size, 3000 routes result in a packet that exceeds the limit. Consider 2900 type 1 routes to be the maximum number supported.

Configure OSPFv2

This section describes the tasks involved in configuring an OSPFv2 routing process.

Configure OSPF Areas, Ranges, and Virtual Links

You can configure several OSPF area parameters, which include setting authentication, defining stub areas, and assigning specific costs to the default summary route. You can enable up to two OSPF process instances. Each OSPF process has its own associated areas and networks. Authentication provides password-based protection against unauthorized access to an area.
Stub areas are areas into which information on external routes is not sent. Instead, there is a default external route generated by the ABR into the stub area for destinations outside the autonomous system. To take advantage of the OSPF stub area support, default routing must be used in the stub area.

**Procedure**

**Step 1** Choose Devices > Device Management, and edit the FTD device.

**Step 2** Click Routing.

**Step 3** Click OSPF.

**Step 4** Select Process 1. You can enable up to two OSPF process instances for each context. You must choose an OSPF process to be able to configure the Area parameters.

**Step 5** Choose the OSPF role from the drop-down list, and enter a description for it in the next field. The options are Internal, ABR, ASBR, and ABR and ASBR. See About OSPF, on page 691 for a description of the OSPF roles.

**Step 6** Select Area > Add.

You can click edit ( ), or use the right-click menu to cut, copy, past, insert, and delete areas.

**Step 7** Configure the following area options for each OSPF process:

- **OSPF Process**—Choose 1 or 2.
- **Area ID**—Designation of the area for which routes are to be summarized.
- **Area Type**—Choose one of the following:
  - **Normal**—(Default) Standard OSPF area.
  - **Stub**—A stub area does not have any routers or areas beyond it. Stub areas prevent Autonomous System (AS) External LSAs (Type 5 LSAs) from being flooded into the stub area. When you create a stub area, you can prevent summary LSAs (Types 3 and 4) from being flooded into the area by NOT checking the Summary Stub check box.
  - **NSSA**—Makes the area a not-so-stubby area (NSSA). NSSAs accept Type 7 LSAs. You can disable route redistribution by NOT checking the redistribute check box and checking the Default Information Originate check box. You can prevent summary LSAs from being flooded into the area by NOT checking the Summary NSSA check box.
- **Metric Value**—The metric used for generating the default route. The default value is 10. Valid metric values range from 0 through 16777214.
- **Metric Type**—The metric type is the external link type that is associated with the default route that is advertised into the OSPF routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.
- **Available Network**—Choose one of the available networks and click Add, or click add ( ) to add a new network object. See Network Objects, on page 396 for the procedure for adding networks.
- **Authentication**—Choose the OSPF authentication:
  - **None**—(Default) Disables OSPF area authentication.
• **Password**—Provides a clear text password for area authentication, which is not recommended where security is a concern.

• **MD5**—Allows MD5 authentication.

• **Default Cost**—The default cost for the OSPF area, which is used to determine the shortest paths to the destination. Valid values range from 0 through 65535. The default value is 1.

**Step 8** Click **OK** to save the area configuration.

**Step 9** Select **Range > Add**.

• Choose one of the available networks and whether to advertise, or,

• Click add (🗑) to add a new network object. See Network Objects, on page 396 for the procedure for adding networks.

**Step 10** Click **OK** to save the range configuration.

**Step 11** Select **Virtual Link**, click **Add**, and configure the following options for each OSPF process:

• **Peer Router**—Choose the IP address of the peer router. To add a new peer router, click add (🗑). See Network Objects, on page 396 for the procedure for adding networks.

• **Hello Interval**—The time in seconds between the hello packets sent on an interface. The hello interval is an unsigned integer that is to be advertised in the hello packets. The value must be the same for all routers and access servers on a specific network. Valid values range from 1 through 65535. The default is 10.

The smaller the hello interval, the faster topological changes are detected, but the more traffic is sent on the interface.

• **Transmit Delay**—The estimated time in seconds that is required to send an LSA packet on the interface. The integer value must be greater than zero. Valid values range from 1 through 8192. The default is 1.

LSAs in the update packet have their own ages incremented by this amount before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.

• **Retransmit Interval**—The time in seconds between LSA retransmissions for adjacencies that belong to the interface. The retransmit interval is the expected round-trip delay between any two routers on the attached network. The value must be greater than the expected round-trip delay, and can range from 1 through 65535. The default is 5.

When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links.

• **Dead Interval**—The time in seconds that hello packets are not seen before a neighbor indicates that the router is down. The dead interval is an unsigned integer. The default is four times the hello interval, or 40 seconds. The value must be the same for all routers and access servers that are attached to a common network. Valid values range from 1 through 65535.

• **Authentication**—Choose the OSPF virtual link authentication from the following:
Configure OSPF Redistribution

The Firepower Threat Defense device can control the redistribution of routes between the OSPF routing processes. The rules for redistributing routes from one routing process into an OSPF routing process are displayed. You can redistribute routes discovered by RIP and BGP into the OSPF routing process. You can also redistribute static and connected routes into the OSPF routing process.

Procedure

Step 1 Choose Devices > Device Management, and edit the FTD device.
Step 2 Click Routing.
Step 3 Click OSPF.
Step 4 Select Distribution > Add.

You can click edit ( ), or use the right-click menu to cut, copy, past, insert, and delete areas.

Step 5 Configure the following redistribution options for each OSPF process:

- **Route Type**—Choose one of the following types:
  - **Static**—Redistributes static routes to the OSPF routing process.
  - **Connected**—Redistributes connected routes (routes established automatically by virtue of having the IP address enabled on the interface) to the OSPF routing process. Connected routes are redistributed as external to the device. You can select whether to use subnets under the Optional list.

Note

Step 12 Click OK to save the virtual link configuration.
Step 13 Click Save on the Routing page to save your changes.

What to do next

Continue with Configure OSPF Redistribution.
• **OSPF**—Redistributes routes from another OSPF routing process, for example, internal, external 1 and 2, NSSA external 1 and 2, or whether to use subnets. You can select these options under the Optional list.

• **BGP**—Redistribute routes from the BGP routing process. Add the AS number and whether to use subnets.

• **RIP**—Redistributes routes from the RIP routing process. You can select whether to use subnets under the Optional list.

• **Metric Value**—Metric value for the routes being distributed. The default value is 10. Valid values range from 0 to 16777214.

When redistributing from one OSPF process to another OSPF process on the same device, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified.

• **Metric Type**—The metric type is the external link type that is associated with the default route that is advertised into the OSPF routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.

• **Tag Value**—Tag specifies the 32-bit decimal value attached to each external route that is not used by OSPF itself, but which may be used to communicate information between ASBRs. If none is specified, then the remote autonomous system number is used for routes from BGP and EGP. For other protocols, zero is used. Valid values are from 0 to 4294967295.

• **RouteMap**—Checks for filtering the importing of routes from the source routing protocol to the current routing protocol. If this parameter is not specified, all routes are redistributed. If this parameter is specified, but no route map tags are listed, no routes are imported. Or you can add a new route map by clicking add ( ). See Route Maps to add a new route map.

**Step 6**
Click **OK** to save the redistribution configuration.

**Step 7**
Click **Save** on the Routing page to save your changes.

---

**What to do next**
Continue with Configure OSPF Inter-Area Filtering, on page 699.

**Configure OSPF Inter-Area Filtering**

ABR type 3 LSA filtering extends the capability of an ABR that is running OSPF to filter type 3 LSAs between different OSPF areas. Once a prefix list is configured, only the specified prefixes are sent from one OSPF area to another OSPF area. All other prefixes are restricted to their OSPF area. You can apply this type of area filtering to traffic going into or coming out of an OSPF area, or to both the incoming and outgoing traffic for that area.

When multiple entries of a prefix list match a given prefix, the entry with the lowest sequence number is used. For efficiency, you may want to put the most common matches or denials near the top of the list by manually assigning them a lower sequence number. By default, sequence numbers are automatically generated in increments of 5, beginning with 5.
Configure OSPF Filter Rules

You can configure ABR Type 3 LSA filters for each OSPF process. ABR Type 3 LSA filters allow only specified prefixes to be sent from one area to another area and restrict all other prefixes. You can apply this type of area filtering out of a specific OSPF area, into a specific OSPF area, or into and out of the same OSPF...
area at the same time. OSPF ABR Type 3 LSA filtering improves your control of route distribution between OSPF areas.

Procedure

Step 1  Choose Devices > Device Management, and edit the FTD device.
Step 2  Click Routing.
Step 3  Click OSPF.
Step 4  Select Filter Rule > Add.

You can click edit ( ), or use the right-click menu to cut, copy, past, insert, and delete filter rules.

Step 5  Configure the following filter rule options for each OSPF process:

- **OSPF Process**—Choose 1 or 2.
- **Access List**—The access list for this OSPF process. To add a new standard access list object, click add ( ) and see Configure Standard ACL Objects, on page 458.
- **Traffic Direction**—Choose In or Out for the traffic direction being filtered. Choose In to filter LSAs coming into an OSPF area, or Out to filter LSAs coming out of an OSPF area. If you are editing an existing filter entry, you cannot modify this setting.
- **Interface**—The interface for this filter rule.

Step 6  Click OK to save the filter rule configuration.
Step 7  Click Save on the Routing page to save your changes.

What to do next

Continue with Configure OSPF Summary Addresses, on page 701.

**Configure OSPF Summary Addresses**

When routes from other protocols are redistributed into OSPF, each route is advertised individually in an external LSA. However, you can configure the Firepower Threat Defense device to advertise a single route for all the redistributed routes that are included for a specified network address and mask. This configuration decreases the size of the OSPF link-state database. Routes that match the specified IP address mask pair can be suppressed. The tag value can be used as a match value for controlling redistribution through route maps.

Routes learned from other routing protocols can be summarized. The metric used to advertise the summary is the smallest metric of all the more specific routes. Summary routes help reduce the size of the routing table.

Using summary routes for OSPF causes an OSPF ASBR to advertise one external route as an aggregate for all redistributed routes that are covered by the address. Only routes from other routing protocols that are being redistributed into OSPF can be summarized.
## Configure OSPF Interfaces and Neighbors

You can change some interface-specific OSPFv2 parameters, if necessary. You are not required to change any of these parameters, but the following interface parameters must be consistent across all routers in an attached network: the hello interval, the dead interval, and the authentication key. If you configure any of these parameters, be sure that the configurations for all routers on your network have compatible values.

You need to define static OSPFv2 neighbors to advertise OSPFv2 routes over a point-to-point, non-broadcast network. This feature lets you broadcast OSPFv2 advertisements across an existing VPN connection without having to encapsulate the advertisements in a GRE tunnel.

### Procedure

**Step 1** Choose Devices > Device Management, and edit the FTD device.

**Step 2** Click Routing.

**Step 3** Click OSPF.

You can click edit (✏️) to edit, or use the right-click menu to cut, copy, paste, insert, and delete summary addresses.

**Step 5** Configure the following summary address options for each OSPF process:

- **OSPF Process**—Choose 1 or 2.
- **Available Network**—The IP address of the summary address. Select one from the Available networks list and click Add, or to add a new network, click add (➕). See Network Objects, on page 396 for the procedure for adding networks.
- **Tag**—A 32-bit decimal value that is attached to each external route. This value is not used by OSPF itself, but may be used to communicate information between ASBRs.
- **Advertise**—Advertises the summary route. Uncheck this check box to suppress routes that fall under the summary address. By default, this check box is checked.

**Step 6** Click OK to save the summary address configuration.

**Step 7** Click Save on the Routing page to save your changes.

### What to do next

Continue with Configure OSPF Interfaces and Neighbors, on page 702.
Step 4

Select Interface > Add.

You can click edit ( ), or use the right-click menu to cut, copy, paste, insert, and delete areas.

Step 5

Configure the following Interface options for each OSPF process:

- **Interface**—The interface you are configuring.

- **Default Cost**—The cost of sending a packet through the interface. The default value is 10.

- **Priority**—Determines the designated router for a network. Valid values range from 0 to 255. The default value is 1. Entering 0 for this setting makes the router ineligible to become the designated router or backup designated router.

   When two routers connect to a network, both attempt to become the designated router. The device with the higher router priority becomes the designated router. If there is a tie, the router with the higher router ID becomes the designated router. This setting does not apply to interfaces that are configured as point-to-point interfaces.

- **MTU Ignore**—OSPF checks whether neighbors are using the same MTU on a common interface. This check is performed when neighbors exchange DBD packets. If the receiving MTU in the DBD packet is higher than the IP MTU configured on the incoming interface, OSPF adjacency is not established.

- **Database Filter**—Use this setting to filter the outgoing LSA interface during synchronization and flooding. By default, OSPF floods new LSAs over all interfaces in the same area, except the interface on which the LSA arrives. In a fully meshed topology, this flooding can waste bandwidth and lead to excessive link and CPU usage. Checking this check box prevents OSPF flooding of the LSA on the selected interface.

- **Hello Interval**—Specifies the interval, in seconds, between hello packets sent on an interface. Valid values range 1–8192 seconds. The default value is 10 seconds.

   The smaller the hello interval, the faster topological changes are detected, but more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface.

- **Transmit Delay**—Estimated time in seconds to send an LSA packet on the interface. Valid values range 1–65535 seconds. The default is 1 second.

   LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.

- **Retransmit Interval**—Time in seconds between LSA retransmissions for adjacencies that belong to the interface. The time must be greater than the expected round-trip delay between any two routers on the attached network. Valid values range from 1 to 65535 seconds. The default is 5 seconds.

   When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links.

- **Dead Interval**—Time period in seconds for which hello packets must not be seen before neighbors indicate that the router is down. The value must be the same for all nodes on the network and can range 1–65535.

- **Hello Multiplier**—Specifies the number of Hello packets to be sent per second. Valid values are 3–20.
Configure OSPF Advanced Properties

- **Point-to-Point**—Lets you transmit OSPF routes over VPN tunnels.
- **Authentication**—Choose the OSPF interface authentication from the following:
  - **None**—(Default) Disables interface authentication.
  - **Area Authentication**—Enables interface authentication using MD5. Click Add, and enter the key ID, key, confirm the key, and then click OK.
  - **Password**—Provides a clear text password for virtual link authentication, which is not recommended where security is a concern.
  - **MD5**—Allows MD5 authentication. Click Add, and enter the key ID, key, confirm the key, and then click OK.
    
    **Note** Ensure to enter only numbers as the MD5 key ID.

- **Enter Password**—The password you configure if you choose Password as the type of authentication.
- **Confirm Password**—Confirm the password that you chose.

**Step 6** Select Neighbor > Add.

You can click edit (✏️), or use the right-click menu to cut, copy, past, insert, and delete areas.

**Step 7** Configure the following parameters for each OSPF process:

- **OSPF Process**—Choose 1 or 2.
- **Neighborhood**—Choose one of the neighbors in the drop-down list, or click add (🔗) to add a new neighbor; enter the name, description, network, whether to allow overrides, and then click Save.
- **Interface**—Choose the interface associated with the neighbor.

**Step 8** Click OK to save the neighbor configuration.

**Step 9** Click Save on the Routing page to save your changes.

---

**Configure OSPF Advanced Properties**

The Advanced Properties allows you to configure options, such as syslog message generation, administrative route distances, an LSA timer, and graceful restarts.

**Graceful Restarts**

The Firepower Threat Defense device may experience some known failure situations that should not affect packet forwarding across the switching platform. The Non-Stop Forwarding (NSF) capability allows data forwarding to continue along known routes, while the routing protocol information is being restored. This capability is useful when there is a scheduled hitless software upgrade. You can configure graceful restart on OSPFv2 by using either using NSF Cisco (RFC 4811 and RFC 4812) or NSF IETF (RFC 3623).
NSF capability is also useful in HA mode and clustering.

Configuring the NSF graceful-restart feature involves two steps; configuring capabilities and configuring a device as NSF-capable or NSF-aware. A NSF-capable device can indicate its own restart activities to neighbors and a NSF-aware device can help a restarting neighbor.

A device can be configured as NSF-capable or NSF-aware, depending on some conditions:

- A device can be configured as NSF-aware irrespective of the mode in which it is.
- A device has to be in either Failover or Spanned Etherchannel (L2) cluster mode to be configured as NSF-capable.
- For a device to be either NSF-aware or NSF-capable, it should be configured with the capability of handling opaque Link State Advertisements (LSAs)/ Link Local Signaling (LLS) block as required.

**Procedure**

**Step 1** Choose Devices > Device Management, and edit the FTD device.

**Step 2** Click Routing.

**Step 3** Click OSPF > Advanced Settings.

**Step 4** Select General, and configure the following:

- **Router ID**—Choose Automatic or IP address for the router ID. If you choose IP address, enter the IP address in the IP Address field.

- **Ignore LSA MOSPF**—Suppresses syslog messages when the route receives unsupported LSA Type 6 multicast OSPF (MOSPF) packets.

- **RFC 1583 Compatible**—Configures RFC 1583 compatibility as the method used to calculate summary route costs. Routing loops can occur with RFC 1583 compatibility enabled. Disable it to prevent routing loops. All OSPF routers in an OSPF routing domain should have RFC compatibility set identically.

- **Adjacency Changes**—Defines the adjacency changes that cause syslog messages to be sent.

By default, a syslog message is generated when an OSPF neighbor goes up or down. You can configure the router to send a syslog message when an OSPF neighbor goes down and also a syslog for each state.

- **Log Adjacency Changes**—Causes the Firepower Threat Defense device to send a syslog message whenever an OSPF neighbor goes up or down. This setting is checked by default.

- **Log Adjacency Change Details**—Causes the Firepower Threat Defense device to send a syslog message whenever any state change occurs, not just when a neighbor goes up or down. This setting is unchecked by default.

- **Administrative Route Distance**—Allows you to modify the settings that were used to configure administrative route distances for inter-area, intra-area, and external IPv6 routes. The administrative route distance is an integer from 1 to 254. The default is 110.

- **LSA Group Pacing**—Specifies the interval in seconds at which LSAs are collected into a group and refreshed, check summed, or aged. Valid values range from 10 to 1800. The default value is 240.
Configure OSPF Advanced Properties

• **Enable Default Information Originate**—Check the **Enable** check box to generate a default external route into an OSPF routing domain and configure the following options:
  
  • **Always advertise the default route**—Ensures that the default route is always advertised.
  
  • **Metric Value**—Metric used for generating the default route. Valid metric values range from 0 to 16777214. The default value is 10.
  
  • **Metric Type**—The external link type that is associated with the default route that is advertised into the OSPFv3 routing domain. Valid values are 1 (Type 1 external route) and 2 (Type 2 external route). The default is Type 2 external route.
  
  • **RouteMap**—Choose the routing process that generates the default route if the route map is satisfied or click add (_instruction) to add a new one. See **Route Maps** to add a new route map.

**Step 5**  
Click **OK** to save the general configuration.

**Step 6**  
Select **Non Stop Forwarding**, and configure Cisco NSF graceful restart for OSPFv2, for an NSF-capable or NSF-aware device:

**Note**  
There are two graceful restart mechanisms for OSPFv2, Cisco NSF and IETF NSF. Only one of these graceful restart mechanisms can be configured at a time for an OSPF instance. An NSF-aware device can be configured as both Cisco NSF helper and IETF NSF helper but a NSF-capable device can be configured in either Cisco NSF or IETF NSF mode at a time for an OSPF instance.

a) Check the **Enable Cisco Non Stop Forwarding Capability** check box.

b) (Optional) Check the **Cancel NSF restart when non-NSF-aware neighboring networking devices are detected** check box if required.

c) (Optional) Make sure the **Enable Cisco Non Stop Forwarding Helper** mode check box is unchecked to disable the helper mode on an NSF-aware device.

**Step 7**
Configure IETF NSF Graceful Restart for OSPFv2, for an NSF-capable or NSF-aware device:

a) Check the **Enable IETF Non Stop Forwarding Capability** check box.

b) In the **Length of graceful restart interval (seconds)** field, enter the restart interval in seconds. The default value is 120 seconds. For a restart interval below 30 seconds, graceful restart will be terminated.

c) (Optional) Make sure the **Enable IETF nonstop forwarding (NSF) for helper mode** check box is unchecked to disable the IETF NSF helper mode on an NSF-aware device.

d) **Enable Strict Link State advertisement checking**—When enabled, it indicates that the helper router will terminate the process of restarting the router if it detects that there is a change to a LSA that would be flooded to the restarting router, or if there is a changed LSA on the retransmission list of the restarting router when the graceful restart process is initiated.

e) **Enable IETF Non Stop Forwarding**—Enables non stop forwarding, which allows for the forwarding of data packets to continue along known routes while the routing protocol information is being restored following a switchover. OSPF uses extensions to the OSPF protocol to recover its state from neighboring OSPF devices. For the recovery to work, the neighbors must support the NSF protocol extensions and be willing to act as "helpers" to the device that is restarting. The neighbors must also continue forwarding data traffic to the device that is restarting while protocol state recovery takes place.
Configure OSPFv3

This section describes the tasks involved in configuring an OSPFv3 routing process.

Configure OSPFv3 Areas, Route Summaries, and Virtual Links

To enable OSPFv3, you need to create an OSPFv3 routing process, create an area for OSPFv3, enable an interface for OSPFv3, and then redistribute the route into the targeted OSPFv3 routing process.

Procedure

Step 1  Choose Devices > Device Management, and edit the FTD device.
Step 2  Select Routing > OSPFv3.
Step 3  By default Enable Process 1 is selected. You can enable up to two OSPF process instances.
Step 4  Chose the OSPFv3 role from the drop-down list, and enter a description for it. The options are Internal, ABR, ASBR, and ABR and ASBR. See About OSPF, on page 691 for descriptions of the OSPFv3 roles.
Step 5  Select Area > Add.

You can click edit ( ), or use the right-click menu to cut, copy, past, insert, and delete areas.

Step 6  Select General, and configure the following options for each OSPF process:

- Area ID—The area for which routes are to be summarized.
- Cost—The metric or cost for the summary route, which is used during OSPF SPF calculations to determine the shortest paths to the destination. Valid values range from 0 to 16777215.
- Type—Specifies Normal, NSSA, or Stub. If you select Normal, there are no other parameters to configure. If you select Stub, you can choose to send summary LSAs in the area. If you select NSSA, you can configure the next three options:
  - Allow Sending summary LSA into this area—Allows the sending of summary LSAs into the area.
  - Redistribute imports routes to normal and NSSA area—Allows redistribution to import routes to normal and not to stubby areas.
  - Defaults information originate—Generates a default external route into an OSPFv3 routing domain.
- Metric—Metric used for generating the default route. The default value is 10. Valid metric values range from 0 to 16777214.
- Metric Type—The metric type is the external link type that is associated with the default route that is advertised into the OSPFv3 routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.

Step 7  Click OK to save the general configuration.
Step 8  Select Route Summary > Add Route Summary.
Configure OSPFv3 Areas, Route Summaries, and Virtual Links

You can click edit ( ), or use the right-click menu to cut, copy, past, insert, and delete route summaries.

**Step 9**
Configure the following route summary options for each OSPF process:

- **IPv6 Prefix/Length**—The IPv6 prefix. To add a new network object, click add ( ). See Network Objects, on page 396 for the procedure for adding networks.

- **Cost**—The metric or cost for the summary route, which is used during OSPF SPF calculations to determine the shortest paths to the destination. Valid values range from 0 to 16777215.

- **Advertise**—Advertises the summary route. Uncheck this check box to suppress routes that fall under the summary address. By default, this check box is checked.

**Step 10**
Click OK to save the route summary configuration.

**Step 11**
Select **Virtual Link**, click **Add Virtual Link**, and configure the following options for each OSPF process:

- **Peer RouterID**—Choose the IP address of the peer router. To add a new network object, click add ( ). See Network Objects, on page 396 for the procedure for adding networks.

- **TTL Security**—Enables TTL security check. The value for the hop-count is a number from 1 to 254. The default is 1.

  OSPF sends outgoing packets with an IP header Time to Live (TTL) value of 255 and discards incoming packets that have TTL values less than a configurable threshold. Because each device that forwards an IP packet decrements the TTL, packets received via a direct (one-hop) connection have a value of 255. Packets that cross two hops have a value of 254, and so on. The receive threshold is configured in terms of the maximum number of hops that a packet may have traveled.

- **Dead Interval**—The time in seconds that hello packets are not seen before a neighbor indicates that the router is down. The default is four times the hello interval, or 40 seconds. Valid values range from 1 to 65535.

  The dead interval is an unsigned integer. The value must be the same for all routers and access servers that are attached to a common network.

- **Hello Interval**—The time in seconds between the hello packets sent on an interface. Valid values range from 1 to 65535. The default is 10.

  The hello interval is an unsigned integer that is to be advertised in the hello packets. The value must be the same for all routers and access servers on a specific network. The smaller the hello interval, the faster topological changes are detected, but the more traffic is sent on the interface.

- **Retransmit Interval**—The time in seconds between LSA retransmissions for adjacencies that belong to the interface. The retransmit interval is the expected round-trip delay between any two routers on the attached network. The value must be greater than the expected round-trip delay, and can range from 1 to 65535. The default is 5.

  When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links.

- **Transmit Delay**—The estimated time in seconds that is required to send an LSA packet on the interface. The integer value must be greater than zero. Valid values range from 1 to 8192. The default is 1.
LSAs in the update packet have their own ages incremented by this amount before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.

**Step 12**  
Click OK to save the virtual link configuration.

**Step 13**  
Click Save on the Router page to save your changes.

---

**What to do next**  
Continue with [Configure OSPFv3 Redistribution](#).

---

**Configure OSPFv3 Redistribution**

The Firepower Threat Defense device can control the redistribution of routes between the OSPF routing processes. The rules for redistributing routes from one routing process into an OSPF routing process are displayed. You can redistribute routes discovered by RIP and BGP into the OSPF routing process. You can also redistribute static and connected routes into the OSPF routing process.

**Procedure**

**Step 1**  
Choose Devices > Device Management, and edit the FTD device.

**Step 2**  
Select Routing > OSPF.

**Step 3**  
Select Redistribution, and click Add.

You can click edit ( ), or use the right-click menu to cut, copy, past, insert, and delete areas.

**Step 4**  
Configure the following redistribution options for each OSPF process:

- **Source Protocol**—The source protocol from which routes are being redistributed. The supported protocols are connected, OSPF, static, and BGP. If you choose OSPF, you must enter the Process ID in the Process ID field. If you choose BGP, you must add the AS number in the AS Number field.

- **Metric**—Metric value for the routes being distributed. The default value is 10. Valid values range from 0 to 16777214.

  When redistributing from one OSPF process to another OSPF process on the same device, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified.

- **Metric Type**—The metric type is the external link type that is associated with the default route that is advertised into the OSPF routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.

- **Tag**—Tag specifies the 32-bit decimal value attached to each external route that is not used by OSPF itself, but which may be used to communicate information between ASBRs. If none is specified, then the remote autonomous system number is used for routes from BGP and EGP. For other protocols, zero is used. Valid values are from 0 to 4294967295.
Configure OSPFv3 Summary Prefixes

You can configure the Firepower Threat Defense device to advertise routes that match a specified IPv6 prefix and mask pair.

Procedure

Step 1 Choose Devices > Device Management, and edit the FTD device.
Step 2 Select Routing > OSPFv3.
Step 3 Select Summary Prefix > Add.

You can click edit ( Modiﬁe), or use the right-click menu to cut, copy, past, insert, and delete summary prefixes.

Step 4 Configure the following summary prefix options for each OSPF process:

- **Route Map**—Checks for filtering the importing of routes from the source routing protocol to the current routing protocol. If this parameter is not specified, all routes are redistributed. If this parameter is specified, but no route map tags are listed, no routes are imported. Or you can add a new route map by clicking add ( Modiﬁe). See Route Maps, on page 453 for the procedure to add a new route map.

- **Process ID**—The OSPF process ID, either 1 or 2.

  Note The Process ID is enabled the OSPFv3 process is redistributing a route learned by another OSPFv3 process.

- **Match**—Enables OSPF routes to be redistributed into other routing domains:
  - **Internal** for routes that are internal to a specific autonomous system.
  - **External 1** for routes that are external to the autonomous system, but are imported into OSPFv3 as Type 1 external routes.
  - **External 2** for routes that are external to the autonomous system, but are imported into OSPFv3 as Type 2 external routes.
  - **NSSA External 1** for routes that are external to the autonomous system, but are imported into OSPFv3 in an NSSA for IPv6 as Type 1 external routes.
  - **NSSA External 2** for routes that are external to the autonomous system, but are imported into OSPFv3 in an NSSA for IPv6 as Type 2 external routes.

Step 5 Click OK to save the redistribution configuration.
Step 6 Click Save on the Routing page to save your changes.

What to do next

Continue with Configure OSPFv3 Summary Prefixes, on page 710.
Configure OSPFv3 Interfaces, Authentication, and Neighbors

You can change certain interface-specific OSPFv3 parameters, if necessary. You are not required to change any of these parameters, but the following interface parameters must be consistent across all routers in an attached network: the hello interval and the dead interval. If you configure any of these parameters, be sure that the configurations for all routers on your network have compatible values.

Procedure

Step 1 Choose Devices > Device Management, and edit the FTD device.
Step 2 Select Routing > OSPFv3.
Step 3 Select Interface > Add.

You can click Edit to edit, or use the right-click menu to cut, copy, past, insert, and delete areas.

Step 4 Configure the following interface options for each OSPFv3 process:

- **Interface** — The interface you are configuring.
- **Enable OSPFv3** — Enables OSPFv3.
- **OSPF Process** — Choose 1 or 2.
- **Area** — The area ID for this process.
- **Instance** — Specifies the area instance ID to be assigned to the interface. An interface can have only one OSPFv3 area. You can use the same area on multiple interfaces, and each interface can use a different area instance ID.

Step 5 Select Properties, and configuring the following options for each OSPFv3 process:

- **Filter Outgoing Link Status Advertisements** — Filters outgoing LSAs to an OSPFv3 interface. All outgoing LSAs are flooded to the interface by default.

What to do next

Continue with Configure OSPFv3 Interfaces, Authentication, and Neighbors, on page 711.
• **Disable MTU mismatch detection**—Disables the OSPF MTU mismatch detection when DBD packets are received. OSPF MTU mismatch detection is enabled by default.

• **Flood Reduction**—Changes normal LSAs into Do Not Age LSAs, so that they don't get flooded every 3600 seconds across areas.

OSPF LSAs are refreshed every 3600 seconds. In large OSPF networks, this can lead to large amounts of unnecessary LSA flooding from area to area.

• **Point-to-Point Network**—Lets you transmit OSPF routes over VPN tunnels. When an interface is configured as point-to-point, non-broadcast, the following restrictions apply:
  - You can define only one neighbor for the interface.
  - You need to manually configure the neighbor.
  - You need to define a static route pointing to the crypto endpoint.
  - If OSPF over a tunnel is running on the interface, regular OSPF with an upstream router cannot be run on the same interface.
  - You should bind the crypto map to the interface before specifying the OSPF neighbor to ensure that the OSPF updates are passed through the VPN tunnel. If you bind the crypto map to the interface after specifying the OSPF neighbor, use the `clear local-host all` command to clear OSPF connections so that the OSPF adjacencies can be established over the VPN tunnel.

• **Broadcast**—Specifies that the interface is a broadcast interface. By default, this check box is checked for Ethernet interfaces. Uncheck this check box to designate the interface as a point-to-point, non-broadcast interface. Specifying an interface as point-to-point, nonbroadcast lets you transmit OSPF routes over VPN tunnels.

• **Cost**—Specifies the cost of sending a packet on the interface. Valid values for this setting range from 0 to 255. The default value is 1. Entering 0 for this setting makes the router ineligible to become the designated router or backup designated router. This setting does not apply to interfaces that are configured as point-to-point, nonbroadcast interfaces.

When two routers connect to a network, both attempt to become the designated router. The device with the higher router priority becomes the designated router. If there is a tie, the router with the higher router ID becomes the designated router.

• **Priority**—Determines the designated router for a network. Valid values range from 0 to 255.

• **Dead Interval**—Time period in seconds for which hello packets must not be seen before neighbors indicate that the router is down. The value must be the same for all nodes on the network and can range from 1 to 65535.

• **Poll Interval**—Time period in seconds between OSPF packets that the router will send before adjacency is established with a neighbor. Once the routing device detects an active neighbor, the hello packet interval changes from the time specified in the poll interval to the time specified in the hello interval. Valid values range from 1 to 65535 seconds.

• **Retransmit Interval**—Time in seconds between LSA retransmissions for adjacencies that belong to the interface. The time must be greater than the expected round-trip delay between any two routers on the attached network. Valid values range from 1 to 65535 seconds. The default is 5 seconds.

• **Transmit Delay**—Estimated time in seconds to send a link-state update packet on the interface. Valid values range from 1 to 65535 seconds. The default is 1 second.
Step 6  Click OK to save the properties configuration.

Step 7  Select Authentication, and configure the following options for each OSPFv3 process:

- **Type**—Type of authentication. The available options are Area, Interface, and None. The None option indicates that no authentication is used.

- **Security Parameters Index**—A number from 256 to 4294967295. Configure this if you chose Interface as the type.

- **Authentication**—Type of authentication algorithm. Supported values are SHA-1 and MD5. Configure this if you chose Interface as the type.

- **Authentication Key**—When MD5 authentication is used, the key must be 32 hexadecimal digits (16 bytes) long. When SHA-1 authentication is used, the key must be 40 hexadecimal digits (20 bytes) long.

- **Encrypt Authentication Key**—Enables encryption of the authentication key.

- **Include Encryption**—Enables encryption.

- **Encryption Algorithm**—Type of encryption algorithm. Supported value is DES. The NULL entry indicates no encryption. Configure this if you chose Include Encryption.

- **Encryption Key**—Enter the encryption key. Configure this if you chose Include Encryption.

- **Encrypt Key**—Enables the key to be encrypted.

Step 8  Click OK to save the authentication configuration.

Step 9  Select Neighbor, click Add, and configure the following options for each OSPFv3 process:

- **Link Local Address**—The IPv6 address of the static neighbor.

- **Cost**—Enables cost. Enter the cost in the Cost field, and check the Filter Outgoing Link State Advertisements if you want to advertise.

- **Poll Interval**—Enables the poll interval. Enter the Priority level and the Poll Interval in seconds.

Step 10  Click Add to add the neighbor.

Step 11  Click OK to save the Interface configuration.

### Configure OSPFv3 Advanced Properties

The Advanced Properties allows you to configure options, such as syslog message generation, administrative route distances, passive OSPFv3 routing, LSA timers, and graceful restarts.

**Graceful Restarts**

The Firepower Threat Defense device may experience some known failure situations that should not affect packet forwarding across the switching platform. The Non-Stop Forwarding (NSF) capability allows data forwarding to continue along known routes, while the routing protocol information is being restored. This capability is useful when there is a scheduled hitless software upgrade. You can configure graceful restart on OSPFv3 using graceful-restart (RFC 5187).
NSF capability is also useful in HA mode and clustering.

Configuring the NSF graceful-restart feature involves two steps; configuring capabilities and configuring a device as NSF-capable or NSF-aware. A NSF-capable device can indicate its own restart activities to neighbors and a NSF-aware device can help a restarting neighbor.

A device can be configured as NSF-capable or NSF-aware, depending on some conditions:

- A device can be configured as NSF-aware irrespective of the mode in which it is.
- A device has to be in either Failover or Spanned Etherchannel (L2) cluster mode to be configured as NSF-capable.
- For a device to be either NSF-aware or NSF-capable, it should be configured with the capability of handling opaque Link State Advertisements (LSAs)/ Link Local Signaling (LLS) block as required.

Procedure

Step 1
Choose Devices > Device Management, and edit the FTD device.

Step 2
Select Routing > OSPFv3 > Advanced.

Step 3
For Router ID, choose Automatic or IP address. If you choose IP address, enter the IP address in the IP Address field.

Step 4
Check the Ignore LSA MOSPF check box if you want to suppress syslog messages when the route receives unsupported LSA Type 6 multicast OSPF (MOSPF) packets.

Step 5
Select General, and configure the following:

- **Adjacency Changes**—Defines the adjacency changes that cause syslog messages to be sent.
  
  By default, a syslog message is generated when an OSPF neighbor goes up or down. You can configure the router to send a syslog message when an OSPF neighbor goes down and also a syslog for each state.
  
  - **Adjacency Changes**—Causes the Firepower Threat Defense device to send a syslog message whenever an OSPF neighbor goes up or down. This setting is checked by default.
  
  - **Include Details**—Causes the Firepower Threat Defense device to send a syslog message whenever any state change occurs, not just when a neighbor goes up or down. This setting is unchecked by default.

- **Administrative Route Distances**—Allows you to modify the settings that were used to configure administrative route distances for inter-area, intra-area, and external IPv6 routes. The administrative route distance is an integer from 1 to 254. The default is 110.

- **Default Information Originate**—Check the Enable check box to generate a default external route into an OSPFv3 routing domain and configure the following options:
  
  - **Always Advertise**—Will always advertise the default route whether or not one exists.
  
  - **Metric**—Metric used for generating the default route. Valid metric values range from 0 to 16777214. The default value is 10.
• **Metric Type**—The external link type that is associated with the default route that is advertised into the OSPFv3 routing domain. Valid values are 1 (Type 1 external route) and 2 (Type 2 external route). The default is Type 2 external route.

• **Route Map**—Choose the routing process that generates the default route if the route map is satisfied or click add ( ) to add a new one. See Route Maps, on page 453 to add a new route map.

**Step 6**
Click OK to save the general configuration.

**Step 7**
Select Passive Interface, select the interfaces on which you want to enable passive OSPFv3 routing from the Available Interfaces list, and click Add to move them to the Selected Interfaces list.

Passive routing assists in controlling the advertisement of OSPFv3 routing information and disables the sending and receiving of OSPFv3 routing updates on an interface.

**Step 8**
Click OK to save the passive interface configuration.

**Step 9**
Select Timer, and configure the following LSA pacing and SPF calculation timers:

- **Arrival**—Specifies the minimum delay in milliseconds that must pass between acceptance of the same LSA arriving from neighbors. The range is from 0 to 6000,000 milliseconds. The default is 1000 milliseconds.

- **Flood Pacing**—Specifies the time in milliseconds at which LSAs in the flooding queue are paced in between updates. The configurable range is from 5 to 100 milliseconds. The default value is 33 milliseconds.

- **Group Pacing**—Specifies the interval in seconds at which LSAs are collected into a group and refreshed, checked summed, or aged. Valid values range from 10 to 1800. The default value is 240.

- **Retransmission Pacing**—Specifies the time in milliseconds at which LSAs in the retransmission queue are paced. The configurable range is from 5 to 200 milliseconds. The default value is 66 milliseconds.

- **LSA Throttle**—Specifies the delay in milliseconds to generate the first occurrence of the LSA. The default value is 0 millisecond. The minimum specifies the minimum delay in milliseconds to originate the same LSA. The default value is 5000 milliseconds. The maximum specifies the maximum delay in milliseconds to originate the same LSA. The default value is 5000 milliseconds.

  **Note** For LSA throttling, if the minimum or maximum time is less than the first occurrence value, then OSPFv3 automatically corrects to the first occurrence value. Similarly, if the maximum delay specified is less than the minimum delay, then OSPFv3 automatically corrects to the minimum delay value.

- **SPF Throttle**—Specifies the delay in milliseconds to receive a change to the SPF calculation. The default value is 5000 milliseconds. The minimum specifies the delay in milliseconds between the first and second SPF calculations. The default value is 10000 milliseconds. The maximum specifies the maximum wait time in milliseconds for SPF calculations. The default value is 10000 milliseconds.

  **Note** For SPF throttling, if the minimum or maximum time is less than the first occurrence value, then OSPFv3 automatically corrects to the first occurrence value. Similarly, if the maximum delay specified is less than the minimum delay, then OSPFv3 automatically corrects to the minimum delay value.

**Step 10**
Click OK to save the LSA timer configuration.
Step 11  Select **Non Stop Forwarding**, and check the **Enable graceful-restart helper** check box. This is checked by default. Uncheck this to disable the graceful-restart helper mode on an NSF-aware device.

Step 12  Check the **Enable link state advertisement** check box to enable strict link state advertisement checking. When enabled, it indicates that the helper router will terminate the process of restarting the router if it detects that there is a change to a LSA that would be flooded to the restarting router, or if there is a changed LSA on the retransmission list of the restarting router when the graceful restart process is initiated.

Step 13  Check the **Enable graceful-restart (Use when Spanned Cluster or Failover Configured)** and enter the graceful-restart interval in seconds. The range is 1-1800. The default value is 120 seconds. For a restart interval below 30 seconds, graceful restart will be terminated.

Step 14  Click **OK** to save the graceful restart configuration.

Step 15  Click **Save** on the Routing page to save your changes.
CHAPTER 37

BGP for Firepower Threat Defense

This section describes how to configure the FTD to route data, perform authentication, and redistribute routing information using the Border Gateway Protocol (BGP).

- About BGP, on page 717
- Guidelines for BGP, on page 720
- Configure BGP, on page 720

About BGP

BGP is an inter and intra autonomous system routing protocol. An autonomous system is a network or group of networks under a common administration and with common routing policies. BGP is used to exchange routing information for the Internet and is the protocol used between Internet service providers (ISP).

Routing Table Changes

BGP neighbors exchange full routing information when the TCP connection between neighbors is first established. When changes to the routing table are detected, the BGP routers send to their neighbors only those routes that have changed. BGP routers do not send periodic routing updates, and BGP routing updates advertise only the optimal path to a destination network.

AS loop detection is done by scanning the full AS path (as specified in the AS_PATH attribute), and checking that the AS number of the local system does not appear in the AS path. By default, E.BGP advertises the learned routes to the same peer to prevent additional CPU cycles on the ASA in performing loop checks and to avoid delays in the existing outgoing update tasks.

Routes learned via BGP have properties that are used to determine the best route to a destination, when multiple paths exist to a particular destination. These properties are referred to as BGP attributes and are used in the route selection process:

- Weight—This is a Cisco-defined attribute that is local to a router. The weight attribute is not advertised to neighboring routers. If the router learns about more than one route to the same destination, the route with the highest weight is preferred.

- Local preference—The local preference attribute is used to select an exit point from the local AS. Unlike the weight attribute, the local preference attribute is propagated throughout the local AS. If there are
multiple exit points from the AS, the exit point with the highest local preference attribute is used as an exit point for a specific route.

- Multi-exit discriminator—The multi-exit discriminator (MED) or metric attribute is used as a suggestion to an external AS regarding the preferred route into the AS that is advertising the metric. It is referred to as a suggestion because the external AS that is receiving the MEDs may also be using other BGP attributes for route selection. The route with the lower MED metric is preferred.

- Origin—The origin attribute indicates how BGP learned about a particular route. The origin attribute can have one of three possible values and is used in route selection.
  - IGP—The route is interior to the originating AS. This value is set when the network router configuration command is used to inject the route into BGP.
  - EGP—The route is learned via the Exterior Border Gateway Protocol (EBGP).
  - Incomplete—The origin of the route is unknown or learned in some other way. An origin of incomplete occurs when a route is redistributed into BGP.

- AS_path—When a route advertisement passes through an autonomous system, the AS number is added to an ordered list of AS numbers that the route advertisement has traversed. Only the route with the shortest AS_path list is installed in the IP routing table.

- Next hop—The EBGP next-hop attribute is the IP address that is used to reach the advertising router. For EBGP peers, the next-hop address is the IP address of the connection between the peers. For IBGP, the EBGP next-hop address is carried into the local AS.

- Community—The community attribute provides a way of grouping destinations, called communities, to which routing decisions (such as acceptance, preference, and redistribution) can be applied. Route maps are used to set the community attribute. The predefined community attributes are as follows:
  - no-export—Do not advertise this route to EBGP peers.
  - no-advertise—Do not advertise this route to any peer.
  - internet—Advertise this route to the Internet community; all routers in the network belong to it.

### When to Use BGP

Customer networks, such as universities and corporations, usually employ an Interior Gateway Protocol (IGP) such as OSPF for the exchange of routing information within their networks. Customers connect to ISPs, and ISPs use BGP to exchange customer and ISP routes. When BGP is used between autonomous systems (AS), the protocol is referred to as External BGP (EBGP). If a service provider is using BGP to exchange routes within an AS, then the protocol is referred to as Interior BGP (IBGP).

BGP can also be used for carrying routing information for IPv6 prefix over IPv6 networks.

### BGP Path Selection

BGP may receive multiple advertisements for the same route from different sources. BGP selects only one path as the best path. When this path is selected, BGP puts the selected path in the IP routing table and propagates the path to its neighbors. BGP uses the following criteria, in the order presented, to select a path for a destination:
If the path specifies a next hop that is inaccessible, drop the update.

 Prefer the path with the largest weight.

 If the weights are the same, prefer the path with the largest local preference.

 If the local preferences are the same, prefer the path that was originated by BGP running on this router.

 If no route was originated, prefer the route that has the shortest AS_path.

 If all paths have the same AS_path length, prefer the path with the lowest origin type (where IGP is lower than EGP, and EGP is lower than incomplete).

 If the origin codes are the same, prefer the path with the lowest MED attribute.

 If the paths have the same MED, prefer the external path over the internal path.

 If the paths are still the same, prefer the path through the closest IGP neighbor.

 Determine if multiple paths require installation in the routing table for BGP Multipath, on page 719.

 If both paths are external, prefer the path that was received first (the oldest one).

 Prefer the path with the lowest IP address, as specified by the BGP router ID.

 If the originator or router ID is the same for multiple paths, prefer the path with the minimum cluster list length.

 Prefer the path that comes from the lowest neighbor address.

### BGP Multipath

BGP Multipath allows installation into the IP routing table of multiple equal-cost BGP paths to the same destination prefix. Traffic to the destination prefix is then shared across all installed paths.

These paths are installed in the table together with the best path for load-sharing. BGP Multipath does not affect best-path selection. For example, a router still designates one of the paths as the best path, according to the algorithm, and advertises this best path to its BGP peers.

In order to be candidates for multipath, paths to the same destination need to have these characteristics equal to the best-path characteristics:

- Weight
- Local preference
- AS-PATH length
- Origin code
- Multi Exit Discriminator (MED)

One of these:

- Neighboring AS or sub-AS (before the addition of the BGP Multipaths)
- AS-PATH (after the addition of the BGP Multipaths)

Some BGP Multipath features put additional requirements on multipath candidates:
- The path should be learned from an external or confederation-external neighbor (eBGP).
- The IGP metric to the BGP next hop should be equal to the best-path IGP metric.

These are the additional requirements for internal BGP (iBGP) multipath candidates:
- The path should be learned from an internal neighbor (iBGP).
- The IGP metric to the BGP next hop should be equal to the best-path IGP metric, unless the router is configured for unequal-cost iBGP multipath.

BGP inserts up to \( n \) most recently received paths from multipath candidates into the IP routing table, where \( n \) is the number of routes to install to the routing table, as specified when you configure BGP Multipath. The default value, when multipath is disabled, is 1.

For unequal-cost load balancing, you can also use BGP Link Bandwidth.

---

**Guidelines for BGP**

**Firewall Mode Guidelines**

Does not support transparent firewall mode. BGP is supported only in routed mode.

**IPv6 Guidelines**

Supports IPv6. Graceful restart is not supported for IPv6 address family.

**Additional Guidelines**

ASA does not add route entry for the IP address received over PPPoE in the CP route table. BGP always looks into CP route table for initiating the TCP session, hence BGP does not form TCP session.

Thus, BGP over PPPoE is not supported.

---

**Configure BGP**

To configure BGP, see the following topics:

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Configure BGP Basic Settings, on page 721</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Configure BGP General Settings, on page 723</td>
</tr>
<tr>
<td>Step 3</td>
<td>Configure BGP Neighbor Settings, on page 724</td>
</tr>
</tbody>
</table>
Configure BGP Basic Settings

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

You can set many basic settings for BGP.

Procedure

Step 1  Choose Devices > Device Management, and edit the FTD device.
Step 2  Select Routing.
Step 3  (For a non-virtual-router-aware device) Select BGP.
Step 4  Select the Enable BGP check box to enable the BGP routing process.
Step 5  In the AS Number field, enter the autonomous system (AS) number for the BGP process. The AS number internally includes multiple autonomous numbers. The AS number can be from 1 to 4294967295 or from 1.0 to 65535.65535. The AS number is a uniquely assigned value, that identifies each network on the Internet.
Step 6  (Optional) Edit the various BGP settings, starting with General. The defaults for these settings are appropriate in most cases, but you can adjust them to fit the needs of your network. Click Edit (pencil) to edit the settings in the group:

a) In the Router ID drop-down list, select Automatic or Manual from the drop-down list. If you choose Automatic, the highest-level IP address on the Firepower Threat Defense device is used as the router ID. To use a fixed router ID, choose Manual and enter an IPv4 address in the IP Address field. The default value is Automatic.

b) Enter the Number of AS numbers in AS_PATH attribute. An AS_PATH attribute is a sequence of intermediate AS numbers between source and destination routers that form a directed route for packets to travel. Valid values are between 1 and 254. The default value is None.

c) Check the Log Neighbor Changes check box to enable logging of BGP neighbor changes (up or down) and resets. This helps in troubleshooting network connectivity problems and measuring network stability. This is enabled by default.

d) Check the Use TCP Path MTU Discovery check box to use the Path MTU determining technique to determine the maximum transmission unit (MTU) size on the network path between two IP hosts. This avoids IP fragmentation. This is enabled by default.
e) Check the **Reset session upon Failover** check box to reset the external BGP session immediately upon link failure. This is enabled by default.

f) Check the **Enforce that the first AS is peer’s AS for EBGP routes** check box to discard incoming updates received from external BGP peers that do not list their AS number as the first segment in the AS_PATH attribute. This prevents a mis-configured or unauthorized peer from misdirecting traffic by advertising a route as if it was sourced from another autonomous system. This is enabled by default.

g) Check the **Use dot notation for AS number** check box to split the full binary 4-byte AS number into two words of 16 bits each, separated by a dot. AS numbers from 0-65553 are represented as decimal numbers and AS numbers larger than 65535 are represented using the dot notation. This is disabled by default.

h) Click **OK**.

**Step 7**

(Optional) Edit the **Best Path Selection** section:

a) Enter a value for **Default Local Preference** between 0 and 4294967295. The default value is 100. Higher values indicate higher preference. This preference is sent to all routers and access servers in the local autonomous system.

b) Check the **Allow comparing MED from different neighbors** check box to allow the comparison of Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems. This is disabled by default.

c) Check the **Compare Router ID for identical EBGP paths** check box to compare similar paths received from external BGP peers during the best path selection process and switch the best path to the route with the lowest router ID. This is disabled by default.

d) Check the **Pick the best MED path among paths advertised from the neighboring AS** check box to enable MED comparison among paths learned from confederation peers. The comparison between MEDs is made only if no external autonomous systems are there in the path. This is disabled by default.

e) Check the **Treat missing MED as the least preferred one** check box to consider the missing MED attribute as having a value of infinity, making the path the least desirable; therefore, a path with a missing MED is least preferred. This is disabled by default.

f) Click **OK**.

**Step 8**

(Optional) Edit the **Neighbor Timers** section:

a) Enter the time interval for which the BGP neighbor remains active after not sending a keepalive message in the **Keepalive interval** field. At the end of this keepalive interval, the BGP peer is declared dead, if no messages are sent. The default value is 60 seconds.

b) Enter the time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured in the **Hold time** field. The default value is 180 seconds.

c) (Optional) Enter the minimum time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured in the **Min Hold time** field. Specify a value from 0 to 65535.

d) Click **OK**.

**Step 9**

(Optional) Edit the **Gracious Restart** section:

**Note** This section is available only when the Firepower Threat Defense device is in failover or spanned cluster mode. This is done so that there is no drop in packets in the traffic flow, when one of the devices in the failover setup fails.

a) Check the **Enable Graceful Restart** checkbox to enable FTD peers to avoid a routing flap following a switchover.

b) Specify the time duration that FTD peers will wait to delete stale routes before a BGP open message is received in the **Restart Time** field. The default value is 120 seconds. Valid values are between 1 and 3600 seconds.
c) Enter the time duration that the FTD will wait before deleting stale routes after an end of record (EOR) message is received from the restarting FTD in the Stalepath Time field. The default value is 360 seconds. Valid values are between 1 and 3600 seconds.

d) Click OK.

Step 10
Click Save.

Configure BGP General Settings

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

Configure Route maps, Administrative Route Distances, Synchronisation, Next-hop, and packet forwarding. The defaults for these settings are appropriate in most cases, but you can adjust them to fit the needs of your network.

Procedure

Step 1 On the Device Management page, click Routing.
Step 2 Choose BGP > IPv4 or IPv6.
Step 3 Click General.
Step 4 In General, update the following sections:
  a) In the Settings section, enter or select a Route Map object and enter a Scanning Interval for BGP routers for next-hop validation. Valid values are from 5 to 60 seconds. The default value is 60. Click OK.

  Note The Route Map field is applicable only to IPv4 settings.

b) In the Routes and Synchronization section, update the following as required, and click OK:
   - (Optional) Generate Default Routes—Select this to configure, a BGP routing process to distribute a default route (network 0.0.0.0).
   - (Optional) Summarize subnet routes into network-level routes—Select this to configure automatic summarization of subnet routes into network-level routes. This checkbox is applicable only to IPv4 settings.
   - (Optional) Advertise inactive routes—Select this to advertise routes that are not installed in the routing information base (RIB).
   - (Optional) Synchronise between BGP and IGP system—Select this to enable synchronization between BGP and your Interior Gateway Protocol (IGP) system. Usually, a BGP speaker does not advertise a route to an external neighbor unless that route is local or exists in the IGP. This feature allows routers and access servers within an autonomous system to have the route before BGP makes it available to other autonomous systems.
   - (Optional) Redistribute IBGP into IGP—Select this to configure iBGP redistribution into an interior gateway protocol (IGP), such as OSPF.
c) In the **Administrative Route Distances** section, update the following as required, and click **OK**:

- **External** — Enter the administrative distance for external BGP routes. Routes are external when learned from an external autonomous system. The range of values for this argument are from 1 to 255. The default value is 20.

- **Internal** — Enter administrative distance for internal BGP routes. Routes are internal when learned from peer in the local autonomous system. The range of values for this argument are from 1 to 255. The default value is 200.

- **Local** — Enter administrative distance for local BGP routes. Local routes are those networks listed with a network router show command, often as back doors, for the router or for the networks that is being redistributed from another process. The range of values for this argument are from 1 to 255. The default value is 200.

d) In the **Next Hop** section, optionally select the **Enable address tracking** checkbox to enable BGP next hop address tracking and enter the **Delay Interval** between checks on updated next-hop routes installed in the routing table. Click **OK**.

**Note** The **Next Hop** section is applicable only to IPv4 settings.

e) In the **Forward Packets over Multiple Paths** section, update the following as required and click **OK**:

- (Optional) **Number of Paths** — Specify the maximum number of Border Gateway Protocol routes that can be installed in a routing table. The range of values are from 1 to 8. The default value is 1.

- (Optional) **IBGP Number of Paths** — Specify the maximum number of parallel internal Border Gateway Protocol (iBGP) routes that can be installed in a routing table. The range of values are from 1 to 8. The default value is 1.

**Step 5** Click **Save**.

---

### Configure BGP Neighbor Settings

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>

<td>Network Admin</td>
</tr>
</tbody>
</table>

A BGP router must connect with each of its peers before exchanging updates. These peers are called BGP neighbors. Use Neighbor to define BGP IPv4 or IPv6 neighbors and neighbor settings.

**Procedure**

**Step 1** On the Device Management page, click **Routing**.

**Step 2** Choose **BGP > IPv4** or **IPv6**.

**Step 3** Click **Neighbor**.

**Step 4** Click **Add** to define BGP neighbors and neighbor settings.
Step 5  Enter the BGP neighbor IP address. This IP address is added to the BGP neighbor table.

Step 6  Choose the BGP neighbor Interface.

Note  The Interface field is only applicable to IPv6 settings.

Step 7  Enter the autonomous system to which the BGP neighbor belongs, in the Remote AS field.

Step 8  Select the Enabled address check box to enable communication with this BGP neighbor. Further neighbor settings will be configured only if the Enabled address check box is selected.

Step 9  (Optional) Select the Shutdown administratively check box to disable a neighbor or peer group.

Step 10  (Optional) Select the Configure graceful restart check box to enable configuration of the BGP graceful restart capability for this neighbor. After selecting this option, you must use the Graceful Restart (failover / spanned mode) option to specify whether graceful restart should be enabled or disabled for this neighbor.

Note  The graceful restart fields are only applicable to IPv4 settings.

Step 11  (Optional) Enter a Description for the BGP neighbor.

Step 12  (Optional) In Filtering Routes, use access lists, route maps, prefix lists and AS path filters as required, to distribute BGP Neighbor information. Update the following sections:

a)  Enter or Select the appropriate incoming or outgoing Access List to distribute BGP neighbor information.

Note  Access Lists are only applicable to IPv4 settings.

b)  Enter or Select the appropriate incoming or outgoing Route Maps to apply a route map to incoming or outgoing routes.

c)  Enter or Select the appropriate incoming or outgoing Prefix List to distribute BGP neighbor information.

d)  Enter or Select the appropriate incoming or outgoing AS path filter to distribute BGP neighbor information.

e)  Select the Limit the number of prefixes allowed from the neighbor to control the number of prefixes that can be received from a neighbor.

   •  Enter the maximum number of prefixes allowed from a specific neighbor in the Maximum Prefixes field.

   •  Enter the percentage (of maximum) at which the router starts to generate a warning message in the Threshold Level field. Valid values are integers between 1 and 100. The default value is 75.

f)  Select the Control prefixes received from the peer check box to specify additional controls for the prefixes received from a peer. Do one of the following

   •  Select Terminate peering when prefix limit is exceeded to stop the BGP neighbor when the prefix limit is reached. Specify the interval after which the BGP neighbor will restart in the Restart interval field.

   •  Select Give only warning message when prefix limit is exceeded to generate a log message when the maximum prefix limit is exceeded. Here, the BGP neighbor will not be terminated.

g)  Click OK.

Step 13  (Optional) In Routes, specify miscellaneous Neighbor route parameter. Proceed to update the following:

a)  Enter the minimum interval (in seconds) between the sending of BGP routing updates in the Advertisment Interval field. Valid values are between 1 and 600.

b)  Select the Remove private AS numbers from outbound routing updates to exclude the private AS numbers from being advertised on outbound routes.
c) Select the **Generate default routes** checkbox to allow the local router to send the default route 0.0.0.0 to a neighbor to use as a default route. Enter or select the route map that allows the route 0.0.0.0 to be injected conditionally in the **Route map** field.

d) To add conditionally advertised routes, click Add Row +. In the Add Advertised Route dialog box, do the following:

1. Add or select a route map in the **Advertise Map** field, that will be advertised if the conditions of the exist map or the non-exist map are met.

2. Select **Exist Map** and choose a route map from the Route Map Object Selector. This route map is compared with the routes in the BGP table, to determine whether the advertise map route is advertised.

3. Select **Non-Exist Map** and choose a route map from the Route Map Object Selector. This route map is compared with the routes in the BGP table, to determine whether the advertise map route is advertised.

4. Click **OK**.

**Step 14**

In **Timers**, select the **Set Timers for the BGP Peer** check box to set the keepalive frequency, hold time and minimum hold time

- **Keepalive Interval**—Enter the frequency (in seconds) with which the FTD device sends keepalive messages to the neighbor. Valid values are between 0 and 65535. The default value is 60 seconds.
- **Hold time**—Enter the interval (in seconds) after not receiving a keepalive message that the FTD device declares a peer dead. Valid values are between 0 and 65535. The default value is 180 seconds.
- **Min hold time**—(Optional) Enter the minimum interval (in seconds) after not receiving a keepalive message that the FTD device declares a peer dead. Valid values are between 0 and 65535. The default value is 0 seconds.

**Step 15**

In **Advanced**, update the following:

a) (Optional) Select **Enable Authentication** to enable MD5 authentication on a TCP connection between two BGP peers.

1. Choose an encryption type from the **Enable Encryption** drop-down list.

2. Enter a password in the **Password** field. Reenter the password in the **Confirm** field. The password is case-sensitive and can be up to 25 characters long when the service password-encryption command is enabled and up to 81 characters long when the service password-encryption command is not enabled. The first character cannot be a number. The string can contain any alphanumeric characters, including spaces.

   **Note** You cannot specify a password in the format number-space-anything. The space after the number can cause authentication to fail.

b) (Optional) Select the **Send Community attribute to this neighbor** check box to specify that communities attributes should be sent to the BGP neighbor

c) (Optional) Select the **Use FTD as next hop for this neighbor** check box to configure the router as the next-hop for a BGP speaking neighbor or peer group.

d) Select the **Disable Connection Verification** checkbox to disable the connection verification process for eBGP peering sessions that are reachable by a single hop but are configured on a loopback interface or otherwise configured with a non-directly connected IP address. When deselected (default), a BGP routing process will verify the connection of single-hop eBGP peering session (TTL=254) to determine if the eBGP peer is directly connected to the same network segment by default. If the peer is not directly
connected to same network segment, connection verification will prevent the peering session from being established.

e) Select **Allow connections with neighbor that is not directly connected** to accept and attempt BGP connections to external peers residing on networks that are not directly connected. (Optional) Enter the time-to-live in the **TTL hops** field. Valid values are between 1 and 255. Alternately, select **Limited number of TTL hops to neighbor**, to secure a BGP peering session. Enter the maximum number of hops that separate eBGP peers in the **TTL hops** field. Valid values are between 1 and 254.

f) (Optional) Select the **Use TCP MTU path discovery** check box to enable a TCP transport session for a BGP session.

g) Choose the TCP connection mode from the **TCP Transport Mode** drop-down list. Options are Default, Active, or Passive.

h) (Optional) Enter a **Weight** for the BGP neighbor connection.

i) Select the **BGP Version** that the FTD device will accept from the drop-down list. The version can be set to 4-Only to force the software to use only Version 4 with the specified neighbor. The default is to use Version 4 and dynamically negotiate down to Version 2 if requested.

**Step 16**
Update **Migration**, only if AS migration is considered.

**Note**
The AS migration customization should be removed after transition has been completed.

a) (Optional) Select the **Customize the AS number for routes received from the neighbor** check box to customize the AS_PATH attribute for routes received from an eBGP neighbor.

b) Enter the local autonomous system number in the **Local AS number** field. Valid values are any valid autonomous system number from 1 to 4294967295 or 1.0 to 65535.65535.

c) (Optional) Select the **Do not prepend local AS number to routes received from neighbor** check box to prevent the local AS number from being prepended to any routes received from eBGP peer.

d) (Optional) Select the **Replace real AS number with local AS number in routes received from neighbor** check box to replace the real autonomous system number with the local autonomous system number in the eBGP updates. The autonomous system number from the local BGP routing process is not prepended.

e) (Optional) Select the **Accept either real AS number or local AS number in routes received from neighbor** check box to configure the eBGP neighbor to establish a peering session using the real autonomous system number (from the local BGP routing process) or by using the local autonomous system number.

**Step 17**
Click **OK**.

**Step 18**
Click **Save**.

---

### Configure BGP Aggregate Address Settings

<table>
<thead>
<tr>

<td>Admin Access</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin Network</td>
</tr>
</tbody>
</table>

BGP neighbors store and exchange routing information and the amount of routing information increases as more BGP speakers are configured. Route aggregation is the process of combining the attributes of several different routes so that only a single route is advertised. Aggregate prefixes use the classless interdomain routing (CIDR) principle to combine contiguous networks into one classless set of IP addresses that can be
summarized in routing tables. As a result fewer routes need to be advertised. Use the Add/Edit Aggregate Address dialog box to define the aggregation of specific routes into one route.

**Procedure**

**Step 1** When editing a Firepower Threat Defense device, click **Routing**.

**Step 2** Choose **BGP > IPv4 or IPv6**.

**Step 3** Click **Add Aggregate Address**.

**Step 4** Enter a value for the aggregate timer (in seconds) in the **Aggregate Timer** field. Valid values are 0 or any value between 6 and 60. The default value is 30.

**Step 5** Click **Add** and update the **Add Aggregate Address** dialog:

a) **Network** — Enter an IPv4 address or select the desired network/hosts objects.

b) **Attribute Map** — (Optional) Enter or select the route map used to set the attribute of the aggregate route.

c) **Advertise Map** — (Optional) Enter or select the route map used to select the routes to create AS_SET origin communities.

d) **Suppress Map** — (Optional) Enter or select the route map used to select the routes to be suppressed.

e) **Generate AS set path Information** — (Optional) Select the check box to enable generation of autonomous system set path information.

f) **Filter all routes from updates** — (Optional) Select the check box to filter all more-specific routes from updates.

g) Click **OK**.

**What to do next**

- For BGPv4 settings, proceed to **Configure BGPv4 Filtering Settings**, on page 728
- For BGPv6 settings, proceed to **Configure BGP Network Settings**, on page 729

### Configure BGPv4 Filtering Settings

<table>
<thead>
<tr>

<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

Filtering settings are used to filter routes or networks received in incoming BGP updates. Filtering is used to restrict routing information that the router learns or advertises.

**Before you begin**

Filtering is only applicable for a BGP IPv4 routing policy.
**Procedure**

**Step 1** On the Device Management page, click **Routing**.

**Step 2** Choose **BGP > IPv4**.

**Step 3** Click **Filtering**.

**Step 4** Click **Add** and update the **Add Filter** dialog:

a) **Access List**— Select an access control list that defines which networks are to be received and which are to be suppressed in routing updates.

b) **Direction**— (Optional) Select a direction that specifies if the filter should be applied to inbound updates or outbound updates.

c) **Protocol**— (Optional) Select the routing process for which you want to filter: None, BGP, Connected, OSPF, RIP, or Static.

d) **Process ID**— (Optional) Enter the process ID for the OSPF routing protocol.

e) Click **OK**.

**Step 5** Click **Save**.

---

**Configure BGP Network Settings**

<table>
<thead>

</tr>
</tbody>
</table>

Network settings are used to add networks that will be advertised by the BGP routing process and route maps that will be examined to filter the networks to be advertised.

**Procedure**

**Step 1** On the **Device Management** page, click **Routing**.

**Step 2** Choose **BGP > IPv4 or IPv6**.

**Step 3** Click **Networks**.

**Step 4** Click **Add** and update the **Add Networks** dialog:

a) **Network**— Enter the network to be advertised by the BGP routing processes.

b) (Optional) **Route Map**— Enter or select a route map that should be examined to filter the networks to be advertised. If not specified, all networks are redistributed.

c) Click **OK**.

**Step 5** Click **Save**.

---

Firepower Management Center Configuration Guide, Version 6.1
Configure BGP Redistribution Settings

Redistribution settings allow you to define the conditions for redistributing routes from another routing domain into BGP.

Procedure

**Step 1**  On the **Device Management** page, click **Routing**.

**Step 2**  Choose **BGP > IPv4** or **IPv6**.

**Step 3**  Click **Redistribution**.

**Step 4**  Click **Add** and update the **Add Redistribution** dialog:

a) **Source Protocol** — Select the protocol from which you want to redistribute routes into the BGP domain from the Source Protocol drop-down list.

b) **Process ID** — Enter the identifier for the selected source protocol. Applies to the OSPF protocol.

c) **Metric** — (Optional) Enter a metric for the redistributed route.

d) **Route Map** — Enter or select a route map that should be examined to filter the networks to be redistributed. If not specified, all networks are redistributed.

e) **Match** — The conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions. These options are enabled only when OSPF is chosen as the Source Protocol.

   - Internal
   - External 1
   - External 2
   - NSSA External 1
   - NSSA External 2

f)  Click **OK**.

Configure BGP Route Injection Settings

Route Injection settings allow you to define the routes to be conditionally injected into the BGP routing table.
Procedure

Step 1
On the Device Management page, click Routing.

Step 2
Choose BGP > IPv4 or IPv6.

Step 3
Click Route Injection.

Step 4
Click Add and update the Add Route Injection dialog:

a) Inject Map — Enter or select the route map that specifies the prefixes to inject into the local BGP routing table.

b) Exist Map — Enter or select the route map containing the prefixes that the BGP speaker will track.

c) Injected routes will inherit the attributes of the aggregate route — Select this to configure the injected route to inherit attributes of the aggregate route.

d) Click OK.

Step 5
Click Save.
This chapter describes how to configure the FTD to route data, perform authentication, and redistribute routing information, using the Routing Information Protocol (RIP).

- About RIP, on page 733
- Guidelines for RIP, on page 734
- Configure RIP, on page 735

### About RIP

The Routing Information Protocol, or RIP, as it is more commonly called, is one of the most enduring of all routing protocols. RIP has four basic components: routing update process, RIP routing metrics, routing stability, and routing timers. Devices that support RIP send routing-update messages at regular intervals and when the network topology changes. These RIP packets include information about the networks that the devices can reach, as well as the number of routers or gateways that a packet must travel through to reach the destination address. RIP generates more traffic than OSPF, but is easier to configure.

RIP is a distance-vector routing protocol that uses hop count as the metric for path selection. When RIP is enabled on an interface, the interface exchanges RIP broadcasts with neighboring devices to dynamically learn about and advertise routes.

The Firepower Threat Defense device supports both RIP Version 1 and RIP Version 2. RIP Version 1 does not send the subnet mask with the routing update. RIP Version 2 sends the subnet mask with the routing update and supports variable-length subnet masks. Additionally, RIP Version 2 supports neighbor authentication when routing updates are exchanged. This authentication ensures that the Firepower Threat Defense device receives reliable routing information from a trusted source.

RIP has advantages over static routes because the initial configuration is simple, and you do not need to update the configuration when the topology changes. The disadvantage to RIP is that there is more network and processing overhead than in static routing.

### Routing Update Process

RIP sends routing-update messages at regular intervals and when the network topology changes. When a router receives a routing update that includes changes to an entry, it updates its routing table to reflect the new route. The metric value for the path is increased by 1, and the sender is indicated as the next hop. RIP routers maintain only the best route (the route with the lowest metric value) to a destination. After updating
its routing table, the router immediately begins transmitting routing updates to inform other network routers of the change. These updates are sent independently of the regularly scheduled updates that RIP routers send.

RIP Routing Metric

RIP uses a single routing metric (hop count) to measure the distance between the source and a destination network. Each hop in a path from source to destination is assigned a hop count value, which is typically 1. When a router receives a routing update that contains a new or changed destination network entry, the router adds 1 to the metric value indicated in the update and enters the network in the routing table. The IP address of the sender is used as the next hop.

RIP Stability Features

RIP prevents routing loops from continuing indefinitely by implementing a limit on the number of hops allowed in a path from the source to a destination. The maximum number of hops in a path is 15. If a router receives a routing update that contains a new or changed entry, and if increasing the metric value by 1 causes the metric to be infinity (that is, 16), the network destination is considered unreachable. The downside of this stability feature is that it limits the maximum diameter of a RIP network to less than 16 hops.

RIP includes a number of other stability features that are common to many routing protocols. These features are designed to provide stability despite potentially rapid changes in network topology. For example, RIP implements the split horizon and hold-down mechanisms to prevent incorrect routing information from being propagated.

RIP Timers

RIP uses numerous timers to regulate its performance. These include a routing-update timer, a route-timeout timer, and a route-flush timer. The routing-update timer clocks the interval between periodic routing updates. Generally, it is set to 30 seconds, with a small random amount of time added whenever the timer is reset. This is done to help prevent congestion, which could result from all routers simultaneously attempting to update their neighbors. Each routing table entry has a route-timeout timer associated with it. When the route-timeout timer expires, the route is marked invalid but is retained in the table until the route-flush timer expires.

Guidelines for RIP

IPv6 Guidelines

Does not support IPv6.

Additional Guidelines

The following information applies to RIP Version 2 only:

• If using neighbor authentication, the authentication key and key ID must be the same on all neighbor devices that provide RIP Version 2 updates to the interface.

• With RIP Version 2, the Firepower Threat Defense device transmits and receives default route updates using the multicast address 224.0.0.9. In passive mode, it receives route updates at that address.
• When RIP Version 2 is configured on an interface, the multicast address 224.0.0.9 is registered on that interface. When a RIP Version 2 configuration is removed from an interface, that multicast address is unregistered.

**Limitations**

• The Firepower Threat Defense device cannot pass RIP updates between interfaces.
• RIP Version 1 does not support variable-length subnet masks.
• RIP has a maximum hop count of 15. A route with a hop count greater than 15 is considered unreachable.
• RIP convergence is relatively slow compared to other routing protocols.
• You can only enable a single RIP process on the Firepower Threat Defense device.

**Configure RIP**

RIP is a distance-vector routing protocol that uses hop count as the metric for path selection.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Devices &gt; Device Management, and edit the FTD device.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Select Routing.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Select RIP from the table of contents.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Select the Enable RIP check box to configure the RIP settings.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Select the RIP versions for sending and receiving RIP updates from the RIP Version drop-down list.</td>
</tr>
</tbody>
</table>
| Step 6 | (Optional) Select the Generate Default Route check box to generate a default route for distribution, based on the route map that you specify.  
   a) Specify a route map name to use for generating default routes, in the Route Map field.  
   The default route 0.0.0.0/0 is generated for distribution over a certain interface, when the route map, specified in the Route Map field, is present. |
| Step 7 | When Send and Receive Version 2 is the chosen RIP Version, the Enable Auto Summary option is available.  
   When the Enable Auto Summary checkbox is checked, automatic route summarization is enabled. Disable automatic summarization if you must perform routing between disconnected subnets. When automatic summarization is disabled, subnets are advertised. |
| **Note** | RIP Version 1 always uses automatic summarization—you cannot disable it. |
| Step 8 | Click Networks. Define one or more networks for RIP routing. Enter IP address(es), or enter or select the desired Network/Hosts objects. There is no limit to the number of networks you can add to the security appliance configuration. Any interface that belongs to a network defined by this command, will participate in the RIP routing process. The RIP routing updates will be sent and received only through interfaces on the specified networks. Also, if the network of an interface is not specified, the interface will not be advertised in any RIP updates. |
| **Note** | RIP only supports IPv4 objects. |
Step 9  (Optional) Click **Passive Interface**. Use this option to specify passive interfaces on the appliance, and by extension the active interfaces. The device listens for RIP routing broadcasts on passive interfaces, using that information to populate its routing tables, but does not broadcast routing updates on passive interfaces. Interfaces that are not designated as passive, receive and send updates.

Step 10  Click **Redistribution** to manage redistribution routes. These are the routes that are being redistributed from other routing processes into the RIP routing process.

  a) Click **Add** to specify redistribution routes.
  b) Select the routing protocol to redistribute into the RIP routing process, in the **Protocol** drop-down list.

    **Note** For the OSPF protocol, specify a process ID. Similarly, specify an AS path for BGP. When you choose the Connected option in the **Protocol** drop-down list, you can redistribute, directly connected networks into the RIP routing process.

  c) (Optional) If you are redistributing OSPF routes into the RIP routing process, you can select specific types of OSPF routes to redistribute in the **Match** drop-down list. Ctrl-click to select multiple types:

    - Internal – Routes internal to the autonomous system (AS) are redistributed.
    - External 1 – Type 1 routes external to the AS are redistributed.
    - External 2 – Type 2 routes external to the AS are redistributed.
    - NSSA External 1 – Type 1 routes external to a not-so-stubby area (NSSA) are redistributed.
    - NSSA External 2 – Type 2 routes external to an NSSA are redistributed

    **Note** The default is match Internal, External 1, and External 2

  d) Select the RIP metric type to apply to the redistributed routes in the **Metric** drop-down list. The two choices are:

    - Transparent – Use the current route metric
    - Specified Value – Assign a specific metric value. Enter a specific value from 0-16, in the **Metric Value** field.
    - None – No metric is specified. Do not use any metric value, to apply to redistributed routes.

  e) (Optional) Enter the name of a route map that must be satisfied, in the **Route Map** field before the route can be redistributed into the RIP routing process. Routes are redistributed only if IP address matches an allow statement in the route map address list.

  f) Click **OK**.

Step 11  (Optional) Click **Filtering** to manage filters for the RIP policy. In this section, filters are used to prevent routing updates through an interface, control the advertising of routes in routing updates, control the processing of routing updates and filtering sources of routing updates.

  a) Click **Add** to add RIP filters.
  b) Select the type of traffic to be filtered - Inbound or Outbound in the **Traffic Direction** field.

    **Note** If traffic direction is inbound, you can only define an Interface filter.

  c) Specify whether the filter is based on an Interface or a Route, by selecting appropriate in the **Filter On** field. If you select Interface, enter or Select the name of the interface on which routing updates are to be filtered. If you select Route, choose the route type:
• Static – Only static routes are filtered.
• Connected – Only connected routes are filtered.
• OSPF – Only OSPFv2 routes discovered by the specified OSPF process are filtered. Enter the Process ID of the OSPF process to be filtered.
• BGP – Only BGPv4 routes discovered by the specified BGP process are filtered. Enter the AS path of the BGP process to be filtered.

d) In the Access List field, enter or select the name of one or more access control lists (ACLs) that define the networks to be allowed or removed from RIP route advertisements.

e) Click OK.

Step 12
(Optional) Click Broadcast to add or edit interface configurations. Using Broadcast, you can override the global RIP versions to send or receive per interface. You can also define the authentication parameters per interface if you want to implement authentication to ensure valid RIP updates.

a) Click Add to add interface configurations.

b) Enter or Select an interface defined on this appliance in the Interface field.

c) In the Send option, select the appropriate boxes to specify sending updates using the RIP Version 1, Version 2, or both. These options let you override, for the specified interface, the global Send versions specified.

d) In the Receive option, select the appropriate boxes to specify accepting updates using the RIP Version 1, Version 2, or both. These options let you override, for the specified interface, the global Receive versions specified.

e) Select the Authentication used on this interface for RIP broadcasts.

• None – No authentication
• MD5 – Employ MD5
• Clear Text – Employ clear-text authentication

If you choose MD5 or Clear Text, you must also provide the following authentication parameters.

• Key ID – The ID of the authentication key. Valid values are from 0 to 255.
• Key – The key used by the chosen authentication method. Can contain up to 16 characters
• Confirm – Enter the authentication key again, to confirm

f) Click OK.
Configure RIP
CHAPTER 39

Multicast Routing for Firepower Threat Defense

This chapter describes how to configure the Firepower Threat Defense device to use the multicast routing protocol.

- About Multicast Routing, on page 739
- Guidelines for Multicast Routing, on page 743
- Configure IGMP Features, on page 743
- Configure PIM Features, on page 748
- Configure Multicast Routes, on page 754
- Configure Multicast Boundary Filters, on page 755

About Multicast Routing

Multicast routing is a bandwidth-conserving technology that reduces traffic by simultaneously delivering a single stream of information to thousands of corporate recipients and homes. Applications that take advantage of multicast routing include videoconferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news.

Multicast routing protocols deliver source traffic to multiple receivers without adding any additional burden on the source or the receivers while using the least network bandwidth of any competing technology. Multicast packets are replicated in the network by Firepower Threat Defense device enabled with Protocol Independent Multicast (PIM) and other supporting multicast protocols, which results in the most efficient delivery of data to multiple receivers possible.

The Firepower Threat Defense device supports both stub multicast routing and PIM multicast routing. However, you cannot configure both concurrently on a single Firepower Threat Defense device.

Note

The UDP and non-UDP transports are both supported for multicast routing. However, the non-UDP transport has no FastPath optimization.

IGMP Protocol

IP hosts use the Internet Group Management Protocol (IGMP) to report their group memberships to directly-connected multicast routers. IGMP is used to dynamically register individual hosts in a multicast group on a particular LAN. Hosts identify group memberships by sending IGMP messages to their local...
multicast router. Under IGMP, routers listen to IGMP messages and periodically send out queries to discover which groups are active or inactive on a particular subnet.

IGMP uses group addresses (Class D IP address) as group identifiers. Host group address can be in the range of 224.0.0.0 to 239.255.255.255. The address 224.0.0.0 is never assigned to any group. The address 224.0.0.1 is assigned to all systems on a subnet. The address 224.0.0.2 is assigned to all routers on a subnet.

**Note** When you enable multicast routing on the Firepower Threat Defense device, IGMP Version 2 is automatically enabled on all interfaces.

**Query Messages to Multicast Groups**

The Firepower Threat Defense device sends query messages to discover which multicast groups have members on the networks attached to the interfaces. Members respond with IGMP report messages indicating that they want to receive multicast packets for specific groups. Query messages are addressed to the all-systems multicast group, which has an address of 224.0.0.1, with a time-to-live value of 1.

These messages are sent periodically to refresh the membership information stored on the Firepower Threat Defense device. If the Firepower Threat Defense device discovers that there are no local members of a multicast group still attached to an interface, it stops forwarding multicast packets for that group to the attached network, and it sends a prune message back to the source of the packets.

By default, the PIM designated router on the subnet is responsible for sending the query messages. By default, they are sent once every 125 seconds.

When changing the query response time, by default, the maximum query response time advertised in IGMP queries is 10 seconds. If the Firepower Threat Defense device does not receive a response to a host query within this amount of time, it deletes the group.

**Stub Multicast Routing**

Stub multicast routing provides dynamic host registration and facilitates multicast routing. When configured for stub multicast routing, the Firepower Threat Defense device acts as an IGMP proxy agent. Instead of fully participating in multicast routing, the Firepower Threat Defense device forwards IGMP messages to an upstream multicast router, which sets up delivery of the multicast data. When configured for stub multicast routing, the Firepower Threat Defense device cannot be configured for PIM sparse or bidirectional mode. You must enable PIM on the interfaces participating in IGMP stub multicast routing.

The Firepower Threat Defense device supports both PIM-SM and bidirectional PIM. PIM-SM is a multicast routing protocol that uses the underlying unicast routing information base or a separate multicast-capable routing information base. It builds unidirectional shared trees rooted at a single Rendezvous Point (RP) per multicast group and optionally creates shortest-path trees per multicast source.

**PIM Multicast Routing**

Bidirectional PIM is a variant of PIM-SM that builds bidirectional shared trees connecting multicast sources and receivers. Bidirectional trees are built using a Designated Forwarder (DF) election process operating on each link of the multicast topology. With the assistance of the DF, multicast data is forwarded from sources to the Rendezvous Point (RP), and therefore along the shared tree to receivers, without requiring source-specific state. The DF election takes place during RP discovery and provides a default route to the RP.
If the Firepower Threat Defense device is the PIM RP, use the untranslated outside address of the Firepower Threat Defense device as the RP address.

### PIM Source Specific Multicast Support

The Firepower Threat Defense device does not support PIM Source Specific Multicast (SSM) functionality and related configuration. However, the Firepower Threat Defense device allows SSM-related packets to pass through unless it is placed as a last-hop router.

SSM is classified as a data delivery mechanism for one-to-many applications such as IPTV. The SSM model uses a concept of "channels" denoted by an (S, G) pair, where S is a source address and G is an SSM destination address. Subscribing to a channel is achieved by using a group management protocol such as IGMPv3. SSM enables a receiving client, once it has learned about a particular multicast source, to receive multicast streams directly from the source rather than receiving it from a shared Rendezvous Point (RP). Access control mechanisms are introduced within SSM providing a security enhancement not available with current sparse or sparse-dense mode implementations.

PIM-SSM differs from PIM-SM in that it does not use an RP or shared trees. Instead, information on source addresses for a multicast group is provided by the receivers through the local receivership protocol (IGMPv3) and is used to directly build source-specific trees.

### Multicast Bidirectional PIM

Multicast bidirectional PIM is useful for networks that have many sources and receivers talking to each other simultaneously and where each participant can become both the source and receiver of multicast traffic, such as in videoconferencing, Webex meetings, and group chat. When PIM bidirectional mode is used, the RP only creates the (*, G) entry for the shared tree. There is no (S, G) entry. This conserves resources on the RP because state tables for each (S, G) entry are not maintained.

In PIM sparse mode, traffic only flows down the shared tree. In PIM bidirectional mode, traffic flows up and down the shared tree.

PIM bidirectional mode also does not use the PIM register/register-stop mechanism to register sources to the RP. Each source can begin sending to the source at any time. When the multicast packets arrive at the RP, they are forwarded down the shared tree (if there are receivers) or dropped (when there are no receivers). However, there is no way for the RP to tell the source to stop sending multicast traffic.

Design-wise you must think about where to place the RP in your network because it should be somewhere in the middle between the sources and receivers in the network.

PIM bidirectional mode has no Reverse Path Forwarding (RPF) check. Instead it uses the concept of a Designated Forwarder (DF) to prevent loops. This DF is the only router on the segment that is allowed to send multicast traffic to the RP. If there is only one router per segment that forwards multicast traffic, there will be no loops. The DF is chosen using the following mechanism:

- The router with the lowest metric to the RP is the DF.
- If the metric is equal, then the router with the highest IP address becomes the DF.
PIM Bootstrap Router (BSR)

PIM Bootstrap Router (BSR) is a dynamic Rendezvous Point (RP) selection model that uses candidate routers for RP function and for relaying the RP information for a group. The RP function includes RP discovery and provides a default route to the RP. It does this by configuring a set of devices as candidate BSRs (C-BSR) which participate in a BSR election process to choose a BSR amongst themselves. Once the BSR is chosen, devices that are configured as candidate Rendezvous Points (C-RP) start sending their group mapping to the elected BSR. The BSR then distributes the group-to-RP mapping information to all the other devices down the multicast tree through BSR messages that travel from PIM router to PIM router on a per-hop basis.

This feature provides a means of dynamically learning RPs, which is very essential in large complex networks where an RP can periodically go down and come up.

PIM Bootstrap Router (BSR) Terminology

The following terms are frequently referenced in the PIM BSR configuration:

- **Bootstrap Router (BSR)** — A BSR advertises Rendezvous Point (RP) information to other routers with PIM on a hop-by-hop basis. Among multiple Candidate-BSRs, a single BSR is chosen after an election process. The primary purpose of this Bootstrap router is to collect all Candidate-RP (C-RP) announcements in to a database called the RP-set and to periodically send this out to all other routers in the network as BSR messages (every 60 seconds).

- **Bootstrap Router (BSR) messages** — BSR messages are multicast to the All-PIM-Routers group with a TTL of 1. All PIM neighbors that receive these messages retransmit them (again with a TTL of 1) out of all interfaces except the one in which the messages were received. BSR messages contain the RP-set and the IP address of the currently active BSR. This is how C-RPs know where to unicast their C-RP messages.

- **Candidate Bootstrap Router (C-BSR)** — A device that is configured as a candidate-BSR participates in the BSR election mechanism. A C-BSR with highest priority is elected as the BSR. The highest IP address of the C-BSR is used as a tiebreaker. The BSR election process is preemptive, for example if a new C-BSR with a higher priority comes up, it triggers a new election process.

- **Candidate Rendezvous Point (C-RP)** — An RP acts as a meeting place for sources and receivers of multicast data. A device that is configured as a C-RP periodically advertises the multicast group mapping information directly to the elected BSR through unicast. These messages contain the Group-range, C-RP address, and a hold time. The IP address of the current BSR is learned from the periodic BSR messages that are received by all routers in the network. In this way, the BSR learns about possible RPs that are currently up and reachable.

**Note**

The Firepower Threat Defense device does not act as a C-RP, even though the C-RP is a mandatory requirement for BSR traffic. Only routers can act as a C-RP. So, for BSR testing functionality, you must add routers to the topology.

- **BSR Election Mechanism** — Each C-BSR originates Bootstrap messages (BSMs) that contain a BSR Priority field. Routers within the domain flood the BSMs throughout the domain. A C-BSR that hears about a higher-priority C-BSR than itself suppresses its sending of further BSMs for some period of time. The single remaining C-BSR becomes the elected BSR, and its BSMs inform all the other routers in the domain that it is the elected BSR.
Multicast Group Concept

Multicast is based on the concept of a group. An arbitrary group of receivers expresses an interest in receiving a particular data stream. This group does not have any physical or geographical boundaries—the hosts can be located anywhere on the Internet. Hosts that are interested in receiving data flowing to a particular group must join the group using IGMP. Hosts must be a member of the group to receive the data stream.

Multicast Addresses

Multicast addresses specify an arbitrary group of IP hosts that have joined the group and want to receive traffic sent to this group.

Clustering

Multicast routing supports clustering. In Spanned EtherChannel clustering, the primary unit sends all multicast routing packets and data packets until fast-path forwarding is established. After fast-path forwarding is established, subordinate units may forward multicast data packets. All data flows are full flows. Stub forwarding flows are also supported. Because only one unit receives multicast packets in Spanned EtherChannel clustering, redirection to the primary unit is common.

Guidelines for Multicast Routing

Firewall Mode

Supported only in routed firewall mode. Transparent firewall mode is not supported.

IPv6

Does not support IPv6.

Clustering

In clustering, for IGMP and PIM, this feature is only supported on the primary unit.

Additional Guidelines

You must configure an access control or prefilter rule on the inbound security zone to allow traffic to the multicast host, such as 224.1.2.3. However, you cannot specify a destination security zone for the rule, or it cannot be applied to multicast connections during initial connection validation.

Configure IGMP Features

IP hosts use IGMP to report their group memberships to directly-connected multicast routers. IGMP is used to dynamically register individual hosts in a multicast group on a particular LAN. Hosts identify group memberships by sending IGMP messages to their local multicast router. Under IGMP, routers listen to IGMP messages and periodically send out queries to discover which groups are active or inactive on a particular subnet.

This section describes how to configure optional IGMP settings on a per-interface basis.
Enable Multicast Routing

Enabling multicast routing on the Firepower Threat Defense device, enables IGMP and PIM on all interfaces by default. IGMP is used to learn whether members of a group are present on directly attached subnets. Hosts join multicast groups by sending IGMP report messages. PIM is used to maintain forwarding tables to forward multicast datagrams.

Only the UDP transport layer is supported for multicast routing.

The following table lists the maximum number of entries for specific multicast tables based on the amount of RAM on the Firepower Threat Defense device. Once these limits are reached, any new entries are discarded.

<table>
<thead>
<tr>
<th>Table</th>
<th>16 MB</th>
<th>128 MB</th>
<th>128+ MB</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFIB</td>
<td>1000</td>
<td>3000</td>
<td>30000</td>
</tr>
<tr>
<td>IGMP Groups</td>
<td>1000</td>
<td>3000</td>
<td>30000</td>
</tr>
<tr>
<td>PIM Routes</td>
<td>3000</td>
<td>7000</td>
<td>72000</td>
</tr>
</tbody>
</table>

Procedure

Step 1
Choose Devices > Device Management, and edit the FTD device.

Step 2
Choose Routing > Multicast Routing > IGMP.

Step 3
Check the Enable Multicast Routing check box.

Checking this check box enables IP multicast routing on the Firepower Threat Defense device. Unchecking this check box disables IP multicast routing. By default, multicast is disabled. Enabling multicast routing enables multicast on all interfaces.

You can disable multicast on a per-interface basis. This is useful if you know that there are no multicast hosts on a specific interface and you want to prevent the Firepower Threat Defense device from sending host query messages on that interface.
Configure IGMP Protocol

You can configure IGMP parameters per interface, such as the forward interface, query messages, and time intervals.

Procedure

Step 1
Choose Devices > Device Management, and edit the FTD device.

Step 2
Choose Routing > Multicast Routing > IGMP.

Step 3
On Protocol, click Add or Edit.

Use the Add IGMP parameters dialog box to add new IGMP parameters to the Firepower Threat Defense device. Use the Edit IGMP parameters dialog box to change existing parameters.

Step 4
Configure the following options:

- **Interface**—From the drop-down list, select the interface for which you want to configure IGMP protocol.
- **Enable IGMP**—Check the check box to enable IGMP.

**Note** Disabling IGMP on specific interfaces is useful if you know that there are no multicast hosts on a specific interface and you want to prevent the Firepower Threat Defense device from sending host query messages on that interface.

- **Forward Interface**—From the drop-down list, select the specific interface from which you want to forward IGMP messages.

This configures the Firepower Threat Defense device to act as an IGMP proxy agent and forward IGMP messages from hosts connected on one interface to an upstream multicast router on another interface.

- **Version**—Choose IGMP Version 1 or 2.

By default, the Firepower Threat Defense device runs IGMP Version 2, which enables several additional features.

**Note** All multicast routers on a subnet must support the same version of IGMP. The Firepower Threat Defense device does not automatically detect Version 1 routers and switch to Version 1. However, you can have a mix of IGMP Version 1 and 2 hosts on the subnet; the Firepower Threat Defense device running IGMP Version 2 works correctly when IGMP Version 1 hosts are present.

- **Query Interval**—The interval in seconds at which the designated router sends IGMP host-query messages. The range is 1 to 3600. The default is 125.

**Note** If the Firepower Threat Defense device does not hear a query message on an interface for the specified timeout value, then the Firepower Threat Defense device becomes the designated router and starts sending the query messages.

- **Response Time**—The interval in seconds before the Firepower Threat Defense device deletes the group. The range is 1 to 25. The default is 10.

If the Firepower Threat Defense device does not receive a response to a host query within this amount of time, it deletes the group.
• **Group Limit**—The maximum number of hosts that can join on an interface. The range is 1 to 500. The default is 500.

  You can limit the number of IGMP states resulting from IGMP membership reports on a per-interface basis. Membership reports exceeding the configured limits are not entered in the IGMP cache, and traffic for the excess membership reports is not forwarded.

• **Query Timeout**—The period of time in seconds before which the Firepower Threat Defense device takes over as the requester for the interface after the previous requester has stopped. The range is 60 to 300. The default is 255.

**Step 5**  
Click **OK** to save the IGMP protocol configuration.

---

### Configure IGMP Access Groups

You can control access to multicast groups by using access control lists.

**Procedure**

1. **Step 1**  
   Choose **Devices > Device Management**, and edit the FTD device.

2. **Step 2**  
   Choose **Routing > Multicast Routing > Access Group**.

3. **Step 3**  
   On **Access Group**, click **Add** or **Edit**.

   Use the **Add IGMP Access Group parameters** dialog box to add new IGMP access groups to the Access Group table. Use the **Edit IGMP Access Group parameters** dialog box to change existing parameters.

4. **Step 4**  
   Configure the following options:

   a) From the **Interface** drop-down list, select the interface with which the access group is associated. You cannot change the associated interface when you are editing an existing access group.

   b) Click one of the following:

      • **Standard Access List**—From the **Standard Access List** drop-down list, select the standard ACL or click add (+) to create a new standard ACL. See Configure Standard ACL Objects, on page 458 for the procedure.

      • **Extended Access List**—From the **Extended Access List** drop-down list, select the extended ACL or click add (+) to create a new extended ACL. See Configure Extended ACL Objects, on page 456 for the procedure.

5. **Step 5**  
   Click **OK** to save the access group configuration.

---

### Configure IGMP Static Groups

Sometimes a group member cannot report its membership in the group or there may be no members of a group on the network segment, but you still want multicast traffic for that group to be sent to that network segment. You can have multicast traffic for that group sent to the segment by configuring a statically joined IGMP
group. With this method, the Firepower Threat Defense device does not accept the packets itself, but only forwards them. Therefore, this method allows fast switching. The outgoing interface appears in the IGMP cache, but this interface is not a member of the multicast group.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose <strong>Devices &gt; Device Management</strong>, and edit the FTD device.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Choose <strong>Routing &gt; Multicast Routing &gt; IGMP</strong>.</td>
</tr>
<tr>
<td>Step 3</td>
<td>On <strong>Static Group</strong>, click <strong>Add</strong> or <strong>Edit</strong>.</td>
</tr>
</tbody>
</table>

Use the **Add IGMP Static Group parameters** dialog box to statically assign a multicast group to an interface. Use the **Edit IGMP Static Group parameters** dialog box to change existing static group assignments.

**Step 4** Configure the following options:

- From the **Interface** drop-down list, select the interface to which you want to statically assign a multicast group. If you are editing an existing entry, you cannot change the value.
- From the **Multicast Groups** drop-down list, select the multicast group to which you want to assign the interface, or click add (bullseye) to create a new multicast group. See **Creating Network Objects** for the procedure.

**Step 5** Click **OK** to save the static group configuration.

---

### Configure IGMP Join Groups

You can configure an interface to be a member of a multicast group. Configuring the Firepower Threat Defense device to join a multicast group causes upstream routers to maintain multicast routing table information for that group and keep the paths for that group active.

**Note**

See **Configure IGMP Static Groups**, on page 746 if you want to forward multicast packets for a specific group to an interface without the Firepower Threat Defense device accepting those packets as part of the group.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose <strong>Devices &gt; Device Management</strong>, and edit the FTD device.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Choose <strong>Routing &gt; Multicast Routing &gt; IGMP</strong>.</td>
</tr>
<tr>
<td>Step 3</td>
<td>On <strong>Join Group</strong>, click <strong>Add</strong> or <strong>Edit</strong>.</td>
</tr>
</tbody>
</table>

Use the **Add IGMP Join Group parameters** dialog box to configure the Firepower Threat Defense device to be a member of a multicast group. Use the **Edit IGMP Join Group parameters** dialog box to change existing parameters.

**Step 4** Configure the following options:
Configure PIM Features

Routers use PIM to maintain forwarding tables to use for forwarding multicast diagrams. When you enable multicast routing on the Firepower Threat Defense device, PIM and IGMP are automatically enabled on all interfaces.

Note

PIM is not supported with PAT. The PIM protocol does not use ports, and PAT only works with protocols that use ports.

This section describes how to configure optional PIM settings.

Procedure

Step 1 Configure PIM Protocol, on page 748
Step 2 Configure PIM Neighbor Filters, on page 749
Step 3 Configure PIM Bidirectional Neighbor Filters, on page 750
Step 4 Configure PIM Rendezvous Points, on page 751
Step 5 Configure PIM Route Trees, on page 752
Step 6 Configure PIM Request Filters, on page 752
Step 7 Configure Multicast Boundary Filters, on page 755

Configure PIM Protocol

You can enable or disable PIM on a specific interface.

You can also configure the Designated Router (DR) priority. The DR is responsible for sending PIM register, join, and prune messages to the RP. When there is more than one multicast router on a network segment, choosing the DR is based on the DR priority. If multiple devices have the same DR priority, then the device with the highest IP address becomes the DR. By default, the Firepower Threat Defense device has a DR priority of 1.

Router query messages are used to choose the PIM DR. The PIM DR is responsible for sending router query messages. By default, router query messages are sent every 30 seconds. Additionally, every 60 seconds, the Firepower Threat Defense device sends PIM join or prune messages.
Procedure

Step 1  Choose Devices > Device Management, and edit the FTD device.
Step 2  Choose Routing > Multicast Routing > PIM.
Step 3  On Protocol, click Add or Edit.

Use the Add PIM parameters dialog box to add new PIM parameters to the interface. Use the Edit PIM parameters dialog box to change existing parameters.

Step 4  Configure the following options:

• **Interface**—From the drop-down list, select the interface for which you want to configure PIM protocol.
• **Enable PIM**—Check the check box to enable PIM.
• **DR Priority**—The value for the DR for the selected interface. The router with the highest DR priority on the subnet becomes the designated router. Valid values range from 0 to 4294967294. The default DR priority is 1. Setting this value to 0 makes the Firepower Threat Defense device interface ineligible to become the default router.
• **Hello Interval**—The interval in seconds at which the interface sends PIM hello messages. The range is 1 to 3600. The default is 30.
• **Join Prune Interval**—The interval in seconds at which the interface sends PIM join and prune advertisements. The range is 10 to 600. The default is 60.

Step 5  Click OK to save the PIM protocol configuration.

Configure PIM Neighbor Filters

You can define the routers that can become PIM neighbors. By filtering the routers that can become PIM neighbors, you can do the following:

• Prevent unauthorized routers from becoming PIM neighbors.
• Prevent attached stub routers from participating in PIM.

Procedure

Step 1  Choose Devices > Device Management, and edit the FTD device.
Step 2  Choose Routing > Multicast Routing > PIM.
Step 3  On Neighbor Filter, click Add or Edit.

Use the Add PIM Neighbor Filter dialog box to add new PIM neighbor filters to the interface. Use the Edit PIM Neighbor Filter dialog box to change existing parameters.

Step 4  Configure the following options:

• From the Interface drop-down list, select the interface to which you want to add a PIM neighbor filter.
Configure PIM Bidirectional Neighbor Filters

A PIM bidirectional neighbor filter is an ACL that defines the neighbor devices that can participate in the Designated Forwarder (DF) election. If a PIM bidirectional neighbor filter is not configured for an interface, there are no restrictions. If a PIM bidirectional neighbor filter is configured, only those neighbors permitted by the ACL can participate in the DF election process.

Bidirectional PIM allows multicast routers to keep reduced state information. All of the multicast routers in a segment must be bidirectionally enabled to elect a DF.

When a PIM bidirectional neighbor filter is enabled, the routers that are permitted by the ACL are considered to be bidirectionally capable. Therefore, the following is true:

- If a permitted neighbor does not support bidirectional mode, then the DF election does not occur.
- If a denied neighbor supports bidirectional mode, then the DF election does not occur.
- If a denied neighbor does not support bidirectional mode, the DF election can occur.

Procedure

Step 1 Choose Devices > Device Management, and edit the FTD device.
Step 2 Choose Multicast Routing > PIM.
Step 3 On Bidirectional Neighbor Filter, click Add or Edit.

Use the Add PIM Bidirectional Neighbor Filter dialog box to create ACL entries for the PIM bidirectional neighbor filter ACL. Use the Edit PIM Bidirectional Neighbor Filter dialog box to change existing parameters.

Step 4 Configure the following options:

- From the Interface drop-down list, select the interface to which you want to configure the PIM bidirectional neighbor filter ACL entry.

- Standard Access List— From the Standard Access List drop-down list, select a standard ACL or click add ( ) to create a new standard ACL. See Configure Standard ACL Objects, on page 458 for the procedure.
Choosing **Allow** on the **Add Standard Access List Entry** dialog box lets the specified devices participate in the DR election process. Choosing **Block** prevents the specified devices from participating in the DR election process.

**Step 5**

Click **OK** to save the PIM bidirectional neighbor filter configuration.

---

### Configure PIM Rendezvous Points

You can configure the Firepower Threat Defense device to serve as a RP to more than one group. The group range specified in the ACL determines the PIM RP group mapping. If an ACL is not specified, then the RP for the group is applied to the entire multicast group range (224.0.0.0/4). See [Multicast Bidirectional PIM](#) on page 741 for more information about bidirectional PIM.

The following restrictions apply to RPs:

- You cannot use the same RP address twice.
- You cannot specify All Groups for more than one RP.

### Procedure

**Step 1**

Choose **Devices > Device Management**, and edit the FTD device.

**Step 2**

Choose **Routing > Multicast Routing > PIM**.

**Step 3**

On **Rendezvous Points**, click **Add** or **Edit**.

Use the **Add Rendezvous Point** dialog box to create a new entry to the Rendezvous Point table. Use the **Edit Rendezvous Point** dialog box to change existing parameters.

**Step 4**

Configure the following options:

- From the **Rendezvous Point IP address** drop-down list, select the IP address that you want to add as an RP or click **add** to create a new network object. See [Creating Network Objects](#) for the procedure.

- Check the **Use bi-directional forwarding** check box if the specified multicast groups are to operate in bidirectional mode. In bidirectional mode, if the Firepower Threat Defense device receives a multicast packet and has no directly connected members or PIM neighbors present, it sends a prune message back to the source.

- Choose **Use this RP for all Multicast Groups** to use the specified RP for all multicast groups on the interface.

- Choose the **Use this RP for all Multicast Groups as specified below** to designate the multicast groups to use with the specified RP and then from the **Standard Access List** drop-down list, choose a standard ACL or click **add** to create a new standard ACL. See [Configure Standard ACL Objects](#) on page 458 for the procedure.

**Step 5**

Click **OK** to save the rendezvous point configuration.
Configure PIM Route Trees

By default, PIM leaf routers join the shortest-path tree immediately after the first packet arrives from a new source. This method reduces delay, but requires more memory than the shared tree. You can configure whether or not the Firepower Threat Defense device should join the shortest-path tree or use the shared tree, either for all multicast groups or only for specific multicast addresses.

The shortest-path tree is used for any group that is not specified in the Multicast Groups table. The Multicast Groups table displays the multicast groups to use with the shared tree. The table entries are processed from the top down. You can create an entry that includes a range of multicast groups, but excludes specific groups within that range by placing deny rules for the specific groups at the top of the table and the permit rule for the range of multicast groups below the deny statements.

This behavior is known as Shortest Path Switchover (SPT). We recommend that you always use the Shared Tree option.

Procedure

Step 1 Choose Devices > Device Management, and edit the FTD device.
Step 2 Choose Routing > Multicast Routing > PIM.
Step 3 On Route Tree, select the path for the route tree:
   • Click Shortest Path to use the shortest-path tree for all multicast groups.
   • Click Shared Tree to use the shared tree for all multicast groups.
   • Click Shared tree for below mentioned group to designate the groups specified in the Multicast Groups table, and then from the Standard Access List drop-down list, select a standard ACL or click add (+) to create a new standard ACL. See Configure Standard ACL Objects, on page 458 for the procedure.
Step 4 Click OK to save the route tree configuration.

Configure PIM Request Filters

When the Firepower Threat Defense device is acting as an RP, you can restrict specific multicast sources from registering with it to prevent unauthorized sources from registering with the RP. You can define the multicast sources from which the Firepower Threat Defense device will accept PIM register messages.

Procedure

Step 1 Choose Devices > Device Management, and edit the FTD device.
Step 2 Choose Routing > Multicast Routing > PIM.
Step 3 On Request Filter, define the multicast sources that are allowed to register with the Firepower Threat Defense device when it acts as an RP:
From the Filter PIM register messages using: drop-down list select None, Access List, or Route Map.

If you choose Access List from the drop-down list, select an extended ACL or click add ( ) to create a new extended ACL. See Configure Extended ACL Objects, on page 456 for the procedure.

Note In the Add Extended Access List Entry dialog box, select Allow from the drop-down list o create a rule that allows the specified source of the specified multicast traffic to register with the Firepower Threat Defense device, or select Block to create a rule that prevents the specified source of the specified multicast traffic from registering with the Firepower Threat Defense device.

If you choose Route Map, select a route map from the Route Map drop-down list, or click add ( ) to create a new route map. See Creating Network Objects for the procedure.

Step 4 Click OK to save the request filter configuration.

Configure the Firepower Threat Defense Device as a Candidate Bootstrap Router

You can configure the Firepower Threat Defense device as a candidate BSR.

Procedure

Step 1 Choose Devices > Device Management, and edit the FTD device.

Step 2 Choose Routing > Multicast Routing > PIM.

Step 3 On Bootstrap Router, check the Configure this FTD as a Candidate Bootstrap Router (C-BSR) check box to perform the C-BSR setup.

a) From the Interface drop-down list, select the interface on the Firepower Threat Defense device from which the BSR address is derived to make it a candidate.

This interface must be enabled with PIM.

b) In the Hash mask length field, enter the length of a mask (32 bits maximum) that is to be ANDed with the group address before the hash function is called. All groups with the same seed hash (correspond) to the same RP. For example, if this value is 24, only the first 24 bits of the group addresses matter. This fact allows you to get one RP for multiple groups. The range is 0 to 32.

c) In the Priority field, enter the priority of the candidate BSR. The BSR with the larger priority is preferred. If the priority values are the same, the router with the larger IP address is the BSR. The range is 0 to 255. The default value is 0.

Step 4 (Optional) Click add ( ) to select an interface on which no PIM BSR messages will be sent or received in the Configure this FTD as a Border Bootstrap Router (BSR) section.

• From the Interface drop-down list, select the interface on which no PIM BSR messages will be sent or received.

RP or BSR advertisements are filtered effectively isolating two domains of RP information exchange.
Configure Multicast Routes

Configuring static multicast routes lets you separate multicast traffic from unicast traffic. For example, when a path between a source and destination does not support multicast routing, the solution is to configure two multicast devices with a GRE tunnel between them and to send the multicast packets over the tunnel.

When using PIM, the Firepower Threat Defense device expects to receive packets on the same interface where it sends unicast packets back to the source. In some cases, such as bypassing a route that does not support multicast routing, you may want unicast packets to take one path and multicast packets to take another.

Static multicast routes are not advertised or redistributed.

Procedure

Step 1  Choose Devices > Device Management, and edit the FTD device.

Step 2  Choose Routing > Multicast Routing > Multicast Routes > Add or Edit.

Use the Add Multicast Route Configuration dialog box to add a new multicast route to the Firepower Threat Defense device. Use the Edit Multicast Route Configuration dialog box to change an existing multicast route.

Step 3  From the Source Network drop-down box, select an existing network or click add to add a new one. See Creating Network Objects for the procedure.

Step 4  To configure an interface to forward the route, click Interface and configure the following options:

- From the Source Interface drop-down list, select the incoming interface for the multicast route.
- From the Output Interface/Dense drop-down list, select the destination interface that the route is forwarded through.
- In the Distance field, enter the distance of the multicast route. The range is 0 to 255.

Step 5  To configure an RPF address to forward the route, click Address and configure the following options:

- In the RPF Address field, enter the IP address for the multicast route.
- In the Distance field, enter the distance of the multicast route. The range is 0 to 255.

Step 6  Click OK to save the multicast routes configuration.
Configure Multicast Boundary Filters

Address scoping defines domain boundary filters so that domains with RPs that have the same IP address do not leak into each other. Scoping is performed on the subnet boundaries within large domains and on the boundaries between the domain and the Internet.

You can set up an administratively scoped boundary filter on an interface for multicast group addresses. IANA has designated the multicast address range from 239.0.0.0 to 239.255.255.255 as the administratively scoped addresses. This range of addresses can be reused in domains administered by different organizations. The addresses would be considered local, not globally unique.

A standard ACL defines the range of affected addresses. When a boundary filter is set up, no multicast data packets are allowed to flow across the boundary from either direction. The boundary filter allows the same multicast group address to be reused in different administrative domains.

You can configure, examine, and filter Auto-RP discovery and announcement messages at the administratively scoped boundary. Any Auto-RP group range announcements from the Auto-RP packets that are denied by the boundary ACL are removed. An Auto-RP group range announcement is permitted and passed by the boundary filter only if all addresses in the Auto-RP group range are permitted by the boundary ACL. If any address is not permitted, the entire group range is filtered and removed from the Auto-RP message before the Auto-RP message is forwarded.

Procedure

Step 1 Choose Devices > Device Management, and edit the FTD device.

Step 2 Choose Routing > Multicast Routing > Multicast Boundary Filter, and then click Add or Edit. Use the Add Multicast Boundary Filter dialog box to add new multicast boundary filters to the Firepower Threat Defense device. Use the Edit Multicast Boundary Filter dialog box to change existing parameters.

You can configure a multicast boundary for administratively scoped multicast addresses. A multicast boundary restricts multicast data packet flows and enables reuse of the same multicast group address in different administrative domains. When a multicast boundary is defined on an interface, only the multicast traffic permitted by the filter ACL passes through the interface.

Step 3 From the Interface drop-down list, choose the interface for which you are configuring the multicast boundary filter ACL.

Step 4 From the Standard Access List drop-down list, choose the standard ACL you want to use, or click add ( ) to create a new standard ACL. See Configure Standard ACL Objects, on page 458 for the procedure.

Step 5 Check the Remove any Auto-RP group range announcement from the Auto-RP packets that are denied by the boundary check box to filter Auto-RP messages from sources denied by the boundary ACL. If this check box is not checked, all Auto-RP messages are passed.

Step 6 Click OK to save the multicast boundary filter configuration.
Configure Multicast Boundary Filters
PART XI

Firepower Threat Defense VPN

CHAPTER 40

VPN Overview for Firepower Threat Defense

A virtual private network (VPN) connection establishes a secure tunnel between endpoints over a public network such as the Internet.

This chapter applies to Site-to-site VPNs on Firepower Threat Defense devices. It describes the Internet Protocol Security (IPsec), the Internet Security Association and Key Management Protocol (ISAKMP, or IKE) and SSL standards that are used to build site-to-site VPNs.

Site-to-site VPNs on 7000 and 8000 Series devices, referred to as Gateway VPNs or Firepower VPNs in the Firepower Management Center are described in Gateway VPNs, on page 1095.

- VPN Types, on page 759
- VPN Basics, on page 760
- VPN Packet Flow, on page 762
- VPN Licensing, on page 762
- How Secure Should a VPN Connection Be?, on page 762
- VPN Topology Options, on page 765

VPN Types

The Firepower Management Center supports the following types of VPN connections:

- Site-to-site VPNs on Firepower Threat Defense devices.
  
  A site-to-site VPN connects networks in different geographic locations. You can create site-to-site IPsec connections between managed devices, and between managed devices and other Cisco or third-party peers that comply with all relevant standards. These peers can have any mix of inside and outside IPv4 and IPv6 addresses. Site-to-site tunnels are built using the Internet Protocol Security (IPsec) protocol suite and IKEv1 or IKEv2. After the VPN connection is established, the hosts behind the local gateway can connect to the hosts behind the remote gateway through the secure VPN tunnel.

- Site-to-site VPNs on 7000 and 8000 Series devices.
  
  These site-to-site VPNs are referred to as Gateway VPNs or Firepower VPNs in the Firepower Management Center. See Gateway VPNs, on page 1095, for information on this type of VPN connection.
VPN Basics

Tunneling makes it possible to use a public TCP/IP network, such as the Internet, to create secure connections between remote users and private corporate networks. Each secure connection is called a tunnel.

IPsec-based VPN technologies use the Internet Security Association and Key Management Protocol (ISAKMP, or IKE) and IPsec tunneling standards to build and manage tunnels. ISAKMP and IPsec accomplish the following:

- Negotiate tunnel parameters.
- Establish tunnels.
- Authenticate users and data.
- Manage security keys.
- Encrypt and decrypt data.
- Manage data transfer across the tunnel.
- Manage data transfer inbound and outbound as a tunnel endpoint or router.

A device in a VPN functions as a bidirectional tunnel endpoint. It can receive plain packets from the private network, encapsulate them, create a tunnel, and send them to the other end of the tunnel where they are unencapsulated and sent to their final destination. It can also receive encapsulated packets from the public network, unencapsulate them, and send them to their final destination on the private network.

After the site-to-site VPN connection is established, the hosts behind the local gateway can connect to the hosts behind the remote gateway through the secure VPN tunnel. A connection consists of the IP addresses and hostnames of the two gateways, the subnets behind them, and the method the two gateways use to authenticate to each other.

Internet Key Exchange (IKE)

Internet Key Exchange (IKE) is a key management protocol that is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs).

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes SAs for other applications, such as IPsec. Both phases use proposals when they negotiate a connection.

An IKE policy is a set of algorithms that two peers use to secure the IKE negotiation between them. IKE negotiation begins by each peer agreeing on a common (shared) IKE policy. This policy states which security parameters protect subsequent IKE negotiations. For IKE version 1 (IKEv1), IKE policies contain a single set of algorithms and a modulus group. Unlike IKEv1, in an IKEv2 policy, you can select multiple algorithms and modulus groups from which peers can choose during the Phase 1 negotiation. It is possible to create a single IKE policy, although you might want different policies to give higher priority to your most desired options. For site-to-site VPNs, you can create a single IKE policy.

To define an IKE policy, specify:

- A unique priority (1 to 65,543, with 1 the highest priority).
- An encryption method for the IKE negotiation, to protect the data and ensure privacy.
A Hashed Message Authentication Codes (HMAC) method (called integrity algorithm in IKEv2) to ensure the identity of the sender, and to ensure that the message has not been modified in transit.

For IKEv2, a separate pseudorandom function (PRF) used as the algorithm to derive keying material and hashing operations required for the IKEv2 tunnel encryption. The options are the same as those used for the hash algorithm.

A Diffie-Hellman group to determine the strength of the encryption-key-determination algorithm. The device uses this algorithm to derive the encryption and hash keys.

An authentication method, to ensure the identity of the peers.

A limit to the time the device uses an encryption key before replacing it.

When IKE negotiation begins, the peer that starts the negotiation sends all of its policies to the remote peer, and the remote peer searches for a match with its own policies, in priority order. A match between IKE policies exists if they have the same encryption, hash (integrity and PRF for IKEv2), authentication, and Diffie-Hellman values, and an SA lifetime less than or equal to the lifetime in the policy sent. If the lifetimes are not identical, the shorter lifetime—From the remote peer policy—Applies. By default, the Firepower Management Center deploys an IKEv1 policy at the lowest priority for all VPN endpoints to ensure a successful negotiation.

**IPsec**

IPsec is one of the most secure methods for setting up a VPN. IPsec provides data encryption at the IP packet level, offering a robust security solution that is standards-based. With IPsec, data is transmitted over a public network through tunnels. A tunnel is a secure, logical communication path between two peers. Traffic that enters an IPsec tunnel is secured by a combination of security protocols and algorithms.

An IPsec Proposal policy defines the settings required for IPsec tunnels. An IPsec proposal is a collection of one or more crypto-maps that are applied to the VPN interfaces on the devices. A crypto map combines all the components required to set up IPsec security associations, including:

- A proposal (or transform set) is a combination of security protocols and algorithms that secure traffic in an IPsec tunnel. During the IPsec security association (SA) negotiation, peers search for a proposal that is the same at both peers. When it is found, it is applied to create an SA that protects data flows in the access list for that crypto map, protecting the traffic in the VPN. There are separate IPsec proposals for IKEv1 and IKEv2. In IKEv1 proposals (or transform sets), for each parameter, you set one value. For IKEv2 proposals, you can configure multiple encryption and integration algorithms for a single proposal.

- A crypto map, combines all components required to set up IPsec security associations (SA), including IPsec rules, proposals, remote peers, and other parameters that are necessary to define an IPsec SA. When two peers try to establish an SA, they must each have at least one compatible crypto map entry.

Dynamic crypto map policies are used in site-to-site VPNs when an unknown remote peer tries to start an IPsec security association with the local hub. The hub cannot be the initiator of the security association negotiation. Dynamic crypto-policies allow remote peers to exchange IPsec traffic with a local hub even if the hub does not know the remote peer’s identity. A dynamic crypto map policy essentially creates a crypto map entry without all the parameters configured. The missing parameters are later dynamically configured (as the result of an IPsec negotiation) to match a remote peer’s requirements.

Dynamic crypto map policies apply only in a hub-and-spoke and full-mesh VPN topologies. In a point-to-point or full mesh VPN topology, you can apply only static crypto map policies. Emulate the use of dynamic crypto-maps in a point-to-point topology by creating a hub-and-spoke topology with two devices. Specify a dynamic IP address for the spoke and enable dynamic crypto-maps on this topology.
Simultaneous IKEv2 dynamic crypto map is not supported for the same interface for both remote access and site-to-site VPNs on Firepower Threat Defense (FTD).

VPN Packet Flow

On a FTD device, by default no traffic is allowed to pass through access-control without explicit permission. VPN tunnel traffic as well, is not relayed to the endpoints until it has passed through Snort. Incoming tunnel packets are decrypted before being sent to the Snort process. Snort processes outgoing packets before encryption.

Access Control identifying the protected networks for each endpoint node of a VPN tunnel determines which traffic is allowed to pass through the FTD device and reach the endpoints.

In addition, the system does not send tunnel traffic to the public source when the tunnel is down.

VPN Licensing

There is no specific licensing for enabling Firepower Threat Defense VPN, it is available by default.

The Firepower Management Center determines whether to allow or block the usage of strong crypto on a Firepower Threat Defense device based on attributes provided by the smart licensing server.

This is controlled by whether you selected the option to allow export-controlled functionality on the device when you registered with Cisco Smart License Manager. If you are using the evaluation license, or you did not enable export-controlled functionality, you cannot use strong encryption.

How Secure Should a VPN Connection Be?

Because a VPN tunnel typically traverses a public network, most likely the Internet, you need to encrypt the connection to protect the traffic. You define the encryption and other security techniques to apply using IKE polices and IPsec proposals.

If your device license allows you to apply strong encryption, there is a wide range of encryption and hash algorithms, and Diffie-Hellman groups, from which to choose. However, as a general rule, the stronger the encryption that you apply to the tunnel, the worse the system performance. Find a balance between security and performance that provides sufficient protection without compromising efficiency.

We cannot provide specific guidance on which options to choose. If you operate within a larger corporation or other organization, there might already be defined standards that you need to meet. If not, take the time to research the options.

The following topics explain the available options.

Deciding Which Encryption Algorithm to Use

When deciding which encryption algorithms to use for the IKE policy or IPsec proposal, your choice is limited to algorithms supported by the devices in the VPN.
For IKEv2, you can configure multiple encryption algorithms. The system orders the settings from the most secure to the least secure and negotiates with the peer using that order. For IKEv1, you can select a single option only.

For IPsec proposals, the algorithm is used by the Encapsulating Security Protocol (ESP), which provides authentication, encryption, and anti-replay services. ESP is IPv4 protocol type 50. In IKEv1 IPsec proposals, the algorithm name is prefixed with ESP-.

If your device license qualifies for strong encryption, you can choose from the following encryption algorithms. If you are not qualified for strong encryption, you can select DES only.

- **AES-GCM**—(IKEv2 only.) Advanced Encryption Standard in Galois/Counter Mode is a block cipher mode of operation providing confidentiality and data-origin authentication, and provides greater security than AES. AES-GCM offers three different key strengths: 128-, 192-, and 256-bit keys. A longer key provides higher security but a reduction in performance. GCM is a mode of AES that is required to support NSA Suite B. NSA Suite B is a set of cryptographic algorithms that devices must support to meet federal standards for cryptographic strength.

- **AES-GMAC**—(IKEv2 IPsec proposals only.) Advanced Encryption Standard Galois Message Authentication Code is a block cipher mode of operation providing only data-origin authentication. It is a variant of AES-GCM that allows data authentication without encrypting the data. AES-GMAC offers three different key strengths: 128-, 192-, and 256-bit keys.

- **AES**—Advanced Encryption Standard is a symmetric cipher algorithm that provides greater security than DES and is computationally more efficient than 3DES. AES offers three different key strengths: 128-, 192-, and 256-bit keys. A longer key provides higher security but a reduction in performance.

- **3DES**—Triple DES, which encrypts three times using 56-bit keys, is more secure than DES because it processes each block of data three times with a different key. However, it uses more system resources and is slower than DES.

- **DES**—Data Encryption Standard, which encrypts using 56-bit keys, is a symmetric secret-key block algorithm. If your license account does not meet the requirements for export controls, this is your only option. It is faster than 3DES and uses less system resources, but it is also less secure. If you do not need strong data confidentiality, and if system resources or speed is a concern, choose DES.

- **Null**—A null encryption algorithm provides authentication without encryption. This is typically used for testing purposes only.

### Deciding Which Hash Algorithms to Use

In IKE policies, the hash algorithm creates a message digest, which is used to ensure message integrity. In IKEv2, the hash algorithm is separated into two options, one for the integrity algorithm, and one for the pseudo-random function (PRF).

In IPsec proposals, the hash algorithm is used by the Encapsulating Security Protocol (ESP) for authentication. In IKEv2 IPsec Proposals, this is called the integrity hash. In IKEv1 IPsec proposals, the algorithm name is prefixed with ESP-, and there is also an -HMAC suffix (which stands for “hash method authentication code”).

For IKEv2, you can configure multiple hash algorithms. The system orders the settings from the most secure to the least secure and negotiates with the peer using that order. For IKEv1, you can select a single option only.

You can choose from the following hash algorithms.
• SHA (Secure Hash Algorithm)—Standard SHA (SHA1) produces a 160-bit digest. SHA is more resistant
to brute-force attacks than MD5. However, it is also more resource intensive than MD5. For
implementations that require the highest level of security, use the SHA hash algorithm.

The following SHA-2 options, which are even more secure, are available for IKEv2 configurations.
Choose one of these if you want to implement the NSA Suite B cryptography specification.
• SHA256—Specifies the Secure Hash Algorithm SHA 2 with the 256-bit digest.
• SHA384—Specifies the Secure Hash Algorithm SHA 2 with the 384-bit digest.
• SHA512—Specifies the Secure Hash Algorithm SHA 2 with the 512-bit digest.

• MD5 (Message Digest 5)—Produces a 128-bit digest. MD5 uses less processing time for an overall faster
performance than SHA, but it is considered to be weaker than SHA.

• Null or None (NULL, ESP-NONE)—(IPsec Proposals only.) A null Hash Algorithm; this is typically
used for testing purposes only. However, you should choose the null integrity algorithm if you select
one of the AES-GCM/GMAC options as the encryption algorithm. Even if you choose a non-null option,
the integrity hash is ignored for these encryption standards.

Deciding Which Diffie-Hellman Modulus Group to Use

You can use the following Diffie-Hellman key derivation algorithms to generate IPsec security association
(SA) keys. Each group has a different size modulus. A larger modulus provides higher security, but requires
more processing time. You must have a matching modulus group on both peers.

If you select AES encryption, to support the large key sizes required by AES, you should use Diffie-Hellman
(DH) Group 5 or higher. IKEv1 policies do not support all of the groups listed below.

To implement the NSA Suite B cryptography specification, use IKEv2 and select one of the elliptic curve
Diffie-Hellman (ECDH) options: 19, 20, or 21. Elliptic curve options and groups that use 2048-bit modulus
are less exposed to attacks such as Logjam.

For IKEv2, you can configure multiple groups. The system orders the settings from the most secure to the
least secure and negotiates with the peer using that order. For IKEv1, you can select a single option only.

• 1—Diffie-Hellman Group 1: 768-bit modulus. DH group 1 is considered insecure, please do not use it.
• 2—Diffie-Hellman Group 2: 1024-bit modular exponential (MODP) group. This option is no longer
considered good protection.
• 5—Diffie-Hellman Group 5: 1536-bit MODP group. Formerly considered good protection for 128-bit
keys, this option is no longer considered good protection.
• 14—Diffie-Hellman Group 14: 2048-bit modular exponential (MODP) group. Considered good protection
for 192-bit keys.
• 19—Diffie-Hellman Group 19: National Institute of Standards and Technology (NIST) 256-bit elliptic
curve modulo a prime (ECP) group.
• 20—Diffie-Hellman Group 20: NIST 384-bit ECP group.
• 24—Diffie-Hellman Group 24: 2048-bit MODP group with 256-bit prime order subgroup. This option
is no longer recommended.
VPN Topology Options

When you create a new VPN topology you must, at minimum, give it a unique name, specify a topology type, and select the IKE version. You can select from three types of topologies, each containing a group of VPN tunnels:

- Point-to-point (PTP) topologies establish a VPN tunnel between two endpoints.
- Hub and Spoke topologies establish a group of VPN tunnels connecting a hub endpoint to a group of spoke endpoints.
- Full Mesh topologies establish a group of VPN tunnels among a set of endpoints.

Define a pre-shared key for VPN authentication manually or automatically, there is no default key. When choosing automatic, the Firepower Management Center generates a pre-shared key and assigns it to all the nodes in the topology.

Point-to-Point VPN Topology

In a point-to-point VPN topology, two endpoints communicate directly with each other. You configure the two endpoints as peer devices, and either device can start the secured connection.

The following diagram displays a typical point-to-point VPN topology.

Hub and Spoke VPN Topology

In a Hub and Spoke VPN topology, a central endpoint (hub node) connects with multiple remote endpoints (spoke nodes). Each connection between the hub node and an individual spoke endpoint is a separate VPN tunnel. The hosts behind any of the spoke nodes can communicate with each other through the hub node.

The Hub and Spoke topology commonly represent a VPN that connects an organization’s main and branch office locations using secure connections over the Internet or other third-party network. These deployments provide all employees with controlled access to the organization’s network. Typically, the hub node is located at the main office. Spoke nodes are located at branch offices and start most of the traffic.

The following diagram displays a typical Hub and Spoke VPN topology.
In a Full Mesh VPN topology, all endpoints can communicate with every other endpoint by an individual VPN tunnel. This topology offers redundancy so that when one endpoint fails, the remaining endpoints can still communicate with each other. It commonly represents a VPN that connects a group of decentralized branch office locations. The number of VPN-enabled managed devices you deploy in this configuration depends on the level of redundancy you require.

The following diagram displays a typical Full Mesh VPN topology.
Implicit Topologies

In addition to the three main VPN topologies, other more complex topologies can be created as combinations of these topologies. They include:

- **Partial mesh**—A network in which some devices are organized in a full mesh topology, and other devices form either a hub-and-spoke or a point-to-point connection to some of the fully meshed devices. A partial mesh does not provide the level of redundancy of a full mesh topology, but it is less expensive to implement. Partial mesh topologies are used in peripheral networks that connect to a fully meshed backbone.

- **Tiered hub-and-spoke**—A network of hub-and-spoke topologies in which a device can behave as a hub in one or more topologies and a spoke in other topologies. Traffic is permitted from spoke groups to their most immediate hub.

- **Joined hub-and-spoke**—A combination of two topologies (hub-and-spoke, point-to-point, or full mesh) that connect to form a point-to-point tunnel. For example, a joined hub-and-spoke topology could comprise two hub-and-spoke topologies, with the hubs acting as peer devices in a point-to-point topology.
Implicit Topologies
FTD VPN Deployments

- About Firepower Threat Defense Site-to-site VPNs, on page 769
- VPN Licensing, on page 770
- Firepower Threat Defense Site-to-site VPN Guidelines and Limitations, on page 770

About Firepower Threat Defense Site-to-site VPNs

Firepower Threat Defense site-to-site VPN supports the following features:

- Both IPsec IKEv1 & IKEv2 protocols are supported.
- Automatic or manual preshared keys for authentication.
- IPv4 & IPv6. All combinations of inside and outside are supported.
- Static and Dynamic Interfaces.
- Support for both Firepower Management Center and FTD HA environments.
- VPN alerts when the tunnel goes down.
- Tunnel statistics available using the FTD Unified CLI.

VPN Topology

To create a new site-to-site VPN topology you must, at minimum, give it a unique name, specify a topology type, choose the IKE version that is used for IPsec IKEv1 or IKEv2, or both. Also, designate a preshared key. Once configured, you deploy the topology to Firepower Threat Defense devices. The Firepower Management Center configures site-to-site VPNs on FTD devices only.

You can select from three types of topologies, containing one or more VPN tunnels:

- Point-to-point (PTP) deployments establish a VPN tunnel between two endpoints.
- Hub and Spoke deployments establish a group of VPN tunnels connecting a hub endpoint to a group of spoke nodes.
- Full Mesh deployments establish a group of VPN tunnels among a set of endpoints.
**IPsec and IKE**

In the Firepower Management Center, site-to-site VPNs are configured based on IKE policies and IPsec proposals that are assigned to VPN topologies. Policies and proposals are sets of parameters that define the characteristics of a site-to-site VPN, such as the security protocols and algorithms that are used to secure traffic in an IPsec tunnel. Several policy types may be required to define a full configuration image that can be assigned to a VPN topology.

**Authentication**

Define a preshared key for VPN authentication. You can manually specify a default key to use in all the VPN nodes in a topology, or have the Firepower Management Center automatically generate one.

**Extranet Devices**

Each topology type can include Extranet devices, devices that you do not manage in Firepower Management Center. These include:

- Cisco devices that Firepower Management Center supports, but for which your organization is not responsible. Such as spokes in networks managed by other organizations within your company, or a connection to a service provider or partner's network.
- Non-Cisco devices. You cannot use Firepower Management Center to create and deploy configurations to non-Cisco devices.

Add non-Cisco devices, or Cisco devices not managed by the Firepower Management Center, to a VPN topology as "Extranet" devices. Also specify the IP address of each remote device.

**VPN Licensing**

There is no specific licensing for enabling Firepower Threat Defense VPN, it is available by default.

The Firepower Management Center determines whether to allow or block the usage of strong crypto on a Firepower Threat Defense device based on attributes provided by the smart licensing server.

This is controlled by whether you selected the option to allow export-controlled functionality on the device when you registered with Cisco Smart License Manager. If you are using the evaluation license, or you did not enable export-controlled functionality, you cannot use strong encryption.

**Firepower Threat Defense Site-to-site VPN Guidelines and Limitations**

- PKI Certification is not supported. Only preshared keys are supported for authentication.
- A VPN connection can only be made across domains by using an extranet peer for the endpoint not in the current domain.
- A VPN topology cannot be moved between domains.
- Network objects with a 'range' option are not supported in VPN.
- Firepower Threat Defense VPNs are only be backed up using the Firepower Management backup.
• The Firepower Threat Defense VPNs do not currently support PDF export and policy comparison.

• There is no per-tunnel or per-device edit option for Firepower Threat Defense VPNs, only the whole topology can be edited.

• FTD VPNs are not supported in clustered environment.

• Tunnel status is not updated in realtime, but at an interval of 5 minutes in the Firepower Management Center.

• Transport mode is not supported, only tunnel mode. IPsec tunnel mode encrypts the entire original IP datagram which becomes the payload in a new IP packet. Use tunnel mode when the firewall is protecting traffic to and from hosts positioned behind a firewall. Tunnel mode is the normal way regular IPsec is implemented between two firewalls (or other security gateways) that are connected over an untrusted network, such as the Internet.
CHAPTER 42

Administering FTD VPNs

- Managing Firepower Threat Defense Site-to-site VPNs, on page 773
- Configuring Firepower Threat Defense Site-to-site VPNs, on page 774
- Monitoring FTD VPNs, on page 781

Managing Firepower Threat Defense Site-to-site VPNs

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Export-Compliance</td>
<td>N/A</td>
<td>FTD</td>
<td>Leaf only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Procedure

Select Devices > VPN > Site To Site to manage your Firepower Threat Defense Site-to-site VPN configurations and deployments. Choose from the following:

- Add—To create a new VPN topology, click Add VPN > Firepower Threat Defense Device, and continue as instructed in Configuring Firepower Threat Defense Site-to-site VPNs, on page 774:
  
  **Note** VPNs topologies can be created only on leaf domains.

- Edit—To modify the settings of an existing VPN topology, click edit ( ). Modifying is similar to configuring, continue as instructed above.
  
  **Note** You cannot edit the topology type after you initially save it. To change the topology type, delete the topology and create a new one.

  Two users should **not** edit the same topology simultaneously; however, the web interface does not prevent simultaneous editing.

- Delete—To delete a VPN deployment, click delete ( )

- View VPN status—This status applies to Firepower VPNs ONLY. Currently, no status is displayed for FTD VPNs. To determine the status of the FTD VPNs, see .

- Deploy—Click Deploy; see Deploy Configuration Changes, on page 337.
Some VPN settings are validated only during deployment. Be sure to verify that your deployment was successful.

## Configuring Firepower Threat Defense Site-to-site VPNs

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Export-Compliance</td>
<td>N/A</td>
<td>FTD</td>
<td>Leaf only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

### Procedure

**Step 1** Choose Devices > VPN > Site To Site. Then Add VPN > Firepower Threat Defense Device, or edit a listed VPN Topology.

**Step 2** Enter a unique Topology Name. We recommend naming your topology to indicate that it is a FTD VPN, and its topology type.

**Step 3** Choose the Network Topology for this VPN.

**Step 4** Choose the IKE versions to use during IKE negotiations. IKEv1 or IKEv2.

Default is IKEv2. Select either or both options as appropriate; select IKEv1 if any device in the topology does not support IKEv2.

**Step 5** Required: Add Endpoints for this VPN deployment by clicking add (➕) for each node in the topology.

Configure each endpoint field as described in FTD VPN Endpoint Options, on page 775.

- For Point to point, configure Node A and Node B.
- For Hub and Spoke, configure a Hub Node and Spoke Nodes
- For Full Mesh, configure multiple Nodes

**Step 6** (Optional) Specify non-default IKE options for this deployment as described in FTD VPN IKE Options, on page 776

**Step 7** (Optional) Specify non-default IPsec options for this deployment as described in FTD VPN IPsec Options, on page 777

**Step 8** (Optional) Specify non-default Advanced options for this deployment as described in FTD Advanced VPN Deployment Options, on page 779

**Step 9** Click Save.

The endpoints are added to your configuration.

### What to do next

Deploy configuration changes; see Deploy Configuration Changes, on page 337.
Some VPN settings are validated only during deployment. Be sure to verify that your deployment was successful.

FTD VPN Endpoint Options

Navigation Path
Devices > VPN > Site To Site. Then Add VPN > Firepower Threat Defense Device, or edit a listed VPN Topology. Open the Endpoint tab.

Fields
Device
Choose an endpoint node for your deployment:
• A FTD device managed by this Firepower Management Center.
• A FTD high availability container managed by this Firepower Management Center.
• An Extranet device, any device (Cisco or third-party) not managed by this Firepower Management Center.

Device Name
For Extranet devices only, provide a name for this device. We recommend naming it such that it is identifiable as an un-managed device.

Interface
If you chose a managed device as your endpoint, choose an interface on that managed device.

IP Address
• If you choose an extranet device, a device not managed by the Firepower Management Center, specify an IP address for the endpoint.
• If you chose a managed device as an endpoint, choose a single IPv4 address or multiple IPv6 addresses from the drop-down list (these are the addresses already assigned to this interface on this managed device).
• All endpoints in a topology must have the same IP addressing scheme. IPv4 tunnels can carry IPv6 traffic and vice-versa. The Protected Networks define which addressing scheme the tunneled traffic will use.
• If the managed device is a high-availability container, choose from a list of interfaces.

This IP is Private
Check the check box if the endpoint resides behind a firewall with network address translation (NAT).

Public IP address
If you checked the This IP is Private check box, specify a public IP address for the firewall. If the endpoint is a responder, specify this value.
Connection Type

Specify the allowed negotiation as bidirectional, answer-only, or originate-only. Supported combinations for the connection type are:

Table 69: Connection Type Supported Combinations

<table>
<thead>
<tr>
<th>Remote Node</th>
<th>Central Node</th>
</tr>
</thead>
<tbody>
<tr>
<td>Originate-Only</td>
<td>Answer-Only</td>
</tr>
<tr>
<td>Bi-Directional</td>
<td>Answer-Only</td>
</tr>
<tr>
<td>Bi-Directional</td>
<td>Bi-Directional</td>
</tr>
</tbody>
</table>

Protected Networks

Defines a list of networks protected by this VPN endpoint. Click add ( ) to select from available Network Objects or add Network Objects inline. See Creating Network Objects, on page 397. Access Control Lists will be generated from the choices made here.

- **Subnet/IP Address (Network)**—VPN endpoints cannot have the same IP address and protected networks in a VPN endpoint pair cannot overlap. If a list of protected networks for an endpoint contains one or more IPv4 or IPv6 entries, the other endpoint's protected network must have at least one entry of the same type (that is, IPv4 or IPv6). If it does not, then the other endpoint's IP address must be of the same type and must not overlap with the entries in the protected network. (Use /32 CIDR address blocks for IPv4 and /128 CIDR address blocks for IPv6.) If both of these checks fail, the endpoint pair is invalid.

Note

Reverse Route Injection is enabled by default in Firepower Management Center.

FTD VPN IKE Options

For the versions of IKE you have chosen for this topology, specify the IKEv1/IKEv2 Settings.

Note

Settings in this dialog apply to the entire topology, all tunnels, and all managed devices.

Navigation Path

Devices > VPN > Site To Site. Then Add VPN > Firepower Threat Defense Device, or edit a listed VPN Topology. Open the IKE tab.

Fields

Policy

Choose a predefined IKEv1 or IKEv2 policy object or create a new one to use. For details, see FTD IKE Policies, on page 462.
Key Type

- **Manual**—Manually assign the pre-shared key that is used for this VPN. Specify the **Key** and then re-enter to **Confirm Key**.

- **Automatic**—The Management Center automatically defines the pre-shared key that is used for this VPN. Specify the **Key Length**, the number of characters in the key, 1-27.

---

**FTD VPN IPsec Options**

**Note**

Settings in this dialog apply to the entire topology, all tunnels, and all managed devices.

**Crypto-Map Type**

A crypto map combines all the components required to set up IPsec security associations (SA). When two peers try to establish an SA, they must each have at least one compatible crypto map entry. The proposals defined in the crypto map entry are used in the IPsec security negotiation to protect the data flows specified by that crypto map’s IPsec rules. Choose static or dynamic for this deployment’s crypto-map:

- **Static**—Use a static crypto map in a point-to-point or full mesh VPN topology.

- **Dynamic**—Dynamic crypto-maps essentially create a crypto map entry without all the parameters configured. The missing parameters are later dynamically configured (as the result of an IPsec negotiation) to match a remote peer’s requirements.

Dynamic crypto map policies apply only in a hub-and-spoke VPN configuration. In a point-to-point or full mesh VPN topology, you can apply only static crypto map policies. Emulate the use of dynamic crypto-maps in a point-to-point topology by creating a hub-and-spoke topology with two devices. Specify a dynamic IP address for the spoke, and enable dynamic crypto map on this topology.

**IKEv2 Mode**

For IPsec IKEv2 only, specify the encapsulation mode for applying ESP encryption and authentication to the tunnel. This determines what part of the original IP packet has ESP applied.

- **Tunnel mode**—(default) Encapsulation mode is set to tunnel mode. Tunnel mode applies ESP encryption and authentication to the entire original IP packet (IP header and data), hiding the ultimate source and destination addresses and becoming the payload in a new IP packet.

The major advantage of tunnel mode is that the end systems do not need to be modified to receive the benefits of IPsec. This mode allows a network device, such as a router, to act as an IPsec proxy. That is, the router performs encryption on behalf of the hosts. The source router encrypts packets and forwards them along the IPsec tunnel. The destination router decrypts the original IP datagram and forwards it onto the destination system. Tunnel mode also protects against traffic analysis; with tunnel mode, an attacker can only determine the tunnel endpoints and not the true source and destination of the tunneled packets, even if they are the same as the tunnel endpoints.

- **Transport preferred**—Encapsulation mode is set to transport mode with an option to fallback to tunnel mode if the peer does not support it. In Transport mode only the IP payload is encrypted, and the original IP headers are left intact. Therefore, the admin must select a protected network that matches the VPN interface IP address.
This mode has the advantages of adding only a few bytes to each packet and allowing devices on the public network to see the final source and destination of the packet. With transport mode, you can enable special processing (for example, QoS) on the intermediate network based on the information in the IP header. However, the Layer 4 header is encrypted, which limits examination of the packet.

- **Transport required**— Encapsulation mode is set to transport mode only, falling back to tunnel mode is not allowed. If the endpoints cannot successfully negotiate transport mode, due to one endpoint not supporting it, the VPN connection is not made.

**Proposals**

Click to specify the proposals for your chosen IKEv1 or IKEv2 method. Select from the available IKEv1 IPsec Proposals or IKEv2 IPsec Proposals objects, or create and then select a new one. See Configure IKEv1 IPsec Proposal Objects, on page 466 and Configure IKEv2 IPsec Proposal Objects, on page 466 for details.

**Enable Security Association (SA) Strength Enforcement**

Enabling this option ensures that the encryption algorithm used by the child IPsec SA is not stronger (in terms of the number of bits in the key) than the parent IKE SA.

**Enable Reverse Route Injection**

Reverse Route Injection (RRI) enables static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint.

**Enable Perfect Forward Secrecy**

Whether to use Perfect Forward Secrecy (PFS) to generate and use a unique session key for each encrypted exchange. The unique session key protects the exchange from subsequent decryption, even if the entire exchange was recorded and the attacker has obtained the preshared or private keys used by the endpoint devices. If you select this option, also select the Diffie-Hellman key derivation algorithm to use when generating the PFS session key in the Modulus Group list.

**Modulus Group**

The Diffie-Hellman group to use for deriving a shared secret between the two IPsec peers without transmitting it to each other. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. For a full explanation of the options, see Deciding Which Diffie-Hellman Modulus Group to Use, on page 764.

**Lifetime (seconds)**

The number of seconds a security association exists before expiring. The default is 28,800 seconds.

**Lifetime (kbytes)**

The volume of traffic (in kilobytes) that can pass between IPsec peers using a given security association before it expires. The default is 4,608,000 kilobytes. Infinite data is not allowed.

**ESPv3 Settings**

**Validate incoming ICMP error messages**

Choose whether to validate ICMP error messages received through an IPsec tunnel and destined for an interior host on the private network.

**Enable ’Do Not Fragment’ Policy**

Define how the IPsec subsystem handles large packets that have the do-not-fragment (DF) bit set in the IP header.

**Policy**

- Copy DF bit—Maintains the DF bit.
- Clear DF bit—Ignores the DF bit.
• Set DF bit—Sets and uses the DF bit.

**Enable Traffic Flow Confidentiality (TFC) Packets**
Enable dummy TFC packets that mask the traffic profile which traverses the tunnel. Use the **Burst**, **Payload Size**, and **Timeout** parameters to generate random length packets at random intervals across the specified SA.

---

## FTD Advanced VPN Deployment Options

The following list describes the advanced options you can specify in your deployment.

*Note*
Settings in this dialog apply to the entire topology, all tunnels, and all managed devices.

### Advanced > IKE > ISAKAMP Settings

#### IKE Keepalive
Enable or disables IKE Keepalives. Or set to EnableInfinite specifying that the device never starts keepalive monitoring itself.

**Threshold**
Specifies the IKE keep alive confidence interval. This is the number of seconds allowing a peer to idle before beginning keepalive monitoring. The minimum and default is 10 seconds; the maximum is 3600 seconds.

**Retry Interval**
Specifies number of seconds to wait between IKE keep alive retries. The default is 2 seconds, the maximum is 10 seconds.

#### Identity Sent to Peers:
Choose the Identity that the peers will use to identify themselves during IKE negotiations:

- **autoOrDN**(default)—Determines IKE negotiation by connection type: IP address for preshared key, or Cert DN for certificate authentication (not supported).
- **ipAddress**—Uses the IP addresses of the hosts exchanging ISAKMP identity information.
- **hostname**—Uses the fully qualified domain name of the hosts exchanging ISAKMP identity information. This name comprises the hostname and the domain name.

### Enable Aggressive Mode
Available only in a hub-and-spoke VPN topology. Select this negotiation method for exchanging key information if the IP address is not known and DNS resolution might not be available on the devices. Negotiation is based on hostname and domain name.

### Advanced > IKE > IVEv2 Security Association (SA) Settings

More session controls are available for IKE v2 that limit the number of open SAs. By default, there is no limit to the number of open SAs:
Cookie Challenge
Whether to send cookie challenges to peer devices in response to SA initiate packets, which can help thwart denial of service (DoS) attacks. The default is to use cookie challenges when 50% of the available SAs are in negotiation. Select one of these options:

- Custom:
- Never (default)
- Always

Threshold to Challenge Incoming Cookies
The percentage of the total allowed SAs that are in-negotiation. This triggers cookie challenges for any future SA negotiations. The range is zero to 100%.

Number of SAs Allowed in Negotiation
Limits the maximum number of SAs that can be in negotiation at any time. If used with Cookie Challenge, configure the cookie challenge threshold lower than this limit for an effective cross-check.

Maximum number of SAs Allowed
Limits the number of allowed IKEv2 connections. Default is unlimited.

Enable Notification on Tunnel Disconnect
Allows an administrator to enable or disable the sending of an IKE notification to the peer when an inbound packet that is received on an SA does not match the traffic selectors for that SA. Sending this notification is disabled by default.

Do not allow device reboot until all sessions are terminated
Check to enable waiting for all active sessions to voluntarily terminate before the system reboots. This is disabled by default.

Advanced > IPsec > IPsec Settings
Enable Fragmentation Before Encryption
This option lets traffic travel across NAT devices that do not support IP fragmentation. It does not impede the operation of NAT devices that do support IP fragmentation.

Path Maximum Transmission Unit Aging
Check to enable PMTU (Path Maximum Transmission Unit) Aging, the interval to Reset PMTU of an SA (Security Association)

Value Reset Interval
Enter the number of minutes at which the PMTU value of an SA (Security Association) is reset to its original value. Valid range is 10 to 30 minutes, default is unlimited.

Advanced > Tunnel > Tunnel Options
Enable Spoke to Spoke Connectivity through Hub

Advanced > Tunnel > NAT Settings
Keepalive Messages Traversal
Select whether to enable NAT keepalive message traversal. NAT traversal keepalive is used for the transmission of keepalive messages when there is a device (middle device) located between a VPN-connected hub and spoke, and that device performs NAT on the IPsec flow. If you select this option, configure the interval, in seconds, between the keepalive signals sent between the spoke and the middle device to indicate that the session is active. The value can be from 5 to 3600 seconds. The default is 20 seconds.
Interval

Sets the NAT keepalive interval, from 5 to 3600 seconds. The default is 20 seconds.

Monitoring FTD VPNs

Monitor FTD VPN activity in the following ways:

- **System Messages**
  
  The Message Center is the place to start your monitoring. This feature allows you to view messages that are continually generated about system activities and status. To open the Message Center, click in the **System Status** icon, located to the immediate right of the **Deploy** button in the main menu. See **System Messages**, on page 311 for details on using the Message Center.

- **VPN Health Events**
  
  These events are displayed along with other system events under **System > Health > Events > VPN Status**. See **Health Monitoring**, on page 273 for details on viewing system health events.

- **System Logs**
  
  Currently the Firepower Management Center does not have the capability to read the FTD VPN syslogs. These syslogs need to be forwarded to a third-party server for analysis and archiving. See **About Configuring Syslog**, on page 888 for details on configuring syslog servers and viewing the system logs.

- **Unified CLI Commands**, see **Command Reference for Firepower Threat Defense**
  
  Use the show, clear, and debug commands on the FTD device to monitor and troubleshoot VPN activity.

**Monitoring Guidelines**

- If more than 300 FTD devices are configured in the Firepower Management Center, event handling issues may arise.

- Event loss between the FTD device and the Firepower Management Center is possible if the connection is broken.

About System Configuration

System configuration settings apply to either a Firepower Management Center or a Classic managed device (7000 and 8000 Series, ASA FirePOWER, NGIPSv):
• For the Firepower Management Center these configuration settings are part of a "local" system configuration. Note that system configuration on the Firepower Management Center is specific to a single system, and changes to a FMC's system configuration affect only that system.

• For a Classic managed device, you apply a configuration from the Firepower Management Center as part of a platform settings policy. You create a shared policy to configure a subset of the system configuration settings, appropriate for managed devices, that are likely to be similar across a deployment.

Tip
For 7000 and 8000 Series devices, you can perform limited system configuration tasks from the local web interface, such as console configuration and remote management. These are not the same configurations that you apply to a 7000 or 8000 Series device using a platform settings policy.

Navigating the Firepower Management Center System Configuration

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

The system configuration identifies basic settings for a Firepower Management Center.

Procedure

Step 1 Choose System > Configuration.
Step 2 Use the navigation panel to choose configurations to change; see Table 70: System Configuration Settings, on page 786 for more information.

System Configuration Settings

Note that for managed devices, many of these configurations are handled by a platform settings policy applied from the FMC; see Platform Settings Policies, on page 853. For 7000/8000 series devices, you can also log into the local web interface for non-policy based system configurations; see Local System Configuration for 7000/8000 Series Devices, on page 868.

Appliance Information

The System > Configuration page of the web interface includes the information listed in the table below. Unless otherwise noted, all fields are read-only.

**Note**

See also the Help > About page, which includes similar but slightly different information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name you assign to the appliance. Note that this name is only used within the context of the Firepower System. Although you can use the host name as the name of the appliance, entering a different name in this field does not change the host name.</td>
</tr>
<tr>
<td>Product Model</td>
<td>The model name of the appliance.</td>
</tr>
<tr>
<td>Serial Number</td>
<td>The serial number of the appliance.</td>
</tr>
<tr>
<td>Software Version</td>
<td>The version of the software currently installed on the appliance.</td>
</tr>
<tr>
<td>Prohibit Packet Transfer to the Firepower Management Center</td>
<td>Specifies whether the managed device sends packet data with events, allowing the data to be stored on the Firepower Management Center. This setting is available on the local web interface on 7000 and 8000 Series devices.</td>
</tr>
<tr>
<td>Operating System</td>
<td>The operating system currently running on the appliance.</td>

</tr>
<tr>
<td>Current Policies</td>
<td>The system-level policies currently deployed. If a policy has been updated since it was last deployed, the name of the policy appears in italics.</td>
</tr>
<tr>
<td>Model Number</td>
<td>The appliance-specific model number stored on the internal flash drive. This number may be important for troubleshooting.</td>
</tr>
</tbody>
</table>

**HTTPS Certificates**

Secure Sockets Layer (SSL)/TLS certificates enable Firepower Management Centers and 7000 and 8000 Series devices to establish an encrypted channel between the system and a web browser. A default certificate is included with all Firepower devices, but it is not generated by a certificate authority (CA) trusted by any globally known CA. For this reason, consider replacing it with a custom certificate signed by a globally known or internally trusted CA.

⚠️ **Caution**
The FMC supports 2048-bit HTTPS certificates. If the certificate used by the FMC was generated using a public server key larger than 2048 bits, you will not be able to log in to the FMC web interface. If this happens, contact Cisco TAC.

**Default HTTPS Server Certificates**

If you use the default server certificate provided with an appliance, do not configure the system to require a valid HTTPS client certificate for web interface access because the default server certificate is not signed by the CA that signs your client certificate.

The default server certificate provided with an appliance expires 20 years from when it was first generated.

**Custom HTTPS Server Certificates**

You can use the Firepower Management Center web interface to generate a server certificate request based on your system information and the identification information you supply. You can use that request to sign a certificate if you have an internal certificate authority (CA) installed that is trusted by your browser. You can
also send the resulting request to a certificate authority to request a server certificate. After you have a signed
certificate from a certificate authority (CA), you can import it.

**HTTPS Server Certificate Requirements**

When you use HTTPS certificates to secure the connection between your web browser and the Firepower
appliance web interface, you must use certificates that comply with the Internet X.509 Public Key Infrastructure
Certificate and Certificate Revocation List (CRL) Profile (RFC 5280). When you import a server certificate
to the appliance, the system rejects the certificate if it does not comply with version 3 (X.509 v3) of that
standard.

Before importing an HTTPS server certificate, be certain it includes the following fields:

<table>
<thead>
<tr>
<th>Certificate Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Serial number</td>
<td>A positive integer assigned to the certificate by the issuing CA. Issuer and serial number together uniquely identify the certificate. See RFC 5280, section 4.1.2.2.</td>
</tr>
<tr>
<td>Signature</td>
<td>Identifier for the algorithm used by the CA to sign the certificate. Must match the signatureAlgorithm field. See RFC 5280, section 4.1.2.3.</td>
</tr>
<tr>
<td>Issuer</td>
<td>Identifies the entity that signed and issued the certificate. See RFC 5280, section 4.1.2.4.</td>
</tr>
<tr>
<td>Validity</td>
<td>Interval during which the CA warrants that it will maintain information about the status of the certificate. See RFC 5280, section 4.1.2.5.</td>
</tr>
<tr>
<td>Subject</td>
<td>Identifies the entity associated with the public key stored in the subject public key field; must be an X.500 distinguished name (DN). See RFC 5280, section 4.1.2.6.</td>
</tr>
<tr>
<td>Subject Public Key Info</td>
<td>Public key and an identifier for its algorithm. See RFC 5280, section 4.1.2.7.</td>
</tr>
<tr>
<td>Authority Key Identifier</td>
<td>Provides a means of identifying the public key corresponding to the private key used to sign a certificate. See RFC 5280, section 4.2.1.1.</td>
</tr>
<tr>
<td>Subject Key Identifier</td>
<td>Provides a means of identifying certificates that contain a particular public key. See RFC 5280, section 4.2.1.2.</td>
</tr>
<tr>
<td>Key Usage</td>
<td>Defines the purpose of the key contained in the certificates. See RFC 5280, section 4.2.1.3.</td>
</tr>
<tr>
<td>Certificate Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Basic Constraints</td>
<td>Identifies whether the certificate Subject is a CA, and the maximum depth of validation certification paths that include this certificate. See RFC 5280, section 4.2.1.9. For server certificates used in Firepower appliances, use critical CA:FALSE.</td>
</tr>
<tr>
<td>Extended Key Usage extension</td>
<td>Indicates one or more purposes for which the certified public key may be used, in addition to or in place of the basic purposes indicated in the Key Usage extension. See RFC 5280, section 4.2.1.12. Be certain you import certificates that can be used as server certificates.</td>
</tr>
<tr>
<td>signatureAlgorithm</td>
<td>Identifier for the algorithm the CA used to sign the certificate. Must match the Signature field. See RFC 5280, section 4.1.1.2.</td>
</tr>
<tr>
<td>signatureValue</td>
<td>Digital signature. See RFC 5280, section 4.1.1.3.</td>
</tr>
</tbody>
</table>

**HTTPS Client Certificates**

You can restrict access to the Firepower System web server using client browser certificate checking. When you enable user certificates, the web server checks that a user’s browser client has a valid user certificate selected. That user certificate must be generated by the same trusted certificate authority that is used for the server certificate. The browser cannot load the web interface under any of the following circumstances:

- The user selects a certificate in the browser that is not valid.
- The user selects a certificate in the browser that is not generated by the certificate authority that signed the server certificate.
- The user selects a certificate in the browser that is not generated by a certificate authority in the certificate chain on the device.

To verify client browser certificates, configure the system to use the online certificate status protocol (OCSP) or load one or more certificate revocation lists (CRLs). Using the OCSP, when the web server receives a connection request it communicates with the certificate authority to confirm the client certificate's validity before establishing the connection. If you configure the server to load one or more CRLs, the web server compares the client certificate against those listed in the CRLs. If a user selects a certificate that is listed in a CRL as a revoked certificate, the browser cannot load the web interface.

**Note**

If you choose to verify certificates using CRLs, the system uses the same CRLs to validate both client browser certificates and audit log server certificates.
Viewing the Current HTTPS Server Certificate

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC 7000 and 8000 Series</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can only view server certificates for the appliance you are logged in to.

**Procedure**

**Step 1** Choose System > Configuration.
**Step 2** Click HTTPS Certificate.

Generating an HTTPS Server Certificate Signing Request

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>FMC 7000 and 8000 Series</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If you install a certificate that is not signed by a globally known or internally trusted CA, the user's browser displays a security warning when they try to connect to the web interface.

A certificate signing request (CSR) is unique to the appliance or device from which you generated it. You cannot generate a CSR for multiple devices from a single appliance. Although all fields are optional, we recommend entering values for the following: CN, Organization, Organization Unit, City/Locality, State/Province, Country/Region.

The key generated for the certificate request is in Base-64 encoded PEM format.

**Procedure**

**Step 1** Choose System > Configuration.
**Step 2** Click HTTPS Certificate.
**Step 3** Click Generate New CSR.
**Step 4** Enter a country code in the Country Name (two-letter code) field.
**Step 5** Enter a state or province postal abbreviation in the State or Province field.
**Step 6** Enter a Locality or City.
**Step 7** Enter an Organization name.
**Step 8** Enter an Organizational Unit (Department) name.
Step 9 Enter the fully qualified domain name of the server for which you want to request a certificate in the **Common Name** field.

**Note** Enter the fully qualified domain name of the server exactly as it should appear in the certificate in the **Common Name** field. If the common name and the DNS hostname do not match, you receive a warning when connecting to the appliance.

Step 10 Click **Generate**.

Step 11 Open a text editor.

Step 12 Copy the entire block of text in the certificate request, including the **BEGIN CERTIFICATE REQUEST** and **END CERTIFICATE REQUEST** lines, and paste it into a blank text file.

Step 13 Save the file as `servername.csr`, where `servername` is the name of the server where you plan to use the certificate.

Step 14 Click **Close**.

---

**What to do next**

- Submit the certificate request to the certificate authority.
- When you receive the signed certificate, import it to the Firepower Management Center; see Importing HTTPS Server Certificates, on page 793.

## Importing HTTPS Server Certificates

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>7000 and 8000</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Series</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If the signing authority that generated the certificate requires you to trust an intermediate CA, you must also supply a certificate chain (or certificate path).

If you require client certificates, accessing an appliance via the web interface will fail when the server certificate does not meet either of the following criteria:

- The certificate is signed by the same CA that signed the client certificate.
- The certificate is signed by a CA that has signed an intermediate certificate in the certificate chain.

**Caution**

The Firepower Management Center supports 2048-bit HTTPS certificates. If the certificate used by the Firepower Management Center was generated using a public server key larger than 2048 bits, you will not be able to log in to the FMC web interface. For more information about updating HTTPS Certificates to Version 6.0.0, see "Update Management Center HTTPS Certificates to Version 6.0" in Firepower System Release Notes, Version 6.0. If you generate or import an HTTPS Certificate and cannot log in to the FMC web interface, contact Support.
Before you begin

- Generate a certificate signing request; see Generating an HTTPS Server Certificate Signing Request, on page 792.
- Upload the CSR file to the certificate authority where you want to request a certificate, or use the CSR to create a self-signed certificate.
- Confirm that the certificate meets the requirements described in HTTPS Server Certificate Requirements, on page 790.

Procedure

**Step 1** Choose System > Configuration.

**Step 2** Click HTTPS Certificate.

**Step 3** Click Import HTTPS Server Certificate.

**Step 4** Open the server certificate in a text editor, copy the entire block of text, including the `BEGIN CERTIFICATE` and `END CERTIFICATE` lines. Paste this text into the Server Certificate field.

**Step 5** Whether you must supply a Private Key depends on how you generated the Certificate Signing Request:

- If you generated the Certificate Signing Request using the Firepower Management Center web interface (as described in Generating an HTTPS Server Certificate Signing Request, on page 792), the system already has the private key and you need not enter one here.
- If you generated the Certificate Signing Request using some other means, you must supply the private key here. Open the private key file and copy the entire block of text, include the `BEGIN RSA PRIVATE KEY` and `END RSA PRIVATE KEY` lines. Paste this text into the Private Key field.

**Step 6** Open any required intermediate certificates, copy the entire block of text for each, and paste it into the Certificate Chain field.

**Step 7** Click Save.

Requiring Valid HTTPS Client Certificates

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC 7000 and 8000 Series</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

The system supports validating HTTPS client certificates using either OCSP or imported CRLs in Privacy-enhanced Electronic Mail (PEM) format.

If you choose to use CRLs, to ensure that the list of revoked certificates stays current, you can create a scheduled task to update the CRLs. The system displays the most recent refresh of the CRLs.
To access the web interface after enabling client certificates, you must have a valid client certificate present in your browser (or a CAC inserted in your reader).

Before you begin
- Import a server certificate signed by the same certificate authority that signed the client certificate to be used for the connection; see Importing HTTPS Server Certificates, on page 793.
- Import the server certificate chain if needed; see Importing HTTPS Server Certificates, on page 793.

Procedure

Step 1 Choose System > Configuration.
Step 2 Click HTTPS Certificate.
Step 3 Choose Enable Client Certificates. If prompted, select the appropriate certificate from the drop-down list.
Step 4 You have three options:
- To verify client certificates using one or more CRLS, select Enable Fetching of CRL and continue with Step 5.
- To verify client certificates using OCSP, select Enable OCSP and skip to Step 7.
- To accept client certificates without checking for revocation, skip to Step 8.
Step 5 Enter a valid URL to an existing CRL file and click Add CRL. Repeat to add up to 25 CRLs.
Step 6 Click Refresh CRL to load the current CRL or CRLs from the specified URL or URLs.
   Note Enabling fetching of the CRL creates a scheduled task to regularly update the CRL or CRLs. Edit the task to set the frequency of the update.
Step 7 Verify that the client certificate is signed by the certificate authority loaded onto the appliance and the server certificate is signed by a certificate authority loaded in the browser certificate store. (These should be the same certificate authority.)
   Caution Saving a configuration with enabled client certificates, with no valid client certificate in your browser certificate store, disables all web server access to the appliance. Make sure that you have a valid client certificate installed before saving settings.
Step 8 Click Save.

External Database Access Settings

You can configure the Firepower Management Center to allow read-only access to its database by a third-party client. This allows you to query the database using SQL using any of the following:
Enabling External Access to the Database

- industry-standard reporting tools such as Actuate BIRT, JasperSoft iReport, or Crystal Reports
- any other reporting application (including a custom application) that supports JDBC SSL connections
- the Cisco-provided command-line Java application called RunQuery, which you can either run interactively or use to obtain comma-separated results for a single query

Use the Firepower Management Center’s system configuration to enable database access and create an access list that allows selected hosts to query the database. Note that this access list does not also control appliance access.

You can also download a package that contains the following:
- RunQuery, the Cisco-provided database query tool
- InstallCert, a tool you can use to retrieve and accept the SSL certificate from the Firepower Management Center you want to access
- the JDBC driver you must use to connect to the database

See the Firepower System Database Access Guide for information on using the tools in the package you downloaded to configure database access.

### Enabling External Access to the Database

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose **System > Configuration**.

**Step 2** Click **External Database Access**.

**Step 3** Select the **Allow External Database Access** check box.

**Step 4** Enter an appropriate value in the **Server Hostname** field. Depending on your third-party application requirements, this value can be either the fully qualified domain name (FQDN), IPv4 address, or IPv6 address of the Firepower Management Center.

**Step 5** Next to **Client JDBC Driver**, click **Download** and follow your browser’s prompts to download the client.zip package.

**Step 6** To add database access for one or more IP addresses, click **Add Hosts**. An **IP Address** field appears in the **Access List** field.

**Step 7** In the **IP Address** field, enter an IP address or address range, or **any**.

**Step 8** Click **Add**.

**Step 9** Click **Save**.

**Tip** If you want to revert to the last saved database settings, click **Refresh**.
Database Event Limits

To manage disk space, the FMC periodically prunes the oldest intrusion events, audit records, Security Intelligence data, and URL filtering data from the event database. For each event type, you can specify how many records the FMC retains after pruning; never rely on the event database containing more records of any type than the retention limit configured for that type. To improve performance, tailor the event limits to the number of events you regularly work with. You can optionally choose to receive email notifications when pruning occurs. For some event types, you can disable storage.

To manually delete individual events, use the event viewer. You can also manually purge the database; see FMC Database Purge, on page 203.

Configuring Database Event Limits

<table>
<thead>

<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Before you begin

- If you want to receive email notifications when events are pruned from the Firepower Management Center's database, you must configure an email server; see Configuring a Mail Relay Host and Notification Address, on page 830.

Procedure

1. Choose System > Configuration.
2. Choose Database.
3. For each of the databases, enter the number of records you want to store.
   
   For information on how many records each database can maintain, see Database Event Limits, on page 797.
4. Optionally, in the Data Pruning Notification Address field, enter the email address where you want to receive pruning notifications.
5. Click Save.

Database Event Limits

</table>
Management Interfaces

After setup, you can change the management network settings, including adding more management interfaces, hostname, search domains, DNS servers, and HTTP proxy on both the FMC and the managed devices.

About Management Interfaces

By default, the Firepower Management Center manages all devices on a single management interface. Each device includes a single management interface for communicating with the FMC.

You also perform initial setup on the management interface (for both the FMC and managed devices), and log into the FMC on this interface as an administrator.

Management interfaces are also used to communicate with the Smart Licensing server, to download updates, and to perform other management functions.

Management Interfaces on the Firepower Management Center

The Firepower Management Center uses the eth0 interface for initial setup, HTTP access for administrators, management of devices, as well as other management functions such as licensing and updates.

You can also configure additional management interfaces on the same network, or on different networks. When the FMC manages large numbers of devices, adding more management interfaces can improve throughput and performance. You can also use these interfaces for all other management functions. You might want to use each management interface for particular functions; for example, you might want to use one interface for HTTP administrator access and another for device management.

For device management, the management interface carries two separate traffic channels: the management traffic channel carries all internal traffic (such as inter-device traffic specific to managing the device), and the event traffic channel carries all event traffic (such as web events). You can optionally configure a separate event-only interface on the FMC to handle event traffic; you can configure only one event interface. Event traffic can use a large amount of bandwidth, so separating event traffic from management traffic can improve the performance of the FMC. For example, you can assign a 10 GigabitEthernet interface to be the event interface, if available, while using 1 GigabitEthernet interfaces for management. You might want to configure an event-only interface on a completely secure, private network while using the regular management interface on a network that includes Internet access, for example. You can also use both management and event interfaces on the same network if the goal is only to take advantage of increased throughput. If you configure an event-only interface on the FMC, you can support devices with separate management and event-only interfaces, but also

<table>
<thead>
<tr>

<td>1 million</td>
<td>One</td>
</tr>
</tbody>
</table>
Management Interfaces on Managed Devices

Some models include an additional management interface that you can configure for event-only traffic, so you can separate management and event traffic when communicating with the FMC.

When you set up your device, you specify the FMC IP address that you want to connect to. Both management and event traffic go to this address at initial registration. Note: In some situations, the FMC might establish the initial connection on a different management interface; subsequent connections should use the management interface with the specified IP address.

If both the device and the FMC have separate event interfaces, then after they learn about each other’s event interfaces during management communication, subsequent event traffic is sent between these interfaces if the network allows. If the event network goes down, then event traffic reverts to the regular management interface. The device uses a separate event interface when possible, but the management interface is always the backup. If you use only one management interface on the managed device, then you cannot send management traffic to the FMC management interface, and then send event traffic to the separate FMC event interface; both FMC and managed device must have separate event interfaces. In this case, both management and event traffic go to the FMC management interface, and the FMC event interface is not used for this device.

Management Interface Support

See the hardware installation guide for your model for the management interface locations.

Note

For the Firepower 4100/9300 chassis, the MGMT interface is for chassis management, not for FTD logical device management. You must configure a separate NIC interface to be of type mgmt (and/or firepower-eventing), and then assign it to the FTD logical device.

Note

For FTD on any chassis, the physical management interface is shared between the Diagnostic logical interface, which is useful for SNMP or syslog, and is configured along with data interfaces in the FMC, and the Management logical interface for FMC communication. See Management/Diagnostic Interface, on page 555 for more information.

See the following tables for supported management interfaces on each Firepower Management Center and managed device model.

### Network Routes on Management Interfaces

Management interfaces (including event-only interfaces) support only static routes to reach remote networks. When you set up your FMC or managed device, the setup process creates a default route to the gateway IP address that you specify. You cannot delete this route; you can only modify the gateway address.

The default route always uses the lowest-numbered management interface (e.g. eth0).

At least 1 static route is recommended per management interface to access remote networks, including when multiple interfaces are on the same network.

For example, on the FMC both eth0 and eth1 are on the same network, but you want to manage a different group of devices on each interface. The default gateway is 192.168.45.1. If you want eth1 to manage devices on the remote 10.6.6.0/24 destination network, you can create a static route for 10.6.6.0/24 through eth1 with the same gateway of 192.168.45.1. Traffic to 10.6.6.0/24 will hit this route before it hits the default route, so eth1 will be used as expected.

If you want to use 2 FMC interfaces to manage remote devices that are on the same network, then static routing on the FMC may not scale well, because you need separate static routes per device IP address.

Another example includes separate management and event-only interfaces on both the FMC and the managed device. The event-only interfaces are on a separate network from the management interfaces. In this case, add a static route through the event-only interface for traffic destined for the remote event-only network, and vice versa.

---

The routing for management interfaces is completely separate from routing that you configure for data interfaces.
Management and Event Traffic Channel Examples

The following example shows the Firepower Management Center and managed devices using only the default management interfaces.

*Figure 19: Single Management Interface on the Firepower Management Center*

The following example shows the Firepower Management Center using separate management interfaces for devices; and each managed device using 1 management interface.

*Figure 20: Multiple Management Interfaces on the Firepower Management Center*

The following example shows the Firepower Management Center and managed devices using a separate event interface.

*Figure 21: Separate Event Interface on the Firepower Management Center and Managed Devices*

The following example shows a mix of multiple management interfaces and a separate event interface on the Firepower Management Center and a mix of managed devices using a separate event interface, or using a single management interface.
Configure Management Interfaces

You can change management interface settings for Firepower appliances:

- **Firepower Management Center**—Use the web interface. (We strongly recommend that you do not use the Firepower Management Center Linux shell unless directed by Cisco TAC or by explicit instructions in the FMC documentation.)
- **FTD devices, NGIPSv, ASA FirePOWER**—Use the CLI
- **7000 & 8000 Series devices**—Use the limited web interface or the CLI.

See the following sections.

**Related Topics**
- Communication Port Requirements, on page 2360

**Configure Firepower Management Center Management Interfaces**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Modify the management interface settings on the Firepower Management Center. You can optionally enable additional management interfaces or configure an event-only interface.

**Caution**

Be careful when making changes to the management interface to which you are connected; if you cannot re-connect because of a configuration error, you need to access the FMC console port to re-configure the network settings in the Linux shell. You must contact Cisco TAC to guide you in this operation.
If you change the FMC IP address, then see the following tasks to ensure device management connectivity depending on how you added the device to the FMC:

- **IP address**—No action. If you added the device to the FMC using a reachable device IP address, then the management connection will be reestablished automatically after several minutes. **Note:** If you specified a device IP address that is unreachable, then you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.

- **NAT ID only**—Contact Cisco TAC. If you added the device using only the NAT ID, then the connection cannot be reestablished. In this case, you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.

### Before you begin

If you use a proxy:

- Proxies that use NT LAN Manager (NTLM) authentication are not supported.
- If you use or will use Smart Licensing, the proxy FQDN cannot have more than 64 characters.

### Procedure

**Step 1**
Choose **System > Configuration**, and then choose **Management Interfaces**.

**Step 2**
In the **Interfaces** area, click **Edit** next to the interface that you want to configure.

All available interfaces are listed in this section. You cannot add more interfaces.

You can configure the following options on each management interface:

- **Enabled**—Enable the management interface. Do **not** disable the default eth0 management interface. Some processes require the eth0 interface.

- **Channels**—Configure an event-only interface; you can configure only one event interface on the FMC. To do so, uncheck the **Management Traffic** check box, and leave the **Event Traffic** check box checked. You can optionally disable **Event Traffic** for the management interface(s). In either case, the device will try to send events to the event-only interface, and if that interface is down, it will send events on the management interface even if you disable the event channel. You cannot disable both event and management channels on an interface.

- **Mode**—Specify a link mode. Note that any changes you make to auto-negotiation are ignored for GigabitEthernet interfaces.

- **MDI/MDIX**—Set the **Auto-MDIX** setting.

- **MTU**—Set the maximum transmission unit (MTU). The default is 1500. The range within which you can set the MTU can vary depending on the model and interface type.

Because the system automatically trims 18 bytes from the configured MTU value, any value below 1298 does not comply with the minimum IPv6 MTU setting of 1280, and any value below 594 does not comply with the minimum IPv4 MTU setting of 576. For example, the system automatically trims a configured value of 576 to 558.
• **IPv4 Configuration**—Set the IPv4 IP address. Choose:
  - **Static**—Manually enter the IPv4 Management IP address and IPv4 Netmask.
  - **DHCP**—Set the interface to use DHCP (eth0 only).
  - **Disabled**—Disable IPv4. Do not disable both IPv4 and IPv6.

• **IPv6 Configuration**—Set the IPv6 IP address. Choose:
  - **Static**—Manually enter the IPv6 Management IP address and IPv6 Prefix Length.
  - **DHCP**—Set the interface to use DHCPv6 (eth0 only).
  - **Router Assigned**—Enable stateless autoconfiguration.
  - **Disabled**—Disable IPv6. Do not disable both IPv4 and IPv6.

**Step 3**
In the **Routes** area, edit a static route by clicking edit (_pen), or add a route by clicking add (_plus). View the route statistics by clicking view (eye).

You need a static route for each additional interface to reach remote networks. For more information about when new routes are needed, see Network Routes on Management Interfaces, on page 802.

**Note**
For the default route, you can change only the gateway IP address. The default route always uses the eth0 interface.

You can configure the following settings for a static route:
- **Destination**—Set the destination address of the network to which you want to create a route.
- **Netmask** or **Prefix Length**—Set the netmask (IPv4) or prefix length (IPv6) for the network.
- **Interface**—Set the egress management interface.
- **Gateway**—Set the gateway IP address.

**Step 4**
In the **Shared Settings** area, set network parameters shared by all interfaces.

**Note**
If you selected DHCP for the eth0 interface, you cannot manually specify some shared settings derived from the DHCP server.

You can configure the following shared settings:
- **Hostname**—Set the FMC hostname. If you change the hostname, reboot the FMC if you want the new hostname reflected in syslog messages. Syslog messages do not reflect a new hostname until after a reboot.
- **Domains**—Set the search domain(s) for the FMC, separated by commas. These domains are added to hostnames when you do not specify a fully-qualified domain name in a command, for example, **ping system**. The domains are used only on the management interface, or for commands that go through the management interface.
- **Primary DNS Server**, **Secondary DNS Server**, **Tertiary DNS Server**—Set the DNS servers to be used in order of preference.
**Remote Management Port**—Set the remote management port for communication with managed devices. The FMC and managed devices communicate using a two-way, SSL-encrypted communication channel, which by default is on port 8305.

**Note** Cisco strongly recommends that you keep the default settings for the remote management port, but if the management port conflicts with other communications on your network, you can choose a different port. If you change the management port, you must change it for all devices in your deployment that need to communicate with each other.

**Step 5** In the **Proxy** area, configure HTTP proxy settings.

The FMC is configured to directly-connect to the internet on ports TCP/443 (HTTPS) and TCP/80 (HTTP). You can use a proxy server, to which you can authenticate via HTTP Digest.

See proxy requirements in the prerequisites to this topic.

a) Check the **Enabled** check box.

b) In the **HTTP Proxy** field, enter the IP address or fully-qualified domain name of your proxy server.

   See requirements in the prerequisites to this topic.

c) In the **Port** field, enter a port number.

d) Supply authentication credentials by choosing **Use Proxy Authentication**, and then provide a **User Name** and **Password**.

**Step 6** Click **Save**.

**Step 7** If you change the FMC IP address, then see the following tasks for device management connectivity depending on how you added the device to the FMC.

- **IP address**—**No action**. If you added the device to the FMC using a reachable device IP address, then the management connection will be reestablished automatically after several minutes. **Note**: If you specified a device IP address that is unreachable, then you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.

- **NAT ID only**—**Contact Cisco TAC**. If you added the device using only the NAT ID, then the connection cannot be reestablished. In this case, you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.

---

**Configure Device Management Interfaces at the CLI**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Modify the management interface settings on the managed device using the CLI. Many of these settings are ones that you set when you performed the initial setup; this procedure lets you change those settings, and set additional settings such as enabling an event interface if your model supports it, or adding static routes.

For information about the FTD CLI, see *Command Reference for Firepower Threat Defense*.

For information about the classic device CLI, see *Classic Device Command Line Reference, on page 2363* in this guide.
The FTD and classic devices use the same commands for management interface configuration. Other commands may differ between the platforms.

**Note** When using SSH, be careful when making changes to the management interface; if you cannot re-connect because of a configuration error, you will need to access the device console port.

**Note** If you change the device management IP address, then see the following tasks for FMC connectivity depending on how you identified the FMC during initial device setup using the `configure manager add` command (see Identify a New FMC, on page 231):

- **IP address**—No action. If you identified the FMC using a reachable IP address, then the management connection will be reestablished automatically after several minutes. To establish the connection faster, you can change the device IP address shown in FMC; see Editing Device Management Settings, on page 238. **Note**: If you specified an unreachable FMC IP address, then see the procedure for NAT ID below.

- **NAT ID only**—Manually reestablish the connection. If you identified the FMC using only the NAT ID, then the connection cannot be automatically reestablished. In this case, change the device management IP address in FMC according to Editing Device Management Settings, on page 238.

**Before you begin**

- For Firepower Threat Defense devices, you can create user accounts that can log into the CLI using the `configure user add` command; see Creating Local User Accounts for the FTD CLI, on page 70.

- For the 7000 & 8000 Series devices, you can create user accounts at the web interface as described in Creating a User Account, on page 65.

**Procedure**

**Step 1**
Connect to the device CLI, either from the console port or using SSH.
See Logging Into the Command Line Interface on FTD Devices, on page 28 or Logging Into the CLI on 7000/8000 Series, ASA FirePOWER, and NGIPSv Devices, on page 27.

**Step 2**
Log in with the Admin username and password.

**Step 3**
Enable an event-only interface (for supported models; see Management Interface Support, on page 800):

```
configure network management-interface enable management_interface
```

```
configure network management-interface disable-management-channel management_interface
```

**Example:**
This example is for a Firepower 4100 or 9300 device; valid interface names differ by device type.

```
> configure network management-interface enable management1
Configuration updated successfully
```

```
> configure network management-interface disable-management-channel management1
Configuration updated successfully
```
The Firepower Management Center event-only interface cannot accept management channel traffic, so you should simply disable the management channel on the device event interface.

You can optionally disable events for the management interface using the `configure network management-interface disable-events-channel` command. In either case, the device will try to send events on the event-only interface, and if that interface is down, it will send events on the management interface even if you disable the event channel.

You cannot disable both event and management channels on an interface.

### Step 4
Configure the network settings of the management interface and/or event interface:

If you do not specify the `management_interface` argument, then you change the network settings for the default management interface. When configuring an event interface, be sure to specify the `management_interface` argument. The event interface can be on a separate network from the management interface, or on the same network. If you are connected to the interface you are configuring, you will be disconnected. You can re-connect to the new IP address.

#### a) Configure the IPv4 address:

- Manual configuration:

  `configure network ipv4 manual ip_address netmask gateway_ip [management_interface]`

  Note that the `gateway_ip` in this command is only used to create the default route for the primary management interface. If you set the gateway for an event-only interface, then this command ignores the gateway and does not create a default or static route for it. You must create a static route separately using the `configure network static-routes` command.

  **Example:**

  ```
  > configure network ipv4 manual 10.10.10.45 255.255.255.0 management1
  Setting IPv4 network configuration.
  Network settings changed.
  ```

- DHCP (supported on the default management interface only):

  `configure network ipv4 dhcp`

#### b) Configure the IPv6 address:

- Stateless autoconfiguration:

  `configure network ipv6 router [management_interface]`

  **Example:**

  ```
  > configure network ipv6 router management0
  Setting IPv6 network configuration.
  Network settings changed.
  ```
• Manual configuration:

configure network ipv6 manual ip6_address ip6_prefix_length [ip6_gateway_ip] [management_interface]

Note that the ip6_gateway_ip in this command is only used to create the default route for the primary management interface. If you set the gateway for an event-only interface, then this command ignores the gateway and does not create a default or static route for it. You must create a static route separately using the configure network static-routes command.

Example:

> configure network ipv6 manual 2001:0DB8:BA98::3210 64 management1
Setting IPv6 network configuration.
Network settings changed.
>

• DHCPv6 (supported on the default management interface only):

configure network ipv6 dhcp

Step 5

Add a static route for the event-only interface if the Firepower Management Center is on a remote network; otherwise, all traffic will match the default route through the management interface.

configure network static-routes {ipv4 | ipv6} add management_interface destination_ip netmask_or_prefix gateway_ip

For the default route, do not use this command; you can only change the default route gateway IP address when you use the configure network ipv4 or ipv6 commands for the default management interface (see step 4).

For information about routing, see Network Routes on Management Interfaces, on page 802.

Example:

> configure network static-routes ipv4 add management1 192.168.6.0 255.255.255.0 10.10.10.1
Configuration updated successfully

> configure network static-routes ipv6 add management1 2001:0DB8:AA89::5110 64 2001:0DB8:BA98::3211
2001:0DB8:AA89::5110 64
Configuration updated successfully

>

To display static routes, enter show network-static-routes (the default route is not shown):

> show network-static-routes

-------------[ IPv4 Static Routes ]-------------
Interface      : management1
Destination    : 192.168.6.0
Gateway        : 10.10.10.1
Netmask        : 255.255.255.0
[...]

Step 6

Set the hostname:
configure network hostname name

Example:

> configure network hostname farscape1

Syslog messages do not reflect a new hostname until after a reboot.

Step 7

Set the search domains:

configure network dns searchdomains domain_list

Example:

> configure network dns searchdomains example.com,cisco.com

Set the search domain(s) for the device, separated by commas. These domains are added to hostnames when you do not specify a fully-qualified domain name in a command, for example, ping system. The domains are used only on the management interface, or for commands that go through the management interface.

Step 8

Set up to 3 DNS servers, separated by commas:

configure network dns servers dns_ip_list

Example:

> configure network dns servers 10.10.6.5,10.20.89.2,10.80.54.3

Step 9

Set the remote management port for communication with the FMC:

configure network management-interface tcpport number

Example:

> configure network management-interface tcpport 8555

The FMC and managed devices communicate using a two-way, SSL-encrypted communication channel, which by default is on port 8305.

Note: Cisco strongly recommends that you keep the default settings for the remote management port, but if the management port conflicts with other communications on your network, you can choose a different port. If you change the management port, you must change it for all devices in your deployment that need to communicate with each other.

Step 10

Configure an HTTP proxy. The device is configured to directly-connect to the internet on ports TCP/443 (HTTPS) and TCP/80 (HTTP). You can use a proxy server, to which you can authenticate via HTTP Digest. After issuing the command, you are prompted for the HTTP proxy address and port, whether proxy authentication is required, and if it is required, the proxy username, proxy password, and confirmation of the proxy password.

configure network http-proxy

Example:

> configure network http-proxy
Manual proxy configuration
Enter HTTP Proxy address: 10.100.10.10
Enter HTTP Proxy Port: 80
Use Proxy Authentication? (y/n) [n]: Y
Enter Proxy Username: proxuser
Enter Proxy Password: proxypassword
Confirm Proxy Password: proxypassword

Step 11
If you change the device management IP address, then see the following tasks for FMC connectivity depending on how you identified the FMC during initial device setup using the configure manager add command (see Identify a New FMC, on page 231):

• IP address—No action. If you identified the FMC using a reachable IP address, then the management connection will be reestablished automatically after several minutes. To establish the connection faster, you can change the device IP address shown in FMC; see Editing Device Management Settings, on page 238. Note: If you specified an unreachable FMC IP address, then you must manually reestablish the connection using Editing Device Management Settings, on page 238.

• NAT ID only—Manually reestablish the connection. If you identified the FMC using only the NAT ID, then the connection cannot be automatically reestablished. In this case, change the device management IP address in FMC according to Editing Device Management Settings, on page 238.

Shut Down or Restart

Use the web interface to control the shut down and restart of processes on the FMC. You can:

• Shut down: Initiate a graceful shutdown of the appliance.

⚠️ Caution
Do not shut off Firepower appliances using the power button; it may cause a loss of data. Using the web interface (or CLI) prepares the system to be safely powered off and restarted without losing configuration data.

• Reboot: Shut down and restart gracefully.

• Restart the console: Restart the communications, database, and HTTP server processes. This is typically used during troubleshooting.

🔍 Tip
For information on shutting down/restarting a 7000/8000 series device, including restarting the Snort process, see Shut Down or Restart a 7000/8000 Series Device, on page 873. For virtual devices, refer to the documentation for your virtual platform. For VMware in particular, custom power options are part of VMware Tools.

Remote Storage Management

On Firepower Management Centers, you can use the following for local or remote storage for backups and reports:

- Network File System (NFS)
- Server Message Block (SMB)/Common Internet File System (CIFS)
- Secure Shell (SSH)

You cannot send backups to one remote system and reports to another, but you can choose to send either to a remote system and store the other on the Firepower Management Center.

Tip
After configuring and selecting remote storage, you can switch back to local storage only if you have not increased the connection database limit.
## Configuring Local Storage

</tr>
</tbody>
</table>

### Before you begin

- Ensure that your external remote storage system is functional and accessible from your FMC.

### Procedure

**Step 1** Choose System > Configuration.

**Step 2** Click Remote Storage Device.

**Step 3** Choose NFS from the Storage Type drop-down list.

**Step 4** Add the connection information:

- Enter the IPv4 address or hostname of the storage system in the Host field.
- Enter the path to your storage area in the Directory field.

**Step 5** Optionally, check the Use Advanced Options check box and enter any required command line options; see Remote Storage Management Advanced Options, on page 816.

**Step 6** Under System Usage:

- Choose Use for Backups to store backups on the designated host.
- Choose Use for Reports to store reports on the designated host.
- Enter Disk Space Threshold for backup to remote storage. Default is 90%.

**Step 7** To test the settings, click Test.
Step 8  Click Save.

### Configuring SMB for Remote Storage

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Before you begin**

Ensure that your external remote storage system is functional and accessible from your FMC:

- The system recognizes top-level SMB shares, not full file paths. You must use Windows to share the exact directory you want to use.
- Make sure the Windows user you will use to access the SMB share from the FMC has ownership of and read/change access to the share location.

**Procedure**

**Step 1**  Choose **System > Configuration**.

**Step 2**  Click **Remote Storage Device**.

**Step 3**  Choose **SMB** from the **Storage Type** drop-down list.

**Step 4**  Add the connection information:

- Enter the IPv4 address or hostname of the storage system in the **Host** field.
- Enter the share of your storage area in the **Share** field.
- Optionally, enter the domain name for the remote storage system in the **Domain** field.
- Enter the user name for the storage system in the **Username** field and the password for that user in the **Password** field.

**Step 5**  Optionally, check the **Use Advanced Options** check box and enter any required command line options; see **Remote Storage Management Advanced Options, on page 816**.

**Step 6**  Under **System Usage**:

- Choose **Use for Backups** to store backups on the designated host.
- Choose **Use for Reports** to store reports on the designated host.

**Step 7**  To test the settings, click **Test**.

**Step 8**  Click **Save**.
Configuring SSH for Remote Storage

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Before you begin**

- Ensure that your external remote storage system is functional and accessible from your Firepower Management Center.

**Procedure**

**Step 1** Choose System > Configuration.

**Step 2** Click Remote Storage Device.

**Step 3** Choose SSH from the Storage Type drop-down list.

**Step 4** Add the connection information:

- Enter the IP address or host name of the storage system in the Host field.
- Enter the path to your storage area in the Directory field.
- Enter the storage system’s user name in the Username field and the password for that user in the Password field. To specify a network domain as part of the connection user name, precede the user name with the domain followed by a forward slash (/).
- To use SSH keys, copy the content of the SSH Public Key field and place it in your authorized_keys file.

**Step 5** Optionally, check the Use Advanced Options check box and enter any required command line options; see Remote Storage Management Advanced Options, on page 816.

**Step 6** Under System Usage:

- Choose Use for Backups to store backups on the designated host.
- Choose Use for Reports to store reports on the designated host.

**Step 7** If you want to test the settings, you must click Test.

**Step 8** Click Save.

**Remote Storage Management Advanced Options**

If you select the Network File System (NFS) protocol, Server Message Block (SMB) protocol, or SSH to use secure file transfer protocol (SFTP) to store your reports and backups, you can select the Use Advanced Options check box to use one of the mount binary options as documented in an NFS, SMB, or SSH mount man page.

If you select SMB, you can enter the security mode in the Command Line Options field using the following format:
where \textit{mode} is the security mode you want to use for remote storage.

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
\textbf{Mode} & \textbf{Description} \\
\hline
[none] & Attempt to connect as null user (no name). \\
krb5 & Use Kerberos version 5 authentication. \\
krb5i & Use Kerberos authentication and packet signing. \\

\end{table}

**Change Reconciliation**

To monitor the changes that users make and ensure that they follow your organization’s preferred standard, you can configure the system to send, via email, a detailed report of changes made over the past 24 hours. Whenever a user saves changes to the system configuration, a snapshot is taken of the changes. The change reconciliation report combines information from these snapshots to present a clear summary of recent system changes.

The following sample graphic displays a User section of an example change reconciliation report and lists both the previous value for each configuration and the value after changes. When users make multiple changes to the same configuration, the report lists summaries of each distinct change in chronological order, beginning with the most recent.

You can view changes made during the previous 24 hours.

**Configuring Change Reconciliation**

\begin{table}[h]
\centering
\begin{tabular}{|l|l|l|l|l|}
\hline
\textbf{Smart License} & \textbf{Classic License} & \textbf{Supported Devices} & \textbf{Supported Domains} & \textbf{Access} \\

Change Reconciliation Options

The **Include Policy Configuration** option controls whether the system includes records of policy changes in the change reconciliation report. This includes changes to access control, intrusion, system, health, and network discovery policies. If you do not select this option, the report will not show changes to any policies. This option is available on Firepower Management Centers only.

The **Show Full Change History** option controls whether the system includes records of all changes over the past 24 hours in the change reconciliation report. If you do not select this option, the report includes only a consolidated view of changes for each category.

Policy Change Comments

You can configure the Firepower System to track several policy-related changes using the comment functionality when users modify access control, intrusion, or network analysis policies.

With policy change comments enabled, administrators can quickly assess why critical policies in a deployment were modified. Optionally, you can have changes to intrusion and network analysis policies written to the audit log.
Configuring Comments to Track Policy Changes

You can configure the Firepower System to prompt users for comments when they modify an access control policy, intrusion policy, or network analysis policy. You can use comments to track users’ reasons for policy changes. If you enable comments on policy changes, you can make the comment optional or mandatory. The system prompts the user for a comment when each new change to a policy is saved.

**Procedure**

**Step 1** Choose **System > Configuration**.
The system configuration options appear in the left navigation panel.

**Step 2** Configure the policy comment preferences for any of the following:
- Click **Access Control Preferences** for comment preferences for access control policies.
- Click **Intrusion Policy Preferences** for comment preferences for intrusion policies.
- Click **Network Analysis Policy Preferences** for comment preferences for network analysis policies.

**Step 3** You have the following choices for each policy type:
- **Disabled**—Disables change comments.
- **Optional**—Gives users the option to describe their changes in a comment.
- **Required**—Requires users to describe their changes in a comment before saving.

**Step 4** Optionally for intrusion or network analysis policy comments:
- Check **Write changes in Intrusion Policy to audit log** to write all intrusion policy changes to the audit log.
- Check **Write changes in Network Analysis Policy to audit log** to write all network analysis policy changes to the audit log.

**Step 5** Click **Save**.

**Access List**

You can limit access to the FMC by IP address and port. By default, the following ports are enabled for any IP address:
- 443 (HTTPS) for web interface access.
- 22 (SSH) for CLI access.

You can also add access to poll for SNMP information over port 161. Because SNMP is disabled by default, you must first enable SNMP before you can add SNMP access rules. For more information, see Configure SNMP Polling, on page 833.
By default, access is not restricted. To operate in a more secure environment, consider adding access for specific IP addresses and then deleting the default any option.

**Caution**

Configure an Access List

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

This access list does not control external database access. See Enabling External Access to the Database, on page 796.

**Caution**

If you delete access for the IP address that you are currently using to connect to the FMC, and there is no entry for “IP=any port=443”, you will lose access when you save.

To configure access lists for Classic devices, use device platform settings. See Configure Access Lists for Classic Devices, on page 859.

**Before you begin**

By default, the access list includes rules for HTTPS and SSH. To add SNMP rules to the access list, you must first enable SNMP. For more information, see Configure SNMP Polling, on page 833.

**Procedure**

1. Choose System > Configuration.
2. (Optional) Click SNMP to configure SNMP if you want to add SNMP rules to the access list. By default, SNMP is disabled; see Configure SNMP Polling, on page 833.
3. Click Access List.
4. To add access for one or more IP addresses, click Add Rules.
5. In the IP Address field, enter an IP address or address range, or any.
6. Choose SSH, HTTPS, SNMP, or a combination of these options to specify which ports you want to enable for these IP addresses.
7. Click Add.
8. Click Save.

**Related Topics**

- Firepower System IP Address Conventions, on page 15
Audit Logs

The Firepower Management Center records user activity in read-only audit logs. You can review audit log data in several ways:

- Use the web interface: Auditing the System, on page 2347.
  
  Audit logs are presented in a standard event view where you can view, sort, and filter audit log messages based on any item in the audit view. You can easily delete and report on audit information and you can view detailed reports of the changes that users make.

- Stream audit log messages to the syslog: Stream Audit Logs to Syslog, on page 821.

- Stream audit log messages to an HTTP server: Stream Audit Logs to an HTTP Server, on page 822.

Streaming audit log data to an external server allows you to conserve space on the FMC. Note that sending audit information to an external URL may affect system performance.

Optionally, you can secure the channel for audit log streaming, enable TLS and mutual authentication using TLS certificates; see Audit Log Certificate, on page 823.

Classic devices also maintain audit logs. To stream audit logs from a Classic devices, see Stream Audit Logs from Classic Devices, on page 860.

Stream Audit Logs to Syslog

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When this feature is enabled, audit log records appear in the syslog in the following format:

```
Date Time Host [Tag] Sender: User_Name@User_IP, Subsystem, Action
```

Where the local date, time, and originating hostname precede the bracketed optional tag, and the sending device name precedes the audit log message.

For example, if you specify a tag of `FMC-AUDIT-LOG` for audit log messages from your management center, a sample audit log message from your FMC could appear as follows:

```
Mar 01 14:45:24 localhost [FMC-AUDIT-LOG] Dev-MC7000: admin@10.1.1.2, Operations > Monitoring, Page View
```

If you specify a severity and facility, these values do not appear in syslog messages; instead, they tell the system that receives the syslog messages how to categorize them.

To stream audit logs from Classic devices, use device platform settings: Stream Audit Logs from Classic Devices, on page 860.

Before you begin

Make sure the FMC can communicate with the syslog server. When you save your configuration, the system uses port 7/UDP to verify that the syslog server is reachable. Then, the system uses port 514/UDP to stream audit logs. If you secure the channel (optional, see Audit Log Certificate, on page 823), the system uses 6514/TCP.
Procedure

**Step 1** Choose System > Configuration.

**Step 2** Click Audit Log.

**Step 3** Choose Enabled from the Send Audit Log to Syslog drop-down menu.

**Step 4** The following fields are applicable only for audit logs sent to syslog:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The IP address or the fully qualified name of the syslog server to which you will send audit logs.</td>
</tr>
<tr>
<td>Facility</td>
<td>The subsystem that creates the message. Choose a facility described in Syslog Alert Facilities, on page 2004. For example, choose AUDIT.</td>
</tr>
<tr>
<td>Severity</td>
<td>The severity of the message. Choose a severity described in Syslog Severity Levels, on page 2005.</td>
</tr>
<tr>
<td>Tag</td>
<td>An optional tag to include in audit log syslog messages. Best practice: Enter a value in this field to easily differentiate audit log messages from other, similar syslog messages such as health alerts. For example, if you want all audit log records sent to the syslog to be labeled with FMC-AUDIT-LOG, enter FMC-AUDIT-LOG in the field.</td>
</tr>
</tbody>
</table>

**Step 5** Click Save. The system attempts to reach the syslog server on port 7/UDP.

Stream Audit Logs to an HTTP Server

When this feature is enabled, the appliance sends audit log records to an HTTP server in the following format:

```
Date Time Host [Tag] Sender: User_Name@User_IP, Subsystem, Action
```

Where the local date, time, and originating hostname precede the bracketed optional tag, and the sending appliance or device name precedes the audit log message.

For example, if you specify a tag of FROMMC, a sample audit log message could appear as follows:

```
Mar 01 14:45:24 localhost [FROMMC] Dev-MC7000: admin@10.1.1.2, Operations > Monitoring, Page View
```

To stream audit logs from Classic devices, use device platform settings: Stream Audit Logs from Classic Devices, on page 860.
Before you begin

Make sure the device can communicate with the HTTP server. Optionally, secure the channel; see Audit Log Certificate, on page 823.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose System &gt; Configuration.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Audit Log.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Optionally, in the Tag field, enter the tag name that you want to appear with the message. For example, if you want all audit log records to be preceded with FROMMC, enter FROMMC in the field.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Choose Enabled from the Send Audit Log to HTTP Server drop-down list.</td>
</tr>
<tr>
<td>Step 5</td>
<td>In the URL to Post Audit field, designate the URL where you want to send the audit information. Enter a URL that corresponds to a Listener program that expects the HTTP POST variables as listed:</td>
</tr>
<tr>
<td></td>
<td>• subsystem</td>
</tr>
<tr>
<td></td>
<td>• actor</td>
</tr>
<tr>
<td></td>
<td>• event_type</td>
</tr>
<tr>
<td></td>
<td>• message</td>
</tr>
<tr>
<td></td>
<td>• action_source_ip</td>
</tr>
<tr>
<td></td>
<td>• action_destination_ip</td>
</tr>
<tr>
<td></td>
<td>• result</td>
</tr>
<tr>
<td></td>
<td>• time</td>
</tr>
<tr>
<td></td>
<td>• tag (if defined; see Step 3)</td>
</tr>
</tbody>
</table>

Caution  To allow encrypted posts, use an HTTPS URL. Sending audit information to an external URL may affect system performance.

| Step 6 | Click Save. |

Audit Log Certificate

You can use Transport Layer Security (TLS) certificates to secure communications between Firepower appliances and a trusted audit log server.

Client Certificates (Required)

For each appliance (client certificates are unique), you must generate a certificate signing request (CSR), submit it to a Certificate Authority (CA) for signing, then import the signed certificate onto the appliance.

You cannot use the FMC to import audit log certificates onto its managed devices. These certificates are unique to each appliance, and you must log into each appliance to import them locally:
• For the FMC, use the local system configuration: Obtain a Signed Audit Log Client Certificate for the FMC, on page 825 and Import an Audit Log Client Certificate into the FMC, on page 826.

• For 7000/8000 series devices, use the local system configuration: Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device, on page 868.

• For ASA FirePOWER and NGIPSv, generate a CSR with a tool like OpenSSL, then use the CLI to import the signed certificate: `configure audit_cert import`.

Server Certificates (Optional)

For additional security, we recommend you require mutual authentication between Firepower appliances and the audit log server. To accomplish this, load one or more certificate revocation lists (CRLs). You cannot stream audit logs to servers with revoked certificates listed in those CRLs.

Firepower supports CRLs encoded in Distinguished Encoding Rules (DER) format. Note that these are the same CRLs that the system uses to validate HTTPS client certificates for the FMC web interface.

To require valid audit log server certificates, use the FMC web interface:

• For the FMC, use the local system configuration: Require Valid Audit Log Server Certificates, on page 827.

• For Classic devices (including 7000/8000 series), use device platform settings: Require Valid Audit Log Server Certificates for Classic Devices, on page 861.

Securely Stream Audit Logs

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If you stream the audit log to a trusted HTTP server or syslog server, you can use Transport Layer Security (TLS) certificates to secure the channel between the FMC and the server. You must generate a unique client certificate for each appliance you want to audit.

To securely stream audit logs to Classic devices, see Stream Audit Logs from Classic Devices, on page 860.

Before you begin

See ramifications of requiring client and server certificates at Audit Log Certificate, on page 823.

Procedure

Step 1

Obtain and install a signed client certificate on the FMC:

a) Obtain a Signed Audit Log Client Certificate for the FMC, on page 825:

Generate a Certificate Signing Request (CSR) from the FMC based on your system information and the identification information you supply.

Submit the CSR to a recognized, trusted certificate authority (CA) to request a signed client certificate.
If you will require mutual authentication between the FMC and the audit log server, the client certificate must be signed by the same CA that signed the server certificate to be used for the connection.

b) After you receive the signed certificate from the certificate authority, import it into the FMC. See Import an Audit Log Client Certificate into the FMC, on page 826.

**Step 2** Configure the communication channel with the server to use Transport Layer Security (TLS) and enable mutual authentication.

See Require Valid Audit Log Server Certificates, on page 827.

**Step 3** Configure audit log streaming if you have not yet done so.

See Stream Audit Logs to Syslog, on page 821 or Stream Audit Logs to an HTTP Server, on page 822.

---

**Obtain a Signed Audit Log Client Certificate for the FMC**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

To obtain a certificate for a managed Classic device, see Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device, on page 868.

The system generates certificate request keys in Base-64 encoded PEM format.

**Before you begin**

Keep the following in mind:

- You must generate a certificate signing request (CSR) from the device or appliance on which you will install the certificate. (For example, you cannot generate a certificate signing request for Device B from Appliance A.) You must generate a unique certificate signing request from each device and appliance.

- To ensure security, use a globally recognized and trusted Certificate Authority (CA) to sign your certificate.

- If you will require mutual authentication between the appliance and the audit log server, the same Certificate Authority must sign both the client certificate and the server certificate.

**Procedure**

**Step 1** Choose **System > Configuration**.

**Step 2** Click **Audit Log Certificate**.

**Step 3** Click **Generate New CSR**.

**Step 4** Enter a country code in the **Country Name (two-letter code)** field.

**Step 5** Enter a state or province postal abbreviation in the **State or Province** field.

**Step 6** Enter a **Locality or City**.

**Step 7** Enter an **Organization** name.

**Step 8** Enter an **Organizational Unit (Department)** name.
Step 9 Enter the fully qualified domain name of the server for which you want to request a certificate in the **Common Name** field.

**Note** If the common name and the DNS hostname do not match, audit log streaming will fail.

Step 10 Click **Generate**.

Step 11 Open a new blank file with a text editor.

Step 12 Copy the entire block of text in the certificate request, including the `BEGIN CERTIFICATE REQUEST` and `END CERTIFICATE REQUEST` lines, and paste it into a blank text file.

Step 13 Save the file as `clientname.csr`, where `clientname` is the name of the appliance where you plan to use the certificate.

Step 14 Click **Close**.

---

**What to do next**

- Submit the certificate signing request to the certificate authority that you selected using the guidelines in the "Before You Begin" section of this procedure.
- When you receive the signed certificate, import it to the appliance; see Import an Audit Log Client Certificate into the FMC, on page 826.

---

**Import an Audit Log Client Certificate into the FMC**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

For ASA FirePOWER and NGIPSv, use the CLI to import a signed certificate: `configure audit_cert import`.

For 7000/8000 series devices, use the system configuration (System > Configuration) on the device's local web interface: Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device, on page 868.

**Before you begin**

- Obtain a Signed Audit Log Client Certificate for the FMC, on page 825.
- Make sure you are importing the signed certificate for the correct appliance. Each certificate is unique to a specific appliance or device.
- If the signing authority that generated the certificate requires you to trust an intermediate CA, be prepared to provide the necessary certificate chain (or certificate path). The CA that signed the client certificate must be the same CA that signed any intermediate certificates in the certificate chain.

**Procedure**

Step 1 On the FMC, choose **System > Configuration**.

Step 2 Click **Audit Log Certificate**.
Step 3: Click Import Audit Client Certificate.

Step 4: Open the client certificate in a text editor, copy the entire block of text, including the `BEGIN CERTIFICATE` and `END CERTIFICATE` lines. Paste this text into the Client Certificate field.

Step 5: To upload a private key, open the private key file and copy the entire block of text, including the `BEGIN RSA PRIVATE KEY` and `END RSA PRIVATE KEY` lines. Paste this text into the Private Key field.

Step 6: Open any required intermediate certificates, copy the entire block of text for each, and paste it into the Certificate Chain field.

Step 7: Click Save.

**Require Valid Audit Log Server Certificates**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

The system supports validating audit log server certificates using imported CRLs in Distinguished Encoding Rules (DER) format.

**Note**

If you choose to verify certificates using CRLs, the system uses the same CRLs to validate both audit log server certificates and certificates used to secure the HTTP connection between an appliance and a web browser.

**Before you begin**

- Understand the ramifications of requiring mutual authentication and of using certificate revocation lists (CRLs) to ensure that certificates are still valid. See Audit Log Certificate, on page 823.

- Obtain and import the client certificate following the steps in Securely Stream Audit Logs, on page 824 and the topics referenced in that procedure.

**Procedure**

Step 1: On the FMC, choose System > Configuration.

Step 2: Click Audit Log Certificate.

Step 3: To use Transport Layer Security to securely stream the audit log to an external server, choose Enable TLS.

Step 4: If you want to accept server certificates without verification (not recommended):
  - a) Deselect Enable Mutual Authentication.
  - b) Click Save and skip the remainder of this procedure.

Step 5: To verify the certificate of the audit log server, choose Enable Mutual Authentication.

Step 6: (If you enabled mutual authentication) To automatically recognize certificates that are no longer valid:
  - a) Select Enable Fetching of CRL.

  **Note** Enabling fetching of the CRL creates a scheduled task to regularly update the CRL or CRLs.
b) Enter a valid URL to an existing CRL file and click Add CRL.
Repeat to add up to 25 CRLs.
c) Click Refresh CRL to load the current CRL or CRLs from the specified URL or URLs.

**Step 7**
Verify that you have a valid server certificate generated by the same certificate authority that created the client certificate.

**Step 8**
Click Save.

---

**What to do next**
(Optional) Set the frequency of CRL updates. See Configuring Certificate Revocation List Downloads, on page 186.

**View the Audit Log Client Certificate on the FMC**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can view the audit log client certificate only for the appliance that you are logged in to.

To view audit log certificates on Classic devices, use the system configuration on a 7000/8000 series device's web interface, or the CLI: `show audit_cert`.

**Procedure**

**Step 1**
Choose System > Configuration.

**Step 2**
Click Audit Log Certificate.

---

**Dashboard Settings**

Dashboards provide you with at-a-glance views of current system status through the use of widgets: small, self-contained components that provide insight into different aspects of the Firepower System. The Firepower System is delivered with several predefined dashboard widgets.

You can configure the Firepower Management Center so that Custom Analysis widgets are enabled on the dashboard.

**Related Topics**

- About Dashboards, on page 251
Enabling Custom Analysis Widgets for Dashboards

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Use Custom Analysis dashboard widgets to create a visual representation of events based on a flexible, user-configurable query.

**Procedure**

1. Choose **System > Configuration**.
2. Click **Dashboard**.
3. Check the **Enable Custom Analysis Widgets** check box to allow users to add Custom Analysis widgets to dashboards.
4. Click **Save**.

DNS Cache

You can configure the system to resolve IP addresses automatically on the event view pages. You can also configure basic properties for DNS caching performed by the appliance. Configuring DNS caching allows you to identify IP addresses you previously resolved without performing additional lookups. This can reduce the amount of traffic on your network and speed the display of event pages when IP address resolution is enabled.

**Configuring DNS Cache Properties**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

DNS resolution caching is a system-wide setting that allows the caching of previously resolved DNS lookups.

**Procedure**

1. Choose **System > Configuration**.
2. Choose **DNS Cache**.
3. From the **DNS Resolution Caching** drop-down list, choose one of the following:
   - **Enabled**—Enable caching.
   - **Disabled**—Disable caching.
4. In the **DNS Cache Timeout (in minutes)** field, enter the number of minutes a DNS entry remains cached in memory before it is removed for inactivity.
The default setting is 300 minutes (five hours).

**Step 5** Click **Save**.

---

### Email Notifications

Configure a mail host if you plan to:
- Email event-based reports
- Email status reports for scheduled tasks
- Email change reconciliation reports
- Email data-pruning notifications
- Use email for discovery event, impact flag, correlation event alerting, intrusion event alerting, and health event alerting

When you configure email notification, you can select an encryption method for the communication between the system and mail relay host, and can supply authentication credentials for the mail server if needed. After configuring, you can test the connection.

### Configuring a Mail Relay Host and Notification Address

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose **System > Configuration**.

**Step 2** Click **Email Notification**.

**Step 3** In the **Mail Relay Host** field, enter the hostname or IP address of the mail server you want to use. The mail host you enter **must** allow access from the appliance.

**Step 4** In the **Port Number** field, enter the port number to use on the email server.

Typical ports include:
- 25, when using no encryption
- 465, when using SSLv3
- 587, when using TLS
Step 5  Choose an Encryption Method:

- **TLS**—Encrypt communications using Transport Layer Security.
- **SSLv3**—Encrypt communications using Secure Socket Layers.
- **None**—Allow unencrypted communication.

**Note**  Certificate validation is not required for encrypted communication between the appliance and mail server.

Step 6  In the **From Address** field, enter the valid email address you want to use as the source email address for messages sent by the appliance.

Step 7  Optionally, to supply a user name and password when connecting to the mail server, choose **Use Authentication**. Enter a user name in the **Username** field. Enter a password in the **Password** field.

Step 8  To send a test email using the configured mail server, click **Test Mail Server Settings**. A message appears next to the button indicating the success or failure of the test.

Step 9  Click **Save**.

---

**Language Selection**

You can use the Language page to specify a different language for the web interface.

**Set the Language for the Web Interface**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

The language you specify here is used for the web interface for every user. You can choose from:

- English
- Chinese (simplified)
- Japanese
- Korean

To set the language for 7000/8000 series devices, use device platform settings: Set the Language for the 7000/8000 Series Web Interface, on page 864.

**Procedure**

**Step 1**  Choose **System > Configuration**.

**Step 2**  Click **Language**.

**Step 3**  Choose the language you want to use.

**Step 4**  Click **Save**.
Login Banners

You can use the Login Banner page to specify session, login, or custom message banners for a security appliance or shared policy.

You can use spaces but not tabs in banner text. You can specify multiple lines of text for the banner. If your text includes empty lines, the system displays this as a carriage return (CR) in the banner. You can only use ASCII characters, including new-line (press the Enter key), which counts as two characters.

When you access the security appliance through Telnet or SSH, the session closes if there is not enough system memory available to process the banner messages, or if a TCP write error occurs when attempting to display the banner messages.

Customize the Login Banner

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

To customize login banners for Classic devices, use device platform settings. See Customize the Login Banner for Classic Devices, on page 864.

Procedure

**Step 1** Choose System > Configuration.

**Step 2** Choose Login Banner.

**Step 3** In the Custom Login Banner field, enter the login banner text you want to use.

**Step 4** Click Save.

SNMP Polling

You can enable Simple Network Management Protocol (SNMP) polling. This feature supports use of versions 1, 2, and 3 of the SNMP protocol. This feature allows access to the standard management information base (MIB), which includes system details such as contact, administrative, location, service information, IP addressing and routing information, and transmission protocol usage statistics.

**Note**

When selecting SNMP versions for the SNMP protocol, note that SNMPv2 only supports read-only communities and SNMPv3 only supports read-only users. SNMPv3 also supports encryption with AES128.

Enabling SNMP polling does not cause the system to send SNMP traps; it only makes the information in the MIBs available for polling by your network management system.
Configure SNMP Polling

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

To configure SNMP polling on Classic managed devices, use the device platform settings. See Configure SNMP Polling on Classic Devices, on page 866.

**Before you begin**

Add SNMP access for each computer you plan to use to poll the system. See Configure an Access List, on page 820.

---

**Note**

The SNMP MIB contains information that could be used to attack your deployment. We recommend that you restrict your access list for SNMP access to the specific hosts that will be used to poll for the MIB. We also recommend you use SNMPv3 and use strong passwords for network management access.

---

**Procedure**

**Step 1** Choose **System > Configuration**.

**Step 2** Click **SNMP**.

**Step 3** From the **SNMP Version** drop-down list, choose the SNMP version you want to use:

- **Version 1** or **Version 2**: Enter a read-only SNMP community name in the **Community String** field, then skip to the end of the procedure.
  
  **Note** Do not include special characters (< > / % # & ? ', etc.) in the SNMP community string name.

- **Version 3**: Click **Add User** to display the user definition page. SNMPv3 only supports read-only users and encryption with AES128.

**Step 4** Enter a **Username**.

**Step 5** Choose the protocol you want to use for authentication from the **Authentication Protocol** drop-down list.

**Step 6** Enter the password required for authentication with the SNMP server in the **Authentication Password** field.

**Step 7** Re-enter the authentication password in the **Verify Password** field.

**Step 8** Choose the privacy protocol you want to use from the **Privacy Protocol** list, or choose **None** to not use a privacy protocol.

**Step 9** Enter the SNMP privacy key required by the SNMP server in the **Privacy Password** field.

**Step 10** Re-enter the privacy password in the **Verify Password** field.

**Step 11** Click **Add**.

**Step 12** Click **Save**.
Security Certifications Compliance

Your organization might be required to use only equipment and software complying with security standards established by the U.S. Department of Defense and global certification organizations. Firepower supports compliance with the following security certifications standards:

- **Common Criteria (CC):** a global standard established by the international Common Criteria Recognition Arrangement, defining properties for security products
- **Unified Capabilities Approved Products List (UCAPL):** a list of products meeting security requirements established by the U.S. Defense Information Systems Agency (DISA)

Note

The U.S. Government has changed the name of the Unified Capabilities Approved Products List (UCAPL) to the Department of Defense Information Network Approved Products List (DODIN APL). References to UCAPL in this documentation and the Firepower Management Center web interface can be interpreted as references to DODIN APL.

- **Federal Information Processing Standards (FIPS) 140:** a requirements specification for encryption modules

You can enable security certifications compliance in CC mode or UCAPL mode. Enabling security certifications compliance does not guarantee strict compliance with all requirements of the security mode selected. For more information on hardening procedures, refer to the guidelines for this product provided by the certifying entity.

Caution

After you enable this setting, you cannot disable it. If you need to take an appliance out of CC or UCAPL mode, you must reimage.

Security Certifications Compliance Characteristics

The following table describes behavior changes when you enable CC or UCAPL mode. (Restrictions on login accounts refers to command line or shell access, not web interface access.)

<table>
<thead>
<tr>
<th>System Change</th>

</table>

**Security Certifications Compliance Recommendations**

Cisco recommends that you observe the following best practices when using a system with security certifications compliance enabled:

- To enable security certifications compliance in your deployment, enable it first on the Firepower Management Center, then enable it in the same mode on all managed devices.

  Caution
  
  The Firepower Management Center will not receive event data from a managed device unless both are operating in the same security certifications compliance mode.

- For all users, enable password strength checking and set the minimum password length to the value required by the certifying agency.

- If you are using Firepower Management Centers in a high-availability configuration, configure them both to use the same security certifications compliance mode.

- Do not configure the system to use any of the following features:
  
  - Email reports, alerts, or data pruning notifications.
  - Nmap Scan, Cisco IOS Null Route, Set Attribute Value, or ISE EPS remediations.
  - Remote storage for backups or reports.
  - Third-party client access to the system database.
Enable Security Certifications Compliance

• External notifications or alerts transmitted via email, SNMP trap, or syslog.
• Audit log messages transmitted to an HTTP server or to a syslog server without using SSL certificates to secure the channel between the appliance and the server.
• You may configure the system to export event data to an external client using eStreamer only for Version 6.1.0.6 and subsequent 6.1.0.x patches.
• Do not enable external authentication using LDAP or RADIUS in deployments using CC mode.
• Do not enable CACs in deployments using CC mode.
• Disable access to the Firepower Management Center and managed devices via the Firepower REST API in deployments using CC or UCAPL mode.
• Enable CACs in deployments using UCAPL mode.

**Note**
The Firepower System does not support CC or UCAPL mode for classic devices in stacks or high availability pairs.

### Enable Security Certifications Compliance

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>FMC Classic</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

This configuration applies to either a Firepower Management Center or a Classic managed device:

• For the Firepower Management Center, this configuration is part of the system configuration.
• For a managed device, you apply this configuration from the FMC as part of a platform settings policy.

In either case, the configuration does not take effect until you save your system configuration changes or deploy the shared platform settings policy.

**Caution**

After you enable this setting, you cannot disable it. If you need to take the appliance out of CC or UCAPL mode, you must reimage.

**Before you begin**

• We recommend you register all devices that you plan to be part of your deployment to the FMC before enabling security certifications compliance on any appliances.
Procedure

Step 1  Depending on whether you are configuring an FMC or a managed device:
   • FMC: Choose System > Configuration.
   • Classic device: Choose Devices > Platform Settings and create or edit a Firepower policy.

Step 2  Click UCAPL/CC Compliance.

Note  Appliances reboot when you enable UCAPL or CC compliance. The FMC reboots when you save the system configuration; managed devices reboot when you deploy configuration changes.

Step 3  To permanently enable security certifications compliance on the appliance, you have two choices:
   • To enable security certifications compliance in Common Criteria mode, choose CC from the drop-down list.
   • To enable security certifications compliance in Unified Capabilities Approved Products List mode, choose UCAPL from the drop-down list.

Step 4  Click Save.

What to do next
   • If you have not already, apply Control and Protection licenses to all Classic devices in your deployment.
   • If your appliances were updated from versions earlier than Version 5.2.0, enabling security certifications compliance regenerates appliance certificates. After you enable security certifications compliance in the same mode across your deployment, reregister managed devices to the FMC.
   • Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Time and Time Synchronization

Synchronizing the system time on your Firepower Management Center (FMC) and its managed devices is essential to successful operation of your Firepower System. We recommend that you specify NTP servers during FMC initial configuration, but you can use the information in this section to establish or change time synchronization settings after initial configuration is complete.

Use a Network Time Protocol (NTP) server to synchronize system time on the FMC and all devices.

Caution  Unintended consequences can occur when time is not synchronized between the FMC and managed devices.

To synchronize time on FMC and managed devices, see:
   • Recommended: Synchronize Time on the FMC with an NTP Server, on page 838
     This topic includes links for instructions on configuring managed devices to synchronize with your FMC.
   • Otherwise: Synchronize Time Without Access to a Network NTP Server, on page 839
     This topic includes links for instructions on configuring managed devices to synchronize with your FMC.
Synchronize Time on the FMC with an NTP Server

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

Time synchronization among all of the components of your system is critically important.

The best way to ensure proper time synchronization between Firepower Management Center and all managed devices is to use an NTP server on your network.

Before you begin

Note the following:

• If your FMC and managed devices cannot access a network NTP server, do not use this procedure. Instead, see Synchronize Time Without Access to a Network NTP Server, on page 839.

• Do not specify an untrusted NTP server.

• Connections to NTP servers do not use configured proxy settings.

• Firepower 4100 Series devices and Firepower 9300 devices cannot use this procedure to set the system time. Instead, configure those devices to use the same NTP server(s) that you configure using this procedure. For instructions, see the documentation for your hardware model.

Caution

If the Firepower Management Center is rebooted and your DHCP server sets an NTP server record different than the one you specify here, the DHCP-provided NTP server will be used instead. To avoid this situation, configure your DHCP server to use the same NTP server.

Procedure

Step 1 Choose System > Configuration.
Step 2 Click Time Synchronization.
Step 3 If Serve Time via NTP is Enabled, choose Disabled to disable the FMC as an NTP server.
Step 4 For the Set My Clock option, choose Via NTP from and enter the hostname or IP address of an NTP server. If your organization has corroborative NTP servers, enter multiple NTP servers as a comma-separated list.
Step 5 Click Save.

What to do next

Set managed devices to synchronize with the same NTP server or servers:

• Configure device platform settings: Configure NTP Time Synchronization for Threat Defense, on page 904 and Synchronize Time on Classic Devices with an NTP Server, on page 865.
• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Synchronize Time Without Access to a Network NTP Server

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

If your devices cannot directly reach the network NTP server, or your organization does not have a network NTP server, a physical-hardware Firepower Management Center can serve as an NTP server.

Important

- Do not use this procedure unless you have no other NTP server. Instead, use the procedure in Synchronize Time on the FMC with an NTP Server, on page 838.
- Do not use a virtual Firepower Management Center as an NTP server.

Procedure

Step 1
Manually set the system time on the Firepower Management Center:

a) Choose System > Configuration.
b) Click Time Synchronization.
c) If Serve Time via NTP is Enabled, choose Disabled.
d) Click Save.
e) For Set My Clock, choose Manually in Local Configuration.
f) Click Save.
g) In the navigation panel at the left side of the screen, click Time.
h) Use the Set Time drop-down lists to set the time.
i) If the time zone displayed is not UTC, click it and set the time zone to UTC.
j) Click Save.
k) Click Done.
l) Click Apply.

Step 2
Set the Firepower Management Center to serve as an NTP server:

a) In the navigation panel at the left side of the screen, click Time Synchronization.
b) For Serve Time via NTP, choose Enabled.
c) Click Save.

Step 3
Set managed devices to synchronize with the Firepower Management Center NTP server:

a) In the Time Synchronization settings for the platform settings policy assigned to your managed devices, set the clock to synchronize Via NTP from Management Center.
b) Deploy the change to managed devices.

For instructions:

• For Firepower Threat Defense devices, see Configure NTP Time Synchronization for Threat Defense, on page 904
• For all other devices, see Synchronize Time on Classic Devices with an NTP Server, on page 865

About Changing Time Synchronization Settings

• Your Firepower Management Center and its managed devices are heavily dependent on accurate time. The system clock is a system facility that maintains the time of the Firepower System. The system clock is set to Universal Coordinated Time (UTC), which is the primary time standard by which the world regulates clocks and time.

DO NOT ATTEMPT TO CHANGE THE SYSTEM TIME. Changing the system time zone from UTC is NOT supported, and doing so will require you to reimage the device to recover from an unsupported state.

• If you configure the FMC to serve time using NTP, and then later disable it, the NTP service on managed devices still attempts to synchronize time with the FMC. You must update and redeploy any applicable platform settings policies to establish a new time source.

• To change the time manually after configuring the Firepower Management Center as an NTP server, you must disable the NTP option, change the time manually, and then re-enable the NTP option.

View Current System Time, Source, and NTP Server Connection Status

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Time settings are displayed on most pages in local time using the time zone you set on the Time Zone page in User Preferences (the default is America/New York), but are stored on the appliance using UTC time.

Restriction

The Time Zone function (in User Preferences) assumes that the default system clock is set to UTC time. DO NOT ATTEMPT TO CHANGE THE SYSTEM TIME. Be advised that changing the system time from UTC is NOT supported, and doing so will require you to reimage the device to recover from an unsupported state.

Note

To view time and time source information on your 7000- and 8000-Series hardware device, see View System Time for 7000/8000 Series Devices, on page 874.

Procedure

Step 1 Choose System > Configuration.
Step 2 Click Time.

The current time is displayed using the time zone specified for your account in User Preferences.
If your appliance uses an NTP server: For information about the table entries, see NTP Server Status, on page 841.

---

**NTP Server Status**

If you are synchronizing time from an NTP server, you can view connection status on the **Time** page (choose **System > Configuration**).

*Table 75: NTP Status*

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NTP Server</td>
<td>The IP address or name of the configured NTP server.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the NTP server time synchronization:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Being Used</strong> indicates that the appliance is synchronized with the NTP server.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Available</strong> indicates that the NTP server is available for use, but time is not yet synchronized.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Not Available</strong> indicates that the NTP server is in your configuration, but the NTP daemon is unable to use it.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Pending</strong> indicates that the NTP server is new or the NTP daemon was recently restarted. Over time, its value should change to <strong>Being Used</strong>, <strong>Available</strong>, or <strong>Not Available</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unknown</strong> indicates that the status of the NTP server is unknown.</td>
</tr>
<tr>
<td>Offset</td>
<td>The number of milliseconds of difference between the time on the appliance and the configured NTP server. Negative values indicate that the appliance is behind the NTP server, and positive values indicate that it is ahead.</td>
</tr>
<tr>
<td>Last Update</td>
<td>The number of seconds that have elapsed since the time was last synchronized with the NTP server. The NTP daemon automatically adjusts the synchronization times based on a number of conditions. For example, if you see larger update times such as 300 seconds, that indicates that the time is relatively stable and the NTP daemon has determined that it does not need to use a lower update increment.</td>
</tr>
</tbody>
</table>

**Session Timeouts**

Unattended login sessions may be security risks. You can configure the amount of idle time before a user’s login session times out due to inactivity.

Note that you can exempt specific web interface users from timeout, for scenarios where you plan to passively, securely monitor the system for long periods of time. Users with the Administrator role, whose complete access to menu options poses an extra risk if compromised, cannot be made exempt from session timeouts.
Configure Session Timeouts

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

To configure session timeouts for Classic devices, use device platform settings. See Configure Session Timeouts for Classic Devices, on page 866.

Procedure

**Step 1** Choose System > Configuration.

**Step 2** Click Shell Timeout.

**Step 3** Configure session timeouts:

- Web interface (FMC only): Configure the Browser Session Timeout (Minutes). The default value is 60; the maximum value is 1440 (24 hours).
  
  To exempt users from this session timeout, see User Account Login Options, on page 67.

- CLI: Configure the Shell Timeout (Minutes) field. The default value is 0; the maximum value is 1440 (24 hours).

**Step 4** Click Save.

Vulnerability Mapping

The Firepower System automatically maps vulnerabilities to a host IP address for any application protocol traffic received or sent from that address, when the server has an application ID in the discovery event database and the packet header for the traffic includes a vendor and version.

For any servers which do not include vendor or version information in their packets, you can configure whether the system associates vulnerabilities with server traffic for these vendor and versionless servers.

For example, a host serves SMTP traffic that does not have a vendor or version in the header. If you enable the SMTP server on the Vulnerability Mapping page of a system configuration, then save that configuration to the Firepower Management Center managing the device that detects the traffic, all vulnerabilities associated with SMTP servers are added to the host profile for the host.

Although detectors collect server information and add it to host profiles, the application protocol detectors will not be used for vulnerability mapping, because you cannot specify a vendor or version for a custom application protocol detector and cannot select the server for vulnerability mapping.

Mapping Vulnerabilities for Servers

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Protection</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>
Procedure

Step 1 Choose **System > Configuration**.

Step 2 Choose **Vulnerability Mapping**.

Step 3 You have the following choices:

- To prevent vulnerabilities for a server from being mapped to hosts that receive application protocol traffic without vendor or version information, clear the check box for that server.
- To cause vulnerabilities for a server to be mapped to hosts that receive application protocol traffic without vendor or version information, check the check box for that server.

**Tip** You can check or clear all check boxes at once using the check box next to **Enabled**.

Step 4 Click **Save**.

---

Remote Console Access Management

You can use a Linux system console for remote access on supported systems via either the VGA port (which is the default) or the serial port on the physical appliance. Use the Console Configuration page to choose the option most suitable to the physical layout of your organization’s Firepower deployment.

On supported physical-hardware-based Firepower systems, you can use Lights-Out Management (LOM) on the default (`eth0`) management interface on a Serial Over LAN (SOL) connection to remotely monitor or manage the system without logging into the management interface of the system. You can perform limited tasks, such as viewing the chassis serial number or monitoring such conditions as fan speed and temperature, using a command line interface on an out-of-band management connection.

You must enable LOM for both the system and the user you want to manage the system. After you enable the system and the user, you use a third-party Intelligent Platform Management Interface (IPMI) utility to access and manage your system.

Configuring Remote Console Settings on the System

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC 7000 &amp; 8000 Series</td>
<td>Global only</td>
<td>Admin with LOM access</td>
</tr>
</tbody>
</table>

**Before you begin**

- Disable Spanning Tree Protocol (STP) on any third-party switching equipment connected to the device’s management interface.
**Procedure**

**Step 1** Choose System > Configuration.

**Step 2** Click Console Configuration.

**Step 3** Choose a remote console access option:

- Choose **VGA** to use the appliance’s VGA port.
- Choose **Physical Serial Port** to use the appliance’s serial port, or to use LOM/SOL on a Firepower Management Center, Firepower 7050, or 8000 Series device.
- Choose **Lights-Out Management** to use LOM/SOL on a 7000 Series device (except the Firepower 7050). On these devices, you cannot use SOL and a regular serial connection at the same time.

**Note** When you change your remote console from **Physical Serial Port** to **Lights-Out Management** or from **Lights-Out Management** to **Physical Serial Port** on the 70xx Family of devices (except the Firepower 7050), you may have to reboot the appliance twice to see the expected boot prompt.

**Step 4** To configure LOM via SOL, enter the necessary IPv4 settings:

- Choose the address **Configuration** for the system (DHCP or Manual)
- Enter the **IP Address** to be used for LOM.

  **Note** The LOM IP address must be different from the management interface IP address of the system.

- Enter the **Netmask** for the system.
- Enter the **Default Gateway** for the system.

**Step 5** Click **Save**.

**What to do next**

---

**Lights-Out Management User Access Configuration**

You must explicitly grant Lights-Out Management permissions to users who will use the feature. LOM users also have the following restrictions:

- You must assign the Administrator role to the user.
- The username may have up to 16 alphanumeric characters. Hyphens and longer user names are not supported for LOM users.
- The password may have up to 20 alphanumeric characters, except when set on 71xx Family devices. If LOM is enabled on a Firepower 7110, 7115, 7120, or 7125 device, the password may have up to 16 alphanumeric characters. A user’s LOM password is the same as that user’s system password. Cisco recommends that you use a complex, non-dictionary-based password of the maximum supported length for your appliance and change it every three months.
• Physical Firepower Management Centers and 8000 Series devices can have up to 13 LOM users. 8000 Series devices can have up to eight LOM users.

Note that if you deactivate, then reactivate, a role with LOM while a user with that role is logged in, or restore a user or user role from a backup during that user’s login session, that user must log back into the web interface to regain access to IPMItool commands.

### Enabling Lights-Out Management User Access

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC \n 7000 &amp; 8000 Series</td>
<td>Global only</td>
<td>Admin with LOM access</td>
</tr>
</tbody>
</table>

You configure LOM and LOM users on a per-system basis using each system’s local web interface. You cannot use the Firepower Management Center to configure LOM on a managed device. Similarly, because users are managed independently per appliance, enabling or creating a LOM-enabled user on the Firepower Management Center does not transfer that capability to users on managed devices.

**Procedure**

1. Choose **System > Configuration**.
2. Click **Console Configuration**.
3. Click **Lights Out Management**.
4. You have the following choices:
   - To grant LOM user access to an existing user, click edit (📝) next to a user name in the list.
   - To grant LOM user access to a new user, click **Create User**.
5. Under **User Configuration**, enable the Administrator role.
6. Check the **Allow Lights-Out Management Access** check box.
7. Click **Save**.

**Serial Over LAN Connection Configuration**

You use a third-party IPMI utility on your computer to create a Serial Over LAN connection to the appliance. If your computer uses a Linux-like or Mac environment, use IPMItool; for Windows environments, use IPMIutil.

**Note**

Cisco recommends using IPMItool version 1.8.12 or greater.

**Linux**

IPMItool is standard with many distributions and is ready to use.
Mac

You must install IPMItool on a Mac. First, confirm that your Mac has Apple's XCode Developer tools installed, making sure that the optional components for command line development are installed (UNIX Development and System Tools in newer versions, or Command Line Support in older versions). Then you can install macports and the IPMItool. Use your favorite search engine for more information or try these sites:

http://www.macports.org/

Windows

You must compile IPMIutil on Windows. If you do not have access to a compiler, you can use IPMIutil itself to compile. Use your favorite search engine for more information or try this site:

http://ipmiutil.sourceforge.net/

Understanding IPMI Utility Commands

Commands used for IPMI utilities are composed of segments as in the following IPMItool example:

ipmitool -I lanplus -H IP_address -U user_name command

where:

- ipmitool invokes the utility
- -I lanplus enables encryption for the session
- -H IP_address indicates the IP address of the appliance you want to access
- -U user_name is the name of an authorized user
- - command is the name of the command you want to give

Note

Cisco recommends using IPMItool version 1.8.12 or greater.

The same command for Windows looks like this:

ipmiutil command -V 4 -J 3 -N IP_address -U user_name

This command connects you to the command line on the appliance where you can log in as if you were physically present at the appliance. You may be prompted to enter a password.

Configuring Serial Over LAN with IPMItool

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC, 7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin with LOM access</td>
</tr>
</tbody>
</table>
Procedure

Using IPMItool, enter the following command, and a password if prompted:

```
ipmitool -I lanplus -H IP_address -U user_name sol activate
``` 

Configuring Serial Over LAN with IPMIutil

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC 7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin with LOM access</td>
</tr>
</tbody>
</table>

Procedure

Using IPMIutil, enter the following command, and a password if prompted:

```
ipmiutil -J 3 -H IP_address -U username sol -a
``` 

Lights-Out Management Overview

Lights-Out Management (LOM) provides the ability to perform a limited set of actions over an SOL connection on the default (eth0) management interface without the need to log into the system. You use the command to create a SOL connection followed by one of the LOM commands. After the command is completed, the connection ends. Note that not all power control commands are valid on 70xx Family devices.

Note

The baseboard management controller (BMC) for a Firepower 71xx, Firepower 82xx, or a Firepower 83xx device is only accessible via 1 Gbps link speeds when the host is powered on. When the device is powered down, the BMC can only establish Ethernet link at 10 and 100 Mbps. Therefore if LOM is being used to remotely power the device, connect the device to the network using 10 and 100 Mbps link speeds only.

Caution

In rare cases, if your computer is on a different subnet than the system's management interface and the system is configured for DHCP, attempting to access LOM features can fail. If this occurs, you can either disable and then re-enable LOM on the system, or use a computer on the same subnet as the system to ping its management interface. You should then be able to use LOM.
Cisco is aware of a vulnerability inherent in the Intelligent Platform Management Interface (IPMI) standard (CVE-2013-4786). Enabling Lights-Out Management (LOM) on a system exposes this vulnerability. To mitigate this vulnerability, deploy your systems on a secure management network accessible only to trusted users and use a complex, non-dictionary-based password of the maximum supported length for your system and change it every three months. To prevent exposure to this vulnerability, do not enable LOM.

If all attempts to access your system have failed, you can use LOM to restart your system remotely. Note that if a system is restarted while the SOL connection is active, the LOM session may disconnect or time out.

Do not restart your system unless it does not respond to any other attempts to restart. Remotely restarting does not gracefully reboot the system and you may lose data.

### Table 76: Lights-Out Management Commands

<table>
<thead>
<tr>
<th>IPMItool</th>
<th>IPMIutil</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(not applicable)</td>
<td>-V 4</td>
<td>Enables admin privileges for the IPMI session</td>
</tr>
<tr>
<td>-I lanplus</td>
<td>-J 3</td>
<td>Enables encryption for the IPMI session</td>
</tr>
<tr>
<td>-H</td>
<td>-N</td>
<td>Indicates the IP address of the remote appliance</td>
</tr>
<tr>
<td>-U</td>
<td>-U</td>
<td>Indicates the username of an authorized LOM account</td>
</tr>
<tr>
<td>sol activate</td>
<td>sol -a</td>
<td>Starts the SOL session</td>
</tr>
<tr>
<td>sol deactivate</td>
<td>sol -d</td>
<td>Ends the SOL session</td>
</tr>
<tr>
<td>chassis power cycle</td>
<td>power -c</td>
<td>Restarts the appliance (not valid on 70xx Family devices)</td>
</tr>
<tr>
<td>chassis power on</td>
<td>power -u</td>
<td>Powers up the appliance</td>
</tr>
<tr>
<td>chassis power off</td>
<td>power -d</td>
<td>Powers down the appliance (not valid on 70xx Family devices)</td>
</tr>
<tr>
<td>sdr</td>
<td>sensor</td>
<td>Displays appliance information, such as fan speeds and temperatures</td>
</tr>
</tbody>
</table>

For example, to display a list of appliance information, the IPMItool command is:

```
ipmitool -I lanplus -H IP_address -U user_name sdr
```
Cisco recommends using IPMItool version 1.8.12 or greater.

The same command with the IPMIutil utility is:

```plaintext
ipmiutil sensor -V 4 -J 3 -N IP_address -U user_name
```

### Configuring Lights-Out Management with IPMItool

<table>

</tbody>
</table>

**Procedure**

Enter the following command for IPMIutil and a password if prompted:

```plaintext
ipmiutil -J 3 -H IP_address -U username command
```

### REST API Preferences

The Firepower REST API provides a lightweight interface for third-party applications to view and manage appliance configuration using a REST client and standard HTTP methods. For more information on the Firepower REST API, see the Firepower REST API Quick Start Guide.
By default, the Firepower Management Center allows requests from applications using the REST API. You can configure the Firepower Management Center to block this access.

### Enabling REST API Access

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

In deployments using Firepower Management Center high availability, this feature is available only in the active Firepower Management Center.

**Procedure**

1. Choose **System > Configuration**
2. Click **REST API Preferences**.
3. To enable or disable REST API access to the Firepower Management Center, check or uncheck the **Enable REST API** check box.
4. Click **Save**.

### VMware Tools and Virtual Systems

VMware Tools is a suite of performance-enhancing utilities intended for virtual machines. These utilities allow you to make full use of the convenient features of VMware products. Firepower virtual appliances running on VMware support the following plugins:

- guestInfo
- powerOps
- timeSync
- vmbackup

You can also enable VMware Tools on all supported versions of ESXi. For a list of supported versions, see the [Cisco Firepower NGIPSv Quick Start Guide for VMware](https://www.cisco.com/c/en/us/products/collateral/security/ips-systems/fmg/vmware-rn-cms-qs-guide/white-paper-c11-596958.html). For information on the full functionality of VMware Tools, see the VMware website (http://www.vmware.com/).
Enabling VMware Tools on the Firepower Management Center for VMware

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>

<td>Any</td>
<td>Any</td>
<td>Firepower</td>
<td>Global only</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Management Center</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Because NGIPSv does not have a web interface, you must use the CLI to enable VMware Tools on that platform; see the Cisco Firepower NGIPSv Quick Start Guide for VMware.

Procedure

**Step 1** Choose System > Configuration.

**Step 2** Click VMware Tools.

**Step 3** Click Enable VMware Tools.

**Step 4** Click Save.
Platform Settings Policies

The following topics explain platform settings policies and how to deploy them to managed devices:

- Introduction to Platform Settings, on page 853
- Managing Platform Settings Policies, on page 854
- Create a Platform Settings Policy, on page 854
- Setting Target Devices for a Platform Settings Policy, on page 855

Introduction to Platform Settings

A platform settings policy is a shared set of features or parameters that define the aspects of a managed device that are likely to be similar to other managed devices in your deployment, such as time settings and external authentication.

A shared policy makes it possible to configure multiple managed devices at once, which provides consistency in your deployment and streamlines your management efforts. Any changes to a platform settings policy affects all the managed devices where you applied the policy. Even if you want different settings per device, you must create a shared policy and apply it to the desired device.

For example, your organization’s security policies may require that your appliances have a “No Unauthorized Use” message when a user logs in. With platform settings, you can set the login banner once in a platform settings policy.

You can also benefit from having multiple platform settings policies on a Firepower Management Center. For example, if you have different mail relay hosts that you use under different circumstances or if you want to test different access lists, you can create several platform settings policies and switch between them, rather than editing a single policy.

Related Topics

- Configure Platform Settings for Classic Devices, on page 859
- System Configuration Settings, on page 786
Managing Platform Settings Policies

Use the Platform Settings page (Devices > Platform Settings) to manage platform settings policies. This page indicates the type of device for each policy. The Status column shows the device targets for the policy.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Step 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choose Devices &gt; Platform Settings. Manage your platform settings policies:</td>
<td></td>
</tr>
<tr>
<td><strong>Create</strong> — To create a new platform settings policy, click <strong>New Policy</strong>; see Create a Platform Settings Policy, on page 854.</td>
<td></td>
</tr>
<tr>
<td><strong>Copy</strong> — To copy a platform settings policy, click copy ( ).</td>
<td></td>
</tr>
<tr>
<td><strong>Edit</strong> — To modify the settings in an existing platform settings policy, click edit ( ).</td>
<td></td>
</tr>
<tr>
<td><strong>Delete</strong> — To delete a policy that is not in use, click delete ( ), then confirm your choice.</td>
<td></td>
</tr>
</tbody>
</table>

**Caution** You should not delete a policy that is the last deployed policy on any of its target devices, even if it is out of date. Before you delete the policy completely, it is good practice to deploy a different policy to those targets.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Create a Platform Settings Policy

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

</tbody>
</table>

Platform settings for Firepower Threat Defense devices differ from platform settings for Classic devices. When you create a new platform settings policy you must choose a type: Firepower (for Classic managed devices) or Threat Defense (for FTD devices).
Appliance Platform Settings

Setting Target Devices for a Platform Settings Policy

**Procedure**

**Step 1** Choose Devices > Platform Settings.

**Step 2** Click New Policy.

**Step 3** Choose a device type from the drop-down list:

- Firepower Settings to create a shared policy for Classic managed devices.
- Threat Defense Settings to create a shared policy for Firepower Threat Defense managed devices.

**Step 4** Enter a Name for the new policy and optionally, a Description.

**Step 5** Optionally, choose the Available Devices where you want to apply the policy and click Add to Policy (or drag and drop) to add the selected devices. You can enter a search string in the Search field to narrow the list of devices.

**Step 6** Click Save.

The system creates the policy and opens it for editing.

**Step 7** Configure the platform settings based on the device platform type:

- For Firepower Settings, see Platform Settings for Classic Devices, on page 857.
- For Threat Defense Settings, see Platform Settings for Firepower Threat Defense, on page 875.

**Step 8** Click Save.

---

**What to do next**

Deploy configuration changes; see Deploy Configuration Changes, on page 337.

---

### Setting Target Devices for a Platform Settings Policy

<table>
<thead>

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin/Network</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Admin</td>
</tr>
</tbody>
</table>

You can add targeted devices at the same time you create a new policy, or you can change them later.

**Procedure**

**Step 1** Choose Devices > Platform Settings.

**Step 2** Click edit (✏️) next to the platform settings policy that you want to edit.

**Step 3** Click Policy Assignment.

**Step 4** Do any of the following:

- To assign a device, stack, high-availability pair, or device group to the policy, select it in the Available Devices list and click Add to Policy. You can also drag and drop.
• To remove a device assignment, click delete (🗑️) next to a device, stack, high-availability pair, or device group in the **Selected Devices** list.

**Step 5**
Click **OK**.

**What to do next**

• Deploy configuration changes; see **Deploy Configuration Changes, on page 337.**
Platform Settings for Classic Devices

The following topics explain Firepower platform settings and how to configure them on Classic devices:

- About Platform Settings for Classic Devices, on page 857
- Requirements for Platform Settings for Classic Devices, on page 858
- Configure Platform Settings for Classic Devices, on page 859
- Local System Configuration for 7000/8000 Series Devices, on page 868

About Platform Settings for Classic Devices

Platform settings for managed devices are policy-based so that you can apply the same configuration to multiple devices. Use a Firepower platform settings policy with Classic devices:

- 7000/8000 series devices
- ASA FirePOWER modules
- NGIPSv

Note that for the FMC, many of these settings are handled in the system configuration; see System Configuration, on page 785.

Table 77: Firepower Platform Settings for Classic Devices

</tbody>
</table>
## Requirements for Platform Settings for Classic Devices

### License Requirements
None.

### Model Requirements
You can apply a Firepower platform settings policy to any Classic device.

Some platform settings apply only to 7000/8000 series devices because those devices have a web interface: external authentication settings, display language, session timeouts, and so on. Applying these settings to ASA FirePOWER or NGIPSv has no effect.

You can also log into the local web interface on 7000/8000 series devices for non-policy based system configurations. See Local System Configuration for 7000/8000 Series Devices, on page 868.

### Domain Requirements
None.

---

### Platform Setting

<table>

</tr>
</tbody>
</table>
You can apply a Firepower platform setting policy at any Domain level.

## Configure Platform Settings for Classic Devices

Platform settings for managed devices are policy-based so that you can apply the same configuration to multiple devices. Use a Firepower platform settings policy with Classic devices.

### Procedure

1. Choose Devices > Platform Settings and create or edit a Firepower policy.
   
   See About Platform Settings for Classic Devices, on page 857 and Create a Platform Settings Policy, on page 854.

2. Choose the Available Devices where you want to deploy the policy by clicking Policy Assignment.

3. Click Add to Policy (or drag and drop) to add the selected devices.

4. Click Save.

### What to do next

Deploy configuration changes; see Deploy Configuration Changes, on page 337.

## Configure Access Lists for Classic Devices

By default, access to Firepower devices is not restricted. Port 22 (SSH) is open for CLI access. For 7000/8000 series devices, port 443 (HTTPS) is also open for web interface access.

To operate in a more secure environment, consider adding access for specific IP addresses. You can also add access to poll for SNMP information over port 161.

### Procedure

1. Choose Devices > Platform Settings and create or edit a Firepower policy.

2. Click Access List.

3. To add access for one or more IP addresses, click Add Rules.

4. In the IP Address field, enter an IP address or address range, or any.

5. Choose SSH, HTTPS, SNMP, or a combination of these options to specify which ports you want to enable for these IP addresses.

6. Click Add.

7. Click Save.

### What to do next

Deploy configuration changes; see Deploy Configuration Changes, on page 337.
Stream Audit Logs from Classic Devices

Firepower appliances generate records (or audit logs) of user interactions. You can stream these audit logs to a syslog or HTTP server. Note that sending audit information to an external URL may affect system performance.

On 7000/8000 series devices, you can also review audit logs on the device's web interface: Auditing the System, on page 2347.

Tip

Optionally, you can use Transport Layer Security (TLS) certificates to secure communications between Firepower devices and a trusted audit log server. For each device (client certificates are unique), you must generate a certificate signing request (CSR), submit it to a Certificate Authority (CA) for signing, then import the signed certificate onto the device. You cannot use the FMC to import audit log certificates onto its managed devices. These certificates are unique to each device, and you must log into each device to import them.

To ensure security, use a globally recognized and trusted CA. The same CA must sign:

- Both the client certificate and the server certificate, if you plan to require mutual authentication between the device and the audit log server.
- Any intermediate certificates in the certificate chain. If the signing CA requires you to trust an intermediate CA, you must provide the necessary certificate chain (or certificate path).

Audit logs have the following format:

timestamp host [tag] appliance_name: username@ip_address, subsystem, action

For example:

Mar 01 14:45:24 localhost [FIREPOWER] MyFirepowerAppliance: admin@10.1.1.2, System > Configuration, Page View

Note that the tag is optional and user-configurable. Syslog events also have an optional facility and severity.

Before you begin

Make sure your devices can communicate with the server or servers where you plan to stream audit logs. For syslog streaming, the system uses port 7/UDP to verify that the syslog server is reachable when you save the configuration. Then, the system uses port 514/UDP to stream audit logs. If you secure the channel, the system uses 6514/TCP.

Procedure

Step 1 (Optional) Set up secure communications with the audit log server.

For ASA FirePOWER and NGIPSv, you can generate a CSR with a tool like OpenSSL, then use the CLI to import the signed certificate: configure audit_cert import. For 7000/8000 series devices, use the system configuration (System > Configuration) on the device's web interface: Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device, on page 868.

To verify that the certificate imported correctly, use the 7000/8000 series device's web interface, or the CLI: show audit_cert.

Step 2 On the FMC, choose Devices > Platform Settings and create or edit a Firepower policy.
Step 3
Click Audit Log to configure audit log streaming.

Syslog streaming:
  a) Set Send Audit Log to Syslog to Enabled.
  b) Provide Host information for the syslog server: IP address or fully qualified name.
  c) Choose a Facility (Syslog Alert Facilities, on page 2004) and Severity (Syslog Severity Levels, on page 2005).

HTTP streaming:
  a) Set Send Audit Log to HTTP Server to Enabled.
  b) Provide a URL to Post Audit where you want to send audit logs. HTTPS is supported.

The URL must correspond to a Listener program that expects the following HTTP POST variables:

- subsystem
- actor
- event_type
- message
- action_source_ip
- action_destination_ip
- result
- time
- tag (if provided).

Step 4
(Optional) Enter a Tag in include in each message. For example, you might want to tag Firepower audit logs with FIREPOWER.

Step 5
Click Save.

If you configured syslog streaming, the system verifies that the syslog server is reachable.

What to do next
• (Optional) If you configured secure communications, we recommend you also require mutual authentication between the device and the audit log server: Require Valid Audit Log Server Certificates for Classic Devices, on page 861.

• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Require Valid Audit Log Server Certificates for Classic Devices

For additional security, we recommend you require mutual authentication between Firepower appliances and the audit log server. To accomplish this, load one or more certificate revocation lists (CRLs). You cannot stream audit logs to servers with revoked certificates listed in those CRLs.

Firepower supports CRLs encoded in Distinguished Encoding Rules (DER) format. Note that these are the same CRLs that the system uses to validate HTTPS client certificates for the FMC web interface.

Before you begin
Obtain and import a signed client certificate onto each device.

• For ASA FirePOWER and NGIPSv, you can generate a CSR with a tool like OpenSSL, then use the CLI to import the signed certificate: configure audit_cert import.

• For 7000/8000 series devices, use the system configuration (System > Configuration) on the device's web interface: Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device, on page 868.

Use a globally recognized and trusted CA. The same CA must sign the client certificates you imported and the server certificate you will require with this procedure.
Procedure

**Step 1** Choose Devices > Platform Settings and create or edit a Firepower policy.

**Step 2** Click Audit Log Certificate.

**Step 3** Select Enable TLS, then Enable Mutual Authentication.

We recommend you enable mutual authentication. If you do not, the device will accept server certificates without verification.

**Step 4** Select Enable Fetching of CRL, provide the URL to a CRL file, and click Add CRL.

You can add up to 25 CRLs. When you deploy, the system will schedule CRL updates. To set the update frequency, see Configuring Certificate Revocation List Downloads, on page 186.

**Step 5** Click Save.

**What to do next**

Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Enable External Authentication to 7000/8000 Series Devices

Use device platform settings to allow users of 7000/8000 series devices to authenticate to an LDAP or RADIUS server, rather than using the local database.

**Before you begin**

Configure external authentication objects. See External Authentication, on page 74.

**Procedure**

**Step 1** Choose Devices > Platform Settings and create or edit a Firepower policy.

**Step 2** Click External Authentication.

**Step 3** From the Status drop-down list, choose Enabled.

**Step 4** From the Default User Role drop-down list, choose user roles to define the default permissions you want to grant to externally authenticated users.

**Step 5** If you want to use the external server to authenticate CLI or shell access accounts, choose Enabled from the Shell Authentication drop-down list.

**Step 6** If you want to enable CAC authentication and authorization, choose an available CAC authentication object from the CAC Authentication drop-down list.

For more information, see CAC Authentication, on page 77.

**Step 7** Check the check boxes next to the each external authentication object that you want to use. If you enable more than 1 object, then users are checked against servers in the order specified. See the next step to reorder servers.
If you enable shell authentication, you must enable an external authentication object that includes a **Shell Access Filter**. CLI/shell access users can only authenticate against the server whose authentication object is highest in the list.

If you need both CLI and CAC authentication, you must use separate authentication objects for each purpose.

**Step 8**
(Optional) Use the up and down arrows to change the order in which authentication servers are accessed when an authentication request occurs.

**Step 9**
Click **Save**.

---

**What to do next**

Deploy configuration changes; see **Deploy Configuration Changes**, on page 337.

---

**About External Authentication for 7000/8000 Series Devices**

If you create an authentication object referencing an external authentication server, you can enable external authentication to let users logging into the managed device authenticate to that server, rather than using the local database.

When you enable external authentication, the system verifies the user credentials against users on an LDAP or RADIUS server. In addition, if a user has local, internal authentication enabled and the user credentials are not found in the internal database, the system then checks the external server for a set of matching credentials. If a user has the same username on multiple systems, all passwords across all servers work. Note, however, that if authentication fails on the available external authentication servers, the system does not revert to checking the local database.

When you enable external authentication, you can set the default user role for any user whose account is externally authenticated. You can select multiple roles, as long as those roles can be combined. For example, if you enable external authentication that retrieves only users in the Network Security group in your company, you may set the default user role to include the Security Analyst role so users can access collected event data without any additional user configuration on your part. However, if your external authentication retrieves records for other personnel in addition to the security group, you would probably want to leave the default role unselected.

If no access role is selected, users can log in but cannot access any functionality. After a user attempts to log in, their account is listed on the user management page (**System > Users**), where you can edit the account settings to grant additional permissions.

---

**Tip**

If you configure the system to use one user role and apply the policy, then later modify the configuration to use different default user roles, any user accounts created before the modification retain the first user role until you modify the accounts, or delete and recreate them.

If you want to specify the set of users who can authenticate against the LDAP server for CLI/shell access or for CAC authentication and authorization, you must create separate authentication objects for each and enable the objects separately.

If a user with internal authentication attempts to log in, the system first checks if that user is in the local user database. If the user exists, the system then checks the username and password against the local database. If a match is found, the user logs in successfully. If the login fails, however, and external authentication is enabled, the system checks the user against each external authentication server in the authentication order.
shown in the configuration. If the username and password match results from an external server, the system changes the user to an external user with the default privileges for that authentication object.

If an external user attempts to log in, the system checks the username and password against the external authentication server. If a match is found, the user logs in successfully. If the login fails, the user login attempt is rejected. External users cannot authenticate against the user list in the local database. If the user is a new external user, an external user account is created in the local database with the default privileges from the external authentication object.

Set the Language for the 7000/8000 Series Web Interface

The language you specify here is used for the web interface for every user who logs in. You can choose from:

- English
- Chinese (simplified)
- Japanese
- Korean

Procedure

Step 1 Choose Devices > Platform Settings and create or edit a Firepower policy.
Step 2 Click Language.
Step 3 Choose the language you want to use.
Step 4 Click Save.

What to do next
Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Customize the Login Banner for Classic Devices

You can customize the CLI login banner for Classic devices. For 7000/8000 series devices, the login banner also appears in the web interface. Note that if the banner is too large or causes errors, CLI sessions can fail when the system attempts to display the banner.

Procedure

Step 1 Choose Devices > Platform Settings and create or edit a Firepower policy.
Step 2 Choose Login Banner.
Step 3 In the Custom Login Banner field, enter the login banner text you want to use.

The system will not preserve tab spacing.
Step 4  Click Save.

What to do next
Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Synchronize Time on Classic Devices with an NTP Server

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin Network Admin</td>
</tr>
</tbody>
</table>

Synchronizing the system time on your Firepower Management Center and all its managed devices is essential to successful operations. If your deployment includes FTD devices, see Configure NTP Time Synchronization for Threat Defense, on page 904.

Caution
Unintended consequences can occur when time is not synchronized between the FMC and managed devices.

After you deploy, it may take a few minutes for managed devices to synchronize with the configured NTP servers.

Before you begin
Make sure the device can communicate with the NTP server or servers you plan to use. You can either:

- (Recommended.) Use the same NTP servers as the FMC: Synchronize Time on the FMC with an NTP Server, on page 838.

  If you choose this option, the device gets its time directly from the configured NTP server. If the device's configured NTP servers are not reachable for any reason, it synchronizes its time with the FMC.

- If your device cannot reach an NTP server or your organization does not have one, you must use the Via NTP from Management Center option discussed in the following procedure.

Procedure

Step 1  Choose Devices > Platform Settings and create or edit a Firepower policy.
Step 2  Click Time Synchronization.
Step 3  Specify how time is synchronized:
  - Via NTP from: If your Firepower Management Center is using NTP servers on the network, select this option and enter the fully-qualified DNS name (such as ntp.example.com), or IP address, of the same NTP servers you specified in System > Configuration > Time Synchronization. If the NTP servers are not reachable, the Firepower Management Center acts as an NTP server.
  - Via NTP from Management Center: (Default). The managed device gets time from the NTP servers you configured for the Firepower Management Center (except for authenticated NTP servers) and
synchronizes time with those servers directly. However, if any of the following are true, the managed device synchronizes time from the Firepower Management Center:

• The Firepower Management Center’s NTP servers are not reachable by the device.
• The Firepower Management Center has no unauthenticated servers.

Step 4  Click Save.

What to do next
Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Configure Session Timeouts for Classic Devices

Unattended login sessions may be security risks. You can configure the amount of idle time before a user’s login session times out due to inactivity. The maximum value is 24 hours, or 1440 minutes.

Procedure

Step 1  Choose Devices > Platform Settings and create or edit a Firepower policy.
Step 2  Click Shell Timeout.
Step 3  Configure session timeouts:

• Web interface (7000/8000 series only): Enter a Browser Session Timeout (Minutes).

You can exempt specific web interface users from timeout, for scenarios where you plan to passively, securely monitor the system for long periods of time. For more information, see User Account Login Options, on page 67.

• CLI: Enter a Shell Timeout (Minutes).

Step 4  Click Save.

What to do next
Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Configure SNMP Polling on Classic Devices

Simple Network Management Protocol (SNMP) polling allows access to the standard management information base (MIB) on Firepower devices, which includes system details such as contact, administrative, location, service information, IP addressing and routing information, and transmission protocol usage statistics. Additional MIBs for 7000/8000 series devices include statistics on traffic passing through physical interfaces, logical interfaces, virtual interfaces, ARP, NDP, virtual bridges, and virtual routers. Note that enabling SNMP polling does not cause the system to send SNMP traps; it only makes the information in the MIBs available for polling by your network management system.
The system supports SNMPv1, v2, and v3. SNMPv2 only supports read-only communities and SNMPv3 only supports read-only users. SNMPv3 also supports encryption with AES128.

**Before you begin**

Add SNMP access for each computer you plan to use to poll the system. See [Configure Access Lists for Classic Devices](#), on page 859.

---

**Note**

The SNMP MIB contains information that could be used to attack your deployment. We recommend that you restrict your access list for SNMP access to the specific hosts that will be used to poll for the MIB. We also recommend you use SNMPv3 and use strong passwords for network management access.

---

**Procedure**

**Step 1** Choose Devices > Platform Settings and create or edit a Firepower policy.

**Step 2** Click SNMP.

**Step 3** From the SNMP Version drop-down list, choose the SNMP version you want to use:

- **Version 1** or **Version 2**: Enter a read-only SNMP community name in the Community String field, then skip to the end of the procedure.

  **Note** Do not include special characters (<> / % # & ? ', etc.) in the SNMP community string name.

- **Version 3**: Click Add User to display the user definition page. SNMPv3 only supports read-only users and encryption with AES128.

**Step 4** Enter a Username.

**Step 5** Choose the protocol you want to use for authentication from the Authentication Protocol drop-down list.

**Step 6** Enter the password required for authentication with the SNMP server in the Authentication Password field.

**Step 7** Re-enter the authentication password in the Verify Password field.

**Step 8** Choose the privacy protocol you want to use from the Privacy Protocol list, or choose None to not use a privacy protocol.

**Step 9** Enter the SNMP privacy key required by the SNMP server in the Privacy Password field.

**Step 10** Re-enter the privacy password in the Verify Password field.

**Step 11** Click Add.

**Step 12** Click Save.

---

**What to do next**

Deploy configuration changes; see [Deploy Configuration Changes](#), on page 337.
Local System Configuration for 7000/8000 Series Devices

You can log into the local web interface on 7000/8000 series devices for non-policy based system configurations. Many of these configurations parallel FMC system configurations, and are documented in the FMC system configuration chapter: System Configuration, on page 785.

Table 78: Local System Configurations for 7000/8000 Series Devices

<table>
<thead>
<tr>
<th>System Configuration</th>

Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device

Optionally, you can use Transport Layer Security (TLS) certificates to secure communications between Firepower devices and a trusted audit log server. For each device (client certificates are unique), you must generate a certificate signing request (CSR), submit it to a Certificate Authority (CA) for signing, then import
the signed certificate onto the device. You cannot use the FMC to import audit log certificates onto its managed devices. These certificates are unique to each device, and you must log into each device to import them.

To ensure security, use a globally recognized and trusted CA. The same CA must sign:

- Both the client certificate and the server certificate, if you plan to require mutual authentication between the device and the audit log server.
- Any intermediate certificates in the certificate chain. If the signing CA requires you to trust an intermediate CA, you must provide the necessary certificate chain (or certificate path).

The system generates certificate request keys in Base-64 encoded PEM format.

**Procedure**

**Step 1** Log into the device's web interface and choose **System > Configuration**.

**Step 2** Click **Audit Log Certificate**.

**Step 3** Generate a CSR.
   a) Click **Generate New CSR**.
   b) Fill out the required location and organizational information.
   c) Enter the fully qualified domain name of the server for which you want to request a certificate in the **Common Name** field. If the common name and the DNS hostname do not match, audit log streaming will fail.
   d) Click **Generate**.

**Step 4** Create a text file for the CSR.
   a) Copy and paste the entire block of text in the certificate request, including the **BEGIN CERTIFICATE REQUEST** and **END CERTIFICATE REQUEST** lines.
   b) Save the file as **clientname.csr**, where **clientname** is the name of the device where you plan to use the certificate.

**Step 5** Submit the CSR to the CA and wait to receive the signed certificate.

**Step 6** Import the signed certificate onto the device.

If you left the page, browse back to **System > Configuration > Audit Log Certificate**, then click **Import Audit Client Certificate**. Copy and paste the following:

- **Client Certificate**: All of the text in the signed certificate, including the **BEGIN CERTIFICATE** and **END CERTIFICATE** lines.

- **Private Key**: All of the text in the private key file, including the **BEGIN RSA PRIVATE KEY** and **END RSA PRIVATE KEY** lines.

- **Certificate Chain**: All of the text in each required intermediate certificate.

Make sure you import the correct certificate. Client certificates are unique.

**Step 7** Click **Save**.
What to do next

If you have not already, use the device platform settings on the FMC to configure audit log streaming: Stream Audit Logs from Classic Devices, on page 860.

Prohibit Packet Transfer to FMC

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>7000 &amp; 8000 Series</td>
<td>N/A</td>
<td>Admin</td>
</tr>
</tbody>
</table>

You may want to disable sending packet data from 7000 or 8000 Series devices to the Firepower Management Center in a low-bandwidth deployment if you are not concerned about the specific content of the packet that triggered an intrusion policy violation.

Procedure

Step 1 In the local web interface of your 7000 or 8000 Series device, choose System > Configuration.
Step 2 Click Information.
Step 3 Select Prohibit Packet Transfer to the Management Center.
Step 4 Click Save.

Configure Management Interfaces on a 7000/8000 Series Device

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>7000 &amp; 8000 Series</td>
<td>Global only</td>
<td>Admin</td>
</tr>
</tbody>
</table>

Modify the management interface settings on the managed device using the web interface. You can optionally enable an event interface if your model supports it. For more information on management interfaces, see Management Interfaces, on page 799.

Caution

Be careful when making changes to the management interface; if you cannot re-connect because of a configuration error, you will need to access the device console port and reconfigure the settings at the CLI.

Procedure

Step 1 Choose System > Configuration, and then choose Management Interfaces.
Step 2 In the Interfaces area, click Edit next to the interface that you want to configure.

All available interfaces are listed in this section. You cannot add more interfaces.

You can configure the following options on each management interface:
• Enabled—Enable the management interface. Do not disable the default eth0 management interface. Some processes require the eth0 interface.

• Channels—(8000 series only) Configure an event-only interface. You can enable the eth1 management interface on your 8000 series device to act as an event interface. To do so, uncheck the Management Traffic check box, and leave the Event Traffic check box checked. For the eth0 management interface, leave both check boxes checked.

The Firepower Management Center event-only interface cannot accept management channel traffic, so you should simply disable the management channel on the device event interface.

You can optionally disable Event Traffic for the management interface. In either case, the device will try to send events on the event-only interface, and if that interface is down, it will send events on the management interface even if you disable the event channel.

You cannot disable both event and management channels on an interface.

• Mode—Specify a link mode. Note that any changes you make to auto-negotiation are ignored for GigabitEthernet interfaces.

• MTU—Set the maximum transmission unit (MTU). The default is 1500. The range within which you can set the MTU can vary depending on the model and interface type.

Because the system automatically trims 18 bytes from the configured MTU value, any value below 1298 does not comply with the minimum IPv6 MTU setting of 1280, and any value below 594 does not comply with the minimum IPv4 MTU setting of 576. For example, the system automatically trims a configured value of 576 to 558.

• MDI/MDIX—Set the Auto-MDI setting.

• IPv4 Configuration—Set the IPv4 IP address. Choose:
  • Static—Manually enter the IPv4 Management IP address and IPv4 Netmask.
  • DHCP—Set the interface to use DHCP (eth0 only).

• IPv6 Configuration—Set the IPv6 IP address. Choose:
  • Static—Manually enter the IPv6 Management IP address and IPv6 Prefix Length.
  • DHCP—Set the interface to use DHCPv6 (eth0 only).
  • Router Assigned—Enable stateless autoconfiguration.

Step 3 In the Routes area, edit a static route by clicking edit ( ), or add a route by clicking add ( ). View the route statistics by clicking view ( ).

Note You need to add a static route for the event-only interface if the Firepower Management Center is on a remote network; otherwise, all traffic will match the default route through the management interface. For the default route, you can change only the gateway IP address. The default route always uses the eth0 interface. For information about routing, see Network Routes on Management Interfaces, on page 802.
You can configure the following settings for a static route:

- **Destination**—Set the destination address of the network to which you want to create a route.
- **Netmask or Prefix Length**—Set the netmask (IPv4) or prefix length (IPv6) for the network.
- **Interface**—Set the egress management interface.
- **Gateway**—Set the gateway IP address.

**Step 4**

In the **Shared Settings** area, set network parameters shared by all interfaces.

**Note**  If you selected DHCP for the eth0 interface, you cannot manually specify some shared settings derived from the DHCP server.

You can configure the following shared settings:

- **Hostname**—Set the device hostname. If you change the hostname, reboot the device if you want the new hostname reflected in syslog messages. Syslog messages do not reflect a new hostname until after a reboot.

- **Domains**—Set the search domain(s) for the device, separated by commas. These domains are added to hostnames when you do not specify a fully-qualified domain name in a command, for example, `ping system`. The domains are used only on the management interface, or for commands that go through the management interface.

- **Primary DNS Server, Secondary DNS Server, Tertiary DNS Server**—Set the DNS servers to be used in order of preference.

- **Remote Management Port**—Set the remote management port for communication with the FMC. The FMC and managed devices communicate using a two-way, SSL-encrypted communication channel, which by default is on port 8305.

  **Note**  Cisco strongly recommends that you keep the default settings for the remote management port, but if the management port conflicts with other communications on your network, you can choose a different port. If you change the management port, you must change it for all devices in your deployment that need to communicate with each other.

**Step 5**

In the **LCD Panel** area, check the **Allow reconfiguration of network settings** check box to enable changing network settings using the device’s LCD panel.

You can use the LCD panel to edit the IP address for the device. Confirm that any changes you make are reflected on the managing Firepower Management Center. In some cases, you may need to update the data manually on the Firepower Management Center as well.

**Caution**  Allowing reconfiguration using the LCD panel can present a security risk. You need only physical access, not authentication, to configure network settings using the LCD panel. The web interface warns you that enabling this option is a potential security issue.

**Step 6**

In the **Proxy** area, configure HTTP proxy settings.

The device is configured to directly-connect to the internet on ports TCP/443 (HTTPS) and TCP/80 (HTTP). You can use a proxy server, to which you can authenticate via HTTP Digest.

**Note**  Proxies that use NT LAN Manager (NTLM) authentication are not supported.
a) Check the Enabled check box.
b) In the HTTP Proxy field, enter the IP address or fully-qualified domain name of your proxy server.
c) In the Port field, enter a port number.
d) Supply authentication credentials by choosing Use Proxy Authentication, and then provide a User Name and Password.

Step 7 Click Save.
Step 8 If you changed the management IP address, it might affect communication between the FMC and the managed device.

Changing the IP address will not affect the current connection. However, if the device or FMC reloads, then the connection needs to be reestablished. You need at least one of the devices (FMC or managed device) to have the correct IP address of the peer. For example, if you specified a NAT ID (instead of an IP address) for the FMC during device setup, then the device IP address that you defined on the FMC when you added the device will be wrong, and the FMC will not be able to reestablish communications. In this case, you must change the management IP address of the device in the FMC; see Editing Device Management Settings, on page 238.

---

**Shut Down or Restart a 7000/8000 Series Device**

**Procedure**

**Step 1** On the device's web interface, choose System > Configuration.

**Step 2** Choose Process.

**Step 3** Do one of the following:

<table>
<thead>
<tr>
<th>Action</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Shut down</strong></td>
<td>Run Command</td>
</tr>
<tr>
<td><strong>Caution</strong></td>
<td>Do not shut off Firepower appliances using the power button; it may cause a loss of data. Using the web interface (or CLI) prepares the system to be safely powered off and restarted without losing configuration data.</td>
</tr>
<tr>
<td><strong>Reboot</strong></td>
<td>Run Command</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Rebooting logs you out, and the system runs a database check that can take up to an hour to complete.</td>
</tr>
<tr>
<td><strong>Restart the console</strong></td>
<td>Run Command</td>
</tr>
<tr>
<td><strong>Restart the Snort process</strong></td>
<td>Run Command</td>
</tr>
<tr>
<td><strong>Caution</strong></td>
<td>Restart the Snort process temporarily interrupts traffic inspection. Whether traffic drops during this interruption or passes without inspection depends on how the device is configured. See Snort® Restart Traffic Behavior, on page 340 for more information.</td>
</tr>
</tbody>
</table>
View System Time for 7000/8000 Series Devices

Time settings are displayed on most pages in local time using the time zone you set on the Time Zone page in User Preferences, but are stored on the appliance using UTC time. In addition, the current time appears in UTC at the top of the Time Synchronization page (local time is displayed in the Manual clock setting option, if enabled).

**Restriction**

The Time Zone function (in User Preferences) assumes that the default system clock is set to UTC time. Do not change this. Changing the system time from UTC is not supported, and you will have to reimage the device.

Use this procedure to verify system time information on 7000 and 8000 Series devices.

**Procedure**

**Step 1**
Log into the device's web interface and choose **System > Configuration**.

**Step 2**
Click **Time**.

If you are using NTP, see **NTP Server Status, on page 841**.
Platform Settings for FTD devices configure a range of unrelated features whose values you might want to share among several devices. Even if you want different settings per device, you must create a shared policy and apply it to the desired device.

- Configure ARP Inspection, on page 875
- Configure Banners, on page 877

**Configure ARP Inspection**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin</td>
</tr>
</tbody>
</table>

By default, all ARP packets are allowed between bridge group members. You can control the flow of ARP packets by enabling ARP inspection.

ARP inspection prevents malicious users from impersonating other hosts or routers (known as ARP spoofing). ARP spoofing can enable a “man-in-the-middle” attack. For example, a host sends an ARP request to the gateway router; the gateway router responds with the gateway router MAC address. The attacker, however, sends another ARP response to the host with the attacker MAC address instead of the router MAC address. The attacker can now intercept all the host traffic before forwarding it on to the router.

ARP inspection ensures that an attacker cannot send an ARP response with the attacker MAC address, so long as the correct MAC address and the associated IP address are in the static ARP table.
When you enable ARP inspection, the Firepower Threat Defense device compares the MAC address, IP address, and source interface in all ARP packets to static entries in the ARP table, and takes the following actions:

- If the IP address, MAC address, and source interface match an ARP entry, the packet is passed through.
- If there is a mismatch between the MAC address, the IP address, or the interface, then the Firepower Threat Defense device drops the packet.
- If the ARP packet does not match any entries in the static ARP table, then you can set the Firepower Threat Defense device to either forward the packet out all interfaces (flood), or to drop the packet.

Note
The dedicated Diagnostic interface never floods packets even if this parameter is set to flood.

Procedure

Step 1
Select Devices > Platform Settings and create or edit a FTD policy.

Step 2
Select ARP Inspection.

Step 3
Add entries to the ARP inspection table.

a) Click Add to create a new entry, or click Edit if the entry already exists.

b) Select the desired options.

- Inspect Enabled—To perform ARP inspection on the selected interfaces and zones.

- Flood Enabled—Whether to flood ARP requests that do not match static ARP entries out all interfaces other than the originating interface or the dedicated management interface. This is the default behavior.

If you do not elect to flood ARP requests, then only those requests that exactly match static ARP entries are allowed.

- Security Zones—Add the zones that contain the interfaces on which to perform the selected actions. The zones must be switched zones. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click Add. These rules will be applied to a device only if the device includes the selected interfaces or zones.

c) Click OK.

Step 4
Add static ARP entries according to Add a Static ARP Entry, on page 591.

Step 5
Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.
Configure Banners

You can configure messages to show users when they connect to the device command line interface (CLI).

**Procedure**

1. **Step 1** Select Devices > Platform Settings and create or edit a FTD policy.
2. **Step 2** Select Banner.
3. **Step 3** Configure the banner.

Following are some tips and requirements for banners:

- Only ASCII characters are allowed. You can use line returns (press Enter), but you cannot use tabs.
- You can dynamically add the hostname or domain name of the device by including the variables $\text{hostname}$ or $\text{domain}$.
- Although there is no absolute length restriction on banners, Telnet or SSH sessions will close if there is not enough system memory available to process the banner messages.
- From a security perspective, it is important that your banner discourage unauthorized access. Do not use the words "welcome" or "please," as they appear to invite intruders in. The following banner sets the correct tone for unauthorized access:

```
You have logged in to a secure device.
If you are not authorized to access this device, log out immediately or risk criminal charges.
```

4. **Step 4** Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure Fragment Handling

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>

<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

Firepower Management Center Configuration Guide, Version 6.1
By default, the FTD device allows up to 24 fragments per IP packet, and up to 200 fragments awaiting reassembly. You might need to let fragments on your network if you have an application that routinely fragments packets, such as NFS over UDP. However, if you do not have an application that fragments traffic, we recommend that you do not allow fragments by setting Chain to 1. Fragmented packets are often used as Denial of Service (DoS) attacks.

Note
These settings establish the defaults for devices assigned this policy. You can override these settings for specific interfaces on a device by selecting Override Default Fragment Setting in the interface configuration. When you edit an interface, you can find the option on Advanced > Security Configuration. Select Devices > Device Management, edit a FTD device, and select Interfaces to edit interface properties.

Procedure

**Step 1** Select Devices > Platform Settings and create or edit a FTD policy.

**Step 2** Select Fragment Settings.

**Step 3** Configure the following options. Click Reset to Defaults if you want to use the default settings.

- **Size (Block)**—The maximum number of packet fragments from all connections collectively that can be waiting for reassembly. The default is 200 fragments.
- **Chain (Fragment)**—The maximum number of packets into which a full IP packet can be fragmented. The default is 24 packets. Set this option to 1 to disallow fragments.
- **Timeout (Sec)**—The maximum number of seconds to wait for an entire fragmented packet to arrive. The default is 5 seconds. If all fragments are not received within this time, all fragments are discarded.

**Step 4** Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

**Configure HTTP**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin, Access Admin, Network Admin</td>
</tr>
</tbody>
</table>

If you want to allow HTTPS connections to one or more interfaces on the FTD device, configure HTTPS settings. You can use HTTPS to download packet captures for troubleshooting.

**Before you begin**

- When you manage the FTD using the Firepower Management Center, HTTPS access to the FTD is only for viewing packet capture files. The FTD does not have a web interface for configuration in this management mode.
HTTPS local users can only be configured at the CLI using the `configure user add` command. By default, there is an admin user for which you configured the password during initial setup. AAA external authentication is not supported.

The physical management interface is shared between the Diagnostic logical interface and the Management logical interface; this configuration applies only to the Diagnostic logical interface, if used, or to other data interfaces. The Management logical interface is separate from the other interfaces on the device. It is used to set up and register the device to the Firepower Management Center. It has a separate IP address and static routing.

To use HTTPS, you do not need an access rule allowing the host IP address. You only need to configure HTTPS access according to this section.

You can only use HTTPS to a reachable interface; if your HTTPS host is located on the outside interface, you can only initiate a management connection directly to the outside interface.

The device allows a maximum of 5 concurrent HTTPS connections.

You need network objects that define the hosts or networks you will allow to make HTTPS connections to the device. You can add objects as part of the procedure, but if you want to use object groups to identify a group of IP addresses, ensure that the groups needed in the rules already exist. Select Objects > Object Management to configure objects.

**Procedure**

**Step 1** Select Devices > Platform Settings and create or edit a FTD policy.

**Step 2** Select HTTP.

**Step 3** Enable the HTTPS server by clicking Enable HTTP server.

**Step 4** (Optional) Change the HTTPS port. The default is 443.

**Step 5** Identify the interfaces and IP addresses that allow HTTPS connections.

Use this table to limit which interfaces will accept HTTPS connections, and the IP addresses of the clients who are allowed to make those connections. You can use network addresses rather than individual IP addresses.

a) Click Add to add a new rule, or click Edit to edit an existing rule.

b) Configure the rule properties:

- **IP Address**—The network object that identifies the hosts or networks you are allowing to make HTTPS connections. Choose an object from the drop-down menu, or add a new network object by clicking +.

- **Security Zones**—Add the zones that contain the interfaces to which you will allow HTTPS connections. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click Add. These rules will be applied to a device only if the device includes the selected interfaces or zones.

c) Click OK.

**Step 6** Click Save.
You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

**Configure ICMP Access Rules**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

By default, you can send ICMP packets to any interface using either IPv4 or IPv6, with these exceptions:

- The Firepower Threat Defense device does not respond to ICMP echo requests directed to a broadcast address.
- The Firepower Threat Defense device only responds to ICMP traffic sent to the interface that traffic comes in on; you cannot send ICMP traffic through an interface to a far interface.

To protect the device from attacks, you can use ICMP rules to limit ICMP access to interfaces to particular hosts, networks, or ICMP types. ICMP rules function like access rules, where the rules are ordered, and the first rule that matches a packet defines the action.

If you configure any ICMP rule for an interface, an implicit deny ICMP rule is added to the end of the ICMP rule list, changing the default behavior. Thus, if you want to simply deny a few message types, you must include a permit any rule at the end of the ICMP rule list to allow the remaining message types.

We recommend that you always grant permission for the ICMP unreachable message type (type 3). Denying ICMP unreachable messages disables ICMP path MTU discovery, which can halt IPsec and PPTP traffic. Additionally ICMP packets in IPv6 are used in the IPv6 neighbor discovery process.

**Before you begin**

Ensure that the objects needed in the rules already exist. Select **Objects > Object Management** to configure objects. You need network objects or groups that define the desired hosts or networks, and port objects that define the ICMP message types you want to control.

**Procedure**

**Step 1**
Select **Devices > Platform Settings** and create or edit a FTD policy.

**Step 2**
Select **ICMP**.

**Step 3**
Configure ICMP rules.

a) Click **Add** to add a new rule, or click **Edit** to edit an existing rule.

b) Configure the rule properties:

- **Action**—Whether to permit (allow) or deny (drop) matching traffic.
- **ICMP Service**—The port object that identifies the ICMP message type.
• **Network**—The network object or group that identifies the hosts or networks whose access you are controlling.

• **Security Zones**—Add the zones that contain the interfaces that you are protecting. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.

c) Click **OK**.

**Step 4** (Optional.) Set rate limits on ICMPv4 Unreachable messages.

• **Rate Limit**—Sets the rate limit of unreachable messages, between 1 and 100 messages per second. The default is 1 message per second.

• **Burst Size**—Sets the burst rate, between 1 and 10. This value is not currently used by the system.

**Step 5** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

### Configure Secure Shell

<table>
<thead>
<tr>

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

If you want to allow SSH connections to one or more *data* interfaces on the FTD device, configure Secure Shell settings. SSH is not supported to the Diagnostic logical interface. The physical management interface is shared between the Diagnostic logical interface and the Management logical interface. SSH is enabled by default on the Management logical interface; however, this screen does not affect Management SSH access.

The Management logical interface is separate from the other interfaces on the device. It is used to set up and register the device to the Firepower Management Center. SSH for data interfaces shares the internal user list with SSH for the Management interface. Other settings are configured separately: for data interfaces, enable SSH and access lists using this screen; SSH traffic for data interfaces uses the regular routing configuration, and not any static routes configured at setup or at the CLI.

For the Management interface, to configure an SSH access list, see the `configure ssh-access-list` command in the **Firepower Threat Defense Command Reference**. To configure a static route, see the `configure network static-routes` command. By default, you configure the default route through the Management interface at initial setup.

To use SSH, you do not also need an access rule allowing the host IP address. You only need to configure SSH access according to this section.

You can only SSH to a reachable interface; if your SSH host is located on the outside interface, you can only initiate a management connection directly to the outside interface.
The device allows a maximum of 5 concurrent SSH connections.

**Before you begin**

- SSH local users can only be configured at the CLI using the `configure user add` command; see Creating Local User Accounts for the FTD CLI, on page 70. By default, there is an admin user for which you configured the password during initial setup. AAA external authentication is not supported.

- You need network objects that define the hosts or networks you will allow to make SSH connections to the device. You can add objects as part of the procedure, but if you want to use object groups to identify a group of IP addresses, ensure that the groups needed in the rules already exist. Select Objects > Object Management to configure objects.

| Note | You cannot use the system-provided any network object. Instead, use any-ipv4 or any-ipv6. |

**Procedure**

- **Step 1** Select Devices > Platform Settings and create or edit a FTD policy.
- **Step 2** Select Secure Shell.
- **Step 3** Identify the interfaces and IP addresses that allow SSH connections.

Use this table to limit which interfaces will accept SSH connections, and the IP addresses of the clients who are allowed to make those connections. You can use network addresses rather than individual IP addresses.

a) Click Add to add a new rule, or click Edit to edit an existing rule.

b) Configure the rule properties:

- **IP Address** — The network object that identifies the hosts or networks you are allowing to make SSH connections. Choose an object from the drop-down menu, or add a new network object by clicking +.

- **Security Zones** — Add the zones that contain the interfaces to which you will allow SSH connections. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click Add. These rules will be applied to a device only if the device includes the selected interfaces or zones.

c) Click OK.

- **Step 4** Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.
Configure SMPT

</table>

You must identify an SMTP server if you configure email alerts in the Syslog settings. The source email address you configure for Syslog must be a valid account on the SMTP servers.

Before you begin

Ensure that the network objects that define the host address of the primary and secondary SMTP servers exist. Select Objects > Object Management to define the objects. Alternatively, you can create the objects while editing the policy.

Procedure

Step 1 Select Devices > Platform Settings and create or edit a FTD policy.
Step 2 Click SMTP Server.
Step 3 Select the network objects that identify the Primary Server IP Address and optionally, the Secondary Server IP Address.
Step 4 Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

Simple Network Management Protocol (SNMP) defines a standard way for network management stations running on PCs or workstations to monitor the health and status of many types of devices, including switches, routers, and security appliances. You can use the SNMP page to configure a firewall device for monitoring by SNMP management stations.

The Simple Network Management Protocol (SNMP) enables monitoring of network devices from a central location. Cisco security appliances support network monitoring using SNMP versions 1, 2c, and 3, as well as traps and SNMP read access; SNMP write access is not supported.

SNMPv3 only supports read-only users and encryption with AES128.
To create an alert to an external SNMP server, access Policies > Action > Alerts

Procedure

Step 1
Select Devices > Platform Settings and create or edit a FTD policy.

Step 2
Select SNMP.

Step 3
Enable SNMP and configure basic options.

- **Enable SNMP Servers**—Whether to provide SNMP information to the configured SNMP hosts. You can deselect this option to disable SNMP monitoring while retaining the configuration information.

- **Read Community String, Confirm**—Enter the password used by a SNMP management station when sending requests to the FTD device. The SNMP community string is a shared secret among the SNMP management stations and the network nodes being managed. The security device uses the password to determine if the incoming SNMP request is valid. The password is a case-sensitive alphanumeric string of up to 32 characters; spaces and special characters are not permitted.

- **System Administrator Name**—Enter the name of the device administrator or other contact person. This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.

- **Location**—Enter the location of this security device (for example, Building 42, Sector 54). This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.

- **Port**—Enter the UDP port on which incoming requests will be accepted. The default is 161.

Step 4
(SNMPv3 only.) Add SNMPv3 Users, on page 884.

Step 5
Add SNMP Hosts, on page 886.

Step 6
Configure SNMP Traps, on page 887.

Step 7
Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

**Add SNMPv3 Users**

**Note**

You create users for SNMPv3 only. These steps are not applicable for SNMPv1 or SNMPv2c.

Note that SNMPv3 only supports read-only users.

SNMP users have a specified username, an authentication password, an encryption password, and authentication and encryption algorithms to use. The authentication algorithm options are MD5 and SHA. The encryption algorithm options are DES, 3DES, and AES128.
**Procedure**

**Step 1**  Select **Devices > Platform Settings** and create or edit a FTD policy.

**Step 2**  Click **SNMP > Users**.

**Step 3**  Click **Add**.

**Step 4**  Select the security level for the user from the **Security Level** drop-down list.

- **Auth**—Authentication but No Privacy, which means that messages are authenticated.
- **No Auth**—No Authentication and No Privacy, which means that no security is applied to messages.
- **Priv**—Authentication and Privacy, which means that messages are authenticated and encrypted.

**Step 5**  Enter the name of the SNMP user in the **Username** field. Usernames must be 32 characters or less.

**Step 6**  Select the type of password, you want to use in the **Encryption Password Type** drop-down list.

- **Clear text**—The FTD device will still encrypt the password when deploying to the device.
- **Encrypted**—The FTD device will directly deploy the encrypted password.

**Step 7**  Select the type of authentication you want to use: MD5 or SHA, in the **Auth Algorithm Type** drop-down list.

**Step 8**  In the **Authentication Password** field, enter the password to use for authentication. If you selected Encrypted as the Encrypt Password Type, the password must be formatted as xx:xx:xx..., where xx are hexadecimal values.

**Note**  The length of the password will depend on the authentication algorithm selected. For all passwords, the length must be 256 characters or less.

If you selected Clear Text as the Encrypt Password Type, repeat the password in the **Confirm** field.

**Step 9**  In the **Encryption Type** drop-down list, select the type of encryption you want to use: AES128, AES192,AES256, 3DES, DES.

**Note**  To use AES or 3DES encryption, you must have the appropriate license installed on the device.

**Step 10**  Enter the password to use for encryption in the **Encryption Password** field. If you selected Encrypted as the Encrypt Password Type, the password must be formatted as xx:xx:xx..., where xx are hexadecimal values. For encrypted passwords, the length of the password depends on the encryption type selected. The password sizes are as follows (where each xx is one octal):

- AES 128 requires 16 octals
- AES 192 requires 24 octals
- AES 256 requires 32 octals
- 3DES requires 32 octals
- DES can be any size

**Note**  For all passwords, the length must be 256 characters or less.

If you selected Clear Text as the Encrypt Password Type, repeat the password in the **Confirm** field.
Step 11  Click OK.
Step 12  Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Add SNMP Hosts

Use Host to add or edit entries in the SNMP Hosts table on the SNMP page. These entries represent SNMP management stations allowed to access the FTD device.

### Before you begin

Ensure that the network objects that define the SNMP management stations exist. Select Device > Object Management to configure network objects.

### Note

Only IPv4 addresses are supported.

### Procedure

**Step 1** Select Devices > Platform Settings and create or edit a FTD policy.
**Step 2** Click SNMP > Hosts.
**Step 3** Click Add.
**Step 4** In the IP Address field, either enter a valid IPv6 or IPv4 host or select the network object that defines the SNMP management station's host address.
**Step 5** Select the appropriate SNMP version from the SNMP version drop-down list.
**Step 6** (SNMPv3 only.) Select the username of the SNMP user that you configured from the User Name drop-down list.

- **Note** You can associate up to 23 SNMP users per SNMP host.

**Step 7** (SNMPv1, 2c only.) In the Read Community String field, enter the community string that you have already configured, for read access to the device. Re-enter the string to confirm it.

- **Note** This string is required, only if the string used with this SNMP station is different from the one already defined in the Enable SNMP Server section.

**Step 8** Select the type of communication between the device and the SNMP management station. You can select both types.

- **Poll**—The management station periodically requests information from the device.
- **Trap**—The device sends trap events to the management station as they occur.

**Step 9** In the Port field, enter a UDP port number for the SNMP host. The default value is 162. The valid range is 1 to 65535.

**Step 10** Click Add to enter or select the interface on which this SNMP management station contacts the device.
Step 11 In the **Zones/Interfaces** list, add the zones that contain the interfaces through which the device communicates with the management station. For interfaces not in a zone, you can type the interface name into the field below the **Selected Zone/Interface** list and click **Add**. The host will be configured on a device only if the device includes the selected interfaces or zones.

Step 12 Click **OK**.

Step 13 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

**Configure SNMP Traps**

Use SNMP Traps to configure SNMP traps (event notifications) for the FTD device. Traps are different from browsing; they are unsolicited “comments” from the FTD device to the management station for certain events, such as linkup, linkdown, and syslog event generated. An SNMP object ID (OID) for the device appears in SNMP event traps sent from the device.

Some traps are not applicable to certain hardware models. These traps will be ignored if you apply the policy to one of these models. For example, not all models have field-replaceable units, so the **Field Replaceable Unit Insert/Delete** trap will not be configured on those models.

SNMP traps are defined in either standard or enterprise-specific MIBs. Standard traps are created by the IETF and documented in various RFCs. SNMP traps are compiled into the FTD software.

If needed, you can download RFCs, standard MIBs, and standard traps from the following location:

http://www.ietf.org/

Browse the complete list of Cisco MIBs, traps, and OIDs from the following location:

In addition, download Cisco OIDs by FTP from the following location:

**Procedure**

**Step 1** Select **Devices > Platform Settings** and create or edit a FTD policy.

**Step 2** Click **SNMP > SNMP Traps** to configure SNMP traps (event notifications) for the FTD device.

**Step 3** Select the appropriate Enable Traps options. You can select either or both options.

a) Check **Enable All SNMP Traps** to quickly select all traps in the subsequent four sections.

b) Check **Enable All Syslog Traps** to enable transmission of trap-related syslog messages.

**Note** SNMP traps are of higher priority than other notification messages from the FTD as they are expected to be near real-time. When you enable all SNMP or syslog traps, it is possible for the SNMP process to consume excess resources in the agent and in the network, causing the system to hang. If you notice system delays, unfinished requests, or timeouts, you can selectively enable SNMP and syslog traps. You can also limit the rate at which syslog messages are generated by severity level or message ID. For example, all syslog message IDs that begin with the digits 212 are associated with the SNMP class; see **Limit the Rate of Syslog Message Generation**, on page 899.
Step 4  The event-notification traps in the **Standard** section are enabled by default for an existing policy:

- **Authentication** – Unauthorized SNMP access. This authentication failure occurs for packets with an incorrect community string
- **Link Up** – One of the device’s communication links has become available (it has “come up”), as indicated in the notification
- **Link Down** – One of the device’s communication links has failed, as indicated in the notification
- **Cold Start** – The device is reinitializing itself such that its configuration or the protocol entity implementation may be altered
- **Warm Start** – The device is reinitializing itself such that its configuration and the protocol entity implementation is unaltered

Step 5  Select the desired event-notification traps in the **Entity MIB** section:

- **Field Replaceable Unit Insert** – A Field Replaceable Unit (FRU) has been inserted, as indicated. (FRUs include assemblies such as power supplies, fans, processor modules, interface modules, etc.)
- **Field Replaceable Unit Delete** – A Field Replaceable Unit (FRU) has been removed, as indicated in the notification
- **Configuration Change** – There has been a hardware change, as indicated in the notification

Step 6  Select the desired event-notification traps in the **Resource** section:

- **Connection Limit Reached** – This trap indicates that a connection attempt was rejected because the configured connections limit has been reached.

Step 7  Select the desired event-notification traps in the **Other** section:

- **NAT Packet Discard** – This notification is generated when IP packets are discarded by the NAT function. Available Network Address Translation addresses or ports have fallen below configured threshold

Step 8  Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

**About Configuring Syslog**

You can enable system logging (syslog) for FTD devices. Logging information can help you identify and isolate network or device configuration problems. The following topics explain logging and how to configure it.

**About Syslog**

System logging is a method of collecting messages from devices to a server running a syslog daemon. Logging to a central syslog server helps in aggregation of logs and alerts. Cisco devices can send their log messages
to a UNIX-style syslog service. A syslog service accepts messages and stores them in files, or prints them according to a simple configuration file. This form of logging provides protected long-term storage for logs. Logs are useful both in routine troubleshooting and in incident handling.

Table 79: System Logs for Firepower Threat Defense

<table>
<thead>
<tr>
<th>Logs Related To</th>
<th>Details</th>
<th>Configure In</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device and system health, network configuration</td>
<td>This syslog configuration generates messages for features running on the data plane, that is, features that are defined in the CLI configuration that you can view with the <code>show running-config</code> command. This includes features such as routing, VPN, data interfaces, DHCP server, NAT, and so forth. Data plane syslog messages are numbered, and they are the same as those generated by devices running ASA software. However, Firepower Threat Defense does not necessarily generate every message type that is available for ASA Software. For information on these messages, see Cisco Firepower Threat Defense Syslog Messages at <a href="https://www.cisco.com/c/en/us/td/docs/security/firepower/Syslogs/b_fptd_syslog_guide.html">https://www.cisco.com/c/en/us/td/docs/security/firepower/Syslogs/b_fptd_syslog_guide.html</a>. This configuration is explained in the following topics.</td>
<td>Platform Settings</td>
</tr>
<tr>
<td>Policies, rules, and events</td>
<td>This syslog configuration generates alerts for access control rules, intrusion rules, and other advanced services as described in Configurations Supporting Alert Responses, on page 2002. These messages are not numbered. For information on configuring this type of syslog, see Creating a Syslog Alert Response, on page 2003.</td>
<td>Alert Responses</td>
</tr>
</tbody>
</table>

You can configure more than one syslog server, and control the messages and events sent to each server. You can also configure different destinations, such as console, email, internal buffer, and so forth.

Severity Levels

The following table lists the syslog message severity levels.

Table 80: Syslog Message Severity Levels

<table>
<thead>

</tr>
</tbody>
</table>
Syslog Message Filtering

You can filter generated syslog messages so that only certain syslog messages are sent to a particular output destination. For example, you could configure the Firepower Threat Defense device to send all syslog messages to one output destination and to send a subset of those syslog messages to a different output destination.

Specifically, you can direct syslog messages to an output destination according to the following criteria:

- Syslog message ID number
- Syslog message severity level
- Syslog message class (equivalent to a functional area)

You customize these criteria by creating a message list that you can specify when you set the output destination. Alternatively, you can configure the Firepower Threat Defense device to send a particular message class to each type of output destination independently of the message list.

Syslog Message Classes

You can use syslog message classes in two ways:

- Specify an output location for an entire category of syslog messages.
- Create a message list that specifies the message class.

The syslog message class provides a method of categorizing syslog messages by type, equivalent to a feature or function of the device. For example, the rip class denotes RIP routing.

All syslog messages in a particular class share the same initial three digits in their syslog message ID numbers. For example, all syslog message IDs that begin with the digits 611 are associated with the vpnc (VPN client) class. Syslog messages associated with the VPN client feature range from 611101 to 611323.

In addition, most of the ISAKMP syslog messages have a common set of prepended objects to help identify the tunnel. These objects precede the descriptive text of a syslog message when available. If the object is not known at the time that the syslog message is generated, the specific heading = value combination does not appear.

The objects are prefixed as follows:

Group = \textit{groupname}, Username = \textit{user}, IP = \textit{IP_address}

Where the group is the tunnel-group, the username is the username from the local database or AAA server, and the IP address is the public IP address of the remote access client or Layer 2 peer.

The following table lists the message classes and the range of message IDs in each class.

</tbody>
</table>
Guidelines for Logging

This section includes guidelines and limitations that you should review before configuring logging.

IPv6 Guidelines

Does not support IPv6.

Additional Guidelines

- The syslog server must run a server program called syslogd. Windows provides a syslog server as part of its operating system.

- To view logs generated by the Firepower Threat Defense device, you must specify a logging output destination. If you enable logging without specifying a logging output destination, the Firepower Threat Defense device generates messages but does not save them to a location from which you can view them. You must specify each different logging output destination separately.

- It is not possible to have two different lists or classes being assigned to different syslog servers or same locations.

- You can configure up to 16 syslog servers.

- The syslog server should be reachable through the Firepower Threat Defense device. You should configure the device to deny ICMP unreachable messages on the interface through which the syslog server is reachable and to send syslogs to the same server. Make sure that you have enabled logging for all severity levels. To prevent the syslog server from crashing, suppress the generation of syslogs 313001, 313004, and 313005.

- The number of UDP connections for syslog is directly related to the number of CPUs on the hardware platform and the number of syslog servers you configure. At any point in time, there can be as many UDP syslog connections as there are CPUs times the number of configured syslog servers. For example, for each syslog server:
  - A Firepower 4110 can have up to 22 UDP syslog connections.
  - A Firepower 4120 can have up to 46 UDP syslog connections.
This is the expected behavior. Note that the global UDP connection idle timeout applies to these sessions, and the default is 2 minutes. You can adjust that setting if you want to close these session more quickly, but the timeout applies to all UDP connections, not just syslog.

- When the Firepower Threat Defense device sends syslogs via TCP, the connection takes about one minute to initiate after the syslogd service restarts.

**Configure Syslog Logging for FTD Devices**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

To configure syslog settings, perform the following steps:

**Before you begin**

See requirements in Guidelines for Logging, on page 893.

**Procedure**

**Step 1** Select Devices > Platform Settings and create or edit a FTD policy.

**Step 2** Click Syslog from the table of contents.

**Step 3** Click Logging Setup to enable logging, specify FTP Server settings, and specify Flash usage. For more information, see Enable Logging and Configure Basic Settings, on page 895.

**Step 4** Click Logging Destinations to enable logging to specific destinations and to specify filtering on message severity level, event class, or on a custom event list. For more information, see Enable Logging Destinations, on page 896.

You must enable a logging destination to see messages at that destination.

**Step 5** Click E-mail Setup to specify the e-mail address that is used as the source address for syslog messages that are sent as e-mail messages. For more information, see Send Syslog Messages to an E-mail Address, on page 897.

**Step 6** Click Events List to define a custom event list that includes an event class, a severity level, and an event ID. For more information, see Create a Custom Event List, on page 898.

**Step 7** Click Rate Limit to specify the volume of messages being sent to all configured destinations and define the message severity level to which you want to assign rate limits. For more information, see Limit the Rate of Syslog Message Generation, on page 899.

**Step 8** Click Syslog Settings to specify the logging facility, enable the inclusion of a time stamp, and enable other settings to set up a server as a syslog destination. For more information, see Configure Syslog Settings, on page 899.

**Step 9** Click Syslog Servers to specify the IP address, protocol used, format, and security zone for the syslog server that is designated as a logging destination. For more information, see Configure a Syslog Server, on page 901.
Enable Logging and Configure Basic Settings

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>

<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

You must enable logging for the system to generate syslog messages for data plane events.

You can also set up archiving on flash or an FTP server as a storage location when the local buffer becomes full. You can manipulate logging data after it is saved. For example, you could specify actions to be executed when certain types of syslog messages are logged, extract data from the log and save the records to another file for reporting, or track statistics using a site-specific script.

The following procedure explains some of the basic syslog settings.

Procedure

**Step 1** Select Devices > Platform Settings and create or edit a FTD policy.

**Step 2** Select Syslog > Logging Setup.

**Step 3** Enable logging and configure basic logging settings.

- **Enable Logging**—Turns on data plane system logging for the Firepower Threat Defense device.
- **Enable Logging on the Failover Standby Unit**—Turns on logging for the standby for the Firepower Threat Defense device, if available.
- **Send syslogs in EMBLEM format**—Enables EMBLEM format logging for every logging destination. If you enable EMBLEM, you must use the UDP protocol to publish syslog messages; EMBLEM is not compatible with TCP.

  **Note** Syslog messages in RFC5424 format, typically displays the priority value (PRI). However, in FMC, if you want to display the PRI value in the syslog messages of the managed FTD, ensure to enable the EMBLEM format. For more information on PRI, see RFC5424.

- **Send debug messages as syslogs**—Redirects all the debug trace output to the syslog. The syslog message does not appear in the console if this option is enabled. Therefore, to see debug messages, you must enable logging at the console and configure it as the destination for the debug syslog message number and logging level. The syslog message number used is 711011. Default logging level for this syslog is debug.
- **Memory Size of Internal Buffer**—Specify the size of the internal buffer to which syslog messages are saved if the logging buffer is enabled. When the buffer fills up, it is overwritten. The default is 4096 bytes. The range is 4096 to 52428800.

**Step 4** (Optional) Configure an FTP server if you want to save log buffer contents to the server before the buffer is overwritten. Specify the FTP Server information.

- **FTP Server Buffer Wrap**—To save the buffer contents to the FTP server before it is overwritten, check this box and enter the necessary destination information in the following fields. To remove the FTP configuration, deselect this option.
- **IP Address**—Select the host network object that contains the IP address of the FTP server.
- **User Name**—Enter the user name to use when connecting to the FTP server.
- **Path**—Enter the path, relative to the FTP root, where the buffer contents should be saved.
Enable Logging Destinations

- **Password/ Confirm**—Enter and confirm the password used to authenticate the user name to the FTP server.

**Step 5** (Optional) Specify Flash size if you want to save log buffer contents to flash before the buffer is overwritten.

- **Flash**—To save the buffer contents to the flash memory before it is overwritten, check this box.
- **Maximum flash to be used by logging (KB)**—Specify the maximum space to be used in the flash memory for logging (in KB). The range is 4-8044176 bytes.
- **Minimum free space to be preserved (KB)**—Specifies the minimum free space to be preserved in flash memory (in KB). The range is 0-8044176 bytes.

**Step 6** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

### Enable Logging Destinations

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

You must enable a logging destination to see messages at that destination. When enabling a destination, you must also specify the message filter for the destination.

#### Procedure

**Step 1** Select **Devices > Platform Settings** and create or edit a FTD policy.

**Step 2** Select **Syslog > Logging Destinations**.

**Step 3** Click **Add** to enable a destination and apply a logging filter, or edit an existing destination.

**Step 4** In the **Logging Destinations** dialog box, select a destination and configure the filter to use for a destination:

a) Choose the destination you are enabling in the **Logging Destination** drop-down list. You can create one filter per destination: Console, E-Mail, Internal buffer, SNMP trap, SSH Sessions, and Syslog servers.

**Note** Console and SSH session logging works in the diagnostic CLI only. Enter **system support diagnostic-cli**.

b) In **Event Class**, choose the filter that will apply to all classes not listed in the table.

You can configure these filters:

- **Filter on severity**—Select the severity level. Messages at this level or higher are sent to the destination

- **Use Event List**—Select the event list that defines the filter. You create these lists on the **Event Lists** page.

- **Disable Logging**—Prevents messages from being sent to this destination.
c) If you want to create filters per event class, click **Add** to create a new filter, or edit an existing filter, and select the event class and severity level to limit messages in that class. Click **OK** to save the filter.

For an explanation of the event classes, see **Syslog Message Classes, on page 890.**

d) Click **OK**.

**Step 5**

Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Send Syslog Messages to an E-mail Address

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

You can set up a list of recipients for syslog messages to be sent as e-mails.

**Before you begin**

- Configure an SMTP server on the SMTP Server platform settings page
- **Enable Logging and Configure Basic Settings, on page 895**
- **Enable Logging Destinations**

**Procedure**

**Step 1**

Select **Devices > Platform Settings** and create or edit a FTD policy.

**Step 2**

Select **Syslog > Email Setup.**

**Step 3**

Specify the e-mail address that is used as the source address for syslog messages that are sent as e-mail messages.

**Step 4**

Click **Add** to enter a new e-mail address recipient of the specified syslog messages.

**Step 5**

Choose the severity level of the syslog messages that are sent to the recipient from the drop-down list.

The syslog message severity filter used for the destination e-mail address causes messages of the specified severity level and higher to be sent. For information on the levels, see **Severity Levels, on page 889.**

**Step 6**

Click **OK**.

**Step 7**

Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
Create a Custom Event List

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

An event list is a custom filter you can apply to a logging destination to control which messages are sent to the destination. Normally, you filter messages for a destination based on severity only, but you can use an event list to fine-tune which messages are sent based on a combination of event class, severity, and message identifier (ID).

Creating a custom event list is a two-step process. You create a custom list in the Event Lists, and then use the event list to define the logging filter for the various types of destination, in the Logging Destinations.

**Procedure**

**Step 1**  
Select Devices > Platform Settings and create or edit a FTD policy.

**Step 2**  
Select Syslog > Events List.

**Step 3**  
Configure an event list.  
   a) Click Add to add a new list, or edit an existing list.  
   b) Enter a name for the event list in the Name field. Spaces are not allowed.  
   c) To identify messages based on severity or event class, select the Severity/Event Class tab and add or edit entries.  
      
      For information on the available classes see Syslog Message Classes, on page 890.  
      
      For information on the levels, see Severity Levels, on page 889.  
      
      Certain event classes are not applicable for the device in transparent mode. If such options are configured then they will be bypassed and not deployed.  
   d) To identify messages specifically by message ID, select the Message ID and add or edit the IDs.  
      
      You can enter a range of IDs using a hyphen, for example, 100000-200000. IDs are six digits. For information on how the initial three digits map to features, see Syslog Message Classes, on page 890.  
      
      For specific message numbers, see Cisco ASA Series Syslog Messages.  
   e) Click OK to save the event list.

**Step 4**  
Click Logging Destinations and add or edit the destination that should use the filter.  
See Enable Logging Destinations, on page 896.

**Step 5**  
Click Save.  
You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.
Limit the Rate of Syslog Message Generation

You can limit the rate at which syslog messages are generated by severity level or message ID. You can specify individual limits for each logging level and each Syslog message ID. If the settings conflict, the Syslog message ID limits take precedence.

**Procedure**

**Step 1** Select Devices > Platform Settings and create or edit a FTD policy.

**Step 2** Select Syslog > Rate Limit.

**Step 3** To limit message generation by severity level, click Logging Level > Add and configure the following options:

- **Logging Level** — The severity level you are rate limiting. For information on the levels, see Severity Levels, on page 889.
- **Number of messages** — The maximum number of messages of the specified type allowed in the specified time period.
- **Interval** — The number of seconds before the rate limit counter resets.

**Step 4** Click OK.

**Step 5** To limit message generation by syslog message ID, click Syslog Level > Add and configure the following options:

- **Syslog ID** — The syslog message ID you are rate limiting. For specific message numbers, see Cisco ASA Series Syslog Messages.
- **Number of messages** — The maximum number of messages of the specified type allowed in the specified time period.
- **Interval** — The number of seconds before the rate limit counter resets.

**Step 6** Click OK.

**Step 7** Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

**Configure Syslog Settings**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>
You can configure general syslog settings to set the facility code to be included in syslog messages that are sent to syslog servers, specify whether a timestamp is included in each message, specify the device ID to include in messages, view and modify the severity levels for messages, and disable the generation of specific messages.

**Procedure**

**Step 1** Select Devices > Platform Settings and create or edit a FTD policy.

**Step 2** Select Syslog > Syslog Settings.

**Step 3** Select a system log facility for syslog servers to use as a basis to file messages in the Facility drop-down list. The default is LOCAL4(20), which is what most UNIX systems expect. However, because your network devices share available facilities, you might need to change this value for system logs.

**Step 4** Select the **Enable timestamp on each syslog message** check box to include the date and time a message was generated in the syslog message.

Timestamp timezone is always UTC.

**Step 5** If you want to add a device identifier to syslog messages (which is placed at the beginning of the message), check the **Enable Syslog Device ID** check box and then select the type of ID.

- **Interface**—To use the IP address of the selected interface, regardless of the interface through which the appliance sends the message. Select the security zone that identifies the interface. The zone must map to a single interface.
- **User Defined ID**—To use a text string (up to 16 characters) of your choice.
- **Host Name**—To use the hostname of the device.

**Step 6** Use the Syslog Message table to alter the default settings for specific syslog messages. You need to configure rules in this table only if you want to change the default settings. You can change the severity assigned to a message, or you can disable the generation of a message.

By default, Netflow is enabled and the entries are shown in the table.

a) To suppress syslog messages that are redundant because of Netflow, select **Netflow Equivalent Syslogs**. This adds the messages to the table as suppressed messages.

   **Note** If any of these syslog equivalents are already in the table, your existing rules are not overwritten.

b) To add a rule, click **Add**.

c) You select the message number whose configuration you want to change, from the **Syslog ID** drop down list and then select the new severity level from the **Logging Level** drop down list, or select **Suppressed** to disable the generation of the message. Typically, you would not change the severity level and disable the message, but you can make changes to both fields if desired.

d) Click **OK** to add the rule to the table.

**Step 7** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Configure a Syslog Server

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

To configure a syslog server to handle messages generated from your system, perform the following steps.

Before you begin

- See requirements in Guidelines for Logging, on page 893.
- Make sure your devices can reach your syslog collector on the network.

Procedure

Step 1
Select Devices > Platform Settings and create or edit a FTD policy.

Step 2
Select Syslog > Syslog Server.

Step 3
Check the Allow user traffic to pass when TCP syslog server is down check box, to allow traffic if any syslog server that is using the TCP protocol is down.

Step 4
Enter a size of the queue for storing syslog messages on the security appliance when syslog server is busy in the Message queue size (messages) field. The minimum is 1 message. The default is 512. Specify 0 to allow an unlimited number of messages to be queued (subject to available block memory).

Step 5
Click Add to add a new syslog server.

a) In the IP Address drop-down list, select a network host object that contains the IP address of the syslog server.

b) Choose the protocol (either TCP or UDP) and enter the port number for communications between the Firepower Threat Defense device and the syslog server.

UDP is faster and uses less resources on the device than TCP.

The default ports are 514 for UDP, 1470 for TCP. Valid non-default port values for either protocol are 1025 through 65535.

c) Check the Log messages in Cisco EMBLEM format (UDP only) check box to specify whether to log messages in Cisco EMBLEM format (available only if UDP is selected as the protocol).

Note Synlog messages in RFC5424 format, typically displays the priority value (PRI). However, in FMC, only when you enable logging in Cisco EMBLEM format, the PRI value in the syslog messages of the managed FTD is displayed. For more information on PRI, see RFC5424.

d) Check the Enable Secure Syslog check box to encrypt the connection between the device and server using SSL/TLS over TCP.
e) Add the zones that contain the interfaces used to communicate with the syslog server. For interfaces not in a zone, you can type the interface name into the field below the Selected Zones/Interface list and click Add. These rules will be applied to a device only if the device includes the selected interfaces or zones.

Note: If the syslog server is on the network attached to the physical Management interface, you must type the name of that interface into the Interface Name field below the Selected Security Zones list and click Add. You must also configure this name (if not already configured), and an IP address, for the Diagnostic interface (edit the device from the Device Management page and select the Interfaces tab). For more information about the management/diagnostic interface, see Diagnostic Interface, on page 555.

f) Click OK.

Step 6 Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Configure Global Timeouts

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Access Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

You can set the global idle timeout durations for the connection and translation slots of various protocols. If the slot has not been used for the idle time specified, the resource is returned to the free pool.

You can also set a time out for console sessions with the device.

Procedure

Step 1 Select Devices > Platform Settings and create or edit a FTD policy.

Step 2 Select Timeouts.

Step 3 Configure the timeouts you want to change.

For any given setting, select Custom to define your own value, Default to return to the system default value. In most cases, the maximum timeout is 1193 hours.

You can disable some timeouts by selecting Disable.

• Console Timeout—The idle time until a connection to the console is closed, range is 0 to 60 minutes. The default is 0, which means the session does not time out. If you change the value, existing console sessions use the old timeout value. The new value applies to new connections only.
Appliance Platform Settings

Configure Global Timeouts

- **Translation Slot (xlate)**—The idle time until a NAT translation slot is freed. This duration must be at least 1 minute. The default is 3 hours.

- **Connection (Conn)**—The idle time until a connection slot is freed. This duration must be at least 5 minutes. The default is 1 hour.

- **Half-Closed**—The idle time until a TCP half-closed connection closes. The minimum is 30 seconds. The default is 10 minutes.

- **UDP**—The idle time until a UDP connection closes. This duration must be at least 1 minute. The default is 2 minutes.

- **ICMP**—The idle time after which general ICMP states are closed. The default (and minimum) is 2 seconds.

- **RPC/Sun RPC**—The idle time until a SunRPC slot is freed. This duration must be at least 1 minute. The default is 10 minutes.

- **H.225**—The idle time until an H.225 signaling connection closes. The default is 1 hour. To close a connection immediately after all calls are cleared, a timeout of 1 second (0:0:1) is recommended.

- **H.323**—The idle time after which H.245 (TCP) and H.323 (UDP) media connections close. The default (and minimum) is 5 minutes. Because the same connection flag is set on both H.245 and H.323 media connections, the H.245 (TCP) connection shares the idle timeout with the H.323 (RTP and RTCP) media connection.

- **SIP**—The idle time until a SIP signaling port connection closes. This duration must be at least 5 minutes. The default is 30 minutes.

- **SIP Media**—The idle time until a SIP media port connection closes. This duration must be at least 1 minute. The default is 2 minutes. The SIP media timer is used for SIP RTP/RTCP with SIP UDP media packets, instead of the UDP inactivity timeout.

- **SIP Disconnect**—The idle time after which SIP session is deleted if the 200 OK is not received for a CANCEL or a BYE message, between 0:0:1 and 0:10:0. The default is 2 minutes (0:2:0).

- **SIP Invite**—The idle time after which pinholes for PROVISIONAL responses and media xlates will be closed, between 0:1:0 and 00:30:0. The default is 3 minutes (0:3:0).

- **SIP Provisional Media**—The timeout value for SIP provisional media connections, between 1 and 30 minutes. The default is 2 minutes.

- **Floating Connection**—When multiple routes exist to a network with different metrics, the ASA uses the one with the best metric at the time of connection creation. If a better route becomes available, then this timeout lets connections be closed so a connection can be reestablished to use the better route. The default is 0 (the connection never times out). To make it possible to use better routes, set the timeout to a value between 0:0:30 and 1193:0:0.

- **ARP Timeout**—(Transparent mode only.) The number of seconds between ARP table rebuilds, from 60 to 4294967. The default is 14,400 seconds (4 hours).

**Step 4** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
Configure NTP Time Synchronization for Threat Defense

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Global only</td>
<td>Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

Use a Network Time Protocol (NTP) server to synchronize the clock settings on your devices. We recommend you configure all FTDs managed by an FMC to use the same NTP server as the FMC. The FTD gets its time directly from the configured NTP server. If the FTD's configured NTP servers are not reachable for any reason, it synchronizes its time with the FMC.

**Note**

If you are deploying FTD on the Firepower 4100/9300 chassis, you must configure NTP on the Firepower 4100/9300 chassis so that Smart Licensing will work properly and to ensure proper timestamps on device registrations. You should use the same NTP server for the Firepower 4100/9300 chassis and the Firepower Management Center.

**Before you begin**

- If your organization has one or more NTP servers that your FTD can reach, use the same NTP server or servers for your devices that you have configured for Time Synchronization on the **System > Configuration** page on your FMC. Copy the specified value.
- If your device cannot reach an NTP server or your organization does not have one, you must use the **Via NTP from Defense Center** option as discussed in the following procedure.

**Procedure**

**Step 1** Select **Devices > Platform Settings** and create or edit a FTD policy.

**Step 2** Select **Time Synchronization**.

**Step 3** Configure one of the following clock options:

- **Via NTP from Defense Center**—(Default). The managed device gets time from the NTP servers you configured for the Firepower Management Center (except for authenticated NTP servers) and synchronizes time with those servers directly. However, if any of the following are true, the managed device synchronizes time from the Firepower Management Center:
  - The Firepower Management Center’s NTP servers are not reachable by the device.
  - The Firepower Management Center has no unauthenticated servers.

- **Via NTP from**—If your Firepower Management Center is using NTP servers on the network, select this option and enter the fully-qualified DNS name (such as ntp.example.com), or IP address, of the same NTP servers you specified in **System > Configuration > Time Synchronization**. If the NTP servers are not reachable, the Firepower Management Center acts as an NTP server.
Step 4  Click Save.

What to do next

- Make sure the policy is assigned to your devices. See Setting Target Devices for a Platform Settings Policy, on page 855.
- Deploy configuration changes; see Deploy Configuration Changes, on page 337.
- If your Firepower system includes Classic devices, set up time synchronization for those devices. See Synchronize Time on Classic Devices with an NTP Server, on page 865.

History for Firepower Threat Defense Platform Settings

<table>
<thead>
<tr>
<th>Feature</th>
<th>Version</th>
<th>Details</th>
</tr>
</thead>
</table>
| External Authentication for SSH and HTML removed | 6.1.0   | Due to changes to support converged management access, only local users are supported for SSH and HTML to data interfaces. Also, you can no longer SSH to the logical Diagnostic interface; instead you can SSH to the logical Management interface (which shares the same physical port). Previously, only external authentication was supported for SSH and HTML access to Diagnostic and data interfaces, while only local users were supported to the Management interface. New/Modified screen:  
  Devices > Platform Settings > External Authentication

PART XIII

Network Address Translation (NAT)

- NAT Policy Management, on page 909
- NAT for 7000 and 8000 Series Devices, on page 915
- Network Address Translation (NAT) for Firepower Threat Defense, on page 933
NAT Policy Management

The following topics describe how to manage NAT policies for your Firepower System:

- Managing NAT Policies, on page 909
- Creating NAT Policies, on page 910
- Configuring NAT Policies, on page 911
- Configuring NAT Policy Targets, on page 912
- Copying NAT Policies, on page 913

### Managing NAT Policies

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series FTD</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies. If a NAT policy targets devices in different descendant domains, administrators in the descendant domains can view information about target devices belonging to their domain only.

**Procedure**

1. **Step 1** Choose Devices > NAT.
2. **Step 2** Manage your NAT policies:
   - Copy — Click copy (ıld sign) next to the policy you want to copy; see Copying NAT Policies, on page 913.
   - Create — Click New Policy; see Creating NAT Policies, on page 910.
Creating NAT Policies

When you create a new NAT policy you must, at minimum, give it a unique name. Although you are not required to identify policy targets at policy creation time, you must perform this step before you can deploy the policy. If you apply a NAT policy with no rules to a device, the system removes all NAT rules from that device.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies. If a NAT policy targets devices in different descendant domains, administrators in the descendant domains can view information about target devices belonging to their domain only.

Procedure

Step 1 Choose Devices > NAT.
Step 2 From the New Policy drop-down list, choose one of the following:

- Firepower NAT for 7000 & 8000 Series devices.
- Threat Defense NAT for FTD devices.

Step 3 Enter a unique Name.
In a multidomain deployment, policy names must be unique within the domain hierarchy. The system may identify a conflict with the name of a policy you cannot view in your current domain.

**Step 4** Optionally, enter a **Description**.

**Step 5** Choose the devices where you want to deploy the policy:
- Choose a device in the **Available Devices** list, and click **Add to Policy**.
- Click and drag a device from the **Available Devices** list to the **Selected Devices** list.
- Remove a device from the **Selected Devices** list by clicking delete (X) next to the device.

**Step 6** Click **Save**.

---

**What to do next**

Deploy configuration changes; see *Deploy Configuration Changes, on page 337*.

</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series FTD</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies. If a NAT policy targets devices in different descendant domains, administrators in the descendant domains can view information about target devices belonging to their domain only.

If you change the type of an interface to a type that is not valid for use with a NAT policy that targets a device with that interface, the policy labels the interface as deleted. Click **Save** in the NAT policy to automatically remove the interface from the policy.

---

**Note**

Rule attributes differ by NAT policy type. When adding or editing rules, click ? in the dialog box for more information, or see the relevant chapter: *Network Address Translation (NAT) for Firepower Threat Defense, on page 933* or *NAT for 7000 and 8000 Series Devices, on page 915*.

---

**Procedure**

**Step 1** Choose **Devices > NAT**.

**Step 2** Click edit (✓) next to the NAT policy you want to modify.
If a view icon (__) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Configure your NAT policies:

- To modify the policy name or description, click the **Name** or **Description** field, delete any characters as needed, then enter the new name or description. In a multidomain deployment, policy names must be unique within the domain hierarchy. The system may identify a conflict with the name of a policy you cannot view in your current domain.
- To manage policy targets, see Configuring NAT Policy Targets, on page 912.
- To save your policy changes, click **Save**.
- To add a rule to a policy, click **Add Rule**.
- To edit an existing rule, click edit (__) next to the rule.
- To delete a rule, click delete (__) next to the rule, then click **OK**.
- To enable or disable an existing rule, right-click a rule, choose **State**, and choose **Disable** or **Enable**.
- (Firepower NAT only) To display the configuration page for a specific rule attribute, click the name or value in the column for the condition on the row for the rule. For example, click the name or value in the **Source Networks** column to display the Source Network page for the selected rule.

---

**What to do next**

Deploy configuration changes; see Deploy Configuration Changes, on page 337.

</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Control</td>
<td>7000 &amp; 8000 Series FTD</td>
<td>Any</td>
<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

You can identify the managed devices you want to target with your policy while creating or editing a policy. You can search a list of available devices, 7000 or 8000 Series stacks, and high-availability pairs, and add them to a list of selected devices.

You cannot target stacked devices running different versions of the Firepower System (for example, if an upgrade on one of the devices fails).

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies. If a NAT policy targets devices in different descendant domains, administrators in the descendant domains can view information about target devices belonging to their domain only.
Procedure

Step 1  Choose Devices > NAT.

Step 2  Click edit (edit symbol) next to the NAT policy you want to modify.

If a view icon (view symbol) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3  Click Policy Assignments.

Step 4  Do any of the following:

• To assign a device, stack, high-availability pair, or device group to the policy, select it in the Available Devices list and click Add to Policy. You can also drag and drop.

• To remove a device assignment, click delete (delete symbol) next to a device, stack, high-availability pair, or device group in the Selected Devices list.

Step 5  Click OK.

What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 337.

Copying NAT Policies

<table>
<thead>

<td>Access Admin Administrator Network Admin</td>
</tr>
</tbody>
</table>

You can make a copy of a NAT policy. The copy includes all policy rules and configurations.

In a multidomain deployment, you can copy policies from current and ancestor domains.

Procedure

Step 1  Choose Devices > NAT.

Step 2  Click copy (copy symbol) next to the NAT policy you want to copy.

Step 3  Enter a unique Name for the policy.

In a multidomain deployment, policy names must be unique within the domain hierarchy. The system may identify a conflict with the name of a policy you cannot view in your current domain.

Step 4  Click OK.
Copying NAT Policies
CHAPTER 48

NAT for 7000 and 8000 Series Devices

The following topics describe how to configure NAT for 7000 and 8000 Series devices:

• NAT Policy Configuration, on page 915
• Rule Organization in a NAT Policy, on page 916
• Organizing NAT Rules, on page 917
• NAT Policy Rules Options, on page 918

NAT Policy Configuration

You can configure NAT policies in different ways to manage specific network needs. You can:

• Expose an internal server to an external network.

  In this configuration, you define a static translation from an external IP address to an internal IP address so the system can access an internal server from outside the network. Traffic sent to the server targets the external IP address or IP address and port, and is translated into the internal IP address or IP address and port. Return traffic from the server is translated back to the external address.

• Allow an internal host/server to connect to an external application.

  In this configuration, you define a static translation from an internal address to an external address. This definition allows the internal host or server to initiate a connection to an external application that is expecting the internal host or server to have a specific IP address and port. Therefore, the system cannot dynamically allocate the address of the internal host or server.

• Hide private network addresses from an external network.

  You can obscure your internal network addresses using either of the following configurations:

  • If you have a sufficient number of external IP addresses to satisfy your internal network needs, you can use a block of IP addresses. In this configuration, you create a dynamic translation that automatically converts the source IP address of any outgoing traffic to an unused IP address from your externally facing IP addresses.

  • If you have an insufficient number of external IP addresses to satisfy your internal network needs, you can use a limited block of IP addresses and port translation. In this configuration, you create a dynamic translation that automatically converts the source IP address and port of outgoing traffic to an unused IP address and port from your externally facing IP addresses.
In 7000 or 8000 Series device high-availability pairs, only select an individual peer interface for a static NAT rule on a paired device if all networks affected by the NAT translations are private. Do not use configurations for static NAT rules affecting traffic between public and private networks.

**NAT Policies Configuration Guidelines**

To configure a NAT policy, you must give the policy a unique name and identify the devices, or targets, where you want to deploy the policy. You can also add, edit, delete, enable, and disable NAT rules. After you create or modify a NAT policy, you can deploy the policy to all or some targeted devices.

You can deploy NAT policies to a 7000 or 8000 Series device high-availability pair, including paired stacks, as you would a standalone device. However, you can define static NAT rules for interfaces on individual paired devices or the entire high-availability pair and use the interfaces in source zones. For dynamic rules, you can use only the interfaces on the whole high-availability pair in source or destination zones.

If you configure dynamic NAT on a device high-availability pair without HA link interfaces established, both paired devices independently allocate dynamic NAT entries, and the system cannot synchronize the entries between devices.

You can deploy NAT policies to a device stack as you would a standalone device. If you establish a device stack from devices that were included in a NAT policy and had rules associated with interfaces from the secondary device that was a member of the stack, the interfaces from the secondary device remain in the NAT policy. You can save and deploy policies with the interfaces, but the rules do not provide any translation.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain. Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

**Rule Organization in a NAT Policy**

The Edit page for the NAT policy lists static NAT rules and dynamic NAT rules separately. The system sorts static rules alphabetically by name, and you cannot change the display order. You cannot create static rules with identical matching values. The system inspects static translations for a match before it inspects any dynamic translations.

Dynamic rules are processed in numerical order. The numeric position of each dynamic rule appears on the left side of the page next to the rule. You can move or insert dynamic rules and otherwise change the rule order. For example, if you move dynamic rule 10 under dynamic rule 3, rule 10 becomes rule 4 and all subsequent numbers increment accordingly.

A dynamic rule’s position is important because the system compares packets to dynamic rules in the rules’ numeric order on the policy Edit page. When a packet meets all the conditions of a dynamic rule, the system applies the conditions of that rule to the packet and ignores all subsequent rules for that packet.
You can specify a dynamic rule’s numeric position when you add or edit a dynamic rule. You can also highlight a dynamic rule before adding a new dynamic rule to insert the new rule below the rule you highlighted.

You can select one or more dynamic rules by clicking a blank space in the row for the rule. You can drag and drop selected dynamic rules into a new location, thereby changing the position of the rules you moved and all subsequent rules.

You can cut or copy selected rules and paste them above or below an existing rule. You can only paste static rules in the Static Translations list and only dynamic rules in the Dynamic Translations list. You can also delete selected rules and insert new rules into any location in the list of existing rules.

You can display explanatory warnings to identify rules that will never match because they are preempted by preceding rules.

If you have access control policies in your deployment, the system does not translate traffic until it has passed through access control.

### Organizing NAT Rules

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

**Procedure**

**Step 1** Choose Devices > NAT.

**Step 2** Click the edit icon ( MODIFY START) next to the NAT policy you want to modify.

If a view icon ( VIEW START) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Organize your NAT rules:

- To choose a rule, click a blank area in the row for a rule.
- To clear rule selections, click the reload icon ( RELOAD START) on the lower right side of the page. To clear individual rules, click a blank area in a rule's row while holding the Ctrl key.
- To cut or copy selected rules, right-click a blank area in the row for a selected rule, then select Cut or Copy.
- To paste rules you have cut or copied into the rule list, right-click a blank area in the row for a rule where you want to paste selected rules, then select Paste above or Paste below.
- To move selected rules, drag and drop selected rules beneath a new location, indicated by a horizontal blue line that appears above your pointer as you drag.
- To delete a rule, click the delete icon ( DELETE START) next to the rule, then click OK.
- To show warnings, click Show Warnings.
NAT Rule Warnings and Errors

The conditions of a NAT rule may preempt a subsequent rule from matching traffic. Any type of rule condition can preempt a subsequent rule.

A rule also preempts an identical subsequent rule where all configured conditions are the same. A subsequent rule would not be preempted if any condition were different.

If you create a rule that causes the NAT policy to fail upon deploy, an error icon ( ) appears next to the rule. An error occurs if there is a conflict in the static rules, or if you edit a network object used in the policy that now makes the policy invalid. For example, an error occurs if you change a network object to use only IPv6 addresses and the rule that uses that object no longer has any valid networks where at least one network is required. Error icons appear automatically; you do not have to click Show Warnings.

Showing and Hiding NAT Rule Warnings

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Procedure

**Step 1** Choose Devices > NAT.

**Step 2** Click the edit icon ( ) next to the NAT policy you want to modify.

If a view icon ( ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** To show warnings, click Show Warnings.

The page updates with a warning icon ( ) next to each preempted rule.

**Step 4** To display the warning for a rule, hover your pointer over the warning icon ( ) next to a rule.

A message indicates which rule preempts the rule.

**Step 5** To clear warnings, click Hide Warnings.

The page refreshes and the warnings disappear.

NAT Policy Rules Options

A NAT rule is simply a set of configurations and conditions that:

- qualifies network traffic
- specifies how the traffic that matches those qualifications is translated

You create and edit NAT rules from within an existing NAT policy. Each rule belongs to only one policy.
The web interface for adding or editing a rule is similar. You specify the rule name, state, type, and position (if dynamic) at the top of the page. You build conditions using the tabs on the left side of the page; each condition type has its own tab.

The following list summarizes the configurable components of a NAT rule.

Name
Give each rule a unique name. For static NAT rules, use a maximum of 22 characters. For dynamic NAT rules, use a maximum of 30 characters. You can use printable characters, including spaces and special characters, with the exception of the colon (:).

Rule State
By default, rules are enabled. If you disable a rule, the system does not use it to evaluate network traffic for translation. When viewing the list of rules in a NAT policy, disabled rules are grayed out, although you can still modify them.

Type
A rule’s type determines how the system handles traffic that matches the rule’s conditions. When you create and edit NAT rules, the configurable components vary according to rule type.

Position (Dynamic Rules Only)
Dynamic rules in a NAT policy are numbered, starting at 1. The system matches traffic to NAT rules in top-down order by ascending rule number.

When you add a rule to a policy, you specify its position by placing it above or below a specific rule, using rule numbers as a reference point. When editing an existing rule, you can Move the rule in a similar fashion.

Conditions
Rule conditions identify the specific traffic you want to translate. Conditions can match traffic by any combination of multiple attributes, including security zone, network, and transport protocol port.

</tbody>
</table>

In a multidomain deployment, the system displays policies and rules created in the current domain, which you can edit. It also displays policies and rules created in ancestor domains, which you cannot edit. To view and edit rules created in a lower domain, switch to that domain.
NAT Rule Types

Every NAT rule has an associated type that:

- qualifies network traffic
- specifies how the traffic that matches those qualifications is translated

The following list summarizes the NAT rule types.

**Static**

Static rules provide one-to-one translations on destination networks and optionally port and protocol. When configuring static translations, you can configure source zones, destination networks, and destination ports. You cannot configure destination zones or source networks.
You must specify an original destination network. For destination networks, you can only select network objects and groups containing a single IP address or enter literal IP addresses that represent a single IP address. You can only specify a single original destination network and a single translated destination network.

---

**Note**
The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

You can specify a single original destination port and a single translated destination port. You must specify an original destination network before you can specify an original destination port. In addition, you cannot specify a translated destination port unless you also specify an original destination port, and the translated value must match the protocol of the original value.

---

**Caution**
For static NAT rules on a 7000 or 8000 Series device in a high-availability pair, only select an individual peer interface if all networks affected by the NAT translations are private. Do not use this configuration for static NAT rules affecting traffic between public and private networks.

**Dynamic IP Only**
Dynamic IP Only rules translate many-to-many source networks, but maintain port and protocol. When configuring dynamic IP only translations, you can configure zones, source networks, original destination networks, and original destination ports. You cannot configure translated destination networks or translated destination ports.

You must specify at least one translated source network. If the number of translated source network values is less than the number of original source networks, the system displays a warning on the rule that it is possible to run out of translated addresses before all original addresses are matched.

If there are multiple rules with conditions that match the same packet, the low priority rules become dead, meaning they can never be triggered. The system also displays warnings for dead rules. You can view tooltips to determine which rule supersedes the dead rule.

---

**Note**
You can save and deploy policies with dead rules, but the rules cannot provide any translation.

In some instances, you may want to create rules with limited scope preceding rules with a broader scope. For example:

Rule 1: Match on address A and port A/Translate to address B
Rule 2: Match on address A/Translate to Address C

In this example, rule 1 matches some packets that also match rule 2. Therefore, rule 2 is not completely dead.

If you specify only original destination ports, you cannot specify translated destination ports.

**Dynamic IP + Port**
Dynamic IP and port rules translate many-to-one or many-to-many source networks and port and protocol. When configuring dynamic IP and port translations, you can configure zones, source networks, original
destination networks, and original destination ports. You cannot configure translated destination networks or translated destination ports.

You must specify at least one translated source network. If there are multiple rules with conditions that match the same packet, the low priority rules become dead, meaning they can never be triggered. The system also displays warnings for dead rules. You can view tool tips to determine which rule supersedes the dead rule.

You must specify at least one translated source network. If there are multiple rules with conditions that match the same packet, the low priority rules become dead, meaning they can never be triggered. The system also displays warnings for dead rules. You can view tool tips to determine which rule supersedes the dead rule.

---

**Note**

You can save and deploy policies with dead rules, but the rules cannot provide any translation.

If you specify only original destination ports, you cannot specify translated destination ports.

---

**Note**

If you create a dynamic IP and port rule, and the system passes traffic that does not use a port, no translation occurs for the traffic. For example, a ping (ICMP) from an IP address that matches the source network does not map, because ICMP does not use a port.

### NAT Rule Condition Types

The following table summarizes the NAT rule condition types that can be configured based on the specified NAT rule type:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Static</th>
<th>Dynamic (IP Only or IP + Port)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Zones</td>
<td>Optional</td>
<td>Optional</td>
</tr>

<td>Optional</td>
</tr>
<tr>
<td>Original Source Networks</td>
<td>Not allowed</td>
<td>Optional</td>
</tr>
<tr>
<td>Translated Source Networks</td>
<td>Not allowed</td>
<td>Required</td>
</tr>
<tr>
<td>Original Destination Networks</td>
<td><strong>Required</strong></td>
<td>Optional</td>
</tr>
<tr>
<td>Translated Destination Networks</td>
<td>Optional; single address only</td>
<td>Not allowed</td>
</tr>
<tr>
<td>Original Destination Ports</td>
<td>Optional; single port only, and only allowed if you define the original destination network</td>
<td>Optional</td>
</tr>
<tr>
<td>Translated Destination Ports</td>
<td>Optional; single port only, and only allowed if you define the original destination port</td>
<td>Not allowed</td>
</tr>
</tbody>
</table>

### NAT Rule Conditions and Condition Mechanics

You can add conditions to NAT rules to identify the type of traffic that matches the rule. For each condition type, you select conditions you want to add to a rule from a list of available conditions. When applicable, condition filters allow you to constrain available conditions. Lists of available and selected conditions may
be as short as a single condition or many pages long. You can search available conditions and display only those matching a typed name or value in a list that updates as you type.

Depending on the type of condition, lists of available conditions may be comprised of a combination of conditions provided directly by Cisco or configured using other Firepower System features, including objects created using the object manager (Objects > Object Management), objects created directly from individual conditions pages, and literal conditions.

**NAT Rule Conditions**

You can set a NAT rule to match traffic meeting any of the conditions described in the following table:

**Table 83: NAT Rule Condition Types**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zones</td>
<td>A configuration of one or more routed interfaces where you can deploy NAT policies. Zones provide a mechanism for classifying traffic on source and destination interfaces, and you can add source and destination zone conditions to rules.</td>
</tr>
<tr>
<td>Networks</td>
<td>Any combination of individual IP addresses, CIDR blocks, and prefix lengths, either specified explicitly or using network objects and groups. You can add source and destination network conditions to NAT rules.</td>
</tr>
<tr>
<td>Destination Ports</td>
<td>Transport protocol ports, including individual and group port objects you create based on transport protocols.</td>
</tr>
</tbody>
</table>

**Adding Conditions to NAT Rules**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Adding conditions to NAT rules is essentially the same for each type of condition. You choose from a list of available conditions on the left, and add the conditions you chose to one or two lists of selected conditions on the right.
