Installing a Certificate Using a PKCS12 File 535
Troubleshooting FTD Certificates 536

PART V

Classic Device Configuration Basics 537

CHAPTER 23

Classic Device Management Basics 539
Requirements and Prerequisites for Classic Device Management 539
Remote Management Configuration (Classic Devices) 539
  Configuring Remote Management on a Managed Device 540
  Editing Remote Management on a Managed Device 541
  Changing the Management Port 541
Interface Configuration Settings 542
  The Physical Hardware View 542
  The Interfaces Page 542
  Interface Icons 544
  Using the Physical Hardware View 544
  Configuring Sensing Interfaces 545
  Configuring HA Link Interfaces 546
  Disabling Interfaces 547
Managing Cisco ASA FirePOWER Interfaces 547
MTU Ranges for 7000 and 8000 Series Devices and NGIPSv 548
Synchronizing Security Zone Object Revisions 549

CHAPTER 24

IPS Device Deployments and Configuration 551
Introduction to IPS Device Deployment and Configuration 551
License Requirements for IPS Device Deployment 551
Requirements and Prerequisites for IPS Device Deployment 551
Passive IPS Deployments 552
  Passive Interfaces on the Firepower System 552
Configuring Passive Interfaces 552

Inline IPS Deployments 553
   Inline Interfaces on the Firepower System 555
   Configuring Inline Interfaces 555
   Inline Sets on the Firepower System 556
   Viewing Inline Sets 558
   Adding Inline Sets 558
   Advanced Inline Set Options 559
   Configuring Advanced Inline Set Options 560
   Deleting Inline Sets 561

PART VI

Classic Device High Availability and Scalability 563

CHAPTER 25

7000 and 8000 Series Device High Availability 565
   About 7000 and 8000 Series Device High Availability 565
   Device High Availability Requirements 566
   Device High Availability Failover and Maintenance Mode 566
   Configuration Deployment and Upgrade Behavior for High-Availability Pairs 567
   Deployment Types and Device High Availability 567
   7000/8000 Series High Availability Configuration 569
   Establishing Firepower 7000/8000 Series High Availability 569
   Editing Device High Availability 570
   Configuring Individual Devices in a High-Availability Pair 571
   Configuring Individual Device Stacks in a High-Availability Pair 571
   Configuring Interfaces on a Device in a High-Availability Pair 572
   Switching the Active Peer in a Device High-Availability Pair 572
   Placing a High-Availability Peer into Maintenance Mode 573
   Replacing a Device in a Stack in a High-Availability Pair 574
   Device High Availability State Sharing 574
      Establishing Device High-Availability State Sharing 576
   Device High Availability State Sharing Statistics for Troubleshooting 577
      Viewing Device High Availability State Sharing Statistics 579
   Separating Device High-Availability Pairs 580
### CHAPTER 26

#### 8000 Series Device Stacking  581
- About Device Stacks  581
- Device Stack Configuration  583
- Establishing Device Stacks  584
- Editing Device Stacks  585
- Replacing a Device in a Stack  585
- Replacing a Device in a Stack in a High-Availability Pair  586
- Configuring Individual Devices in a Stack  586
- Configuring Interfaces on a Stacked Device  587
- Separating Stacked Devices  587
- Replacing a Device in a Stack  588

### PART VII

#### Firepower Threat Defense Getting Started  589

### CHAPTER 27

#### Transparent or Routed Firewall Mode for Firepower Threat Defense  591
- About the Firewall Mode  591
  - About Routed Firewall Mode  591
  - About Transparent Firewall Mode  592
    - Using the Transparent Firewall in Your Network  592
    - Diagnostic Interface  592
    - Passing Traffic For Routed-Mode Features  593
- About Bridge Groups  593
  - Bridge Virtual Interface (BVI)  593
  - Bridge Groups in Transparent Firewall Mode  593
  - Bridge Groups in Routed Firewall Mode  594
  - Allowing Layer 3 Traffic  595
  - Allowed MAC Addresses  595
  - BPDU Handling  595
  - MAC Address vs. Route Lookups  596
  - Unsupported Features for Bridge Groups in Transparent Mode  597
  - Unsupported Features for Bridge Groups in Routed Mode  598
- Default Settings  599
- Guidelines for Firewall Mode  599
Set the Firewall Mode  600

CHAPTER 28  Logical Devices for the Firepower Threat Defense on the Firepower 4100/9300  603

About Firepower Interfaces  603
  Chassis Management Interface  603
  Interface Types  604
  FXOS Interfaces vs. Application Interfaces  604
  Shared Interface Scalability  607
    Shared Interface Best Practices  607
    Shared Interface Usage Examples  609
    Viewing Shared Interface Resources  615
  Inline Set Link State Propagation for the Firepower Threat Defense  616

About Logical Devices  616
  Standalone and Clustered Logical Devices  616
  Logical Device Application Instances: Container and Native  617
    Container Instance Interfaces  617
    How the Chassis Classifies Packets  617
    Classification Examples  618
    Cascading Container Instances  621
    Typical Multi-Instance Deployment  622
    Automatic MAC Addresses for Container Instance Interfaces  623
    Container Instance Resource Management  624
    Performance Scaling Factor for Multi-Instance Capability  624
    Container Instances and High Availability  624
  Licenses for Container Instances  624
  Requirements and Prerequisites for Logical Devices  625
    Requirements and Prerequisites for Hardware and Software Combinations  625
    Requirements and Prerequisites for Container Instances  626
    Requirements and Prerequisites for High Availability  627
  Guidelines and Limitations for Logical Devices  628
    Guidelines and Limitations for Firepower Interfaces  628
    General Guidelines and Limitations  630
  Configure Interfaces  631
    Enable or Disable an Interface  631
CHAPTER 31

Inline Sets and Passive Interfaces for Firepower Threat Defense 695

About IPS Interfaces 695
**CHAPTER 32**

** DHCP and DDNS Services for Threat Defense  **  **705**

- About DHCP and DDNS Services  **705**
- About the DHCPv4 Server  **705**
  - DHCP Options  **705**
- About the DHCP Relay Agent  **706**

**CHAPTER 33**

**SNMP for the Firepower 1000/2100**  **715**

- About SNMP for the Firepower 1000/2100 Series  **715**
- Enabling SNMP and Configuring SNMP Properties for Firepower 1000/2100  **715**
- Creating an SNMP Trap for Firepower 1000/2100  **716**
- Creating an SNMP User for Firepower 1000/2100  **717**

**CHAPTER 34**

**Quality of Service (QoS) for Firepower Threat Defense**  **719**

- Introduction to QoS  **719**
- About QoS Policies  **719**
- Requirements and Prerequisites for QoS  **720**
- Rate Limiting with QoS Policies  **720**
Creating a QoS Policy 721
Setting Target Devices for a QoS Policy 722
Configuring QoS Rules 722
QoS Rule Components 723
History for QOS 724

PART IX

Firepower Threat Defense High Availability and Scalability 725

CHAPTER 35

High Availability for Firepower Threat Defense 727
About Firepower Threat Defense High Availability 727
High Availability System Requirements 727
  Hardware Requirements 727
  Software Requirements 728
  License Requirements for FTD Devices in a High Availability Pair 728
Failover and Stateful Failover Links 729
  Failover Link 729
  Stateful Failover Link 730
  Avoiding Interrupted Failover and Data Links 730
MAC Addresses and IP Addresses in High Availability 732
Stateful Failover 733
  Supported Features 733
  Unsupported Features 735
Bridge Group Requirements for High Availability 735
Failover Health Monitoring 736
  Unit Health Monitoring 736
  Interface Monitoring 736
Failover Triggers and Detection Timing 738
About Active/Standby Failover 739
  Primary/Secondary Roles and Active/Standby Status 739
  Active Unit Determination at Startup 739
  Failover Events 740
Requirements and Prerequisites for High Availability 741
Guidelines for High Availability 741
Add a Firepower Threat Defense High Availability Pair 742
Clustering Guidelines and Limitations  759
Configure Clustering  762
   FXOS: Add a Firepower Threat Defense Cluster  762
   Create a Firepower Threat Defense Cluster  762
   Add More Cluster Units  770
FMC: Add a Cluster  771
   FMC: Configure Cluster, Data, and Diagnostic Interfaces  773
FXOS: Remove a Cluster Unit  775
FMC: Manage Cluster Members  776
   Add a New Cluster Member  776
   Replace a Cluster Member  777
   Deactivate a Member  778
   Rejoin the Cluster  778
   Delete a Data Unit  779
   Reconcile Cluster Members  779
FMC: Monitoring the Cluster  780
Reference for Clustering  780
   Firepower Threat Defense Features and Clustering  780
      Unsupported Features with Clustering  781
      Centralized Features for Clustering  781
      Dynamic Routing and Clustering  782
      Connection Settings  782
      FTP and Clustering  782
      NAT and Clustering  783
      SIP Inspection and Clustering  784
      SNMP and Clustering  784
      Syslog and Clustering  784
      TLS/SSL Connections and Clustering  784
      Cisco TrustSec and Clustering  784
      VPN and Clustering  785
      Performance Scaling Factor  785
      Control Unit Election  785
      High Availability Within the Cluster  786
      Chassis-Application Monitoring  786
PART X

Firepower Threat Defense Routing

CHAPTER 37

Routing Overview for Firepower Threat Defense

Path Determination

Supported Route Types

Static Versus Dynamic

Single-Path Versus Multipath

Flat Versus Hierarchical

Link-State Versus Distance Vector

Supported Internet Protocols for Routing

Routing Table

How the Routing Table Is Populated

Administrative Distances for Routes

Backup Dynamic and Floating Static Routes

How Forwarding Decisions Are Made

Dynamic Routing and High Availability

Dynamic Routing in Clustering

Routing Table for Management Traffic

Equal-Cost Multi-Path (ECMP) Routing

About Route Maps

Permit and Deny Clauses

Match and Set Clause Values
CHAPTER 38  Static and Default Routes for Firepower Threat Defense  805
  About Static and Default Routes  805
    Default Route  805
    Static Routes  806
  Route to null0 Interface to Drop Unwanted Traffic  806
  Route Priorities  806
  Transparent Firewall Mode and Bridge Group Routes  806
  Static Route Tracking  807
  Requirements and Prerequisites for Static Routes  807
  Guidelines for Static and Default Routes  808
  Add a Static Route  808

CHAPTER 39  OSPF for Firepower Threat Defense  811
  OSPF for Firepower Threat Defense  811
    About OSPF  811
    OSPF Support for Fast Hello Packets  813
      Prerequisites for OSPF Support for Fast Hello Packets  813
      OSPF Hello Interval and Dead Interval  813
      OSPF Fast Hello Packets  813
      Benefits of OSPF Fast Hello Packets  813
      Implementation Differences Between OSPFv2 and OSPFv3  814
    Requirements and Prerequisites for OSPF  814
    Guidelines for OSPF  814
    Configure OSPFv2  816
      Configure OSPF Areas, Ranges, and Virtual Links  816
      Configure OSPF Redistribution  819
      Configure OSPF Inter-Area Filtering  820
      Configure OSPF Filter Rules  821
      Configure OSPF Summary Addresses  822
      Configure OSPF Interfaces and Neighbors  823
      Configure OSPF Advanced Properties  825
    Configure OSPFv3  827
      Configure OSPFv3 Areas, Route Summaries, and Virtual Links  827
About Multicast Routing 857
  IGMP Protocol 857
  Stub Multicast Routing 858
  PIM Multicast Routing 858
  PIM Source Specific Multicast Support 859
  Multicast Bidirectional PIM 859

Requirements and Prerequisites for Multicast Routing 861
Guidelines for Multicast Routing 861
Configure IGMP Features 862
  Enable Multicast Routing 862
  Configure IGMP Protocol 863
  Configure IGMP Access Groups 864
  Configure IGMP Static Groups 865
  Configure IGMP Join Groups 865
Configure PIM Features 866
  Configure PIM Protocol 866
  Configure PIM Neighbor Filters 867
  Configure PIM Bidirectional Neighbor Filters 868
  Configure PIM Rendezvous Points 869
  Configure PIM Route Trees 869
  Configure PIM Request Filters 870
  Configure the Firepower Threat Defense Device as a Candidate Bootstrap Router 871
Configure Multicast Routes 871
  Configure Multicast Boundary Filters 872

PART XI  Firepower Threat Defense VPN 875

CHAPTER 43  VPN Overview for Firepower Threat Defense 877
  VPN Types 877
VPN Basics 878
   Internet Key Exchange (IKE) 878
   IPsec 879
VPN Packet Flow 880
VPN Licensing 880
How Secure Should a VPN Connection Be? 881
   Complying with Security Certification Requirements 881
   Deciding Which Encryption Algorithm to Use 881
   Deciding Which Hash Algorithms to Use 882
   Deciding Which Diffie-Hellman Modulus Group to Use 883
   Deciding Which Authentication Method to Use 883
   Pre-shared Keys 884
   PKI Infrastructure and Digital Certificates 884
VPN Topology Options 885
   Point-to-Point VPN Topology 886
   Hub and Spoke VPN Topology 886
   Full Mesh VPN Topology 887
   Implicit Topologies 888

CHAPTER 44  Site-to-Site VPNs for Firepower Threat Defense 889
   About Firepower Threat Defense Site-to-site VPNs 889
      Firepower Threat Defense Site-to-site VPN Guidelines and Limitations 890
   Requirements and Prerequisites for Site-to-Site VPN 891
   Managing Firepower Threat Defense Site-to-site VPNs 891
   Configuring Firepower Threat Defense Site-to-site VPNs 892
      FTD VPN Endpoint Options 893
      FTD VPN IKE Options 895
      FTD VPN IPsec Options 897
      FTD Advanced Site-to-site VPN Deployment Options 899
         FTD VPN Advanced IKE Options 900
         FTD VPN Advanced IPsec Options 901
         FTD Advanced Site-to-site VPN Tunnel Options 901

CHAPTER 45  Remote Access VPNs for Firepower Threat Defense 903
VPN Troubleshooting for Firepower Threat Defense

Part XIII | Appliance Platform Settings | 1027
CHAPTER 50  System Configuration  1029

Requirements and Prerequisites for the System Configuration  1030
About System Configuration  1030
Navigating the Firepower Management Center System Configuration  1030
System Configuration Settings  1031
Appliance Information  1032
HTTPS Certificates  1034
Default HTTPS Server Certificates  1034
Custom HTTPS Server Certificates  1034
HTTPS Server Certificate Requirements  1034
HTTPS Client Certificates  1036
Viewing the Current HTTPS Server Certificate  1036
Generating an HTTPS Server Certificate Signing Request  1036
Importing HTTPS Server Certificates  1038
Requiring Valid HTTPS Client Certificates  1039
Renewing the Default HTTPS Server Certificate  1040
External Database Access Settings  1040
Enabling External Access to the Database  1041
Database Event Limits  1041
Configuring Database Event Limits  1042
Database Event Limits  1042
Management Interfaces  1044
About FMC Management Interfaces  1044
Management Interfaces on the FMC  1044
Management Interface Support Per FMC Model  1045
Network Routes on FMC Management Interfaces  1045
NAT Environments  1046
Management and Event Traffic Channel Examples  1047
Modify FMC Management Interfaces  1049
Shut Down or Restart  1052
Shut Down or Restart the FMC  1053
Remote Storage Management  1053
Configuring Local Storage  1053
Synchronize Time Without Access to a Network NTP Server 1072
About Changing Time Synchronization Settings 1073
View Current System Time, Source, and NTP Server Connection Status 1074
NTP Server Status 1074
Global User Configuration Settings 1075
Set Password Reuse Limit 1076
Track Successful Logins 1076
Enabling Temporary Lockouts 1077
Session Timeouts 1077
Configure Session Timeouts 1077
Vulnerability Mapping 1078
Mapping Vulnerabilities for Servers 1078
Remote Console Access Management 1078
Configuring Remote Console Settings on the System 1079
Lights-Out Management User Access Configuration 1081
Enabling Lights-Out Management User Access 1081
Serial Over LAN Connection Configuration 1081
Configuring Serial Over LAN with IPMItool 1083
Configuring Serial Over LAN with IPMUtil 1083
Lights-Out Management Overview 1083
Configuring Lights-Out Management with IPMItool 1085
Configuring Lights-Out Management with IPMUtil 1085
REST API Preferences 1085
Enabling REST API Access 1085
VMware Tools and Virtual Systems 1086
Enabling VMware Tools on the Firepower Management Center for VMware 1086
(Optional) Opt Out of Web Analytics Tracking 1086
History for System Configuration 1087

CHAPTER 51 Platform Settings Policies 1089
Introduction to Platform Settings 1089
Requirements and Prerequisites for Platform Settings Policies 1090
Managing Platform Settings Policies 1090
Create a Platform Settings Policy 1091
Setting Target Devices for a Platform Settings Policy  1091

CHAPTER 52 Platform Settings for Classic Devices  1093
   About Platform Settings for Classic Devices  1093
   Requirements for Platform Settings for Classic Devices  1094
   Configure Platform Settings for Classic Devices  1095
      Configure Access Lists for Classic Devices  1095
      Stream Audit Logs from Classic Devices  1096
         Require Valid Audit Log Server Certificates for Classic Devices  1097
         Filter Syslogs from Audit Logs  1098
      Enable External Authentication to 7000/8000 Series Devices  1099
         About External Authentication for 7000/8000 Series Devices  1099
      Set the Language for the 7000/8000 Series Web Interface  1100
      Customize the Login Banner for Classic Devices  1101
      Synchronize Time on Classic Devices with an NTP Server  1101
      Configure Session Timeouts for Classic Devices  1102
      Configure SNMP Polling on Classic Devices  1103
   Local System Configuration for 7000/8000 Series Devices  1104
      Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device  1105
      Prohibit Packet Transfer to FMC  1106
      Configure Management Interfaces on a 7000/8000 Series Device  1106
      Shut Down or Restart a 7000/8000 Series Device  1109
      View System Time for 7000/8000 Series Devices  1109

CHAPTER 53 Platform Settings for Firepower Threat Defense  1111
   Configure ARP Inspection  1111
   Configure Banners  1112
   Configure DNS  1113
   Configure External Authentication for SSH  1114
   Configure Fragment Handling  1119
   Configure HTTP  1120
   Configure ICMP Access Rules  1121
   Configure SSL Settings  1122

**Security Certifications Compliance** 1153

Security Certifications Compliance Modes 1153

Security Certifications Compliance Characteristics 1154

Security Certifications Compliance Recommendations 1155

Appliance Hardening 1156

Protecting Your Network 1157

Enable Security Certifications Compliance 1158
Adding Port Conditions to NAT Rules 1185

CHAPTER 57

Network Address Translation (NAT) for Firepower Threat Defense 1187

Why Use NAT? 1187

NAT Basics 1188

NAT Terminology 1188

NAT Types 1188

NAT in Routed and Transparent Mode 1189

NAT in Routed Mode 1189

NAT in Transparent Mode or Within a Bridge Group 1190

Auto NAT and Manual NAT 1191

Auto NAT 1191

Manual NAT 1191

Comparing Auto NAT and Manual NAT 1192

NAT Rule Order 1192

NAT Interfaces 1194

Configuring Routing for NAT 1195

Addresses on the Same Network as the Mapped Interface 1195

Addresses on a Unique Network 1195

The Same Address as the Real Address (Identity NAT) 1195

Guidelines for NAT 1196

Firewall Mode Guidelines for NAT 1196

IPv6 NAT Guidelines 1196

IPv6 NAT Best Practices 1197

NAT Support for Inspected Protocols 1197

Additional Guidelines for NAT 1199

Configure NAT for Threat Defense 1201

Customizing NAT Rules for Multiple Devices 1202

Dynamic NAT 1204

About Dynamic NAT 1204

Dynamic NAT Disadvantages and Advantages 1205

Configure Dynamic Auto NAT 1206

Configure Dynamic Manual NAT 1207

Dynamic PAT 1209
Rewriting DNS Queries and Responses Using NAT 1270
  DNS64 Reply Modification 1271
  DNS Reply Modification, DNS Server on Outside 1277
  DNS Reply Modification, DNS Server on Host Network 1280

History for FTD NAT 1282

PART XV
7000 and 8000 Series Advanced Deployment Options 1283

CHAPTER 58
Setting Up Virtual Switches 1285
  Virtual Switches 1285
    Switched Interface Configuration 1285
      Switched Interface Configuration Notes 1286
      Configuring Physical Switched Interfaces 1287
      Adding Logical Switched Interfaces 1288
      Deleting Logical Switched Interfaces 1289

   Viewing VPN Status  1357
VPN Statistics and Logs 1357
Viewing VPN Statistics and Logs 1359

PART XVI

Access Control 1361

CHAPTER 63

Understanding Access Control 1363
Introduction to Access Control 1363
Access Control Policy Default Action 1363
Deep Inspection Using File and Intrusion Policies 1365
Access Control Traffic Handling with Intrusion and File Policies 1366
File and Intrusion Inspection Order 1367
Access Control Policy Inheritance 1369

CHAPTER 64

Best Practices for Access Control 1371
General Best Practices for Access Control 1371
Best Practices for Access Control Rules 1372
Best Practices for Ordering Rules 1372
Rule Preemption 1373
Rule Actions and Rule Order 1373
Content Restriction Rule Order 1374
Application Rule Order 1375
SSL Rule Order 1375
URL Rule Order 1376
Best Practices for Simplifying and Focusing Rules 1376
Maximum Number of Access Control Rules and Intrusion Policies 1377

CHAPTER 65

Access Control Policies 1379
Access Control Policy Components 1379
Requirements and Prerequisites for Access Control Policies 1380
Managing Access Control Policies 1381
System-Created Access Control Policies 1381
Creating a Basic Access Control Policy 1382
Editing an Access Control Policy 1383
Managing Access Control Policy Inheritance 1384
Choosing a Base Access Control Policy 1385
Inheriting Access Control Policy Settings from the Base Policy 1385
Locking Settings in Descendant Access Control Policies 1386
Requiring an Access Control Policy in a Domain 1386
Setting Target Devices for an Access Control Policy 1387
Logging Settings for Access Control Policies 1387
Access Control Policy Advanced Settings 1388
  Associating Other Policies with Access Control 1391
Viewing Policy Hit Counts 1391
History for Access Control Policies 1393

CHAPTER 66  Access Control Rules 1395
  Introduction to Access Control Rules 1395
    Access Control Rule Management 1397
      Access Control Rule Components 1398
        Access Control Rule Order 1399
        Requirements and Prerequisites for Access Control Rules 1399
    Adding an Access Control Rule Category 1400
    Create and Edit Access Control Rules 1400
    Enabling and Disabling Access Control Rules 1402
    Positioning an Access Control Rule 1402
    Access Control Rule Actions 1403
      Access Control Rule Monitor Action 1403
      Access Control Rule Trust Action 1403
      Access Control Rule Blocking Actions 1404
      Access Control Rule Interactive Blocking Actions 1404
      Access Control Rule Allow Action 1405
    Access Control Rule Comments 1406
      Adding Comments to an Access Control Rule 1406

CHAPTER 67  URL Filtering 1409
  URL Filtering Overview 1409
    About URL Filtering with Category and Reputation 1409
      URL Filtering Data from the Cisco Cloud 1410
Best Practices for URL Filtering 1410
  Filtering HTTPS Traffic 1412
License Requirements for URL Filtering 1413
Requirements and Prerequisites for URL Filtering 1414
How to Configure URL Filtering with Category and Reputation 1414
  Enable URL Filtering Using Category and Reputation 1415
    URL Filtering Options 1416
  Configuring URL Conditions 1417
    Rules with URL Conditions 1418
    URL Rule Order 1418
Manual URL Filtering 1419
  Manual URL Filtering Options 1419
    Supplement or Selectively Override Category and Reputation-Based URL Filtering 1420
Configure URL Filtering Health Monitors 1421
Troubleshoot URL Filtering 1421
History for URL Filtering 1423

CHAPTER 68 HTTP Response Pages and Interactive Blocking 1425
  About HTTP Response Pages 1425
    Limitations to HTTP Response Pages 1425
  Requirements and Prerequisites for HTTP Response Pages 1426
Choosing HTTP Response Pages 1427
Interactive Blocking with HTTP Response Pages 1427
  Configuring Interactive Blocking 1428
  Setting the User Bypass Timeout for a Blocked Website 1428

CHAPTER 69 Security Intelligence Block Listing 1429
  About Security Intelligence 1429
  Best Practices for Security Intelligence 1430
  License Requirements for Security Intelligence 1430
  Requirements and Prerequisites for Security Intelligence 1431
Security Intelligence Sources 1431
Configure Security Intelligence 1432
  Security Intelligence Options 1433
Security Intelligence Categories 1435
Block List Icons 1436
Configuration Example: Security Intelligence Blocking 1437
Security Intelligence Monitoring 1438
Override Security Intelligence Blocking 1438
Troubleshooting Security Intelligence 1439
  Security Intelligence Categories Are Missing from the Available Options List 1439
  Troubleshooting Memory Use 1439
History for Security Intelligence Block Listing 1440

CHAPTER 70  DNS Policies 1441
DNS Policy Overview 1441
DNS Policy Components 1442
License Requirements for DNS Policies 1443
Requirements and Prerequisites for DNS Policies 1443
Managing DNS Policies 1443
  Creating Basic DNS Policies 1444
  Editing DNS Policies 1444
DNS Rules 1445
  Creating and Editing DNS Rules 1445
DNS Rule Management 1446
    Enabling and Disabling DNS Rules 1446
DNS Rule Order Evaluation 1447
DNS Rule Actions 1447
DNS Rule Conditions 1448
    Controlling Traffic Based on DNS and Security Zone 1449
    Controlling Traffic Based on DNS and Network 1449
    Controlling Traffic Based on DNS and VLAN 1450
    Controlling Traffic Based on DNS List, Feed, or Category 1450
DNS Policy Deploy 1451

CHAPTER 71  Prefiltering and Prefilter Policies 1453
About Prefiltering 1453
  Prefiltering vs Access Control 1453
CHAPTER 76

Get Started with TLS/SSL Rules 1521

TLS/SSL Rules Overview 1521
TLS/SSL Rule Guidelines and Limitations 1521
  Guideline for Using TLS/SSL Decryption 1522
  TLS/SSL Rule Unsupported Features 1522
  TLS/SSL Do Not Decrypt Guidelines 1523
  TLS/SSL Decrypt - Resign Guidelines 1523
  TLS/SSL Decrypt - Known Key Guidelines 1525
  TLS/SSL Block Guidelines 1526
  TLS/SSL Certificate Pinning Guidelines 1526
  TLS/SSL Heartbeat Guidelines 1526
  TLS/SSL Anonymous Cipher Suite Limitation 1527
  TLS/SSL Normalizer Guidelines 1527
  Other TLS/SSL Rule Guidelines 1527

Requirements and Prerequisites for TLS/SSL Rules 1528

Creating and Modifying TLS/SSL Rules 1528
  Adding a TLS/SSL Rule to a Rule Category 1529
  Positioning a TLS/SSL Rule by Number 1529

TLS/SSL Rule Traffic Handling 1530
  Encrypted Traffic Inspection Configuration 1531
  TLS/SSL Rule Order Evaluation 1532

TLS/SSL Rule Conditions 1533
  TLS/SSL Rule Condition Types 1534

TLS/SSL Rule Actions 1535
  TLS/SSL Rule Monitor Action 1535
  TLS/SSL Rule Do Not Decrypt Action 1535
  TLS/SSL Rule Blocking Actions 1536
  TLS/SSL Rule Decrypt Actions 1536

Configuring TLS/SSL Rule Actions 1536
  Configuring a Decrypt - Resign Action 1537
  Configuring a Decrypt - Known Key Action 1538

TLS/SSL Rules Management 1538
TLS/SSL Rule Search 1538
Searching TLS/SSL Rules 1539
Enabling and Disabling TLS/SSL Rules 1539
Moving a TLS/SSL Rule 1539
Adding a New TLS/SSL Rule Category 1540

CHAPTER 77
Decryption Tuning Using TLS/SSL Rules 1541
TLS/SSL Rule Conditions Overview 1541
Requirements and Prerequisites for Decryption Tuning 1542
Server Certificate-Based TLS/SSL Rule Conditions 1542
Certificate Distinguished Name TLS/SSL Rule Conditions 1543
Controlling Encrypted Traffic by Certificate Distinguished Name 1543
Certificate TLS/SSL Rule Conditions 1544
Controlling Encrypted Traffic by Certificate 1545
Certificate Status TLS/SSL Rule Conditions 1546
Trusting External Certificate Authorities 1549
Matching Traffic on Certificate Status 1550
Cipher Suite TLS/SSL Rule Conditions 1552
Controlling Encrypted Traffic by Cipher Suite 1554
Encryption Protocol Version TLS/SSL Rule Conditions 1555
Controlling Traffic by Encryption Protocol Version 1555

CHAPTER 78
Monitor SSL Hardware Acceleration 1557
Informational Counters 1557
Alert Counters 1558
Error Counters 1558
Fatal Counters 1559

TID Intelligence and Threat Analysis 1617

CHAPTER 82

Cisco Threat Intelligence Director (TID) 1619
  Cisco Threat Intelligence Director (TID) Overview 1619
    TID and Security Intelligence 1621
    Performance Impact of Threat Intelligence Director 1621
  Cisco Threat Intelligence Director (TID) and High Availability Configurations 1622
    Requirements and Prerequisites for Threat Intelligence Director 1622
      Platform, Element, and License Requirements 1622
    Source Requirements 1623
      Source Content Limitations 1624
### Contents

- **How To Set Up Cisco Threat Intelligence Director (TID)** 1624
  - Configure Policies to Support TID 1625
  - Options for Ingesting Data Sources 1625
    - Fetch TAXII Feeds to Use as Sources 1626
    - Fetch Sources from a URL 1627
    - Upload a Local File to Use as a Source 1628
    - Handling of Duplicate Indicators 1629
    - Configure TLS/SSL Settings for a TID Source 1629
  - User Roles with TID Access 1631
  - About Backing Up and Restoring TID Data 1631
  - Analyze TID Incident and Observation Data 1631
    - Observation and Incident Generation 1631
    - View and Manage Incidents 1633
      - Incident Summary Information 1634
      - Incident Details 1635
    - View Events for a TID Observation 1638
      - TID Observations in Firepower Management Center Events 1638
    - Factors That Affect the Action Taken 1639
    - TID-Firepower Management Center Action Prioritization 1640
  - View and Change Cisco Threat Intelligence Director (TID) Configurations 1643
    - View TID Status of Elements (Managed Devices) 1643
    - View and Manage Sources 1644
      - Source Summary Information 1644
      - Source Status Details 1645
    - View and Manage Indicators 1646
      - Indicator Summary Information 1647
      - Indicator Details 1648
    - View and Manage Observables 1649
      - Observable Summary Information 1649
  - Filter TID Data in Table Views 1650
  - Inheritance in TID Configurations 1651
    - Inheritance of TID Settings from Multiple Parents 1651
    - About Overriding Inherited TID Settings 1652
  - Edit TID Actions at the Source, Indicator, or Observable Level 1652
PART XX

Intrusion Detection and Prevention 1659

CHAPTER 83

An Overview of Intrusion Detection and Prevention 1661

Network Analysis and Intrusion Policy Basics 1661

How Policies Examine Traffic For Intrusions 1662

Decoding, Normalizing, and Preprocessing: Network Analysis Policies 1663

Access Control Rules: Intrusion Policy Selection 1664

Intrusion Inspection: Intrusion Policies, Rules, and Variable Sets 1665

Intrusion Event Generation 1666

System-Provided and Custom Network Analysis and Intrusion Policies 1667

System-Provided Network Analysis and Intrusion Policies 1667

Benefits of Custom Network Analysis and Intrusion Policies 1669

Benefits of Custom Network Analysis Policies 1669

Benefits of Custom Intrusion Policies 1670

Limitations of Custom Policies 1671

License Requirements for Network Analysis and Intrusion Policies 1673

Requirements and Prerequisites for Network Analysis and Intrusion Policies 1673

The Navigation Panel: Network Analysis and Intrusion Policies 1673

Conflicts and Changes: Network Analysis and Intrusion Policies 1675

Exiting a Network Analysis or Intrusion Policy 1676

CHAPTER 84

Layers in Intrusion and Network Analysis Policies 1677

Layer Basics 1677

License Requirements for Network Analysis and Intrusion Policy Layers 1677

Firepower Management Center Configuration Guide, Version 6.4
Requirements and Prerequisites for Network Analysis and Intrusion Policy Layers 1678

The Layer Stack 1678

The Base Layer 1679

System-Provided Base Policies 1679

Custom Base Policies 1679

The Effect of Rule Updates on Base Policies 1680

Changing the Base Policy 1681

The Firepower Recommendations Layer 1681

Layer Management 1682

Shared Layers 1683

Managing Layers 1684

Navigating Layers 1685

Intrusion Rules in Layers 1686

Configuring Intrusion Rules in Layers 1687

Removing Rule Settings from Multiple Layers 1687

Accepting Rule Changes from a Custom Base Policy 1688

Preprocessors and Advanced Settings in Layers 1689

Configuring Preprocessors and Advanced Settings in Layers 1690

CHAPTER 85

Getting Started with Intrusion Policies 1691

Intrusion Policy Basics 1691

License Requirements for Intrusion Policies 1692

Requirements and Prerequisites for Intrusion Policies 1693

Managing Intrusion Policies 1693

Custom Intrusion Policy Creation 1694

Creating a Custom Intrusion Policy 1694

Editing Snort 2 Intrusion Policies 1695

Intrusion Policy Changes 1695

Access Control Rule Configuration to Perform Intrusion Prevention 1696

Access Control Rule Configuration and Intrusion Policies 1696

Configuring an Access Control Rule to Perform Intrusion Prevention 1697

Drop Behavior in an Inline Deployment 1697

Setting Drop Behavior in an Inline Deployment 1698

Drop Behavior in a Dual System Deployment 1698
Intrusion Policy Advanced Settings 1698
Optimizing Performance for Intrusion Detection and Prevention 1699

CHAPTER 86
Tuning Intrusion Policies Using Rules 1701
Intrusion Rule Tuning Basics 1701
Intrusion Rule Types 1701
License Requirements for Intrusion Rules 1702
Requirements and Prerequisites for Intrusion Rules 1703
Viewing Intrusion Rules in an Intrusion Policy 1703
Intrusion Rules Page Columns 1703
Intrusion Rule Details 1704
Viewing Intrusion Rule Details 1705
Setting a Threshold for an Intrusion Rule 1706
Setting Suppression for an Intrusion Rule 1706
Setting a Dynamic Rule State from the Rule Details Page 1707
Setting an SNMP Alert for an Intrusion Rule 1707
Adding a Comment to an Intrusion Rule 1708
Intrusion Rule Filters in an Intrusion Policy 1708
Intrusion Rule Filters Notes 1708
Intrusion Policy Rule Filters Construction Guidelines 1709
Intrusion Rule Configuration Filters 1712
Intrusion Rule Content Filters 1712
Intrusion Rule Categories 1713
Intrusion Rule Filter Components 1713
Intrusion Rule Filter Usage 1714
Setting a Rule Filter in an Intrusion Policy 1715
Intrusion Rule States 1715
Intrusion Rule State Options 1716
Setting Intrusion Rule States 1716
Intrusion Event Notification Filters in an Intrusion Policy 1717
Intrusion Event Thresholds 1717
Intrusion Event Thresholds Configuration 1717
Adding and Modifying Intrusion Event Thresholds 1719
Viewing and Deleting Intrusion Event Thresholds 1720
### Intrusion Policy Suppression Configuration

- Suppression Conditions
- Dynamic Intrusion Rule States
- Dynamic Intrusion Rule State Configuration
- Setting a Dynamic Rule State from the Rules Page
- Adding Intrusion Rule Comments

### Tailoring Intrusion Protection to Your Network Assets

- About Firepower Recommended Rules
- Default Settings for Firepower Recommendations
- Advanced Settings for Firepower Recommendations
- Generating and Applying Firepower Recommendations

### Sensitive Data Detection

- Sensitive Data Detection Basics
- Global Sensitive Data Detection Options
- Individual Sensitive Data Type Options
- System-Provided Sensitive Data Types
- License Requirements for Sensitive Data Detection
- Requirements and Prerequisites for Sensitive Data Detection
- Configuring Sensitive Data Detection
- Monitored Application Protocols and Sensitive Data
- Selecting Application Protocols to Monitor
- Special Case: Sensitive Data Detection in FTP Traffic
- Custom Sensitive Data Types
- Data Patterns in Custom Sensitive Data Types
- Configuring Custom Sensitive Data Types
- Editing Custom Sensitive Data Types

### Globally Limiting Intrusion Event Logging

- Global Rule Thresholding Basics
- Global Rule Thresholding Options
License Requirements for Global Thresholds 1750
Requirements and Prerequisites for Global Thresholds 1750
Configuring Global Thresholds 1751
Disabling the Global Threshold 1751

CHAPTER 90

The Intrusion Rules Editor 1753
An Introduction to Intrusion Rule Editing 1753
License Requirements for the Intrusion Rule Editor 1754
Requirements and Prerequisites for the Intrusion Rule Editor 1754
Rule Anatomy 1754
The Intrusion Rule Header 1755
Intrusion Rule Header Action 1756
Intrusion Rule Header Protocol 1756
Intrusion Rule Header Direction 1757
Intrusion Rule Header Source and Destination IP Addresses 1757
Intrusion Rule Header Source and Destination Ports 1760
Intrusion Event Details 1761
Adding a Custom Classification 1764
Defining an Event Priority 1765
Defining an Event Reference 1765
Custom Rule Creation 1765
Writing New Rules 1766
Modifying Existing Rules 1767
Viewing Rule Documentation 1768
Adding Comments to Intrusion Rules 1769
Deleting Custom Rules 1770
Searching for Rules 1770
Search Criteria for Intrusion Rules 1771
Rule Filtering on the Intrusion Rules Editor Page 1772
Filtering Guidelines 1772
Keyword Filtering 1772
Character String Filtering 1774
Combination Keyword and Character String Filtering 1774
Filtering Rules 1774
CHAPTER 91

Intrusion Prevention Performance Tuning 1865

About Intrusion Prevention Performance Tuning 1865
License Requirements for Intrusion Prevention Performance Tuning 1866
Requirements and Prerequisites for Intrusion Prevention Performance Tuning 1866
Limiting Pattern Matching for Intrusions 1866
Regular Expression Limits Overrides for Intrusion Rules 1867
Overriding Regular Expression Limits for Intrusion Rules 1868
Per Packet Intrusion Event Generation Limits 1868
Limiting Intrusion Events Generated Per Packet 1869
Packet and Intrusion Rule Latency Threshold Configuration 1870
Latency-Based Performance Settings 1870
Packet Latency Thresholding 1870
Packet Latency Thresholding Notes 1871
CHAPTER 94  
Application Layer Preprocessors  1893

Introduction to Application Layer Preprocessors  1893
License Requirements for Application Layer Preprocessors  1894
Requirements and Prerequisites for Application Layer Preprocessors  1894
The DCE/RPC Preprocessor  1894
  Connectionless and Connection-Oriented DCE/RPC Traffic  1895
DCE/RPC Target-Based Policies  1896
  RPC over HTTP Transport  1896
DCE/RPC Global Options  1897
DCE/RPC Target-Based Policy Options  1899
Traffic-Associated DCE/RPC Rules  1903
Configuring the DCE/RPC Preprocessor  1903

History for the Firepower Management Center CLI
CHAPTER 1

Getting Started With Firepower

Cisco Firepower is an integrated suite of network security and traffic management products, deployed either on purpose-built platforms or as a software solution. The system is designed to help you handle network traffic in a way that complies with your organization’s security policy—your guidelines for protecting your network.

In a typical deployment, multiple traffic-sensing managed devices installed on network segments monitor traffic for analysis and report to a manager:

• Firepower Management Center
• Firepower Device Manager
• Adaptive Security Device Manager (ASDM)

Managers provide a centralized management console with graphical user interface that you can use to perform administrative, management, analysis, and reporting tasks.

This guide focuses on the Firepower Management Center managing appliance. For information about the Firepower Device Manager or ASA with FirePOWERS Services managed via ASDM, see the guides for those management methods.

• Cisco Firepower Threat Defense Configuration Guide for Firepower Device Manager
• ASA with FirePOWER Services Local Management Configuration Guide

Quick Start: Basic Setup, on page 2
Firepower Devices, on page 5
Firepower Features, on page 6
Switching Domains on the Firepower Management Center, on page 11
The Context Menu, on page 11
Sharing Data with Cisco, on page 13
Firepower Online Help, How To, and Documentation, on page 13
Firepower System IP Address Conventions, on page 17
Additional Resources, on page 17
Quick Start: Basic Setup

The Firepower feature set is powerful and flexible enough to support basic and advanced configurations. Use the following sections to quickly set up a Firepower Management Center and its managed devices to begin controlling and analyzing traffic.

Installing and Performing Initial Setup on Physical Appliances

Install and perform initial setup on all physical appliances using the documentation for your appliance:

- **Firepower Management Center**

- **Firepower Threat Defense managed devices**
  
  **Important** Ignore Firepower Device Manager documents on these pages.
  
  - *Cisco Firepower 1010 Getting Started Guide*
  - *Cisco Firepower 1100 Series Getting Started Guide*
  - *Cisco Firepower 2100 Series Getting Started Guide*
  - *Cisco Firepower 4100 Getting Started Guide*
  - *Cisco Firepower 9300 Getting Started Guide*
  - *Cisco Firepower Threat Defense for the ASA 5508-X and ASA 5516-X Using Firepower Management Center Quick Start Guide*
  - *Cisco Firepower Threat Defense for the ISA 3000 Using Firepower Management Center Quick Start Guide*

- **Classic managed devices**
  
  - *Cisco ASA FirePOWER Module Quick Start Guide*
  - *Cisco Firepower 8000 Series Getting Started Guide*
  - *Cisco Firepower 7000 Series Getting Started Guide*
Deploying Virtual Appliances

Follow these steps if your deployment includes virtual appliances. Use the documentation roadmap to locate the documents listed below: http://www.cisco.com/c/en/us/td/docs/security/firepower/roadmap/firepower-roadmap.html.

---

**Step 1**  
Determine the supported virtual platforms you will use for the Management Center and devices (these may not be the same). See the *Cisco Firepower Compatibility Guide*.

**Step 2**  
Deploy virtual Firepower Management Centers using the documentation for your environment:

- Firepower Management Center Virtual running on VMware: *Cisco Firepower Management Center Virtual for VMware Deployment Quick Start Guide*
- Firepower Management Center Virtual running on AWS: *Cisco Firepower Management Center Virtual for AWS Deployment Quick Start Guide*
- Firepower Management Center Virtual running on KVM: *Cisco Firepower Management Center Virtual for KVM Deployment Quick Start Guide*

**Step 3**  
Deploy virtual devices using the documentation for your appliance:

- NGIPSv running on VMware: *Cisco Firepower NGIPSv Quick Start Guide for VMware*
- Firepower Threat Defense Virtual running on VMware: *Cisco Firepower Threat Defense for the ASA 5508-X and ASA 5516-X Using Firepower Management Center Quick Start Guide*
- Firepower Threat Defense Virtual running on AWS: *Cisco Firepower Threat Defense Virtual for AWS Deployment Quick Start Guide*
- Firepower Threat Defense Virtual running on KVM: *Cisco Firepower Threat Defense Virtual for KVM Deployment Quick Start Guide*
- Firepower Threat Defense Virtual running on Azure: *Cisco Firepower Threat Defense Virtual for Azure Deployment Quick Start Guide*

---

Logging In for the First Time

**Before you begin**

- Prepare your appliances as described in *Installing and Performing Initial Setup on Physical Appliances*, on page 2 or *Deploying Virtual Appliances*, on page 3.

**Step 1**  
Log in to the Firepower Management Center web interface with `admin` as the username and `Admin123` as the password. Change the password for this account as described in the *Quick Start Guide* for your appliance.

**Step 2**  
Set a time zone for this account as described in *Setting Your Default Time Zone*, on page 39.

**Step 3**  
Add licenses as described in *Licensing the Firepower System*, on page 77.

**Step 4**  
Register managed devices as described in *Add a Device to the FMC*, on page 252.
Step 5  Configure your managed devices as described in:

- **Introduction to IPS Device Deployment and Configuration, on page 551**, to configure passive or inline interfaces on 7000 Series or 8000 Series devices
- **Interface Overview for Firepower Threat Defense, on page 651**, to configure transparent or routed mode on Firepower Threat Defense devices
- **Interface Overview for Firepower Threat Defense, on page 651**, to configure interfaces on Firepower Threat Defense devices

What to do next

- Begin controlling and analyzing traffic by configuring basic policies as described in Setting Up Basic Policies and Configurations, on page 4.

Setting Up Basic Policies and Configurations

You must configure and deploy basic policies in order to see data in the dashboard, Context Explorer, and event tables.

*Note*

This is not a full discussion of policy or feature capabilities. For guidance on other features and more advanced configurations, see the rest of this guide.

Before you begin

- Log into the web interface, set your time zone, add licenses, register devices, and configure devices as described in Logging In for the First Time, on page 3.

Step 1  Configure an access control policy as described in Creating a Basic Access Control Policy, on page 1382.

- In most cases, Cisco suggests setting the Balanced Security and Connectivity intrusion policy as your default action. For more information, see Access Control Policy Default Action, on page 1363 and System-Provided Network Analysis and Intrusion Policies, on page 1667.
- In most cases, Cisco suggests enabling connection logging to meet the security and compliance needs of your organization. Consider the traffic on your network when deciding which connections to log so that you do not clutter your displays or overwhelm your system. For more information, see About Connection Logging, on page 2459.

Step 2  Apply the system-provided default health policy as described in Applying Health Policies, on page 310.

Step 3  Customize a few of your system configuration settings:

- If you want to allow inbound connections for a service (for example, SNMP or the syslog), modify the ports in the access list as described in Configure an Access List, on page 1059.
- Understand and consider editing your database event limits as described in Configuring Database Event Limits, on page 1042.
Step 4 Customize your network discovery policy as described in Configuring the Network Discovery Policy, on page 2173. By default, the network discovery policy analyzes all traffic on your network. In most cases, Cisco suggests restricting discovery to the addresses in RFC 1918.

Step 5 Consider customizing these other common settings:

- If you do not want to display message center pop-ups, disable notifications as described in Configuring Notification Behavior, on page 353.
- If you want to customize the default values for system variables, understand their use as described in Variable Sets, on page 453.
- If you want to update the Geolocation Database, update manually or on a scheduled basis as described in Update the Geolocation Database (GeoDB), on page 151.
- If you want to create additional locally authenticated user accounts to access the FMC, see Add an Internal User at the Web Interface, on page 45.
- If you want to use LDAP or RADIUS external authentication to allow access to the FMC, see Configure External Authentication, on page 50.

Step 6 Deploy configuration changes; see Deploy Configuration Changes, on page 382.

What to do next

- Review and consider configuring other features described in Firepower Features, on page 6 and the rest of this guide.

Firepower Devices

In a typical deployment, multiple traffic-handling devices report to one Firepower Management Center, which you use to perform administrative, management, analysis, and reporting tasks.

Classic Devices

Classic devices run next-generation IPS (NGIPS) software. They include:

- Firepower 7000 series and Firepower 8000 series physical devices.
- NGIPSv, hosted on VMware.
- ASA with FirePOWER Services, available on select ASA 5500-X series devices (also includes ISA 3000). The ASA provides the first-line system policy, and then passes traffic to an ASA FirePOWER module for discovery and access control.

Note that you must use the ASA CLI or ASDM to configure the ASA-based features on an ASA FirePOWER device. This includes device high availability, switching, routing, VPN, NAT, and so on.
You cannot use the FMC to configure ASA FirePOWER interfaces, and the FMC GUI does not display ASA interfaces when the ASA FirePOWER is deployed in SPAN port mode. Also, you cannot use the FMC to shut down, restart, or otherwise manage ASA FirePOWER processes.

### Firepower Threat Defense Devices

A Firepower Threat Defense (FTD) device is a next-generation firewall (NGFW) that also has NGIPS capabilities. NGFW and platform features include site-to-site and remote access VPN, robust routing, NAT, clustering, and other optimizations in application inspection and access control.

FTD is available on a wide range of physical and virtual platforms.

### Compatibility

For details on manager-device compatibility, including the software compatible with specific device models, virtual hosting environments, operating systems, and so on, see the Cisco Firepower Release Notes and Cisco Firepower Compatibility Guide.

### Firepower Features

These tables list some commonly used Firepower features.

High Availability and Scalability Features by Platform

High availability configurations (sometimes called failover) ensure continuity of operations. Clustered and stacked configurations group multiple devices together as a single logical device, achieving increased throughput and redundancy.

Switching Domains on the Firepower Management Center

In a multidomain deployment, user role privileges determine which domains a user can access and which privileges the user has within each of those domains. You can associate a single user account with multiple domains and assign different privileges for that user in each domain. For example, you can assign a user read-only privileges in the Global domain, but Administrator privileges in a descendant domain.

Users associated with multiple domains can switch between domains within the same web interface session. Under your user name in the toolbar, the system displays a tree of available domains. The tree:

- Displays ancestor domains, but may disable access to them based on the privileges assigned to your user account.
- Hides any other domain your user account cannot access, including sibling and descendant domains.

When you switch to a domain, the system displays:

- Data that is relevant to that domain only.
- Menu options determined by the user role assigned to you for that domain.

From the drop-down list under your user name, choose the domain you want to access.

The Context Menu

Certain pages in the Firepower System web interface support a right-click (most common) or left-click context menu that you can use as a shortcut for accessing other features in the Firepower System. The contents of the context menu depend where you access it—not only the page but also the specific data.

For example:

- IP address hotspots provide information about the host associated with that address, including any available whois and host profile information.
- SHA-256 hash value hotspots allow you to add a file’s SHA-256 hash value to the clean list or custom detection list, or view the entire hash value for copying.

On pages or locations that do not support the Firepower System context menu, the normal context menu for your browser appears.

Policy Editors

Many policy editors contain hotspots over each rule. You can insert new rules and categories; cut, copy, and paste rules; set the rule state; and edit the rule.

Intrusion Rules Editor

The intrusion rules editor contains hotspots over each intrusion rule. You can edit the rule, set the rule state, configure thresholding and suppression options, and view rule documentation. Optionally, after
clicking **Rule documentation** in the context menu, you can click **Rule Documentation** in the documentation pop-up window to view more-specific rule details.

**Event Viewer**

Event pages (the drill-down pages and table views available under the Analysis menu) contain hotspots over each event, IP address, URL, DNS query, and certain files’ SHA-256 hash values. While viewing most event types, you can:

- View related information in the Context Explorer.
- Drill down into event information in a new window.
- View the full text in places where an event field contains text too long to fully display in the event view, such as a file’s SHA-256 hash value, a vulnerability description, or a URL.
- Open a web browser window with detailed information about the element from a source external to Firepower, using the Contextual Cross-Launch feature. For more information, see Event Investigation Using Web-Based Resources, on page 2358.
- (If your organization has deployed Cisco Security Packet Analyzer) Explore packets related to the event. For details, see Event Investigation Using Cisco Security Packet Analyzer, on page 2378.

While viewing connection events, you can add items to the default Security Intelligence Block and Do Not Block lists:

- An IP address, from an IP address hotspot.
- A URL or domain name, from a URL hotspot.
- A DNS query, from a DNS query hotspot.

While viewing captured files, file events, and malware events, you can:

- Add a file to or remove a file from the clean list or custom detection list.
- Download a copy of the file.
- View nested files inside an archive file.
- Download the parent archive file for a nested file.
- View the file composition.
- Submit the file for local malware and dynamic analysis.

While viewing intrusion events, you can perform similar tasks to those in the intrusion rules editor or an intrusion policy:

- Edit the triggering rule.
- Set the rule state, including disabling the rule.
- Configure thresholding and suppression options.
- View rule documentation. Optionally, after clicking **Rule documentation** in the context menu, you can click **Rule Documentation** in the documentation pop-up window to view more-specific rule details.
Intrusion Event Packet View

Intrusion event packet views contain IP address hotspots. The packet view uses a left-click context menu.

Dashboard

Many dashboard widgets contain hotspots to view related information in the Context Explorer. Dashboard widgets can also contain IP address and SHA-256 hash value hotspots.

Context Explorer

The Context Explorer contains hotspots over its charts, tables, and graphs. If you want to examine data from graphs or lists in more detail than the Context Explorer allows, you can drill down to the table views of the relevant data. You can also view related host, user, application, file, and intrusion rule information.

The Context Explorer uses a left-click context menu, which also contains filtering and other options unique to the Context Explorer.

Firepower Online Help, How To, and Documentation

You can reach the online help from the web interface:

• By clicking the context-sensitive help link on each page
• By choosing Help > Online

How To is a widget that provides walkthroughs to navigate through tasks on Firepower Management Center. The walkthroughs guide you to perform the steps required to achieve a task by taking you through each step, one after the other irrespective of the various UI screens that you may have to navigate, to complete the task. The How To widget is enabled by default. To disable the widget, choose User Preferences from the drop-down list under your user name, and uncheck the Enable How-Tos check box in How-To Settings.

The walkthroughs are generally available for all UI pages, and are not user role sensitive. However, depending on the privileges of the user, some of the menu items will not appear on the Firepower Management Center interface. Thereby, the walkthroughs will not execute on such pages.

The following walkthroughs are available on Firepower Management Center:
• Register FMC with Cisco Smart Account: This walkthrough guides you to register Firepower Management Center with Cisco Smart Account.

• Set up a Device and add it to FMC: This walkthrough guides you to set up a device and to add the device to Firepower Management Center.

• Configure Date and Time: This walkthrough guides you to configure the date and time of the Firepower Threat Defense devices using a platform settings policy.

• Configure Interface Settings: This walkthrough guides you to configure the interfaces on the Firepower Threat Defense devices.

• Create an Access Control Policy: An access control policy consists of a set of ordered rules, which are evaluated from top to bottom. This walkthrough guides you to create an access control policy.

• Add an Access Control Rule - A Feature Walkthrough: This walkthrough describes the components of an access control rule, and how you can use them in Firepower Management Center.

• Configure Routing Settings: Various routing protocols are supported by Firepower Threat Defense. A static route defines where to send traffic for specific destination networks. This walkthrough guides you to configure static routing for the devices.

• Create a NAT Policy - A Feature Walkthrough: This walkthrough guides you to create a NAT policy and walks you through the various features of a NAT rule.

Top-Level Documentation Listing Pages for FMC Deployments

The following documents may be helpful when configuring Firepower Management Center deployments, Version 6.0+.

Note
Some of the linked documents are not applicable to Firepower Management Center deployments. For example, some links on Firepower Threat Defense pages are specific to deployments managed by Firepower Device Manager, and some links on hardware pages are unrelated to Firepower. To avoid confusion, pay careful attention to document titles. Also, some documents cover multiple products and therefore may appear on multiple product pages.

  - ISA 3000 with FirePOWER Services:
License Statements in the Documentation

The License statement at the beginning of a section indicates which Classic or Smart license you must assign to a managed device in the Firepower System to enable the feature described in the section.

Because licensed capabilities are often additive, the license statement provides only the highest required license for each feature.

An “or” statement in a License statement indicates that you must assign a particular license to the managed device to enable the feature described in the section, but an additional license can add functionality. For example, within a file policy, some file rule actions require that you assign a Protection license to the device while others require that you assign a Malware license.

For more information about licenses, see About Firepower Licenses, on page 77.

Related Topics

About Firepower Licenses, on page 77

Supported Devices Statements in the Documentation

The Supported Devices statement at the beginning of a chapter or topic indicates that a feature is supported only on the specified device series, family, or model. For example, many features are supported only on Firepower Threat Defense devices.

For more information on platforms supported by this release, see the release notes.

Access Statements in the Documentation

The Access statement at the beginning of each procedure in this documentation indicates the predefined user roles required to perform the procedure. Any of the listed roles can perform the procedure.

Users with custom roles may have permission sets that differ from those of the predefined roles. When a predefined role is used to indicate access requirements for a procedure, a custom role with similar permissions also has access. Some users with custom roles may use slightly different menu paths to reach configuration pages. For example, users who have a custom role with only intrusion policy privileges access the network analysis policy via the intrusion policy instead of the standard path through the access control policy.
For more information about user roles, see User Roles, on page 43 and Customize User Roles for the Web Interface, on page 66.

**Firepower System IP Address Conventions**

You can use IPv4 Classless Inter-Domain Routing (CIDR) notation and the similar IPv6 prefix length notation to define address blocks in many places in the Firepower System.

When you use CIDR or prefix length notation to specify a block of IP addresses, the Firepower System uses only the portion of the network IP address specified by the mask or prefix length. For example, if you type 10.1.2.3/8, the Firepower System uses 10.0.0.0/8.

In other words, although Cisco recommends the standard method of using a network IP address on the bit boundary when using CIDR or prefix length notation, the Firepower System does not require it.

**Additional Resources**

The Firewalls Community is an exhaustive repository of reference material that complements our extensive documentation. This includes links to 3D models of our hardware, hardware configuration selector, product collateral, configuration examples, troubleshooting tech notes, training videos, lab and Cisco Live sessions, social media channels, Cisco Blogs and all the documentation published by the Technical Publications team.

Some of the individuals posting to community sites or video sharing sites, including the moderators, work for Cisco Systems. Opinions expressed on those sites and in any corresponding comments are the personal opinions of the original authors, not of Cisco. The content is provided for informational purposes only and is not meant to be an endorsement or representation by Cisco or any other party.

---

*Note*

Some of the videos, technical notes, and reference material in the Firewalls Community points to older versions of the Firepower Management Center. Your version of the Firepower Management Center and the version referenced in the videos or technical notes might have differences in the user interface that cause the procedures not to be identical.
PART I

Your User Account

CHAPTER 2

Logging into the Firepower System

The following topics describe how to log into the Firepower System:

- Firepower System User Accounts, on page 21
- Firepower System User Interfaces, on page 23
- Logging Into the Firepower Management Center Web Interface, on page 26
- Logging Into the Web Interface of a 7000 or 8000 Series Device, on page 27
- Logging Into the Firepower Management Center with CAC Credentials, on page 28
- Logging Into a 7000 or 8000 Series Device with CAC Credentials, on page 29
- Logging Into the FMC Command Line Interface, on page 29
- Logging Into the CLI on 7000/8000 Series, ASA FirePOWER, and NGIPSv Devices, on page 30
- Logging Into the Command Line Interface on FTD Devices, on page 31
- Logging Out of a Firepower System Web Interface, on page 32
- History for Logging into the Firepower System, on page 32

Firepower System User Accounts

You must provide a username and password to obtain local access to the web interface, shell, or CLI on an FMC or managed device. On managed devices, CLI users with Config level access can use the `expert` command to access the Linux shell. On the FMC, all CLI users can use the `expert` command. The FTD and FMC can be configured to use external authentication, storing user credentials on an external LDAP or RADIUS server; you can withhold or provide CLI/shell access rights to external users.

The FMC CLI provides a single `admin` user who has access to all commands. The features FMC web interface users can access are controlled by the privileges an administrator grants to the user account. On managed devices, the features that users can access for both the CLI and the web interface are controlled by the privileges an administrator grants to the user account.

Note

The system audits user activity based on user accounts; make sure that users log into the system with the correct account.
All FMC CLI users and, on managed devices, users with Config level CLI access can obtain root privileges in the Linux shell, which can present a security risk. For system security reasons, we strongly recommend:

- If you establish external authentication, make sure that you restrict the list of users with CLI/shell access appropriately.
- When granting CLI access privileges on managed devices, restrict the list of internal users with Config level CLI access.
- Do not establish Linux shell users; use only the pre-defined admin user and users created by the admin user within the CLI.

We strongly recommend that you do not use the Linux shell unless directed by Cisco TAC or explicit instructions in the Firepower user documentation.

Different appliances support different types of user accounts, each with different capabilities.

**Firepower Management Centers**

Firepower Management Centers support the following user account types:

- A pre-defined admin account for web interface access, which has the administrator role and can be managed through the web interface.
- Custom user accounts, which provide web interface access and which admin users and users with administrator privileges can create and manage.
- A pre-defined admin account for CLI or shell access, which can obtain root privileges. By default, when this admin account logs into the device, it has direct access to the shell. But when the Firepower Management Center CLI is enabled, users logging in with this account must use the expert command to gain access to the shell.

For system security reasons, Cisco strongly recommends that you not establish additional Linux shell users on any appliance.

**7000 & 8000 Series Devices**

7000 & 8000 Series devices support the following user account types:

- A pre-defined admin account which can be used for all forms of access to the device.
- Custom user accounts, which admin users and users with the administrator role can create and manage.

The 7000 & 8000 Series supports external authentication for users.

**NGIPSv Devices**

NGIPSv devices support the following user account types:
• A pre-defined admin account which can be used for all forms of access to the device.
• Custom user accounts, which admin users and users with Config access can create and manage.

The NGIPSv does not support external authentication for users.

Firepower Threat Defense and Firepower Threat Defense Virtual Devices

Firepower Threat Defense and Firepower Threat Defense Virtual devices support the following user account types:
• A pre-defined admin account which can be used for all forms of access to the device.
• Custom user accounts, which admin users and users with Config access can create and manage.

The Firepower Threat Defense supports external authentication for SSH users.

ASA FirePOWER Devices

The ASA FirePOWER module supports the following user account types:
• A pre-defined admin account.
• Custom user accounts, which admin users and users with Config access can create and manage.

The ASA FirePOWER module does not support external authentication for users. Accessing ASA devices via the ASA CLI and ASDM is described in the Cisco ASA Series General Operations CLI Configuration Guide and the Cisco ASA Series General Operations ASDM Configuration Guide.

Firepower System User Interfaces

Depending on appliance type, you can interact with Firepower appliances using a web-based GUI, auxiliary CLI, or the Linux shell. In a Firepower Management Center deployment, you perform most configuration tasks from the FMC GUI. Only a few tasks require that you access the appliance directly using the CLI or Linux shell. We strongly discourage using the Linux shell unless directed by Cisco TAC or explicit instructions in the Firepower user documentation.

For information on browser requirements, see the Firepower Release Notes.

Note
On all appliances, after a user makes three consecutive failed attempts to log into the CLI or shell via SSH, the system terminates the SSH connection.

</tbody>
</table>
Web Interface Considerations

• If your organization uses Common Access Cards (CACs) for authentication, external users authenticated with LDAP can use CAC credentials to obtain access to the web interface of an appliance.

• The first time you visit the appliance home page during a web session, you can view information about your last login session for that appliance. You can see the following information about your last login:
  • the day of the week, month, date, and year of the login
  • the appliance-local time of the login in 24-hour notation
  • the host and domain name last used to access the appliance

• The menus and menu options listed at the top of the default home page are based on the privileges for your user account. However, the links on the default home page include options that span the range of user account privileges. If you click a link that requires different privileges from those granted to your account, the system displays a warning message and logs the activity.

• Some processes that take a significant amount of time may cause your web browser to display a message that a script has become unresponsive. If this occurs, make sure you allow the script to continue until it finishes.

Session Timeout

By default, the Firepower System automatically logs you out of a session after 1 hour of inactivity, unless you are otherwise configured to be exempt from session timeout.

Users with the Administrator role can change the session timeout interval for an appliance via the following settings:

<table>
<thead>
<tr>
<th>Appliance</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firepower Management Center</td>
<td>System &gt; Configuration &gt; Shell Timeout</td>
</tr>
<tr>
<td>7000 &amp; 8000 Series devices</td>
<td>Devices &gt; Platform Settings &gt; Shell Timeout</td>
</tr>
</tbody>
</table>

Logging Into the Firepower Management Center Web Interface

Users are restricted to a single active session. If you try to log in with a user account that already has an active session, the system prompts you to terminate the other session or log in as a different user.

In a NAT environment where multiple FMCs share the same IP address:
• Each FMC can support only one login session at a time.

• To access different FMCs, use a different browser for each login (for example Firefox and Chrome), or set the browser to incognito or private mode.

**Before you begin**

• If you do not have access to the web interface, contact your system administrator to modify your account privileges, or log in as a user with Administrator access and modify the privileges for the account.

• Create user accounts as described in [Add an Internal User at the Web Interface, on page 45](#).

**Step 1**

Direct your browser to `https://ipaddress_or_hostname`, where `ipaddress` or `hostname` corresponds to your FMC.

**Step 2**

In the **Username** and **Password** fields, enter your username and password. Pay attention to the following guidelines:

• User names are not case-sensitive.

• In a multidomain deployment, prepend the user name with the domain where your user account was created. You are not required to prepend any ancestor domains. For example, if your user account was created in SubdomainB, which has an ancestor DomainA, enter your username in the following format:

  SubdomainB\username

• If your organization uses SecurID® tokens when logging in, append the token to your SecurID PIN and use that as your password to log in. For example, if your PIN is `1111` and the SecurID token is `222222`, enter `1111222222`. You must have already generated your SecurID PIN before you can log into the Firepower System.

**Step 3**

Click **Login**.

**Related Topics**

[Session Timeout](#), on page 26

## Logging Into the Web Interface of a 7000 or 8000 Series Device

Users are restricted to a single active session on a 7000 & 8000 Series device. If you try to log in with a user account that already has an active session, the system prompts you to terminate the other session or log in as a different user.

**Before you begin**

• If you do not have access to the web interface, contact your system administrator to modify your account privileges, or log in as a user with Administrator access and modify the privileges for the account.

• Complete the initial setup process and create user accounts as described in the Firepower getting started guide appropriate to the device, and [Add an Internal User at the Web Interface, on page 45](#).

**Step 1**

Direct your browser to `https://hostname/`, where `hostname` corresponds to the host name of the managed device you want to access.
Logging Into the Firepower Management Center with CAC Credentials

Users are restricted to a single active session. If you try to log in with a user account that already has an active session, the system prompts you to terminate the other session or log in as a different user.

In a NAT environment where multiple FMCs share the same IP address:

- Each FMC can support only one login session at a time.
- To access different FMCs, use a different browser for each login (for example Firefox and Chrome), or set the browser to incognito or private mode.

Caution

Do not remove a CAC during an active browsing session. If you remove or replace a CAC during a session, your web browser terminates the session and the system logs you out of the web interface.

Before you begin

- If you do not have access to the web interface, contact your system administrator to modify your account privileges, or log in as a user with Administrator access and modify the privileges for the account.
- Create user accounts as described in the Add an Internal User at the Web Interface, on page 45.
- Configure CAC authentication and authorization as described in Configure Common Access Card Authentication with LDAP, on page 65.

Step 2
In the Username and Password fields, enter your user name and password. Pay attention to the following guidelines:

- User names are not case-sensitive.
- If your organization uses SecurID® tokens when logging in, append the token to your SecurID PIN and use that as your password to log in. For example, if your PIN is 1111 and the SecurID token is 222222, enter 1111222222. You must have already generated your SecurID PIN before you can log into the Firepower System.

Step 3
Click Login.

Related Topics
Session Timeout, on page 26
Logging Into a 7000 or 8000 Series Device with CAC Credentials

Users are restricted to a single active session on a 7000 & 8000 Series device.

⚠️ Caution
Do not remove a CAC during an active browsing session. If you remove or replace a CAC during a session, your web browser terminates the session and the system logs you out of the web interface.

Before you begin

- If you do not have access to the web interface, contact your system administrator to modify your account privileges, or log in as a user with Administrator access and modify the privileges for the account.
- Create user accounts as described in Add an Internal User at the Web Interface, on page 45.
- Configure CAC authentication and authorization as described in Configure Common Access Card Authentication with LDAP, on page 65.

Step 1
Insert a CAC as instructed by your organization.

Step 2
Direct your browser to https://hostname/, where hostname corresponds to the host name of the appliance you want to access.

Step 3
If prompted, enter the PIN associated with the CAC you inserted in step 1.

Step 4
If prompted, choose the appropriate certificate from the drop-down list.

Step 5
Click Continue.

Configure Common Access Card Authentication with LDAP, on page 65
Session Timeout, on page 26

Logging Into the FMC Command Line Interface

The admin CLI user and certain custom external users can log into the FMC CLI/shell.

⚠️ Caution
We strongly recommend that you do not use the Linux shell unless directed by Cisco TAC or explicit instructions in the FMC documentation.
For all appliances, after a user makes three consecutive failed attempts to log into the CLI or shell via SSH, the system terminates the SSH connection.

**Before you begin**

Complete the initial configuration process as the admin user. See Logging In for the First Time, on page 3.

**Step 1**

Use the admin username and password to connect to the FMC via SSH or the console port.

If your organization uses SecurID® tokens when logging in, append the token to your SecurID PIN and use that as your password to log in. For example, if your PIN is 1111 and the SecurID token is 222222, enter 1111222222. You must have already generated your SecurID PIN before you can log in.

**Step 2**

If CLI access is enabled, use any of the available CLI commands.

## Logging Into the CLI on 7000/8000 Series, ASA FirePOWER, and NGIPSv Devices

With a minimum of basic CLI configuration access, you can log directly into Classic managed devices.

**Before you begin**

• Complete the initial setup process using the default admin user for the initial login.

• Create additional user accounts that can log into the CLI using the configure user add command.

• For the 7000 & 8000 Series devices, create user accounts at the web interface as described in Add an Internal User at the Web Interface, on page 45.

**Step 1**

SSH to the device's management interface (hostname or IP address) or use the console.

With the exception of ASA 5585-X devices, which have dedicated ASA FirePOWER console port, ASA FirePOWER devices accessed via the console default to the operating system CLI. This requires an extra step to access the Firepower CLI: session sfr.

If your organization uses SecurID® tokens when logging in, append the token to your SecurID PIN and use that as your password to log in. For example, if your PIN is 1111 and the SecurID token is 222222, enter 1111222222. You must have already generated your SecurID PIN before you can log in.
Step 2

At the CLI prompt, use any of the commands allowed by your level of command line access.

---

**Logging Into the Command Line Interface on FTD Devices**

You can log directly into the command line interface on FTD managed devices.

---

**Note**

On all appliances, after a user makes three consecutive failed attempts to log into the CLI or shell via SSH, the system terminates the SSH connection.

---

**Before you begin**

Complete the initial setup process using the default admin user for the initial login. Create additional user accounts that can log into the CLI using the configure user add command.

---

**Step 1**

Connect to the FTD CLI, either from the console port or using SSH.

You can SSH to the management interface of the FTD device. You can also connect to the address on a data interface if you open the interface for SSH connections. SSH access to data interfaces is disabled by default. See Configure Secure Shell, on page 1125 to allow SSH connections to specific data interfaces.

You can directly connect to the Console port on the device. Use the console cable included with the device to connect your PC to the console using a terminal emulator set for 9600 baud, 8 data bits, no parity, 1 stop bit, no flow control. See the hardware guide for your device for more information about the console cable.

The initial CLI you access on the Console port differs by device type.

- **ASA Series devices**—The CLI on the Console port is the regular FTD CLI.
- **Firepower Series devices**—The CLI on the Console port is FXOS. You can get to the FTD CLI using the connect ftd command. Use the FXOS CLI for chassis-level configuration and troubleshooting only. Use the FTD CLI for basic configuration, monitoring, and normal system troubleshooting. See the FXOS documentation for information on FXOS commands.

**Step 2**

Log in with the admin username and password.

**Step 3**

At the CLI prompt (>), use any of the commands allowed by your level of command line access.

**Step 4**

(Optional) Access the diagnostic CLI:

```plaintext
system support diagnostic-cli
```

Use this CLI for advanced troubleshooting. This CLI includes additional show and other commands, including the session wlan console command needed to enter the CLI for the wireless access point on an ASA 5506W-X.

This CLI has two sub-modes: user EXEC and privileged EXEC mode. More commands are available in privileged EXEC mode. To enter privileged EXEC mode, enter the enable command; press enter without entering a password when prompted.

**Example:**

```plaintext
> system support diagnostic-cli
```
Logging Out of a Firepower System Web Interface

When you are no longer actively using a Firepower System web interface, Cisco recommends that you log out, even if you are only stepping away from your web browser for a short period of time. Logging out ends your web session and ensures that no one can use the interface with your credentials.

**Note**

If you are logging out of an SSO session at the FMC, when you log out the system redirects your browser to the SSO IdP for your organization. To ensure FMC security and prevent others from accessing the FMC using your SSO account, we recommend you log out of the SSO federation at the IdP.

**Step 1**
From the drop-down list under your username, choose **Logout**.

**Step 2**
If you are logging out of an SSO session at the FMC, the system redirects you to the SSO IdP for your organization. Log out at the IdP to ensure FMC security.

Specifying User Preferences

The following topics describe how to specify user preferences:

- User Preferences Introduction, on page 33
- Changing Your Password, on page 33
- Changing an Expired Password, on page 34
- Specifying Your Home Page, on page 34
- Configuring Event View Settings, on page 34
- Setting Your Default Time Zone, on page 39
- Specifying Your Default Dashboard, on page 39

User Preferences Introduction

Depending on your user role, you can specify certain preferences for your user account.

In a multidomain deployment, user preferences apply to all domains where your account has access. When specifying home page and dashboard preferences, keep in mind that certain pages and dashboard widgets are constrained by domain.

Changing Your Password

All user accounts are protected with a password. You can change your password at any time, and depending on the settings for your user account, you may have to change your password periodically.

If password strength checking is enabled, passwords must be at least eight alphanumeric characters of mixed case and must include at least one numeric character. Passwords cannot be a word that appears in a dictionary or include consecutive repeating characters.

If you are an LDAP or a RADIUS user, you cannot change your password through the web interface.

---

**Step 1**
From the drop-down list under your user name, choose User Preferences.

**Step 2**
Enter your Current Password, and click Change.

**Step 3**
In the New Password and Confirm fields, enter your new password.

**Step 4**
Click Change.
Changing an Expired Password

Depending on the settings for your user account, your password may expire. The password expiration time period is set when your account is created. If your password has expired, the Password Expiration Warning page appears.

On the Password Expiration Warning page, you have two choices:

- Click **Change Password** to change your password now. If you have zero warning days left, you **must** change your password.

  **Tip** If password strength checking is enabled, passwords must be at least eight alphanumeric characters of mixed case and must include at least one numeric character. Passwords cannot be a word that appears in a dictionary or include consecutive repeating characters.

- Click **Skip** to change your password later.

Specifying Your Home Page

You can specify the page within the web interface to use as your home page for the appliance. The default home page is the default dashboard (Overview > Dashboards), except for user accounts with no dashboard access, such as External Database users. (See Specifying Your Default Dashboard, on page 39 to set the default dashboard.)

In a multidomain deployment, the home page you choose applies to all domains where your user account has access. When choosing a home page for an account that frequently accesses multiple domains, keep in mind that certain pages are constrained to the Global domain.

**Step 1**
From the drop-down list under your user name, choose **User Preferences**.

**Step 2**
Click **Home Page**.

**Step 3**
Choose the page you want to use as your home page from the drop-down list.

The options in the drop-down list are based on the access privileges for your user account. For more information, see Web Interface User Roles, on page 43.

**Step 4**
Click **Save**.

Configuring Event View Settings

Use the Event View Settings page to configure characteristics of event views on the Firepower Management Center. Note that some event view configurations are available only for specific user roles. Users with the External Database User role can view parts of the event view settings user interface, but changing those settings has no meaningful result.
**Event View Preferences**

Use the Event Preferences section of the Event View Settings page to configure basic characteristics of event views in the Firepower System. This section is available for all user roles, although it has little to no significance for users who cannot view events.

The following fields appear in the Event Preferences section:

- **The Confirm “All” Actions** field controls whether the appliance forces you to confirm actions that affect all events in an event view.

  For example, if this setting is enabled and you click **Delete All** on an event view, you must confirm that you want to delete all the events that meet the current constraints (including events not displayed on the current page) before the appliance will delete them from the database.

- **The Resolve IP Addresses** field allows the appliance, whenever possible, to display host names instead of IP addresses in event views.

  Note that an event view may be slow to display if it contains a large number of IP addresses and you have enabled this option. Note also that for this setting to take effect, you must use management interfaces configuration to establish a DNS server in the system settings.

- **The Expand Packet View** field allows you to configure how the packet view for intrusion events appears.

  By default, the appliance displays a collapsed version of the packet view:

  - **None** - collapse all subsections of the Packet Information section of the packet view
  - **Packet Text** - expand only the Packet Text subsection
  - **Packet Bytes** - expand only the Packet Bytes subsection
  - **All** - expand all sections

  Regardless of the default setting, you can always manually expand the sections in the packet view to view detailed information about a captured packet.

- **The Rows Per Page** field controls how many rows of events per page you want to appear in drill-down pages and table views.
• The **Refresh Interval** field sets the refresh interval for event views in minutes. Entering 0 disables the refresh option. Note that this interval does not apply to dashboards.

• The **Statistics Refresh Interval** controls the refresh interval for event summary pages such as the Intrusion Event Statistics and Discovery Statistics pages. Entering 0 disables the refresh option. Note that this interval does not apply to dashboards.

• The **Deactivate Rules** field controls which links appear on the packet view of intrusion events generated by standard text rules:
  - **All Policies** - a single link that deactivates the standard text rule in all the locally defined custom intrusion policies
  - **Current Policy** - a single link that deactivates the standard text rule in only the currently deployed intrusion policy. Note that you cannot deactivate rules in the default policies.
  - **Ask** - links for each of these options

To see these links on the packet view, your user account must have either Administrator or Intrusion Admin access.

**Related Topics**

[Management Interfaces], on page 1044

---

### File Download Preferences

Use the File Preferences section of the Event View Settings page to configure basic characteristics of local file downloads. This section is only available to users with the Administrator, Security Analyst, or Security Analyst (ReadOnly) user roles.

Note that if your appliance does not support downloading captured files, these options are disabled.

The following fields appear in the File Preferences section:

• The **Confirm 'Download File' Actions** check box controls whether a File Download pop-up window appears each time you download a file, displaying a warning and prompting you to continue or cancel.

  **Caution**

  Cisco strongly recommends you do **not** download malware, as it can cause adverse consequences. Exercise caution when downloading any file, as it may contain malware. Ensure you have taken any necessary precautions to secure the download destination before downloading files.

  Note that you can disable this option any time you download a file.

  • When you download a captured file, the system creates a password-protected .zip archive containing the file. The **Zip File Password** field defines the password you want to use to restrict access to the .zip file. If you leave this field blank, the system creates archive files without passwords.

  • The **Show Zip File Password** check box toggles displaying plain text or obfuscated characters in the **Zip File Password** field. When this field is cleared, the **Zip File Password** displays obfuscated characters.
Default Time Windows

The time window, sometimes called the time range, imposes a time constraint on the events in any event view. Use the Default Time Windows section of the Event View Settings page to control the default behavior of the time window.

User role access to this section is as follows:

- Administrators and Maintenance Users can access the full section.
- Security Analysts and Security Analysts (Read Only) can access all options except Audit Log Time Window.
- Access Admins, Discovery Admins, External Database Users, Intrusion Admins, Network Admins, and Security Approvers can access only the Events Time Window option.

Note that, regardless of the default time window setting, you can always manually change the time window for individual event views during your event analysis. Also, keep in mind that time window settings are valid for only the current session. When you log out and then log back in, time windows are reset to the defaults you configured on this page.

There are three types of events for which you can set the default time window:

- The Events Time Window sets a single default time window for most events that can be constrained by time.
- The Audit Log Time Window sets the default time window for the audit log.
- The Health Monitoring Time Window sets the default time window for health events.

You can only set time windows for event types your user account can access. All user types can set event time windows. Administrators, Maintenance Users, and Security Analysts can set health monitoring time windows. Administrators and Maintenance Users can set audit log time windows.

Note that because not all event views can be constrained by time, time window settings have no effect on event views that display hosts, host attributes, applications, clients, vulnerabilities, user identity, or compliance white list violations.

You can either use Multiple time windows, one for each of these types of events, or you can use a Single time window that applies to all events. If you use a single time window, the settings for the three types of time window disappear and a new Global Time Window setting appears.

There are three types of time window:

- **static**, which displays all the events generated from a specific start time to a specific end time
- **expanding**, which displays all the events generated from a specific start time to the present; as time moves forward, the time window expands and new events are added to the event view
- **sliding**, which displays all the events generated from a specific start time (for example, one day ago) to the present; as time moves forward, the time window “slides” so that you see only the events for the range you configured (in this example, for the last day)

The maximum time range for all time windows is from midnight on January 1, 1970 (UTC) to 3:14:07 AM on January 19, 2038 (UTC).

The following options appear in the Time Window Settings drop-down list:
• The **Show the Last - Sliding** option allows you to configure a sliding default time window of the length you specify.

The appliance displays all the events generated from a specific start time (for example, 1 hour ago) to the present. As you change event views, the time window “slides” so that you always see events from the last hour.

• The **Show the Last - Static/Expanding** option allows you to configure either a static or expanding default time window of the length you specify.

For **static** time windows, enable the **Use End Time** check box. The appliance displays all the events generated from a specific start time (for example, 1 hour ago) to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window.

For **expanding** time windows, disable the **Use End Time** check box. The appliance displays all the events generated from a specific start time (for example, 1 hour ago) to the present. As you change event views, the time window expands to the present time.

• The **Current Day - Static/Expanding** option allows you to configure either a static or expanding default time window for the current day. The current day begins at midnight, based on the time zone setting for your current session.

For **static** time windows, enable the **Use End Time** check box. The appliance displays all the events generated from midnight to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window.

For **expanding** time windows, disable the **Use End Time** check box. The appliance displays all the events generated from midnight to the present. As you change event views, the time window expands to the present time. Note that if your analysis continues for over 24 hours before you log out, this time window can be more than 24 hours.

• The **Current Week - Static/Expanding** option allows you to configure either a static or expanding default time window for the current week. The current week begins at midnight on the previous Sunday, based on the time zone setting for your current session.

For **static** time windows, enable the **Use End Time** check box. The appliance displays all the events generated from midnight to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window.

For **expanding** time windows, disable the **Use End Time** check box. The appliance displays all the events generated from midnight Sunday to the present. As you change event views, the time window expands to the present time. Note that if your analysis continues for over 1 week before you log out, this time window can be more than 1 week.

### Default Workflows

A workflow is a series of pages displaying data that analysts use to evaluate events. For each event type, the appliance ships with at least one predefined workflow. For example, as a Security Analyst, depending on the type of analysis you are performing, you can choose among ten different intrusion event workflows, each of which presents intrusion event data in a different way.

The appliance is configured with a default workflow for each event type. For example, the Events by Priority and Classification workflow is the default for intrusion events. This means whenever you view intrusion
events (including reviewed intrusion events), the appliance displays the Events by Priority and Classification workflow.

You can, however, change the default workflow for each event type. The default workflows you are able to configure depend on your user role. For example, intrusion event analysts cannot set default discovery event workflows.

### Setting Your Default Time Zone

This setting determines the times displayed in the web interface for your user account only, for things like task scheduling and viewing dashboards. This setting does not change the system time or affect any other user, and does not affect data stored in the system, which generally uses UTC.

⚠️ **Warning**

The Time Zone function (in User Preferences) assumes that the system clock is set to UTC time. **DO NOT ATTEMPT TO CHANGE THE SYSTEM TIME.** Changing the system time from UTC is **NOT** supported, and doing so will require you to reimage the device to recover from an unsupported state.

**Step 1** From the drop-down list under your user name, choose **User Preferences**.
**Step 2** Click **Time Zone**.
**Step 3** Choose the continent or area that contains the time zone you want to use.
**Step 4** Choose the country and state name that corresponds with the time zone you want to use.

### Specifying Your Default Dashboard

The default dashboard appears when you choose **Overview > Dashboards**. Unless changed, the default dashboard for all users is the Summary dashboard. You can change the default dashboard if your user role is Administrator, Maintenance, or Security Analyst.

In a multidomain deployment, the default dashboard you choose applies to all domains where your user account has access. When choosing a dashboard for an account that frequently accesses multiple domains, keep in mind that certain dashboard widgets are constrained by domain.

**Step 1** From the drop-down list under your user name, choose **User Preferences**.
**Step 2** Click **Dashboard Settings**.
**Step 3** Choose the dashboard you want to use as your default from the drop-down list. If you choose **None**, when you select **Overview > Dashboards**, you can then choose a dashboard to view.
**Step 4** Click **Save**.

[Viewing Dashboards](#), on page 298
User Accounts for Management Access

The Firepower Management Center and managed devices include a default admin account for management access. This chapter discusses how to create custom user accounts for supported models. See Logging into the Firepower System, on page 21 for detailed information about logging into the Firepower Management Center or a managed device with a user account.

This chapter also describes Cisco Security Manager (CSM) single sign-on when you manage an ASA with CSM and the FirePOWER services module with the Firepower Management Center.

• About User Accounts, on page 41
• Requirements and Prerequisites for User Accounts, on page 45
• Guidelines and Limitations for User Accounts, on page 45
• Add an Internal User Account, on page 45
• Configure External Authentication, on page 50
• Customize User Roles for the Web Interface, on page 66
• Configure Cisco Security Manager Single Sign-on, on page 71
• Troubleshooting LDAP Authentication Connections, on page 71
• History for User Accounts, on page 73

About User Accounts

You can add custom user accounts on the Firepower Management Center and on managed devices, either as internal users or, if supported for your model, as external users on a LDAP or RADIUS server. Each Firepower Management Center and each managed device maintains separate user accounts. For example, when you add a user to the Firepower Management Center, that user only has access to the FMC; you cannot then use that username to log directly into a managed device. You must separately add a user on the managed device.

Internal and External Users

Firepower devices support two types of users:

• Internal user—The device checks a local database for user authentication. For more information about internal users, see Add an Internal User Account, on page 45.

• External user—If the user is not present in the local database, the system queries an external LDAP or RADIUS authentication server. For more information about external users, see Configure External Authentication, on page 50.
Web Interface and CLI or Shell Access

When you configure user accounts, you enable web interface access and CLI or shell access separately. Firepower devices include a Firepower CLI that runs on top of Linux. CLI users can also access the Linux shell under TAC supervision or when explicitly instructed by Firepower user documentation. For detailed information about the management UIs, see Firepower System User Interfaces, on page 23.

Caution

On all devices, users with CLI Config level access or shell access can obtain sudoers privileges in the Linux shell, which can present a security risk. For system security reasons, we strongly recommend:

- If you establish external authentication, make sure that you restrict the list of users with CLI/shell access appropriately.
- When granting CLI access privileges, restrict the list of users with Config level access.
- Do not add users directly in the Linux shell; only use the procedures in this chapter.
- Do not access Firepower devices using the Linux shell or CLI expert mode unless directed by Cisco TAC or by explicit instructions in the Firepower user documentation.

Each device type supports different forms of access as detailed here:

- For FTD, ASA FirePOWER, and NGIPSv, CLI access is available for direct management of the device.
  - You can create internal users on these devices using the CLI.
  - You can establish external users on Firepower Threat Defense devices.
  - Users who log into these devices through the management interface access the CLI. Users with CLI Config level access can access the Linux shell using the CLI expert command.

Caution

We strongly recommend that you do not use the Linux shell unless directed by Cisco TAC or explicit instructions in the Firepower user documentation.

- The FMC has a web interface, a CLI, and Linux shell for direct management of the device.
  - The FMC supports two different internal admin users: one for the web interface, and another with CLI or shell access. These two admin users are different accounts and do not share the same password. The system initialization process synchronizes the passwords for these two admin accounts so they start out the same, but they are tracked by different internal mechanisms and may diverge after initial configuration. See the Getting Started Guide for your model for more information on system initialization. (To change the password for the web interface admin, use System > Users > Users. To change the password for the CLI/shell admin, use the FMC CLI command configure password.)
  - FMC internal users added in the web interface have web interface access only.
  - You can grant CLI or shell access to FMC external users.
  - On the FMC by default, when any account with shell or CLI access logs in to the management interface, it directly accesses the Linux shell. When you enable the FMC CLI, these users first gain
access to the CLI on logging in and may gain access to the shell with the **expert** command. See Firepower Management Center Command Line Reference, on page 2753.

- 7000 and 8000 Series devices have both a web interface and a CLI for direct management of the device.
  - 7000 and 8000 Series device internal users have web interface and CLI access.
  - You can enable CLI or shell access for 7000 and 8000 Series device external users.
  - Users who log into these devices through the management interface access the CLI. Users with CLI Config level access can access the shell using the shell **expert** command.

⚠️ **Caution**

We strongly recommend that you do not use the Linux shell unless directed by Cisco TAC or explicit instructions in the FMC documentation.

---

**User Roles**

User privileges are based on the assigned user role. For example, you can grant analysts predefined roles such as Security Analyst and Discovery Admin and reserve the Administrator role for the security administrator managing the device. You can also create custom user roles with access privileges tailored to your organization’s needs.

**Web Interface User Roles**

The 7000 and 8000 Series devices have access to the following user roles: Administrator, Maintenance User, and Security Analyst.

The Firepower Management Center includes the following predefined user roles:

**Access Admin**

Provides access to access control policy and associated features in the **Policies** menu. Access Admins cannot deploy policies.

**Administrator**

Administrators have access to everything in the product; their sessions present a higher security risk if compromised, so you cannot make them exempt from login session timeouts.

You should limit use of the Administrator role for security reasons.

**Discovery Admin**

Provides access to network discovery, application detection, and correlation features in the **Policies** menu. Discovery Admins cannot deploy policies.

**External Database User**

Provides read-only access to the Firepower System database using an application that supports JDBC SSL connections. For the third-party application to authenticate to the Firepower System appliance, you must enable database access in the system settings. On the web interface, External Database Users have access only to online help-related options in the **Help** menu. Because this role’s function does not involve the web interface, access is provided only for ease of support and password changes.
Intrusion Admin

Provides access to all intrusion policy, intrusion rule, and network analysis policy features in the Policies and Objects menus. Intrusion Admins cannot deploy policies.

Maintenance User

Provides access to monitoring and maintenance features. Maintenance Users have access to maintenance-related options in the Health and System menus.

Network Admin

Provides access to access control, SSL inspection, DNS policy, and identity policy features in the Policies menu, as well as device configuration features in the Devices menus. Network Admins can deploy configuration changes to devices.

Security Analyst

Provides access to security event analysis features, and read-only access to health events, in the Overview, Analysis, Health, and System menus.

Security Analyst (Read Only)

Provides read-only access to security event analysis features and health event features in the Overview, Analysis, Health, and System menus.

Security Approver

Provides limited access to access control and associated policies and network discovery policies in the Policies menu. Security Approvers can view and deploy these policies, but cannot make policy changes.

Threat Intelligence Director (TID) User

Provides access to Threat Intelligence Director configurations in the Intelligence menu. Threat Intelligence Director (TID) Users can view and configure TID.

CLI User Roles

On managed devices, user access to commands in the CLI depends on the role you assign.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>The user cannot log into the device on the command line.</td>
</tr>
<tr>
<td>Config</td>
<td>The user can access all commands, including configuration commands. Exercise caution in assigning this level of access to users.</td>
</tr>
<tr>
<td>Basic</td>
<td>The user can access non-configuration commands only.</td>
</tr>
</tbody>
</table>

CLI external users on the FMC do not have a user role; they can use all available commands.

External CLI users on managed devices always have the Config user role. For the Firepower Threat Defense when using RADIUS, you can specify either Config or Basic.
Requirements and Prerequisites for User Accounts

Model Support
External user authentication is supported for the following models:

- Firepower Management Center
- Firepower Threat Defense
- 7000 and 8000 Series

Guidelines and Limitations for User Accounts

Defaults
All devices include an admin user as a local user account for all forms of access; you cannot delete the admin user. The default initial password is Admin123; the system forces you to change this during the initialization process. See the Getting Started Guide for your model for more information about system initialization.

Global Settings
By default the following settings apply to all user accounts on the Firepower Management Center:

- There are no limits on password reuse.
- The system does not track successful logins.
- The system does not enforce a timed temporary lockout for users who enter incorrect login credentials.

You can change these settings for all users as a system configuration. (System > Configuration > User Configuration) See Global User Configuration Settings, on page 1075.

Add an Internal User Account
Each device maintains separate user accounts. The Firepower Management Center and 7000 and 8000 Series have similar web interfaces. For the Firepower Threat Defense, NGIPSv, and ASA FirePOWER, you must add internal users at the CLI. You cannot add users at the CLI on the Firepower Management Center and 7000 and 8000 Series.

Add an Internal User at the Web Interface

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Any</td>
<td>Administrator</td>
</tr>
<tr>
<td></td>
<td></td>
<td>7000 &amp; 8000 Series</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
This procedure describes how to add custom internal user accounts at the web interface of a Firepower Management Center or 7000 & 8000 Series device.

The System > Users > Users shows both internal users that you added manually and external users that were added automatically when a user logged in with LDAP or RADIUS authentication. For external users, you can modify the user role on this screen if you assign a role with higher privileges; you cannot modify the password settings.

In a multidomain deployment on the Firepower Management Center, users are only visible in the domain in which they are created. Note that if you add a user in the Global domain, but then assign a user role for a leaf domain, then that user still shows on the Global Users page where it was added, even though the user "belongs" to a leaf domain.

If you enable security certifications compliance or Lights-Out Management (LOM) on a device, different password restrictions apply. For more information on security certifications compliance, see Security Certifications Compliance, on page 1153.

When you add a user in a leaf domain, that user is not visible from the global domain.

**Note** Avoid having multiple Admin users simultaneously creating new users on the FMC, as this may cause an error resulting from a conflict in user database access.

---

**Step 1** Choose System > Users.

**Step 2** Click Create User.

**Step 3** Enter a User Name.

The username must comply with the following restrictions:

- Maximum 32 alphanumeric characters, plus hyphen (-), underscore (_) and period (.)
- Letters may be upper or lower case.
- Cannot include any punctuation or special characters other than hyphen (-), underscore (_) and period (.)

**Step 4** The Use External Authentication Method checkbox is checked for users that were added automatically when they logged in with LDAP or RADIUS. You do not need to pre-configure external users, so you can ignore this field. For an external user, you can revert this user to an internal user by unchecking the check box.

**Step 5** Enter values in the Password and Confirm Password fields.

The values must conform to the password options you set for this user.

**Step 6** Set the Maximum Number of Failed Logins.

Enter an integer, without spaces, that determines the maximum number of times each user can try to log in after a failed login attempt before the account is locked. The default setting is 5 tries; use 0 to allow an unlimited number of failed logins. The admin account is exempt from being locked out after a maximum number of failed logins unless you enabled security certification compliance.

**Step 7** Set the Minimum Password Length.

Enter an integer, without spaces, that determines the minimum required length, in characters, of a user’s password. The default setting is 8. A value of 0 indicates that no minimum length is required.
Step 8  Set the **Days Until Password Expiration**.
Enter the number of days after which the user’s password expires. The default setting is 0, which indicates that the password never expires. If you change from the default, then the **Password Lifetime** column of the **Users** list indicates the days remaining on each user’s password.

Step 9  Set the **Days Before Password Expiration Warning**.
Enter the number of warning days users have to change their password before their password actually expires. The default setting is 0 days.

Step 10  Set user **Options**.
   • **Force Password Reset on Login**—Forces users to change their passwords the next time they log in.
   • **Check Password Strength**—Requires strong passwords. A strong password must be at least eight alphanumeric characters of mixed case and must include at least 1 numeric character and 1 special character. It cannot be a word that appears in a dictionary or include consecutive repeating characters.
   • **Exempt from Browser Session Timeout**—Exempts a user’s login sessions from termination due to inactivity. Users with the Administrator role cannot be made exempt.

Step 11  (7000 or 8000 Series) Assign the appropriate level of **Command-Line Interface Access** as described in **CLI User Roles**, on page 44.

**Note**  Unlike for the 7000 or 8000 Series, you cannot enable shell access for Firepower Management Center internal users. (On the FMC you can enable shell access for external users, but we recommend against doing so for system security reasons.)

Step 12  In the **User Role Configuration** area, assign user role(s). For more information about user roles, see **Customize User Roles for the Web Interface**, on page 66.

For external users, if the user role is assigned through group membership (LDAP) or based on a user attribute (RADIUS), you cannot remove the minimum access rights. You can, however, assign additional rights. If the user role is the default user role that you set on the device, then you can modify the role in the user account without limitations. When you modify the user role, the **Authentication Method** column on the **Users** tab provides a status of **External - Locally Modified**.

The options you see depend on whether the device is in a single domain or multidomain (Firepower Management Center only) deployment.

   • Single domain—Check the user role(s) you want to assign the user.
   • Multidomain (Firepower Management Center only)—In a multidomain deployment, you can create user accounts in any domain in which you have been assigned Administrator access. Users can have different privileges in each domain. You can assign user roles in both ancestor and descendant domains. For example, you can assign read-only privileges to a user in the Global domain, but Administrator privileges in a descendant domain. See the following steps:
      a. Click **Add Domain**.
      b. Choose a domain from the **Domain** drop-down list.
      c. Check the user roles you want to assign the user.
      d. Click **Save**.
Step 13  (Optional, for physical FMCs only.) If you have assigned the user the Administrator role, the **Administrator Options** appear. You can select **Allow Lights-Out Management Access** to grant Lights-Out Management access to the user. See **Lights-Out Management Overview**, on page 1083 for more information about Lights-Out Management.

Step 14  Click **Save**.

---

### Add an Internal User at the CLI

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FTD</td>
<td>Any</td>
<td>Config</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ASA FirePOWER</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>NGIPSv</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Use the CLI to create internal users on the FTD, ASA FirePOWER, and NGIPSv devices. These devices do not have a web interface, so internal (and external) users can only access the CLI for management.

---

**Step 1**  Log into the device CLI using an account with Config privileges.

The **admin** user account has the required privileges, but any account with Config privileges will work. You can use an SSH session or the Console port.

For certain FTD models, the Console port puts you into the FXOS CLI. Use the **connect ftd** command to get to the FTD CLI.

**Step 2**  Create the user account.

```
configure user add username {basic | config}
```

- **username**—Sets the username. The username must be Linux-valid:
  - Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (_)
  - All lowercase
  - Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)

- **basic**—Gives the user basic access. This role does not allow the user to enter configuration commands.

- **config**—Gives the user configuration access. This role gives the user full administrator rights to all commands.

**Example:**

The following example adds a user account named johncrichton with Config access rights. The password is not shown as you type it.

```
> configure user add johncrichton config
Enter new password for user johncrichton: newpassword
Confirm new password for user johncrichton: newpassword
> show user
Login     UID   Auth Access Enabled Reset   Exp Warn Str Lock Max
admin     1000  Local Config Enabled No Never N/A Dis No N/A
```
Note: Tell users they can change their own passwords using the configure password command.

Step 3: (Optional) Adjust the characteristics of the account to meet your security requirements.

You can use the following commands to change the default account behavior.

- **configure user aging username max_days warn_days**
  Sets an expiration date for the user's password. Specify the maximum number of days for the password to be valid followed by the number of days before expiration the user will be warned about the upcoming expiration. Both values are 1 to 9999, but the warning days must be less than the maximum days. When you create the account, there is no expiration date for the password.

- **configure user forcereset username**
  Forces the user to change the password on the next login.

- **configure user maxfailedlogins username number**
  Sets the maximum number of consecutive failed logins you will allow before locking the account, from 1 to 9999. Use the configure user unlock command to unlock accounts. The default for new accounts is 5 consecutive failed logins.

- **configure user minpasswdlen username number**
  Sets a minimum password length, which can be from 1 to 127.

- **configure user strengthcheck username {enable | disable}**
  Enables or disables password strength checking, which requires a user to meet specific password criteria when changing their password. When a user’s password expires or if the configure user forcereset command is used, this requirement is automatically enabled the next time the user logs in.

Step 4: Manage user accounts as necessary.

Users can get locked out of their accounts, or you might need to remove accounts or fix other issues. Use the following commands to manage the user accounts on the system.

- **configure user access username {basic | config}**
  Changes the privileges for a user account.

- **configure user delete username**
  Deletes the specified account.

- **configure user disable username**
  Disables the specified account without deleting it. The user cannot log in until you enable the account.

- **configure user enable username**
  Enables the specified account.

- **configure user password username**
  Changes the password for the specified user. Users should normally change their own password using the configure password command.
Configure External Authentication

To enable external authentication, you need to add one or more external authentication objects.

About External Authentication

When you enable external authentication for management and administrative users of your Firepower system, the device verifies the user credentials with an LDAP or RADIUS server as specified in an external authentication object.

External authentication objects can be used by the Firepower Management Center, 7000 and 8000 Series, and FTD devices. You can share the same object between the different appliance/device types, or create separate objects.

Attention

External authentication is not supported on FTD virtual devices.

For the FMC, enable the external authentication objects directly on the System > Users > External Authentication tab; this setting only affects FMC usage, and it does not need to be enabled on this tab for managed device usage. For the 7000 and 8000 Series and FTD devices, you must enable the external authentication object in the platform settings that you deploy to the devices.

Web interface users are defined separately from CLI/shell users in the external authentication object. For CLI/shell users on RADIUS for the 7000 or 8000 Series and the Firepower Management Center, you must pre-configure the list of RADIUS usernames in the external authentication object. For FTD, you can either define users on the RADIUS server (with the Service-Type attribute), or you can pre-define the user list in the external authentication object like for the other platforms. For LDAP, you can specify a filter to match CLI users on the LDAP server.

You cannot use an LDAP object for CLI/shell access that is also configured for CAC authentication.

Note

Users with Linux shell access can obtain root privileges, which can present a security risk. Make sure that you:

• restrict the list of users with Linux shell access
• do not create Linux shell users

External Authentication for the Firepower Management Center and 7000 and 8000 Series

You can configure multiple external authentication objects for web interface access. For example, if you have 5 external authentication objects, users from any of them can be authenticated to access the web interface.
You can use only one external authentication object for CLI or shell access. If you have more than one external authentication object enabled, then users can authenticate using only the first object in the list. External CLI users on 7000 or 8000 Series devices always have Config privileges; other user roles are not supported.

### External Authentication for the Firepower Threat Defense

For the FTD, you can only activate one external authentication object.

Only a subset of fields in the external authentication object are used for FTD SSH access. If you fill in additional fields, they are ignored. If you also use this object for other device types, those fields will be used.

**Attention**

External authentication is not supported on FTD virtual devices.

LDAP users always have Config privileges. RADIUS users can be defined as either Config or Basic users.

### About LDAP

The Lightweight Directory Access Protocol (LDAP) allows you to set up a directory on your network that organizes objects, such as user credentials, in a centralized location. Multiple applications can then access those credentials and the information used to describe them. If you ever need to change a user’s credentials, you can change them in one place.

Microsoft has announced that Active Directory servers will start enforcing LDAP binding and LDAP signing in 2020. Microsoft is making these a requirement because when using default settings, an elevation of privilege vulnerability exists in Microsoft Windows that could allow a man-in-the-middle attacker to successfully forward an authentication request to a Windows LDAP server. For more information, see [2020 LDAP channel binding and LDAP signing requirement for Windows](https://support.microsoft.com) on the Microsoft support site.

If you have not done so already, we recommend you start using TLS/SSL encryption to authenticate with an Active Directory server.

### About RADIUS

Remote Authentication Dial In User Service (RADIUS) is an authentication protocol used to authenticate, authorize, and account for user access to network resources. You can create an authentication object for any RADIUS server that conforms to [RFC 2865](https://www.rfc-editor.org/rfc/rfc2865).

Firepower devices support the use of SecurID tokens. When you configure authentication by a server using SecurID, users authenticated against that server append the SecurID token to the end of their SecurID PIN and use that as their password when they log in. You do not need to configure anything extra on the Firepower device to support SecurID.

### Add an LDAP External Authentication Object

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FTD 7000 and 8000 Series FMC</td>
<td>Any</td>
<td>Administrator</td>
</tr>
</tbody>
</table>
Add an LDAP server to support external users for device management.

For the FTD, only a subset of fields are used for CLI access. See Configure External Authentication for SSH, on page 1114 for details about which fields are used.

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.

**Before you begin**

- You must specify DNS server(s) for domain name lookup on your device. Even if you specify an IP address and not a hostname for the LDAP server on this procedure, the LDAP server may return a URI for authentication that can include a hostname. A DNS lookup is required to resolve the hostname. See Modify FMC Management Interfaces, on page 1049 or Modify Device Management Interfaces at the CLI, on page 257 to add DNS servers.
- If you are configuring an LDAP authentication object for use with CAC authentication, do not remove the CAC inserted in your computer. You must have a CAC inserted at all times after enabling user certificates.

**Step 1** Choose System > Users.

**Step 2** Click the External Authentication tab.

**Step 3** Click Add External Authentication Object.

**Step 4** Set the Authentication Method to LDAP.

**Step 5** (Optional) Check the checkbox for CAC if you plan to use this authentication object for CAC authentication and authorization.

You must also follow the procedure in Configure Common Access Card Authentication with LDAP, on page 65 to fully configure CAC authentication and authorization. You cannot use this object for CLI users.

**Step 6** Enter a Name and optional Description.

**Step 7** Choose a Server Type from the drop-down list.

*Tip* If you click Set Defaults, the device populates the User Name Template, UI Access Attribute, Shell Access Attribute, Group Member Attribute, and Group Member URL Attribute fields with default values for the server type.

**Step 8** For the Primary Server, enter a Host Name/IP Address.

If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used in this field. In addition, IPv6 addresses are not supported for encrypted connections.

**Step 9** (Optional) Change the Port from the default.

**Step 10** (Optional) Enter the Backup Server parameters.

**Step 11** Enter LDAP-Specific Parameters.

a) Enter the Base DN for the LDAP directory you want to access. In the LDAP directory tree, Base DN is the entry that contains the subtree in which your users exists. For example, to authenticate names in the Security organization at the Example company, enter ou=security,dc=example,dc=com. Alternatively, click Fetch DNs, and choose the appropriate base distinguished name from the drop-down list.

b) (Optional) Enter the Base Filter. To limit the number of authenticated users, extend the Base DN filter by specifying the attribute and value for the user objects. For example, if the user objects in a directory tree have a
physicalDeliveryOfficeName attribute and users in the New York office have an attribute value of NewYork for that attribute, to retrieve only users in the New York office, enter (physicalDeliveryOfficeName=NewYork).

If you are using CAC authentication, to retrieve only active user accounts (excluding the disabled user accounts), enter !(userAccountControl:1.2.840.113556.1.4.803:=2)). This criteria filters user accounts within AD belonging to ldpgrp group and with userAccountControl attribute value that is not 2 (disabled).

a) Enter a User Name for a user who has sufficient credentials to browse the LDAP server. For example, if you are connecting to an OpenLDAP server where user objects have a uid attribute, and the object for the administrator in the Security division at your example company has a uid value of NetworkAdmin, you might enter uid=NetworkAdmin,ou=security,dc=example,dc=com.

b) Enter the user password in the Password and the Confirm Password fields.

c) (Optional) Click Show Advanced Options to configure the following advanced options.

• Encryption—Click None, TLS, or SSL.
  If you change the encryption method after specifying a port, you reset the port to the default value for that method. For None or TLS, the port resets to the default value of 389. If you choose SSL encryption, the port resets to 636.

• SSL Certificate Upload Path—For SSL or TLS encryption, you must choose a certificate by clicking Choose File.
  If you previously uploaded a certificate and want to replace it, upload the new certificate and redeploy the configuration to your devices to copy over the new certificate.

  Note: TLS encryption requires a certificate on all platforms. For SSL, the FTD also requires a certificate. For other platforms, SSL does not require a certificate. However, we recommend that you always upload a certificate for SSL to prevent man-in-the-middle attacks.

• User Name Template—Provide a template that corresponds with your UI Access Attribute. For example, to authenticate all users who work in the Security organization of the Example company by connecting to an OpenLDAP server where the UI access attribute is uid, you might enter uid=%s,ou=security,dc=example,dc=com in the User Name Template field. For a Microsoft Active Directory server, you could enter %s@security.example.com.
  This field is required for CAC authentication.

• Timeout—Enter the number of seconds before rolling over to the backup connection. The default is 30.

Step 12 (Optional) Configure Attribute Matching to retrieve users based on an attribute.

• Enter a UI Access Attribute, or click Fetch Attrs to retrieve a list of available attributes. For example, on a Microsoft Active Directory Server, you may want to use the UI Access Attribute to retrieve users, because there may not be a uid attribute on Active Directory Server user objects. Instead, you can search the userPrincipalName attribute by typing userPrincipalName in the UI Access Attribute field.
  This field is required for CAC authentication.

• Set the Shell Access Attribute if you want to use a shell access attribute other than the user distinguished type. For example, on a Microsoft Active Directory Server, use the sAMAccountName shell access attribute to retrieve CLI/shell access users by typing sAMAccountName.

Step 13 (Optional) Configure Group Controlled Access Roles.
Group controlled access roles allows you to grant privileges to the users belonging to the specified groups. If you do not configure a user’s privileges using group-controlled access roles, a user has only the privileges granted by default in the external authentication policy.

**Note** Configuring group controlled access roles does not limit the filter criteria on the LDAP server. To extend the user filter beyond the Base DN, use the Base Filter option.

a) (Optional) In the fields that correspond to user roles, enter the distinguished name for the LDAP groups that contain users who should be assigned to those roles.

Any group you reference must exist on the LDAP server. You can reference static LDAP groups or dynamic LDAP groups. Static LDAP groups are groups where membership is determined by group object attributes that point to specific users, and dynamic LDAP groups are groups where membership is determined by creating an LDAP search that retrieves group users based on user object attributes. Group access rights for a role only affect users who are members of the group.

If you use a dynamic group, the LDAP query is used exactly as it is configured on the LDAP server. For this reason, the Firepower device limits the number of recursions of a search to 4 to prevent search syntax errors from causing infinite loops.

**Example:**
Enter the following in the Administrator field to authenticate names in the information technology organization at the Example company:

```
cn=itgroup,ou=groups, dc=example,dc=com
```

b) Choose a Default User Role for users that do not belong to any of the specified groups.

c) If you use static groups, enter a Group Member Attribute.

**Example:**
If the member attribute is used to indicate membership in the static group for default Security Analyst access, enter member.

d) If you use dynamic groups, enter a Group Member URL Attribute.

**Example:**
If the memberURL attribute contains the LDAP search that retrieves members for the dynamic group you specified for default Admin access, enter memberURL.

If you change a user's role, you must save/deploy the changed external authentication object and also remove the user from the Users screen. The user will be re-added automatically the next time they log in.

**Step 14** (Optional) Set the Shell Access Filter to allow CLI/shell users.

To prevent LDAP authentication of CLI/shell access, leave this field blank. To specify CLI/shell users, choose one of the following methods:

- To use the same filter you specified when configuring authentication settings, choose Same as Base Filter.

- To retrieve administrative user entries based on attribute value, enter the attribute name, a comparison operator, and the attribute value you want to use as a filter, enclosed in parentheses (maximum 450 characters, including the enclosing parentheses). For example, if all network administrators have a manager attribute which has an attribute value of shell, you can set a base filter of (manager=shell).

The usernames must be Linux-valid:
Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (_)

All lowercase

Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)

**Note** For the 7000 or 8000 Series and Firepower Management Center, do not create any internal users that have the same username as users included in the **Shell Access Filter**. The only internal FMC user should be **admin**, do not include an **admin** user in the **Shell Access Filter**.

For the FTD, if you previously configured the same username for an internal user, the FTD first checks the password against the internal user, and if that fails, it checks the LDAP server. Note that you cannot later add an internal user with the same name as an external user; only pre-existing internal users are supported.

**Step 15** (Optional) Click **Test** to test connectivity to the LDAP server.

The test output lists valid and invalid user names. Valid user names are unique, and can include underscores (_), periods (.), hyphens (-), and alphanumeric characters. Note that testing the connection to servers with more than 1000 users only returns 1000 users because of UI page size limitations. If the test fails, see Troubleshooting LDAP Authentication Connections, on page 71.

**Step 16** (Optional) You can also enter **Additional Test Parameters** to test user credentials for a user who should be able to authenticate: enter a **User Name uid** and **Password**, and then click **Test**.

If you are connecting to a Microsoft Active Directory Server and supplied a UI access attribute in place of **uid**, use the value for that attribute as the user name. You can also specify a fully qualified distinguished name for the user.

**Tip** If you mistype the name or password of the test user, the test fails even if the server configuration is correct. To verify that the server configuration is correct, click **Test** without entering user information in the **Additional Test Parameters** field first. If that succeeds, supply a username and password to test with the specific user.

**Example:**

To test if you can retrieve the **JSmith** user credentials at the Example company, enter **JSmith** and the correct password.

**Step 17** Click **Save**.

**Step 18** Enable use of this server:

- Firepower Management Center—**Enable External Authentication for Users on the Firepower Management Center**, on page 64
- FTD—**Configure External Authentication for SSH**, on page 1114
- 7000 and 8000 Series—**About External Authentication for 7000/8000 Series Devices**, on page 1099

**Step 19** If you later add or delete users on the LDAP server, you must refresh the user list and redeploy the Platform Settings on managed devices. This step is not required for the Firepower Management Center.

a) Click the **Refresh** (↺) next to each LDAP server.

If the user list changed, you will see a message advising you to deploy configuration changes for your device.

b) For 7000 and 8000 Series devices, make a small configuration change in the Platform Settings so that the settings are marked as Out-of-Date. 7000 and 8000 Series Platform Settings are not automatically marked as Out-of-Date for LDAP shell user list updates.

Note that the Firepower Threat Defense Platform Settings are automatically marked as Out-of-Date, so you do not need to perform this workaround.
c) Deploy configuration changes; see Deploy Configuration Changes, on page 382.

Examples

Basic Example

The following figures illustrate a basic configuration of an LDAP login authentication object for a Microsoft Active Directory Server. The LDAP server in this example has an IP address of 10.11.3.4. The connection uses port 389 for access.

![LDAP Configuration Form]

This example shows a connection using a base distinguished name of OU=security,DC=it,DC=example,DC=com for the security organization in the information technology domain of the Example company.
However, because this server is a Microsoft Active Directory server, it uses the `sAMAccountName` attribute to store user names rather than the `uid` attribute. Choosing the MS Active Directory server type and clicking `Set Defaults` sets the UI Access Attribute to `sAMAccountName`. As a result, the Firepower System checks the `sAMAccountName` attribute for each object for matching user names when a user attempts to log into the Firepower System.

In addition, a Shell Access Attribute of `sAMAccountName` causes each `sAMAccountName` attribute to be checked for all objects in the directory for matches when a user logs into a shell or CLI account on the appliance.

Note that because no base filter is applied to this server, the Firepower System checks attributes for all objects in the directory indicated by the base distinguished name. Connections to the server time out after the default time period (or the timeout period set on the LDAP server).

**Advanced Example**

This example illustrates an advanced configuration of an LDAP login authentication object for a Microsoft Active Directory Server. The LDAP server in this example has an IP address of 10.11.3.4. The connection uses port 636 for access.

This example shows a connection using a base distinguished name of `OU=security, DC=it, DC=example, DC=com` for the security organization in the information technology domain of the Example company. However, note that this server has a base filter of `(cn=*smith)`. The filter restricts the users retrieved from the server to those with a common name ending in `smith`. 

---

Firepower Management Center Configuration Guide, Version 6.4
The connection to the server is encrypted using SSL and a certificate named `certificate.pem` is used for the connection. In addition, connections to the server time out after 60 seconds because of the Timeout setting.

Because this server is a Microsoft Active Directory server, it uses the `sAMAccountName` attribute to store user names rather than the `uid` attribute. Note that the configuration includes a UI Access Attribute of `sAMAccountName`. As a result, the Firepower System checks the `sAMAccountName` attribute for each object for matching user names when a user attempts to log into the Firepower System.

In addition, a Shell Access Attribute of `sAMAccountName` causes each `sAMAccountName` attribute to be checked for all objects in the directory for matches when a user logs into a CLI/shell account on the appliance.

This example also has group settings in place. The Maintenance User role is automatically assigned to all members of the group with a member group attribute and the base domain name of `CN=SFmaintenance,DC=it,DC=example,DC=com`. 
The shell access filter is set to be the same as the base filter, so the same users can access the appliance through the shell or CLI as through the web interface.

Add a RADIUS server to support external users for device management.

For the FTD, only a subset of fields are used for CLI access. See Configure External Authentication for SSH, on page 1114 for details about which fields are used.

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.
Step 1
Choose System > Users.

Step 2
Click External Authentication.

Step 3
Click Add External Authentication Object.

Step 4
Set the Authentication Method to RADIUS.

Step 5
Enter a Name and optional Description.

Step 6
For the Primary Server, enter a Host Name/IP Address.

Step 7
(Optional) Change the Port from the default.

Step 8
Enter the RADIUS Secret Key.

Step 9
(Optional) Enter the Backup Server parameters.

Step 10
(Optional) Enter RADIUS-Specific Parameters.
   a) Enter the Timeout in seconds before retrying the primary server. The default is 30.
   b) Enter the Retries before rolling over to the backup server. The default is 3.
   c) In the fields that correspond to user roles, enter the name of each user or identifying attribute-value pair that should be assigned to those roles.
      Separate usernames and attribute-value pairs with commas.

Example:
If you know all users who should be Security Analysts have the value Analyst for their User-Category attribute, you can enter User-Category=Analyst in the Security Analyst field to grant that role to those users.

Example:
To grant the Administrator role to the users jsmith and jdoe, enter jsmith, jdoe in the Administrator field.

Example:
To grant the Maintenance User role to all users with a User-Category value of Maintenance, enter User-Category=Maintenance in the Maintenance User field.

d) Select the Default User Role for users that do not belong to any of the specified groups.

If you change a user's role, you must save/deploy the changed external authentication object and also remove the user from the Users screen. The user will be re-added automatically the next time they log in.

Step 11
(Optional) Define Custom RADIUS Attributes.

If your RADIUS server returns values for attributes not included in the dictionary file in /etc/radiusclient/, and you plan to use those attributes to set roles for users with those attributes, you need to define those attributes. You can locate the attributes returned for a user by looking at the user’s profile on your RADIUS server.

a) Enter an Attribute Name.
   When you define an attribute, you provide the name of the attribute, which consists of alphanumeric characters. Note that words in an attribute name should be separated by dashes rather than spaces.

b) Enter the Attribute ID as an integer.
   The attribute ID should be an integer and should not conflict with any existing attribute IDs in the etc/radiusclient/dictionary file.

c) Choose the Attribute Type from the drop-down list.
   You also specify the type of attribute: string, IP address, integer, or date.
d) Click **Add** to add the custom attribute.

When you create a RADIUS authentication object, a new dictionary file for that object is created on the device in the `/var/sf/userauth` directory. Any custom attributes you add are added to the dictionary file.

**Example:**

If a RADIUS server is used on a network with a Cisco router, you might want to use the `Ascend-Assign-IP-Pool` attribute to grant a specific role to all users logging in from a specific IP address pool. `Ascend-Assign-IP-Pool` is an integer attribute that defines the address pool where the user is allowed to log in, with the integer indicating the number of the assigned IP address pool.

To declare that custom attribute, you create a custom attribute with an attribute name of `Ascend-IP-Pool-Definition`, an attribute ID of 218, and an attribute type of `integer`.

You could then enter `Ascend-Assign-IP-Pool=2` in the **Security Analyst (Read Only)** field to grant read-only security analyst rights to all users with an `Ascend-IP-Pool-Definition` attribute value of 2.

---

**Step 12** *(Optional) (7000 or 8000 Series and Firepower Management Center)* In the **Shell Access Filter** area **Administrator Shell Access User List** field, enter the user names that should have CLI/shell access, separated by commas.

Make sure that these usernames match usernames on the RADIUS server. The names must be Linux-valid usernames:

- Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (_)
- All lowercase
- Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)

For the FTD, you can optionally use this method to define CLI users, or you can instead define CLI users on the RADIUS server by setting the Service-Type attribute for each user. For more information about the Service-Type attribute, see Configure External Authentication for SSH, on page 1114. You may want to use the **Shell Access Filter** method for FTD so you can use the same external authentication object with FTD and other platform types. Note that if you want to use RADIUS-defined users, you must leave the **Shell Access Filter** empty.

To use the same RADIUS server for the FTD, 7000 or 8000 Series, and FMC while using the Service-Type attribute method for the FTD, create two external authentication objects that identify the same RADIUS server: one object includes the predefined **Shell Access Filter** users (for use with the FMC and the 7000 or 8000 Series), and the other object leaves the **Shell Access Filter** empty (for use with FTDs).

To prevent RADIUS authentication of CLI/shell access for 7000 or 8000 Series and Firepower Management Center users, leave the field blank.

**Note** For the 7000 or 8000 Series and Firepower Management Center, remove any internal users that have the same user name as users included in the shell access filter. For the Firepower Management Center, the only internal CLI/shell user is `admin`, so do not also create an `admin` external user.

For the FTD, if you previously configured the same username for an internal user, the FTD first checks the password against the internal user, and if that fails, it checks the RADIUS server. Note that you cannot later add an internal user with the same name as an external user; only pre-existing internal users are supported.

**Step 13** *(Optional) Click **Test** to test FMC connectivity to the RADIUS server.

This function can only test FMC connectivity to the RADIUS server; there is no test function for managed device connectivity to the RADIUS server.

**Step 14** *(Optional) You can also enter **Additional Test Parameters** to test user credentials for a user who should be able to authenticate: enter a **User Name** and **Password**, and then click **Test**.
If you mistype the name or password of the test user, the test fails even if the server configuration is correct. To verify that the server configuration is correct, click Test without entering user information in the Additional Test Parameters field first. If that succeeds, supply a user name and password to test with the specific user.

**Example:**
To test if you can retrieve the JSmith user credentials at the Example company, enter JSmith and the correct password.

**Step 15**
Click Save.

**Step 16**
Enable use of this server:
- Firepower Management Center—Enable External Authentication for Users on the Firepower Management Center, on page 64
- FTD—Configure External Authentication for SSH, on page 1114
- 7000 and 8000 Series—About External Authentication for 7000/8000 Series Devices, on page 1099

### Examples

#### Simple User Role Assignments

The following figure illustrates a sample RADIUS login authentication object for a server running Cisco Identity Services Engine (ISE) with an IP address of 10.10.10.98 on port 1812. No backup server is defined.

<table>
<thead>
<tr>
<th><strong>External Authentication Object</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Authentication Method</strong></td>
</tr>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td><strong>Description</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Primary Server</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Host Name/IP Address</strong></td>
</tr>
<tr>
<td><strong>Port</strong></td>
</tr>
<tr>
<td><strong>RADIUS Secret Key</strong></td>
</tr>
</tbody>
</table>

The following example shows RADIUS-specific parameters, including the timeout (30 seconds) and number of failed retries before the Firepower System attempts to contact the backup server, if any.

This example illustrates important aspects of RADIUS user role configuration:

Users ewharton and gsand are granted web interface Administrative access.

The user cbronte is granted web interface Maintenance User access.

The user jausten is granted web interface Security Analyst access.

The user ewharton can log into the device using a CLI/shell account.
The following graphic depicts the role configuration for the example:

**Roles for Users Matching an Attribute-Value Pair**

You can use an attribute-value pair to identify users who should receive a particular user role. If the attribute you use is a custom attribute, you must define the custom attribute.

The following figure illustrates the role configuration and custom attribute definition in a sample RADIUS login authentication object for the same ISE server as in the previous example.

In this example, however, the MS-RAS-Version custom attribute is returned for one or more of the users because a Microsoft remote access server is in use. Note the MS-RAS-Version custom attribute is a string. In this example, all users logging in to RADIUS through a Microsoft v. 5.00 remote access server should receive the Security Analyst (Read Only) role, so you enter the attribute-value pair of MS-RAS-Version=MSRASV5.00 in the Security Analyst (Read Only) field.
Enable External Authentication for Users on the Firepower Management Center

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Any</td>
<td>Admin</td>
</tr>
</tbody>
</table>

When you enable external authentication for management users, the Firepower Management Center verifies the user credentials with an LDAP or RADIUS server as specified in an External Authentication object.

**Before you begin**

Add 1 or more external authentication objects according to Add an LDAP External Authentication Object, on page 51 and Add a RADIUS External Authentication Object, on page 59.

**Step 1**  
Choose System > Users.

**Step 2**  
Click External Authentication.

**Step 3**  
Set the default user role for external web interface users.

 Users without a role cannot perform any actions. Any user roles defined in the external authentication object overrides this default user role.

a) Click the Default User Roles value (by default, none selected).

a) In the Default User Role Configuration dialog box, check the role(s) that you want to use.

b) Click Save.
Step 4  Click the Slider enabled (✓) next to the each external authentication object that you want to use. If you enable more than 1 object, then users are compared against servers in the order specified. See the next step to reorder servers.

If you enable shell authentication, you must enable an external authentication object that includes a **Shell Access Filter**. Also, CLI/shell access users can only authenticate against the server whose authentication object is highest in the list.

Step 5  (Optional) Drag and drop servers to change the order in which authentication they are accessed when an authentication request occurs.

Step 6  Choose **Shell Authentication > Enabled** if you want to allow CLI/shell access for external users.

The first external authentication object name is shown next to the **Enabled** option to remind you that only the first object is used for CLI/shell.

Step 7  Click **Save and Apply**.

---

**Enable External Authentication for Users on Managed Devices**

Enable External Authentication in the device Platform Settings, and then deploy the settings to the managed devices. See the following procedures for your managed device type:

- Firepower Threat Defense—[Configure External Authentication for SSH](#), on page 1114
- 7000 and 8000 Series—[About External Authentication for 7000/8000 Series Devices](#), on page 1099

**Attention**

External authentication is not supported on FTD virtual devices.

---

**Configure Common Access Card Authentication with LDAP**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Any</td>
<td>Administrator</td>
</tr>
<tr>
<td></td>
<td></td>
<td>7000 and 8000</td>
<td></td>
<td>Network Admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Series</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If your organization uses Common Access Cards (CACs), you can configure LDAP authentication to authenticate FMC or 7000 and 8000 Series users logging into the web interface. With CAC authentication, users have the option to log in directly without providing a separate username and password for the device.

CAC-authenticated users are identified by their electronic data interchange personal identifier (EDIPi) numbers.

After 24 hours of inactivity, the device deletes CAC-authenticated users from the **Users** tab. The users are re-added after each subsequent login, but you must reconfigure any manual changes to their user roles.

**Before you begin**

You must have a valid user certificate present in your browser (in this case, a certificate passed to your browser via your CAC) to enable user certificates as part of the CAC configuration process. After you configure CAC authentication and authorization, users on your network must maintain the CAC connection for the duration.
of their browsing session. If you remove or replace a CAC during a session, your web browser terminates the session and the system logs you out of the web interface.

Step 1
Insert a CAC as directed by your organization.

Step 2
Direct your browser to https://ipaddress_or_hostname, where ipaddress or hostname corresponds to your device.

Step 3
If prompted, enter the PIN associated with the CAC you inserted in step 1.

Step 4
If prompted, choose the appropriate certificate from the drop-down list.

Step 5
On the Login page, in the Username and Password fields, log in as a user with Administrator privileges. You cannot yet log in using your CAC credentials.

Step 6
Choose System > Users > External Authentication.

Step 7
Create an LDAP authentication object exclusively for CAC, following the procedure in Add an LDAP External Authentication Object, on page 51. You must configure the following:

- CAC check box.
- LDAP-Specific Parameters > Show Advanced Options > User Name Template.
- Attribute Mapping > UI Access Attribute.

Step 8
Click Save.

Step 9
Enable external authentication and CAC authentication as described in Enable External Authentication for Users on the Firepower Management Center, on page 64 or Enable External Authentication to 7000/8000 Series Devices, on page 1099.

Step 10
Choose System > Configuration, and click HTTPS Certificate.

Step 11
Import a HTTPS server certificate, if necessary, following the procedure outlined in Importing HTTPS Server Certificates, on page 1038.

The same certificate authority (CA) must issue the HTTPS server certificate and the user certificates on the CACs you plan to use.

Step 12
Under HTTPS User Certificate Settings, choose Enable User Certificates. For more information, see Requiring Valid HTTPS Client Certificates, on page 1039.

Step 13
Log into the device according to Logging Into the Firepower Management Center with CAC Credentials, on page 28 or Logging Into a 7000 or 8000 Series Device with CAC Credentials, on page 29.

Customize User Roles for the Web Interface

Each user account must be defined with a user role. This section describes how to manage user roles and how to configure a custom user role for web interface access. For default user roles, see Web Interface User Roles, on page 43.

Note CLI/shell user roles for managed devices are limited to Config and Basic roles. See CLI User Roles, on page 44 for more information.
Create Custom User Roles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Any</td>
<td>Administrator</td>
</tr>
<tr>
<td></td>
<td></td>
<td>7000 &amp; 8000 Series</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Custom user roles can have any set of menu-based and system permissions, and may be completely original, copied from a predefined or another custom user role, or imported from another device.

⚠️ Caution

Users with menu-based User Management permissions have the ability to elevate their own privileges or create new user accounts with extensive privileges, including the Administrator user role. For system security reasons we strongly recommend you restrict the list of users with User Management permissions appropriately.

---

**Step 1** Choose **System > Users**.

**Step 2** Click **User Roles**.

**Step 3** Add a new user role with one of the following methods:

- Click **Create User Role**.
- Click the **Copy** next to the user role you want to copy.
- Import a custom user role from another device:
  a. On the old device, click the **Export** to save the role to your PC.
  b. On the new device, choose **System > Tools > Import/Export**.
  c. Click **Upload Package**, then follow the instructions to import the saved user role to the new device.

**Step 4** Enter a **Name** for the new user role. User role names are case sensitive.

**Step 5** (Optional) Add a **Description**.

**Step 6** Choose **Menu-Based Permissions** for the new role.

When you choose a permission, all of its children are chosen, and the multi-value permissions use the first value. If you clear a high-level permission, all of its children are cleared also. If you choose a permission but not its children, it appears in italic text.

Copying a predefined user role to use as the base for your custom role preselects the permissions associated with that predefined role.

You can apply restrictive searches to a custom user role. These searches constrain the data a user can see in the tables on the pages available under the Analysis menu. You can configure a restrictive search by first creating a private saved search and selecting it from the **Restrictive Search** drop-down menu under the appropriate menu-based permission.

**Step 7** (Optional) Check the **External Database Access** check box to set database access permissions for the new role.

This option provides read-only access to the database using an application that supports JDBC SSL connections. For the third-party application to authenticate to the device, you must enable database access in the system settings.
Step 8  (Optional) To set escalation permissions for the new user role, see Enable User Role Escalation, on page 69.

Step 9  Click Save.

Example

You can create custom user roles for access control-related features to designate whether users can view and modify access control and associated policies.

The following table lists custom roles that you could create and user permissions granted for each example. The table lists the privileges required for each custom role. In this example, Policy Approvers can view (but not modify) access control and intrusion policies. They can also deploy configuration changes to devices.

Table 1: Example Access Control Custom Roles

<table>
<thead>
<tr>
<th>Custom Role Permission</th>
<th>Example: Access Control Editor</th>
<th>Example: Intrusion &amp; Network Analysis Editor</th>
<th>Example: Policy Approver</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Control</td>
<td>yes</td>
<td>no</td>
<td>yes</td>
</tr>
<tr>
<td>Access Control Policy</td>
<td>yes</td>
<td>no</td>
<td>yes</td>
</tr>
<tr>
<td>Modify Access Control Policy</td>
<td>yes</td>
<td>no</td>
<td></td>
</tr>
<tr>
<td>Intrusion Policy</td>
<td>no</td>
<td>yes</td>
<td></td>
</tr>
<tr>
<td>Modify Intrusion Policy</td>
<td>no</td>
<td>yes</td>
<td></td>
</tr>
<tr>
<td>Deploy Configuration to Devices</td>
<td>no</td>
<td>no</td>
<td>yes</td>
</tr>
</tbody>
</table>

Deactivate User Roles

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC 7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Administrator</td>
</tr>
</tbody>
</table>

Deactivating a role removes that role and all associated permissions from any user who is assigned that role. You cannot delete predefined user roles, but you can deactivate them.

In a multidomain deployment, the system displays custom user roles created in the current domain, which you can edit. It also displays custom user roles created in ancestor domains, which you cannot edit. To view and edit custom user roles in a lower domain, switch to that domain.

Step 1  Choose System > Users.
Step 2  Click User Roles.
Step 3  Click the slider next to the user role you want to activate or deactivate.
If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

If you deactivate, then reactivate, a role with Lights-Out Management while a user with that role is logged in, or restore a user or user role from a backup during that user’s login session, that user must log back into the web interface to regain access to IPMI tool commands.

---

**Enable User Role Escalation**

For the Firepower Management Center, you can give custom user roles the permission, with a password, to temporarily gain the privileges of another, targeted user role in addition to those of the base role. This feature allows you to easily substitute one user for another during an absence, or to more closely track the use of advanced user privileges. Default user roles do not support escalation.

For example, a user whose base role has very limited privileges can escalate to the Administrator role to perform administrative actions. You can configure this feature so that users can use their own passwords, or so they use the password of another user that you specify. The second option allows you to easily manage one escalation password for all applicable users.

To configure user role escalation, see the following workflow.

---

**Step 1**
Set the Escalation Target Role, on page 69. Only one user role at a time can be the escalation target role.

**Step 2**
Configure a Custom User Role for Escalation, on page 70.

**Step 3**
(For the logged in user) Escalate Your User Role, on page 70.

---

**Set the Escalation Target Role**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>FMC</td>
<td>Any</td>
<td>Administrator</td>
</tr>
</tbody>
</table>

You can assign any of your user roles, predefined or custom, to act as the system-wide escalation target role. This is the role to which a custom role can escalate, if it has the ability. Only one user role at a time can be the escalation target role. Each escalation lasts for the duration of a login session and is recorded in the audit log.

---

**Step 1**
Choose System > Users.

**Step 2**
Click User Roles.

**Step 3**
Click Configure Permission Escalation.

**Step 4**
Choose a user role from the Escalation Target drop-down list.

**Step 5**
Click OK to save your changes.

Changing the escalation target role is effective immediately. Users in escalated sessions now have the permissions of the new escalation target.
Configure a Custom User Role for Escalation

Users for whom you want to enable escalation must belong to a custom user role with escalation enabled. This procedure describes how to enable escalation for a custom user role.

Consider the needs of your organization when you configure the escalation password for a custom role. If you want to easily manage many escalating users, you might want to choose another user whose password serves as the escalation password. If you change that user’s password or deactivate that user, all escalating users who require that password are affected. This action allows you to manage user role escalation more efficiently, especially if you choose an externally-authenticated user that you can manage centrally.

Before you begin
Set a target user role according to Set the Escalation Target Role, on page 69.

Step 1
Begin configuring your custom user role as described in Create Custom User Roles, on page 67.

Step 2
In System Permissions, choose the Set this role to escalate to: Maintenance User checkbox.

The current escalation target role is listed beside the check box.

Step 3
Choose the password that this role uses to escalate. You have two options:

- Choose Authenticate with the assigned user’s password if you want users with this role to use their own passwords when they escalate,
- Choose Authenticate with the specified user’s password and enter that username if you want users with this role to use the password of another user.

Note
When authenticating with another user’s password, you can enter any username, even that of a deactivated or nonexistent user. Reactivating the user whose password is used for escalation makes escalation impossible for users with the role that requires it. You can use this feature to quickly remove escalation powers if necessary.

Step 4
Click Save.

Escalate Your User Role

When a user has an assigned custom user role with permission to escalate, that user can escalate to the target role’s permissions at any time. Note that escalation has no effect on user preferences.

Step 1
From the drop-down list under your user name, choose Escalate Permissions.

If you do not see this option, your administrator did not enable escalation for your user role.
Step 2 Enter the authentication password.

Step 3 Click Escalate. You now have all permissions of the escalation target role in addition to your current role.

Escalation lasts for the remainder of your login session. To return to the privileges of your base role only, you must log out, then begin a new session.

---

## Configure Cisco Security Manager Single Sign-on

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>ASA FirePOWER</td>
<td>Any</td>
<td>Administrator</td>
</tr>
</tbody>
</table>

Single sign-on enables integration between Cisco Security Manager (CSM) Version 4.7 or higher and the Firepower Management Center, which allows you to access the Firepower Management Center from CSM without additional authentication to log in. When managing an ASA with the ASA FirePOWER module, you may want to modify the policies deployed to the module. You can select the managing Firepower Management Center in CSM and launch it in a web browser.

### Note

You cannot log in with single sign-on if your organization uses CACs for authentication.

**Before you begin**

- In NAT environments, the Firepower Management Center and CSM must reside on the same side of the NAT boundary.

---

Step 1 From CSM, generate a single sign-on shared encryption key that identifies the connection. See your CSM documentation for more information.

Step 2 From the Firepower Management Center, choose System > Users.

Step 3 Choose CSM Single Sign-on.

Step 4 Enter the CSM hostname or IP address and the server Port.

Step 5 Enter the Shared key that you generated from CSM.

Step 6 (Optional) Click the Use Proxy For Connection check box if you want to use the Firepower Management Center’s proxy server to communicate with CSM.

Step 7 Click Submit.

Step 8 Click Confirm Certificate to save the Certificate.

---

## Troubleshooting LDAP Authentication Connections

If you create an LDAP authentication object and it either does not succeed in connecting to the server you select, or does not retrieve the list of users you want, you can tune the settings in the object.
If the connection fails when you test it, try the following suggestions to troubleshoot your configuration:

- Use the messages displayed at the top of the web interface screen and in the test output to determine which areas of the object are causing the issue.

- Check that the user name and password you used for the object are valid:
  - Check that the user has the rights to browse to the directory indicated in your base distinguished name by connecting to the LDAP server using a third-party LDAP browser.
  - Check that the user name is unique to the directory information tree for the LDAP server.
  - If you see an LDAP bind error 49 in the test output, the user binding for the user failed. Try authenticating to the server through a third-party application to see if the binding fails through that connection as well.

- Check that you have correctly identified the server:
  - Check that the server IP address or host name is correct.
  - Check that you have TCP/IP access from your local appliance to the authentication server where you want to connect.
  - Check that access to the server is not blocked by a firewall and that the port you have configured in the object is open.
  - If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used for the server.
  - Check that you have not used an IPv6 address for the server connection if you are authenticating shell access.
  - If you used server type defaults, check that you have the correct server type and click **Set Defaults** again to reset the default values.

- If you typed in your base distinguished name, click **Fetch DNs** to retrieve all the available base distinguished names on the server, and select the name from the list.

- If you are using any filters, access attributes, or advanced settings, check that each is valid and typed correctly.

- If you are using any filters, access attributes, or advanced settings, try removing each setting and testing the object without it.

- If you are using a base filter or a shell access filter, make sure that the filter is enclosed in parentheses and that you are using a valid comparison operator.

- To test a more restricted base filter, try setting it to the base distinguished name for the user to retrieve just that user.

- If you are using an encrypted connection:
  - Check that the name of the LDAP server in the certificate matches the host name that you use to connect.
  - Check that you have not used an IPv6 address with an encrypted server connection.

- If you are using a test user, make sure that the user name and password are typed correctly.
• If you are using a test user, remove the user credentials and test the object.
• Test the query you are using by connecting to the LDAP server and using this syntax:

```
ldapsearch -x -b 'base_distinguished_name'
-h LDAPserver_ip_address -p port -v -D
'user_distinguished_name' -W 'base_filter'
```

For example, if you are trying to connect to the security domain on myrtle.example.com using the domainadmin@myrtle.example.com user and a base filter of (cn=*), you could test the connection using this statement:

```
ldapsearch -x -b 'CN=security,DC=myrtle,DC=example,DC=com'
-h myrtle.example.com -p 389 -v -D
'domainadmin@myrtle.example.com' -W '(cn=*)'
```

If you can test your connection successfully but authentication does not work after you deploy a platform settings policy, check that authentication and the object you want to use are both enabled in the platform settings policy that is applied to the device.

If you connect successfully but want to adjust the list of users retrieved by your connection, you can add or change a base filter or shell access filter or use a more restrictive or less restrictive base DN.

**History for User Accounts**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Version</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support for the Service-Type attribute for FTD users defined on the RADIUS server</td>
<td>6.4</td>
<td>For RADIUS authentication of FTD CLI users, you used to have to pre-define the usernames in the RADIUS external authentication object and manually make sure that the list matched usernames defined on the RADIUS server. You can now define CLI users on the RADIUS server using the Service-Type attribute and also define both Basic and Config user roles. To use this method, be sure to leave the shell access filter blank in the external authentication object. Licensing the Firepower System

The Licensing chapter of the Firepower Management Center Configuration Guide provides in-depth information about the different license types, service subscriptions, licensing requirements and more. The chapter also provides procedures and requirements for deploying Smart and classic licenses and licensing for air-gapped solutions.

The following topics explain how to license the Firepower System.

- About Firepower Licenses, on page 77
- Requirements and Prerequisites for Licensing, on page 78
- License Requirements for Firepower Management Center, on page 78
- Evaluation License Caveats, on page 79
- Smart vs. Classic Licenses, on page 79
- License Firepower Threat Defense Devices (FTD), on page 80
- License Classic Devices (Firepower 7000/8000 Series, ASA FirePOWER, and NGIPSv), on page 116
- How to Convert a Classic License for Use on an FTD Device, on page 124
- Assign Licenses to Managed Devices from the Device Management Page, on page 126
- License Expiration, on page 127
- Other Licensing Information in This Guide, on page 130
- Additional Information about Firepower Licensing, on page 131
- Cisco Success Network, on page 132
- End-User License Agreement, on page 145
- History for Licensing, on page 145

About Firepower Licenses

Your Firepower products (Firepower Management Center and managed devices) include licenses for basic operation, but some features require separate licensing or service subscriptions, as described in this chapter.

A "right-to-use" license does not expire, but service subscriptions require periodic renewal.

The type of license your products require (Smart or Classic) depends on the software you use, not on the hardware it runs on.

**Note**

"NGFW" means different things to different people, so this documentation does not use this term.
Requirements and Prerequisites for Licensing

Model Support
Any, but the specific licenses require per model differ as indicated in the procedures.

Supported Domains
Global, except where indicated.

User Roles
• Admin

License Requirements for Firepower Management Center

Firepower Management Center allows you to assign licenses to managed devices and manage licenses for the system.

A single Firepower Management Center can manage both devices that require Classic licenses and devices that require Smart Licenses.

Hardware FMC
A hardware Firepower Management Center does not require purchase of additional licenses or service subscriptions in order to manage devices.

Virtual FMC
Firepower Management Center Virtual has additional licensing requirements. See Firepower Management Center Virtual Licenses, on page 78.

Firepower Management Center Virtual Licenses

Generally, Firepower Management Center Virtual (FMCv) requires a license entitlement for each FTD device that it will manage.

FMCv does not require Smart licenses (Firepower MCv) to manage Classic devices. Classic devices need PAK licenses to be installed via FMCv. However, when you purchase an FMCv25, 25 MCv Entitlements are deposited in your Smart Account. If your FMCv manages both Classic (7K/8K/FP Services and Smart FTDs) and your device limit reaches 25, you see an error in FMC but your Smart License will still comply with the additional MCv Entitlements.

In case of an FTDv high availability configuration, you require two MCv licenses for every FTDv device.

If a single FMCv manages Firepower Threat Defense devices that are configured in a high availability pair, you still need one entitlement for each device (not one entitlement for the pair of FTDs.)

In multi-instance deployments, you need one entitlement for each security module.

In standard, connected Smart Licensing, these licenses are perpetual.
In Specific License Reservation, these licenses are term-based. This entitlement appears in Cisco Smart Software Manager as **Firepower MCv Device License** with different numbers of entitlements.

### Evaluation License Caveats

Not all functionality is available with an evaluation license, functionality under an evaluation license may be partial, and transition from evaluation licensing to standard licensing may not be seamless.

For example, if you have Firepower Threat Defense devices configured in a cluster, and you switch from an evaluation license to Smart Licensing, service will be interrupted when you deploy the change.

Review information about evaluation license caveats in information about particular features in this Licensing chapter and in the chapters related to deploying each feature.

### Smart vs. Classic Licenses

For managed devices, the licenses you need (Smart or Classic) depend on the software that runs on the device.

Any FMC can simultaneously manage devices with Smart and Classic licenses. You must configure each type of licensing separately.

License Firepower Threat Defense Devices (FTD)

Firepower Threat Defense devices require Smart Licensing.

Cisco Smart Licensing lets you purchase and manage a pool of licenses centrally. Unlike product authorization key (PAK) licenses, Smart Licenses are not tied to a specific serial number or license key. Smart Licensing lets you assess your license usage and needs at a glance.

In addition, Smart Licensing does not prevent you from using product features that you have not yet purchased. You can start using a license immediately, as long as you are registered with the Cisco Smart Software Manager, and purchase the license later. This allows you to deploy and use a feature, and avoid delays due to purchase order approval.

How to License Firepower Threat Defense Devices

Firepower Threat Defense devices require Smart Licensing.

Follow the steps outlined in this overview to license FTD devices managed by a hardware or virtual Firepower Management Center.

If your FMC also manages Classic devices (ASA FirePOWER, NGIPSv, or 7000/8000 series), you can follow this procedure for FTD devices, then follow the instructions under License Classic Devices (Firepower 7000/8000 Series, ASA FirePOWER, and NGIPSv), on page 116 for devices that use Classic licensing.

---

**Step 1**

If you do not already have a Smart Account, create one.

We recommend you have a Smart Account before you purchase licenses. To create a new Smart Account, see Create a Smart Account to Hold Your Licenses, on page 91.

*Note* Your account representative may have created a Smart Account on your behalf. If so, make sure you can access the account in the Cisco Smart Software Manager (CSSM) at https://software.cisco.com/#module/SmartLicensing.

---

**Step 2**

Understand the *platform* licenses your organization needs:

- **Firepower Management Center physical hardware:**
  This appliance comes with the licensing it needs; you do not need to do anything to activate this.

- **Firepower Management Center Virtual:**
  You need additional licenses. For details, see Firepower Management Center Virtual Licenses, on page 78.
  (If your FMCv will also manage devices that use Classic licenses, those devices will also require these entitlements when you configure Classic licensing.)

- **Firepower Threat Defense devices:**
  Each device automatically includes a license for basic functionality. For details, see Base Licenses, on page 86.
  You do not need to do anything to activate a base license, but many features require separate licensing, which is discussed below.

---

**Step 3**

Understand the *feature* licenses (sometimes called service subscriptions) that your organization needs.
Step 4 Determine the number of feature licenses/service subscriptions that your organization needs.

- Generally, each managed device needs to be licensed for each feature you will use.

- For Firepower Management Centers in a high availability pair:
  See FMC HA License Requirements for FMC High Availability Configurations, on page 228.

- For Firepower Threat Defense devices in a high availability pair:
  Each device (whether active or standby) must be licensed for each feature to be used. No additional licensing is required.
  See License Requirements for FTD Devices in a High Availability Pair, on page 728.

- For inter- or intra-chassis clustered Firepower Threat Defense devices:
  See Licenses for Clustering, on page 757.

- For a multi-instance deployment:
  See Licensing for Multi-Instance Deployments, on page 90.

Step 5 If you have existing licenses that you need to convert or move:

- To convert a Classic license to a license that can be used for Firepower Threat Defense:
  See How to Convert a Classic License for Use on an FTD Device, on page 124.

- To transfer Smart Licenses that are currently registered to another Firepower Management Center:
  See Transfer FTD Licenses to a Different Firepower Management Center, on page 114 and Deregister a Firepower Management Center from the Cisco Smart Software Manager, on page 115.

- To move Smart Licenses that are currently registered to another Firepower Threat Defense device:
  See Move or Remove Licenses from FTD Devices, on page 113.

Step 6 If your Firepower appliances have restricted internet access:

Determine which solution is best for your situation:

- If your Firepower Management Center is not connected to the internet, but it can connect to an internal server that can connect to Cisco's licensing authority, or can receive manual license updates:
  Deploy Smart Software Manager On-Prem (formerly known as a Smart Software Satellite Server.) For information, see Smart Software Manager On-Prem Overview, on page 97 and How to Deploy Smart Software Manager On-Prem, on page 97.

- If your deployment is completely air-gapped and cannot connect to the licensing authority or to Smart Software Manager On-Prem (which connects to the licensing authority), or receive manual license updates:
  See the options at Specific License Reservation (SLR), on page 98 and skip the rest of this procedure.

- For a comparison, see Licensing Options for Air-Gapped Deployments, on page 96.

Step 7 If you have multiple Firepower Management Center appliances and you want to connect to Cisco's licensing authority through a single proxy:
Deploy Smart Software Manager On-Prem (formerly known as a Smart Software Satellite Server.) For information, see Smart Software Manager On-Prem Overview, on page 97.

**Step 8**
If you want to enable features that use strong encryption and that are restricted by geographic region:

See Licensing for Export-Controlled Functionality, on page 89.

**Step 9**
Purchase the licenses you need:

Contact your Cisco sales representative or authorized reseller.

**Step 10**
Verify that your reseller or Cisco sales representative has added your licenses to your Smart Account.

Look in CSSM: https://software.cisco.com/#SmartLicensing-Inventory. Click **Inventory**, then the **Licenses** tab. Filter the list as needed. You may need your purchase confirmation in order to understand the license naming.

If you don't see the licenses you expect to see, make sure you are looking at the correct virtual account. For assistance with this, see the resource links in CSSM.

If you still don't see your licenses, or the licenses are not correct, contact the person from whom you purchased the licenses.

**Step 11**
After your virtual account (Smart Account) holds the licenses you expect, register your Firepower Management Center to CSSM:

You must configure licensing in the Firepower Management Center using the web interface.

- If your Firepower Management Center connects directly to CSSM:
  
  See the following topics:

  - Obtain a Product License Registration Token for Smart Licensing, on page 92 and
  - Register Smart Licenses, on page 93

- If your Firepower Management Center connects to Smart Software Manager On-Prem:
  
  See Configure the Connection to Smart Software Manager On-Prem, on page 98.

**Step 12**
Verify that registration was successful:

In the Firepower Management Center web interface, go to **System > Licenses > Smart Licenses. Product Registration** should show a green checkmark.

**Step 13**
If you have not yet done so, add your devices to the Firepower Management Center as managed devices.

See Add a Device to the FMC, on page 252

**Step 14**
Assign licenses to your managed Firepower Threat Defense devices:

See Assign Licenses to Multiple Managed Devices, on page 111

**Step 15**
Verify that licenses have successfully been added to your devices.

See View FTD Licenses and License Status, on page 112.

**Step 16**
As applicable, set up licensing for high-availability and clustered deployments:

- For Firepower Management Centers in a high availability pair:
  
  See the prerequisites to Establishing Firepower Management Center High Availability, on page 230.
After you configure FMC high-availability pairs, device licenses are automatically transferred from the active to the standby management center. You do not need to configure anything specific for licensing.

- For Firepower Threat Defense devices in a high availability pair:
  Assign the licenses for the features that you want to use to both the active and standby device before you configure high availability. If the devices are licensed for different features, the licenses on the standby device will be replaced with the same set of licenses as the active device.

- For clustered Firepower Threat Defense devices:
  See Licenses for Clustering, on page 757. Licensing steps are included in FMC: Add a Cluster, on page 771.

What to do next

- (Optional) If your Firepower Management Center also manages Classic devices (ASA FirePOWER, NGIPSv, or 7000/8000 series), configure licensing for those devices:
  See License Classic Devices (Firepower 7000/8000 Series, ASA FirePOWER, and NGIPSv), on page 116.

- Understand validity periods and expiration. See LicenseExpiration, on page 127.

Smart Software Manager (CSSM)

When you purchase one or more Smart Licenses for Firepower features, you manage them in the Cisco Smart Software Manager: http://www.cisco.com/web/ordering/smart-software-manager/index.html. The Smart Software Manager lets you create a master account for your organization.

By default, your licenses are assigned to the Default Virtual Account under your master account. As the account administrator, you can create additional virtual accounts; for example, for regions, departments, or subsidiaries. Multiple virtual accounts help you manage large numbers of licenses and appliances.

You manage licenses and appliances by virtual account. Only that virtual account’s appliances can use the licenses assigned to the account. If you need additional licenses, you can transfer an unused license from another virtual account. You can also transfer appliances between virtual accounts.

For each virtual account, you can create a Product Instance Registration Token. Enter this token ID when you deploy each Firepower Management Center, or when you register an existing FMC. You can create a new token if an existing token expires. An expired token does not affect a registered FMC that used this token for registration, but you cannot use an expired token to register a FMC. Also, a registered FMC becomes associated with a virtual account based on the token you use.

For more information about the Cisco Smart Software Manager, see Cisco Smart Software Manager User Guide or https://www.cisco.com/c/en/us/buy/smart-accounts/software-manager.html or the online help in CSSM, also available from: https://www.cisco.com/web/fw/softwareworkspace/smartlicensing/SSMCompiledHelps/.

Periodic Communication with the License Authority

In order to maintain your product license entitlement, your product must communicate periodically with the Cisco License Authority.

When you use a Product Instance Registration Token to register a Firepower Management Center, the appliance registers with the Cisco License Authority. The License Authority issues an ID certificate for communication between the Firepower Management Center and the License Authority. This certificate is valid for one year, although it will be renewed every six months. If an ID certificate expires (usually in nine months or a year with no communication), the Firepower Management Center reverts to a deregistered state and licensed features usage becomes suspended.

The Firepower Management Center communicates with the License Authority on a periodic basis. If you make changes in the Smart Software Manager, you can refresh the authorization on the Firepower Management Center so the changes immediately take effect. You also can wait for the appliance to communicate as scheduled.

Your Firepower Management Center must either have direct Internet access to the License Authority through the Cisco Smart Software Manager, or use one of the options described in Licensing Options for Air-Gapped Deployments, on page 96. In non-airgapped deployments, normal license communication occurs every 30 days, but with the grace period, your appliance will operate for up to 90 days without calling home. You must contact the License Authority before 90 days have passed.

### Service Subscriptions for FTD Features

Some features require a service subscription.

A service subscription enables a specific Firepower feature on a managed device for a set length of time. Service subscriptions can be purchased in one-, three-, or five-year terms. If a subscription expires, Cisco notifies you that you must renew the subscription. If a subscription expires for a Firepower Threat Defense device, you can continue to use the related features.

<table>
<thead>
<tr>
<th>Subscription You Purchase</th>
<th>Smart Licenses You Assign in Firepower System</th>
</tr>
</thead>
<tbody>
<tr>
<td>T</td>
<td>Threat</td>
</tr>
<tr>
<td>TC</td>
<td>Threat + URL Filtering</td>
</tr>
<tr>
<td>TM</td>

</tr>
<tr>
<td>URL</td>
<td>URL Filtering (can be added to Threat or used without Threat)</td>
</tr>
<tr>
<td>AMP</td>
<td>Malware (can be added to Threat or used without Threat)</td>
</tr>
</tbody>
</table>

Your purchase of a managed device that uses Smart Licenses automatically includes a Base license. This license is perpetual and enables system updates. All service subscriptions are optional for Firepower Threat Defense devices.

### FTD License Types and Restrictions

This section describes the types of Smart Licenses available in a Firepower System deployment. The Firepower Management Center requires Smart Licenses to manage Firepower Threat Defense devices.

The following table summarizes Firepower System Smart Licenses.
### Table 3: Firepower System Smart Licenses

<table>
<thead>
<tr>
<th>License You Assign in Firepower System</th>
<th>Subscription You Purchase</th>
<th>Duration</th>
<th>Granted Capabilities</th>
</tr>
</thead>
</table>
| Base (Except for Specific License Reservation, Base licenses are automatically assigned with all Firepower Threat Defense devices) | No subscription required (license is included with device) | Perpetual | User and application control
Switching and routing
NAT
For details, see Base Licenses, on page 86. |
| Threat                                 | • T
• TC (Threat + URL)
• TMC (Threat + Malware + URL) | Term-based | Intrusion detection and prevention
File control
Security Intelligence filtering
For details, see Threat Licenses, on page 87 |
| Malware                                | • TM (Threat + Malware)
• TMC (Threat + Malware + URL)
• AMP | Term-based | AMP for Networks (network-based Advanced Malware Protection)
Cisco Threat Grid
File storage
For details, see Malware Licenses for Firepower Threat Defense Devices, on page 87 and License Requirements for File and Malware Policies, on page 1575. |
| URL Filtering                          | • TC (Threat + URL)
• TMC (Threat + Malware + URL)
• URL | Term-based | Category and reputation-based URL filtering
For details, see URL Filtering Licenses for Firepower Threat Defense Devices, on page 88. |
| Firepower Management Center Virtual    | Based on license type. | Term-based or perpetual based on license type. | The platform license determines the number of devices the virtual appliance can manage.
For details, see Firepower Management Center Virtual Licenses, on page 78. |
### Base Licenses

A base license is automatically included with every purchase of a Firepower Threat Defense or Firepower Threat Defense Virtual device.

The Base license allows you to:

- configure your FTD devices to perform switching and routing (including DHCP relay and NAT)
- configure FTD devices as a high availability pair
- configure security modules as a cluster within a Firepower 9300 chassis (intra-chassis clustering)
- configure Firepower 9300 or Firepower 4100 series devices running Firepower Threat Defense as a cluster (inter-chassis clustering)
- implement user and application control by adding user and application conditions to access control rules

Threat and malware detection and URL filtering features require additional, optional licenses.

Except in deployments using Specific License Reservation, Base licenses are automatically added to the Firepower Management Center for every Firepower Threat Defense device you register.

For multi-instance deployments, see **Licensing for Multi-Instance Deployments**, on page 90.
Malware Licenses for Firepower Threat Defense Devices

A Malware license for Firepower Threat Defense devices allows you to perform Cisco Advanced Malware Protection (AMP) with AMP for Networks and Cisco Threat Grid. With this feature, you can use Firepower Threat Defense devices to detect and block malware in files transmitted over your network. To support this feature license, you can purchase the Malware (AMP) service subscription as a stand-alone subscription or in combination with Threat (TM) or Threat and URL Filtering (TMC) subscriptions.

Note

Firepower Threat Defense managed devices with Malware licenses enabled periodically attempt to connect to the AMP cloud even if you have not configured dynamic analysis. Because of this, the device’s Interface Traffic dashboard widget shows transmitted traffic; this is expected behavior.

You configure AMP for Networks as part of a file policy, which you then associate with one or more access control rules. File policies can detect your users uploading or downloading files of specific types over specific application protocols. AMP for Networks allows you to use local malware analysis and file preclassification to inspect a restricted set of those file types for malware. You can also download and submit specific file types to the Cisco Threat Grid cloud for dynamic and Spero analysis to determine whether they contain malware. For these files, you can view the network file trajectory, which details the path the file has taken through your network. The Malware license also allows you to add specific files to a file list and enable the file list within a file policy, allowing those files to be automatically allowed or blocked on detection.

If you disable all your Malware licenses, the system stops querying the AMP cloud, and also stops acknowledging retrospective events sent from the AMP cloud. You cannot re-deploy existing access control policies if they include AMP for Networks configurations. Note that for a very brief time after a Malware license is disabled, the system can use existing cached file dispositions. After the time window expires, the system assigns a disposition of Unavailable to those files.

Note that a Malware license is required only if you deploy AMP for Networks and Cisco Threat Grid. Without a Malware license, the Firepower Management Center can receive AMP for Endpoints malware events and indications of compromise (IOC) from the AMP cloud.

See also important information at License Requirements for File and Malware Policies, on page 1575.

Threat Licenses

A Threat license allows you to perform intrusion detection and prevention, file control, and Security Intelligence filtering:

• Intrusion detection and prevention allows you to analyze network traffic for intrusions and exploits and, optionally, drop offending packets.

• File control allows you to detect and, optionally, block users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols. AMP for Networks, which requires a Malware license, allows you to inspect and block a restricted set of those file types based on their dispositions.

• Security Intelligence filtering allows you to block —deny traffic to and from—specific IP addresses, URLs, and DNS domain names, before the traffic is subjected to analysis by access control rules. Dynamic feeds allow you to immediately block connections based on the latest intelligence. Optionally, you can use a “monitor-only” setting for Security Intelligence filtering.
You can purchase a Threat license as a stand-alone subscription (T) or in combination with URL Filtering (TC), Malware (TM), or both (TMC).

If you disable Threat on managed devices, the Firepower Management Center stops acknowledging intrusion and file events from the affected devices. As a consequence, correlation rules that use those events as a trigger criteria stop firing. Additionally, the Firepower Management Center will not contact the internet for either Cisco-provided or third-party Security Intelligence information. You cannot re-deploy existing intrusion policies until you re-enable Threat.

URL Filtering Licenses for Firepower Threat Defense Devices

The URL Filtering license allows you to write access control rules that determine the traffic that can traverse your network based on URLs requested by monitored hosts, correlated with information about those URLs. To support this feature license, you can purchase the URL Filtering (URL) service subscription as a stand-alone subscription or in combination with Threat (TC) or Threat and Malware (TMC) subscriptions.

Tip

Without a URL Filtering license, you can specify individual URLs or groups of URLs to allow or block. This gives you granular, custom control over web traffic, but does not allow you to use URL category and reputation data to filter network traffic.

Although you can add category and reputation-based URL conditions to access control rules without a URL Filtering license, the Firepower Management Center will not download URL information. You cannot deploy the access control policy until you first add a URL Filtering license to the Firepower Management Center, then enable it on the devices targeted by the policy.

If you disable the URL Filtering license on managed devices, you may lose access to URL filtering. If your license expires or if you disable it, access control rules with URL conditions immediately stop filtering URLs, and your Firepower Management Center can no longer download updates to URL data. You cannot re-deploy existing access control policies if they include rules with category and reputation-based URL conditions.

AnyConnect Licenses

You can use Firepower Threat Defense device to configure remote access VPN using the Cisco AnyConnect Secure Mobility Client (AnyConnect) and standards-based IPSec/IKEv2.

To enable the Firepower Threat Defense Remote Access VPN feature, you must purchase and enable one of the following licenses: AnyConnect Plus, AnyConnect Apex, or AnyConnect VPN Only. You can use any of the AnyConnect licenses: Plus, Apex, or VPN Only. You can select AnyConnect Plus and AnyConnect Apex if you have both licenses and you want to use them both. The Any Connect VPN only license cannot be used with Apex or Plus. The AnyConnect license must be shared with the Smart Account. For more instructions, see http://www.cisco.com/c/dam/en/us/products/collateral/security/anyconnect-og.pdf.

You cannot deploy the Remote Access VPN configuration to the FTD device if the specified device does not have the entitlement for a minimum of one of the specified AnyConnect license types. If the registered license moves out of compliance or entitlements expire, the system displays licensing alerts and health events.

While using Remote Access VPN, your Smart License Account must have the export controlled features (strong encryption) enabled. The FTD requires stronger encryption (which is higher than DES) for successfully establishing Remote Access VPN connections with AnyConnect clients. When you register the device, you must do so with a Smart Software Manager account that is enabled for export-controlled features. For more information about export-controlled features, see FTD License Types and Restrictions, on page 84.

You cannot deploy Remote Access VPN if the following are true:
Licensing for Export-Controlled Functionality

Features that require export-controlled functionality

Certain software features are subject to national security, foreign policy, and anti-terrorism laws and regulations. These export-controlled features include:

- Security certifications compliance
- Firepower Threat Defense Remote Access VPN
- Site to Site VPN with strong encryption
- SSH platform policy with strong encryption
- SSL policy with strong encryption
- Functionality such as SNMPv3 with strong encryption

How to determine whether export-controlled functionality is currently enabled for your system

To determine whether export-controlled functionality is currently enabled for your system: Go to System > Licenses > Smart Licenses and see if Export-Controlled Features displays Enabled.

About enabling export-controlled functionality

If Export-Controlled Features shows Disabled and you want to use features that require strong encryption:

There are two ways to enable strong cryptographic features. Your organization may be eligible for one or the other (or neither), but not both.

- If there is no option to enable export-controlled functionality when you generate a new Product Instance Registration Token in Cisco Smart Software Manager (CSSM):
  
  Contact your account representative.

  The Firepower Management Center allows you to use export-controlled features if your Smart Account is eligible for export-controlled functionality. When approved by Cisco, an export control license is added to your virtual account and you can use the export-controlled features. For more information, see Enabling the Export Control Feature (for Accounts Without Global Permission), on page 95

- If the option to use export-controlled functionality appears when you generate a new Product Instance Registration Token in Cisco Smart Software Manager:

  - The entitlement is perpetual and does not require a subscription.
  
  - In order to use export-controlled functionality, your Smart Account must be enabled for this functionality before you license your Firepower Management Center.

  - After export-controlled functionality is enabled for your Smart Account in Cisco Smart Software Manager (CSSM), you must re-register your Firepower Management Center using a new Product Instance Registration Token.
• When you create the new Product Instance Registration Token, you must select the option “Allow export-controlled functionality on the products registered with this token.” This option is enabled by default if this functionality is permitted for your Smart Account.

• After you install a token with export-controlled functionality on your Firepower Management Center and assign the relevant licenses to managed Firepower Threat Defense devices:
  • Reboot each device to make the newly-enabled features available.
  • In a high availability deployment, the active and standby devices must be rebooted together to avoid an Active-Active condition.

More Information

Licensing for High-Availability Configurations
See:
• For Firepower Management Center appliances in a high-availability pair:
  License Requirements for FMC High Availability Configurations, on page 228
• For Firepower Threat Defense devices in a high-availability pair:
  License Requirements for FTD Devices in a High Availability Pair, on page 728

See also the topics for specific license types under the FTD License Types and Restrictions, on page 84 topic.

Licensing for FTD Clusters
In addition to information in this Licensing chapter, see:
• Licenses for Clustering, on page 757
  • FMC: Add a Cluster, on page 771.

Licensing for Multi-Instance Deployments
All licenses apply per security engine/chassis (for the Firepower 4100) or per security module (for the Firepower 9300), not per container instance.

Base Licenses
Each security engine or module consumes a single Base license, which is automatically assigned for all deployments except those using Specific License Reservation.

Firepower Management Center Virtual
One entitlement is required for each security engine/module managed by a Firepower Management Center virtual appliance.
**Feature Licenses**

Each feature you license (Malware, Threat, URL Filtering, AnyConnect Apex, AnyConnect Plus, and AnyConnect VPN Only) requires one license per security engine/module. All instances on the engine/module can share the same feature licenses.

You must assign the license to each instance.

**High-Availability Deployments**

Instances in a high-availability pair cannot share feature licenses with each other, but each instance may share feature licenses with other instances on its respective engine/module.

**Licensing Example**

To see how the above licensing requirements work together, see Licenses for Container Instances, on page 624.

---

**Create a Smart Account to Hold Your Licenses**

A Smart Account is required for Smart Licenses and can also hold Classic licenses.

You should set up this account before you purchase Smart Licenses.

**Before you begin**

Your account representative or reseller may have set up a Smart Account on your behalf. If so, obtain the necessary information to access the account from that person instead of using this procedure, then verify that you can access the account.

For general information about Smart Accounts, see http://www.cisco.com/go/smartaccounts.

---

**Step 1**

Request a Smart Account:

For additional information, see https://communities.cisco.com/docs/DOC-57261.

**Step 2**

Wait for an email telling you that your Smart Account is ready to set up. When it arrives, click the link it contains, as directed.

**Step 3**

Set up your Smart Account:

**Step 4**

Verify that you can access the account in the Cisco Smart Software Manager (CSSM).

Go to https://software.cisco.com/#module/SmartLicensing and sign in.
What to do next

If you are following a longer workflow, return to the workflow:

How to License Firepower Threat Defense Devices, on page 80

How to Configure Smart Licensing with Direct Internet Access

Before you begin

If your deployment is complex or you have questions about the licenses you need, see How to License Firepower Threat Defense Devices, on page 80.

---

Step 1  Obtain a token from the Cisco Smart Software Manager licensing portal.

See Obtain a Product License Registration Token for Smart Licensing, on page 92.

Step 2  Register your Firepower Management Center with the Smart licensing portal.

See Register Smart Licenses, on page 93. Be sure to address the prerequisites in this topic.

Step 3  Verify that your FMC registered successfully with the Smart licensing portal.

In the Firepower Management Center web interface, go to System > Licenses > Smart Licenses. Product Registration should show a green checkmark.

Step 4  If you have not yet done so, add devices to your FMC.

See Add a Device to the FMC, on page 252.

Step 5  Assign licenses to the devices that are managed by your FMC.

See Assign Licenses to Multiple Managed Devices, on page 111.

Step 6  Verify that licenses are successfully installed.

See View FTD Licenses and License Status, on page 112.

---

What to do next

If applicable, set up licensing for high-availability and clustered deployments.

See the final steps in How to License Firepower Threat Defense Devices, on page 80.

Obtain a Product License Registration Token for Smart Licensing

Before you begin

• Create a Smart Account, if you have not already done so: Visit https://software.cisco.com/smartaccounts/setup#accountcreation-account. For information, see https://www.cisco.com/c/en/us/buy/smart-accounts.html.

• Ensure that you have purchased the type and number of licenses you require.
• Verify that the licenses you need appear in your Smart Account.
  
  If your licenses do not appear in your Smart Account, ask the person who ordered them (for example, your Cisco sales representative or authorized reseller) to transfer those licenses to your Smart Account.

• Ideally, check the prerequisites for Register Smart Licenses, on page 93 to ensure that your registration process goes smoothly.

• Make sure you have your credentials to sign in to the Cisco Smart Software Manager.

---

**Step 1**
Go to [https://software.cisco.com](https://software.cisco.com).

**Step 2**
Click **Smart Software Licensing** (in the License section.)

**Step 3**
Sign in to the Cisco Smart Software Manager.

**Step 4**
Click **Inventory**.

**Step 5**
Click **General**.

**Step 6**
Click **New Token**.

**Step 7**
For **Description**, enter a name that uniquely and clearly identifies the Firepower Management Center for which you will use this token.

**Step 8**
Enter an expiration time within 365 days.

This determines how much time you have to register the token to a Firepower Management Center. (Your license entitlement term is independent of this setting but may start to count down even if you have not yet registered your token.)

**Step 9**
If you see an option to enable export-controlled functionality, and you plan to use features that require strong encryption, select this option.

**Important**
If you see this option, you must select it now if you plan to use this functionality. You cannot enable export-controlled functionality later.

If you do not see this option, and your organization has obtained a license for export-controlled functionality, you will enable this functionality later, as described in **Enabling the Export Control Feature (for Accounts Without Global Permission)**, on page 95.

**Step 10**
Click **Create Token**.

**Step 11**
Locate your new token in the list and click **Actions**, then choose **Copy** or **Download**.

**Step 12**
If necessary, save your token in a safe place until you are ready to enter it into your Firepower Management Center.

---

**What to do next**
Continue with the steps in Register Smart Licenses, on page 93.

**Register Smart Licenses**

Register the Firepower Management Center with the Cisco Smart Software Manager.
Before you begin

• If your deployment is air-gapped, do not use this procedure. Instead, see Configure the Connection to 
  Smart Software Manager On-Prem, on page 98 or How to Implement Specific License Reservation, on 
  page 99, respectively.

• Ensure that the Firepower Management Center can reach the Cisco Smart Software Manager (CSSM) 
  server at tools.cisco.com:443.

• Make sure the NTP daemon is running on your Firepower Management Center. During registration, a 
  key exchange occurs between the NTP server and the Cisco Smart Software Manager, so time must be 
  in sync for proper registration.

If you are deploying FTD on a Firepower 4100/9300 chassis, you must configure NTP on the Firepower 
chassis using the same NTP server for the chassis as for the Firepower Management Center.

• If your organization has multiple Firepower Management Center appliances, make sure each FMC has 
a unique name that clearly identifies and distinguishes it from other Firepower Management Center 
appliances that may be registered to the same virtual account. This name is critical for managing your 
Smart License entitlements and ambiguous names will lead to problems later.

• Generate the necessary product license registration token from the Cisco Smart Software Manager. See 
Obtain a Product License Registration Token for Smart Licensing, on page 92, including all prerequisites. 
Make sure the token is accessible from the machine from which you will access your Firepower 
Management Center.

Step 1 Choose System > Licenses > Smart Licenses.

Step 2 Click Register.

Step 3 Paste the token you generated from Cisco Smart Software Manager into the Product Instance Registration Token field. 
Make sure there are no empty spaces or blank lines at the beginning or end of the text.

Step 4 Decide whether to send usage data to Cisco.

  • Enable Cisco Success Network is enabled by default. You can click sample data to see the kind of data Cisco 
collects. To help you make your decision, read the Cisco Success Network information block.

  • Note

  • When enabled, Cisco Support Diagnostics is enabled in the Firepower Threat Defense (FTD) devices 
in the next sync cycle. The FMC sync with the FTD runs once every 30 minutes.

  • When enabled, any new FTD registered in this FMC in the future will have Cisco Support Diagnostics 
enabled on it automatically.

Step 5 Click Apply Changes.

What to do next

• Add your Firepower Threat Defense devices to the Firepower Management Center; see Add a Device to 
  the FMC, on page 252.

• Assign licenses to your Firepower Threat Defense devices; see Assign Licenses to Multiple Managed 
  Devices, on page 111.
Enabling the Export Control Feature (for Accounts Without Global Permission)

Important
Use this procedure only if your Smart Account is not authorized for strong encryption. If your account is authorized, or you aren’t sure, see Licensing for Export-Controlled Functionality, on page 89.

Before you begin

• Make sure that your deployment does not already support the export-controlled functionality.

Note
If your deployment supports export-controlled features, you will see an option that allows you to enable export-controlled functionality in the Create Registration Token page in the Cisco Smart Software Manager. For more information, see https://www.cisco.com/c/en/us/buy/smart-accounts/software-manager.html.

• Make sure your deployment is not using an evaluation license.

• In Cisco Smart Software Manager, on the Inventory > Licenses page, verify that you have the license that corresponds to your Firepower Management Center:

<table>
<thead>
<tr>
<th>Export Control License</th>
<th>Firepower Management Center Model</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Virtual FMC Series Strong Encryption (3DES/AES)</td>
<td>All virtual Firepower Management Centers</td>
</tr>
<tr>
<td>Cisco FMC 1K Series Strong Encryption (3DES/AES)</td>
<td>750, 1000, 1500, 1600</td>
</tr>
<tr>
<td>Cisco FMC 2K Series Strong Encryption (3DES/AES)</td>
<td>2000, 2500, 2600</td>
</tr>
<tr>
<td>Cisco FMC 4K Series Strong Encryption (3DES/AES)</td>
<td>3500, 4000, 4500, 4600</td>
</tr>
</tbody>
</table>

Step 1
Choose System > Licenses > Smart Licenses.

Note
If you see the Request Export Key, your account is approved for the export-controlled functionality and you can proceed to use the required feature.

Step 2
Click Request Export Key to generate an export key.

Tip
If the export control key request fails, make sure that your virtual account has a valid Export Control license.
What to do next

You can now deploy configurations or policies that use the export-controlled features.

Remember

The new export-controlled licenses and all features enabled by it do not take effect on the Firepower Threat Defense devices until the devices are rebooted. Until then, only the features supported by the older license will be active.

In high-availability deployments both the Firepower Threat Defense devices need to be rebooted simultaneously, to avoid an Active-Active condition.

Disabling the Export Control Feature (for Accounts without Global Permission)

If you enabled the export-controlled functionality using the feature described in Enabling the Export Control Feature (for Accounts Without Global Permission), on page 95, you can disable this functionality using this procedure.

Step 1

Choose System > Licenses > Smart Licenses.

This releases the license back into the pool of available licenses in your virtual account, where it is now available for reuse.

Step 2

Disable the export control license by clicking Return Export Key.

Licensing Options for Air-Gapped Deployments

The following table compares the available licensing options for environments without internet access. Your sales representative may have additional advice for your specific situation.

Table 4: Comparison of Licensing Options for Air-Gapped Networks

<table>
<thead>
<tr>
<th>Smart Software Manager On-Prem</th>
<th>Specific License Reservation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scalable for a large number of products</td>
<td>Best for a small number of devices</td>
</tr>
<tr>
<td>Automated licensing management, usage and asset management visibility</td>
<td>Limited usage and asset management visibility</td>
</tr>
<tr>
<td>No incremental operational costs to add devices</td>
<td>Linear operational costs over time to add devices</td>
</tr>
<tr>
<td>Flexible, easier to use, less overhead</td>
<td>Significant administrative and manual overhead for moves, adds, and changes</td>
</tr>
<tr>
<td>Out-of-compliance status is allowed initially and at various expiration states</td>
<td>Out-of-compliance status impacts system functioning</td>
</tr>
</tbody>
</table>

For more information, see Smart Software Manager On-Prem Overview, on page 97

For more information, see Specific License Reservation (SLR), on page 98
Smart Software Manager On-Prem Overview

As described in Periodic Communication with the License Authority, on page 83, your system must communicate regularly with Cisco to maintain your license entitlement. If you have one of the following situations, you might want to use a Smart Software Manager On-Prem (also known as SSM On-Prem, and formerly known as "Smart Software Satellite Server") as a proxy for connections to the License Authority:

- Your Firepower Management Center is offline or otherwise has limited or no connectivity (in other words, is deployed in an air-gapped network.)
  (For an alternate solution for air-gapped networks, see Licensing Options for Air-Gapped Deployments, on page 96.)
- Your Firepower Management Center has permanent connectivity, but you want to manage your Smart Licenses via a single connection from your network.

Cisco Smart Software Manager On-Prem allows you to schedule synchronization or manually synchronize Smart License authorization with the Smart Software Manager.

For more information about Smart Software Manager On-Prem, see https://www.cisco.com/c/en/us/buy/smart-accounts/software-manager.html#~on-prem

How to Deploy Smart Software Manager On-Prem

Before you begin
If your network is air-gapped, determine the best solution for license management for your deployment. See Licensing Options for Air-Gapped Deployments, on page 96.

Step 1
Deploy and set up Smart Software Manager On-Prem.

Step 2
Connect the Firepower Management Center to Smart Software Manager On-Prem, obtain a registration token, and register the FMC to SSM On-Prem.
See Configure the Connection to Smart Software Manager On-Prem, on page 98.

Step 3
Add devices to be managed.
See Add a Device to the FMC, on page 252.

Step 4
Assign licenses to managed devices
See Assign Licenses to Multiple Managed Devices, on page 111

Step 5
Synchronize Smart Software Manager On-Prem to the Cisco Smart Software Management Server (CSSM).
See the Smart Software Manager On-Prem documentation, above.

Step 6
Schedule ongoing synchronization times.
Configure the Connection to Smart Software Manager On-Prem

Before you begin

- Set up Smart Software Manager On-Prem (SSM On-Prem). For information, see How to Deploy Smart Software Manager On-Prem, on page 97.
- Make a note of the CN of the TLS/SSL certificate on your SSM On-Prem.
- Verify that your FMC can reach your SSM On-Prem. For example, verify that the FQDN configured as the SSM On-Prem call-home URL can be resolved by your internal DNS server.
- Go to http://www.cisco.com/security/pki/certs/clrca.cer and copy the entire body of the TLS/SSL certificate (from "-----BEGIN CERTIFICATE-----" to "-----END CERTIFICATE-----") into a place you can access during configuration.

Step 1
Choose System > Integration.

Step 2
Click Smart Software Satellite.

Step 3
Select Connect to Cisco Smart Software Satellite Server.

Step 4
Enter the URL of your Smart Software Manager On-Prem, using the CN value you collected in the prerequisites of this procedure, in the following format:
https://FQDN_or_hostname_of_your_SSM_On-Prem/Transportgateway/services/DeviceRequestHandler

The FQDN or hostname must match the CN value of the certificate presented by your SSM On-Prem.

Step 5
Add a new SSL Certificate and paste the certificate text that you copied in the prerequisites for this procedure.

Step 6
Click Apply.

Step 7
Select System > Licenses > Smart Licenses and click Register.

Step 8
Create a new token on Smart Software Manager On-Prem.

Step 9
Copy the token.

Step 10
Paste the token into the form on the management center page.

Step 11
Click Apply Changes.

The management center is now registered to Smart Software Manager On-Prem.

What to do next

Complete remaining steps in How to Deploy Smart Software Manager On-Prem, on page 97.

Specific License Reservation (SLR)

You can use the Specific License Reservation feature to deploy Smart Licensing in an air-gapped network.
Various names are used at Cisco for Specific License Reservation, including SLR, SPLR, PLR, and Permanent License Reservation. These terms may also be used at Cisco to refer to similar but not necessarily identical licensing models.

When Specific License Reservation is enabled, the Firepower Management Center reserves licenses from your virtual account for a specified duration without accessing the Cisco Smart Software Manager or using Smart Software Manager On-Prem.

Your Firepower Management Center can also simultaneously manage devices that use standard Classic licenses. However, those devices do not use Specific License Reservation.

Features that require access to the internet, such as URL Lookups or contextual cross-launch to public web sites, will not work.

Cisco does not collect web analytics or telemetry data for deployments that use Specific License Reservation.

• Deactivate and Return the Specific License Reservation, on page 108
• Troubleshoot Specific License Reservation, on page 109

Best Practices for Specific License Reservation
You will not be able to successfully implement Specific License Reservation without reading this documentation.

An unsuccessful attempt is likely to result in the need to contact TAC.

To avoid problems, follow the instructions carefully, including the prerequisites and verification procedures.

Requirements for Specific License Reservation
Usage of Specific License Reservation requires approval and authorization from Cisco.
See also Prerequisites for Specific License Reservation, on page 100.

</table>

**Prerequisites for Specific License Reservation**

- Set up your Smart Account.
  
  See [Create a Smart Account to Hold Your Licenses](#), on page 91.

- If you are currently using standard Smart Licensing on your Firepower Management Center, de-register the Firepower Management Center before you implement Specific License Reservation. For information, see [Deregister a Firepower Management Center from the Cisco Smart Software Manager](#), on page 115.

  All Smart Licenses that are currently deployed to your Firepower Management Center will be returned to the pool of available licenses in your account, and you can re-use them when you implement Specific License Reservation.

- Specific License Reservation requires the same number and types of licenses as standard Smart Licensing. Determine how many standard licenses and service subscriptions you need for the devices and features you will deploy. Be sure to include entitlements for Firepower Management Center Virtual if applicable.

  For descriptions of Firepower licenses and service subscriptions, see [FTD License Types and Restrictions](#), on page 84 and its subtopics, especially [Firepower Management Center Virtual Licenses](#), on page 78.

- Purchase the licenses you need.

- Arrange for export-controlled strong cryptographic functionality, if required and if your organization is eligible. Confirm that your account is enabled to use it, or the required per-Firepower Management Center licenses appear in your virtual account. Your account representative can assist you with this.

  For more information, see [Licensing for Export-Controlled Functionality](#), on page 89.

- Work with your account representative to obtain approval for Specific License Reservation (SLR) for your Firepower products.
• Obtain confirmation from your account representative that the Specific License Reservation is ready for use and reflected in your Smart Account.

• Add managed devices to your Firepower Management Center. For instructions, see Add a Device to the FMC, on page 252. (You can add managed devices at any time, but adding them now simplifies this process.) You will need to enable the evaluation license in order to do this (under System > Licenses > Smart Licenses). Evaluation licensing does not require a connection to the License Authority.

• Make sure NTP is configured on the Firepower Management Center and managed devices. Time must be synchronized for registration to succeed.

If you are deploying FTD on a Firepower 4100/9300 chassis, you must configure NTP on the Firepower chassis using the same NTP server for the chassis as for the Firepower Management Center.

• (Recommended) If you will deploy a Firepower Management Center pair in a high availability configuration, configure that before you assign licenses. (FMCs in a high availability configuration require the same number of licenses as a single FMC.) If you have already deployed licenses to the secondary appliance, de-register licensing from that appliance.

Verify that your Smart Account is Ready to Deploy Specific License Reservation

In order to prevent problems when deploying your Specific License Reservation, complete this procedure before you make any changes in your Firepower Management Center.

Before you begin

• Ensure that you have met the requirements described in Prerequisites for Specific License Reservation, on page 100.

• Make sure you have your Cisco Smart Software Manager credentials.

Step 1
Sign in to the Cisco Smart Software Manager:
https://software.cisco.com/#SmartLicensing-Inventory

Step 2
If applicable, select the correct account from the top right corner of the page.

Step 3
If necessary, click Inventory.

Step 4
Click Licenses.

Step 5
Verify the following:

• There is a License Reservation button.

• There are enough platform and feature licenses for the devices and features you will deploy, including Firepower Management Center Virtual entitlements for your devices, if applicable.

Step 6
If any of these items is missing or incorrect, contact your account representative to resolve the problem.

Important Do not continue with this process until any problems are corrected.
Enable the Specific Licensing Menu Option

This procedure changes the "Smart Licenses" menu option to "Specific Licenses" in Firepower Management Center.

**Step 1**
Access the Firepower Management Center console using a USB keyboard and VGA monitor, or use SSH to access the management interface.

**Step 2**
Log into the Firepower Management Center admin account. By default, this gives you access to the Linux shell. If the Firepower Management Center CLI is enabled, this gives you access to the command line interface.

**Step 3**
For a Firepower Management Center with the CLI enabled, enter the expert command to access the Linux shell.

**Step 4**
Execute the following command to access the Specific License Reservation options:

```
sudo manage_slr.pl
```

**Example:**

```
admin@fmc63betaslrl: ~$ sudo manage_slr.pl
Password:

************** Configuration Utility **************
1 Show SLR Status
2 Enable SLR
3 Disable SLR
0 Exit

************************************************************
```

**Step 5**
Enable Specific License Reservation by selecting option 2.

**Step 6**
Select option 0 to exit the manage_slr utility.

**Step 7**
Type exit to exit the Linux shell.

**Step 8**
On a Firepower Management Center with the CLI enabled, enter exit to exit the command line interface.

**Step 9**
Verify that you can access the Specific License Reservation page in the Firepower Management Center web interface:

- If the System > Licenses > Smart Licenses page is currently displayed, refresh the page.
- Otherwise, choose System > Licenses > Specific Licenses.

---

Generate a Reservation Request Code from the Firepower Management Center

**Step 1**
If you are not already viewing the Specific License Reservation page, choose System > Licenses > Specific Licenses.

**Step 2**
Click Generate.

**Step 3**
Make a note of the Reservation Request Code.

---

Generate a Reservation Authorization Code from Cisco Smart Software Manager

**Step 1**
Go to the Cisco Smart Software Manager:
Step 2 If necessary, select the correct account from the top right of the page.
Step 3 If necessary, click Inventory.
   (This page may display automatically.)
Step 4 Click Licenses.
Step 5 Click License Reservation.
Step 6 Enter the code that you generated from Firepower Management Center into the Reservation Request Code box.
Step 7 Click Next.
Step 8 Select Reserve a specific license.
Step 9 Scroll down to display the entire License grid.
Step 10 Under Quantity To Reserve, enter the number of each platform and feature license needed for your deployment.

Important

• You must explicitly include a Firepower Threat Defense Base Features license for each managed device, or, for multi-instance deployments, a Firepower Threat Defense Base Features license for each module.

• If you are using a virtual management center, you must include a Firepower MCv Device License entitlement for each module (in multi-instance deployments) or each managed device (all other deployments).

• If you use strong cryptographic functionality:
  • If your entire Smart Account is enabled for export-controlled functionality, you do not need to do anything here.
  • If your organization’s entitlement is per-Firepower Management Center, you must select the appropriate license for your appliance.

For the correct license name to choose for your device, see the prerequisites in Enabling the Export Control Feature (for Accounts Without Global Permission), on page 95.

Step 11 Click Next.
Step 12 Click Generate Authorization Code.

At this point, the license is now in use according to the Smart Software Manager.

Step 13 Download the Authorization Code in preparation for entering it into the Firepower Management Center.

Enter the Specific License Reservation Authorization Code into the Firepower Management Center

Step 1 If you are not already viewing the Specific License Reservation page, in the Firepower management center web interface, choose System > Licenses > Specific Licenses.
Step 2 Click Browse to upload the text file with the authorization code that you generated from CSSM.
Step 3 Click Install.
Step 4 Verify that the Specific License Reservation page shows the Usage Authorization status as authorized.
Step 5 Click the Reserved License tab to verify the licenses selected while generating the Authorization Code.
If you do not see the licenses you require, then add the necessary licenses. For more info, see Update a Specific License Reservation.

Assign Specific Licenses to Managed Devices

Use this procedure to quickly assign licenses to multiple managed devices at one time.

You can also use this procedure to disable or move licenses from one Firepower Threat Defense device to another. If you disable a license for a device, you cannot use the features associated with that license on that device.

**Step 1**
Choose System > Licenses > Specific Licenses.

**Step 2**
Click Edit Licenses.

**Step 3**
Click each tab and assign licenses to devices as needed.

**Step 4**
Click Apply.

**Step 5**
Click the Assigned Licenses tab and verify that your licenses are correctly installed on each device.

**What to do next**

- If export-controlled functionality is enabled, reboot each device. If devices are configured in a high-availability pair, reboot both devices at the same time to avoid an Active-Active condition.

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

Update a Specific License Reservation

After you have successfully deployed Specific Licenses on your Firepower Management Center, you can add or remove entitlements at any time using this procedure.

**Step 1**
In Firepower Management Center, obtain the unique product instance identifier of this appliance:

a) Select System > Licenses > Specific Licenses.

b) Make a note of the Product Instance value.

You will need this value several times during this process.

**Step 2**
In Cisco Smart Software Manager, identify the Firepower Management Center appliance to update:

a) Go to the Cisco Smart Software Manager:

https://software.cisco.com/#SmartLicensing-Inventory

b) If necessary, click Inventory.

(This page may display automatically.)

c) Click Product Instances.

d) Look for a product instance that has FP in the Type column and a generic SKU (not a hostname) in the Name column. You may also be able to use the values in other table columns to help determine which Firepower Management Center is the correct Firepower Management Center. Click the name.
e) Look at the UUID and see if it is the UUID of the Firepower Management Center that you are trying to modify. If not, you must repeat these steps until you find the correct Firepower Management Center.

**Step 3** When you have located the correct Firepower Management Center appliance in Cisco Smart Software Manager, update the reserved licenses and generate a new authorization code:

a) On the page that shows the correct UUID, choose **Actions > Update Reserved Licenses**.
b) Update the reserved licenses as needed.

**Important**

- You must explicitly include a **Firepower Threat Defense Base Features** license for each managed device, or, for multi-instance deployments, a **Firepower Threat Defense Base Features** license for each module.
- If you are using a virtual management center, you must include a **Firepower MCv Device License** entitlement for each module (in multi-instance deployments) or each managed device (all other deployments).
- If you use strong cryptographic functionality:
  - If your entire Smart Account is enabled for export-controlled functionality, you do not need to do anything here.
  - If your organization's entitlement is per-Firepower Management Center, you must select the appropriate license for your appliance.

For the correct license name to choose for your device, see the prerequisites in **Enabling the Export Control Feature (for Accounts Without Global Permission)**, on page 95.

c) Click **Next** and verify the details.
d) Click **Generate Authorization Code**.
e) Download the Authorization Code in preparation for entering it into the Firepower Management Center.
f) Leave the Update Reservation page open. You will return to it later in this procedure.

**Step 4** Update the Specific Licenses in Firepower Management Center:

a) Choose **System > Licenses > Specific Licenses**.
b) Click **Edit SLR**.
c) Click **Browse** to upload the newly generated authorization code.
d) Click **Install** to update the licenses.

After successful installation of the authorization code, ensure that the licenses shown in the Reserved column of Firepower Management Center, matches with the licenses that you have reserved in Cisco Smart Software Manager.

e) Make a note of the **Confirmation Code**.

**Step 5** Enter the confirmation code in Cisco Smart Software Manager:

a) Return to the Cisco Smart Software Manager page that you left open earlier in this procedure.
b) Choose **Actions > Enter Confirmation Code**:
c) Enter the confirmation code that you generated from the Firepower Management Center.

**Step 6**

In Firepower Management Center, verify that your licenses are reserved as you expect them, and that each feature for each managed device shows a green circle with a **Check Mark**.

If necessary, see Specific License Reservation Status, on page 106 for more information.

---

**What to do next**

If your deployment includes export-controlled functionality, reboot each device. If devices are configured in a high-availability pair, reboot both devices at the same time to avoid an Active-Active condition.

Deploy configuration changes; see Deploy Configuration Changes, on page 382.

---

**Important! Maintain Your SLR Deployment**

To update the threat data and software that keep your deployment effective, see Maintain Your Air-Gapped Deployment, on page 161.

To ensure that all functionality continues to work without interruption, monitor your license expiration dates (on the **Reserved Licenses** tab).

---

**Specific License Reservation Status**

The **System > Licenses > Specific Licenses** page provides an overview of license usage on the Firepower Management Center, as described below.
Usage Authorization

Possible status values are:

- **Authorized** — The Firepower Management Center is in compliance and registered successfully with the License Authority, which has authorized the license entitlements for the appliance.

- **Out-of-compliance** — If licenses are expired or if the Firepower Management Center has overused licenses even though they are not reserved, status shows as Out-of-Compliance. License entitlements are enforced in Specific License Reservation, so you must take action.

Product Registration

Specifies registration status and the date that an authorization code was last installed or renewed on the Firepower Management Center.

Export-Controlled Features

Specifies whether you have enabled export-controlled functionality for the Firepower Management Center.

For more information about Export-Controlled Features, see Licensing for Export-Controlled Functionality, on page 89.

Product Instance

The Universally Unique Identifier (UUID) of this Firepower Management Center. This value identifies this device in Cisco Smart Software Manager.

Confirmation Code

The Confirmation Code is needed if you update or deactivate and return Specific Licenses.

Assigned Licenses Tab

Shows the licenses assigned to each device and the status of each.

Reserved Licenses Tab

Shows the number of licenses used and available to be assigned, and license expiration dates.

Expired Specific License Reservation

If required licenses are unavailable or expired, the following actions are restricted:

- Device registration
- Policy deployment

To renew your Specific License Reservation entitlements, purchase the necessary licenses, then follow the procedure in Update a Specific License Reservation, on page 104.

Renew Specific License Reservation Entitlements

When it is time to renew your Specific License Reservation entitlements, purchase the necessary licenses, then follow the procedure in Update a Specific License Reservation, on page 104.
Deactivate and Return the Specific License Reservation

If you no longer need a specific license, you must return it to your Smart Account.

---

**Important**

If you do not follow all of the steps in this procedure, the license remains in an in-use state and cannot be re-used.

---

This procedure releases all license entitlements associated with the Firepower Management Center back to your virtual account. After you de-register, no updates or changes on licensed features are allowed.

---

**Step 1**

In the Firepower Management Center Web interface, select **System > Licenses > Specific Licenses**.

**Step 2**

Make a note of the **Product Instance** identifier for this Firepower Management Center.

**Step 3**

Generate a return code from Firepower Management Center:

a) Click **Return SLR**.

The following figure shows Return SLR.

![Return SLR](image)

Firepower Threat Defense devices become unlicensed and Firepower Management Center moves to the de-registered state.

b) Make a note of the **Return Code**.

**Step 4**

In Cisco Smart Software Manager, identify the Firepower Management Center appliance to deregister:

a) Go to the Cisco Smart Software Manager:

   https://software.cisco.com/#SmartLicensing-Inventory

b) If necessary, click **Inventory**.

   (This page may display automatically.)

c) Click **Product Instances**.
d) Look for a product instance that has **FP** in the **Type** column and a generic SKU (not a hostname) in the **Name** column. You may also be able to use the values in other table columns to help determine which Firepower Management Center is the correct Firepower Management Center. Click the name.

e) Look at the **UUID** and see if it is the UUID of the Firepower Management Center that you are trying to modify. If not, you must repeat these steps until you find the correct Firepower Management Center.

**Step 5**  
When you have identified the correct Firepower Management Center, return the licenses to your Smart Account:

a) On the page that shows the correct UUID, choose **Actions > Remove**.

b) Enter the reservation return code that you generated from the Firepower Management Center into the **Remove Product Instance** dialog box.

c) Click **Remove Product Instance**.

   The specific reserved licenses are returned to the available pool in your Smart Account and this Firepower Management Center is removed from the Cisco Smart Software Manager Product Instances list.

**Step 6**  
Disable the Specific License in the Firepower Management Center Linux shell:

a) Access the Firepower Management Center console using a USB keyboard and VGA monitor, or use SSH to access the management interface.

b) Log in to the Firepower Management Center **admin** account. By default, this gives you access to the Linux shell. If the Firepower Management Center CLI is enabled, this gives you access to the command line interface.

c) For a Firepower Management Center with the CLI enabled, enter the **expert** command to access the Linux shell.

d) Execute the following command:

   `sudo manage_slr.pl`

   **Example:**

   `admin@fmc63betaslrl: ~$ sudo manage_slr.pl`

   `Password:`

   `*************** Configuration Utility ***************`

   1  Show SLR Status
   2  Enable SLR
   3  Disable SLR
   0  Exit

   `***********************************************

   Enter choice:`

e) Select menu option 3 to disable the Specific License Reservation.

f) Select option 0 to exit the manage_slr utility.

g) Enter **exit** to exit the Linux shell.

h) On a Firepower Management Center with the CLI enabled, enter **exit** to exit the command line interface.

---

**Troubleshoot Specific License Reservation**

**How do I identify a particular Firepower Management Center in the Product Instance list in Cisco Smart Software Manager?**

On the Product Instances page in Cisco Smart Software Manager, if you cannot identify the product instance based on a value in one of the columns in the table, you must click the name of each generic product instance
of type **FP** to view the product instance details page. The **UUID** value on this page uniquely identifies one Firepower Management Center.

In the Firepower Management Center web interface, the UUID for a Firepower Management Center is the **Product Instance** value displayed on the **System > Licenses > Specific Licenses** page.

**I do not see a License Reservation button in Cisco Smart Software Manager**

If you do not see the **License Reservation** button, then your account is not authorized for specific license reservation. If you have already enabled Specific License Reservation in the Linux shell and generated a request code, perform the following:

1. If you have already generated a **Request Code** in the Firepower Management Center web interface, cancel the request code.
2. Disable Specific License Reservation in the Firepower Management Center Linux shell as described within the section **Deactivate and Return the Specific License Reservation, on page 108**.
3. Register a Firepower Management Center with Cisco Smart Software Manager in regular mode using smart token.
4. Contact Cisco TAC to enable Specific License for your smart account.

**I was interrupted in the middle of the licensing process. How can I pick up where I left off?**

If you have generated but not yet downloaded an Authorization code from Cisco Smart Software Manager, you can go to the **Product Instance** page in Cisco Smart Software Manager, click the product instance, then click **Download Reservation Authorization Code**.

**I am unable to register Firepower Threat Defense devices to Firepower Management Center Virtual**

Make sure you have enough MCV entitlements in your Smart Account to cover the devices you want to register, then update your deployment to add the necessary entitlements.

See **Update a Specific License Reservation, on page 104**.

**I have enabled Specific Licensing, but now I do not see a Smart License page.**

This is the expected behavior. When you enable Specific Licensing, Smart Licensing is disabled. You can use the Specific License page to perform licensing operations.

If you want to use Smart Licensing, you must return the Specific License. For more information see, **Deactivate and Return the Specific License Reservation, on page 108**.

**What if I do not see a Specific License page in Firepower Management Center?**

You need to enable Specific License to view the Specific License page. For more information see, **Enable the Specific Licensing Menu Option, on page 102**.

**I have disabled Specific Licensing, but forgot to copy the Return Code. What should I do?**

The **Return Code** is saved in Firepower Management Center. You must re-enable the Specific License from the Linux shell (see **Enable the Specific Licensing Menu Option, on page 102**), then refresh the Firepower Management Center web interface. Your **Return Code** will be displayed.
Assign Licenses to Multiple Managed Devices

Devices managed by a Firepower Management Center obtain their licenses via the Firepower Management Center, not directly from the Cisco Smart Software Manager.

Use this procedure to enable licensing on multiple Firepower Threat Defense devices at once.

**Note**
For container instances on the same security module/engine, you apply the license to each instance; note that the security module/engine consumes only one license per feature for all instances on the security module/engine.

**Note**
For an FTD cluster, you apply the licenses to the cluster as a whole; note that each unit in the cluster consumes a separate license per feature.

**Before you begin**

- If you have not yet done so, register your devices with the Firepower Management Center. See Add a Device to the FMC, on page 252.
- Prepare licenses for distribution to managed devices: See Register Smart Licenses, on page 93

**Step 1** Choose **System > Licenses > Smart Licenses** or **Specific Licenses**.

**Step 2** Click **Edit Licenses**.

**Step 3** For each type of license you want to add to a device:

a) Click the tab for that type of license.

b) Click a device in the list on the left.

c) Click **Add** to move that device to the list on the right.

d) Repeat for each device to receive that type of license.

For now, don't worry about whether you have licenses for all of the devices you want to add.

e) Repeat this subprocedure for each type of license you want to add.

f) Click **Apply**.

**What to do next**

- Verify that your licenses are correctly installed. Follow the procedure in View FTD Licenses and License Status, on page 112.

- If export-controlled functionality is newly enabled, reboot each device. If devices are configured in a high-availability pair, reboot both devices at the same time to avoid an Active-Active condition.

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.
View FTD Licenses and License Status

To view the license status for a Firepower Management Center and its managed Firepower Threat Defense devices, use the Smart Licenses page in FMC.

For each type of license in your deployment, the page lists the total number of licenses consumed, whether the license is in compliance or out of compliance, the device type, and the domain and group where the device is deployed. You can also view the Firepower Management Center’s Smart License Status. Container instances on the same security module/engine only consume one license per security module/engine. Therefore, even though the FMC lists each container instance separately under each license type, the number of licenses consumed for feature license types will only be one.

Other than the Smart Licenses page, there are a few other ways you can view licenses:

- The Product Licensing dashboard widget provides an at-a-glance overview of your licenses.
  
  See Adding Widgets to a Dashboard, on page 293 and Dashboard Widget Availability by User Role, on page 281 and The Product Licensing Widget, on page 290.

- The Device Management page (Devices > Device Management) lists the licenses applied to each of your managed devices.

- The Smart License Monitor health module communicates license status when used in a health policy.

---

**Step 1** Choose System > Licenses > Smart Licenses.

**Step 2** In the Smart Licenses table, click the arrow at the left side of each License Type folder to expand that folder.

**Step 3** In each folder, verify that each device has a green circle with a Check Mark (✔) in the License Status column.

**Note** If you see duplicate Firepower Management Center Virtual licenses, each represents one managed device.

If all devices show a green circle with a Check Mark (✔), your devices are properly licensed and ready to use.

If you see any License Status other than a green circle with a Check Mark (✔), hover over the status icon to view the message.

---

**What to do next**

- If you had any devices that did NOT have a green circle with a Check Mark (✔), you may need to purchase more licenses.

**FTD License Status**

*Permanent License Reservation*

See Specific License Reservation Status, on page 106
Smart Licensing

The Smart License Status section of the System > Licenses > Smart Licenses page provides an overview of license usage on the Firepower Management Center, as described below.

Usage Authorization

Possible status values are:

- **In-compliance** — All licenses assigned to managed devices are in compliance and the Firepower Management Center is communicating successfully with the Cisco licensing authority.

- **License is in compliance but communication with licensing authority has failed** — Device licenses are in compliance, but the Firepower Management Center is not able to communicate with the Cisco licensing authority.

- **Out-of-compliance icon or unable to communicate with License Authority** — One or more managed devices is using a license that is out of compliance, or the Firepower Management Center has not communicated with the Cisco licensing authority in more than 90 days.

Product Registration

Specifies the last date when the Firepower Management Center contacted the License Authority and registered.

Assigned Virtual Account

Specifies the Virtual Account under the Smart Account that you used to generate the Product Instance Registration Token and register the Firepower Management Center. If this deployment is not associated with a particular virtual account within your Smart Account, this information is not displayed.

Export-Controlled Features

If this option is enabled, you can deploy restricted features. For details, see Licensing for Export-Controlled Functionality, on page 89.

Cisco Success Network

Specifies whether you have enabled Cisco Success Network for the Firepower Management Center. If this option is enabled, you provide usage information and statistics to Cisco which are essential to provide you with technical support. This information also allows Cisco to improve the product and make you aware of unused available features so that you can maximize the value of the product in your network. See Cisco Success Network, on page 132 for more information.

Move or Remove Licenses from FTD Devices

Use this procedure to manage licenses for Firepower Threat Defense devices managed by an Firepower Management Center.

For example, you can move a license from one FTD device to another device registered to the same FMC, or to remove a license from a device.

If you remove (disable) a license for a device, you cannot use the features associated with that license on that device.
**Important**  If you need to move a license to a device managed by a different Firepower Management Center, see Transfer FTD Licenses to a Different Firepower Management Center, on page 114.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Choose <strong>System &gt; Licenses &gt; Smart Licenses</strong>.</td>
</tr>
<tr>
<td>2</td>
<td>Click <strong>Edit Licenses</strong>.</td>
</tr>
<tr>
<td>3</td>
<td>Click either the <strong>Malware</strong>, <strong>Threat</strong>, <strong>URL Filtering</strong>, <strong>AnyConnect Plus</strong>, <strong>AnyConnect Apex</strong>, or <strong>AnyConnect VPN Only</strong>.</td>
</tr>
<tr>
<td>4</td>
<td>Choose the devices you want to license, then click <strong>Add</strong>, and/or click each device form which you want to remove a license and click the <strong>Delete</strong>.</td>
</tr>
<tr>
<td>5</td>
<td>Click <strong>Apply</strong>.</td>
</tr>
</tbody>
</table>

**What to do next**  Deploy the changes to the managed devices.

**Transfer FTD Licenses to a Different Firepower Management Center**

When you register a Smart License to a Firepower Management Center, your virtual account allocates the license to the FMC. If you need to transfer your Smart Licenses to another Firepower Management Center, you must deregister the currently licensed FMC. This removes it from your virtual account and frees your existing licenses, so you can register the licenses to the new FMC. Otherwise, you cannot reuse these licenses, and you may receive an Out-of-Compliance notification because your virtual account does not have enough free licenses. For instructions, see Deregister a Firepower Management Center from the Cisco Smart Software Manager, on page 115.

Then you can register the licenses to the destination Firepower Management Center.

**If FTD License Status is Out of Compliance**

If the Usage Authorization status on the Smart Licenses page (**System > Licenses > Smart Licenses**) shows Out of Compliance, you must take action.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Look at the Smart Licenses section at the bottom of the page to determine which licenses are needed.</td>
</tr>
<tr>
<td>2</td>
<td>Purchase the required licenses through your usual channels.</td>
</tr>
</tbody>
</table>
| 3    | In Cisco Smart Software Manager ([https://software.cisco.com/#SmartLicensing-Inventory](https://software.cisco.com/#SmartLicensing-Inventory)), verify that the licenses appear in your virtual account.  
If the expected licenses are not present, see Troubleshoot FTD Licensing, on page 115. |
| 4    | In Firepower Management Center, select **System > Licenses > Smart Licenses**. |
| 5    | Click **Re-Authorize**. |
Deregister a Firepower Management Center from the Cisco Smart Software Manager

Deregister (unregister) your Firepower Management Center from the Cisco Smart Software Manager before you reinstall (reimage) the appliance, or if you need to release all of the license entitlements back to your Smart Account for any reason.

Deregistering removes the FMC from your virtual account. All license entitlements associated with the Firepower Management Center release back to your virtual account. After deregistration, the Firepower Management Center enters Enforcement mode where no update or changes on licensed features are allowed.

If you need to remove the licenses from a subset of managed Firepower Threat Defense devices, see Assign Licenses to Multiple Managed Devices, on page 111 or Assign Licenses to Managed Devices from the Device Management Page, on page 126.

**Step 1** Choose System > Licenses > Smart Licenses.
**Step 2** Click Deregister ( ).

Synchronize a Firepower Management Center with the Cisco Smart Software Manager

If you make changes in the Cisco Smart Software Manager, you can refresh the authorization on the Firepower Management Center so the changes immediately take effect.

**Step 1** Choose System > Licenses > Smart Licenses.
**Step 2** Click Refresh ( ).

Troubleshoot FTD Licensing

**Expected Licenses Do Not Appear in My Smart Account**

If the licenses you expect to see are not in your Smart Account, try the following:

- Make sure they are not in a different Virtual Account. Your organization's license administrator may need to assist you with this.
- Check with the person who sold you the licenses to be sure that transfer to your account is complete.

**Unable to Connect to Smart License Server**

Check the obvious causes first. For example, make sure your Firepower system has outside connectivity. See Internet Access Requirements, on page 2678.
Unexpected Out-of-Compliance Notification or Other Error

- If a device is already registered to a different FMC, you need to deregister the original FMC before you can license the device under a new FMC. See Deregister a Firepower Management Center from the Cisco Smart Software Manager, on page 115.

- Try synchronizing: Synchronize a Firepower Management Center with the Cisco Smart Software Manager, on page 115.

Troubleshoot Other Issues

License Classic Devices (Firepower 7000/8000 Series, ASA FirePOWER, and NGIPSv)

7000 and 8000 Series and NGIPSv devices and ASA FirePOWER modules require Classic licenses. These devices are frequently referred to in this documentation as Classic devices.

Important

If you are running Firepower hardware but not Firepower software, see licensing information for the software product you are using. This documentation is not applicable.

Classic licenses require a product authorization key (PAK) to activate and are device-specific. Classic licensing is sometimes also referred to as "traditional licensing."

Product License Registration Portal

When you purchase one or more Classic licenses for Firepower features, you manage them in the Cisco Product License Registration Portal:

https://cisco.com/go/license

For more information on using this portal, see:

https://slexui.cloudapps.cisco.com/SWIFT/LicensingUI/Quickstart

You will need your account credentials in order to access these links.

Service Subscriptions for Firepower Features (Classic Licensing)

Some features require a service subscription.

A service subscription enables a specific Firepower feature on a managed device for a set length of time. Service subscriptions can be purchased in one-, three-, or five-year terms. If a subscription expires, Cisco notifies you that you must renew the subscription. If a subscription expires for a Classic device, you might not be able to use the related features, depending on the feature type.
### Table 5: Service Subscriptions and Corresponding Classic Licenses

<table>
<thead>
<tr>
<th>Subscription You Purchase</th>
<th>Classic Licenses You Assign in Firepower System</th>
</tr>
</thead>
<tbody>
<tr>
<td>TA</td>
<td>Control + Protection (a.k.a. &quot;Threat &amp; Apps,&quot; required for system updates)</td>
</tr>
<tr>
<td>TAC</td>
<td>Control + Protection + URL Filtering</td>
</tr>
<tr>
<td>TAM</td>
<td>Control + Protection + Malware</td>
</tr>
<tr>
<td>TAMC</td>
<td>Control + Protection + URL Filtering + Malware</td>
</tr>
<tr>
<td>URL</td>
<td>URL Filtering (add-on where TA is already present)</td>
</tr>
<tr>
<td>AMP</td>
<td>Malware (add-on where TA is already present)</td>
</tr>
</tbody>
</table>

Your purchase of a managed device that uses Classic licenses automatically includes Control and Protection licenses. These licenses are perpetual, but you must also purchase a TA service subscription to enable system updates. Service subscriptions for additional features are optional.

## Classic License Types and Restrictions

This section describes the types of Classic licenses available in a Firepower System deployment. The licenses you can enable on a device depend on its model, version, and the other licenses enabled.

Licenses are model-specific for 7000 and 8000 Series and NGIPSv devices and for ASA FirePOWER modules. You cannot enable a license on a managed device unless the license exactly matches the device’s model. For example, you cannot use a Firepower 8250 Malware license (FP8250-TAM-LIC=) to enable Malware capabilities on an 8140 device; you must purchase a Firepower 8140 Malware license (FP8140-TAM-LIC=).

**Note**

For NGIPSv or ASA FirePOWER, the Control license allows you to perform user and application control, but these devices do not support switching, routing, stacking, or 7000 and 8000 Series device high availability.

There are a few ways you may lose access to licensed features in the Firepower System:

- You can remove Classic licenses from the Firepower Management Center, which affects all of its managed devices.
- You can disable licensed capabilities on specific managed devices.

Though there are some exceptions, you cannot use the features associated with an expired or deleted license.

The following table summarizes Classic licenses in the Firepower System.
Table 6: Firepower System Classic Licenses

<table>
<thead>
<tr>
<th>License You Assign in Firepower System</th>
<th>Service Subscription You Purchase</th>

</tr>
</tbody>
</table>

Protection Licenses

A Protection license allows you to perform intrusion detection and prevention, file control, and Security Intelligence filtering:
• **Intrusion detection and prevention** allows you to analyze network traffic for intrusions and exploits and, optionally, drop offending packets.

• **File control** allows you to detect and, optionally, block users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols. **AMP for Networks**, which requires a Malware license, allows you to inspect and block a restricted set of those file types based on their dispositions.

• **Security Intelligence filtering** allows you to block—deny traffic to and from—specific IP addresses, URLs, and DNS domain names, before the traffic is subjected to analysis by access control rules. Dynamic feeds allow you to immediately block connections based on the latest intelligence. Optionally, you can use a “monitor-only” setting for Security Intelligence filtering.

A Protection license (along with a Control license) is automatically included in the purchase of any Classic managed device. This license is perpetual, but you must also purchase a TA subscription to enable system updates.

Although you can configure an access control policy to perform Protection-related inspection without a license, you cannot deploy the policy until you first add a Protection license to the Firepower Management Center, then enable it on the devices targeted by the policy.

If you delete your Protection license from the Firepower Management Center or disable Protection on managed devices, the Firepower Management Center stops acknowledging intrusion and file events from the affected devices. As a consequence, correlation rules that use those events as a trigger criteria stop firing. Additionally, the Firepower Management Center will not contact the internet for either Cisco-provided or third-party Security Intelligence information. You cannot re-deploy existing policies until you re-enable Protection.

Because a Protection license is required for URL Filtering, Malware, and Control licenses, deleting or disabling a Protection license has the same effect as deleting or disabling your URL Filtering, Malware, or Control license.

### Control Licenses

A Control license allows you to implement user and application control by adding user and application conditions to access control rules. For 7000 and 8000 Series devices only, this license also allows you to configure switching and routing (including DHCP relay and NAT) and device high-availability pairs. To enable a Control license on a managed device, you must also enable a Protection license. A Control license is automatically included (along with a Protection license) in the purchase of any Classic managed device. This license is perpetual, but you must also purchase a TA subscription to enable system updates.

If you do not enable a Control license for a Classic managed device, you can add user and application conditions to rules in an access control policy, but you cannot deploy the policy to the device. If you do not enable a Control license for 7000 or 8000 Series devices specifically, you also cannot:

- create switched, routed, or hybrid interfaces
- create NAT entries
- configure DHCP relay for virtual routers
- deploy a device configuration that includes switch or routing to the device
- establish high availability between devices
Although you can create virtual switches and routers without a Control license, they are not useful without switched and routed interfaces to populate them.

If you delete a Control license from the Firepower Management Center or disable Control on individual devices:

- The affected devices do not stop performing switching or routing, nor do device high-availability pairs break.
- You can continue to edit and delete existing configurations, but you cannot deploy those changes to the affected devices.
- You cannot add new switched, routed, or hybrid interfaces, nor can you add new NAT entries, configure DHCP relay, or establish 7000 or 8000 Series device high-availability.
- You cannot re-deploy existing access control policies if they include rules with user or application conditions.

URL Filtering Licenses for Classic Devices

URL filtering allows you to write access control rules that determine the traffic that can traverse your network based on URLs requested by monitored hosts, correlated with information about those URLs. To enable a URL Filtering license, you must also enable a Protection license. You can purchase a URL Filtering license for Classic devices as a services subscription combined with Threat & Apps (TAC) or Threat & Apps and Malware (TAMC) subscriptions, or as an add-on subscription (URL) for a system where Threat & Apps (TA) is already enabled.

Without a URL Filtering license, you can specify individual URLs or groups of URLs to allow or block. This gives you granular, custom control over web traffic, but does not allow you to use URL category and reputation data to filter network traffic.

Although you can add category and reputation-based URL conditions to access control rules without a URL Filtering license, the Firepower Management Center will not download URL information. You cannot deploy the access control policy until you first add a URL Filtering license to the Firepower Management Center, then enable it on the devices targeted by the policy.

You may lose access to URL filtering if you delete the license from the Firepower Management Center or disable URL Filtering on managed devices. Also, URL Filtering licenses may expire. If your license expires or if you delete or disable it, access control rules with URL conditions immediately stop filtering URLs, and your Firepower Management Center can no longer download updates to URL data. You cannot re-deploy existing access control policies if they include rules with category and reputation-based URL conditions.

Malware Licenses for Classic Devices

A Malware license allows you to perform Cisco Advanced Malware Protection (AMP) with AMP for Networks and Cisco Threat Grid. You can use managed devices to detect and block malware in files transmitted over your network. To enable a Malware license, you must also enable Protection. You can purchase a Malware license as a subscription combined with Threat & Apps (TAM) or Threat & Apps and URL Filtering (TAMC) subscriptions, or as an add-on subscription (AMP) for a system where Threat & Apps (TA) is already enabled.
7000 and 8000 Series managed devices with Malware licenses enabled attempt to connect periodically to the AMP cloud even if you have not configured dynamic analysis. Because of this, the device’s Interface Traffic dashboard widget shows transmitted traffic; this is expected behavior.

You configure AMP for Networks as part of a file policy, which you then associate with one or more access control rules. File policies can detect your users uploading or downloading files of specific types over specific application protocols. AMP for Networks allows you to use local malware analysis and file preclassification to inspect a restricted set of those file types for malware. You can also download and submit specific file types to the Cisco Threat Grid cloud for dynamic and Spero analysis to determine whether they contain malware. For these files, you can view the network file trajectory, which details the path the file has taken through your network. The Malware license also allows you to add specific files to a file list and enable the file list within a file policy, allowing those files to be automatically allowed or blocked on detection.

Before you can deploy an access control policy that includes AMP for Networks configurations, you must add a Malware license, then enable it on the devices targeted by the policy. If you later disable the license on the devices, you cannot re-deploy the existing access control policy to those devices.

If you delete all your Malware licenses or they all expire, the system stops querying the AMP cloud, and also stops acknowledging retrospective events sent from the AMP cloud. You cannot re-deploy existing access control policies if they include AMP for Networks configurations. Note that for a very brief time after a Malware license expires or is deleted, the system can use existing cached file dispositions. After the time window expires, the system assigns a disposition of Unavailable to those files.

A Malware license is required only if you deploy AMP for Networks and Cisco Threat Grid. Without a Malware license, the Firepower Management Center can receive AMP for Endpoints malware events and indications of compromise (IOC) from the AMP cloud.

VPN Licenses for 7000 and 8000 Series Devices

VPN allows you to establish secure tunnels between endpoints via a public source, such as the Internet or other network. You can configure the Firepower System to build secure VPN tunnels between the virtual routers of 7000 and 8000 Series devices. To enable VPN, you must also enable Protection and Control licenses. To purchase a VPN license, contact Sales.

Without a VPN license, you cannot configure a VPN deployment with your 7000 and 8000 Series devices. Although you can create deployments, they are not useful without at least one VPN-enabled routed interface to populate them.

If you delete your VPN license from the Firepower Management Center or disable VPN on individual devices, the affected devices do not break the current VPN deployments. Although you can edit and delete existing deployments, you cannot deploy your changes to the affected devices.

Classic Licenses in Device Stacks and High-Availability Pairs

Individual devices must have equivalent licenses before they can be stacked or configured into 7000 or 8000 Series device high-availability pairs. After you stack devices, you can change the licenses for the entire stack. However, you cannot change the enabled licenses on a 7000 or 8000 Series device high-availability pair.

See also About Device Stacks, on page 581 and Device High Availability Requirements, on page 566.
View Your Classic Licenses

Do one of the following, depending on your needs:

<table>
<thead>
<tr>
<th>To View</th>
<th>Do This</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Classic licenses that you have added to the Firepower Management Center and details including their type, status, usage, expiration dates, and the managed devices to which they are applied.</td>
<td>Choose System &gt; Licenses &gt; Classic Licenses. The summary shows the number of licenses you have purchased, followed by the number of licenses that are in used in parentheses.</td>
</tr>
<tr>
<td>The licenses applied to each of your managed devices</td>
<td>Choose Devices &gt; Device Management.</td>
</tr>
<tr>
<td>License status in the Health Monitor</td>
<td>Use the Classic License Monitor health module in a health policy. For information, see Health Monitoring, on page 299, including Health Modules, on page 301 and Creating Health Policies, on page 309.</td>
</tr>
<tr>
<td>An overview of your licenses in the Dashboard</td>
<td>Add the Product Licensing widget to the dashboard of your choice. For instructions, see The Product Licensing Widget, on page 290 and Adding Widgets to a Dashboard, on page 293 and Dashboard Widget Availability by User Role, on page 281.</td>
</tr>
</tbody>
</table>

Identify the License Key

The license key uniquely identifies the Firepower Management Center in the Cisco License Registration Portal. It is composed of a product code (for example, 66) and the MAC address of the management port (eth0) of the Firepower Management Center; for example, 66:00:00:77:FF:CC:88.

You will use the license key in the Cisco License Registration Portal to obtain the license text required to add licenses to the Firepower Management Center.

Step 1 Choose System > Licenses > Classic Licenses.
Step 2 Click Add New License.
Step 3 Note the value in the License Key field at the top of the Add Feature License dialog.

What to do next

- Add a license to the Firepower Management Center; see Generate a Classic License and Add It to the Firepower Management Center, on page 123.

This procedure includes the process of generating the actual license text using the license key.
Generate a Classic License and Add It to the Firepower Management Center

Tip
You can also request licenses on the Licenses tab after you log into the Support Site.

Before you begin

- Make sure you have the product activation key (PAK) from the Software Claim Certificate that Cisco provided when you purchased the license. If you have a legacy, pre-Cisco license, contact Support.
- Identify the license key for the Firepower Management Center; see Identify the License Key, on page 122.
- You will need your account credentials to complete this procedure.

Step 1
Choose System > Licenses > Classic Licenses.

Step 2
Click Add New License.

Step 3
Continue as appropriate:
- If you have already obtained the license text, skip to Step 8.
- If you still need to obtain the license text, go to the next step.

Step 4
Click Get License to open the Cisco License Registration Portal.

Note
If you cannot access the Internet using your current computer, switch to a computer that can, and browse to http://cisco.com/go/license.

Step 5
Generate a license from the PAK in the License Registration Portal.

This step requires the PAK you received during the purchase process, as well as the license key for the Firepower Management Center.

For information, see Product License Registration Portal, on page 116.

Step 6
Copy the license text from either the License Registration Portal display, or the email the License Registration Portal sends you.

Important
The licensing text block in the portal or email message may include more than one license. Each license is bounded by a BEGIN LICENSE line and an END LICENSE line. Make sure that you copy and paste only one license at a time.

Step 7
Return to the Add Feature License page in the Firepower Management Center’s web interface.

Step 8
Paste the license text into the License field.
Step 9  
Click **Verify License**.

If the license is invalid, make sure that you correctly copied the license text.

Step 10  
Click **Submit License**.

---

**What to do next**

- Assign the license to a managed device; see Assign Licenses to Managed Devices from the Device Management Page, on page 126. You **must** assign licenses to your managed devices before you can use licensed features on those devices.

---

**How to Convert a Classic License for Use on an FTD Device**

You can convert licenses using either the License Registration Portal (LRP) or the Cisco Smart Software Manager (CSSM), and you can convert an unused Product Authorization Key (PAK) or a Classic license that has already been assigned to a device.

---

**Important**

You cannot undo this process. You cannot convert a Smart License to a Classic license, even if the license was originally a Classic license.

In documentation on Cisco.com, Classic licenses may also be referred to as "traditional" licenses.

---

**Before you begin**

- It is easiest to convert a Classic license to a Smart License when it is still an unused PAK that has not yet been assigned to a product instance.

- You must have a Smart Account. If you do not have one, create one. See Create a Smart Account to Hold Your Licenses, on page 91.

- The PAKs or licenses that you want to convert must appear in your Smart Account.

- If you convert using the License Registration Portal instead of the Cisco Smart Software Manager, you must have your Smart Account credentials in order to initiate the conversion process.

---

**Step 1**

The conversion process you will follow depends on whether or not the license has been consumed:

- If the PAK that you want to convert has never been used, follow instructions for converting a PAK.

- If the PAK you want to convert has already been assigned to a device, follow instructions for converting a Classic license.

Make sure your existing classic license is still registered to your device.
Step 2  See instructions for your type of conversion (PAK or installed Classic license) in the following documentation:

- To convert PAKs or licenses using the LRP:
  - To view a video that steps you through the License Registration Portal part of the conversion process, click https://salesconnect.cisco.com/#/content-detail/7da52358-0fc1-4d85-8920-14a1b7721780.
  - Search for "Convert" in the following document: https://cisco.app.box.com/s/mds3ab3fctk6pzonq5meukvcpjzt7wu.

There are three conversion procedures. Choose the conversion procedure applicable to your situation.

- Sign in to the License Registration Portal (LRP) at https://tools.cisco.com/SWIFT/LicensingUI/Home and follow the instructions in the documentation above.

- To convert PAKs or licenses using CSSM:
  - Sign in to CSSM at https://software.cisco.com/#SmartLicensing-LicenseConversion and follow the instructions for your type of conversion (PAK or installed Classic license) in the documentation above.

Step 3  Freshly install Firepower Threat Defense on your hardware.

Step 4  If you will use Firepower Device Manager to manage this device as a standalone device:

Skip the rest of this procedure.

Step 5  If you have already deployed Smart Licensing on your Firepower Management Center:

a) Set up Smart Licensing on your new Firepower Threat Defense device.
   
   See Assign Licenses to Multiple Managed Devices, on page 111.

b) Verify that the new Smart License has been successfully applied to the device.
   
   See View FTD Licenses and License Status, on page 112.

Step 6  If you have not yet deployed Smart Licensing on your Firepower Management Center:

See How to License Firepower Threat Defense Devices, on page 80. (Skip any steps that do not apply or that you have already completed.)
Assign Licenses to Managed Devices from the Device Management Page

Although there are some exceptions, you cannot use the features associated with a license if you disable it on a managed device.

**Note**
For container instances on the same security module/engine, you apply the license to each instance; note that the security module/engine consumes only one license per feature for all instances on the security module/engine.

**Note**
For an FTD cluster, you apply the licenses to the cluster as a whole; note that each unit in the cluster consumes a separate license per feature.

**Before you begin**
- Add your devices to the Firepower Management Center. See Add a Device to the FMC, on page 252.
- You must have Admin or Network Admin privileges to perform this task. When operating with multiple domains, you must do this task in leaf domains.
- If you will assign Smart Licenses:
  - If you need to apply Smart Licenses to many devices at one time, use the Smart Licenses page instead of following this procedure. See Assign Licenses to Multiple Managed Devices, on page 111
  - Prepare Smart Licenses for distribution to managed devices: See Register Smart Licenses, on page 93

**Step 1**  Choose Devices > Device Management.

**Step 2**  Next to the device where you want to assign or disable a license, click **Edit**.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3**  Click **Device**.

**Step 4**  Next to the License section, click **Edit**.

**Step 5**  Check or clear the appropriate check boxes to assign or disable licenses for the device.

**Step 6**  Click **Save**.

**What to do next**
- If you assigned Smart Licenses, verify license status:
Go to System > Licenses > Smart Licenses, enter the hostname or IP address of the device into the filter at the top of the Smart Licenses table, and verify that only a green circle with a Check Mark (✓) appears for each device, for each license type. If you see any other icon, hover over the icon for more information.

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.
- If you are licensing Firepower Threat Defense devices and you applied a Base license with export-controlled functionality enabled, reboot each device. For devices configured in a high-availability pair, reboot both devices at the same time to avoid an Active-Active condition.

License Expiration

- License Expiration vs. Service Subscription Expiration
- Smart Licensing
- Specific License Reservation
- Classic Licensing
- Subscription Renewals

License Expiration vs. Service Subscription Expiration

Q. Do Firepower feature licenses expire?

Smart Licensing

Q. Can a Product Instance Registration Token expire?
A. A token can expire if it is not used to register a product within the specified validity period. You set the number of days that the token is valid when you create the token in the Cisco Smart Software Manager. If the token expires before you use it to register a Firepower Management Center, you must create a new token.

After you use the token to register a Firepower Management Center, the token expiration date is no longer relevant. When the token expiration date elapses, there is no impact on the Firepower Management Center that you used the token to register.

Token expiration dates do not affect subscription expiration dates.

For more information, see the Cisco Smart Software Manager User Guide.

Q. How can I tell if my Smart Licenses/service subscriptions are expired or about to expire?
A. To determine when a service subscription will expire (or when it expired), review your entitlements in the Cisco Smart Software Manager.

On the Firepower Management Center, you can determine whether a service subscription for a feature license is currently in compliance by choosing System > Licenses > Smart Licenses. On this page, a
table summarizes the Smart License entitlements associated with this Firepower Management Center via its product registration token. You can determine whether the service subscription for the license is currently in compliance based on the **License Status** field.

On Firepower Device Manager, use the Smart License page to view the current license status for the system: Click **Device**, then click **View Configuration** in the Smart License summary.

In addition, the Cisco Smart Software Manager will send you a notification 3 months before a license expires.

**Q.** What happens if my Smart License/subscription expires?

**A.** If a purchased service subscription expires, you can see in Firepower Management Center and in your Smart Account that your account is out of compliance. Cisco notifies you that you must renew the subscription; see **Subscription Renewals**. There is no other impact.

**Specific License Reservation**

**Q.** What happens if my Specific License Reservation expires?

**A.** SLR licenses are term-based.

If required licenses are unavailable or expired, the following actions are restricted:

- Device registration
- Policy deployment

**Classic Licensing**

**Q.** How can I tell if my Classic licenses/service subscriptions are expired or about to expire?

**A.** On the Firepower Management Center, choose **System > Licenses > Classic Licenses**.

On this page, a table summarizes the Classic licenses you have added to this Firepower Management Center.

You can determine whether the service subscription for the license is currently in compliance based on the **Status** field.

You can determine when the service subscription will expire (or when it expired) by the date in the **Expires** field.

You can also obtain this information by reviewing your license information in the Cisco Product License Registration Portal.

**Q.** What does this mean: ‘IPS Term Subscription is still required for IPS’?

**A.** This message merely informs you that Protect and Control functionality requires not only a right-to-use license (which never expires), but also one or more associated service subscriptions, which must be renewed periodically. If the service subscriptions you want to use are current and will not expire soon, no action is required.

**Q.** What happens if my Classic license/subscription expires?

**A.** If a service subscription supporting a Classic license expires, Cisco notifies you that you must renew the subscription; see **Subscription Renewals**.

You might not be able to use the related features, depending on the feature type:
Table 7: Expiration Impact for Classic Licenses/Subscriptions

<table>
<thead>
<tr>
<th>Classic License</th>
<th>Possible Supporting Subscriptions</th>
<th>Expiration Impact</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control</td>
<td>TA, TAC, TAM, TAMC</td>
<td>You can continue to use existing Firepower functionality, but you cannot download VDB updates, including application signature updates.</td>

<td>• The system stops querying the AMP cloud, and stops acknowledging retrospective events sent from the AMP cloud.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• You cannot re-deploy existing access control policies if they include AMP for Firepower configurations.</td>
</tr>
</tbody>
</table>

Subscription Renewals

Q. How do I renew an expiring Classic license?
A. To renew an expiring Classic license, simply purchase a new PAK key and follow the same process as for implementing a new subscription.

Q. Can I renew a Firepower service subscription from the Firepower Management Center?
A. No. To renew a Firepower service subscription (Classic or Smart), purchase a new subscription using either the Cisco Commerce Workspace or the Cisco Service Contract Center.

**Additional Information about Firepower Licensing**

For additional information to help resolve common licensing questions, see the following documents:
Cisco Success Network

Cisco Success Network is a user-enabled cloud service. When you enable Cisco Success Network, a secure connection is established between the Firepower Management Center and the Cisco cloud to stream usage information and statistics. Streaming telemetry provides a mechanism to select data of interest from the Firepower System and to transmit it in a structured format to remote management stations for the following benefits:

- To inform you of available unused features that can improve the effectiveness of the product in your network.
- To inform you of additional technical support services and monitoring that might be available for your product.
- (If you integrate with SecureX) To summarize appliance and device status in SecureX tiles. This lets you see at a glance, for example, whether all of your devices are running optimal software versions.

For more information about SecureX, see Integrate with Cisco SecureX, on page 2357.

- To help Cisco improve our products.

The Firepower Management Center establishes and maintains the secure connection at all times, and allows you to enroll in the Cisco Success Network. You can turn off this connection at any time by disabling Cisco Success Network, which disconnects the device from the Cisco Success Network cloud.

Enabling Cisco Success Network

You enable Cisco Success Network when you register the Firepower Management Center with the Cisco Smart Software Manager. See Register Smart Licenses, on page 93.

You can view your current Cisco Success Network enrollment status on the Licences > Smart Licenses page, and you can change your enrollment status. See Changing Cisco Success Network Enrollment, on page 144.

Note

The Cisco Success Network feature is disabled if the Firepower Management Center has a valid Smart Software Manager On-Prem (formerly known as Smart Software Satellite Server) configuration, or uses Specific License Reservation.

Cisco Success Network Telemetry Data

Cisco Success Network allows enrolled Firepower Management Centers to continuously stream real time configuration and operating state information to the Cisco Success Network cloud. Collected and monitored data include the following:
• **Enrolled device information**—This includes the Firepower Management Center device name, model, serial number, UUID, system uptime, and Smart Licensing information; see [Enrolled Device Data, on page 133](#).

• **Software information**—This includes software information about the enrolled Firepower Management Center, such as version number, rule update version, geolocation database version, and vulnerability database (VDB) version information; see [Software Version Data, on page 134](#).

• **Managed device information**—This includes information about all the managed devices associated with the enrolled Firepower Management Center, including device names, device models, serial numbers, software versions, and licenses in use per device; see [Managed Device Data, on page 134](#).

• **Deployment information**—This includes information about policy deployments. After you configure your deployment, and any time you change that configuration, you must deploy the changes to affected devices; see [Deployment Information, on page 135](#).

• **Feature usage**—This includes feature-specific policy and licensing information:

  - **URL filtering**—This includes how many URL filtering licenses are configured and deployed to devices, and how many devices have policies deployed that are using the URL filtering capability.

  - **Intrusion prevention**—This includes how many managed devices are configured for intrusion prevention, and whether a device has been enabled for Threat Intelligence Director (TID).

  - **Malware detection**—This includes how many malware licenses are configured and deployed to devices, and how many devices have policies deployed that are using the malware detection capability.

---

**Enrolled Device Data**

Once you enroll the Firepower Management Center in Cisco Success Network, select telemetry data about the enrolled Firepower Management Center device is streamed to the Cisco cloud. The following table describes the collected and monitored data about the enrolled device. This includes feature-specific information about intrusion policies (both system-provided and custom) and malware detection for enrolled Firepower Management Centers.

<table>
<thead>
<tr>
<th><strong>Data Point</strong></th>
<th><strong>Example Value</strong></th>
</tr>
</thead>

Device Version | 6.4.0
Policy Bundle Size | 3588153

**TLS/SSL Inspection Event Data**

By default, the Firepower System cannot inspect traffic encrypted with the Secure Socket Layer (SSL) protocol or its successor, the Transport Layer Security (TLS) protocol. TLS/SSL inspection enables you to either block encrypted traffic without inspecting it, or inspect encrypted or decrypted traffic with access control. The following tables describe statistics shared with Cisco Success Network about encrypted traffic.

### Handshake Process

When the system detects a TLS/SSL handshake over a TCP connection, it determines whether it can decrypt the detected traffic. As the system handles encrypted sessions, it logs details about the traffic.

**Table 12: TLS/SSL Inspection - Handshake Telemetry Data**

<table>
<thead>
<tr>
<th>Data Point</th>
<th>Example Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>The system reports the following applied actions when the traffic <strong>cannot be decrypted</strong> and is:</td>
<td>An integer value of 0 or greater</td>
</tr>
<tr>
<td>• Blocked</td>
<td></td>
</tr>
<tr>
<td>• Blocked with a TCP reset</td>
<td></td>
</tr>
<tr>
<td>• Not decrypted</td>
<td></td>
</tr>
<tr>
<td>The system reports the following applied actions when the traffic <strong>can be decrypted</strong>:</td>
<td>An integer value of 0 or greater</td>
</tr>
<tr>
<td>• With a known private key</td>
<td></td>
</tr>
<tr>
<td>• With a replacement key only</td>
<td></td>
</tr>
<tr>
<td>• By resigning a self-signed certificate</td>
<td></td>
</tr>
<tr>
<td>• By resigning the server certificate</td>
<td></td>
</tr>
</tbody>
</table>
Cache Data

After a TLS/SSL handshake completes, the managed device caches encrypted session data, which allows session resumption without requiring the full handshake. The managed device also caches server certificate data, which allows faster handshake processing in subsequent sessions.

Table 13: TLS/SSL Inspection - Cache Telemetry Data

<table>
<thead>
<tr>
<th>Data Point</th>
<th>Example Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>The system caches encrypted session data and server certificate data, and reports on the cache per SSL connections, specifically:</td>
<td>An integer value of 0 or greater</td>
</tr>
<tr>
<td>- The number of times SSL session information was cached</td>
<td></td>
</tr>
<tr>
<td>- The number of times the SSL certificate validation cache was hit</td>
<td></td>
</tr>
<tr>
<td>- The number of times the SSL certificate validation cache lookup missed</td>
<td></td>
</tr>
<tr>
<td>- The number of times the SSL original certificate cache was hit</td>
<td></td>
</tr>
<tr>
<td>- The number of times the SSL original certificate cache lookup missed</td>
<td></td>
</tr>
<tr>
<td>- The number of times the SSL resigned certificate cache was hit</td>
<td></td>
</tr>
<tr>
<td>- The number of times the SSL resigned certificate cache lookup missed</td>
<td></td>
</tr>
</tbody>
</table>

Certificate Status

The system evaluates encrypted traffic and reports the certificate status of the encrypting server.
Table 14: TLS/SSL Inspection - Certificate Status Telemetry Data

<table>
<thead>
<tr>
<th>Data Point</th>
<th>Example Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>The system evaluates encrypted traffic based on the certificate status of the encrypting server, and reports the number of connections where the SSL Certificate:</td>
<td>An integer value of 0 or greater</td>
</tr>
<tr>
<td>• Is valid</td>
<td></td>
</tr>
<tr>
<td>• Is expired</td>
<td></td>
</tr>
<tr>
<td>• Has an invalid issuer</td>
<td></td>
</tr>
<tr>
<td>• Has an invalid signature</td>
<td></td>
</tr>
<tr>
<td>• Is not checked</td>
<td></td>
</tr>
<tr>
<td>• Is not yet valid</td>
<td></td>
</tr>
<tr>
<td>• Is revoked</td>
<td></td>
</tr>
<tr>
<td>• Is self signed</td>
<td></td>
</tr>
<tr>
<td>• Is unknown</td>
<td></td>
</tr>
</tbody>
</table>

Failure Reason

The system evaluates encrypted traffic and reports the failure reason when the system fails to decrypt traffic.

Table 15: TLS/SSL Inspection - Failure Telemetry Data

<table>
<thead>
<tr>
<th>Data Point</th>
<th>Example Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>The system evaluates encrypted traffic and reports the failure reason when the system fails to decrypt traffic due to:</td>
<td>An integer value of 0 or greater</td>
</tr>
<tr>
<td>• A decryption error</td>
<td></td>
</tr>
<tr>
<td>• Making a policy verdict during the handshake</td>
<td></td>
</tr>
<tr>

</tbody>
</table>

Version

The system evaluates encrypted traffic and reports the negotiated TLS/SSL version per connection.
Table 16: TLS/SSL Inspection - Version Telemetry Data

<table>
<thead>
<tr>
<th>Data Point</th>
<th>Example Value</th>
</tr>
</thead>
</table>
| The system evaluates encrypted traffic and reports the negotiated *version* per SSL connections where:  
  • SSLv2 was negotiated  
  • SSLv3 was negotiated  
  • An unknown version was negotiated  
  • TLSv1.0 was negotiated  
  • TLSv1.1 was negotiated  
  • TLSv1.2 was negotiated  
  • TLSv1.3 was negotiated | An integer value of 0 or greater |

Snort Restart Data

When the traffic inspection engine referred to as the Snort process on a managed device restarts, inspection is interrupted until the process resumes. Creating or deleting a user-defined application, or activating or deactivating a system or custom application detector immediately restarts the Snort process without going through the deploy process. The system warns you that continuing restarts the Snort process and allows you to cancel; the restart occurs on any managed device in the current domain or in any of its child domains.

Table 17: Snort Restart Telemetry Data

<table>
<thead>
<tr>
<th>Data Point</th>
<th>Example Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count of snort restarts when you enable or disable a custom application detector</td>
<td>An integer value of 0 or greater</td>
</tr>
<tr>
<td>Count of snort restarts when you create or modify a custom application detector</td>
<td>An integer value of 0 or greater</td>
</tr>
</tbody>
</table>

Cisco Security Packet Analyzer Data

If your organization has deployed Cisco Security Packet Analyzer (a separate product from your Firepower system), you can use Cisco Security Packet Analyzer to gather context, in the form of full packet captures, around incidents and suspicious events that your Firepower system detects.

The Cisco Security Packet Analyzer and the Firepower Management Center are deployed independently of each other, and the Cisco Security Packet Analyzer deployment is unaware of the Firepower system. Captured data is not moved between packet analyzers and the management center.

Table 18: CSPA Telemetry Data

<table>
<thead>
<tr>
<th>Data Point</th>
<th>Example Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>The total number of Cisco Security Packet Analyzer instances registered to the FMC</td>
<td>An integer value of 0 or greater</td>
</tr>
</tbody>
</table>
## Contextual Cross-Launch Data

The contextual cross-launch feature allows you to quickly find more information about potential threats in web-based resources outside of the Firepower Management Center. You can click directly from an event in the event viewer or dashboard in the FMC to the relevant information in an external resource. This lets you quickly gather context around a specific event based on its IP addresses, ports, protocol, domain, and/or SHA 256 hash.

### Table 19: Contextual Cross-Launch Telemetry Data

<table>
<thead>

### Changing Cisco Success Network Enrollment

You enable Cisco Success Network when you register the Firepower Management Center with the Cisco Smart Software Manager. After that, use the following procedure to view or change enrollment status.
Note
Cisco Success Network does not work in evaluation mode.

Step 1 Click **System > Licenses > Smart Licenses**.
Step 2 Under Smart License Status, next to Cisco Success Network, click **Enabled/Disabled** control for the Cisco Success Network feature to change the setting as appropriate.
Step 3 Read the information provided by Cisco, choose whether you want to **Enable Cisco Success Network**, and click **Apply Changes**.

What to do next
(Optional) See (Optional) Opt Out of Web Analytics Tracking, on page 1086.

End-User License Agreement

The Cisco end-user license agreement (EULA) and any applicable supplemental agreement (SEULA) that governs your use of this product are available from http://www.cisco.com/go/softwareterms.

System Updates

The following topics explain how to update Firepower deployments:

- About System Updates, on page 147
- Requirements and Prerequisites for System Updates, on page 148
- Guidelines and Limitations for System Updates, on page 149
- Upgrade System Software, on page 149
- Update the Vulnerability Database (VDB), on page 150
- Update the Geolocation Database (GeoDB), on page 151
- Update Intrusion Rules, on page 153
- Maintain Your Air-Gapped Deployment, on page 161
- History for System Updates, on page 162

About System Updates

You can use the FMC to upgrade the system software for itself and the devices it manages. You can also update various databases and feeds that provide advanced services.

For FMCs with internet access, the system can often obtain updates directly from Cisco. We recommend you schedule or enable automatic updates whenever possible. Some updates are auto-enabled when you enable the related feature. Other updates you must schedule yourself. After initial setup, we recommend you review all auto-updates and adjust them if necessary.

Table 20: Upgrades and Updates in FMC Deployments

Guidelines and Limitations for System Updates

Before You Update
Before you update any component of your Firepower deployment (including intrusion rules, VDB, or GeoDB) read the release notes or advisory text that accompanies the update. These provide critical and release-specific information, including compatibility, prerequisites, new capabilities, behavior changes, and warnings.

Scheduled Updates
The system schedules tasks — including updates — in UTC. This means that when they occur locally depends on the date and your specific location. Also, because updates are scheduled in UTC, they do not adjust for Daylight Saving Time, summer time, or any such seasonal adjustments that you may observe in your location. If you are affected, scheduled updates occur one hour "later" in the summer than in the winter, according to local time.

Important
We strongly recommend you review scheduled updates to be sure they occur when you intend.

Bandwidth Guidelines
To upgrade a Firepower appliance (or perform a readiness check), the upgrade package must be on the appliance. Firepower upgrade package sizes vary. Make sure you have the bandwidth to perform a large data transfer to your managed devices. See Guidelines for Downloading Data from the Firepower Management Center to Managed Devices (Troubleshooting TechNote).

Upgrade System Software
Upgrading a Firepower deployment can be a complex process. Careful planning and preparation can help you avoid missteps. These are as much a part of the upgrade process as actually performing the mechanical steps that invoke the upgrade scripts.

Note
This guide does not contain detailed upgrade instructions for either system software or companion operating systems. Instead, see the Cisco Firepower Management Center Upgrade Guide.

This guide does currently contain information on scheduling downloads and installations for system software patches; see Software Update Automation, on page 209.
Update the Vulnerability Database (VDB)

The Cisco vulnerability database (VDB) is a database of known vulnerabilities to which hosts may be susceptible, as well as fingerprints for operating systems, clients, and applications. The system uses the VDB to help determine whether a particular host increases your risk of compromise.

Cisco issues periodic updates to the VDB. The time it takes to update the VDB and its associated mappings on the Firepower Management Center depends on the number of hosts in your network map. As a rule of thumb, divide the number of hosts by 1000 to determine the approximate number of minutes to perform the update.

If the FMC has internet access, we recommend you schedule tasks to perform automatic recurring VDB update downloads and installations.

Caution

In most cases, the first deploy after updating the VDB restarts the Snort process on managed devices. The system warns you that this can happen — warnings can appear after manual VDB updates, when you schedule VDB updates, during background VDB updates, when you deploy, and so on. Snort restarts cause an interruption in traffic inspection and, depending on how the managed device handles traffic, possibly interrupts traffic flow. For more information, see Snort® Restart Traffic Behavior, on page 386.

Manually Update the VDB

To update the VDB, the VDB update package must be on the FMC.

If the Firepower Management Center cannot access the internet, or you want to manually upload the VDB update to the Firepower Management Center, use this procedure. To automate VDB updates, use task scheduling (System > Tools > Scheduling). For details, see Vulnerability Database Update Automation, on page 212.

Before you begin

- Consider the update's effect on traffic flow and inspection due to Snort restarts. We recommend performing updates in a maintenance window.

Step 1
Choose System > Updates, then click Product Updates.

Step 2
Choose how you want to upload the VDB update to the FMC.

- Download directly from Cisco.com: Click Download Updates. If it can access the Cisco Support & Download site, the Firepower Management Center downloads the latest VDB. Note that the Firepower Management Center also downloads a package for each patch and hotfix (but not major release) associated with the version your appliances are currently running.
- Upload manually: Click Upload Update, then Choose File. Browse to the update you downloaded earlier, and click Upload.

VDB updates appear on the same page as Firepower software upgrade and uninstaller packages.

Step 3
Install the update.

a) Click Install next to the Vulnerability and Fingerprint Database update.
b) Choose the Firepower Management Center.
c) Click Install.

Step 4  (Optional) Monitor update progress in the Message Center.
Do not perform tasks related to mapped vulnerabilities until the update completes. Even if the Message Center shows no progress for several minutes or indicates that the update has failed, do not restart the update. Instead, contact Cisco TAC.

After the update completes, the system uses the new vulnerability information. However, you must deploy before updated application detectors and operating system fingerprints can take effect.

Step 5  Verify update success.
Choose Help > About to view the current VDB version.

What to do next
Deploy configuration changes; see Deploy Configuration Changes, on page 382.

Schedule VDB Updates
If your FMC has internet access, we recommend you schedule regular VDB updates. See Vulnerability Database Update Automation, on page 212.

Update the Geolocation Database (GeoDB)
The Cisco Geolocation Database (GeoDB) is a database of geographical data (such as country, city, coordinates) and connection-related data (such as Internet service provider, domain name, connection type) associated with routable IP addresses. When your system detects GeoDB information that matches a detected IP address, you can view the geolocation information associated with that IP address. The system comes with an initial GeoDB, so country and continent information should always be available. However, Cisco issues periodic updates to the GeoDB, and you must regularly update the GeoDB to have accurate geolocation information.

To update the GeoDB, use the Geolocation Updates page (System > Updates > Geolocation Updates) on the Firepower Management Center. When you upload GeoDB updates you obtained from Support or from your appliance, they appear on this page.

Note
Download the update directly from the Support Site, either manually or by clicking Download and install geolocation update from the Support Site on the Geolocation Updates page. If you transfer an update file by email, it may become corrupted.

Time needed to update the GeoDB depends on your appliance; the installation usually takes 30 to 40 minutes. Although a GeoDB update does not interrupt any other system functions (including the ongoing collection of geolocation information), the update does consume system resources while it completes. Consider this when planning your updates.

The GeoDB update overrides any previous versions of the GeoDB and is effective immediately. When you update the GeoDB, the Firepower Management Center automatically updates the related data on its managed
devices. It may take a few minutes for a GeoDB update to take effect throughout your deployment. You do not need to re-deploy after you update.

**Manually Update the GeoDB (Internet Connection)**

You can import a new GeoDB update by automatically connecting to the Support Site only if the appliance has Internet access.

**Step 1** Choose System > Updates.

**Step 2** Click Geolocation Updates.

**Step 3** Choose Download and install geolocation update from the Support Site.

**Step 4** Click Import.

The system queues a Geolocation Update task, which checks for the latest updates on the Cisco Support Site (http://www.cisco.com/cisco/web/support/index.html).

**Step 5** Optionally, monitor the task status; see Viewing Task Messages, on page 352.

**Step 6** After the update finishes, return to the Geolocation Updates page or choose Help > About to confirm that the GeoDB build number matches the update you installed.

**Manually Update the GeoDB (No Internet Connection)**

If your Firepower Management Center does not have Internet access, you can download the GeoDB update from the Cisco Support Site to a local machine on your network, then manually upload it to your Firepower Management Center.

**Step 1** Manually download the update from the Cisco Support Site (http://www.cisco.com/cisco/web/support/index.html).

**Step 2** Choose System > Updates.

**Step 3** Click Geolocation Updates.

**Step 4** Choose Upload and install geolocation update.

**Step 5** Browse to the update you downloaded, and click Upload.

**Step 6** Click Import.

**Step 7** Optionally, monitor the task status; see Viewing Task Messages, on page 352.

**Step 8** After the update finishes, return to the Geolocation Updates page or choose Help > About to confirm that the GeoDB build number matches the update you installed.

**Schedule GeoDB Updates**

If the Firepower Management Center has internet access, we recommend you schedule weekly GeoDB updates.

**Before you begin**

Make sure the FMC can access the internet.
Update Intrusion Rules

As new vulnerabilities become known, the Cisco Talos Intelligence Group (Talos) releases intrusion rule updates that you can import onto your Firepower Management Center, and then implement by deploying the changed configuration to your managed devices. These updates affect intrusion rules, preprocessor rules, and the policies that use the rules.

Intrusion rule updates are cumulative, and Cisco recommends you always import the latest update. You cannot import an intrusion rule update that either matches or predates the version of the currently installed rules.

An intrusion rule update may provide the following:

- **New and modified rules and rule states**—Rule updates provide new and updated intrusion and preprocessor rules. For new rules, the rule state may be different in each system-provided intrusion policy. For example, a new rule may be enabled in the Security over Connectivity intrusion policy and disabled in the Connectivity over Security intrusion policy. Rule updates may also change the default state of existing rules, or delete existing rules entirely.

- **New rule categories**—Rule updates may include new rule categories, which are always added.

- **Modified preprocessor and advanced settings**—Rule updates may change the advanced settings in the system-provided intrusion policies and the preprocessor settings in system-provided network analysis policies. They can also update default values for the advanced preprocessor and performance options in your access control policies.

- **New and modified variables**—Rule updates may modify default values for existing default variables, but do not override your changes. New variables are always added.

In a multidomain deployment, you can import local intrusion rules in any domain, but you can import intrusion rule updates from Talos in the Global domain only.

**Understanding When Intrusion Rule Updates Modify Policies**

Intrusion rule updates can affect both system-provided and custom network analysis policies, as well as all access control policies:

- **system provided**—Changes to system-provided network analysis and intrusion policies, as well as any changes to advanced access control settings, automatically take effect when you re-deploy the policies after the update.

- **custom**—Because every custom network analysis and intrusion policy uses a system-provided policy as its base, or as the eventual base in a policy chain, rule updates can affect custom network analysis and intrusion policies. However, you can prevent rule updates from automatically making those changes. This allows you to update system-provided base policies manually, on a schedule independent of rule...
update imports. Regardless of your choice (implemented on a per-custom-policy basis), updates to system-provided policies do not override any settings you customized.

Note that importing a rule update discards all cached changes to network analysis and intrusion policies. For your convenience, the Rule Updates page lists policies with cached changes and the users who made those changes.

**Deploying Intrusion Rule Updates**

For changes made by an intrusion rule update to take effect, you must redeploy configurations. When importing a rule update, you can configure the system to automatically redeploy to affected devices. This approach is especially useful if you allow the intrusion rule update to modify system-provided base intrusion policies.

**Recurring Intrusion Rule Updates**

You can import rule updates on a daily, weekly, or monthly basis, using the Rule Updates page.

If your deployment includes a high availability pair of Firepower Management Centers, import the update on the primary only. The secondary Firepower Management Center receives the rule update as part of the regular synchronization process.

Applicable subtasks in the intrusion rule update import occur in the following order: download, install, base policy update, and configuration deploy. When one subtask completes, the next subtask begins.

At the scheduled time, the system installs the rule update and deploys the changed configuration as you specified in the previous step. You can log off or use the web interface to perform other tasks before or during the import. When accessed during an import, the Rule Update Log displays a Red Status ( ), and you can view messages as they occur in the Rule Update Log detailed view. Depending on the rule update size and content, several minutes may pass before status messages appear.

As a part of initial configuration the FMC configures a daily automatic intrusion rule update from the Cisco support site. (The FMC deploys automatic intrusion rule updates to affected managed devices when it next deploys affected policies.) You can observe the status of this update using the web interface Message Center. If configuring the update fails and your FMC has internet access, we recommend you configure regular intrusion rule updates as described in Schedule Intrusion Rule Updates, on page 155.

**Importing Local Intrusion Rules**

A local intrusion rule is a custom standard text rule that you import from a local machine as a plain text file with ASCII or UTF-8 encoding. You can create local rules using the instructions in the Snort users manual, which is available at http://www.snort.org.

In a multidomain deployment, you can import local intrusion rules in any domain. You can view local intrusion rules imported in the current domain and ancestor domains.

**Update Intrusion Rules One-Time Manually**

Import a new intrusion rule update manually if your Firepower Management Center does not have Internet access.

---

**Step 1**
Manually download the update from the Cisco Support Site (http://www.cisco.com/cisco/web/support/index.html).

**Step 2**
Choose System > Updates, then click Rule Updates.
**Update Intrusion Rules One-Time Automatically**

To import a new intrusion rule update automatically, your appliance must have Internet access to connect to the Support Site.

**Before you begin**

- Ensure the Firepower Management Center has internet access; see Security, Internet Access, and Communication Ports, on page 2677.

---

**Step 1**
Choose **System > Updates**.

**Tip** You can also click **Import Rules** on the Rule Editor page, which you access by choosing **Policies > Intrusion > Intrusion Rules**.

**Step 2**
Click **Rule Updates**.

**Step 3**
If you want to move all user-defined rules that you have created or imported to the deleted folder, click **Delete All Local Rules** in the toolbar, then click **OK**.

**Step 4**
Choose **Download new Rule Update from the Support Site**.

**Step 5**
If you want to automatically re-deploy the changed configuration to managed devices after the update completes, check the **Reapply all policies after the rule update import completes** check box.

**Step 6**
Click **Import**. The system installs the rule update and displays the Rule Update Log detailed view.

**Caution** Contact Support if you receive an error message while installing the rule update.

---

**Schedule Intrusion Rule Updates**

**Step 1**
Choose **System > Updates**.

**Tip** You can also click **Import Rules** on the Rule Editor page, which you access by choosing **Policies > Intrusion > Intrusion Rules**.
Step 2  Click Rule Updates.

Step 3  If you want to move all user-defined rules that you have created or imported to the deleted folder, click Delete All Local Rules in the toolbar, then click OK.

Step 4  Check Enable Recurring Rule Update Imports from the Support Site check box.

Import status messages appear beneath the Recurring Rule Update Imports section heading.

Step 5  In the Import Frequency field, specify:

- The frequency of the update (Daily, Weekly, or Monthly)
- The day of the week or month you want the update to occur
- The time you want the update to start

Step 6  If you want to automatically re-deploy the changed configuration to your managed devices after the update completes, check the Deploy updated policies to targeted devices after rule update completes check box.

Step 7  Click Save.

Caution  Contact Support if you receive an error message while installing the intrusion rule update.

The status message under the Recurring Rule Update Imports section heading changes to indicate that the rule update has not yet run.

Best Practices for Importing Local Intrusion Rules

Observe the following guidelines when importing a local rule file:

- The rules importer requires that all custom rules are imported in a plain text file encoded in ASCII or UTF-8.
- The text file name can include alphanumeric characters, spaces, and no special characters other than underscore (_), period (.), and dash (-).
- The system imports local rules preceded with a single pound character (#), but they are flagged as deleted.
- The system imports local rules preceded with a single pound character (#), and does not import local rules preceded with two pound characters (##).
- Rules cannot contain any escape characters.
- In a multidomain deployment, the system assigns a GID of 1 to a rule imported into or created in the Global domain, and a domain-specific GID between 1000 and 2000 for all other domains.
- You do not have to specify a Generator ID (GID) when importing a local rule. If you do, specify only GID 1 for a standard text rule.
- When importing a rule for the first time, do not specify a Snort ID (SID) or revision number. This avoids collisions with SIDs of other rules, including deleted rules. The system will automatically assign the rule the next available custom rule SID of 1000000 or greater, and a revision number of 1.

If you must import rules with SIDs, a SID can be any unique number 1,000,000 or greater.

In a multidomain deployment, if multiple administrators are importing local rules at the same time, SIDs within an individual domain might appear to be non-sequential because the system assigned the intervening numbers in the sequence to another domain.
When importing an updated version of a local rule you have previously imported, or when reinstating a local rule you have deleted, you must include the SID assigned by the system and a revision number greater than the current revision number. You can determine the revision number for a current or deleted rule by editing the rule.

Note

The system automatically increments the revision number when you delete a local rule; this is a device that allows you to reinstate local rules. All deleted local rules are moved from the local rule category to the deleted rule category.

Import local rules on the primary Firepower Management Center in a high availability pair to avoid SID numbering issues.

The import fails if a rule contains any of the following:

- A SID greater than 2147483647.
- A list of source or destination ports that is longer than 64 characters.
- When importing into the Global domain in a multidomain deployment, a GID:SID combination uses GID 1 and a SID that already exists in another domain; this indicates that the combination existed before Version 6.2.1. You can reimport the rule using GID 1 and a unique SID.

Policy validation fails if you enable an imported local rule that uses the deprecated `threshold` keyword in combination with the intrusion event thresholding feature in an intrusion policy.

All imported local rules are automatically saved in the local rule category.

The system always sets local rules that you import to the disabled rule state. You must manually set the state of local rules before you can use them in your intrusion policy.

Import Local Intrusion Rules

- Make sure your local rule file follows the guidelines described in Best Practices for Importing Local Intrusion Rules, on page 156.
- Make sure your process for importing local intrusion rules complies with your security policies.
- Consider the import's effect on traffic flow and inspection due to bandwidth constraints and Snort restarts. We recommend scheduling rule updates during maintenance windows.
- You can perform this task in any domain.

Use this procedure to import local intrusion rules. Imported intrusion rules appear in the local rule category in a disabled state.

**Step 1**

Choose System > Updates, then click Rule Updates.

**Step 2**

(Optional) Delete existing local rules.

Click Delete All Local Rules, then confirm that you want to move all created and imported intrusion rules to the deleted folder.
Step 3  Under **One-Time Rule Update/Rules Import**, choose **Rule update or text rule file to upload and install**, then click **Choose File** and browse to your local rule file.

Step 4  Click **Import**.

Step 5  Monitor import progress in the Message Center.

To display the Message Center, click System Status on the menu bar. Even if the Message Center shows no progress for several minutes or indicates that the import has failed, do not restart the import. Instead, contact Cisco TAC.

---

**What to do next**

- Edit intrusion policies and enable the rules you imported.
- Deploy configuration changes; see **Deploy Configuration Changes, on page 382**.

---

**Rule Update Log**

The Firepower Management Center generates a record for each rule update and local rule file that you import. Each record includes a time stamp, the name of the user who imported the file, and a status icon indicating whether the import succeeded or failed. You can maintain a list of all rule updates and local rule files that you import, delete any record from the list, and access detailed records for all imported rules and rule update components.

The Rule Update Import Log detailed view lists a detailed record for each object imported in a rule update or local rule file. You can also create a custom workflow or report from the records listed that includes only the information that matches your specific needs.

**Intrusion Rule Update Log Table**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Summary</td>
<td>The name of the import file. If the import fails, a brief statement of the reason for the failure appears under the file name.</td>
</tr>
<tr>
<td>Time</td>
<td>The time and date that the import started.</td>
</tr>
<tr>
<td>User ID</td>
<td>The user name of the user that triggered the import.</td>
</tr>
<tr>
<td>Status</td>
<td>Whether the import:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Succeeded</strong> (✔)</td>
</tr>
<tr>
<td></td>
<td>• failed or is currently in progress <strong>Red Status</strong> (❗)</td>
</tr>
</tbody>
</table>

The red status icon indicating an unsuccessful or incomplete import appears on the Rule Update Log page during the import and is replaced by the green icon only when the import has successfully completed.
Viewing the Intrusion Rule Update Log

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Step 1** Choose **System > Updates**.

**Tip** You can also click **Import Rules** on the intrusion rules editor page (**Objects > Intrusion Rules**).

**Step 2** Click **Rule Updates**.

**Step 3** Click **Rule Update Log**.

**Step 4** You have two options:

- **View** — To view details for each object imported in a rule update or local rule file, click **View ( )** next to the file you want to view; see Viewing Details of the Intrusion Rule Update Import Log, on page 161.
- **Delete** — To delete an import file record from the import log, including detailed records for all objects included with the file, click **Delete ( )** next to the import file name.

**Note** Deleting the file from the log does not delete any object imported in the import file, but only deletes the import log records.

**Fields in an Intrusion Rule Update Log**

**Tip** You search the entire Rule Update Import Log database even when you initiate a search by clicking **Search** on the toolbar from the Rule Update Import Log detailed view with only the records for a single import file displayed. Make sure you set your time constraints to include all objects you want to include in the search.
### Table 22: Rule Update Import Log Detailed View Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>An indication that one of the following has occurred for the object type:</td>
</tr>
<tr>
<td></td>
<td>• <strong>new</strong> (for a rule, this is the first time the rule has been stored on this appliance)</td>
</tr>
<tr>
<td></td>
<td>• <strong>changed</strong> (for a rule update component or rule, the rule update component has been modified, or the rule has a higher revision number and the same GID and SID)</td>
</tr>
<tr>
<td></td>
<td>• <strong>collision</strong> (for a rule update component or rule, import was skipped because its revision conflicts with an existing component or rule on the appliance)</td>
</tr>
<tr>
<td></td>
<td>• <strong>deleted</strong> (for rules, the rule has been deleted from the rule update)</td>
</tr>
<tr>
<td></td>
<td>• <strong>enabled</strong> (for a rule update edit, a preprocessor, rule, or other feature has been enabled in a default policy provided with the system)</td>
</tr>
<tr>
<td></td>
<td>• <strong>disabled</strong> (for rules, the rule has been disabled in a default policy provided with the system)</td>
</tr>
<tr>
<td></td>
<td>• <strong>drop</strong> (for rules, the rule has been set to Drop and Generate Events in a default policy provided with the system)</td>
</tr>
<tr>
<td></td>
<td>• <strong>error</strong> (for a rule update or local rule file, the import failed)</td>
</tr>
<tr>
<td></td>
<td>• <strong>apply</strong> (the <strong>Reapply all policies after the rule update import completes</strong> option was enabled for the import)</td>
</tr>
<tr>
<td>Default Action</td>
<td>The default action defined by the rule update. When the imported object type is <strong>rule</strong>, the default action is <strong>Pass, Alert, or Drop</strong>. For all other imported object types, there is no default action.</td>
</tr>
<tr>
<td>Details</td>
<td>A string unique to the component or rule. For rules, the GID, SID, and previous revision number for a changed rule, displayed as <strong>previously (GID:SID:Rev)</strong>. This field is blank for a rule that has not changed.</td>
</tr>
<tr>
<td>Domain</td>
<td>The domain whose intrusion policies can use the updated rule. Intrusion policies in descendant domains can also use the rule. This field is only present in a multidomain deployment.</td>
</tr>
<tr>
<td>GID</td>
<td>The generator ID for a rule. For example, <strong>1</strong> (standard text rule, Global domain or legacy GID) or <strong>3</strong> (shared object rule).</td>
</tr>
<tr>
<td>Name</td>
<td>The name of the imported object, which for rules corresponds to the rule Message field, and for rule update components is the component name.</td>
</tr>
<tr>
<td>Policy</td>
<td>For imported rules, this field displays <strong>All</strong>. This means that the rule was imported successfully, and can be enabled in all appropriate default intrusion policies. For other types of imported objects, this field is blank.</td>
</tr>
<tr>
<td>Rev</td>
<td>The revision number for a rule.</td>
</tr>
<tr>
<td>Rule Update</td>
<td>The rule update file name.</td>
</tr>
<tr>
<td>SID</td>
<td>The SID for a rule.</td>
</tr>
<tr>
<td>Time</td>
<td>The time and date the import began.</td>
</tr>
</tbody>
</table>
Field | Description
---|---
Type | The type of imported object, which can be one of the following:
  - *rule update component* (an imported component such as a rule pack or policy pack)
  - *rule* (for rules, a new or updated rule; note that in Version 5.0.1 this value replaced the update value, which is deprecated)
  - *policy apply* (the Reapply all policies after the rule update import completes option was enabled for the import)
Count | The count (1) for each record. The Count field appears in a table view when the table is constrained, and the Rule Update Log detailed view is constrained by default to rule update records. This field is not searchable.

**Viewing Details of the Intrusion Rule Update Import Log**

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

**Step 1** Choose System > Updates.

**Tip** You can also click Import Rules on the Rule Editor page, which you access by choosing Policies > Intrusion > Intrusion Rules.

**Step 2** Click Rule Updates.

**Step 3** Click Rule Update Log.

**Step 4** Click View ( ) next to the file whose detailed records you want to view.

**Step 5** You can take any of the following actions:

  - **Bookmark**—To bookmark the current page, click Bookmark This Page.
  - **Edit Search**—To open a search page prepopulated with the current single constraint, choose Edit Search or Save Search next to Search Constraints.
  - **Manage bookmarks**—To navigate to the bookmark management page, click Report Designer.
  - **Report**—To generate a report based on the data in the current view, click Report Designer.
  - **Search**—To search the entire Rule Update Import Log database for rule update import records, click Search.
  - **Sort**—To sort and constrain records on the current workflow page, see Using Drill-Down Pages, on page 2407 for more information.
  - **Switch workflows**—To temporarily use a different workflow, click (switch workflows).

**Maintain Your Air-Gapped Deployment**

If your Firepower system is not connected to the internet, essential updates will not occur automatically.
You must manually obtain and install these updates. See the following information:

- Manually Update the VDB, on page 150
- Update Intrusion Rules One-Time Manually, on page 154
- Manually Update the GeoDB (No Internet Connection), on page 152

## History for System Updates

<table>
<thead>
<tr>
<th>Feature</th>
<th>Version</th>
<th>Details</th>
</tr>
</thead>
</table>
| FMC upgrades postpone scheduled tasks | 6.4.0.10 | FMC upgrades now postpone scheduled tasks. Any task scheduled to begin during the upgrade will begin five minutes after the post-upgrade reboot.  
**Note** Before you begin any upgrade, you must still make sure running tasks are complete. Tasks running when the upgrade begins are stopped, become failed tasks, and cannot be resumed.

Note that this feature is supported for all upgrades *from* a supported version. As of January 2021, this includes Version 6.4.0.10 and later patches, and Version 6.7.0+. This feature is not supported for upgrades *to* a supported version. |
| Signed SRU, VDB, and GeoDB updates | 6.4.0   | So Firepower can verify that you are using the correct update files, the system now uses *signed* updates for intrusion rules (SRU), the vulnerability database (VDB), and the geolocation database (GeoDB). Earlier versions continue to use unsigned updates.

Unless you manually download updates from the Cisco Support & Download site—for example, in an air-gapped deployment—you should not notice any difference in functionality.

If, however, you do manually download and install SRU, VDB, and GeoDB updates, make sure you download the correct package for your current version. Signed update files begin with ‘Cisco’ instead of ‘Sourcefire,’ and terminate in .sh.REL.tar instead of .sh:

- SRU: Cisco_Firepower_SRU-date-build-vrt.sh.REL.tar
- VDB: Cisco_VDB_Fingerprint_Database-4.5.0-version.sh.REL.tar
- GeoDB: Cisco_GEODB_Update-date-build.sh.REL.tar

Do not untar signed (.tar) packages. |
| Faster upgrade                      | 6.4.0   | Improvements to the event database mean that upgrading Firepower appliances is now faster. |

Firepower Management Center Configuration Guide, Version 6.4
<table>
<thead>
<tr>
<th>Feature</th>
<th>Version</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy upgrade packages to managed devices</td>
<td>6.2.3</td>
<td>You can now copy (or push) an upgrade package from the FMC to a managed device before you run the actual upgrade. This is useful because you can push during times of low bandwidth use, outside of the upgrade maintenance window. When you push to high availability, clustered, or stacked devices, the system sends the upgrade package to the active/control/primary first, then to the standby/data/secondary. New/modified screens: System &gt; Updates</td>
</tr>
</tbody>
</table>
| FMC warns of Snort restart before VDB       | 6.2.3   | The FMC now warns you that Vulnerability Database (VDB) updates restart the Snort process. This interrupts traffic inspection and, depending on how the managed device handles traffic, possibly interrupts traffic flow. You can cancel the install until a more convenient time, such as during a maintenance window. These warnings can appear:  
  • After you download and manually install a VDB.  
  • When you create a scheduled task to install the VDB.  
  • When the VDB installs in the background, such as during a previously scheduled task or as part of a Firepower software upgrade. |
Backup and Restore

- About Backup and Restore, on page 165
- Requirements for Backup and Restore, on page 167
- Guidelines and Limitations for Backup and Restore, on page 168
- Best Practices for Backup and Restore, on page 169
- Backing Up Firepower Appliances, on page 173
- Restoring Firepower Appliances, on page 178
- Manage Backups and Remote Storage, on page 189
- History for Backup and Restore, on page 192

About Backup and Restore

The ability to recover from a disaster is an essential part of any system maintenance plan. As part of your disaster recovery plan, we recommend that you perform periodic backups to a secure remote location.

On-Demand Backups

You can perform on-demand backups for the FMC, 7000/8000 series devices, and many FTD devices from the FMC.

You can also use the local web interface on a 7000/8000 series device to perform on-demand backups. Local backup management on 7000/8000 series devices is slightly different and has fewer options than backup management on the FMC, but in general works in the same way. Note that you can use the FMC to back up these devices remotely.

For more information, see Backing Up Firepower Appliances, on page 173.

Scheduled Backups

You can use the scheduler on an FMC or 7000/8000 series device to automate backups. You can also schedule remote device backups from the FMC.

For more information, see Scheduled Backups, on page 201.

Storing Backup Files

You can store backups locally. However, we recommend you back up Firepower appliances to a secure remote location by mounting an NFS, SMB, or SSHFS network volume as remote storage. After you do this, all subsequent backups are copied to that volume, but you can still use the FMC to manage them.
For more information, see Remote Storage Management, on page 1053 and Manage Backups and Remote Storage, on page 189.

Restoring Firepower Appliances

You restore the FMC and 7000/8000 series devices from the local Backup Management page. You must use the FTD CLI to restore an FTD device.

For more information, see Restoring Firepower Appliances, on page 178.

What Is Backed Up?

FMC backups can include:

• Configurations.
  All configurations you can set on the FMC web interface are included in a configuration backup, with the exception of remote storage and audit log server certificate settings. In a multidomain deployment, you must back up configurations. You cannot back up events or TID data only.

• Events.
  Event backups include all events in the FMC database. However, FMC event backups do not include intrusion event review status. Restored intrusion events do not appear on Reviewed Events pages.

• Threat Intelligence Director (TID) data.
  For more information, see About Backing Up and Restoring TID Data, on page 1631.

7000/8000 series device backups are always configuration-only.

Device backups are always configuration-only.

What Is Restored?

Restoring configurations overwrites all backed-up configurations, with very few exceptions. On the FMC, restoring events and TID data overwrites all existing events and TID data, with the exception of intrusion events.

Make sure you understand and plan for the following:

• You cannot restore what is not backed up.
  FMC configuration backups do not include remote storage and audit log server certificate settings, so you must reconfigure these after restore. Also, because FMC event backups do not include intrusion event review status, restored intrusion events do not appear on Reviewed Events pages.

• Restoring fails VPN certificates.
  The FTD restore process removes VPN certificates from FTD devices, including certificates added after the backup was taken. After you restore an FTD device, you must re-add/re-enroll all VPN certificates.

• Restoring to a configured FMC — instead of factory-fresh or reimaged — merges intrusion events and file lists.
  The FMC event restore process does not overwrite intrusion events. Instead, the intrusion events in the backup are added to the database. To avoid duplicates, delete existing intrusion events before you restore.
The FMC configuration restore process does not overwrite clean and custom detection file lists used by AMP for Networks. Instead, it merges existing file lists with the file lists in the backup. To replace file lists, delete existing file lists before you restore.

Requirements for Backup and Restore

Backup and restore has the following requirements.

Model Requirements: Backup

You can back up:

- FMCs
- FTD: standalone, native instance, or HA
- FTDv: VMware, standalone or HA
- 7000/8000 series devices

Backup is not supported for:

- FTD: Container instances
- FTD: Clustered devices
- FTDv: KVM, AWS, Azure
- NGIPSv
- ASA FirePOWER

If you need to replace a device where backup and restore is not supported, you must manually recreate device-specific configurations. However, backing up the FMC does back up policies and other configurations that you deploy to managed devices, as well as events already transmitted from the devices to the FMC.

Model Requirements: Restore

A replacement appliance must be the same model as the one you are replacing. Replacement managed devices should have the same number of network modules and same type and number of physical interfaces.

Version Requirements

As the first step in any backup, note the patch level. To restore a backup, the old and the new appliance must be running the same Firepower version, including patches.

Additionally, to restore Firepower software on a Firepower 4100/9300 chassis, the chassis must be running a compatible FXOS version.

For FMC backups, you must also have the same VDB. You are not required to have the same SRU.

License Requirements

Address licensing or orphan entitlements concerns as described in the best practices and procedures. If you notice licensing conflicts, contact Cisco TAC.
Domain Requirements

To:

• Back up or restore the FMC: Global only.
• Back up a device from the FMC: Global only.
• Restore a device: None. Restore devices locally.

In a multidomain deployment you cannot back up only events/TID data. You must also back up configurations.

Guidelines and Limitations for Backup and Restore

Backup and restore has the following guidelines and limitations.

Backup and Restore is for Disaster Recovery/RMA

Backup and restore is primarily intended for RMA scenarios. Before you begin the restore process of a faulty or failed physical appliance, contact Cisco TAC for replacement hardware.

Backup and Restore is not Configuration Import/Export

A backup file contains information that uniquely identifies an appliance, and cannot be shared. Do not use the backup and restore process to copy configurations between appliances or devices, or as a way to save configurations while testing new ones. Instead, use the import/export feature.

For example, FTD device backups include the device's management IP address and all information the device needs to connect to its managing FMC. Do not restore an FTD backup to a device being managed by a different FMC; the restored device will attempt to connect to the FMC specified in the backup.

Restore is Individual and Local

You restore to Firepower appliances individually and locally. This means:

• You cannot batch-restore to high availability (HA) FMCs or devices. The restore procedures in this guide explain how to restore in an HA environment.
• You cannot use the FMC to restore a device. For the FMC and 7000/8000 series devices, you can use the local web interface to restore. For FTD devices, you must use the FTD CLI.
• You cannot use an FMC user account to log into and restore one of its managed devices. Firepower appliances maintain their own user accounts.

Configuration Import/Export Guidelines for Firepower 4100/9300

You can use the configuration export feature to export an XML file containing logical device and platform configuration settings for your Firepower 4100/9300 chassis to a remote server or your local computer. You can later import that configuration file to quickly apply the configuration settings to your Firepower 4100/9300 chassis to return to a known good configuration or to recover from a system failure.
Guidelines and Restrictions

- Do not modify the contents of the configuration file. If a configuration file is modified, configuration import using that file might fail.

- Application-specific configuration settings are not contained in the configuration file. You must use the configuration backup tools provided by the application to manage application-specific settings and configurations.

- When you import a configuration to the Firepower 4100/9300 chassis, all existing configuration on the Firepower 4100/9300 chassis (including any logical devices) are deleted and completely replaced by the configuration contained in the import file.

- Except in an RMA scenario, we recommend you only import a configuration file to the same Firepower 4100/9300 chassis where the configuration was exported.

- The platform software version of the Firepower 4100/9300 chassis where you are importing should be the same version as when the export was taken. If not, the import operation is not guaranteed to be successful. We recommend you export a backup configuration whenever the Firepower 4100/9300 chassis is upgraded or downgrade.

- The Firepower 4100/9300 chassis where you are importing must have the same Network Modules installed in the same slots as when the export was taken.

- The Firepower 4100/9300 chassis where you are importing must have the correct software application images installed for any logical devices defined in the export file that you are importing.

- To avoid overwriting existing backup files, change the file name in the backup operation or copy the existing file to another location.

Best Practices for Backup and Restore

Backup and restore has the following best practices.

When to Back Up

We recommend backing up during a maintenance window or other time of low use.

While the system collects backup data, there may be a temporary pause in data correlation (FMC only), and you may be prevented from changing configurations related to the backup.

You should back up in the following situations:

- Regular scheduled backups.
  As part of your disaster recovery plan, we recommend that you perform periodic backups. To automate this process, see Scheduled Backups, on page 201.

- After SLR changes.
  Back up the FMC after you make changes to Specific Licensing Reservations (SLRs). If you make changes and then restore an older backup, you will have issues with your Specific Licensing return code and can accrue orphan entitlements.

- Before upgrade or reimage.
If an upgrade fails catastrophically, you may have to reimage and restore. Reimaging returns most settings to factory defaults, including the system password. If you have a recent backup, you can return to normal operations more quickly.

- **After upgrade.**

Back up after you upgrade, so you have a snapshot of your freshly upgraded deployment. We recommend you back up the FMC *after* you upgrade its managed devices, so your new FMC backup file 'knows' that its devices have been upgraded.

**Maintaining Backup File Security**

Backups are stored as unencrypted archive (.tar) files.

Private keys in PKI objects—which represent the public key certificates and paired private keys required to support your deployment—are decrypted before they are backed up. The keys are reencrypted with a randomly generated key when you restore the backup.

---

**Caution**

We recommend you back up Firepower appliances to a secure remote location and verify transfer success. Backups left on an appliance may be deleted, either manually or by the upgrade process, which purges locally stored backups.

Especially because backup files are unencrypted, do *not* allow unauthorized access. If backup files are modified, the restore process will fail. Keep in mind that anyone with the Admin/Maint role can access the Backup Management page, where they can move and delete files from remote storage.

In the FMC's system configuration, you can mount an NFS, SMB, or SSHFS network volume as remote storage. After you do this, all subsequent backups are copied to that volume, but you can still use the FMC to manage them. For more information, see Remote Storage Management, on page 1053 and Manage Backups and Remote Storage, on page 189.

Note that only the FMC mounts the network volume. Managed device backup files are routed through the FMC. Make sure you have the bandwidth to perform a large data transfer between the FMC and its devices. For more information, see Guideline for Downloading Data from the Firepower Management Center to Managed Devices (Troubleshooting TechNote).

**Backup and Restore in FMC High Availability Deployments**

In an FMC high availability deployment, backing up one FMC does not back up the other. You should regularly back up both peers. Do not restore one HA peer with the backup file from the other. A backup file contains information that uniquely identifies an appliance, and cannot be shared.

Note that you can replace an HA FMC without a successful backup. For more information on replacing HA FMCs, both with and without successful backups, see Replacing FMCs in a High Availability Pair, on page 236.

**Backup and Restore in FTD High Availability Deployments**

In an FTD HA deployment, you should:

- Back up the device pair from the FMC, but restore individually and locally from the FTD CLI.
The backup process produces unique backup files for FTD HA devices. Do not restore one HA peer with the backup file from the other. A backup file contains information that uniquely identifies an appliance, and cannot be shared.

An FTD HA device's role is noted in its backup file name. When you restore, make sure you choose the appropriate backup file: primary vs secondary.

• Do not suspend or break HA before you restore.

Maintaining the HA configuration ensures replacement devices can easily reconnect after restore. Note that you will have to resume HA synchronization to make this happen.

• Do not run the restore CLI command on both peers at the same time.

Assuming you have successful backups, you can replace either or both peers in an HA pair. Any physical replacement tasks you can perform simultaneously: unracking, reracking, and so on. However, do not run the restore command on the second device until the restore process completes for the first device, including the reboot.

Note that you can replace an FTD HA device without a successful backup; see Replace a Unit in an FTD High Availability Pair, on page 747.

**Backup and Restore for Firepower 4100/9300 Chassis**

To restore Firepower software on a Firepower 4100/9300 chassis, the chassis must be running a compatible FXOS version.

When you back up a Firepower 4100/9300 chassis, we strongly recommend you also back up FXOS configurations. For additional best practices, see Configuration Import/Export Guidelines for Firepower 4100/9300, on page 168.

**Before Backup**

Before you back up, you should:

• Update the VDB and SRU on the FMC.

  We always recommend you use the latest vulnerability database (VDB) and intrusion rules (SRU). Before you back up an FMC, check the Cisco Support & Download site for newer versions.

  This is especially important for the VDB, because the VDB versions must match to restore a backup. Because you cannot downgrade the VDB, you do not want a situation where your replacement FMC has a newer VDB than the backed up FMC.

• Check Disk Space.

  Before you begin a backup, make sure you have enough disk space on the appliance or on your remote storage server. The space available is displayed on the Backup Management page.

  Backups can fail if there is not enough space. Especially if you schedule backups, make sure you regularly prune backup files or allocate more disk space to the remote storage location.

**Before Restore**

Before restore, you should:

• Revert licensing changes.
Revert any licensing changes made since you took the backup.

Otherwise, you may have license conflicts or orphan entitlements after the restore. However, do not unregister from Cisco Smart Software Manager (CSSM). If you unregister from CSSM, you must unregister again after you restore, then re-register.

After the restore completes, reconfigure licensing. If you notice licensing conflicts or orphan entitlements, contact Cisco TAC.

• Disconnect faulty appliances.

Disconnect the management interface, and for devices, the data interfaces.

Restoring an FTD device sets the management IP address of the replacement device to the management IP address of the old device. To avoid IP conflicts, disconnect the old device from the management network before you restore the backup on its replacement.

Note that restoring an FMC or 7000/8000 series device does not change the management IP address. You must set that manually on the replacement — just make sure you disconnect the old appliance from the network before you do.

• Do not unregister managed devices.

Whether you are restoring an FMC or managed device, do not unregister devices from the FMC, even if you physically disconnect an appliance from the network.

If you unregister, you will need to redo some device configurations, such as security zone to interface mappings. After you restore, the FMC and devices should begin communicating normally.

• Reimage.

In an RMA scenario, the replacement appliance will arrive configured with factory defaults. However, if the replacement appliance is already configured, we recommend you reimage. Reimaging returns most settings to factory defaults, including the system password. You can only reimage to major versions, so you may need to patch after you reimage.

If you do not reimage, keep in mind that FMC intrusion events and file lists are merged rather than overwritten.

**After Restore**

After restore, you should:

• Reconfigure anything that was not restored.

  This can include reconfiguring licensing, remote storage, and audit log server certificate settings. You also must re-add/re-enroll failed FTD VPN certificates.

• Update the VDB and SRU on the FMC.

  We always recommend you use the latest vulnerability database (VDB) and intrusion rules (SRU).

• Deploy.

  After you restore an FMC, deploy to all managed devices. After you restore a device, deploy to that device. You must deploy. If the device or devices are not marked out of date, force deploy from the Device Management page: Redeploy Existing Configurations to a Device, on page 384.
Backing Up Firepower Appliances

You can perform on-demand or scheduled backups for supported appliances.

You do not need a backup profile to back up devices from the FMC. However, FMC backups require backup profiles, as do local backups on 7000/8000 series devices. The on-demand backup process allows you to create a new backup profile.

For more information, see:

- Back up the FMC, on page 173
- Back up a Device from the FMC, on page 174
- Back up a 7000/8000 Series Device Locally, on page 176
- Create a Backup Profile, on page 177
- Scheduled Backups, on page 201

Back up the FMC

Use this procedure to perform an on-demand FMC backup. To back up a 7000/8000 series device from its local web interface, see Back up a 7000/8000 Series Device Locally, on page 176.

Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- Requirements for Backup and Restore, on page 167
- Guidelines and Limitations for Backup and Restore, on page 168
- Best Practices for Backup and Restore, on page 169

Step 1

Select System > Tools > Backup/Restore.

The Backup Management page lists all locally and remotely stored backups. It also lists how much disk space you have available to store backups. Backups can fail if there is not enough space.

Step 2

Choose whether to use an existing backup profile or start fresh.

FMC backups require that you use or create a backup profile.

- Click Backup Profiles to use an existing backup profile.
  
  Next to the profile you want to use, click the edit icon. You can then click Start Backup to begin the backup right now. Or, if you want to edit the profile, go on to the next step.

- Click Firepower Management Backup to start fresh and create a new backup profile.
  
  Enter a Name for the backup profile.
Step 3  Choose what to back up:

• **Back Up Configuration**
• **Back Up Events**
• **Back Up Threat Intelligence Director**

In a multidomain deployment, you must back up configurations. You cannot back up events or TID data only. For details on what is and what is not backed up for each of these choices, see About Backup and Restore, on page 165.

Step 4  Note the **Storage Location** for FMC backup files.

This will either be local storage in /var/sf/backup/, or a remote network volume. For more information, see Manage Backups and Remote Storage, on page 189.

Step 5  (Optional) Enable **Copy when complete** to copy completed FMC backups to a remote server.

Provide a hostname or IP address, the path to the remote directory, and a username and password. To use an SSH public key instead of a password, copy the contents of the **SSH Public Key** field to the specified user's authorized_keys file on the remote server.

**Note**  This option is useful if you want to store backups locally and also SCP them to a remote location. If you configured SSH remote storage, do not copy backup files to the same directory using **Copy when complete**.

Step 6  (Optional) Enable **Email** and enter an email address to be notified when the backup completes.

To receive email notifications, you must configure the FMC to connect to a mail server: Configuring a Mail Relay Host and Notification Address, on page 1068.

Step 7  Click **Start Backup** to start the on-demand backup.

If you are not using an existing backup profile, the system automatically creates one and uses it. If you decide not to run the backup now, you can click **Save** or **Save As New** to save the profile. In either case, you can use the newly created profile to configure scheduled backups.

Step 8  Monitor progress in the Message Center.

While the system collects backup data, there may be a temporary pause in data correlation, and you may be prevented from changing configurations related to the backup. If you configured remote storage or enabled **Copy when complete**, the FMC may write temporary files to the remote server. These files are cleaned up at the end of the backup process.

---

**What to do next**

If you configured remote storage or enabled **Copy when complete**, verify transfer success of the backup file.

**Back up a Device from the FMC**

Use this procedure to perform an on-demand backup of any of the following devices:

• FTD: Physical devices, standalone or HA
• FTDv: VMware, standalone or HA
• 7000/8000 series devices
Backup and restore is not supported for any other platforms or configurations, including clustered devices and container instances.

**Before you begin**

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- Requirements for Backup and Restore, on page 167
- Guidelines and Limitations for Backup and Restore, on page 168
- Best Practices for Backup and Restore, on page 169

If you are backing up a Firepower 4100/9300 chassis, it is especially important that you also back up FXOS configurations: Exporting an FXOS Configuration File, on page 175.

---

**Step 1**
Select System > Tools > Backup/Restore, then click Managed Device Backup.

**Step 2**
Select one or more Managed Devices.

**Step 3**
Note the Storage Location for device backup files.
This will either be local storage in /var/sf/remote-backup/, or a remote network volume. For more information, see Manage Backups and Remote Storage, on page 189.

**Step 4**
If you did not configure remote storage, choose whether you want to Retrieve to Management Center.
- Enabled (default): Saves the backup to the FMC in /var/sf/remote-backup/.
- Disabled: Saves the backup to the device in /var/sf/backup.

If you configured remote backup storage, backup files are saved remotely and this option has no effect.

**Step 5**
Click Start Backup to start the on-demand backup.

**Step 6**
Monitor progress in the Message Center.

---

**What to do next**

If you configured remote storage, verify transfer success of the backup file.

**Exporting an FXOS Configuration File**

Use the configuration export feature to export an XML file containing logical device and platform configuration settings for your Firepower 4100/9300 chassis to a remote server or your local computer.

---

**Note**

This procedure explains how to use Firepower Chassis Manager to export FXOS configurations when you back up Firepower Threat Defense. For the CLI procedure, see the appropriate version of the Cisco Firepower 4100/9300 FXOS CLI Configuration Guide.
Before you begin
Review the Configuration Import/Export Guidelines for Firepower 4100/9300.

Step 1
Choose System > Configuration > Export on the Firepower Chassis Manager.

Step 2
To export a configuration file to your local computer:
   a) Click Local.
   b) Click Export.
      The configuration file is created and, depending on your browser, the file might be automatically downloaded to your
      default download location or you might be prompted to save the file.

Step 3
To export the configuration file to a remote server:
   a) Click Remote.
   b) Choose the protocol to use when communicating with the remote server. This can be one of the following: FTP, TFTP, SCP, or SFTP.
   c) Enter the hostname or IP address of the location where the backup file should be stored. This can be a server, storage
      array, local drive, or any read/write media that the Firepower 4100/9300 chassis can access through the network.
      If you use a hostname rather than an IP address, you must configure a DNS server.
   d) If you are using a non-default port, enter the port number in the Port field.
   e) Enter the username the system should use to log in to the remote server. This field does not apply if the protocol is TFTP.
   f) Enter the password for the remote server username. This field does not apply if the protocol is TFTP.
   g) In the Location field, enter the full path to where you want the configuration file exported including the filename.
   h) Click Export.
      The configuration file is created and exported to the specified location.

Back up a 7000/8000 Series Device Locally

Use this procedure to perform a local, on-demand backup for a 7000/8000 series device. Device backups are
always configuration-only.

Note that local backup management on 7000/8000 series devices is slightly different and has fewer options
than backup management on the FMC, but in general works in the same way. Unless you have a specific need,
we recommend you use the FMC to back up these devices remotely.

Before you begin
You must read and understand the requirements, guidelines, limitations, and best practices. You do not want
to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

   • Requirements for Backup and Restore, on page 167
   • Guidelines and Limitations for Backup and Restore, on page 168
   • Best Practices for Backup and Restore, on page 169

Step 1
On the device's local web interface, select System > Tools > Backup/Restore.
The Backup Management page lists all locally stored backups. It also lists how much disk space you have available to store backups. Backups can fail if there is not enough space.

**Step 2** Choose whether to use an existing backup profile or start fresh.

7000/8000 series local backups require that you use or create a backup profile. When you perform an on-demand backup, if you do not pick an existing backup profile, the system automatically creates one and uses it. You can then use the newly created profile to configure scheduled backups.

- Click **Backup Profiles** to use an existing backup profile.
  
  Next to the profile you want to use, click the edit icon. You can then click **Start Backup** to begin the backup right now. Or, if you want to edit the profile, go on to the next step.

- Click **Device Backup** to start fresh and create a new backup profile.
  
  Enter a **Name** for the backup profile.

**Step 3** *(Optional)* Enable **Copy when complete** to copy completed backups to a remote server.

This is your only option for remote storage for 7000/8000 series local backups.

Provide a hostname or IP address, the path to the remote directory, and a username and password. To use an SSH public key instead of a password, copy the contents of the **SSH Public Key** field to the specified user's `authorized_keys` file on the remote server.

**Step 4** *(Optional)* Enable **Email** and enter an email address to be notified when the backup completes.

To receive email notifications, you must configure the device to connect to a mail server: Configuring a Mail Relay Host and Notification Address, on page 1068.

**Step 5** Click **Start Backup** to start the on-demand backup.

If you are not using an existing backup profile, the system automatically creates one and uses it. If you decide not to run the backup now, you can click **Save** or **Save As New** to save the profile. In either case, you can use the newly created profile to configure scheduled backups.

**Step 6** Monitor progress in the Message Center.

While the system collects backup data, you may be prevented from changing configurations related to the backup. If you enabled **Copy when complete**, the device may write temporary files to the remote server. These files are cleaned up at the end of the backup process.

---

**What to do next**

If you enabled **Copy when complete**, verify transfer success of the backup file.

**Create a Backup Profile**

A backup profile is a saved set of preferences—what to back up, where to store the backup file, and so on. FMC backups and 7000/8000 series local backups require backup profiles. Backup profiles are not required to back up a device from the FMC.
When you perform an on-demand FMC or 7000/8000 series local backup, if you do not pick an existing backup profile, the system automatically creates one and uses it. You can then use the newly created profile to configure scheduled backups.

The following procedure explains how to create a backup profile without performing an on-demand backup.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Select System &gt; Tools &gt; Backup/Restore, then click Backup Profiles.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Create Profile and enter a Name.</td>
</tr>
</tbody>
</table>
| Step 3 | (FMC only) Choose what to back up. 7000/8000 series backups are always configuration-only.  
  - Back Up Configuration  
  - Back Up Events  
  - Back Up Threat Intelligence Director |
| Step 4 | Note the Storage Location for backup files. For FMC backup profiles, this will either be local storage in /var/sf/backup/, or a remote network volume. For 7000/8000 local backup profiles, this is always /var/sf/backup/. For more information, see Manage Backups and Remote Storage, on page 189. |
| Step 5 | (Optional) Enable Copy when complete to copy completed FMC backups to a remote server. Provide a hostname or IP address, the path to the remote directory, and a username and password. To use an SSH public key instead of a password, copy the contents of the SSH Public Key field to the specified user's authorized_keys file on the remote server.  
  Note: This option is useful if you want to store backups locally and also SCP them to a remote location. If you configured SSHFS remote storage, do not copy backup files to the same directory using Copy when complete. |
| Step 6 | (Optional) Enable Email and enter an email address to be notified when the backup completes. To receive email notifications, you must configure the FMC to connect to a mail server: Configuring a Mail Relay Host and Notification Address, on page 1068. |
| Step 7 | Click Save. |

## Restoring Firepower Appliances

For the FMC and 7000/8000 series devices, you use the local web interface to restore from backup. For FTD devices, you must use the FTD CLI. You cannot use the FMC to restore a device.

The following sections explain how to restore Firepower appliances.

- Restore an FMC from Backup, on page 179
- Replacing FMCs in a High Availability Pair, on page 236
• Restore FTD from Backup: Firepower 1000/2100 and ASA-5500-X Series, on page 180 (includes high availability examples)
• Restore FTD from Backup: Firepower 4100/9300 Chassis, on page 183
• Restore FTD from Backup: FTDv, on page 186
• Restore a 7000/8000 Series Device from Backup, on page 189

**Restore an FMC from Backup**

When you restore an FMC backup, you can choose to restore any or all of the components included in the backup file (events, configurations, TID data).

---

**Note**

Restoring configurations overwrites *all* configurations, with very few exceptions. It also reboots the FMC. Restoring events and TID data overwrites *all* existing events and TID data, with the exception of intrusion events. Make sure you are ready.

Use this procedure to restore an FMC from backup. For more information on backup and restore in an FMC HA deployment, see Replacing FMCs in a High Availability Pair, on page 236. To restore a 7000/8000 series device, see Restore a 7000/8000 Series Device from Backup, on page 189.

**Before you begin**

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

• Requirements for Backup and Restore, on page 167
• Guidelines and Limitations for Backup and Restore, on page 168
• Best Practices for Backup and Restore, on page 169

---

**Step 1**
Log into the FMC you want to restore.

**Step 2**
Select System > Tools > Backup/Restore.

The Backup Management page lists all locally and remotely stored backup files. You can click a backup file to view its contents.

If the backup file is not in the list and you have it saved on your local computer, click Upload Backup; see Manage Backups and Remote Storage, on page 189.

**Step 3**
Select the backup file you want to restore and click Restore.

**Step 4**
Select from the available components to restore, then click Restore again to begin.

**Step 5**
Monitor progress in the Message Center.

If you are restoring configurations, you can log back in after the FMC reboots.
What to do next

- If necessary, reconfigure any licensing settings that you reverted before the restore. If you notice licensing conflicts or orphan entitlements, contact Cisco TAC.

- If necessary, reconfigure remote storage and audit log server certificate settings. These settings are not included in backups.

- (Optional) Update the SRU and VDB. If the SRU or the VDB available on the Cisco Support & Download site is newer than the version currently running, we recommend you install the newer version.

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

Restore FTD from Backup: Firepower 1000/2100 and ASA-5500-X Series

FTD backup and restore is intended for RMA. Restoring configurations overwrites all configurations on the device, including the management IP address. It also reboots the device.

In case of hardware failure, this procedure outlines how to replace a Firepower 1000/2100 or ASA-5500-X series FTD device, either standalone or in an HA pair. It assumes you have access to a successful backup of the device or devices you are replacing; see Back up a Device from the FMC, on page 174.

In an FTD HA deployment, you can use this procedure to replace either or both peers. To replace both, perform all steps on both devices simultaneously, except the restore CLI command itself. Note that you can replace an FTD HA device without a successful backup; see Replace a Unit in an FTD High Availability Pair, on page 747.

Note

Do not unregister from the FMC, even when disconnecting a device from the network. In an FTD HA deployment, do not suspend or break HA. Maintaining these links ensures replacement devices can automatically reconnect after restore.

Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- Requirements for Backup and Restore, on page 167
- Guidelines and Limitations for Backup and Restore, on page 168
- Best Practices for Backup and Restore, on page 169

Step 1

Contact Cisco TAC for replacement hardware.

Obtain an identical model, with the same number of network modules and same type and number of physical interfaces. You can begin the RMA process from the Cisco Returns Portal.

Step 2

Locate a successful backup of the faulty device.

Depending on your backup configuration, device backups may be stored:

- On the faulty device itself in /var/sf/backup.
• On the FMC in /var/sf/remote-backup.
• In a remote storage location.

In an FTD HA deployment, you back up the pair as a unit but the backup process produces unique backup files. The device's role is noted in the backup file name.

If the only copy of the backup is on the faulty device, copy it somewhere else now. If you reimagine the device, the backup will be erased. If something else goes wrong, you may not be able to recover the backup. For more information, see Manage Backups and Remote Storage, on page 189.

The replacement device will need the backup, but can retrieve it with SCP during the restore process. We recommend you put the backup somewhere SCP-accessible to the replacement device. Or, you can copy the backup to the replacement device itself.

Step 3 Remove (unrack) the faulty device.

Disconnect all interfaces. In FTD HA deployments, this includes the failover link.

See the hardware installation and getting started guides for your model: Cisco Firepower NGFW: Install and Upgrade Guides.

Note Do not unregister from the FMC, even when disconnecting a device from the network. In an FTD HA deployment, do not suspend or break HA. Maintaining these links ensures replacement devices can automatically reconnect after restore.

Step 4 Install the replacement device and connect it to the management network.

Connect the device to power and the management interface to the management network. In an FTD HA deployment, connect the failover link. However, do not connect the data interfaces.

See the hardware installation guide for your model: Cisco Firepower NGFW: Install and Upgrade Guides.

Step 5 (Optional) Reimage the replacement device.

In an RMA scenario, the replacement device will arrive configured with factory defaults. If the replacement device is not running the same major version as the faulty device, we recommend you reimagine.

See the Cisco ASA and Firepower Threat Defense Reimage Guide.

Step 6 Perform initial configuration on the replacement device.

Access the FTD CLI as the admin user. You can use the console or you can SSH to the factory-default management interface IP address (192.168.45.45). A setup wizard prompts you to configure the management IP address, gateway, and other basic network settings.

Do not set the same management IP address as the faulty device. This can cause problems if you need to register the device in order to patch it. The restore process will correctly reset the management IP address.

See the initial configuration topics in the getting started guide for your model: Cisco Firepower NGFW: Install and Upgrade Guides.

Note If you need to patch the replacement device, start the FMC registration process as described in the getting started guide. If you do not need to patch, do not register.

Step 7 Make sure the replacement device is running the same Firepower software version, including patches, as the faulty device.
Ensure that the existing device should not be deleted from the FMC. The replacement device should be unmanaged from the physical network and the new hardware as well as the replacing FTD patch should have the same version. The FTD CLI does not have an upgrade command. To patch:

a) From the FMC web interface, complete the device registration process: **Add a Device to the FMC, on page 252.**

   Create a new AC policy and use the default action "Network Discovery". Leave this policy as is; do not add any features or modifications. This is being used to register the device and deploy a policy with no features so that you do not require licenses, and you will then be able to patch the device. Once backup is restored, it should restore the licensing and policy into the expected state.

b) Patch the device: **Cisco Firepower Management Center Upgrade Guide.**

c) Unregister the freshly patched device from the FMC: **Delete a Device from the FMC, on page 255.**

   If you do not unregister, you will have a ghost device registered to the FMC after the restore process brings your "old" device back up.

**Step 8**
Make sure the replacement device has access to the backup file.

The restore process can retrieve the backup with SCP, so we recommend you put the backup somewhere accessible. Or, you can manually copy the backup to the replacement device itself, to /var/sf/backup.

**Step 9**
From the FTD CLI, restore the backup.

Access the FTD CLI as the admin user. You can use the console or you can SSH to the newly configured management interface (IP address or hostname). Keep in mind that the restore process will change this IP address.

To restore:

   • With SCP: **restore remote-manager-backup location scp-hostname username filepath backup tar-file**

   • From the local device: **restore remote-manager-backup backup tar-file**

In an FTD HA deployment, make sure you choose the appropriate backup file: primary vs secondary. The role is noted in the backup file name. If you are restoring both devices in the HA pair, do this sequentially. Do not run the restore command on the second device until the restore process completes for the first device, including the reboot.

**Step 10**
Log into the FMC and wait for the replacement device to connect.

When the restore is done, the device logs you out of the CLI, reboots, and automatically connects to the FMC. At this time, the device should appear out of date.

**Step 11**
Before you deploy, perform any post-restore tasks and resolve any post-restore issues:

   • Resolve licensing conflicts or orphan entitlements. Contact Cisco TAC.

   • Resume HA synchronization. From the FTD CLI, enter **configure high-availability resume.** See **Suspend and Resume High Availability, on page 747.**

   • Re-add/re-enroll all VPN certificates. The restore process removes VPN certificates from FTD devices, including certificates added after the backup was taken. See **Managing FTD Certificates, on page 532.**

**Step 12**
Deploy configurations.

You must deploy. If a restored device is not marked out of date, force deploy from the Device Management page: **Redeploy Existing Configurations to a Device, on page 384.**

**Step 13**
Connect the device's data interfaces.
See the hardware installation guide for your model: Cisco Firepower NGFW: Install and Upgrade Guides.

What to do next
Verify that the restore succeeded and the replacement device is passing traffic as expected.

Restore FTD from Backup: Firepower 4100/9300 Chassis

FTD backup and restore is intended for RMA. Restoring configurations overwrites all configurations on the device, including the management IP address. It also reboots the device.

In case of hardware failure, this procedure outlines how to replace a Firepower 4100/9300 chassis. It assumes you have access to a successful backups of:

- The logical device or devices you are replacing; see Back up a Device from the FMC, on page 174.
- FXOS configurations; see Exporting an FXOS Configuration File, on page 175.

Note
Do not unregister from the FMC, even when disconnecting a device from the network. Maintaining registration ensures replacement devices can automatically reconnect after restore.

Before you begin
You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- Requirements for Backup and Restore, on page 167
- Guidelines and Limitations for Backup and Restore, on page 168
- Best Practices for Backup and Restore, on page 169

Step 1
Contact Cisco TAC for replacement hardware.
Obtain an identical model, with the same number of network modules and same type and number of physical interfaces. You can begin the RMA process from the Cisco Returns Portal.

Step 2
Locate a successful backup of the faulty device.
Depending on your backup configuration, device backups may be stored:

- On the faulty device itself in /var/sf/backup.
- On the FMC in /var/sf/remote-backup.
- In a remote storage location.

If the only copy of the backup is on the faulty device, copy it somewhere else now. If you reimage the device, the backup will be erased. If something else goes wrong, you may not be able to recover the backup. For more information, see Manage Backups and Remote Storage, on page 189.
The replacement device will need the backup, but can retrieve it with SCP during the restore process. We recommend you put the backup somewhere SCP-accessible to the replacement device. Or, you can copy the backup to the replacement device itself.

**Step 3**  
Locate a successful backup of your FXOS configurations.

**Step 4**  
Remove (unrack) the faulty device.  
Disconnect all interfaces.  
See the hardware installation and getting started guides for your model: Cisco Firepower NGFW: Install and Upgrade Guides.  
**Note**  
Do not unregister from the FMC, even when disconnecting a device from the network. Maintaining registration ensures replacement devices can automatically reconnect after restore.

**Step 5**  
Install the replacement device and connect it to the management network.  
Connect the device to power and the management interface to the management network. However, do not connect the data interfaces.  
See the hardware installation guide for your model: Cisco Firepower NGFW: Install and Upgrade Guides.

**Step 6**  
(Optional) Reimage the replacement device.  
In an RMA scenario, the replacement device will arrive configured with factory defaults. If the replacement device is not running the same major version as the faulty device, we recommend you reimage.  
See the instructions on restoring the factory default configuration in the appropriate Cisco Firepower 4100/9300 FXOS Firepower Chassis Manager Configuration Guide.

**Step 7**  
Make sure FXOS is running a compatible version.  
You must be running a compatible FXOS version before you re-add logical devices. You can use Firepower Chassis Manager to import your backed-up FXOS configurations: Importing a Configuration File, on page 185.

**Step 8**  
Use Firepower Chassis Manager to add logical devices and perform initial configurations.  
Do not set the same management IP addresses as the logical device or devices on the faulty chassis. This can cause problems if you need to register a logical device in order to patch it. The restore process will correctly reset the management IP address.  
See the FMC deployment chapter in the getting started guide for your model: Cisco Firepower NGFW: Install and Upgrade Guides.  
**Note**  
If you need to patch a logical device, register to the FMC as described in the getting started guide. If you do not need to patch, do not register.

**Step 9**  
Make sure the replacement device is running the same Firepower software version, including patches, as the faulty device.  
Ensure that the existing device should not be deleted from the FMC. The replacement device should be unmanaged from the physical network and the new hardware as well as the replacing FTD patch should have the same version. The FTD CLI does not have an upgrade command. To patch:  
a) From the FMC web interface, complete the device registration process: Add a Device to the FMC, on page 252.  
Create a new AC policy and use the default action "Network Discovery". Leave this policy as is; do not add any features or modifications. This is being used to register the device and deploy a policy with no features so that you
do not require licenses, and you will then be able to patch the device. Once backup is restored, it should restore the licensing and policy into the expected state.

b) Patch the device: Cisco Firepower Management Center Upgrade Guide.

c) Unregister the freshly patched device from the FMC: Delete a Device from the FMC, on page 255.

If you do not unregister, you will have a ghost device registered to the FMC after the restore process brings your "old" device back up.

Step 10
Make sure the replacement device has access to the backup file.

The restore process can retrieve the backup with SCP, so we recommend you put the backup somewhere accessible. Or, you can manually copy the backup to the replacement device itself, to /var/sf/backup.

Step 11
From the FTD CLI, restore the backup.

Access the FTD CLI as the admin user. You can use the console or you can SSH to the newly configured management interface (IP address or hostname). Keep in mind that the restore process will change this IP address.

To restore:
- With SCP: restore remote-manager-backup location scp-hostname username filepath backup tar-file
- From the local device: restore remote-manager-backup backup tar-file

Step 12
Log into the FMC and wait for the replacement device to connect.

When the restore is done, the device logs you out of the CLI, reboots, and automatically connects to the FMC. At this time, the device should appear out of date.

Step 13
Before you deploy, perform any post-restore tasks and resolve any post-restore issues:

- Resolve licensing conflicts or orphan entitlements. Contact Cisco TAC.

- Re-add/re-enroll all VPN certificates. The restore process removes VPN certificates from FTD devices, including certificates added after the backup was taken. See Managing FTD Certificates, on page 532.

Step 14
Deploy configurations.

You must deploy. If a restored device is not marked out of date, force deploy from the Device Management page: Redeploy Existing Configurations to a Device, on page 384.

Step 15
Connect the device's data interfaces.

See the hardware installation guide for your model: Cisco Firepower NGFW: Install and Upgrade Guides.

---

What to do next

Verify that the restore succeeded and the replacement device is passing traffic as expected.

Importing a Configuration File

You can use the configuration import feature to apply configuration settings that were previously exported from your Firepower 4100/9300 chassis. This feature allows you to return to a known good configuration or to recover from a system failure.
This procedure explains how to use Firepower Chassis Manager to import FXOS configurations before you restore the Firepower software. For the CLI procedure, see the appropriate version of the Cisco Firepower 4100/9300 FXOS CLI Configuration Guide.

**Before you begin**

Review the Configuration Import/Export Guidelines for Firepower 4100/9300.

---

**Step 1**

Choose System > Tools > Import/Export on the Firepower Chassis Manager.

**Step 2**

To import from a local configuration file:

a) Click Local.

b) Click Choose File to navigate to and select the configuration file that you want to import.

c) Click Import.

A confirmation dialog box opens asking you to confirm that you want to proceed and warning you that the chassis might need to restart.

d) Click Yes to confirm that you want to import the specified configuration file.

The existing configuration is deleted and the configuration specified in the import file is applied to the Firepower 4100/9300 chassis. If there is a breakout port configuration change during the import, the Firepower 4100/9300 chassis will need to restart.

**Step 3**

To import from a configuration file on a remote server:

a) Click Remote.

b) Choose the protocol to use when communicating with the remote server. This can be one of the following: FTP, TFTP, SCP, or SFTP.

c) If you are using a non-default port, enter the port number in the Port field.

d) Enter the hostname or IP address of the location where the backup file is stored. This can be a server, storage array, local drive, or any read/write media that the Firepower 4100/9300 chassis can access through the network.

If you use a hostname rather than an IP address, you must configure a DNS server.

e) Enter the username the system should use to log in to the remote server. This field does not apply if the protocol is TFTP.

f) Enter the password for the remote server username. This field does not apply if the protocol is TFTP.

g) In the File Path field, enter the full path to the configuration file including the file name.

h) Click Import.

A confirmation dialog box opens asking you to confirm that you want to proceed and warning you that the chassis might need to restart.

i) Click Yes to confirm that you want to import the specified configuration file.

The existing configuration is deleted and the configuration specified in the import file is applied to the Firepower 4100/9300 chassis. If there is a breakout port configuration change during the import, the Firepower 4100/9300 chassis will need to restart.

---

**Restore FTD from Backup: FTDv**

Use this procedure to replace a faulty or failed Firepower Threat Defense Virtual device for VMware.
Do not unregister from the FMC, even when disconnecting a device from the network. Maintaining registration ensures replacement devices can automatically reconnect after restore.

Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- Requirements for Backup and Restore, on page 167
- Guidelines and Limitations for Backup and Restore, on page 168
- Best Practices for Backup and Restore, on page 169

Step 1

Locate a successful backup of the faulty device.

Depending on your backup configuration, device backups may be stored:

- On the faulty device itself in /var/sf/backup.
- On the FMC in /var/sf/remote-backup.
- In a remote storage location.

If the only copy of the backup is on the faulty device, copy it somewhere else now. If you reimage the device, the backup will be erased. If something else goes wrong, you may not be able to recover the backup. For more information, see Manage Backups and Remote Storage, on page 189.

The replacement device will need the backup, but can retrieve it with SCP during the restore process. We recommend you put the backup somewhere SCP-accessible to the replacement device. Or, you can copy the backup to the replacement device itself.

Step 2

Remove the faulty device.

Shut down, power off, and delete the virtual machine. For procedures, see the documentation for your virtual environment.

Step 3

Deploy a replacement device.

See the Cisco Firepower Threat Defense Virtual for VMware Getting Started Guide.

Step 4

Perform initial configuration on the replacement device.

Use the VMware console to access the FTD CLI as the admin user. A setup wizard prompts you to configure the management IP address, gateway, and other basic network settings.

Do not set the same management IP address as the faulty device. This can cause problems if you need to register the device in order to patch it. The restore process will correctly reset the management IP address.

See the CLI setup topics in the getting started guide: Cisco Firepower Threat Defense Virtual for VMware Getting Started Guide.

Note

If you need to patch the replacement device, start the FMC registration process as described in the getting started guide. If you do not need to patch, do not register.
**Step 5**

Make sure the replacement device is running the same Firepower software version, *including patches*, as the faulty device.

Ensure that the existing device should not be deleted from the FMC. The replacement device should be unmanaged from the physical network and the new hardware as well as the replacing FTD patch should have the same version. The FTD CLI does not have an upgrade command. To patch:

a) From the FMC web interface, complete the device registration process: *Add a Device to the FMC, on page 252.* Create a new AC policy and use the default action "Network Discovery". Leave this policy as is; do not add any features or modifications. This is being used to register the device and deploy a policy with no features so that you do not require licenses, and you will then be able to patch the device. Once backup is restored, it should restore the licensing and policy into the expected state.

b) Patch the device: *Cisco Firepower Management Center Upgrade Guide.*

c) Unregister the freshly patched device from the FMC: *Delete a Device from the FMC, on page 255.* If you do not unregister, you will have a ghost device registered to the FMC after the restore process brings your "old" device back up.

**Step 6**

Make sure the replacement device has access to the backup file.

The restore process can retrieve the backup with SCP, so we recommend you put the backup somewhere accessible. Or, you can manually copy the backup to the replacement device itself, to `/var/sf/backup`.

**Step 7**

From the FTD CLI, restore the backup.

Access the FTD CLI as the *admin* user. You can use the console or you can SSH to the newly configured management interface (IP address or hostname). Keep in mind that the restore process will change this IP address.

To restore:

- With SCP: `restore remote-manager-backup location scp-hostname username filepath backup tar-file`

- From the local device: `restore remote-manager-backup backup tar-file`

**Step 8**

Log into the FMC and wait for the replacement device to connect.

When the restore is done, the device logs you out of the CLI, reboots, and automatically connects to the FMC. At this time, the device should appear out of date.

**Step 9**

Before you deploy, perform any post-restore tasks and resolve any post-restore issues:

- Resolve licensing conflicts or orphan entitlements. Contact Cisco TAC.

- Re-add/re-enroll all VPN certificates. The restore process removes VPN certificates from FTD devices, including certificates added after the backup was taken. See *Managing FTD Certificates, on page 532.*

**Step 10**

Deploy configurations.

You must deploy. If a restored device is not marked out of date, force deploy from the Device Management page: *Redeploy Existing Configurations to a Device, on page 384.*

**Step 11**

Add and configure data interfaces.
See the Cisco Firepower Threat Defense Virtual for VMware Getting Started Guide and the documentation for your virtual environment.

What to do next
Verify that the restore succeeded and the replacement device is passing traffic as expected.

Restore a 7000/8000 Series Device from Backup

This procedure explains how to use the 7000/8000 series local web interface to restore from backup. Restoring overwrites all configurations, with very few exceptions. It also reboots the device.

Before you begin
You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- Requirements for Backup and Restore, on page 167
- Guidelines and Limitations for Backup and Restore, on page 168
- Best Practices for Backup and Restore, on page 169

Step 1 Log into the device you want to restore.

Step 2 Select System > Tools > Backup/Restore.

The Backup Management page lists all locally stored backup files. You can click a backup file to view its contents.

If the backup file is not in the list and you have it saved on your local computer, click Upload Backup; see Manage Backups and Remote Storage, on page 189.

Step 3 Select the backup file you want to restore and click Restore.

Step 4 Make sure Replace Configuration Data is enabled, then click Restore again to begin.

Device backups are always configuration-only.

Step 5 Monitor progress in the Message Center until the device reboots.

What to do next
Deploy configuration changes; see Deploy Configuration Changes, on page 382.

Manage Backups and Remote Storage

Backups are stored as unencrypted archive (.tar) files. The file name includes identifying information that can include:

- The name of the backup profile or scheduled task associated with the backup.
• The display name or IP address of the backed-up appliance.
• The appliance's role, such as a member of an HA pair.

We recommend you back up Firepower appliances to a secure remote location and verify transfer success. Backups left on an appliance may be deleted, either manually or by the upgrade process; upgrades purge locally stored backups. For more information on your options, see Backup Storage Locations, on page 191.

⚠️

Caution

Especially because backup files are unencrypted, do not allow unauthorized access. If backup files are modified, the restore process will fail. Keep in mind that anyone with the Admin/Maint role can access the Backup Management page, where they can move and delete files from remote storage.

The following procedure describes how to manage backup files.

---

**Step 1**

Select **System > Tools > Backup/Restore**.

The Backup Management page lists available backups. It also lists how much disk space you have available to store backups. Backups can fail if there is not enough space.

**Step 2**

Do one of the following:

<table>
<thead>
<tr>
<th>Table 22: Remote Storage and Backup File Management</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>To</strong></td>
</tr>
<tr>
<td>Enable or disable remote storage for backups without having to edit the FMC system configuration.</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Move a file between the FMC and the remote storage location.</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>View the contents of the backup.</td>
</tr>
<tr>
<td>Delete a backup file.</td>
</tr>
<tr>
<td>Upload a backup file from your computer.</td>
</tr>
</tbody>
</table>
To

Download a backup to your computer.

Do This

Choose a backup file and click Download.

Unlike moving a backup file, this does not delete the backup from the FMC.

Backup Storage Locations

The following table describes backup storage options for Firepower appliances.

Table 24: Backup Storage Locations

<table>
<thead>
<tr>
<th>Location</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote, by mounting a network volume (NFS, SMB, SSHFS).</td>
<td>In the FMC's system configuration, you can mount an NFS, SMB, or SSHFS network volume as remote storage for FMC and device backups; see Remote Storage Management, on page 1053. After you do this, all subsequent FMC backups and FMC-initiated device backups are copied to that volume, but you can still use the FMC to manage them (restore, download, upload, delete, move). Note that only the FMC mounts the network volume. Managed device backup files are routed through the FMC. Make sure you have the bandwidth to perform a large data transfer between the FMC and its devices. For more information, see Guidelines for Downloading Data from the Firepower Management Center to Managed Devices (Troubleshooting TechNote).</td>
</tr>
<tr>
<td>Remote, by copying (SCP).</td>
<td>For the FMC and for 7000/8000 series local backups, you can use a Copy when complete option to securely copy (SCP) completed backups to a remote server. Compared with remote storage by mounting a network volume, Copy when complete cannot copy to NFS or SMB volumes. You cannot provide CLI options or set a disk space threshold, and it does not affect remote storage of reports. You also cannot manage backup files after they are copied out. This option is useful if you want to store backups locally and SCP them to a remote location. It is also your only option for remote storage for 7000/8000 series local backups. Note If you configure SSHFS remote storage in the FMC system configuration, do not copy backup files to the same directory using Copy when complete.</td>
</tr>
</tbody>
</table>

Firepower Management Center Configuration Guide, Version 6.4
If you do not configure remote storage by mounting a network volume, you can save backup files on the FMC:

- FMC backups are saved to /var/sf/backup.
- Device backups are saved to /var/sf/remote-backup on the FMC if you enable the Retrieve to Management Center option when you perform the backup.

Note that you cannot save 7000/8000 series local backups to the FMC.

<table>
<thead>
<tr>
<th>Location</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local, on the FMC.</td>
<td>If you do not configure remote storage by mounting a network volume, you can save backup files on the FMC:</td>
</tr>
<tr>
<td></td>
<td>• FMC backups are saved to /var/sf/backup.</td>
</tr>
<tr>
<td></td>
<td>• Device backups are saved to /var/sf/remote-backup on the FMC if you enable the Retrieve to Management Center option when you perform the backup.</td>
</tr>
<tr>
<td>Local, on the device.</td>
<td>Device backup files are saved to /var/sf/backup on the device if you:</td>
</tr>
<tr>
<td></td>
<td>• Do not configure remote storage by mounting a network volume.</td>
</tr>
<tr>
<td></td>
<td>• Do not enable Retrieve to Management Center.</td>
</tr>
</tbody>
</table>

**History for Backup and Restore**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Version</th>

CHAPTER 8

Configuration Import and Export

The following topics explain how to use the Import/Export feature:

- About Configuration Import/Export, on page 193
- Requirements and Prerequisites for Configuration Import/Export, on page 195
- Exporting Configurations, on page 195
- Importing Configurations, on page 196

About Configuration Import/Export

You can use the Import/Export feature to copy configurations between appliances. Import/Export is not a backup tool, but can simplify the process of adding new appliances to your deployment.

You can export a single configuration, or you can export a set of configurations (of the same type or of different types) with a single action. When you later import the package onto another appliance, you can choose which configurations in the package to import.

An exported package contains revision information for that configuration, which determines whether you can import that configuration onto another appliance. When the appliances are compatible but the package includes a duplicate configuration, the system offers resolution options.

Note

The importing and exporting appliances must be running the same version of the Firepower System. For access control and its subpolicies (including intrusion policies), the intrusion rule update version must also match. If the versions do not match, the import fails. You cannot use the Import/Export feature to update intrusion rules. Instead, download and apply the latest rule update version.

Configurations that Support Import/Export

Import/Export is supported for the following configurations:

- Access control policies and the policies they invoke: prefilter, network analysis, intrusion, SSL, file, Threat Defense Service Policy
- Intrusion policies, independently of access control
- NAT policies (Firepower Threat Defense only)
• FlexConfig policies. However, the contents of any secret key variables are cleared when you export the policy. You must manually edit the values of all secret keys after importing a FlexConfig policy that uses secret keys.

• Platform settings

• Health policies

• Alert responses

• Application detectors (both user-defined and those provided by Cisco Professional Services)

• Dashboards

• Custom tables

• Custom workflows

• Saved searches

• Custom user roles

• Report templates

• Third-party product and vulnerability mappings

Special Considerations for Configuration Import/Export

When you export a configuration, the system also exports other required configurations. For example, exporting an access control policy also exports any subpolicies it invokes, objects and object groups it uses, ancestor policies (in a multidomain deployment), and so on. As another example, if you export a platform settings policy with external authentication enabled, the authentication object is exported as well. There are some exceptions, however:

• System-provided databases and feeds—The system does not export URL filtering category and reputation data, Cisco Intelligence Feed data, or the geolocation database (GeoDB). Make sure all the appliances in your deployment obtain up-to-date information from Cisco.

• Global Security Intelligence lists—The system exports Global Security Intelligence Block and Do Not Block lists associated with exported configurations. (In a multidomain deployment, this occurs regardless of your current domain. The system does not export descendant domain lists.) The import process converts these lists to user-created lists, then uses those new lists in the imported configurations. This ensures that imported lists do not conflict with existing Global Block and Do Not Block lists. To use Global lists on the importing Firepower Management Center in your imported configurations, add them manually.

• Intrusion policy shared layers—The export process breaks intrusion policy shared layers. The previously shared layer is included in the package, and imported intrusion policies do not contain shared layers.

• Intrusion policy default variable set—The export package includes a default variable set with custom variables and system-provided variables with user-defined values. The import process updates the default variable set on the importing Firepower Management Center with the imported values. However, the import process does not delete custom variables not present in the export package. The import process also does not revert user-defined values on the importing Firepower Management Center, for values not set in the export package. Therefore, an imported intrusion policy may behave differently than expected if the importing Firepower Management Center has differently configured default variables.
• Custom user objects—If you have created custom user groups or objects in your Firepower Management Center and if such a custom user object is a part of any rule in your access control policy, note that the export file (.sfo) does not carry the user object information and therefore while importing such a policy, any reference to such custom user objects will be removed and will not be imported to the destination Firepower Management Center. To avoid detection issues due to the missing user group, add the customized user objects manually to the new Firepower Management Center and re-configure the access control policy after import.

When you import objects and object groups:

• Generally, the import process imports objects and groups as new, and you cannot replace existing objects and groups. However, if network and port objects or groups in an imported configuration match existing objects or groups, the imported configuration reuses the existing objects/groups, rather than creating new objects/groups. The system determines a match by comparing the name (minus any autogenerated number) and content of each network and port object/group.

• If the names of imported objects match existing objects on the importing Firepower Management Center, the system appends autogenerated numbers to the imported object and group names to make them unique.

• You must map any security zones and interface groups used in the imported configurations to matching-type zones and groups managed by the importing Firepower Management Center.

• If you export a configuration that uses PKI objects containing private keys, the system decrypts the private keys before export. On import, the system encrypts the keys with a randomly generated key.

Requirements and Prerequisites for Configuration Import/Export

Model Support
Any

Supported Domains
Any

User Roles
• Admin

Exporting Configurations

Depending on the number of configurations being exported and the number of objects those configurations reference, the export process may take several minutes.

Tip
Many list pages in the Firepower System include an YouTube EDU (©) next to list items. Where this icon is present, you can use it as a quick alternative to the export procedure that follows.
Before you begin

- Confirm that the importing and exporting appliances are running the same version of the Firepower System. For access control and its subpolicies (including intrusion policies), the intrusion rule update version must also match.

---

### Importing Configurations

Depending on the number of configurations being imported and the number of objects those configurations reference, the import process may take several minutes.

#### Note

If you log out of the system, if you change to a different domain, or if your user session times out after you click **Import**, the import process continues in the background until it is complete.

Before you begin

- Confirm that the importing and exporting appliances are running the same version of the Firepower System. For access control and its subpolicies (including intrusion policies), the intrusion rule update version must also match.

---

### Importing Configurations

- **Step 1**: On the importing appliance, choose **System > Tools > Import/Export**.
- **Step 2**: Click **Upload Package**.
- **Step 3**: Enter the path to the exported package or browse to its location, then click **Upload**.
- **Step 4**: If there are no version mismatches or other issues, choose the configurations you want to import, then click **Import**. If you do not need to perform any conflict resolution or interface object mapping, the import completes and a success message appears. Skip the rest of this procedure.
- **Step 5**: If prompted, on the Import Conflict Resolution page, map interface objects used in the imported configurations to zones and groups with matching interface types managed by the importing Firepower Management Center.

   Interface object type (security zone or interface group) and interface type (passive, inline, routed, and so on) of source and destination objects must match. For information, see Interface Objects: Interface Groups and Security Zones, on page 450.

   If the configurations you are importing reference security zones or interface groups that do not already exist, you can map them to existing interface objects, or create new ones.

   **Note**: For individual access control policies, you have the option of replacing an existing policy with the imported ones. However, for nested access control policies, you can only import them as new policies.
Step 6  Click Import.

Step 7  If prompted, on the Import Resolution page, expand each configuration and choose the appropriate option as described in Import Conflict Resolution, on page 197.

Step 8  Click Import.

Step 9  Update all feeds.

For example, go to Objects > Object Management > Security Intelligence and click the Update Feed button on the URL, Network, and DNS Lists and Feeds pages.

Imported policies do not include feed contents.

Step 10  Wait for all feed updates to complete before deploying the policies to devices.

What to do next

- Optionally, view a report summarizing the imported configurations; see Viewing Task Messages, on page 352.

Import Conflict Resolution

When you attempt to import a configuration, the system determines whether a configuration of the same name and type already exists on the appliance. In a multidomain deployment, the system also determines whether a configuration is a duplicate of a configuration defined in the current domain or any of its ancestor or descendant domains. (You cannot view configurations in descendant domains, but if a configuration with a duplicate name exists in a descendant domain, the system notifies you of the conflict.) When an import includes a duplicate configuration, the system offers resolution options suitable to your deployment from among the following:

- **Keep existing**
  
The system does not import that configuration.

- **Replace existing**
  
The system overwrites the current configuration with the configuration selected for import.

- **Keep newest**
  
The system imports the selected configuration only if its timestamp is more recent than the timestamp on the current configuration on the appliance.

- **Import as new**
  
The system imports the selected duplicate configuration, appending a system-generated number to the name to make it unique. (You can change this name before completing the import process.) The original configuration on the appliance remains unchanged.

The resolution options the system offers depends on whether your deployment uses domains, and whether the imported configuration is a duplicate of a configuration defined in the current domain, or a configuration defined in an ancestor or descendant of the current domain. The following table lists when the system does or does not present a resolution option.
When you import an access control policy with a file policy that uses clean or custom detection file lists and a file list presents a duplicate name conflict, the system offers conflict resolution options as described in the table above, but the action the system performs on the policies and file lists varies as described in the table below:

<table>
<thead>
<tr>
<th>Resolution Option</th>
<th>System Action</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Firepower Management Center</strong></td>
</tr>
<tr>
<td></td>
<td>Duplicate in current domain</td>
</tr>
<tr>
<td>Keep existing</td>
<td>Yes</td>
</tr>
<tr>

</table>

If you modify an imported configuration on an appliance, and later re-import that configuration to the same appliance, you must choose which version of the configuration to keep.
Task Scheduling

The following topics explain how to schedule tasks:

• About Task Scheduling, on page 199
• Requirements and Prerequisites for Task Scheduling, on page 199
• Configuring a Recurring Task, on page 200
• Scheduled Task Review, on page 215
• History for Scheduled Tasks, on page 217

About Task Scheduling

You can schedule many different types of administrative tasks to run at designated times, either once or on a recurring basis.

Tasks configured using this feature are scheduled in UTC, which means when they occur locally depends on the date and your specific location. Also, because tasks are scheduled in UTC, they do not adjust for Daylight Saving Time, summer time, or any such seasonal adjustments that you may observe in your location. If you are affected, scheduled tasks occur one hour "later" in the summer than in the winter, according to local time.

Important

We strongly recommend you review scheduled tasks to be sure they occur when you intend.

Note

Some tasks (such as those involving automated software updates or that require pushing updates to managed devices) may place a significant load on networks with low bandwidths. You should schedule tasks like these to run during periods of low network use.

Requirements and Prerequisites for Task Scheduling

Model Support

Any.
Configuring a Recurring Task

You set the frequency for a recurring task using the same process for all types of tasks.

Note that the time displayed on most pages on the web interface is the local time, which is determined by using the time zone you specify in your local configuration. Further, the Firepower Management Center automatically adjusts its local time display for daylight saving time (DST), where appropriate. However, recurring tasks that span the transition dates from DST to standard time and back do not adjust for the transition. That is, if you create a task scheduled for 2:00 AM during standard time, it will run at 3:00 AM during DST. Similarly, if you create a task scheduled for 2:00 AM during DST, it will run at 1:00 AM during standard time.

Step 1
Select System > Tools > Scheduling.

Step 2
Click Add Task.

Step 3
From the Job Type drop-down list, select the type of task that you want to schedule.

Step 4
Click Recurring next to the Schedule task to run option.

Step 5
In the Start On field, specify the date when you want to start your recurring task.

Step 6
In the Repeat Every field, specify how often you want the task to recur.
You can either type a number or click Up (↑) and Down (↓) to specify the interval. For example, type 2 and click Days to run the task every two days.

Step 7
In the Run At field, specify the time when you want to start your recurring task.

Step 8
For a task to be run on a weekly or monthly basis, select the days when you want to run the task in the Repeat On field.

Step 9
Select the remaining options for the type of task you are creating:

- Backup - Schedule backup jobs as described in Schedule FMC Backups, on page 201.
- Download CRL - Schedule certificate revocation list downloads as described in Configuring Certificate Revocation List Downloads, on page 203.
- Deploy Policies - Schedule policy deployment as described in Automating Policy Deployment, on page 204.
- Nmap Scan - Schedule Nmap scans as described in Scheduling an Nmap Scan, on page 205.
- Firepower Recommended Rules - Schedule automatic update of Firepower recommended rules as described in Automating Firepower Recommendations, on page 208.
Scheduled Backups

You can use the scheduler on a Firepower Management Center or a 7000/8000 series device to automate its own backups. You can also schedule remote device backups from the FMC. For more information on backups, see Backup and Restore, on page 165.

Note that not all devices support remote backups.

Schedule FMC Backups

You can use the scheduler on the Firepower Management Center to automate both FMC and device backups. Note that not all devices support remote backups. For more information, see Backup and Restore, on page 165.

Before you begin

Create a backup profile that specifies your backup preferences: Create a Backup Profile, on page 177. You must be in the global domain to perform this task.

Step 1 Choose System > Tools > Scheduling.

Step 2 From the Job Type list, select Backup.

Step 3 Specify whether you want to back up Once or Recurring.

• For one-time tasks, use the drop-down lists to specify the start date and time.

• For recurring tasks, see Configuring a Recurring Task, on page 200.

Step 4 Enter a Job Name.

Step 5 For the Backup Type, click Management Center.

Step 6 Choose a Backup Profile.

Step 7 (Optional) Enter a Comment.

Keep comments brief. They will appear in the Task Details section of the schedule calendar page.

Step 8 (Optional) Enter an email address, or a comma-separated list of email addresses, in the Email Status To: field.
For information on setting up an email relay server to send task status messages, see Configuring a Mail Relay Host and Notification Address, on page 1068.

Step 9 Click Save.

---

**Schedule Remote Device Backups**

You can use the scheduler on the Firepower Management Center to automate both FMC and device backups. Note that not all devices support remote backups. For more information, see Backup and Restore, on page 165.

You must be in the global domain to perform this task.

---

**Step 1** Choose System > Tools > Scheduling.

**Step 2** From the Job Type list, select Backup.

**Step 3** Specify whether you want to back up Once or Recurring.

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see Configuring a Recurring Task, on page 200.

**Step 4** Enter a Job Name.

**Step 5** For the Backup Type, click Device.

**Step 6** Select one or more devices.

If your device is not listed, it does not support remote backup.

**Step 7** If you did not configure remote storage for backups, choose whether you want to Retrieve to Management Center.

- Enabled (default): Saves the backup to the FMC in /var/sf/remote-backup/.
- Disabled: Saves the backup to the device in /var/sf/backup/.

If you configured remote backup storage, backup files are saved remotely and this option has no effect. For more information, see Manage Backups and Remote Storage, on page 189.

**Step 8** (Optional) Enter a Comment.

Keep comments brief. They will appear in the Task Details section of the schedule calendar page.

**Step 9** (Optional) Enter an email address, or a comma-separated list of email addresses, in the Email Status To: field.

For information on setting up an email relay server to send task status messages, see Configuring a Mail Relay Host and Notification Address, on page 1068.

**Step 10** Click Save.

---

**Schedule Local 7000 & 8000 Series Device Backups**

You can use the scheduler on a 7000 or 8000 Series device to automate its own backups. To use the FMC to schedule backups, see Schedule FMC Backups, on page 201.
Step 1: On the device's web interface, choose **System > Tools > Scheduling**.

Step 2: From the **Job Type** list, select **Backup**.

Step 3: Specify whether you want to back up **Once** or **Recurring**.

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see **Configuring a Recurring Task**, on page 200.

Step 4: Enter a **Job Name**.

Step 5: Choose a **Backup Profile**.

Step 6: (Optional) Enter a **Comment**.

Keep comments brief. They will appear in the Task Details section of the schedule calendar page.

Step 7: (Optional) Enter an email address, or a comma-separated list of email addresses, in the **Email Status To:** field.

For information on setting up an email relay server to send task status messages, see **Configuring a Mail Relay Host and Notification Address**, on page 1068.

Step 8: Click **Save**.

---

**Configuring Certificate Revocation List Downloads**

You must perform this procedure using the local web interface for the Firepower Management Center or the 7000 or 8000 Series device. In a multidomain deployment, this task is only supported in the Global domain for the Firepower Management Center.

The system automatically creates the Download CRL task when you enable downloading a certificate revocation list (CRL) in the local configuration on an appliance where you enable user certificates or audit log certificates for the appliance. You can use the scheduler to edit the task to set the frequency of the update.

**Before you begin**

- Enable and configure user certificates or audit log certificates and set one or more CRL download URLs. See **Requiring Valid HTTPS Client Certificates**, on page 1039 and **Require Valid Audit Log Server Certificates**, on page 1065 for more information.

Step 1: Select **System > Tools > Scheduling**.

Step 2: Click **Add Task**.

Step 3: From **Job Type**, select **Download CRL**.

Step 4: Specify how you want to schedule the CRL download, **Once** or **Recurring**:

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see **Configuring a Recurring Task**, on page 200 for details.
Automating Policy Deployment

After modifying configuration settings in the FMC, you must deploy those changes to the affected devices. In a multidomain deployment, you can schedule policy deployments only for your current domain.

Caution

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 and Configurations that Restart the Snort Process When Deployed or Activated, on page 388.

Related Topics

Configuring a Mail Relay Host and Notification Address, on page 1068

Automating Policy Deployment

Select System > Tools > Scheduling.

Click Add Task.

From Job Type, select Deploy Policies.

Specify how you want to schedule the task, Once or Recurring:

• For one-time tasks, use the drop-down lists to specify the start date and time.

• For recurring tasks, see Configuring a Recurring Task, on page 200 for details.

Type a name in the Job Name field.

In the Device field, select a device where you want to deploy policies.

Select or deselect the Skip deployment for up-to-date devices check box, as required.

By default, the Skip deployment for up-to-date devices option is enabled to improve performance during the policy deployment process.

Note

The system does not perform a scheduled policy deployment task if a policy deployment initiated from the Firepower Management Center web interface is in progress. Correspondingly, the system does not permit you to initiate a policy deployment from the web interface if a scheduled policy deployment task is in-progress.

If you want to comment on the task, type a comment in the Comment field.

The comment field displays in the Tasks Details section of the schedule calendar page; keep comments brief.
Step 9
If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.

Step 10
Click **Save**.

---

- Configuring a Mail Relay Host and Notification Address, on page 1068
- Out-of-Date Policies, on page 392

---

**Nmap Scan Automation**

You can schedule regular Nmap scans of targets on your network. Automated scans allow you to refresh information previously supplied by an Nmap scan. Because the Firepower System cannot update Nmap-supplied data, you need to rescan periodically to keep that data up to date. You can also schedule scans to automatically test for unidentified applications or servers on hosts in your network.

Note that a Discovery Administrator can also use an Nmap scan as a remediation. For example, when an operating system conflict occurs on a host, that conflict may trigger an Nmap scan. Running the scan obtains updated operating system information for the host, which resolves the conflict.

If you have not used the Nmap scanning capability before, you configure Nmap scanning before defining a scheduled scan.

**Related Topics**
- Nmap Scanning, on page 2063

---

**Scheduling an Nmap Scan**

After Nmap replaces a host’s operating system, applications, or servers detected by the system with the results from an Nmap scan, the system no longer updates the information replaced by Nmap for the host. Nmap-supplied service and operating system data remains static until you run another Nmap scan. If you plan to scan a host using Nmap, you may want to set up regularly scheduled scans to keep Nmap-supplied operating systems, applications, or servers up to date. If the host is deleted from the network map and re-added, any Nmap scan results are discarded and the system resumes monitoring of all operating system and service data for the host.

In a multidomain deployment:

- You can schedule scans only for your current domain
- The remediation and Nmap targets you select must exist at your current domain or an ancestor domain.
- Choosing to perform an Nmap scan on a non-leaf domain scans the same targets in each descendant of that domain.

---

**Step 1**
Select **System > Tools > Scheduling**.

**Step 2**
Click **Add Task**.

**Step 3**
From **Job Type**, select **Nmap Scan**.

**Step 4**
Specify how you want to schedule the task, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
Automating Report Generation

You can automate reports so that they run at regular intervals.

In a multidomain deployment, you can schedule reports only for your current domain.

Before you begin

- For reports other than risk reports: Create a report template. See Report Templates, on page 2273 for more information.

- If you want to distribute email reports using the scheduler, configure a mail relay host and specify report recipients and message information. See Configuring a Mail Relay Host and Notification Address, on page 1068 and (for reports other than risk reports) Distributing Reports by Email at Generation Time, on page 2291 or (for risk reports) Generating, Viewing, and Printing Risk Reports, on page 2272.

- (Optional) Set or change the file name, output format, time window, or email distribution settings of the scheduled report. See Specify Report Generation Settings for a Scheduled Report, on page 207.

- If you will choose PDF as the report output format, look at the report template and verify that the number of results in each section of the template does not exceed the limit for PDFs. For information, see Report Template Fields, on page 2274.

Step 1
Select System > Tools > Scheduling.
Step 2
Click Add Task.
Step 3
From the Job Type list, select Report.
Step 4
Specify how you want to schedule the task, Once or Recurring:

- For one-time tasks, use the drop-down lists to specify the start date and time.

- For recurring tasks, see Configuring a Recurring Task, on page 200 for details.

Step 5
Type a name in the Job Name field.
Step 6
In the Nmap Remediation field, select an Nmap remediation.
Step 7
In the Nmap Target field, select the scan target.
Step 8
In the Domain field, select the domain whose network map you want to augment.
Step 9
If you want to comment on the task, type a comment in the Comment field.

Tip
The comment field appears in the Task Details section of the calendar schedule page; keep comments brief.

Step 10
If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the Email Status To: field. You must have a valid email relay server configured to send status messages.
Step 11
Click Save.

Related Topics

Configuring a Mail Relay Host and Notification Address, on page 1068
Step 5  Type a name in the **Job Name** field.
Step 6  In the **Report Template** field, select a risk report or report template.
Step 7  If you want to comment on the task, type a comment in the **Comment** field.
The comment field appears in the Tasks Details section of the schedule calendar page; keep comments brief.
Step 8  If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.

**Note** Configuring this option does **not** distribute the reports.
Step 9  If you do not want to receive report email attachments when reports have no data (for example, when no events of a certain type occurred during the report period), select the **If report is empty, still attach to email** check box.
Step 10 Click **Save**.

---

**Specify Report Generation Settings for a Scheduled Report**

You must have Admin or Security Analyst privileges to perform this task.

To specify or change the file name, output format, time window, or email distribution settings of a scheduled report:

**Step 1** Select **Overview > Reporting > Report Templates**.
**Step 2** Click **Edit** for the report template to change.
**Step 3** If you will select PDF output:
  a) Look to see whether any of the sections in the report shows a yellow triangle beside the number of results.
  b) If you see any yellow triangles, mouse over the triangle to view the maximum number of results allowable for that section for PDF output.
  c) For each section with a yellow triangle, reduce the number of results to a number below the limit.
  d) When there are no more yellow triangles, click **Save**.
**Step 4** Click **Generate**.

**Note** If you want to change report generation settings without generating the report now, you must click **Generate** from the template configuration page. Changes will not be saved if you click **Generate** from the template list view unless you generate the report.

**Step 5** Modify settings.
**Step 6** To save the new settings without generating the report, click **Cancel**.
To save the new settings and generate the report, click **Generate** and skip the rest of the steps in this procedure.
**Step 7** Click **Save**.
**Step 8** If you see a prompt to save even though you haven't made changes, click **OK**.
Automating Firepower Recommendations

You can automatically generate rule state recommendations based on network discovery data for your network using the most recently saved configuration settings in a custom intrusion policy.

**Note**

If the system automatically generates scheduled recommendations for an intrusion policy with unsaved changes, you must discard your changes in that policy and commit the policy if you want the policy to reflect the automatically generated recommendations.

When the task runs, the system automatically generates recommended rule states, and modifies the states of intrusion rules based on the configuration of your policy. Modified rule states take effect the next time you deploy your intrusion policy.

In a multidomain deployment, you can automate recommendations for intrusion policies at the current domain level. The system builds a separate network map for each leaf domain. In a multidomain deployment, if you enable this feature in an intrusion policy in an ancestor domain, the system generates recommendations using data from all descendant leaf domains. This can enable intrusion rules tailored to assets that may not exist in all leaf domains, which can affect performance.

**Before you begin**

- Configure Firepower recommended rules in an intrusion policy as described in [Generating and Applying Firepower Recommendations, on page 1730](#).
- If you want to email task status messages, configure a valid email relay server.
- You must have the Threat Smart License or Protection Classic License to generate recommendations.

**Step 1** Choose **System > Tools > Scheduling**.

**Step 2** Click **Add Task**.

**Step 3** From **Job Type**, choose **Firepower Recommended Rules**.

**Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see [Configuring a Recurring Task, on page 200](#) for details.

**Step 5** Enter a name in the **Job Name** field.

**Step 6** Next to **Policies**, choose one or more intrusion policies where you want to generate recommendations. Check **All Policies** check box to choose all intrusion policies.

**Step 7** (Optional) Enter a comment in the **Comment** field.

Keep comments brief. Comments appear in the Task Details section of the schedule calendar page.

**Step 8** (Optional) To email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field.

**Step 9** Click **Save**.
Software Update Automation

You can automatically download and apply most patches and feature releases to the Firepower System. The tasks you must schedule to install software updates vary depending on whether you are updating the FMC or are using a FMC to update managed devices.

**Note**

Cisco *strongly* recommends that you use your FMCs to update the devices they manage.

- To update the FMC, schedule the software installation using the Install Latest Update task.
- To use a FMC to automate software updates for its managed devices, you must schedule two tasks:
  - Push (copy) the update to managed devices using the Push Latest Update task.
  - Install the update on managed devices using the Install Latest Update task.

When scheduling updates to managed devices, schedule the push and install tasks to happen in succession; you must first push the update to the device before you can install it. To automate software updates on a device group, you must select all the devices within the group. Allow enough time between tasks for the process to complete; schedule tasks at least 30 minutes apart. If you schedule a task to install an update and the update has not finished copying from the FMC to the device, the installation task will not succeed. However, if the scheduled installation task repeats daily, it will install the pushed update when it runs the next day.

**Note**

You must manually upload and install updates in two situations. First, you cannot schedule major updates to the Firepower System. Second, you cannot schedule updates for or pushes from FMC that cannot access the Support Site. If your FMC is not directly connected to the Internet, you should use management interfaces configuration to set up a proxy to allow it to download updates from the Support Site.

Note that a task scheduled to install an update on a device group will install the pushed update to each device within the device group simultaneously. Allow enough time for the scheduled task to complete for each device within the device group.

If you want to have more control over this process, you can use the **Once** option to download and install updates during off-peak hours after you learn that an update has been released.

### Automating Software Downloads

You can create a scheduled task that automatically downloads the latest software updates from Cisco. You can use this task to schedule download of updates you plan to install manually.

You must be in the global domain to perform this task.

**Step 1** Select System > Tools > Scheduling.

**Step 2** Click Add Task.

**Step 3** From the Job Type list, select Download Latest Update.

**Step 4** Specify how you want to schedule the task, Once or Recurring:

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see Configuring a Recurring Task, on page 200 for details.

**Step 5** Type a name in the Job Name field.

**Step 6** Next to Update Items, check Software check box.

**Step 7** If you want to comment on the task, type a comment in the Comment field.

The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.

**Step 8** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the Email Status To: field. You must have a valid email relay server configured to send status messages.

**Step 9** Click Save.

**Related Topics**

Configuring a Mail Relay Host and Notification Address, on page 1068

### Automating Software Pushes

If you want to automate the installation of software updates on managed devices, you must push the updates to the devices before installing.

When you create the task to push software updates to managed devices, make sure you allow enough time between the push task and a scheduled install task for the updates to be copied to the device.

You must be in the global domain to perform this task.

**Step 1** Select System > Tools > Scheduling.

**Step 2** Click Add Task.

**Step 3** From the Job Type list, select Push Latest Update.

**Step 4** Specify how you want to schedule the task, Once or Recurring:

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see Configuring a Recurring Task, on page 200 for details.

**Step 5** Type a name in the Job Name field.

**Step 6** From the Device drop-down list, select the device that you want to update.
Automating Software Installs

Make sure you allow enough time between the task that pushes the update to a managed device and the task that installs the update.

You must be in the global domain to perform this task.

⚠️ Caution
Depending on the update being installed, the appliance may reboot after the software is installed.

Step 1
Select System > Tools > Scheduling.

Step 2
Click Add Task.

Step 3
From the Job Type list, select Install Latest Update.

Step 4
Specify how you want to schedule the task, Once or Recurring:

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see Configuring a Recurring Task, on page 200 for details.

Step 5
Type a name in the Job Name field.

Step 6
From the Device drop-down list, select the appliance (including the Firepower Management Center) where you want to install the update.

Step 7
Next to Update Items, check the Software check box.

Step 8
If you want to comment on the task, type a comment in the Comment field.

The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.

Step 9
If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the Email Status To: field. You must have a valid email relay server configured to send status messages.

Step 10
Click Save.
Vulnerability Database Update Automation

Cisco uses vulnerability database (VDB) updates to expand the list of network assets, traffic, and vulnerabilities that the Firepower System recognizes. You can use the scheduling feature to update the VDB, thereby ensuring that you are using the most up-to-date information to evaluate the hosts on your network.

When automating VDB updates, you must automate two separate steps:

- Downloading the VDB update.
- Installing the VDB update.

Caution

When a VDB update includes changes applicable to managed devices, the first manual or scheduled deploy after installing the VDB restarts the Snort process, interrupting traffic inspection. Deploy dialog messages warn you of restarts in pending deploys to Firepower Threat Defense devices. Whether traffic drops or passes without further inspection during this interruption depends on how the targeted device handles traffic. You cannot deploy VDB updates that apply only to the Firepower Management Center, and they do not cause restarts. See Snort® Restart Traffic Behavior, on page 386 for more information.

Allow enough time between tasks for the process to complete. For example, if you schedule a task to install an update and the update has not fully downloaded, the installation task will not succeed. However, if the scheduled installation task repeats daily, it will install the downloaded VDB update when the task runs the next day.

Note:

- You cannot schedule updates for appliances that cannot access the Support Site. If your FMC is not directly connected to the Internet, you should use management interfaces configuration to set up a proxy to allow it to download updates from the Support Site.
- If you want to have more control over this process, you can use the Once option to download and install VDB updates during off-peak hours after you learn that an update has been released.
- In multidomain deployments, you can only schedule VDB updates for the Global domain. The changes take effect when you redeploy policies.

Management Interfaces, on page 1044

Automating VDB Update Downloads

You must be in the global domain to perform this task.

Step 1
Select System > Tools > Scheduling.

Step 2
Click Add Task.

Step 3
From the Job Type list, select Download Latest Update.

Step 4
Specify how you want to schedule the task, Once or Recurring:

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see Configuring a Recurring Task, on page 200 for details.
Step 5 Type a name in the Job Name field.
Step 6 Next to Update Items, check the Vulnerability Database check box.
Step 7 If you want to comment on the task, type a comment in the Comment field.

The comment field appears in the Task Details section of the calendar schedule page; keep comments brief.

Step 8 If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the Email Status To: field. You must have a valid email relay server configured to send status messages.
Step 9 Click Save.

Related Topics
Configuring a Mail Relay Host and Notification Address, on page 1068

Automating VDB Update Installs

Allow enough time between the task that downloads the VDB update and the task that installs the update. You must be in the global domain to perform this task.

⚠️ Caution
When a VDB update includes changes applicable to managed devices, the first manual or scheduled deploy after installing the VDB restarts the Snort process, interrupting traffic inspection. Deploy dialog messages warn you of restarts in pending deploys to Firepower Threat Defense devices. Whether traffic drops or passes without further inspection during this interruption depends on how the targeted device handles traffic. You cannot deploy VDB updates that apply only to the Firepower Management Center, and they do not cause restarts. See Snort® Restart Traffic Behavior, on page 386 for more information.

Step 1 Select System > Tools > Scheduling.
Step 2 Click Add Task.
Step 3 From the Job Type list, select Install Latest Update.
Step 4 Specify how you want to schedule the task, Once or Recurring:
  • For one-time tasks, use the drop-down lists to specify the start date and time.
  • For recurring tasks, see Configuring a Recurring Task, on page 200 for details.

Step 5 Type a name in the Job Name field.
Step 6 From the Device drop-down list, select the FMC.
Step 7 Next to Update Items, check the Vulnerability Database check box.
Step 8 If you want to comment on the task, type a comment in the Comment field.

Tip The comment field appears in the View Tasks section of the page, so you should try to keep it relatively short.

Step 9 If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the Email Status To: field. You must have a valid email relay server configured to send status messages.
Step 10 Click Save.
Automating URL Filtering Updates Using a Scheduled Task

In order to ensure that threat data for URL filtering is current, the system must obtain data updates from the Cisco Collective Security Intelligence (CSI) cloud.

By default, when you enable URL filtering, automatic updates are enabled. However, if you need to control when these updates occur, use the procedure described in this topic instead of the default update mechanism.

Although daily updates tend to be small, if it has been more than five days since your last update, new URL filtering data may take up to 20 minutes to download, depending on your bandwidth. Then, it may take up to 30 minutes to perform the update itself.

Before you begin

• Ensure the Firepower Management Center has internet access; see Security, Internet Access, and Communication Ports, on page 2677.
• Ensure that URL filtering is enabled. See Enable URL Filtering Using Category and Reputation, on page 1415 for more information.
• Verify that Enable Automatic Updates is not selected on the Cloud Services under the System > Integration menu.
• You must be in the global domain to perform this task. You must also have the URL Filtering license.

---

Step 1  Select System > Tools > Scheduling.
Step 2  Click Add Task.
Step 3  From the Job Type list, select Update URL Filtering Database.
Step 4  Specify how you want to schedule the update, Once or Recurring:
  • For one-time tasks, use the drop-down lists to specify the start date and time.
  • For recurring tasks, see Configuring a Recurring Task, on page 200 for details.
Step 5  Type a name in the Job Name field.
Step 6  If you want to comment on the task, type a comment in the Comment field.
Step 7  If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the Email Status To: field. You must have a valid email relay server configured to send status messages.
Step 8  Click Save.

---

Scheduled Task Review

After adding scheduled tasks, you can view them and evaluate their status. The View Options section of the page allows you to view scheduled tasks using a calendar and a list of scheduled tasks.

The Calendar view option allows you to view which scheduled tasks occur on which day.

The Task List shows a list of tasks along with their status. The task list appears below the calendar when you open the calendar. In addition, you can view it by selecting a date or task from the calendar.

You can edit a scheduled task that you previously created. This feature is especially useful if you want to test a scheduled task once to make sure that the parameters are correct. Later, after the task completes successfully, you can change it to a recurring task.

There are two types of deletions you can perform from the Schedule View page. You can delete a specific one-time task that has not yet run or you can delete every instance of a recurring task. If you delete an instance of a recurring task, all instances of the task are deleted. If you delete a task that is scheduled to run once, only that task is deleted.

</tbody>
</table>

**Step 1**
Select **System > Tools > Scheduling**.

**Step 2**
You can perform the following tasks using the calendar view:

- Click **Double Left Arrow (ToLeft)** to move back one year.
- Click **Single Left Arrow (Left)** to move back one month.
- Click **Single Right Arrow (Right)** to move forward one month.
- Click **Double Right Arrow (Forward)** to move forward one year.
- Click **Today** to return to the current month and year.
- Click **Add Task** to schedule a new task.
- Click a date to view all scheduled tasks for the specific date in a task list table below the calendar.
- Click a specific task on a date to view the task in a task list table below the calendar.

**Editing Scheduled Tasks**

In a multidomain deployment, you can edit scheduled tasks only for your current domain.

**Step 1**
Select **System > Tools > Scheduling**.

**Step 2**
On the calendar, click either the task that you want to edit or the day on which the task appears.

**Step 3**
In the **Task Details** table, click **Edit (Edit)** next to the task you want to edit.

**Step 4**
Edit the task.

**Step 5**
Click **Save**.
Deleting Scheduled Tasks

In a multidomain deployment, you can delete scheduled tasks only for your current domain.

Step 1
Select System > Tools > Scheduling.

Step 2
In the calendar, click the task you want to delete. For a recurring task, click an instance of the task.

Step 3
In the Task Details table, click Delete ( ), then confirm your choice.

Purging Data from the FMC Database

You can use the database purge page to purge discovery, identity, connection, and Security Intelligence data files from the FMC databases. Note that when you purge a database, the appropriate process is restarted.

⚠️ Caution
Purging a database removes the data you specify from the Firepower Management Center. After the data is deleted, it cannot be recovered.

Before you begin
You must have Admin or Security Analyst privileges to purge data. You can be in the global domain only.

Step 1
Choose System > Tools > Data Purge.

Step 2
Under Discovery and Identity, perform any or all of the following:

• Check the Network Discovery Events check box to remove all network discovery events from the database.
• Check the Hosts check box to remove all hosts and Host Indications of Compromise flags from the database.
• Check the User Activity check box to remove all user activity events from the database.
• Check the User Identities check box to remove all user login and user history data from the database, as well as User Indications of Compromise flags.

Step 3
Under Connections, perform any or all of the following:

• Check the Connection Events check box to remove all connection data from the database.
• Check the Connection Summary Events check box to remove all connection summary data from the database.
• Check the Security Intelligence Events check box to remove all Security Intelligence data from the database.

Note
Checking the Connection Events check box does not remove Security Intelligence events. Connections with Security Intelligence data will still appear in the Security Intelligence event page (available under the Analysis > Connections menu). Correspondingly, checking the Security Intelligence Events check box does not remove connection events with associated Security Intelligence data.

Step 4
Click Purge Selected Events.
The items are purged and the appropriate processes are restarted.

External Data Storage

You can optionally use remote data storage for store certain types of data.
### Remote Data Storage in the Stealthwatch Cloud

Send select Firepower event data via syslog to the Stealthwatch Cloud using Cisco Security Analytics and Logging (SaaS). Supported events: Connection, Security Intelligence, intrusion, file, and malware.

---

**Important**

If you will use syslog or store events externally, avoid special characters in object names such as policy and rule names. Object names should not contain special characters, such as commas, that the receiving application may use as separators.

CHAPTER 11

Firepower Management Center High Availability

The following topics describe how to configure Active/Standby high availability of Cisco Firepower Management Centers:

• About Firepower Management Center High Availability, on page 223
• Requirements for Firepower Management Center High Availability, on page 227
• Prerequisites for Firepower Management Center High Availability, on page 229
• Establishing Firepower Management Center High Availability, on page 230
• Viewing Firepower Management Center High Availability Status, on page 231
• Configurations Synced on Firepower Management Center High Availability Pairs, on page 232
• Using CLI to Resolve Device Registration in Firepower Management Center High Availability, on page 233
• Switching Peers in a Firepower Management Center High Availability Pair, on page 233
• Pausing Communication Between Paired Firepower Management Centers, on page 234
• Restarting Communication Between Paired Firepower Management Centers, on page 234
• Changing the IP address of a Firepower Management Center in a High Availability Pair, on page 234
• Disabling Firepower Management Center High Availability, on page 235
• Replacing FMCs in a High Availability Pair, on page 236

About Firepower Management Center High Availability

To ensure the continuity of operations, the high availability feature allows you to designate redundant Firepower Management Centers to manage devices. Firepower Management Centers support Active/Standby high availability where one appliance is the active unit and manages devices. The standby unit does not actively manage devices. The active unit writes configuration data into a data store and replicates data for both units, using synchronization where necessary to share some information with the standby unit.

Active/Standby high availability lets you configure a secondary Firepower Management Center to take over the functionality of a primary Firepower Management Center if the primary fails. When the primary Firepower Management Center fails, you must promote the secondary Firepower Management Center to become the active unit.

Event data streams from managed devices to both Firepower Management Centers in the high availability pair. If one Firepower Management Center fails, you can monitor your network without interruption using the other Firepower Management Center.

Note that Firepower Management Centers configured as a high availability pair do not need to be on the same trusted management network, nor do they have to be in the same geographic location.
Caution: Because the system restricts some functionality to the active Firepower Management Center, if that appliance fails, you must promote the standby Firepower Management Center to active.

About Remote Access VPN High Availability

If the primary device has Remote Access VPN configuration with an identity certificate enrolled using a CertEnrollment object, the secondary device must have an identity certificate enrolled using the same CertEnrollment object. The CertEnrollment object can have different values for the primary and secondary devices due to device-specific overrides. The limitation is only to have the same CertEnrollment object enrolled on the two devices before the high availability formation.

Roles v. Status in Firepower Management Center High Availability

Primary/Secondary Roles

When setting up Firepower Management Centers in a high availability pair, you configure one Firepower Management Center to be primary and the other as secondary. During configuration, the primary unit's policies are synchronized to the secondary unit. After this synchronization, the primary Firepower Management Center becomes the active peer, while the secondary Firepower Management Center becomes the standby peer, and the two units act as a single appliance for managed device and policy configuration.

Active/Standby Status

The main differences between the two Firepower Management Centers in a high availability pair are related to which peer is active and which peer is standby. The active Firepower Management Center remains fully functional, where you can manage devices and policies. On the standby Firepower Management Center, functionality is hidden; you cannot make any configuration changes.

Event Processing on Firepower Management Center High Availability Pairs

Since both Firepower Management Centers in a high availability pair receive events from managed devices, the management IP addresses for the appliances are not shared. This means that you do not need to intervene to ensure continuous processing of events if a Firepower Management Center fails.

AMP Cloud Connections and Malware Information

Although they share file policies and related configurations, Firepower Management Centers in a high availability pair share neither Cisco AMP cloud connections nor malware dispositions. To ensure continuity of operations, and to ensure that detected files' malware dispositions are the same on both Firepower Management Centers, both primary and secondary Firepower Management Centers must have access to the AMP cloud.

URL Filtering and Security Intelligence

URL filtering and Security Intelligence configurations and information are synchronized between Firepower Management Centers in a high availability deployment. However, only the primary Firepower Management Center downloads URL category and reputation data for updates to Security Intelligence feeds.
If the primary Firepower Management Center fails, not only must you make sure that the secondary Firepower Management Center can access the internet to update threat intelligence data, but you must also use the web interface on the secondary Firepower Management Center to promote it to active.

User Data Processing During Firepower Management Center Failover

If the primary Firepower Management Center fails, the Secondary Firepower Management Center propagates to managed devices user-to-IP mappings from the TS Agent and user agent identity sources; and propagates SGT mappings from the ISE/ISE-PIC identity source. Users not yet seen by identity sources are identified as Unknown.

After the downtime, the Unknown users are re identified and processed according to the rules in your identity policy.

Configuration Management on Firepower Management Center High Availability Pairs

In a high availability deployment, only the active Firepower Management Center can manage devices and apply policies. Both Firepower Management Centers remain in a state of continuous synchronization.

If the active Firepower Management Center fails, the high availability pair enters a degraded state until you manually promote the standby appliance to the active state. Once the promotion is complete, the appliances leave maintenance mode.

Cisco Threat Intelligence Director (TID) and High Availability Configurations

If you host TID on the active Firepower Management Center in a high availability configuration, the system does not synchronize TID configurations and TID data to the standby Firepower Management Center. We recommend performing regular backups of TID data on your active Firepower Management Center so that you can restore the data after failover.

For details, see About Backing Up and Restoring TID Data, on page 1631.

Firepower Management Center High Availability Behavior During a Backup

When you perform a Backup on a Firepower Management Center high availability pair, the Backup operation pauses synchronization between the peers. During this operation, you may continue using the active Firepower Management Center, but not the standby peer.

After Backup is completed, synchronization resumes, which briefly disables processes on the active peer. During this pause, the High Availability page briefly displays a holding page until all processes resume.

Firepower Management Center High Availability Split-Brain

If the active Firepower Management Center in a high-availability pair goes down (due to power issues, network/connectivity issues), you can promote the standby Firepower Management Center to an active state. When the original active peer comes up, both peers can assume they are active. This state is defined as 'split-brain'. When this situation occurs, the system prompts you to choose an active appliance, which demotes the other appliance to standby.
If the active Firepower Management Center goes down (or disconnects due to a network failure), you may either break high availability or switch roles. The standby Firepower Management Center enters a degraded state.

Note: Whichever appliance you use as the secondary loses all of its device registrations and policy configurations when you resolve split-brain. For example, you would lose modifications to any policies that existed on the secondary but not on the primary. If the Firepower Management Center is in a high availability split-brain scenario where both appliances are active, and you register managed devices and deploy policies before you resolve split-brain, you must export any policies and unregister any managed devices from the intended standby Firepower Management Center before re-establishing high availability. You may then register the managed devices and import the policies to the intended active Firepower Management Center.

Upgrading Firepower Management Centers in a High Availability Pair

Cisco electronically distributes several different types of updates periodically. These include major and minor upgrades to the system software. You may need to install these updates on Firepower Management Centers in a high availability setup.

Warning: Make sure that there is at least one operational Firepower Management Center during an upgrade.

Before you begin

Read the release notes or advisory text that accompanies the upgrade. The release notes provide important information, including supported platforms, compatibility, prerequisites, warnings, and specific installation and uninstallation instructions.

Step 1
Access the web interface of the active Firepower Management Center and pause data synchronization; see Pausing Communication Between Paired Firepower Management Centers, on page 234.

Step 2
Upgrade the standby Firepower Management Center; see Update Software on a Firepower Management Center. When the upgrade completes, the standby unit becomes active. When both peers are active, the high availability pair is in a degraded state (split-brain).

Step 3
Upgrade the other Firepower Management Center.

Step 4
Decide which Firepower Management Center you want to use as the standby. Any additional devices or policies added to the standby after pausing synchronization are not synced to the active Firepower Management Center. Unregister only those additional devices and export any configurations you want to preserve.

When you choose a new active Firepower Management Center, the Firepower Management Center you designate as secondary will lose device registrations and deployed policy configurations, which are not synced.

Step 5
Resolve split-brain by choosing the new active Firepower Management Center which has all the latest required configurations for policies and devices.
Troubleshooting Firepower Management Center High Availability

This section lists troubleshooting information for some common Firepower Management Center high availability operation errors.

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>500 Internal</td>
<td>May appear when attempting to access the web interface while performing critical Firepower Management Center high availability operations, including switching peer roles or pausing and resuming synchronization.</td>
<td>Wait until the operation completes before using the web interface.</td>
</tr>
</tbody>
</table>

1. Access the Firepower Management Center shell and use the manage_hadc.pl command to access the Firepower Management Center high availability configuration utility. Note: Run the utility as a root user, using sudo.
2. Pause mirroring operations by using option 5.
3. Reload the Firepower Management Center web interface.
4. Use the web interface to resume synchronization. Choose System > Integration, then click the High Availability tab and choose Resume Synchronization.

System processes are starting, please wait. Also, the web interface does not respond.

May appear when the Firepower Management Center reboots (manually or while recovering from a power down) during a high availability or data synchronization operation.

Requirements for Firepower Management Center High Availability

Model Support

See Hardware Requirements, on page 228.

Supported Domains

Global

User Roles

Admin
Hardware Requirements

- Supported hardware models:
  MC1000, MC1500, MC1600, MC2000, MC2500, MC2600, MC3500, MC4000, MC4500, MC4600
- The two Firepower Management Centers in a high availability configuration must be the same model.
- The primary Firepower Management Center backup must not be restored to the secondary Firepower Management Center.

Bandwidth Requirements: There must be at least a 5Mbps network bandwidth between two Firepower Management Centers to setup a high availability configuration between them.

The two Firepower Management Centers in a high availability configuration may be physically and geographically separated from each other in different data centers.

See also License Requirements for FMC High Availability Configurations, on page 228.

Software Requirements

Access the Appliance Information widget to verify the software version, the intrusion rule update version and the vulnerability database update. By default, the widget appears on the Status tab of the Detailed Dashboard and the Summary Dashboard. For more information, see The Appliance Information Widget, on page 282

- The two Firepower Management Centers in a high availability configuration must have the same major (first number), minor (second number), and maintenance (third number) software version.
- The two Firepower Management Centers in a high availability configuration must have the same version of the intrusion rule update installed.
- The two Firepower Management Centers in a high availability configuration must have the same version of the vulnerability database update installed.
- The two Firepower Management Centers in a high availability configuration must have the same version of the LSP (Lightweight Security Package) installed.

⚠️ Warning

If the software versions, intrusion rule update versions and vulnerability database update versions are not identical on both Firepower Management Centers, you cannot establish high availability.

License Requirements for FMC High Availability Configurations

All Licensing Types

No special license is required for Firepower Management Center hardware appliances in a high availability pair.

A device managed with Firepower Management Center hardware appliances in a high availability configuration requires the same number of feature licenses and subscriptions as a device managed by a single Firepower Management Center hardware appliance.
In Specific License Reservation deployments, only the primary FMC requires a Specific License Reservation. The system automatically replicates all feature licenses from active to standby Firepower Management Center when the high-availability pair is formed, and updates license changes during ongoing data synchronization, so the licenses are available on failover.

**Smart Licensing**

Each FTD device requires the same licenses whether managed by a single FMC or by FMCs in a high availability pair.

Example: If you want to enable advanced malware protection for two Firepower Threat Defense devices managed by a Firepower Management Center pair, buy two Malware licenses and two TM subscriptions, register the active Firepower Management Center with the Cisco Smart Software Manager, then assign the licenses to the two Firepower Threat Defense devices on the active Firepower Management Center.

Only the active Firepower Management Center is registered with Cisco Smart Software Manager. When failover occurs, the system communicates with Cisco Smart Software Manager to release the Smart License entitlements from the originally-active Firepower Management Center and assign them to the newly-active Firepower Management Center.

**Classic Licensing**

Each device requires the same licenses whether managed by a single FMC or by FMCs in a high availability pair.

Example: If you want to enable advanced malware protection for two devices managed by a Firepower Management Center pair, buy two Malware licenses and two TAM subscriptions, add those licenses to the Firepower Management Center, then assign the licenses to the two devices on the active Firepower Management Center.

**Prerequisites for Firepower Management Center High Availability**

Before establishing a Firepower Management Center high availability pair:

- Export required policies from the intended secondary Firepower Management Center to the intended primary Firepower Management Center. For more information, see Exporting Configurations, on page 195.

- Make sure that the intended secondary Firepower Management Center does not have any devices added to it. Delete devices from the intended secondary Firepower Management Center and register these devices to the intended primary Firepower Management Center. For more information see Delete a Device from the FMC, on page 255 and Add a Device to the FMC, on page 252.

- Import the policies into the intended primary Firepower Management Center. For more information, see Importing Configurations, on page 196.

- On the intended primary Firepower Management Center, verify the imported policies, edit them as needed and deploy them to the appropriate device. For more information, see Deploy Configuration Changes, on page 382.
Establishing Firepower Management Center High Availability

Establishing high availability can take a significant amount of time, even several hours, depending on the bandwidth between the peers and the number of policies. It also depends on the number of devices registered to the active Firepower Management Center, which need to be synced to the standby Firepower Management Center. You can view the High Availability page to check the status of the high availability peers.

Before you begin

- Confirm that both the Firepower Management Centers adhere to the high availability system requirements. For more information, see Requirements for Firepower Management Center High Availability, on page 227.
- Confirm that you completed the prerequisites for establishing high availability. For more information, see Prerequisites for Firepower Management Center High Availability, on page 229.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Log into the Firepower Management Center that you want to designate as the secondary.</td>
</tr>
<tr>
<td>2</td>
<td>Choose System &gt; Integration.</td>
</tr>
<tr>
<td>3</td>
<td>Choose High Availability.</td>
</tr>
<tr>
<td>4</td>
<td>Under Role for this Firepower Management Center, choose Secondary.</td>
</tr>
<tr>
<td>5</td>
<td>Enter the hostname or IP address of the primary Firepower Management Center in the Primary Firepower Management Center Host text box. You can leave this empty if the primary Firepower Management Center does not have an IP address reachable from the peer FMC (which can be public or private IP address). In this case, use both the Registration Key and the Unique NAT ID fields. You need to specify the IP address of at least one FMC to enable HA connection.</td>
</tr>
<tr>
<td>6</td>
<td>Enter a one-time-use registration key in the Registration Key text box. The registration key is any user-defined alphanumeric value up to 37 characters in length. This registration key will be used to register both -the secondary and the primary Firepower Management Centers.</td>
</tr>
<tr>
<td>7</td>
<td>If you did not specify the primary IP address, or if you do not plan to specify the secondary IP address on the primary Firepower Management Center, then in the Unique NAT ID field, enter a unique alphanumeric ID. See NAT Environments, on page 1046 for more information.</td>
</tr>
<tr>
<td>8</td>
<td>Click Register.</td>
</tr>
<tr>
<td>9</td>
<td>Using an account with Admin access, log into the Firepower Management Center that you want to designate as the primary.</td>
</tr>
</tbody>
</table>
Step 10  Choose **System > Integration**.

Step 11  Choose **High Availability**.

Step 12  Under Role for this Firepower Management Center, choose **Primary**.

Step 13  Enter the hostname or IP address of the secondary Firepower Management Center in the **Secondary Firepower Management Center Host** text box.

You can leave this empty if the secondary Firepower Management Center does not have an IP address reachable from the peer FMC (which can be public or private IP address). In this case, use both the **Registration Key** and the **Unique NAT ID** fields. You need to specify the IP address of at least one FMC to enable HA connection.

Step 14  Enter the same one-time-use registration key in the **Registration Key** text box you used in step 6.

Step 15  If required, enter the same NAT ID that you used in step 7 in the **Unique NAT ID** text box.

Step 16  Click **Register**.

---

**What to do next**

After establishing a Firepower Management Center high availability pair, devices registered to the active Firepower Management Center are automatically registered to the standby Firepower Management Center.

---

**Note**

When a registered device has a NAT IP address, automatic device registration fails and the secondary Firepower Management Center High Availability page lists the device as local, pending. You can then assign a different NAT IP address to the device on the standby Firepower Management Center High Availability page. If automatic registration otherwise fails on the standby Firepower Management Center, but the device appears to be registered to the active Firepower Management Center, see Using CLI to Resolve Device Registration in Firepower Management Center High Availability, on page 233.

---

**Viewing Firepower Management Center High Availability Status**

After you identify your active and standby Firepower Management Centers, you can view information about the local Firepower Management Center and its peer.

---

**Note**

In this context, Local Peer refers to the appliance where you are viewing the system status. Remote Peer refers to the other appliance, regardless of active or standby status.

---

Step 1  Log into one of the Firepower Management Centers that you paired using high availability.

Step 2  Choose **System > Integration**.

Step 3  Choose **High Availability**.

You can view:

**Summary Information**

- The health status of the high availability pair
- The current synchronization status of the high availability pair
- The IP address of the active peer and the last time it was synchronized
- The IP address of the standby peer and the last time it was synchronized

System Status
- The IP addresses for both peers
- The operating system for both peers
- The software version for both peers
- The appliance model of both peers

Configurations Synced on Firepower Management Center High Availability Pairs

When you establish high availability between two Firepower Management Centers, the following configuration data is synced between them:
- License entitlements
- Access control policies
- Intrusion rules
- Malware and file policies
- DNS policies
- Identity policies
- SSL policies
- Prefilter policies
- Network discovery rules
- Application detectors
- Correlation policy rules
- Alerts
- Scanners
- Response groups
- Contextual cross-launch of external resources for investigating events
- Integration with Cisco Security Packet Analyzer
Using CLI to Resolve Device Registration in Firepower Management Center High Availability

If automatic device registration fails on the standby Firepower Management Center, but appears to be registered to the active Firepower Management Center, complete the following steps:

**Warning**
If you do an RMA of Secondary Firepower Management Center or add a Secondary Firepower Management Center, the managed FTDs are unregistered and as a result, their configuration may be deleted.

**Step 1**
Unregister the device from the active Firepower Management Center.

**Step 2**
Log into the CLI for the affected device.

**Step 3**
Run the CLI command: `configure manager delete`.
This command disables and removes the current Firepower Management Center.

**Step 4**
Run the CLI command: `configure manager add`.
This command configures the device to initiate a connection to a Firepower Management Center.

**Tip**
Configure remote management on the device, only for the active Firepower Management Center. When high availability is established, devices are automatically added to be managed by the standby Firepower Management Center.

**Step 5**
Log into the active Firepower Management Center and register the device.

Switching Peers in a Firepower Management Center High Availability Pair

Because the system restricts some functionality to the active Firepower Management Center, if that appliance fails, you must promote the standby Firepower Management Center to active:

**Step 1**
Log into one of the Firepower Management Centers that you paired using high availability.

**Step 2**
Choose System > Integration.

**Step 3**
Choose High Availability.

**Step 4**
Choose Switch Peer Roles to change the local role from Active to Standby, or Standby to Active. With the Primary or Secondary designation unchanged, the roles are switched between the two peers.
Pausing Communication Between Paired Firepower Management Centers

If you want to temporarily disable high availability, you can disable the communications channel between the Firepower Management Centers. If you pause synchronization on the active peer, you can resume synchronization on either the standby or active peer. However, if you pause synchronization on the standby peer, you only can resume synchronization on the standby peer.

Step 1 Log into one of the Firepower Management Centers that you paired using high availability.
Step 2 Choose System > Integration.
Step 3 Choose High Availability.
Step 4 Choose Pause Synchronization.

Restarting Communication Between Paired Firepower Management Centers

If you temporarily disable high availability, you can restart high availability by enabling the communications channel between the Firepower Management Centers. If you paused synchronization on the active unit, you can resume synchronization on either the standby or active unit. However, if you paused synchronization on the standby unit, you only can resume synchronization on the standby unit.

Step 1 Log into one of the Firepower Management Centers that you paired using high availability.
Step 2 Choose System > Integration.
Step 3 Choose High Availability.
Step 4 Choose Resume Synchronization.

Changing the IP address of a Firepower Management Center in a High Availability Pair

Note

If you landed on this topic while trying to edit remote management on a 7000 and 8000 Series managed device, see Editing Remote Management on a Managed Device, on page 541.

If the IP address for one of the high availability peers changes, high availability enters a degraded state. To recover high availability, you must manually change the IP address.
Step 1  Log into one of the Firepower Management Centers that you paired using high availability.
Step 2  Choose System > Integration.
Step 3  Choose High Availability.
Step 4  Choose Peer Manager.
Step 5  Choose Edit (✓).
Step 6  Enter the display name of the appliance, which is used only within the context of the Firepower System.
   Entering a different display name does not change the host name for the appliance.
Step 7  Enter the fully qualified domain name or the name that resolves through the local DNS to a valid IP address (that is, the host name), or the host IP address.
Step 8  Click Save.

Disabling Firepower Management Center High Availability

Step 1  Log into one of the Firepower Management Centers in the high availability pair.
Step 2  Choose System > Integration.
Step 3  Choose High Availability.
Step 4  Choose Break High Availability.
Step 5  Choose one of the following options for handling managed devices:
   • To control all managed devices with this Firepower Management Center, choose Manage registered devices from this console. All devices will be unregistered from the peer.
   • To control all managed devices with the other Firepower Management Center, choose Manage registered devices from peer console. All devices will be unregistered from this Firepower Management Center.
   • To stop managing devices altogether, choose Stop managing registered devices from both consoles. All devices will be unregistered from both Firepower Management Centers.

Note  If you choose to manage the registered devices from the secondary Firepower Management Center, the devices will be unregistered from the primary Firepower Management Center. The devices are now registered to be managed by the secondary Firepower Management Center. However the licenses that were applied to these devices are deregistered on account of the high availability break operation. You must now proceed to re-register (enable) the licenses on the devices from the secondary Firepower Management Center. For more information see Move or Remove Licenses from FTD Devices, on page 113.

Step 6  Click OK.
Replacing FMCs in a High Availability Pair

If you need to replace a failed unit in a Firepower Management Center high availability pair, you must follow one of the procedures listed below. The table lists four possible failure scenarios and their corresponding replacement procedures.

<table>
<thead>
<tr>
<th>Failure Status</th>
<th>Data Backup Status</th>
<th>Replacement Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary FMC failed</td>
<td>Data backup successful</td>
<td>Replace a Failed Primary FMC (Successful Backup), on page 236</td>
</tr>
<tr>
<td>Secondary FMC failed</td>
<td>Data backup not successful</td>
<td>Replace a Failed Secondary FMC (Successful Backup), on page 238</td>
</tr>
</tbody>
</table>

Replace a Failed Primary FMC (Successful Backup)

Two Firepower Management Centers, FMC1 and FMC2, are part of a high availability pair. FMC1 is the primary and FMC2 is the secondary. This task describes the steps to replace a failed primary Firepower Management Center, FMC1, when data backup from the primary is successful.

Before you begin

Verify that the data backup from the failed primary Firepower Management Center is successful.

---

**Step 1**
Contact Support to request a replacement for a failed Firepower Management Center - FMC1.

**Step 2**
When the primary Firepower Management Center - FMC1 fails, access the web interface of the secondary Firepower Management Center - FMC2 and switch peers. For more information, see Switching Peers in a Firepower Management Center High Availability Pair, on page 233.

This promotes the secondary Firepower Management Center - FMC2 to active.

You can use FMC2 as the active Firepower Management Center until the primary Firepower Management Center - FMC1 is replaced.

**Caution**
Do not break Firepower Management Center High Availability from FMC2, since licenses that were synced to FMC2 from FMC1 (before failure), will be removed from FMC2 and you will be unable to perform any deploy actions from FMC2.

**Step 3**
Reimage the replacement Firepower Management Center with the same software version as FMC1.

**Step 4**
Restore the data backup retrieved from FMC1 to the new Firepower Management Center.

**Step 5**
Install required Firepower Management Center patches, geolocation database (GeoDB) updates, vulnerability database (VDB) updates and system software updates to match FMC2.

The new Firepower Management Center and FMC2 will now both be active peers, resulting in a high availability split-brain.
Step 6 When the Firepower Management Center web interface prompts you to choose an active appliance, select FMC2 as active. This syncs the latest configuration from FMC2 to the new Firepower Management Center - FMC1.

Step 7 When the configuration syncs successfully, access the web interface of the secondary Firepower Management Center - FMC2 and switch roles to make the primary Firepower Management Center - FMC1 active. For more information, see Switching Peers in a Firepower Management Center High Availability Pair, on page 233.

Step 8 Apply Classic licenses received with the new Firepower Management Center - FMC1 and delete the old licenses. For more information, see Generate a Classic License and Add It to the Firepower Management Center, on page 123. Smart licenses work seamlessly.

What to do next
High availability has now been re-established and the primary and the secondary Firepower Management Centers will now work as expected.

Replace a Failed Primary FMC (Unsuccessful Backup)
Two Firepower Management Centers - FMC1 and FMC2 are part of a high availability pair. FMC1 is the primary and FMC2 is the secondary. This task describes the steps to replace a failed primary Firepower Management Center - FMC1 when data backup from the primary is unsuccessful.

Step 1 Contact Support to request a replacement for a failed Firepower Management Center - FMC1.

Step 2 When the primary Firepower Management Center - FMC1 fails, access the web interface of the secondary Firepower Management Center - FMC2 and switch peers. For more information, see Switching Peers in a Firepower Management Center High Availability Pair, on page 233.

This promotes the secondary Firepower Management Center - FMC2 to active.

You can use FMC2 as the active Firepower Management Center until the primary Firepower Management Center - FMC1 is replaced.

Caution Do not break Firepower Management Center High Availability from FMC2, since classic and smart licenses that were synced to FMC2 from FMC1 (before failure), will be removed from FMC2 and you will be unable to perform any deploy actions from FMC2.

Step 3 Reimage the replacement Firepower Management Center with the same software version as FMC1.

Step 4 Install required Firepower Management Center patches, geolocation database (GeoDB) updates, vulnerability database (VDB) updates and system software updates to match FMC2.

Step 5 Deregister the Firepower Management Center - FMC2 from the Cisco Smart Software Manager. For more information, see Deregister a Firepower Management Center from the Cisco Smart Software Manager, on page 115.

Deregistering a Firepower Management Center from the Cisco Smart Software Manager removes the Management Center from your virtual account. All license entitlements associated with the Firepower Management Center release back to your virtual account. After deregistration, the Firepower Management Center enters Enforcement mode where no update or changes on licensed features are allowed.

Step 6 Access the web interface of the secondary Firepower Management Center - FMC2 and break Firepower Management Center high availability. For more information, see Disabling Firepower Management Center High Availability, on page
When prompted to select an option for handling managed devices, choose Manage registered devices from this console.

As a result, classic and smart licenses that were synced to the secondary Firepower Management Center - FMC2, will be removed and you cannot perform deployment activities from FMC2.

Step 7 Re-establish Firepower Management Center high availability, by setting up the Firepower Management Center - FMC2 as the primary and Firepower Management Center - FMC1 as the secondary. For more information, see Establishing Firepower Management Center High Availability, on page 230.

Step 8 Apply Classic licenses received with the new Firepower Management Center - FMC1 and delete the old licenses. For more information, see Generate a Classic License and Add It to the Firepower Management Center, on page 123.

Step 9 Register a Smart License to the primary Firepower Management Center - FMC2. For more information see Register Smart Licenses, on page 93.

What to do next

High availability has now been re-established and the primary and the secondary Firepower Management Centers will now work as expected.

Replace a Failed Secondary FMC (Successful Backup)

Two Firepower Management Centers - FMC1 and FMC2 are part of a high availability pair. FMC1 is the primary and FMC2 is the secondary. This task describes the steps to replace a failed secondary Firepower Management Center -FMC2 when data backup from the secondary is successful.

Before you begin

Verify that the data backup from the failed secondary Firepower Management Center is successful.

Step 1 Contact Support to request a replacement for a failed Firepower Management Center - FMC2.

Step 2 Continue to use the primary Firepower Management Center - FMC1 as the active Firepower Management Center.

Step 3 Reimage the replacement Firepower Management Center with the same software version as FMC2.

Step 4 Restore the data backup from FMC2 to the new Firepower Management Center.

Step 5 Install required Firepower Management Center patches, geolocation database (GeoDB) updates, vulnerability database (VDB) updates and system software updates to match FMC1.

Step 6 Resume data synchronization (if paused) from the web interface of the new Firepower Management Center - FMC2, to synchronize the latest configuration from the primary Firepower Management Center - FMC1. For more information, see Restarting Communication Between Paired Firepower Management Centers, on page 234. Classic and Smart Licenses work seamlessly.

What to do next

High availability has now been re-established and the primary and the secondary Firepower Management Centers will now work as expected.
Replace a Failed Secondary FMC (Unsuccessful Backup)

Two Firepower Management Centers - FMC1 and FMC2 are part of a high availability pair. FMC1 is the primary and FMC2 is the secondary. This task describes the steps to replace a failed secondary Firepower Management Center - FMC2 when data backup from the secondary is unsuccessful.

Step 1
Contact Support to request a replacement for a failed Firepower Management Center - FMC2.

Step 2
Continue to use the primary Firepower Management Center - FMC1 as the active Firepower Management Center.

Step 3
Reimage the replacement Firepower Management Center with the same software version as FMC2.

Step 4
Install required Firepower Management Center patches, geolocation database (GeoDB) updates, vulnerability database (VDB) updates and system software updates to match FMC1.

Step 5
Access the web interface of the primary Firepower Management Center - FMC1 and break Firepower Management Center high availability. For more information, see Disabling Firepower Management Center High Availability, on page 235. When prompted to select an option for handling managed devices, choose Manage registered devices from this console.

Step 6
Re-establish Firepower Management Center high availability, by setting up the Firepower Management Center - FMC1 as the primary and Firepower Management Center - FMC2 as the secondary. For more information, see Establishing Firepower Management Center High Availability, on page 230.

- When high availability is successfully established, the latest configuration from the primary Firepower Management Center - FMC1 is synchronized to the secondary Firepower Management Center - FMC2.

- Classic and Smart Licenses work seamlessly.

What to do next
High availability has now been re-established and the primary and the secondary Firepower Management Centers will now work as expected.
Replace a Failed Secondary FMC (Unsuccessful Backup)
Device Management Basics

The following topics describe how to manage devices in the Firepower System:

- About Device Management, on page 241
- Requirements and Prerequisites for Device Management, on page 249
- Complete the FTD Initial Configuration, on page 249
- Add a Device to the FMC, on page 252
- Delete a Device from the FMC, on page 255
- Add a Device Group, on page 255
- Configure Device Settings, on page 256
- Change the Manager for the Device, on page 268
- Viewing Device Information, on page 272
- History for Device Management Basics, on page 275

About Device Management

Use the Firepower Management Center to manage your devices.

About the Firepower Management Center and Device Management

When the Firepower Management Center manages a device, it sets up a two-way, SSL-encrypted communication channel between itself and the device. The Firepower Management Center uses this channel to send information to the device about how you want to analyze and manage your network traffic to the device. As the device evaluates the traffic, it generates events and sends them to the Firepower Management Center using the same channel.

By using the Firepower Management Center to manage devices, you can:

- configure policies for all your devices from a single location, making it easier to change configurations
- install various types of software updates on devices
- push health policies to your managed devices and monitor their health status from the Firepower Management Center

The Firepower Management Center aggregates and correlates intrusion events, network discovery information, and device performance data, allowing you to monitor the information that your devices are reporting in relation to one another, and to assess the overall activity occurring on your network.
What Can Be Managed by a Firepower Management Center?

You can use the Firepower Management Center as a central management point in a Firepower System deployment to manage the following devices:

- 7000 and 8000 Series devices
- ASA FirePOWER modules
- NGIPSv devices
- Firepower Threat Defense (physical hardware and virtual)

When you manage a device, information is transmitted between the Firepower Management Center and the device over a secure, SSL-encrypted TCP tunnel.

The following illustration lists what is transmitted between a Firepower Management Center and its managed devices. Note that the types of events and policies that are sent between the appliances are based on the device type.

Beyond Policies and Events

In addition to deploying policies to devices and receiving events from them, you can also perform other device-related tasks on the Firepower Management Center.

Backing Up a Device

You cannot create or restore backup files for NGIPSv devices or ASA FirePOWER modules.

When you perform a backup of a physical managed device from the device itself, you back up the device configuration only. To back up configuration data and, optionally, unified files, perform a backup of the device using the managing Firepower Management Center.

To back up event data, perform a backup of the managing Firepower Management Center.
Updating Devices

From time to time, Cisco releases updates to the Firepower System, including:

- intrusion rule updates, which may contain new and updated intrusion rules
- vulnerability database (VDB) updates
- geolocation updates
- software patches and updates

You can use the Firepower Management Center to install an update on the devices it manages.

About Device Management Interfaces

Each device includes a single dedicated Management interface for communicating with the FMC.

You can perform initial setup on the management interface, or on the console port.

Management interfaces are also used to communicate with the Smart Licensing server, to download updates, and to perform other management functions.

Management Interfaces on Managed Devices

When you set up your device, you specify the FMC IP address that you want to connect to. Both management and event traffic go to this address at initial registration. Note: In some situations, the FMC might establish the initial connection on a different management interface; subsequent connections should use the management interface with the specified IP address.

If the FMC has a separate event-only interface, the managed device sends subsequent event traffic is sent to the FMC event-only interface if the network allows. In addition, some managed-device models include an additional management interface that you can configure for event-only traffic. If the event network goes down, then event traffic reverts to the regular management interfaces on the FMC and/or on the managed device.

Management Interface Support Per Device Model

See the hardware installation guide for your model for the management interface locations.

Note

For the Firepower 4100/9300 chassis, the MGMT interface is for chassis management, not for FTD logical device management. You must configure a separate NIC interface to be of type mgmt (and/or firepower-eventing), and then assign it to the FTD logical device.

Note

For FTD on any chassis, the physical management interface is shared between the Diagnostic logical interface, which is useful for SNMP or syslog, and is configured along with data interfaces in the FMC, and the Management logical interface for FMC communication. See Management/Diagnostic Interface, on page 651 for more information.

See the following table for supported management interfaces on each managed device model.
### Table 26: Management Interface Support on Managed Devices

<table>

**Network Routes on Device Management Interfaces**

Management interfaces (including event-only interfaces) support only static routes to reach remote networks. When you set up your managed device, the setup process creates a default route to the gateway IP address that you specify. You cannot delete this route; you can only modify the gateway address.

---

The routing for management interfaces is completely separate from routing that you configure for data interfaces.

You can configure multiple management interfaces on some platforms (a management interface and an event-only interface). The default route does not include an egress interface, so the interface chosen depends on the gateway address you specify, and which interface's network the gateway belongs to. In the case of multiple interfaces on the default network, the device uses the lower-numbered interface as the egress interface.

At least one static route is recommended per management interface to access remote networks. We recommend placing each interface on a separate network to avoid potential routing problems, including routing problems from other devices to the FTD. If you do not experience problems with interfaces on the same network, then be sure to configure static routes correctly. For example, both management0 and management1 are on the same network, but the FMC management and event interfaces are on different networks. The gateway is 192.168.45.1. If you want management1 to connect to the FMC's event-only interface at 10.6.6.1/24, you can...
create a static route for 10.6.6.0/24 through management1 with the same gateway of 192.168.45.1. Traffic to 10.6.6.0/24 will hit this route before it hits the default route, so management1 will be used as expected.

Another example includes separate management and event-only interfaces on both the FMC and the managed device. The event-only interfaces are on a separate network from the management interfaces. In this case, add a static route through the event-only interface for traffic destined for the remote event-only network, and vice versa.

**NAT Environments**

Network address translation (NAT) is a method of transmitting and receiving network traffic through a router that involves reassigning the source or destination IP address. The most common use for NAT is to allow private networks to communicate with the internet. Static NAT performs a 1:1 translation, which does not pose a problem for FMC communication with devices, but port address translation (PAT) is more common. PAT lets you use a single public IP address and unique ports to access the public network; these ports are dynamically assigned as needed, so you cannot initiate a connection to a device behind a PAT router.

Normally, you need both IP addresses (along with a registration key) for both routing purposes and for authentication: the FMC specifies the device IP address when you add a device, and the device specifies the FMC IP address. However, if you only know one of the IP addresses, which is the minimum requirement for routing purposes, then you must also specify a unique NAT ID on both sides of the connection to establish trust for the initial communication and to look up the correct registration key. The FMC and device use the registration key and NAT ID (instead of IP addresses) to authenticate and authorize for initial registration.

For example, you add a device to the FMC, and you do not know the device IP address (for example, the device is behind a PAT router), so you specify only the NAT ID and the registration key on the FMC; leave the IP address blank. On the device, you specify the FMC IP address, the same NAT ID, and the same registration key. The device registers to the FMC’s IP address. At this point, the FMC uses the NAT ID instead of IP address to authenticate the device.

Although the use of a NAT ID is most common for NAT environments, you might choose to use the NAT ID to simplify adding many devices to the FMC. On the FMC, specify a unique NAT ID for each device you want to add while leaving the IP address blank, and then on each device, specify both the FMC IP address and the NAT ID. Note: The NAT ID must be unique per device.

The following example shows three devices behind a PAT IP address. In this case, specify a unique NAT ID per device on both the FMC and the devices, and specify the FMC IP address on the devices.
The following example shows the FMC behind a PAT IP address. In this case, specify a unique NAT ID per device on both the FMC and the devices, and specify the device IP addresses on the FMC.

**Management and Event Traffic Channel Examples**

The following example shows the Firepower Management Center and managed devices using only the default management interfaces.
The following example shows the Firepower Management Center using separate management interfaces for devices; and each managed device using 1 management interface.

The following example shows the Firepower Management Center and managed devices using a separate event interface.

The following example shows a mix of multiple management interfaces and a separate event interface on the Firepower Management Center and a mix of managed devices using a separate event interface, or using a single management interface.
Requirements and Prerequisites for Device Management

Model Support
Any managed device; unless noted in the procedure.

Supported Domains
The domain in which the device resides.

User Roles
- Admin
- Network Admin

Complete the FTD Initial Configuration

Connect to the FTD CLI to perform initial setup, including setting the Management IP address, gateway, and other basic networking settings using the setup wizard. The dedicated Management interface is a special interface with its own network settings. You will also configure FMC communication settings. You can only configure the Management interface settings; you must configure data interface settings in FMC.

Before you begin
This procedure applies to all FTD devices except for the Firepower 4100/9300. For the Firepower 4100/9300, see Add a Standalone Firepower Threat Defense, on page 636.

Step 1
Connect to the FTD CLI, either from the console port or using SSH to the Management interface, which obtains an IP address from a DHCP server by default. If you intend to change the network settings, we recommend using the console port so you do not get disconnected.

(Firepower 1000/2100) The console port connects to the FXOS CLI. The SSH session connects directly to the FTD CLI.

Step 2
Log in with the username admin and the password Admin123.
(Firepower 1000/2100) At the console port, you connect to the FXOS CLI. The first time you log in to FXOS, you are prompted to change the password. This password is also used for the FTD login for SSH.

Example:

```plaintext
classic-login: admin
Password: Admin123
Successful login attempts for user 'admin' : 1

Hello admin. You must change your password.
Enter new password: ********
Confirm new password: ********
Your password was updated successfully.
```

Step 3  (Firepower 1000/2100) If you connected to FXOS on the console port, connect to the FTD CLI.

```plaintext
connect ftd
```

Step 4  The first time you log in to FTD, you are prompted to accept the End User License Agreement (EULA) and, if using an SSH connection, to change the admin password. You are then presented with the CLI setup script.

**Note**  You cannot repeat the CLI setup wizard unless you clear the configuration; for example, by reimaging. However, all of these settings can be changed later at the CLI using `configure network` commands. See the FTD command reference.

Defaults or previously entered values appear in brackets. To accept previously entered values, press **Enter**.

See the following guidelines:

- **Enter the IPv4 default gateway for the management interface**—The `data-interfaces` setting applies only to Firepower Device Manager management; you should set a gateway IP address for Management 1/1 when using FMC. In the edge deployment example shown in the network deployment section, the inside interface acts as the management gateway. In this case, you should set the gateway IP address to be the intended inside interface IP address; you must later use FMC to set the inside IP address.

- **If your networking information has changed, you will need to reconnect**—If you are connected with SSH but you change the IP address at initial setup, you will be disconnected. Reconnect with the new IP address and password. Console connections are not affected. Note also that the DHCP server on Management will be disabled if you change the IP address.

- **Manage the device locally?**—Enter no to use FMC. A yes answer means you will use Firepower Device Manager instead. Note also that the DHCP server on Management 1/1 will be disabled if it wasn't already.

- **Configure firewall mode**?—We recommend that you set the firewall mode at initial configuration. Changing the firewall mode after initial setup erases your running configuration.
Example:

You must accept the EULA to continue.
Press <ENTER> to display the EULA:
End User License Agreement
[...]

Please enter 'YES' or press <ENTER> to AGREE to the EULA:

System initialization in progress. Please stand by.
You must change the password for 'admin' to continue.
Enter new password: ********
Confirm new password: ********
You must configure the network to continue.
You must configure at least one of IPv4 or IPv6.
Do you want to configure IPv4? {y/n} [y]:
Do you want to configure IPv6? {y/n} [n]:
Configure IPv4 via DHCP or manually? {dhcp/manual} [manual]:
Enter an IPv4 address for the management interface [192.168.45.45]: 10.10.10.15
Enter an IPv4 netmask for the management interface [255.255.255.0]: 255.255.255.192
Enter the IPv4 default gateway for the management interface [data-interfaces]: 10.10.10.1
Enter a comma-separated list of DNS servers or 'none' [208.67.222.222,208.67.220.220]:
Enter a comma-separated list of search domains or 'none' []:
If your networking information has changed, you will need to reconnect.
DHCP Server Disabled
The DHCP server has been disabled. You may re-enable with configure network ipv4 dhcp-server-enable
For HTTP Proxy configuration, run 'configure network http-proxy'

Manage the device locally? {yes/no} [yes]: no
DHCP Server Disabled
Configure firewall mode? {routed/transparent} [routed]:
Configuring firewall mode ... 

Update policy deployment information
- add device configuration
- add network discovery
- add system policy

You can register the sensor to a Firepower Management Center and use the Firepower Management Center to manage it. Note that registering the sensor to a Firepower Management Center disables on-sensor Firepower Services management capabilities.

When registering the sensor to a Firepower Management Center, a unique alphanumeric registration key is always required. In most cases, to register a sensor to a Firepower Management Center, you must provide the hostname or the IP address along with the registration key.
'configure manager add [hostname | ip address ] [registration key ]'

However, if the sensor and the Firepower Management Center are separated by a NAT device, you must enter a unique NAT ID, along with the unique registration key.
'configure manager add DONTRESOLVE [registration key ] [ NAT ID ]'

Later, using the web interface on the Firepower Management Center, you must use the same registration key and, if necessary, the same NAT ID when you add this sensor to the Firepower Management Center.

Step 5  Identify the FMC that will manage this FTD.

configure manager add {hostname | IPv4_address | IPv6_address | DONTRESOLVE} reg_key [nat_id]
• \{hostname | IPv4_address | IPv6_address | DONTRESOLVE\}—Specifies either the FQDN or IP address of the FMC. If the FMC is not directly addressable, use DONTRESOLVE and also specify the nat_id. At least one of the devices, either the FMC or the FTD, must have a reachable IP address to establish the two-way, SSL-encrypted communication channel between the two devices. If you specify DONTRESOLVE in this command, then the FTD must have a reachable IP address or hostname.

• reg_key—Specifies a one-time registration key of your choice that you will also specify on the FMC when you register the FTD. The registration key must not exceed 37 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-).

• nat_id—Specifies a unique, one-time string of your choice that you will also specify on the FMC when you register the FTD when one side does not specify a reachable IP address or hostname. It is required if you set the FMC to DONTRESOLVE. The NAT ID must not exceed 37 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-). This ID cannot be used for any other devices registering to the FMC.

**Example:**

```bash
> configure manager add MC.example.com 123456
Manager successfully configured.
```

If the FMC is behind a NAT device, enter a unique NAT ID along with the registration key, and specify DONTRESOLVE instead of the hostname, for example:

**Example:**

```bash
> configure manager add DONTRESOLVE regk3y78 natid90
Manager successfully configured.
```

If the FTD is behind a NAT device, enter a unique NAT ID along with the FMC IP address or hostname, for example:

**Example:**

```bash
> configure manager add 10.70.45.5 regk3y78 natid56
Manager successfully configured.
```

---

**What to do next**

Register your device to a FMC.

---

# Add a Device to the FMC

Use this procedure to add a single device to the FMC. If you plan to link devices for redundancy or performance, you must still use this procedure, keeping in mind the following points:

• 8000 Series stacks—Use this procedure to add each device to the Firepower Management Center, then establish the stack; see Establishing Device Stacks, on page 584.

• 7000 and 8000 Series high availability—Use this procedure to add each device to the Firepower Management Center, then establish high availability; see Establishing Firepower 7000/8000 Series High Availability, on page 569. For high availability stacks, first stack the devices, then establish high availability between the stacks.
• FTD high availability—Use this procedure to add each device to the Firepower Management Center, then establish high availability; see Add a Firepower Threat Defense High Availability Pair, on page 742.

• FTD clusters—For detailed information about adding clusters, see FMC: Add a Cluster, on page 771.

Note

If you have established or will establish FMC high availability, add devices only to the active (or intended active) FMC. When you establish high availability, devices registered to the active FMC are automatically registered to the standby.

Before you begin

• Set up the device to be managed by the FMC. See:
  • FTD devices: Complete the FTD Initial Configuration, on page 249
  • 7000 and 8000 Series devices: Configuring Remote Management on a Managed Device, on page 540
  • Other device types: The getting started guide for your model

• If you are adding an FTD device, the FMC must be registered to the Smart Licensing server (CSSM). A valid evaluation license is sufficient, but if it expires, you will not be able to add new devices until you successfully register.

• If you registered a FMC and a device using IPv4 and want to convert them to IPv6, you must delete and reregister the device.

Step 1
Choose Devices > Device Management.

Step 2
From the Add drop-down menu, choose Device.

Step 3
In the Host field, enter the IP address or the hostname of the device you want to add.

The hostname of the device is the fully qualified domain name or the name that resolves through the local DNS to a valid IP address. Use a hostname rather than an IP address if your network uses DHCP to assign IP addresses.

In a NAT environment, you may not need to specify the IP address or hostname of the device, if you already specified the IP address or hostname of the FMC when you configured the device to be managed by the FMC. For more information, see NAT Environments, on page 246.

Step 4
In the Display Name field, enter a name for the device as you want it to display in the FMC.

Step 5
In the Registration Key field, enter the same registration key that you used when you configured the device to be managed by the FMC. The registration key is a one-time-use shared secret. The key can include alphanumeric characters and hyphens (-).

Step 6
In a multidomain deployment, regardless of your current domain, assign the device to a leaf Domain.

If your current domain is a leaf domain, the device is automatically added to the current domain. If your current domain is not a leaf domain, post-registration, you must switch to the leaf domain to configure the device.

Step 7
(Optional) Add the device to a device Group.

Step 8
Choose an initial Access Control Policy to deploy to the device upon registration, or create a new policy.
If the device is incompatible with the policy you choose, deploying will fail. This incompatibility could occur for multiple reasons, including licensing mismatches, model restrictions, passive vs inline issues, and other misconfigurations. After you resolve the issue that caused the failure, manually deploy configurations to the device.

**Step 9**

Choose licenses to apply to the device.

**Smart Licensing**

Assign the Smart Licenses you need for the features you want to deploy:

- **Malware** (if you intend to use AMP malware inspection)
- **Threat** (if you intend to use intrusion prevention)
- **URL** (if you intend to implement category-based URL filtering)

**Note** You can apply an AnyConnect remote access VPN license after you add the device, from the System > Licenses > Smart Licenses page.

**Classic Licensing**

- Control, Malware, and URL Filtering licenses require a Protection license.
- VPN licenses require a 7000 or 8000 Series device.
- Control licenses are supported on NGIPSv and ASA FirePOWER devices, but do not allow you to configure 8000 Series fastpath rules, switching, routing, stacking, or device high availability.

**Step 10**

If you used a NAT ID during device setup, expand in the **Advanced** section and enter the same NAT ID in the **Unique NAT ID** field. The NAT ID can include alphanumeric characters and hyphens (-).

**Step 11**

Check the **Transfer Packets** check box to allow the device to transfer packets to the Firepower Management Center.

This option is enabled by default. When events like IPS or Snort are triggered with this option enabled, the device sends event metadata information and packet data to the FMC for inspection. If you disable it, only event information will be sent to the FMC but packet data is not sent.

**Step 12**

Click **Register**.

It may take up to two minutes for the FMC to verify the device’s heartbeat and establish communication. If the registration succeeds, the device is added to the list. If it fails, you will see an error message. If the device fails to register, check the following items:

- **Ping**—Access the device CLI, and ping the FMC IP address using the following command:

  ```
ping system ip_address
  ```

  If the ping is not successful, check your network settings using the `show network` command. If you need to change the device IP address, use the `configure network {ipv4 | ipv6} manual` command.

- Registration key, NAT ID, and FMC IP address—Make sure you are using the same registration key, and if used, NAT ID, on both devices. You can set the registration key and NAT ID on the device using the `configure manager add` command.

For more troubleshooting information, see https://cisco.com/go/fmc-reg-error.
Delete a Device from the FMC

If you no longer want to manage a device, you can delete it from the FMC. Deleting a device:

- Severs all communication between the Firepower Management Center and the device.
- Removes the device from the Device Management page.
- Returns the device to local time management if the device is configured via the platform settings policy to receive time from the FMC via NTP.

To manage the device later, re-add it to the FMC.

Note
When a device is deleted and then re-added, the FMC web interface prompts you to re-apply your access control policies. However, there is no option to re-apply the NAT and VPN policies during registration. Any previously applied NAT or VPN configuration will be removed during registration and must be re-applied after registration is complete.

Step 1  Choose Devices > Device Management.
Step 2  Next to the device you want to delete, click Delete (-trash).
Step 3  Confirm that you want to delete the device.

Add a Device Group

The Firepower Management Center allows you to group devices so you can easily deploy policies and install updates on multiple devices. You can expand and collapse the list of devices in the group.

In a multidomain deployment, you can create device groups within a leaf domain only. When you configure a Firepower Management Center for multitenancy, existing device groups are removed; you can re-add them at the leaf domain level.

If you add the primary device in a stack or a high-availability pair to a group, both devices are added to the group. If you unstack the devices or break the high-availability pair, both devices remain in that group.

Step 1  Choose Devices > Device Management.
Step 2  From the Add drop-down menu, choose Add Group.
       To edit an existing group, click Edit (-pencil) for the group you want to edit.
Step 3  Enter a Name.
Step 4  Under Available Devices, choose one or more devices to add to the device group. Use Ctrl or Shift while clicking to choose multiple devices.
Step 5  Click Add to include the devices you chose in the device group.
Configure Device Settings

After you add a device, you can configure some settings on the device's Device page.

Managing System Shut Down

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Any</td>
<td>Any except ASA FirePOWER</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

Note: You cannot shut down or restart the ASA FirePOWER with the Firepower System user interface. See the ASA documentation for more information on how to shut down the respective devices.

Step 1 Choose Devices > Device Management.
Step 2 Next to the device that you want to restart, click Edit (edit).
Step 3 Click Device.
Tip For stacked devices, you shut down or restart an individual device on the Devices page of the appliance editor.
Step 4 To shut down the device, click Shut Down Device (shut down) in the System section.
Step 5 When prompted, confirm that you want to shut down the device.
Step 6 To restart the device, click Restart Device (restart).
Step 7 When prompted, confirm that you want to restart the device.

Edit Management Settings

You can edit management settings in the Management area.

Update the Hostname or IP Address in FMC

If you edit the hostname or IP address of a device after you added it to the FMC (using the device’s CLI, for example), you need to use the procedure below to manually update the hostname or IP address on the managing FMC.
To change the device management IP address on the device, see Modify Device Management Interfaces at the CLI, on page 257.

---

**Step 1**  
Choose **Devices > Device Management**.

**Step 2**  
Next to the device where you want to modify management options, click **Edit**.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3**  
Click **Device**, and view the **Management** area.

**Tip**  
For stacked devices, you modify management options on an individual device on the **Device** page of the appliance editor.

**Step 4**  
Disable management temporarily by clicking the **Slider enabled**.

You are prompted to proceed with disabling management; click **Yes**.

Disabling management blocks the connection between the Firepower Management Center and the device, but does **not** delete the device from the Firepower Management Center.

**Step 5**  
Edit the **Host** IP address or hostname by clicking **Edit**.

In the **Management** dialog box, modify the name or IP address in the **Host** field, and click **Save**.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

---

**Modify Device Management Interfaces at the CLI**

Modify the management interface settings on the managed device using the CLI. Many of these settings are ones that you set when you performed the initial setup; this procedure lets you change those settings, and set additional settings such as enabling an event interface if your model supports it, or adding static routes.

For information about the FTD CLI, see the FTD command reference.

For information about the classic device CLI, see Classic Device Command Line Reference, on page 2685 in this guide.

The FTD and classic devices use the same commands for management interface configuration. Other commands may differ between the platforms.

---

**Note**

When using SSH, be careful when making changes to the management interface; if you cannot re-connect because of a configuration error, you will need to access the device console port.
If you change the device management IP address, then see the following tasks for FMC connectivity depending on how you identified the FMC during initial device setup using the `configure manager add` command (see Identify a New FMC, on page 268):

- **IP address**—No action. If you identified the FMC using a reachable IP address, then the management connection will be reestablished automatically after several minutes. We recommend that you also change the device IP address shown in FMC to keep the information in sync; see Update the Hostname or IP Address in FMC, on page 256. This action can help the connection reestablish faster. **Note:** If you specified an unreachable FMC IP address, then see the procedure for NAT ID below.

- **NAT ID only**—Manually reestablish the connection. If you identified the FMC using only the NAT ID, then the connection cannot be automatically reestablished. In this case, change the device management IP address in FMC according to Update the Hostname or IP Address in FMC, on page 256.

Note: In a High Availability configuration, when you modify the management IP address of a registered Firepower device from the device CLI or from the FMC, the secondary FMC does not reflect the changes even after an HA synchronization. To ensure that the secondary FMC is also updated, switch roles between the two FMCs, making the secondary FMC the active unit. Modify the management IP address of the registered Firepower device on the device management page of the now active FMC.

**Before you begin**

- For Firepower Threat Defense devices, you can create user accounts that can log into the CLI using the `configure user add` command; see Add an Internal User at the CLI, on page 48. You can also configure AAA users according to Configure External Authentication for SSH, on page 1114.

- For the 7000 & 8000 Series devices, you can create user accounts at the web interface as described in Add an Internal User at the Web Interface, on page 45.

---

**Step 1**
Connect to the device CLI, either from the console port or using SSH.
See Logging Into the Command Line Interface on FTD Devices, on page 31 or Logging Into the CLI on 7000/8000 Series, ASA FirePOWER, and NGIPSv Devices, on page 30.

**Step 2**
Log in with the Admin username and password.

**Step 3**
Enable an event-only interface (for supported models; see Management Interface Support Per Device Model, on page 243).

```
configure network management-interface enable management_interface
```

```
configure network management-interface disable-management-channel management_interface
```

**Example:**
This example is for a Firepower 4100 or 9300 device; valid interface names differ by device type.

```
> configure network management-interface enable management1
Configuration updated successfully
```
The Firepower Management Center event-only interface cannot accept management channel traffic, so you should simply disable the management channel on the device event interface.

You can optionally disable events for the management interface using the `configure network management-interface disable-events-channel` command. In either case, the device will try to send events on the event-only interface, and if that interface is down, it will send events on the management interface even if you disable the event channel.

You cannot disable both event and management channels on an interface.

**Step 4**

Configure the network settings of the management interface and/or event interface:

If you do not specify the `management_interface` argument, then you change the network settings for the default management interface. When configuring an event interface, be sure to specify the `management_interface` argument. The event interface can be on a separate network from the management interface, or on the same network. If you are connected to the interface you are configuring, you will be disconnected. You can re-connect to the new IP address.

a) Configure the IPv4 address:

- Manual configuration:

  `configure network ipv4 manual ip_address netmask gateway_ip [management_interface]`

  Note that the `gateway_ip` in this command is used to create the default route for the device. If you configure an event-only interface, then you must enter the `gateway_ip` as part of the command; however, this entry just configures the default route to the value you specify and does not create a separate static route for the eventing interface. If you are using an event-only interface on a different network from the management interface, we recommend that you set the `gateway_ip` for use with the management interface, and then create a static route separately for the event-only interface using the `configure network static-routes` command.

  **Example:**

  ```
  > configure network ipv4 manual 10.10.10.45 255.255.255.0 10.10.10.1 management1
  Setting IPv4 network configuration.
  Network settings changed.
  ```

  - DHCP (supported on the default management interface only):

    `configure network ipv4 dhcp`

b) Configure the IPv6 address:

- Stateless autoconfiguration:

  `configure network ipv6 router [management_interface]`

  **Example:**

  ```
  > configure network ipv6 router management0
  Setting IPv6 network configuration.
  Network settings changed.
  ```
• Manual configuration:

configure network ipv6 manual ip6_address ip6_prefix_length [ip6_gateway_ip] [management_interface]

Note that the ipv6_gateway_ip in this command is used to create the default route for the device. If you configure an event-only interface, then you must enter the ipv6_gateway_ip as part of the command; however, this entry just configures the default route to the value you specify and does not create a separate static route for the eventing interface. If you are using an event-only interface on a different network from the management interface, we recommend that you set the ipv6_gateway_ip for use with the management interface, and then create a static route separately for the event-only interface using the configure network static-routes command.

Example:

> configure network ipv6 manual 2001:0DB8:BA98::3210 64 management1
Setting IPv6 network configuration.
Network settings changed.
>

• DHCPv6 (supported on the default management interface only):

configure network ipv6 dhcp

Step 5

For IPv6, enable or disable ICMPv6 Echo Replies and Destination Unreachable messages. These messages are enabled by default.

configure network ipv6 destination-unreachable {enable | disable}
configure network ipv6 echo-reply {enable | disable}

You might want to disable these packets to guard against potential denial of service attacks. Disabling Echo Reply packets means you cannot use IPv6 ping to the device management interfaces for testing purposes.

Example:

> configure network ipv6 destination-unreachable disable
> configure network ipv6 echo-reply disable

Step 6

(FTD only) Enable a DHCP server on the default management interface to provide IP addresses to connected hosts:

configure network ipv4 dhcp-server-enable start_ip_address end_ip_address

Example:

> configure network ipv4 dhcp-server-enable 10.10.10.200 10.10.10.254
DHCP Server Enabled
>

You can only configure a DHCP server when you set the management interface IP address manually. This command is not supported on the Firepower Threat Defense Virtual. To display the status of the DHCP server, enter show network-dhcp-server:

> show network-dhcp-server
Step 7

Add a static route for the event-only interface if the Firepower Management Center is on a remote network; otherwise, all traffic will match the default route through the management interface.

```bash
configure network static-routes {ipv4 | ipv6} add management_interface destination_ip netmask_or_prefix gateway_ip
```

For the `default` route, do not use this command; you can only change the default route gateway IP address when you use the `configure network ipv4` or `ipv6` commands (see step 4).

For information about routing, see Network Routes on Device Management Interfaces, on page 245.

**Example:**

```
> configure network static-routes ipv4 add management1 192.168.6.0 255.255.255.0 10.10.10.1
Configuration updated successfully

> configure network static-routes ipv6 add management1 2001:0DB8:AA89::5110 64 2001:0DB8:BA98::3211
Configuration updated successfully
```

To display static routes, enter `show network-static-routes` (the default route is not shown):

```
> show network-static-routes
---------------[ IPv4 Static Routes ]---------------
Interface : management1
Destination : 192.168.6.0
Gateway : 10.10.10.1
Netmask : 255.255.255.0
```

Step 8

Set the hostname:

```bash
configure network hostname name
```

**Example:**

```
> configure network hostname farscape1.cisco.com
```

Syslog messages do not reflect a new hostname until after a reboot.

Step 9

Set the search domains:

```bash
configure network dns searchdomains domain_list
```

**Example:**

```
> configure network dns searchdomains example.com,cisco.com
```

Set the search domain(s) for the device, separated by commas. These domains are added to hostnames when you do not specify a fully-qualified domain name in a command, for example, `ping system`. The domains are used only on the management interface, or for commands that go through the management interface.

Step 10

Set up to 3 DNS servers, separated by commas:
configure network dns servers dns_ip_list

Example:

> configure network dns servers 10.10.6.5,10.20.89.2,10.80.54.3

**Step 11**

Set the remote management port for communication with the FMC:

configure network management-interface tcpport number

Example:

> configure network management-interface tcpport 8555

The FMC and managed devices communicate using a two-way, SSL-encrypted communication channel, which by default is on port 8305.

**Note** Cisco strongly recommends that you keep the default settings for the remote management port, but if the management port conflicts with other communications on your network, you can choose a different port. If you change the management port, you must change it for all devices in your deployment that need to communicate with each other.

**Step 12**

Configure an HTTP proxy. The device is configured to directly-connect to the internet on ports TCP/443 (HTTPS) and TCP/80 (HTTP). You can use a proxy server, to which you can authenticate via HTTP Digest. After issuing the command, you are prompted for the HTTP proxy address and port, whether proxy authentication is required, and if it is required, the proxy username, proxy password, and confirmation of the proxy password.

**Note** For proxy password on Cisco Firepower Threat Defense, you can use A-Z, a-z, and 0-9 characters only.

configure network http-proxy

Example:

> configure network http-proxy
Manual proxy configuration
Enter HTTP Proxy address: 10.100.10.10
Enter HTTP Proxy Port: 80
Use Proxy Authentication? (y/n) [n]: Y
Enter Proxy Username: proxyuser
Enter Proxy Password: proxypassword
Confirm Proxy Password: proxypassword

**Step 13**

If you change the device management IP address, then see the following tasks for FMC connectivity depending on how you identified the FMC during initial device setup using the **configure manager add** command (see *Identify a New FMC*, on page 268):

- **IP address—No action.** If you identified the FMC using a reachable IP address, then the management connection will be reestablished automatically after several minutes. We recommend that you also change the device IP address shown in FMC to keep the information in sync; see *Update the Hostname or IP Address in FMC*, on page 256. This action can help the connection reestablish faster. **Note:** If you specified an unreachable FMC IP address, then you must manually reestablish the connection using *Update the Hostname or IP Address in FMC*, on page 256.
• **NAT ID only**—Manually reestablish the connection. If you identified the FMC using only the NAT ID, then the connection cannot be automatically reestablished. In this case, change the device management IP address in FMC according to Update the Hostname or IP Address in FMC, on page 256.

### Edit General Settings

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device you want to modify, click **Edit** (🔗).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click **Device**.

**Step 4** In the **General** section, click **Edit** (🔗).

**Step 5** Enter a **Name** for the managed device.

**Tip** For stacked devices, you edit the assigned device name for the stack on the Stack page of the appliance editor. You can edit the assigned device name for an individual device on the Devices page of the appliance editor.

**Step 6** Change the **Transfer Packets** setting:

• Check the check box to allow packet data to be stored with events on the Firepower Management Center.

• Clear the check box to prevent the managed device from sending packet data with the events.

**Step 7** Click **Force Deploy** to force deployment of current policies and device configuration to the device.

**Note** Force-deploy consumes more time than the regular deployment since it involves the complete generation of the policy rules to be deployed on the FTD.

**Step 8** Click **Deploy**.

### What to do next

• Deploy configuration changes; see Deploy Configuration Changes, on page 382.

### Copy a Configuration to Another Device

When a new device is deployed in the network you can easily copy configurations and policies from a pre-configured device, instead of manually reconfiguring the new device.

**Before you begin**

Confirm that:

• The source and destination Firepower Threat Defense devices are the same model and are running the same version of the Firepower software.
The source is either a standalone Firepower Threat Defense device or a Firepower Threat Defense high availability pair.

The destination device is a standalone Firepower Threat Defense device.

The source and destination Firepower Threat Defense devices have the same number of physical interfaces.

The source and destination Firepower Threat Defense devices are in the same firewall mode - routed or transparent.

The source and destination Firepower Threat Defense devices are in the same security certifications compliance mode.

The source and destination Firepower Threat Defense devices are in the same domain.

Configuration deployment is not in progress on either the source or the destination Firepower Threat Defense devices.

Model Support—FTD

---

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device you want to modify, click **Edit ( )**.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click **Device**.

**Step 4** In the **General** section, do one of the following:

- Click **Get Device Configuration ( )** to copy device configuration from another device to the new device. On the **Get Device Configuration** page, select the source device in the **Select Device** drop-down list.

- Click **Push Device Configuration ( )** to copy device configuration from the current device to the new device. On the **Push Device Configuration** page, select the the destination to which configuration is to be copied in the **Target Device** drop-down list.

**Step 5** (Optional) Check **Include shared policies configuration** check box to copy policies.

Shared policies like AC policy, NAT, Platform Settings and FlexConfig policies can be shared across multiple devices.

**Step 6** Click **OK**.

You can monitor the status of the copy device configuration task on **Tasks** in the Message Center.

---

When the copy device configuration task is initiated, it erases the configuration on the target device and copies the configuration of the source device to the destination device.

---

**Warning**

When you have completed the copy device configuration task, you cannot revert the target device to its original configuration.
Edit License Settings

You can enable licenses on your device if you have available licenses on your Firepower Management Center.

**Step 1** Choose **Devices** > **Device Management**.

**Step 2** Next to the device where you want to enable or disable licenses, click **Edit** (🔗).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click **Device**.

**Tip** For stacked devices, you enable or disable the licenses for the stack on the Stack page of the appliance editor.

**Step 4** In the **License** section, click **Edit** (🔗).

**Step 5** Check or clear the check box next to the license you want to enable or disable for the managed device.

**Step 6** Click **Save**.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 382](#).

Edit Advanced Settings

The following topics explain how to edit the advanced device settings.

---

**Note**

For information about the Transfer Packets setting, see [Edit General Settings, on page 263](#).

Configure Automatic Application Bypass

Automatic Application Bypass (AAB) allows packets to bypass detection if Snort is down or if a packet takes too long to process. AAB causes Snort to restart within ten minutes of the failure, and generates troubleshooting data that can be analyzed to investigate the cause of the Snort failure.

**Caution**

AAB activation partially restarts the Snort process, which temporarily interrupts the inspection of a few packets. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 386](#) for more information.

AAB limits the time allowed to process packets through an interface. You balance packet processing delays with your network’s tolerance for packet latency.

The feature functions with any deployment; however, it is most valuable in inline deployments.

Typically, you use Rule Latency Thresholding in the intrusion policy to fast-path packets after the latency threshold value is exceeded. Rule Latency Thresholding does not shut down the engine or generate troubleshooting data.
If detection is bypassed, the device generates a health monitoring alert.

By default the AAB is disabled; to enable AAB follow the steps described.

---

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device where you want to edit advanced device settings, click Edit (>Edit).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click Device (or Stack for stacked devices), then click Edit (>Edit) in the Advanced section.

**Step 4** Check Automatic Application Bypass.

**Step 5** Enter a Bypass Threshold from 250 ms to 60,000 ms. The default setting is 3000 milliseconds (ms).

**Step 6** Click Save.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

---

**Inspect Local Router Traffic**

If locally-bound traffic matches a Monitor rule in a Layer 3 deployment, that traffic may bypass inspection.

To ensure inspection of the traffic, enable Inspect Local Router Traffic.

---

**Before you begin**

Model Support—7000 & 8000 Series

---

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device where you want to edit advanced device settings, click Edit (>Edit).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click Device (or Stack for stacked devices), then click Edit (>Edit) in the Advanced Settings section.

**Step 4** Check Inspect Local Router Traffic to inspect exception traffic when a 7000 or 8000 Series device is deployed as a router.

**Step 5** Click Save.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

---

**Configure Fastpath Rules (8000 Series)**

As a form of early traffic handling, 8000 Series fastpath rules can send traffic directly through an 8000 Series device without further inspection or logging. (In a passive deployment, 8000 Series fastpath rules simply stop analysis.) Each 8000 Series fastpath rule applies to a specific security zone or inline interface set. Because
8000 Series fastpath rules function at the hardware level, you can use only the following simple, outer-header criteria to fastpath traffic:

- Initiator and responder IP address or address block
- Protocol, and for TCP and UDP, initiator and responder port
- VLAN ID

By default, 8000 Series fastpath rules affect connections from specified initiators to specified responders. To fastpath all connections that meet the rule's criteria, regardless of which host is the initiator and which is the responder, you can make the rule bidirectional.

**Note**

Although they perform a similar function, 8000 Series fastpath rules are not related to the Fastpath tunnel or prefilter rules that you configure in prefilter policies.

**Note**

When you specify a port other than Any for TCP or UDP traffic, only the first fragment in matching fragmented traffic is fastpathed. All other fragments are forwarded for further inspection. This is because the 8000 Series only fastpaths fragmented traffic when the IP header in each fragment contains all the IP header information needed to match the fastpath rule, and subsequent fragments do not contain the field that identifies the port.

**Before you begin**

Model Support—8000 Series

---

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the 8000 Series device where you want to configure the rule, click Edit ( ).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click Device (or Stack for stacked devices), then click Edit ( ) in the Advanced Settings section.

**Step 4** Click New IPv4 Rule or New IPv6 Rule.

**Step 5** From the Domain drop-down list, choose an inline set or passive security zone.

**Step 6** Configure the traffic you want to fastpath. Traffic must meet all the conditions to be fastpathed.

- Initiator and Responder (required): Enter IP addresses or address blocks for initiators and responders.
- Protocol: Choose a protocol, or choose All.
- Initiator Port and Responder Port: For TCP and UDP traffic, enter initiator and responder ports. Leave the fields blank or enter Any to match all TCP or UDP traffic. You can enter a comma-separated list of ports, but you cannot enter port ranges.
- VLAN: Enter a VLAN ID. Leave the field blank or enter Any to match all traffic regardless of VLAN tag.

**Step 7** (Optional) Make the rule Bidirectional.

**Step 8** Click Save, then Save again.
What to do next

Deploy configuration changes; see Deploy Configuration Changes, on page 382.

Change the Manager for the Device

You might need to change the manager on a device in the following circumstances:

- **Reestablish the Management Connection if You Change the FMC IP Address, on page 268**—If you change the FMC IP address or hostname, reestablishing the management connection depends on how you added the device to the FMC.

- **Identify a New FMC, on page 268**—After you delete the device from the old FMC, if present, you can configure the device for the new FMC, and then add it to the FMC.

- **Switch from Firepower Device Manager to FMC, on page 269**—You cannot use both FDM and FMC at the same time for the same device. If you change from FDM to FMC, the FTD configuration will be erased, and you will need to start over.

- **Switch from FMC to Firepower Device Manager, on page 271**—You cannot use both FDM and FMC at the same time for the same device. If you change from FMC to FDM, the FTD configuration will be erased, and you will need to start over.

Reestablish the Management Connection if You Change the FMC IP Address

When you change the FMC IP address, there is not a command on the device to change the FMC IP address to the new address. Reestablishing the management connection depends on how you added the device to the FMC.

**Before you begin**

Model Support—FTD

Depending on how you added the device to the FMC, see the following tasks:

- **IP address**—No action. If you added the device to the FMC using a reachable device IP address, then the management connection will be reestablished automatically after several minutes even though the IP address identified on the FTD is the old IP address. **Note**: If you specified a device IP address that is unreachable, then you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.

- **NAT ID only**—Contact Cisco TAC. If you added the device using only the NAT ID, then the connection cannot be reestablished. In this case, you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.

Identify a New FMC

This procedure shows how to identify a new FMC for the managed device. You should perform these steps even if the new FMC uses the old FMC's IP address.
Step 1  On the old FMC, if present, delete the managed device. See Delete a Device from the FMC, on page 255.
You cannot change the FMC IP address if you have an active connection with an FMC.

Step 2  Connect to the device CLI, for example using SSH.

Step 3  Configure the new FMC.

```
configure manager add {hostname | IPv4_address | IPv6_address | DONTRESOLVE} regkey [nat_id]
```

- `{hostname | IPv4_address | IPv6_address}`—Sets the FMC hostname, IPv4 address, or IPv6 address.

- `DONTRESOLVE`—If the FMC is not directly addressable, use `DONTRESOLVE` instead of a hostname or IP address. If you use `DONTRESOLVE`, then a `nat_id` is required. When you add this device to the FMC, make sure that you specify both the device IP address and the `nat_id`; one side of the connection needs to specify an IP address, and both sides need to specify the same, unique NAT ID.

- `regkey`—Make up a registration key to be shared between the FMC and the device during registration. You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the FTD.

- `nat_id`—Make up an alphanumeric string from 1 to 37 characters used only during the registration process between the FMC and the device when one side does not specify an IP address. This NAT ID is a one-time password used only during registration. Make sure the NAT ID is unique, and not used by any other devices awaiting registration. Specify the same NAT ID on the FMC when you add the FTD.

Example:

```
> configure manager add DONTRESOLVE abc123 efg456
Manager successfully configured.
Please make note of reg_key as this will be required while adding Device in FMC.
>
```

Step 4  Add the device to the FMC. See Add a Device to the FMC, on page 252.

---

## Switch from Firepower Device Manager to FMC

This procedure describes how to change your manager from Firepower Device Manager (FDM), a local device manager, to FMC. You can switch between FDM and FMC without reinstalling the software. You cannot use both FDM and FMC at the same time for the same device. If you change from FDM to FMC, the FTD configuration will be erased, and you will need to start over.

**Caution**

Changing the manager resets the FTD configuration to the factory default. However, the management bootstrap configuration is maintained.

**Before you begin**

Model Support—FTD
Switch from Firepower Device Manager to FMC

<table>
<thead>
<tr>
<th>Step 1</th>
<th>In FDM, for High Availability, break the high availability configuration. Ideally, break HA from the active unit.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>In FDM, unregister the device from the Smart Licensing server.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Connect to the device CLI, for example using SSH.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Remove the current management setting.</td>
</tr>
</tbody>
</table>

    configure manager delete

    Caution  Deleting the local manager resets the FTD configuration to the factory default. However, the management bootstrap configuration is maintained.

    Example:

> configure manager delete

If you enabled any feature licenses, you must disable them in Firepower Device Manager before deleting the local manager. Otherwise, those licenses remain assigned to the device in Cisco Smart Software Manager.

Do you want to continue[yes/no]:yes

DHCP Server Disabled

>  

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Configure the new FMC.</th>
</tr>
</thead>
</table>
|        | configure manager add  \{hostname | IPv4_address | IPv6_address | DONTRESOLVE \} regkey [nat_id]

  *  \{hostname | IPv4_address | IPv6_address\}—Sets the FMC hostname, IPv4 address, or IPv6 address.

  *  DONTRESOLVE—If the FMC is not directly addressable, use DONTRESOLVE instead of a hostname or IP address. If you use DONTRESOLVE , then a nat_id is required. When you add this device to the FMC, make sure that you specify both the device IP address and the nat_id; one side of the connection needs to specify an IP address, and both sides need to specify the same, unique NAT ID.

  *  regkey—Make up a registration key to be shared between the FMC and the device during registration. You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the FTD.

  *  nat_id—Make up an alphanumeric string from 1 to 37 characters used only during the registration process between the FMC and the device when one side does not specify an IP address. This NAT ID is a one-time password used only during registration. Make sure the NAT ID is unique, and not used by any other devices awaiting registration. Specify the same NAT ID on the FMC when you add the FTD.

    Example:

> configure manager add DONTRESOLVE abc123 efg456

Manager successfully configured.

Please make note of reg_key as this will be required while adding Device in FMC.

>  

| Step 6 | Add the device to the FMC. See Add a Device to the FMC, on page 252.                                         |

Switch from FMC to Firepower Device Manager

This procedure describes how to change your manager from FMC to Firepower Device Manager (FDM), a local device manager. You can switch between FDM and FMC without reinstalling the software. You cannot use both FDM and FMC at the same time for the same device. If you change from FMC to FDM, the FTD configuration will be erased, and you will need to start over.

⚠️ Caution
Changing the manager resets the FTD configuration to the factory default. However, the management bootstrap configuration is maintained.

Before you begin
Model Support—FTD

Step 1
In FMC, for High Availability, break the high availability configuration. Ideally, break HA from the active unit. See Separate Units in a High Availability Pair, on page 749.

Step 2
In FMC, delete the managed device. See Delete a Device from the FMC, on page 255.

You cannot change the manager if you have an active connection with an FMC.

Step 3
Connect to the device CLI, for example using SSH.

Step 4
Remove the current management setting.

```bash
configure manager delete
```

⚠️ Caution
Deleting the local manager resets the FTD configuration to the factory default. However, the management bootstrap configuration is maintained.

Example:

```bash
> configure manager delete

If you enabled any feature licenses, you must disable them in Firepower Device Manager before deleting the local manager. Otherwise, those licenses remain assigned to the device in Cisco Smart Software Manager.

Do you want to continue[yes/no]:yes

DHCP Server Disabled
```

Step 5
Configure the new FMC.

```bash
configure manager add {hostname | IPv4_address | IPv6_address | DONTRESOLVE} regkey [nat_id]
```

- `{hostname | IPv4_address | IPv6_address}`—Sets the FMC hostname, IPv4 address, or IPv6 address.
- `DONTRESOLVE`—If the FMC is not directly addressable, use `DONTRESOLVE` instead of a hostname or IP address. If you use `DONTRESOLVE`, then a `nat_id` is required. When you add this device to the FMC, make sure that you specify both the device IP address and the `nat_id`; one side of the connection needs to specify an IP address, and both sides need to specify the same, unique NAT ID.
• *regkey*—Make up a registration key to be shared between the FMC and the device during registration. You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the FTD.

• *nat_id*—Make up an alphanumeric string from 1 to 37 characters used only during the registration process between the FMC and the device when one side does not specify an IP address. This NAT ID is a one-time password used only during registration. Make sure the NAT ID is unique, and not used by any other devices awaiting registration. Specify the same NAT ID on the FMC when you add the FTD.

Example:

```bash
> configure manager add DONTRESOLVE abc123 efg456
Manager successfully configured.
Please make note of reg_key as this will be required while adding Device in FMC.
```

**Step 6**  
Add the device to the FMC. See Add a Device to the FMC, on page 252.

---

**Viewing Device Information**

In a multidomain deployment, ancestor domains can view information about all devices in descendant domains. You must be in a leaf domain to edit a device.

**Step 1**  
Choose Devices > Device Management.

**Step 2**  
Click Edit (-pencil) next to the device you want to view.

In a multidomain deployment, if you are in an ancestor domain, you can click View (eye) to view a device from a descendant domain in read-only mode.

**Step 3**  
Click Device.

**Step 4**  
You can view the following information:

- General — Displays general settings for the device; see General Information, on page 273.
- License — Displays license information for the device; see License Information, on page 273.
- System — Displays system information about the device; see System Information, on page 273.
- Health — Displays information about the current health status of the device; see Health Information, on page 274.
- Management — Displays information about the communication channel between the Firepower Management Center and the device; see Management Information, on page 274.
- Advanced — Displays information about advanced feature configuration; see Advanced Settings, on page 275.

---

**Device Management Page Information**

The Device Management page provides you with a range of information and options that you can use to manage Firepower devices.
Use this page to add, edit, remove, and group devices, and to view basic device properties including health status. You can view devices grouped by various characteristics, and further filter devices by health or deployment status.

This page also provides one-click access to:

- The access control policy deployed to each device.
- Each device's health monitoring page, where you can generate a troubleshooting file.
- For Firepower 4100/9300 series devices, a link to the Firepower Chassis Manager web interface.

## General Information

The General section of the **Device** tab displays the settings described in the table below.

### Table 27: General Section Table Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The display name of the device on the Firepower Management Center.</td>
</tr>
<tr>
<td>Transfer Packets</td>
<td>This displays whether or not the managed device sends packet data with the events to the Firepower Management Center.</td>
</tr>
<tr>
<td>Mode</td>
<td>The displays the mode of the management interface for the device: <strong>routed</strong> or <strong>transparent</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The <strong>Mode</strong> field is displayed only for Firepower Threat Defense devices.</td>
</tr>
<tr>
<td>Compliance Mode</td>
<td>This displays the security certifications compliance for a device. Valid values are CC, UCAPL and None.</td>
</tr>
</tbody>
</table>

## License Information

The License section of the **Device** page displays the licenses enabled for the device.

## System Information

The System section of the **Device** page displays a read-only table of system information, as described in the following table.

### Table 28: System Section Table Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>The model name and number for the managed device.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Serial | The serial number of the chassis of the managed device.
Time | The current system time of the device. This is always in UTC.
Version | The version of the software currently installed on the managed device.
Policy | A link to the platform settings policy currently deployed to the managed device.
Inventory | A link to the inventory details for the associated device. This field only appears for some platforms, for example, the Firepower 2100 or a Firepower 4100/9300 container instance. To update information for a container instance, click **Update**. For example, if you change the resource profile, you can force an update of the inventory to avoid problems with mismatching High Availability pairs. Otherwise, this information is updated when you deploy policy changes.

You can also shut down or restart the device.

### Health Information

The Health section of the **Device** page displays the information described in the table below.

**Table 29: Health Section Table Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>An icon that represents the current health status of the device. Clicking the icon displays the Health Monitor for the appliance.</td>
</tr>
<tr>
<td>Policy</td>
<td>A link to a read-only version of the health policy currently deployed at the device.</td>
</tr>
<tr>
<td>Blacklist</td>
<td>A link to the Health Blacklist page, where you can enable and disable health blacklist modules.</td>
</tr>
</tbody>
</table>

### Management Information

The **Management** section of the **Device** page displays the fields described in the table below.
Table 30: Management Section Table Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The IP address or hostname of the device. To change the hostname or IP Address of the device, see Edit Management Settings, on page 256.</td>
</tr>
<tr>
<td>Status</td>
<td>An icon indicating the status of the communication channel between the Firepower Management Center and the managed device. You can hover over the status icon to view the last time the Firepower Management Center contacted the device.</td>
</tr>
</tbody>
</table>

Advanced Settings

The Advanced section of the Device page displays a table of advanced configuration settings, as described below. You can edit any of these settings.

Table 31: Advanced Section Table Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Supported Devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Bypass</td>
<td>The state of Automatic Application Bypass on the device.</td>
<td>7000 &amp; 8000 Series</td>
</tr>
<tr>
<td>Bypass Threshold</td>
<td>The Automatic Application Bypass threshold, in milliseconds.</td>
<td>NGIPSv</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ASA FirePOWER</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Firepower Threat Defense</td>
</tr>
<tr>
<td>Inspect Local Router Traffic</td>
<td>Whether the device inspects traffic received on routed interfaces that is destined for itself, such as ICMP, DHCP, and OSPF traffic.</td>
<td>7000 &amp; 8000 Series</td>
</tr>
<tr>
<td>Fast-Path Rules</td>
<td>The number of 8000 Series fastpath rules that have been created on the device.</td>
<td>8000 Series</td>
</tr>
</tbody>

PART III

System Monitoring and Troubleshooting

• Dashboards, on page 279
• Health Monitoring, on page 299
• Monitoring the System, on page 327
• Auditing the System, on page 337
• Troubleshooting the System, on page 347
CHAPTER 13

Dashboards

The following topics describe how to use dashboards in the Firepower System:

- About Dashboards, on page 279
- Firepower System Dashboard Widgets, on page 280
- Managing Dashboards, on page 292

About Dashboards

Firepower System dashboards provide you with at-a-glance views of current system status, including data about the events collected and generated by the system. You can also use dashboards to see information about the status and overall health of the appliances in your deployment. Keep in mind that the information the dashboard provides depends on how you license, configure, and deploy the system.

Tip

The dashboard is a complex, highly customizable monitoring feature that provides exhaustive data. For a broad, brief, and colorful picture of your monitored network, use the Context Explorer.

Dashboards are available on the Firepower Management Center and 7000 & 8000 Series devices.

A dashboard uses tabs to display widgets: small, self-contained components that provide insight into different aspects of the system. For example, the predefined Appliance Information widget tells you the appliance name, model, and currently running version of the Firepower System software. The system constrains widgets by the dashboard time range, which you can change to reflect a period as short as the last hour or as long as the last year.

The system is delivered with several predefined dashboards, which you can use and modify. If your user role has access to dashboards (Administrator, Maintenance User, Security Analyst, Security Analyst [Read Only], and custom roles with the Dashboards permission), by default your home page is the predefined Summary Dashboard. However, you can configure a different default home page, including non-dashboards. You can also change the default dashboard. Note that if your user role cannot access dashboards, your default home page is relevant to the role; for example, a Discovery Admin sees the Network Discovery page.

You can also use predefined dashboards as the base for custom dashboards, which you can either share or restrict as private. Unless you have Administrator access, you cannot view or modify private dashboards created by other users.
Some drill-down pages and table views of events include a **Dashboard** toolbar link that you can click to view a relevant predefined dashboard. If you delete a predefined dashboard or tab, the associated toolbar links do not function.

In a multidomain deployment, you cannot view dashboards from ancestor domains; however, you can create new dashboards that are copies of the higher-level dashboards.

### Firepower System Dashboard Widgets

A dashboard has one or more tabs, each of which can display one or more widgets in a three-column layout. The Firepower System is delivered with many predefined dashboard widgets, each of which provides insight into a different aspect of the Firepower System. Widgets are grouped into three categories:

- **Analysis & Reporting widgets** display data about the events collected and generated by the Firepower System.
- **Miscellaneous widgets** display neither event data nor operations data. Currently, the only widget in this category displays an RSS feed.
- **Operations widgets** display information about the status and overall health of the Firepower System.

The dashboard widgets that you can view depend on:

- the type of appliance you are using
- your user role
- your current domain (in a multidomain deployment)

In addition, each dashboard has a set of preferences that determines its behavior.

You can minimize and maximize widgets, add and remove widgets from tabs, as well as rearrange the widgets on a tab.

For widgets that display event counts over a time range, the total number of events may not reflect the number of events for which detailed data is available in the tables on pages under the Analysis menu. This occurs because the system sometimes prunes older event details to manage disk space usage. To minimize the occurrence of event detail pruning, you can fine-tune event logging to log only those events most important to your deployment.

### Widget Availability

The dashboard widgets that you can view depend on the type of appliance you are using, your user role, and your current domain (in a multidomain deployment).

In a multidomain deployment, if you do not see a widget that you expect to see, switch to the Global domain. See [Switching Domains on the Firepower Management Center](#), on page 11.
Note that:

- An **invalid** widget is one that you cannot view because you are using the wrong type of appliance.
- An **unauthorized** widget is one that you cannot view because your user account does not have the necessary privileges.

For example, the Appliance Status widget is available only on the FMC for users with Administrator, Maintenance User, Security Analyst, or Security Analyst (Read Only) account privileges.

Although you cannot add an unauthorized or invalid widget to a dashboard, an imported dashboard may contain unauthorized or invalid widgets. For example, such widgets can be present if the imported dashboard:

- Was created by a user with different access privileges, or
- Belongs to an ancestor domain.

Unavailable widgets are disabled and display error messages that indicate why you cannot view them.

Individual widgets also display error messages when those widgets have timed out or are otherwise experiencing problems.

---

**Note**

You can delete or minimize unauthorized and invalid widgets, as well as widgets that display no data, keeping in mind that modifying a widget on a shared dashboard modifies it for all users of the appliance.

---

**Dashboard Widget Availability by User Role**

The following table lists the user account privileges required to view each widget. Only user accounts with Administrator, Maintenance User, Security Analyst, or Security Analyst (Read Only) access can use dashboards.

Users with custom roles may have access to any combination of widgets, or none at all, as their user roles permit.

**Table 32: User Roles and Dashboard Widget Availability**

<table>
<thead>
<tr>

</table>
Predefined Dashboard Widgets

The Firepower System is delivered with several predefined widgets that, when used on dashboards, can provide you with at-a-glance views of current system status. These views include:

- data about the events collected and generated by the system
- information about the status and overall health of the appliances in your deployment

**Note**

The dashboard widgets you can view depend on the type of appliance you are using, your user role, and your current domain in a multidomain deployment.

The Appliance Information Widget

The Appliance Information widget provides a snapshot of the appliance. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard. The widget provides:

- the name, IPv4 address, IPv6 address, and model of the appliance
- the versions of the Firepower System software, operating system, Snort, rule update, rule pack, module pack, vulnerability database (VDB), and geolocation update installed on the appliances with dashboards, except for virtual Firepower Management Centers
- for managed appliances, the name and status of the communications link with the managing appliance

You can configure the widget to display more or less information by modifying the widget preferences to display a simple or an advanced view; the preferences also control how often the widget updates.

---
The Appliance Status Widget

The Appliance Status widget indicates the health of the appliance and of any appliances it is managing. Note that because the Firepower Management Center does not automatically apply a health policy to managed devices, you must manually apply a health policy to devices or their status appears as Disabled. This widget appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

You can configure the widget to display appliance status as a pie chart or in a table by modifying the widget preferences.

The preferences also control how often the widget updates.

You can click a section on the pie chart or one of the numbers on the appliance status table to go to the Health Monitor page and view the compiled health status of the appliance and of any appliances it is managing.

The Correlation Events Widget

The Correlation Events widget shows the average number of correlation events per second, by priority, over the dashboard time range. It appears by default on the Correlation tab of the Detailed Dashboard.

You can configure the widget to display correlation events of different priorities by modifying the widget preferences, as well as to choose a linear (incremental) or logarithmic (factor of ten) scale.

Check one or more Priorities check boxes to display separate graphs for events of specific priorities, including events that do not have a priority. Choose Show All to display an additional graph for all correlation events, regardless of priority. The preferences also control how often the widget updates.

You can click a graph to view correlation events of a specific priority, or click the All graph to view all correlation events. In either case, the events are constrained by the dashboard time range; accessing correlation events via the dashboard changes the events (or global) time window for the appliance.

The Current Interface Status Widget

The Current Interface Status widget shows the status of all interfaces on the appliance, enabled or unused. On a Firepower Management Center, you can display the management (eth0, eth1, and so on) interfaces. On a managed device, you can choose to show only sensing (s1p1 and so on) interfaces or both management and sensing interfaces. Interfaces are grouped by type: management, inline, passive, switched, routed, stacked, and unused.

For each interface, the widget provides:

- the name of the interface
- the link state of the interface
- the link mode (for example, 100Mb full duplex, or 10Mb half duplex) of the interface
- the type of interface, that is, copper or fiber
- the amount of data received (Rx) and transmitted (Tx) by the interface

The color of the ball representing link state indicates the current status, as follows:

- green: link is up and at full speed
- yellow: link is up but not at full speed
- red: link is not up
The widget preferences control how often the widget updates.

### The Current Sessions Widget

The Current Sessions widget shows which users are currently logged into the appliance, the IP address associated with the machine where the session originated, and the last time each user accessed a page on the appliance (based on the local time for the appliance). The user that represents you, that is, the user currently viewing the widget, is marked with a **User icon** and rendered in bold type. Sessions are pruned from this widget’s data within one hour of logoff or inactivity. This widget appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

On the Current Sessions widget, you can:

- click any user name to manage user accounts on the User Management page.
- click the **Host icon** or **Compromised Host icon** next to any IP address to view the host profile for the associated machine.
- click any IP address or access time to view the audit log constrained by that IP address and by the time that the user associated with that IP address logged on to the web interface.

The widget preferences control how often the widget updates.

### The Custom Analysis Widget

The Custom Analysis widget is a highly customizable widget that allows you to display detailed information on the events collected and generated by the Firepower System.

The widget is delivered with multiple presets that provide quick access to information about your deployment. The predefined dashboards make extensive use of these presets. You can use these presets or create a custom configuration. At a minimum, a custom configuration specifies the data you are interested in (table and field), and an aggregation method for that data. You can also set other display-related preferences, including whether you want to show events as relative occurrences (bar graph) or over time (line graph).

The widget displays the last time it updated, based on local time. The widget updates with a frequency that depends on the dashboard time range. For example, if you set the dashboard time range to an hour, the widget updates every five minutes. On the other hand, if you set the dashboard time range to a year, the widget updates once a week. To determine when the dashboard will update next, hover your pointer over the **Last updated** notice in the bottom left corner of the widget.

---

**Note**

A red-shaded Custom Analysis widget indicates that its use is harming system performance. If the widget continues to stay red over time, remove the widget. You can also disable all Custom Analysis widgets from the Dashboard settings in your system configuration (**System > Configuration > Dashboard**)

---

**Displaying Relative Occurrences of Events (Bar Graphs)**

For bar graphs in the Custom Analysis widget, the colored bars in the widget background show the relative number of occurrences of each event. Read the bars from right to left.
The **Direction icon** indicates and controls the sort order of the display. A downward-pointing icon indicates descending order; an upward-pointing icon indicates ascending order. To change the sort order, click the icon.

Next to each event, the widget can display one of three icons to indicate any changes from the most recent results:

- The new event icon **Add** (✓) signifies that the event is new to the results.
- The **Up Arrow icon** indicates that the event has moved up in the standings since the last time the widget updated. A number indicating how many places the event has moved up appears next to the icon.
- The **Down Arrow icon** indicates that the event has moved down in the standings since the last time the widget updated. A number indicating how many places the event has moved down appears next to the icon.

### Displaying Events Over Time (Line Graphs)

If you want information on events or other collected data over time, you can configure the Custom Analysis widget to display a line graph, such as one that displays the total number of intrusion events generated in your deployment over time.

### Limitations to the Custom Analysis Widget

A Custom Analysis widget may indicate that you are unauthorized to view the data that is configured to display. For example, Maintenance Users are not authorized to view discovery events. As another example, the widget does not display information related to unlicensed features. However, you (and any other users who share the dashboard) can modify the widget preferences to display data that you can see, or even delete the widget. If you want to make sure that this does not happen, save the dashboard as private.

When viewing user data, the system displays only authoritative users.

When viewing URL category information, the system does not display uncategorized URLs.

When viewing intrusion events aggregated by **Count**, the count includes reviewed events for intrusion events; if you view the count in tables on pages under the Analysis menus, the count will not include reviewed events.

---

**Note**

In a multidomain deployment, the system builds a separate network map for each leaf domain. As a result, a leaf domain can contain an IP address that is unique within its network, but identical to an IP address in another leaf domain. When you view Custom Analysis widgets in an ancestor domain, multiple instances of that repeated IP address can be displayed. At first glance, they might appear to be duplicate entries. However, if you drill down to the host profile information for each IP address, the system shows that they belong to different leaf domains.

---

**Example: Custom Configuration**

You can configure the Custom Analysis widget to display a list of recent intrusion events by configuring the widget to display data from the **Intrusion Events** table. Choosing the **Classification** field and aggregating this data by **Count** tells you how many events of each type were generated.

On the other hand, aggregating by **Unique Events** tells you how many unique intrusion events of each type have occurred (for example, how many detections of network trojans, potential violations of corporate policy, attempted denial-of-service attacks, and so on).
You can further constrain the widget using a saved search, either one of the predefined searches delivered with your appliance or a custom search that you created. For example, constraining the first example (intrusion events using the Classification field, aggregated by Count) using the Dropped Events search tells you how many intrusion events of each type were dropped.

Modifying Dashboard Time Settings, on page 296

Custom Analysis Widget Preferences

The following table describes the preferences you can set in the Custom Analysis widget.
Different preferences appear depending on how you configure the widget. For example, a different set of preferences appears if you configure the widget to show relative occurrences of events (a bar graph) vs a graph over time (a line graph). Some preferences, such as Filter, only appear if you choose a specific table from which to display data.

Table 33: Custom Analysis Widget Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>If you do not specify a title for the widget, the system uses the configured event type as the title.</td>
</tr>
<tr>
<td>Preset</td>
<td>Custom Analysis presets provide quick access to information about your deployment. The predefined dashboards make extensive use of these presets. You can use these presets or you can create a custom configuration.</td>
</tr>
<tr>
<td>Table (required)</td>
<td>The table of events or assets that contains the data the widget displays.</td>
</tr>
<tr>
<td>Field (required)</td>
<td>The specific field of the event type you want to display. To show data over time (line graphs), choose Time. To show relative occurrences of events (bar graphs), choose another option.</td>
</tr>
<tr>
<td>Aggregate (required)</td>
<td>The aggregation method configures how the widget groups the data it displays. For most event types, the default option is Count.</td>
</tr>
<tr>
<td>Filter</td>
<td>You can use application filters to constrain data from the Application Statistics and Intrusion Event Statistics by Application tables.</td>
</tr>
</tbody>
</table>
### Preference | Details
--- | ---
Search | You can use a saved search to constrain the data that the widget displays. You do not have to specify a search, although some presets use predefined searches.

Only you can access searches that you have saved as private. If you configure the widget on a shared dashboard and constrain its events using a private search, the widget resets to not using the search when another user logs in. This affects your view of the widget as well. If you want to make sure that this does not happen, save the dashboard as private.

Only fields that constrain connection summaries can constrain Custom Analysis dashboard widgets based on connection events. Invalid saved searches are dimmed.

If you constrain a Custom Analysis widget using a saved search, then edit the search, the widget does not reflect your changes until the next time it updates.

Show | Choose whether you want to display the most (Top) or the least (Bottom) frequently occurring events.

Results | Choose the number of result rows to display.

Show Movers | Choose whether you want to display the icons that indicate changes from the most recent results.

Time Zone | Choose the time zone you want to use to display results.

Color | You can change the color of the bars in the widget's bar graph.

---

**Related Topics**

[Configuring Widget Preferences](#), on page 294

**Viewing Associated Events from the Custom Analysis Widget**

From a Custom Analysis widget, you can invoke an event view (workflow) that provides detailed information about the events displayed in the widget. The events appear in the default workflow for that event type, constrained by the dashboard time range. This also changes the appropriate time window on the Firepower Management Center, depending on how many time windows you configured and on the event type.

For example:

- If you configure multiple time windows, then access health events from a Custom Analysis widget, the events appear in the default health events workflow, and the health monitoring time window changes to the dashboard time range.

- If you configure a single time window and then access any type of event from the Custom Analysis widget, the events appear in the default workflow for that event type, and the global time window changes to the dashboard time range.

---

You have the following choices:
• On any Custom Analysis widget, click View in the lower right corner of the widget to view all associated events, constrained by the widget preferences.
• On a Custom Analysis widget showing relative occurrences of events (bar graph), click any event to view associated events constrained by the widget preferences, as well as by that event.

The Disk Usage Widget

The Disk Usage widget displays the percentage of space used on the hard drive, based on disk usage category. It also indicates the percentage of space used on and capacity of each partition of the appliance’s hard drive. The Disk Usage widget displays the same information for the malware storage pack if installed in the device, or if the Firepower Management Center manages a device containing a malware storage pack. This widget appears by default on the Status tabs of the Default Dashboard and the Summary Dashboard.

The By Category stacked bar displays each disk usage category as a proportion of the total available disk space used. The following table describes the available categories.

<table>
<thead>
<tr>
<th>Disk Usage Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Events</td>
<td>all events logged by the system</td>
</tr>
<tr>
<td>Files</td>
<td>all files stored by the system</td>
</tr>
<tr>
<td>Backups</td>
<td>all backup files</td>
</tr>
<tr>
<td>Updates</td>
<td>all files related to updates, such as rule updates and system updates</td>
</tr>
<tr>
<td>Other</td>
<td>system troubleshooting files and other miscellaneous files</td>
</tr>
<tr>
<td>Free</td>
<td>free space remaining on the appliance</td>
</tr>
</tbody>
</table>

You can hover your pointer over a disk usage category in the By Category stacked bar to view the percentage of available disk space used by that category, the actual storage space on the disk, and the total disk space available for that category. Note that if you have a malware storage pack installed, the total disk space available for the Files category is the available disk space on the malware storage pack.

You can configure the widget to display only the By Category stacked bar, or you can show the stacked bar plus the admin (/), /Volume, and /boot partition usage, as well as the /var/storage partition if the malware storage pack is installed, by modifying the widget preferences.

The widget preferences also control how often the widget updates, as well as whether it displays the current disk usage or collected disk usage statistics over the dashboard time range.

The Interface Traffic Widget

The Interface Traffic widget shows the rate of traffic received (Rx) and transmitted (Tx) on the appliance’s management interface. For 7000 & 8000 Series devices, the widget also shows information on the sensing interfaces. The widget does not appear by default on any of the predefined dashboards.
Devices with Malware licenses enabled periodically attempt to connect to the AMP cloud even if you have not configured dynamic analysis. Because of this, these devices show transmitted traffic; this is expected behavior. Outbound (transmitted) traffic includes flow control packets. Because of this, passive sensing interfaces on 7000 & 8000 Series devices may show transmitted traffic; this is also expected behavior.

The widget preferences control how often the widget updates. On 7000 & 8000 Series devices, the preferences also control whether the widget displays the traffic rate for unused interfaces (by default, the widget only displays the traffic rate for active interfaces).

The Intrusion Events Widget

The Intrusion Events widget shows the intrusion events that occurred over the dashboard time range, organized by priority. This includes statistics on intrusion events with dropped packets and different impacts. This widget appears by default on the Intrusion Events tab of the Summary Dashboard.

In the widget preferences, you can choose:

- **Event Flags** to display separate graphs for events with dropped packets, would have dropped packets, or specific impacts. Choose **All** to display an additional graph for all intrusion events, regardless of impact or rule state.

For explanations of the icons, see Working with Intrusion Events, on page 2503. The arrow (if any) that appears above the impact level numbers describes the inline result and is defined as follows:

<table>
<thead>
<tr>
<th>This Icon</th>
<th>Indicates</th>
</tr>
</thead>
<tbody>
<tr>
<td>A black down arrow</td>
<td>The system dropped the packet that triggered the rule</td>
</tr>
<tr>
<td>A gray down arrow</td>
<td>IPS would have dropped the packet if you enabled the Drop when Inline intrusion policy option (in an inline deployment), or if a Drop and Generate rule generated the event while the system was pruning</td>
</tr>
<tr>
<td>No icon (blank)</td>
<td>The triggered rule was not set to Drop and Generate Events</td>
</tr>
</tbody>
</table>

In a passive deployment, the system does not drop packets, including when an inline interface is in tap mode, regardless of the rule state or the inline drop behavior of the intrusion policy.

- **Show** to specify **Average Events Per Second** (EPS) or **Total Events**.
- **Vertical Scale** to specify **Linear** (incremental) or **Logarithmic** (factor of ten) scale.
- How often the widget updates.

On the widget, you can:

- Click a graph corresponding to dropped packets, to would have dropped packets, or to a specific impact to view intrusion events of that type.
- Click the graph corresponding to dropped events to view dropped events.
- Click the graph corresponding to would have dropped events to view would have dropped events.
- Click the **All** graph to view all intrusion events.
The resulting event view is constrained by the dashboard time range; accessing intrusion events via the dashboard changes the events (or global) time window for the appliance. Note that packets in a passive deployment are not dropped, regardless of intrusion rule state or the inline drop behavior of the intrusion policy.

The Network Compliance Widget

The Network Compliance widget summarizes your hosts’ compliance with the white lists you configured. By default, the widget displays a pie chart that shows the number of hosts that are compliant, non-compliant, and that have not been evaluated, for all compliance white lists in active correlation policies. This widget appears by default on the Correlation tab of the Detailed Dashboard.

You can configure the widget to display network compliance either for all white lists or for a specific white list by modifying the widget preferences.

If you choose to display network compliance for all white lists, the widget considers a host to be non-compliant if it is not compliant with any white list in an active correlation policy.

You can also use the widget preferences to specify which of three different styles you want to use to display network compliance.

The **Network Compliance** style (the default) displays a pie chart that shows the number of hosts that are compliant, non-compliant, and that have not been evaluated. You can click the pie chart to view the host violation count, which lists the hosts that violate at least one white list.

The **Network Compliance over Time (%)** style displays a stacked area graph showing the relative proportion of hosts that are compliant, non-compliant, and that have not yet been evaluated, over the dashboard time range.

The **Network Compliance over Time** style displays a line graph that shows the number of hosts that are compliant, non-compliant, and that have not yet been evaluated, over the dashboard time range.

The preferences control how often the widget updates. You can check the **Show Not Evaluated** box to hide events which have not been evaluated.

The Product Licensing Widget

The Product Licensing widget shows the device and feature licenses currently installed on the Firepower Management Center. It also indicates the number of items licensed and the number of remaining licensed items allowed. It does not appear by default on any of the predefined dashboards.

The top section of the widget displays all device and feature licenses installed on the Firepower Management Center, including temporary licenses, while the Expiring Licenses section displays only temporary and expired licenses.

The bars in the widget background show the percentage of each type of license that is being used; you should read the bars from right to left. Expired licenses are marked with a strikethrough.

You can configure the widget to display either the features that are currently licensed, or all the features that you can license, by modifying the widget preferences. The preferences also control how often the widget updates.

You can click any of the license types to go to the License page of the local configuration and add or delete feature licenses.
The Product Updates Widget

The Product Updates widget provides you with a summary of the software currently installed on the appliance as well as information on updates that you have downloaded, but not yet installed. This widget appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

Because the widget uses scheduled tasks to determine the latest version, it displays Unknown until you configure a scheduled task to download, push or install updates.

You can configure the widget to hide the latest versions by modifying the widget preferences. The preferences also control how often the widget updates.

The widget also provides you with links to pages where you can update the software. You can:

• Manually update an appliance by clicking the current version.

• Create a scheduled task to download an update by clicking the latest version.

The RSS Feed Widget

The RSS Feed widget adds an RSS feed to a dashboard. By default, the widget shows a feed of Cisco security news. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

You can also configure the widget to display a preconfigured feed of company news, the Snort.org blog, or the Cisco Threat Research blog, or you can create a custom connection to any other RSS feed by specifying its URL in the widget preferences.

Feeds update every 24 hours (although you can manually update the feed), and the widget displays the last time the feed was updated based on the local time of the appliance. Keep in mind that the appliance must have access to the website (for the two preconfigured feeds) or to any custom feed you configure.

When you configure the widget, you can also choose how many stories from the feed you want to show in the widget, as well as whether you want to show descriptions of the stories along with the headlines; keep in mind that not all RSS feeds use descriptions.

On the RSS Feed widget, you can:

• click one of the stories in the feed to view the story

• click the more link to go to the feed’s web site

• click Update to manually update the feed

The System Load Widget

The System Load widget shows the CPU usage (for each CPU), memory (RAM) usage, and system load (also called the load average, measured by the number of processes waiting to execute) on the appliance, both currently and over the dashboard time range. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

You can configure the widget to show or hide the load average by modifying the widget preferences. The preferences also control how often the widget updates.

The System Time Widget

The System Time widget shows the local system time, uptime, and boot time for the appliance. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.
You can configure the widget to hide the boot time by modifying the widget preferences. The preferences also control how often the widget synchronizes with the appliance’s clock.

**The White List Events Widget**

The White List Events widget shows the average events per second by priority, over the dashboard time range. It appears by default on the Correlation tab of the Default Dashboard.

You can configure the widget to display white list events of different priorities by modifying the widget preferences.

In the widget preferences, you can:

- choose one or more **Priorities** check boxes to display separate graphs for events of specific priorities, including events that do not have a priority
- choose **Show All** to display an additional graph for all white list events, regardless of priority
- choose **Vertical Scale** to choose **Linear** (incremental) or **Logarithmic** (factor of ten) scale

The preferences also control how often the widget updates.

You can click a graph to view white list events of a specific priority, or click the **All** graph to view all white list events. In either case, the events are constrained by the dashboard time range; accessing white list events via the dashboard changes the events (or global) time window for the Firepower Management Center.

### Managing Dashboards

**Step 1**  
Choose **Overview** > **Dashboards**, and then choose the dashboard you want to modify from the menu.

**Step 2**  
Manage your dashboards:

- **Create Dashboards** — Create a custom dashboard; see Creating Custom Dashboards, on page 294.
- **Delete Dashboards** — To delete a dashboard, click **Delete** next to the dashboard you want to delete. If you delete your default dashboard, you must define a new default or the appliance prompts you to choose a dashboard every time you attempt to view a dashboard.
- **Edit Options** — Edit custom dashboard options; see Editing Dashboards Options, on page 296.
- **Modify Time Constraints** — Modify the time display or pause/unpause the dashboard as described in Modifying Dashboard Time Settings, on page 296.

**Step 3**  
Add (see Adding a Dashboard, on page 293), Delete (click **Close** (×)), and Rename (see Renaming a Dashboard, on page 298) dashboards.

**Note**  
You cannot change the order of dashboards.

**Step 4**  
Manage dashboard widgets:

- **Add Widgets** — Add widgets to a dashboard; see Adding Widgets to a Dashboard, on page 293.
- **Configure Preferences** — Configure widget preferences; see Configuring Widget Preferences, on page 294.
- **Customize Display** — Customize the widget display; see Customizing the Widget Display, on page 296.
- **View Events** — View associated events from the Custom Analysis Widget; see Viewing Associated Events from the Custom Analysis Widget, on page 287.
Every configuration of the Custom Analysis widget in the Cisco predefined dashboards corresponds to a system preset for that widget. If you change or delete one of these widgets, you can restore it by creating a new Custom Analysis widget based on the appropriate preset.

Adding a Dashboard

Step 1 View the dashboard you want to modify; see Viewing Dashboards, on page 298.
Step 2 Click Add (+).
Step 3 Enter a name.
Step 4 Click OK.

Adding Widgets to a Dashboard

Each tab can display one or more widgets in a three-column layout. When adding a widget to a dashboard, you choose the tab to which you want to add the widget. The system automatically adds it to the column with the fewest widgets. If all columns have an equal number of widgets, the new widget is added to the leftmost column. You can add a maximum of 15 widgets to a dashboard tab.

Tip After you add widgets, you can move them to any location on the tab. You cannot, however, move widgets from tab to tab.

The dashboard widgets you can view depend on the type of appliance you are using, your user role, and your current domain (in a multidomain deployment). Keep in mind that because not all user roles have access to all dashboard widgets, users with fewer permissions viewing a dashboard created by a user with more permissions may not be able to use all of the widgets on the dashboard. Although the unauthorized widgets still appear on the dashboard, they are disabled.

Step 1 View the dashboard where you want to add a widget; see Viewing Dashboards, on page 298.
Step 2 Click the tab where you want to add the widget.
Step 3 Click Add Widgets. You can view the widgets in each category by clicking on the category name, or you can view all widgets by clicking All Categories.
Step 4 Click Add next to the widgets you want to add. The Add Widgets page indicates how many widgets of each type are on the tab, including the widget you want to add.

Tip To add multiple widgets of the same type (for example, you may want to add multiple RSS Feed widgets, or multiple Custom Analysis widgets), click Add again.

Step 5 When you are finished adding widgets, click Done to return to the dashboard.
Configuring Widget Preferences

Each widget has a set of preferences that determines its behavior.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>On the title bar of the widget whose preferences you want to change, click Show Preferences (เ.).</td>
</tr>
<tr>
<td>Step 2</td>
<td>Make changes as needed.</td>
</tr>
<tr>
<td>Step 3</td>
<td>On the widget title bar, click Hide Preferences (เ.) to hide the preferences section.</td>
</tr>
</tbody>
</table>

Creating Custom Dashboards

Tip
Instead of creating a new dashboard, you can export a dashboard from another appliance, then import it onto your appliance. You can then edit the imported dashboard to suit your needs.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Overview &gt; Dashboards &gt; Management.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Create Dashboard.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Modify the custom dashboard options as described in Custom Dashboard Options, on page 294.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click Save.</td>
</tr>
</tbody>
</table>

Custom Dashboard Options

The table below describes options you can use when creating or editing custom dashboards.
### Table 36: Custom Dashboard Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy Dashboard</td>
<td>When you create a custom dashboard, you can choose to base it on any existing dashboard, whether user-created or system-defined. This option makes a copy of the preexisting dashboard, which you can modify to suit your needs. Optionally, you can create a blank new dashboard by choosing None. This option is available only when you create a new dashboard. In a multidomain deployment, you can copy any non-private dashboards from ancestor domains.</td>
</tr>
<tr>
<td>Name</td>
<td>A unique name for the custom dashboard.</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of the custom dashboard.</td>
</tr>
<tr>
<td>Change Tabs Every</td>
<td>Specifies (in minutes) how often the dashboard should cycle through its tabs. Unless you pause the dashboard or your dashboard has only one tab, this setting advances your view to the next tab at the interval you specify. To disable tab cycling, enter 0 in the Change Tabs Every field.</td>
</tr>
<tr>
<td>Refresh Page Every</td>
<td>Determines how often the entire dashboard page automatically refreshes. Refreshing the entire dashboard allows you to see any preference or layout changes that were made to a shared dashboard by another user, or that you made to a private dashboard on another computer, since the last time the dashboard refreshed. A frequent refresh can be useful, for example, in a networks operations center (NOC) where a dashboard is displayed at all times. If you make changes to the dashboard at a local computer, the dashboard in the NOC automatically refreshes at the interval you specify, and no manual refresh is required. This refresh does not update the data, and you do not need to refresh the entire dashboard to see data updates; individual widgets update according to their preferences. This value must be greater than the Change Tabs Every setting. Unless you pause the dashboard, this setting will refresh the entire dashboard at the interval you specify. To disable the periodic page refresh, enter 0 in the Refresh Page Every field. <strong>Note</strong> This setting is separate from the update interval available on many individual widgets; although refreshing the dashboard page resets the update interval on individual widgets, widgets will update according to their individual preferences even if you disable the Refresh Page Every setting.</td>
</tr>
</tbody>
</table>
Customizing the Widget Display

You can minimize and maximize widgets, as well as rearrange the widgets on a tab.

**Step 1** View a dashboard; see Viewing Dashboards, on page 298.

**Step 2** Customize the widget display:

- To rearrange a widget on a tab, click the title bar of the widget you want to move, then drag it to its new location.

  **Note** You cannot move widgets from tab to tab. If you want a widget to appear on a different tab, you must delete it from the existing tab and add it to the new tab.

- To minimize or maximize a widget on the dashboard, click **Minimize** (−) or **Maximize** (□) in a widget’s title bar.

- To delete a widget if you no longer want to view it on a tab, click **Close** (×) in the title bar of the widget.

Editing Dashboards Options

**Step 1** View the dashboard you want to edit; see Viewing Dashboards, on page 298.

**Step 2** Click **Edit** (تحرير).

**Step 3** Change the options as described in Custom Dashboard Options, on page 294.

**Step 4** Click **Save**.

Modifying Dashboard Time Settings

You can change the time range to reflect a period as short as the last hour (the default) or as long as the last year. When you change the time range, the widgets that can be constrained by time automatically update to reflect the new time range.

The maximum number of data points in any graph is 300, and the time setting determines how much time is summarized within each data point. Following is the number of data points, and the time span covered, in the dashboards for each time range:

- 1 hour = 12 data points, 5 minutes each
• 6 hours = 72 data points, 5 minutes each
• 1 day = 288 data points, 5 minutes each
• 1 week = 300 data points, 33.6 minutes each
• 2 weeks = 300 data points, 67.2 minutes each
• 30 days = 300 data points, 144 minutes each
• 90 days = 300 data points, 432 minutes each
• 180 days = 300 data points, 864 minutes each
• 1 year = 300 data points, 1752 minutes each

Note that not all widgets can be constrained by time. For example, the dashboard time range has no effect on the Appliance Information widget, which provides information that includes the appliance name, model, and current version of the Firepower System software.

Keep in mind that for enterprise deployments of the Firepower System, changing the time range to a long period may not be useful for widgets like the Custom Analysis widget, depending on how often newer events replace older events.

You can also pause a dashboard, which allows you to examine the data provided by the widgets without the display changing and interrupting your analysis. Pausing a dashboard has the following effects:

• Individual widgets stop updating, regardless of any Update Every widget preference.
• Dashboard tabs stop cycling, regardless of the Cycle Tabs Every setting in the dashboard properties.
• Dashboard pages stop refreshing, regardless of the Refresh Page Every setting in the dashboard properties.
• Changing the time range has no effect.

When you are finished with your analysis, you can unpause the dashboard. Unpausing the dashboard causes all appropriate widgets on the page to update to reflect the current time range. In addition, dashboard tabs resume cycling and the dashboard page resumes refreshing according to the settings you specified in the dashboard properties.

If you experience connectivity problems or other issues that interrupt the flow of system information to the dashboard, the dashboard automatically pauses and an error notice appears until the problem is resolved.

**Note**
Your session normally logs you out after 1 hour of inactivity (or another configured interval), regardless of whether the dashboard is paused. If you plan to passively monitor the dashboard for long periods of time, consider exempting some users from session timeout, or changing the system timeout settings.

---

**Step 1**  View the dashboard where you want to add a widget; see Viewing Dashboards, on page 298.

**Step 2**  Optionally, to change the dashboard time range, choose a time range from the Show the Last drop-down list.

**Step 3**  Optionally, pause or unpause the dashboard on the time range control, using Pause (II) or Play (▶).
Renaming a Dashboard

Step 1  View the dashboard you want to modify; see Viewing Dashboards, on page 298.
Step 2  Click the dashboard title you want to rename.
Step 3  Type a name.
Step 4  Click OK.

Viewing Dashboards

By default, the home page for your appliance displays the default dashboard. If you do not have a default dashboard defined, the home page shows the Dashboard Management page, where you can choose a dashboard to view.

At any time, you can do one of the following:

- To view the default dashboard for your appliance, choose Overview > Dashboards.
- To view a specific dashboard, choose Overview > Dashboards, and choose the dashboard from the menu.
- To view all available dashboards, choose Overview > Dashboards > Management. You can then choose View (%) next to an individual dashboard to view it.
CHAPTER 14

Health Monitoring

The following topics describe how to use health monitoring in the Firepower System:

• Requirements and Prerequisites for Health Monitoring, on page 299
• About Health Monitoring, on page 299
• Health Policies, on page 309

About Health Monitoring

The health monitor on the Firepower Management Center tracks a variety of health indicators to ensure that the hardware and software in the Firepower System are working correctly. You can use the health monitor to check the status of critical functionality across your Firepower System deployment.
You can use the health monitor to create a collection of tests, referred to as a *health policy*, and apply the health policy to one or more appliances. The tests, referred to as *health modules*, are scripts that test for criteria you specify. You can modify a health policy by enabling or disabling tests or by changing test settings, and you can delete health policies that you no longer need. You can also suppress messages from selected appliances by blacklisting them.

The tests in a health policy run automatically at the interval you configure. You can also run all tests, or a specific test, on demand. The health monitor collects health events based on the test conditions configured.

All appliances automatically report their hardware status via the Hardware Alarms health module. The Firepower Management Center also automatically reports status using the modules configured in the default health policy. Some health modules, such as the Appliance Heartbeat module, run on the Firepower Management Center and report the status of the Firepower Management Center's managed devices. Some health modules do not provide managed device status unless you apply a health policy configured with those modules to a device.

You can use the health monitor to access health status information for the entire system, for a particular appliance, or, in a multidomain deployment, a particular domain. Pie charts and status tables on the Health Monitor page provide a visual summary of the status of all appliances on your network, including the Firepower Management Center. Individual appliance health monitors let you drill down into health details for a specific appliance.

Fully customizable event views allow you to quickly and easily analyze the health status events gathered by the health monitor. These event views allow you to search and view event data and to access other information that may be related to the events you are investigating. For example, if you want to see all the occurrences of CPU usage with a certain percentage, you can search for the CPU usage module and enter the percentage value.

You can also configure email, SNMP, or syslog alerting in response to health events. A *health alert* is an association between a standard alert and a health status level. For example, if you need to make sure an appliance never fails due to hardware overload, you can set up an email alert. You can then create a health alert that triggers that email alert whenever CPU, disk, or memory usage reaches the Warning level you configure in the health policy applied to that appliance. You can set alerting thresholds to minimize the number of repeating alerts you receive.

You can also generate troubleshooting files for an appliance if you are asked to do so by Support.

Because health monitoring is an administrative activity, only users with administrator user role privileges can access system health data.
## Health Modules

*Health modules, or health tests, test for the criteria you specify in a health policy.*

### Table 37: Health Modules

<table>
<thead>
<tr>
<th>Module</th>
<th>Appliances</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMP for Endpoints Status</td>
<td>FMC</td>
<td>The module alerts if the FMC cannot connect to the AMP cloud or Cisco AMP Private Cloud after an initial successful connection, or if the private cloud cannot contact the public AMP cloud. It also alerts if you deregister an AMP cloud connection using the AMP for Endpoints management console.</td>
</tr>
<tr>
<td>AMP for Firepower Status (AMP for Networks Status)</td>
<td>FMC</td>
<td>This module alerts if:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The FMC cannot contact the AMP cloud (public or private) or the Cisco Threat Grid public cloud or on-premises appliance, or the AMP private cloud cannot contact the public AMP cloud.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The encryption keys used for the connection are invalid.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• A device cannot contact the Cisco Threat Grid cloud or an Cisco Threat Grid on-premises appliance to submit files for dynamic analysis.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• An excessive number of files are detected in network traffic based on the file policy configuration.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If your FMC loses connectivity to the Internet, the system may take up to 30 minutes to generate a health alert.</td>
</tr>
<tr>
<td>Appliance Heartbeat</td>
<td>Any</td>
<td>This module determines if an appliance heartbeat is being heard from the appliance and alerts based on the appliance heartbeat status.</td>
</tr>
<tr>
<td>Automatic Application Bypass Status</td>
<td>7000 &amp; 8000 Series</td>
<td>This module determines if an appliance has been bypassed because it did not respond within the number of seconds set in the bypass threshold, and alerts when a bypass occurs.</td>
</tr>
<tr>
<td>Backlog Status</td>
<td>FMC</td>
<td>This module alerts if the backlog of event data awaiting transmission from the device to the FMC has grown continuously for more than 30 minutes. To reduce the backlog, evaluate your bandwidth and consider logging fewer events.</td>
</tr>
<tr>
<td>Card Reset</td>
<td>Any</td>
<td>This module checks for network cards which have restarted due to hardware failure and alerts when a reset occurs.</td>
</tr>
<tr>
<td>Classic License Monitor</td>
<td>FMC</td>
<td>This module determines if sufficient Classic licenses remain. It also alerts when devices in a stack have mismatched license sets. It alerts based on a warning level automatically configured for the module. You cannot change the configuration of this module.</td>
</tr>
<tr>
<td>Module</td>
<td>Appliances</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Cluster/Failover Status</td>
<td>FTD</td>
<td>This module monitors the status of device clusters. The module alerts if:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• A new primary unit is elected to a cluster.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• A new secondary unit joins a cluster.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• A primary or secondary unit leaves a cluster.</td>
</tr>
<tr>
<td>CPU Usage</td>
<td>Any</td>
<td>This module checks that the CPU on the appliance is not overloaded and alerts when CPU usage exceeds the percentages configured for the module.</td>
</tr>
<tr>
<td>Disk Status</td>
<td>Any</td>
<td>This module examines performance of the hard disk, and malware storage pack (if installed) on the appliance.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This module generates a Warning (yellow) health alert when the hard disk and RAID controller (if installed) are in danger of failing, or if an additional hard drive is installed that is not a malware storage pack. This module generates an Alert (red) health alert when an installed malware storage pack cannot be detected.</td>
</tr>
<tr>
<td>Disk Usage</td>
<td>Any</td>
<td>This module compares disk usage on the appliance’s hard drive and malware storage pack to the limits configured for the module and alerts when usage exceeds the percentages configured for the module. This module also alerts when the system excessively deletes files in monitored disk usage categories, or when disk usage excluding those categories reaches excessive levels, based on module thresholds. See Disk Usage and Drain of Events Health Monitor Alerts, on page 355 for information about troubleshooting scenarios for Disk Usage alerts.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Use the Disk Usage health status module to monitor disk usage for the / and /volume partitions on the appliance and track draining frequency. Although the disk usage module lists the /boot partition as a monitored partition, the size of the partition is static so the module does not alert on the boot partition.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Attention</strong> If you receive alerts for high unmanaged disk usage for the partition /volume even though the usage is below the critical or warning threshold specified in the health policy, this could indicate that there are files which need to be deleted manually from the system. Contact TAC if you receive these alerts.</td>
</tr>
<tr>
<td>Hardware Alarms</td>
<td>7000 &amp; 8000 Series Threat Defense (physical)</td>
<td>This module determines if hardware needs to be replaced on a physical managed device and alerts based on the hardware status. The module also reports on the status of hardware-related daemons and on the status of 7000 and 8000 Series devices in high-availability deployments.</td>
</tr>
<tr>
<td>Module</td>
<td>Appliances</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HA Status</td>
<td>FMC</td>
<td>This module monitors and alerts on the high availability status of the FMC. If you have not established FMC high availability, the HA Status is <em>Not in HA</em>. This module does not monitor or alert on the high availability status of managed devices, regardless of whether they are paired. The HA Status for a managed device is always <em>Not in HA</em>. Use the device management page <strong>Devices &gt; Device Management</strong> to monitor devices in high availability pairs.</td>
</tr>
<tr>
<td>Health Monitor Process</td>
<td>Any</td>
<td>This module monitors the status of the health monitor itself and alerts if the number of minutes since the last health event received by the FMC exceeds the Warning or Critical limits.</td>
</tr>
<tr>
<td>Host Limit</td>
<td>FMC</td>
<td>This module determines if the number of hosts the FMC can monitor is approaching the limit and alerts based on the warning level configured for the module. For more information, see <em>Firepower System Host Limit, on page 2044</em>.</td>
</tr>
<tr>
<td>Inline Link Mismatch Alarms</td>
<td>Any managed device except ASA FirePOWER</td>
<td>This module monitors the ports associated with inline sets and alerts if the two interfaces of an inline pair negotiate different speeds.</td>
</tr>
<tr>
<td>Interface Status</td>
<td>Any</td>
<td>This module determines if the device currently collects traffic and alerts based on the traffic status of physical interfaces and aggregate interfaces. For physical interfaces, the information includes interface name, link state, and bandwidth. For aggregate interfaces, the information includes interface name, number of active links, and total aggregate bandwidth. For ASA FirePOWER, interfaces labeled DataPlaneInterfacex, where x is a numerical value, are internal interfaces (not user-defined) and involve packet flow within the system.</td>
</tr>
</tbody>
</table>
| Intrusion and File Event Rate | Any managed device | This module compares the number of intrusion events per second to the limits configured for this module and alerts if the limits are exceeded. If the Intrusion and File Event Rate is zero, the intrusion process may be down or the managed device may not be sending events. Select **Analysis > Intrusions > Events** to check if events are being received from the device. Typically, the event rate for a network segment averages 20 events per second. For a network segment with this average rate, Events per second (Critical) should be set to 50 and Events per second (Warning) should be set to 30. To determine limits for your system, find the Events/Sec value on the Statistics page for your device (**System > Monitoring > Statistics**), then calculate the limits using these formulas:  
  * Events per second (Critical) = Events/Sec * 2.5  
  * Events per second (Warning) = Events/Sec * 1.5  
  The maximum number of events you can set for either limit is 999, and the Critical limit must be higher than the Warning limit.                                                                                                                                                                                                                                                                                                                                                                                                 |

---

*Firepower Management Center Configuration Guide, Version 6.4*
## Health Modules

<table>
<thead>
<tr>
<th>Module</th>
<th>Appliances</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISE Connection Status Monitor</td>
<td>FMC</td>
<td>This module monitors the status of the server connections between the Cisco Identity Services Engine (ISE) and the FMC. ISE provides additional user data, device type data, and device location data.</td>
</tr>
<tr>
<td>Link State Propagation</td>
<td>Any except NGIPSv, ASA FirePOWER, Firepower 9300, Firepower 4100 series, Firepower 2100 series, Firepower 1000 series</td>
<td>This module determines when a link in a paired inline set fails and triggers the link state propagation mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If a link state propagates to the pair, the status classification for that module changes to Critical and the state reads:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Module Link State Propagation: ethx_ethy is Triggered</td>
</tr>
<tr>
<td></td>
<td></td>
<td>where x and y are the paired interface numbers.</td>
</tr>
<tr>
<td>Local Malware Analysis</td>
<td>Any</td>
<td>This module alerts if a device running Version 6.2.3 or earlier is configured for local malware analysis and fails to download local malware analysis engine signature updates from the AMP cloud.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For Version 6.3.0+ devices, use the Threat Data Updates on Devices module.</td>
</tr>
<tr>
<td>Memory Usage</td>
<td>Any</td>
<td>This module compares memory usage on the appliance to the limits configured for the module and alerts when usage exceeds the levels configured for the module.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For appliances with more than 4 GB of memory, the preset alert thresholds are based on a formula that accounts for proportions of available memory likely to cause system problems. On &gt;4 GB appliances, because the interval between Warning and Critical thresholds may be very narrow, Cisco recommends that you manually set the Warning Threshold % value to 50. This will further ensure that you receive memory alerts for your appliance in time to address the issue. See Memory Usage Thresholds for Health Monitor Alerts, on page 354 for additional information about how thresholds are calculated.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Complex access control policies and rules can command significant resources and negatively affect performance. Some lower-end ASA devices with FirePOWER Services Software may generate intermittent memory usage warnings, as the device’s memory allocation is being used to the fullest extent possible.</td>
</tr>
<tr>
<td>Platform Faults</td>
<td>Firepower 1000/2100</td>
<td>On Firepower 2100 and Firepower 1000 devices, a fault is a mutable object that is managed by the FMC. Each fault represents a failure in the Firepower 1000/2100 instance or an alarm threshold that has been raised. During the lifecycle of a fault, it can change from one state or severity to another. Each fault includes information about the operational state of the affected object at the time the fault was raised. If the fault is transitional and the failure is resolved, then the object transitions to a functional state. For more information, see the Cisco Firepower 1000/2100 FXOS Faults and Error Messages Guide.</td>
</tr>
<tr>
<td>Module</td>
<td>Appliances</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Power Supply           | Physical FMCs 7000 & 8000 Series | This module determines if power supplies on the device require replacement and alerts based on the power supply status.  
**Note** If an 8000 Series device experiences a power failure, it may take up to 20 minutes to generate an alert. |
| Process Status         | Any                       | This module determines if processes on the appliance exit or terminate outside of the process manager.  
If a process is deliberately exited outside of the process manager, the module status changes to Warning and the health event message indicates which process exited, until the module runs again and the process has restarted. If a process terminates abnormally or crashes outside of the process manager, the module status changes to Critical and the health event message indicates the terminated process, until the module runs again and the process has restarted. |
| Realm                  | Any managed device        | Enables you to set a warning threshold for realm or user mismatches, which are:  
  • User mismatch: A user is reported to the Firepower Management Center without being downloaded.  
    A typical reason for a user mismatch is that the user belongs to a group you have excluded from being downloaded to the Firepower Management Center. Review the information discussed in Realm Fields, on page 2108.  
  • Realm mismatch: A user logs into a domain that corresponds to a realm not known to the Firepower Management Center.  
For more information, see Detect Realm or User Mismatches, on page 2122. |
| Reconfiguring Detection| Any managed device        | This module alerts if a device reconfiguration has failed. |
| RRD Server Process     | FMC                       | This module determines if the round robin data server that stores time series data is running properly. The module will alert if the RRD server has restarted since the last time it updated; it will enter Critical or Warning status if the number of consecutive updates with an RRD server restart reaches the numbers specified in the module configuration. |
| Security Intelligence  | FMC and devices running Version 6.2.3 or earlier | This module alerts if Security Intelligence is in use and:  
  • The FMC cannot update a feed, or feed data is corrupt or contains no recognizable IP addresses.  
  • A device running Version 6.2.3 or earlier had a problem receiving updated Security Intelligence data from the FMC.  
  • A device running Version 6.2.3 or earlier cannot load all of the Security Intelligence data provided to it by the FMC due to memory issues; see Troubleshooting Memory Use, on page 1439.  
For Version 6.3.0+ devices, also see the Threat Data Updates on Devices module. |
This module alerts if:

- There is a communication error between the Smart Licensing Agent (Smart Agent) and the Smart Software Manager.
- The Product Instance Registration Token has expired.
- The Smart License usage is out of compliance.
- The Smart License authorization or evaluation mode has expired.

<table>

</tr>
</thead>
</table>
| Threat Data Updates on Devices | FMC and Version 6.3.0+ devices      | Certain intelligence data and configurations that devices use to detect threats are updated on the FMC from the cloud every 30 minutes. This module alerts you if this information has not been updated on the devices within the time period you have specified. Monitored updates include:  
  - Local URL category and reputation data  
  - Security Intelligence URL lists and feeds, including global Block and Do Not Block lists and URLs from Threat Intelligence Director  
  - Security Intelligence network lists and feeds (IP addresses), including global Block and Do Not Block lists and IP addresses from Threat Intelligence Director  
  - Security Intelligence DNS lists and feeds, including global Block and Do Not Block lists and domains from Threat Intelligence Director  
  - Local malware analysis signatures (from ClamAV)  
  - SHA lists from Threat Intelligence Director, as listed on the Objects > Object Management > Security Intelligence > Network Lists and Feeds page  
  - Dynamic analysis settings configured on the AMP > Dynamic Analysis Connections page  
  - Threat Configuration settings related to expiration of cached URLs, including the Cached URLs Expire setting on the System > Integration > Cloud Services page. (Updates to the URL cache are not monitored by this module.)  
  - Communication issues with the Cisco cloud for sending events. See the Cisco Cloud box on the System > Integration > Cloud Services page.  
  Note: Threat Intelligence Director updates are included only if TID is configured on your system and you have feeds.  
  By default, this module sends a warning after 1 hour and a critical alert after 24 hours.  
  If this module indicates failure on the FMC or on any devices, verify that the FMC can reach the devices.  
  For low-memory devices that show failure of the URL category and reputation data type, see Troubleshooting Memory Use, on page 1439. |
| Time Series Data Monitor       | FMC                                 | This module tracks the presence of corrupt files in the directory where time series data (such as correlation event counts) are stored and alerts when files are flagged as corrupt and removed. |
### Configuring Health Monitoring

**Step 1**
Determine which health modules you want to monitor as discussed in Health Modules, on page 301.

You can set up specific policies for each kind of appliance you have in your Firepower System, enabling only the appropriate tests for that appliance.

**Tip**
To quickly enable health monitoring without customizing the monitoring behavior, you can apply the default policy provided for that purpose.

**Step 2**
Apply a health policy to each appliance where you want to track health status as discussed in Creating Health Policies, on page 309.

**Step 3**
(Optional.) Configure health monitor alerts as discussed in Creating Health Monitor Alerts, on page 315.
You can set up email, syslog, or SNMP alerts that trigger when the health status level reaches a particular severity level for specific health modules.

---

**Health Policies**

A health policy contains configured health test criteria for several modules. You can control which health modules run against each of your appliances and configure the specific limits used in the tests run by each module.

When you configure a health policy, you decide whether to enable each health module for that policy. You also select the criteria that control which health status each enabled module reports each time it assesses the health of a process.

You can create one health policy that can be applied to every appliance in your system, customize each health policy to the specific appliance where you plan to apply it, or use the default health policy provided for you. In a multidomain deployment, administrators in ancestor domains can apply health policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

**Default Health Policy**

The health monitor on the Firepower Management Center provides a default health policy to allow you to quickly implement health monitoring for your appliances. In the default health policy, most of the health modules available on the running platform are automatically enabled. The default health policy is automatically applied to the Firepower Management Center. Additionally, the default health policy is applied to a managed device when you add the device to the Firepower Management Center. You cannot edit the default health policy, but you can copy it to create custom policies based on its configuration.

**Creating Health Policies**

If you want to customize a health policy to use with your appliances, you can create a new policy. The settings in the policy initially populate with the settings from the health policy you choose as a basis for the new policy. You can enable or disable modules within the policy and change the alerting criteria for each module as needed.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain. Administrators in ancestor domains can apply health policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

---

**Step 1** Choose System > Health > Policy.

**Step 2** Click New Policy.

**Step 3** Choose the existing policy that you want to use as the basis for the new policy from the Copy Policy drop-down list.

**Step 4** Enter a name for the policy.

**Step 5** Enter a description for the policy.

**Step 6** Choose Save to save the policy information.

**Step 7** Choose the module you want to use.
Applying Health Policies

When you apply a health policy to an appliance, the health tests for all the modules you enabled in the policy automatically monitor the health of the processes and hardware on the appliance. Health tests then continue to run at the intervals you configured in the policy, collecting health data for the appliance and forwarding that data to the Firepower Management Center.

If you enable a module in a health policy and then apply the policy to an appliance that does not require that health test, the health monitor reports the status for that health module as disabled.

If you apply a policy with all modules disabled to an appliance, it removes all applied health policies from the appliance so no health policy is applied.

When you apply a different policy to an appliance that already has a policy applied, expect some latency in the display of new data based on the newly applied tests.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain. Administrators in ancestor domains can apply health policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

Step 1  Choose System > Health > Policy .

Step 2  Click the Apply (✓) next to the policy you want to apply.

Tip  The Status (✓) next to the Health Policy column indicates the current health status for the appliance.

Step 3  Choose the appliances where you want to apply the health policy.

Step 4  Click Apply to apply the policy to the appliances you chose.
What to do next

• Optionally, monitor the task status; see Viewing Task Messages, on page 352.

Monitoring of the appliance starts as soon as the policy is successfully applied.

Editing Health Policies

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain. Administrators in ancestor domains can apply health policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

Step 1
Choose System > Health > Policy.

Step 2
Click Edit (edit) next to the policy you want to modify.

Step 3
Edit the Policy Name or Policy Description fields as desired.

Step 4
Click the health module you want to modify.

Step 5
Modify settings as described in Health Modules, on page 301.

Step 6
You have three options:

• To save your changes to this module and return to the Health Policy page, click Save Policy and Exit.
• To return to the Health Policy page without saving any of your settings for this module, click Cancel.
• To temporarily save your changes to this module and switch to another module’s settings to modify, choose the other module from the list at the left of the page. If you click Save Policy and Exit when you are done, all changes you made will be saved; if you click Cancel, you discard all changes.

What to do next

• Reapply the health policy as described in Applying Health Policies, on page 310. This applies your changes and updates the policy status for all affected policies.

Deleting Health Policies

You can delete health policies that you no longer need. If you delete a policy that is still applied to an appliance, the policy settings remain in effect until you apply a different policy. In addition, if you delete a health policy that is applied to a device, any health monitoring alerts in effect for the device remain active until you disable the underlying associated alert response.

In a multidomain deployment, you can only delete health policies created in the current domain.

Tip
To stop health monitoring for an appliance, create a health policy with all modules disabled and apply it to the appliance.
The Health Monitor Blacklist

In the course of normal network maintenance, you disable appliances or make them temporarily unavailable. Because those outages are deliberate, you do not want the health status from those appliances to affect the summary health status on your Firepower Management Center.

You can use the health monitor blacklist feature to disable health monitoring status reporting on an appliance or module. For example, if you know that a segment of your network will be unavailable, you can temporarily disable health monitoring for a managed device on that segment to prevent the health status on the Firepower Management Center from displaying a warning or critical status because of the lapsed connection to the device.

When you disable health monitoring status, health events are still generated, but they have a disabled status and do not affect the health status for the health monitor. If you remove the appliance or module from the blacklist, the events that were generated during the blacklisting continue to show a status of disabled.

To temporarily disable health events from an appliance, go to the blacklist configuration page and add an appliance to the blacklist. After the setting takes effect, the system no longer includes the blacklisted appliance when calculating the overall health status. The Health Monitor Appliance Status Summary lists the appliance as disabled.

At times it may be more practical to just blacklist an individual health monitoring module on an appliance. For example, when you reach the host limit on a Firepower Management Center, you can blacklist the Host Limit status messages.

Note that on the main Health Monitor page you can distinguish between appliances that are blacklisted if you expand to view the list of appliances with a particular status by clicking the arrow in that status row.

A Blocklist (ि) and a notation are visible after you expand the view for a blacklisted or partially blacklisted appliance.

Note

On a Firepower Management Center, Health Monitor blacklist settings are local configuration settings. Therefore, if you blacklist a device, then delete it and later re-register it with the Firepower Management Center, the blacklist settings remain persistent. The newly re-registered device remains blacklisted.

In a multidomain deployment, administrators in ancestor domains can blacklist an appliance or health module in descendant domains. However, administrators in the descendant domains can override the ancestor configuration and clear the blacklist for devices in their domain.

Blacklisting Appliances

You can blacklist appliances individually or by group, model, or associated health policy.
After the blacklist settings take effect, the appliance shows as disabled in the Health Monitor Appliance Module Summary and Device Management page. Health events for the appliance have a status of disabled.

If you need to set the events and health status for an individual appliance to disabled, you can blacklist the appliance. After the blacklist settings take effect, the appliance shows as disabled in the Health Monitor Appliance Module Summary, and health events for the appliance have a status of disabled.

In a multidomain deployment, blacklisting an appliance in an ancestor domain blacklists it for all descendant domains. Descendant domains can override this inherited configuration and clear the blacklisting. You can only blacklist the Firepower Management Center at the Global level.

### Blacklisting Health Policy Modules

You can blacklist individual health policy modules on appliances. You may want to do this to prevent events from the module from changing the status for the appliance to warning or critical.

After the blacklist settings take effect, the appliance shows as **Partially Blacklisted** or **All Modules Blacklisted** on the Blacklist page and in the Appliance Health Monitor Module Status Summary, but only in expanded views on the main Appliance Status Summary page.

**Tip**

Make sure that you keep track of individually blacklisted modules so you can reactivate them when you need them. You may miss necessary warning or critical messages if you accidentally leave a module disabled.

In a multidomain deployment, administrators in ancestor domains can blacklist health modules in descendant domains. However, administrators in descendant domains can override this ancestor configuration and clear the blacklisting for policies applied in their domains. You can only blacklist Firepower Management Center health modules at the Global level.

### Step-by-Step Guide

**Step 1** Choose **System > Health > Blacklist**.

**Step 2** Use the drop-down list on the right to sort the list by group, model, or by health policy.

**Tip**

- The status icon next to the Health Policy column **Status (✔)** indicates the current health status for the appliance.
- The status icon next to the System Policy column **Status (✔)** indicates the communication status between the Firepower Management Center and the device.

**Step 3** You have two choices:

- To blacklist all appliances in a group, model, or policy category, check the check box for the category, then click **Blacklist Selected Devices**.
- To clear blacklisting from all appliances in a group, model, or policy category, check the check box for the category, then click **Clear Blacklist on Selected Devices**.
Health Monitor Alerts

You can set up alerts to notify you through email, through SNMP, or through the system log when the status changes for the modules in a health policy. You can associate an existing alert response with health event levels to trigger and alert when health events of a particular level occur.

For example, if you are concerned that your appliances may run out of hard disk space, you can automatically send an email to a system administrator when the remaining disk space reaches the warning level. If the hard drive continues to fill, you can send a second email when the hard drive reaches the critical level.

In a multidomain deployment, you can view and modify health monitor alerts created in the current domain only.

Health Monitor Alert Information

The alerts generated by the health monitor contain the following information:

• Severity, which indicates the severity level of the alert.
• Module, which specifies the health module whose test results triggered the alert.
• Description, which includes the health test results that triggered the alert.

The table below describes these severity levels.

<table>
<thead>
<tr>
<th>Severity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical</td>
<td>The health test results met the criteria to trigger a Critical alert status.</td>
</tr>
<tr>
<td>Warning</td>
<td>The health test results met the criteria to trigger a Warning alert status.</td>
</tr>
<tr>
<td>Normal</td>
<td>The health test results met the criteria to trigger a Normal alert status.</td>
</tr>
<tr>
<td>Error</td>
<td>The health test did not run.</td>
</tr>
<tr>
<td>Recovered</td>
<td>The health test results met the criteria to return to a normal alert status, following a Critical or Warning alert status.</td>
</tr>
</tbody>
</table>
Creating Health Monitor Alerts

You must be an Admin user to perform this procedure.

When you create a health monitor alert, you create an association between a severity level, a health module, and an alert response. You can use an existing alert or configure a new one specifically to report on system health. When the severity level occurs for the selected module, the alert triggers.

If you create or update a threshold in a way that duplicates an existing threshold, you are notified of the conflict. When duplicate thresholds exist, the health monitor uses the threshold that generates the fewest alerts and ignores the others. The timeout value for the threshold must be between 5 and 4,294,967,295 minutes.

In a multidomain deployment, you can view and modify health monitor alerts created in the current domain only.

Before you begin

• Configure an alert response that governs the Firepower Management Center's communication with the SNMP, syslog, or email server where you send the health alert; see Firepower Management Center Alert Responses, on page 2295.

| Step 1 | Choose System > Health > Monitor Alerts. |
| Step 2 | Enter a name for the health alert in the Health Alert Name field. |
| Step 3 | From the Severity list, choose the severity level you want to use to trigger the alert. |
| Step 4 | From the Module list, choose the health policy modules for which you want the alert to apply. |
| Step 5 | From the Alert list, choose the alert response that you want to trigger when the specified severity level is reached. |
| Step 6 | Optionally, in the Threshold Timeout field, enter the number of minutes that should elapse before each threshold period ends and the threshold count resets. Even if the policy run time interval value is less than the threshold timeout value, the interval between two reported health events from a given module is always greater. For example, if you change the threshold timeout to 8 minutes and the policy run time interval is 5 minutes, there is a 10-minute interval (5 x 2) between reported events. |
| Step 7 | Click Save to save the health alert. |

Editing Health Monitor Alerts

You must be an Admin user to perform this procedure.

You can edit existing health monitor alerts to change the severity level, health module, or alert response associated with the health monitor alert.

In a multidomain deployment, you can view and modify health monitor alerts created in the current domain only.

| Step 1 | Choose System > Health > Monitor Alerts. |
| Step 2 | Choose the alert you want to modify from the Active Health Alerts list. |
| Step 3 | Click Load to load the configured settings for the alert you chose. |
Dealing with Health Monitor Alerts

In a multidomain deployment, you can view and modify health monitor alerts created in the current domain only.

**Deleting Health Monitor Alerts**

**Step 1** Choose **System > Health > Monitor Alerts**.

**Step 2** Choose the active health alerts you want to delete, then click **Delete**.

**What to do next**

- Disable or delete the underlying alert response to ensure that alerting does not continue; see Firepower Management Center Alert Responses, on page 2295.

Using the Health Monitor

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The health monitor provides the compiled health status for all devices managed by the Firepower Management Center, plus the Firepower Management Center. The health monitor is composed of:

- The status table — Provides a count of the managed appliances for this Firepower Management Center by overall health status.
- The pie chart — Indicates the percentage of appliances currently in each health status category.
- The appliance list — Provides details on the health of the managed devices.

In a multidomain deployment, the health monitor in an ancestor domain displays data from all descendant domains. In the descendant domains, it displays data from the current domain only.

**Step 1** Choose **System > Health > Monitor**.

**Step 2** Choose the appropriate status in the **Status** column of the table or the appropriate portion of the pie chart to the list appliances with that status.

**Tip**

If the arrow in the row for a status level points down, the appliance list for that status shows in the lower table. If the arrow points right, the appliance list is hidden.

**Step 3** You have the following choices:

- View appliance health monitors; see Viewing Appliance Health Monitors, on page 317.
- Create health policies; see Creating Health Policies, on page 309.
• Create health monitor alerts; see Creating Health Monitor Alerts, on page 315.

Health Monitor Status Categories

Available status categories are listed by severity in the table below.

Table 39: Health Status Indicator

<table>
<thead>
<tr>
<th>Status Level</th>
<th>Status Icon</th>
<th>Status Color in Pie Chart</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Black</td>
<td>Indicates that at least one health monitoring module has failed on the appliance and has not been successfully re-run since the failure occurred. Contact your technical support representative to obtain an update to the health monitoring module.</td>
</tr>
<tr>
<td>Critical</td>
<td>Critical</td>
<td>Red</td>
<td>Indicates that the critical limits have been exceeded for at least one health module on the appliance and the problem has not been corrected.</td>
</tr>
<tr>
<td>Warning</td>
<td>Warning</td>
<td>Yellow</td>
<td>Indicates that warning limits have been exceeded for at least one health module on the appliance and the problem has not been corrected.</td>
</tr>
<tr>
<td>Normal</td>
<td>Normal</td>
<td>Green</td>
<td>Indicates that all health modules on the appliance are running within the limits configured in the health policy applied to the appliance.</td>
</tr>
<tr>
<td>Recovered</td>
<td>Recovered</td>
<td>Green</td>
<td>Indicates that all health modules on the appliance are running within the limits configured in the health policy applied to the appliance, including modules that were in a Critical or Warning state.</td>
</tr>
<tr>
<td>Disabled</td>
<td>Disabled</td>
<td>Blue</td>
<td>Indicates that an appliance is disabled or blacklisted, that the appliance does not have a health policy applied to it, or that the appliance is currently unreachable.</td>
</tr>
</tbody>
</table>

Viewing Appliance Health Monitors

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The Appliance Health Monitor provides a detailed view of the health status of an appliance.

In a multidomain deployment, you can view the health status of appliances in descendant domains.
Your session normally logs you out after 1 hour of inactivity (or another configured interval). If you plan to passively monitor health status for long periods of time, consider exempting some users from session timeout, or changing the system timeout settings. See Add an Internal User at the Web Interface, on page 45 and Configure Session Timeouts, on page 1077 for more information.

Tip

Step 1
Choose System > Health > Monitor.

Step 2
Expand the appliance list. To show appliances with a particular status, click the arrow in that status row. Alternatively, in the Appliance Status Summary graph, click the color for the appliance status category you want to view.

Tip
If the arrow in the row for a status level points down, the appliance list for that status shows in the lower table. If the arrow points right, the appliance list is hidden.

Step 3
In the Appliance column of the appliance list, click the name of the appliance for which you want to view details.

Tip
In the Module Status Summary graph, click the color for an event status category to toggle display of Alert Details for that status category.

What to do next

- If you want to run all health modules for the appliance, see Running All Modules for an Appliance, on page 318
- If you want to run a specific health module for an appliance, see Running a Specific Health Module, on page 319
- If you want to generate health module alert graphs for the appliance, see Generating Health Module Alert Graphs, on page 319
- If you want to produce troubleshooting files for the appliance, see Downloading Advanced Troubleshooting Files, on page 360
- If you want to download advanced troubleshooting files for the appliance, see Downloading Advanced Troubleshooting Files, on page 360
- If you want to execute Firepower Threat Defense CLI commands from the Firepower Management Center web interface, see Using the FTD CLI from the Web Interface, on page 362

Running All Modules for an Appliance

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

Health module tests run automatically at the policy run time interval you configure when you create a health policy. However, you can also run all health module tests on demand to collect up-to-date health information for the appliance.

In a multidomain deployment, you can run health module tests for appliances in the current domain and in any descendant domains.
Step 1 View the health monitor for the appliance; see Viewing Appliance Health Monitors, on page 317.

Step 2 Click Run All Modules. The status bar indicates the progress of the tests, then the Health Monitor Appliance page refreshes.

**Note** When you manually run health modules, the first refresh that automatically occurs may not reflect the data from the manually run tests. If the value has not changed for a module that you just ran manually, wait a few seconds, then refresh the page by clicking the device name. You can also wait for the page to refresh again automatically.

---

**Running a Specific Health Module**

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

Health module tests run automatically at the policy run time interval you configure when you create a health policy. However, you can also run a health module test on demand to collect up-to-date health information for that module.

In a multidomain deployment, you can run health module tests for appliances in the current domain and in any descendant domains.

---

Step 1 View the health monitor for the appliance; see Viewing Appliance Health Monitors, on page 317.

Step 2 In the Module Status Summary graph, click the color for the health alert status category you want to view.

Step 3 In the Alert Detail row for the alert for which you want to view a list of events, click Run.

The status bar indicates the progress of the test, then the Health Monitor Appliance page refreshes.

**Note** When you manually run health modules, the first refresh that automatically occurs may not reflect the data from the manually run tests. If the value has not changed for a module that you just manually ran, wait a few seconds, then refresh the page by clicking the device name. You can also wait for the page to refresh automatically again.

---

**Generating Health Module Alert Graphs**

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

You can graph the results over a period of time of a particular health test for a specific appliance.

---

Step 1 View the health monitor for the appliance; see Viewing Appliance Health Monitors, on page 317.

Step 2 In the Module Status Summary graph of the Health Monitor Appliance page, click the color for the health alert status category you want to view.

Step 3 In the Alert Detail row for the alert for which you want to view a list of events, click Graph.
Health Event Views

The Health Event View page allows you to view health events logged by the health monitor on the Firepower Management Center logs health events. The fully customizable event views allow you to quickly and easily analyze the health status events gathered by the health monitor. You can search event data to easily access other information that may be related to the events you are investigating. If you understand what conditions each health module tests for, you can more effectively configure alerting for health events.

You can perform many of the standard event view functions on the health event view pages.

Viewing Health Events

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The Table View of Health Events page provides a list of all health events on the specified appliance.

When you access health events from the Health Monitor page on your Firepower Management Center, you retrieve all health events for all managed appliances.

In a multidomain deployment, you can view data for the current domain and for any descendant domains.

You cannot view data from higher level or sibling domains.

Tip

You can bookmark this view to allow you to return to the page in the health events workflow containing the Health Events table of events. The bookmarked view retrieves events within the time range you are currently viewing, but you can then modify the time range to update the table with more recent information if needed.

Choose System > Health > Events.

Tip

If you are using a custom workflow that does not include the table view of health events, click (switch workflow). On the Select Workflow page, click Health Events.

Note

If no events appear, you may need to adjust the time range.

Viewing Health Events by Module and Appliance

Step 1

View the health monitor for the appliance; see Viewing Appliance Health Monitors, on page 317.

Step 2

In the Module Status Summary graph, click the color for the event status category you want to view.

The Alert Detail list toggles the display to show or hide events.
Step 3
In the Alert Detail row for the alert for which you want to view a list of events, click Events.
The Health Events page appears, containing results for a query with the name of the appliance and the name of the specified health alert module as constraints. If no events appear, you may need to adjust the time range.

Step 4
If you want to view all health events for the specified appliance, expand Search Constraints, and click the Module Name constraint to remove it.

Viewing the Health Events Table
In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Step 1
Choose System > Health > Events.

Step 2
You have the following choices:

• Bookmark — To bookmark the current page so that you can quickly return to it, click Bookmark This Page, provide a name for the bookmark, and click Save.
• Change Workflow — To choose another health events workflow, click (switch workflow).
• Delete Events — To delete health events, check the check box next to the events you want to delete, and click Delete. To delete all the events in the current constrained view, click Delete All, then confirm you want to delete all the events.
• Generate Reports — Generate a report based on data in the table view — click Report Designer.
• Modify — Modify the time and date range for events listed in the Health table view. Note that events that were generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.
• Navigate — Navigate through event view pages.
• Navigate Bookmark — To navigate to the bookmark management page, click View Bookmarks from any event view.
• Navigate Other — Navigate to other event tables to view associated events.
• Sort — Sort the events that appear, change what columns display in the table of events, or constrain the events that appear
• View All — To view event details for all events in the view, click View All.
• View Details — To view the details associated with a single health event, click the down arrow link on the left side of the event.
• View Multiple — To view event details for multiple health events, choose the check box next to the rows that correspond with the events you want to view details for and then click View.
• View Status — To view all events of a particular status, click status in the Status column for an event with that status.
Hardware Alert Details for 7000 and 8000 Series Devices

The 8350 hardware platform has six fans, which display as FAN2 through FAN7. This is expected behavior. If you receive a hardware alert related to FAN1 or fan numbering in general on the 8350 platform, you can disregard the alert.

Table 40: Conditions Monitored for 7000 and 8000 Series Devices

<table>
<thead>
<tr>
<th>Condition Monitored</th>
<th>Causes of Yellow or Red Error Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device high availability status</td>
<td>If 7000 or 8000 Series devices in a high-availability pair are no longer communicating with each other (due, for example, to a cabling problem), the Hardware Alarms module changes to red.</td>
</tr>
<tr>
<td>ftwo daemon status</td>
<td>If the ftwo daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon.</td>
</tr>
<tr>
<td>NFE cards detected</td>
<td>Indicates the number of NFE cards detected on the system. If this value does not match the appliance’s expected NFE count, the Hardware Alarms module changes to red.</td>
</tr>
<tr>
<td>NFE hardware status</td>
<td>If one or more NFE cards are not communicating, the Hardware Alarms module changes to red and the applicable card appears in the message details.</td>
</tr>
<tr>
<td>NFE heartbeat</td>
<td>If the system detects no NFE heartbeat, the Hardware Alarms module changes to red and message details include a reference to the relevant card(s).</td>
</tr>
<tr>
<td>NFE internal link status</td>
<td>If the link between the NMSB and NFE card(s) goes down, the Hardware Alarms module changes to red and message details include a reference to the relevant ports.</td>
</tr>
<tr>
<td>NFE Message daemon</td>
<td>If the NFE Message daemon goes down, health status for the Hardware Alarms module changes to red and the message details include a reference to the daemon (and, if applicable, the NFE card number).</td>
</tr>
<tr>
<td>Condition Monitored</td>
<td>Causes of Yellow or Red Error Conditions</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>NFE temperature</td>
<td>If NFE temperature exceeds 97 degrees Celsius, health status for the Hardware Alarms module changes to yellow and message details include a reference to the NFE temperature (and, if applicable, the NFE card number). If NFE temperature exceeds 102 degrees Celsius, health status for the Hardware Alarms module changes to red and message details include a reference to the NFE temperature (and, if applicable, the NFE card number).</td>
</tr>
<tr>
<td>NFE temperature status</td>
<td>Indicates the current temperature status of the given NFE card. The Hardware Alarms module indicates green for OK, yellow for Warning, and red for Critical (and, if applicable, the NFE card number).</td>
</tr>
<tr>
<td>NFE TCAM daemon</td>
<td>If the NFE TCAM daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon (and, if applicable, the NFE card number).</td>
</tr>
<tr>
<td>nfm_ipfragd (host frag) daemon</td>
<td>If the nfm_ipfragd daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon (and, if applicable, the NFE card number).</td>
</tr>
<tr>
<td>NFE Platform daemon</td>
<td>If the NFE Platform daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon (and, if applicable, the NFE card number).</td>
</tr>
<tr>
<td>NMSB communications</td>
<td>If the Media assembly is not present or not communicating, health status for the Hardware Alarms module changes to red and message details include a reference to the NFE temperature (and, if applicable, the NFE card number).</td>
</tr>
<tr>
<td>psls daemon status</td>
<td>If the psls daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon.</td>
</tr>
<tr>
<td>Rulesd (host rules) daemon</td>
<td>If the Rulesd daemon goes down, health status for the Hardware Alarms module changes to yellow and message details include a reference to the daemon (and, if applicable, the NFE card number).</td>
</tr>
<tr>
<td>scmd daemon status</td>
<td>If the scmd daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon.</td>
</tr>
</tbody>
</table>
The Health Events Table

The Health Monitor modules you choose to enable in your health policy run various tests to determine appliance health status. When the health status meets criteria that you specify, a health event is generated.

The table below describes the fields that can be viewed and searched in the health events table.

*Table 41: Health Event Fields*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module Name</td>
<td>Specify the name of the module which generated the health events you want to view. For example, to view events that measure CPU performance, type CPU. The search should retrieve applicable CPU Usage and CPU temperature events.</td>
</tr>
<tr>
<td>Test Name</td>
<td>The name of the health module that generated the event.</td>
</tr>
<tr>
<td>Time</td>
<td>The timestamp for the health event.</td>
</tr>
<tr>
<td>Description</td>
<td>The description of the health module that generated the event. For example, health events generated when a process was unable to execute are labeled Unable to Execute.</td>
</tr>
<tr>
<td>Value</td>
<td>The value (number of units) of the result obtained by the health test that generated the event. For example, if the Firepower Management Center generates a health event whenever a device it is monitoring is using 80 percent or more of its CPU resources, the value could be a number from 80 to 100.</td>
</tr>
<tr>
<td>Units</td>
<td>The units descriptor for the result. You can use the asterisk (*) to create wildcard searches. For example, if the Firepower Management Center generates a health event when a device it is monitoring is using 80 percent or more of its CPU resources, the units descriptor is a percentage sign (%).</td>
</tr>
<tr>
<td>Status</td>
<td>The status (Critical, Yellow, Green, or Disabled) reported for the appliance.</td>
</tr>
<tr>
<td>Domain</td>
<td>For health events reported by managed devices, the domain of the device that reported the health event. For health events reported by the Firepower Management Center, Global. This field is only present in a multidomain deployment.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Device</td>
<td>The appliance where the health event was reported.</td>
</tr>

**History for Health Monitoring**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Version</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL Filtering Monitor improvements</td>
<td>6.4</td>
<td>You can now configure time thresholds for URL Filtering Monitor alerts. Modified screens: New options on the System &gt; Health &gt; Policy &gt; URL Filtering Monitor page. Supported platforms: Firepower Management Center</td>
</tr>
<tr>
<td>New health module: Threat Data Updates on Devices</td>
<td>6.3</td>
<td>A new module, Threat Data Updates on Devices, was added. This module alerts you if certain intelligence data and configurations that devices use to detect threats has not been updated on the devices within the time period you specify. New screens: New health policy on System &gt; Health &gt; Policy. Modified screens: New monitor results on System &gt; Health &gt; Monitor. Supported platforms: Firepower Management Center and managed devices running version 6.3 and higher.</td>
</tr>
</tbody>
</table>
Monitoring the System

The following topics describe how to monitor the Firepower System:

- About System Statistics, on page 327
- The Host Statistics Section, on page 327
- The Disk Usage Section, on page 328
- The Processes Section, on page 328
- The SFDataCorrelator Process Statistics Section, on page 334
- The Intrusion Event Information Section, on page 335
- Viewing System Statistics, on page 336

About System Statistics

You can view system statistics for the Firepower Management Center and 7000 & 8000 Series devices. The Statistics page lists the current status of general appliance statistics, including disk usage and system processes, Data Correlator statistics (FMC only), and intrusion event information (FMC only).

The Host Statistics Section

The following table describes the host statistics listed on the Statistics page.

Table 42: Host Statistics

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time</td>
<td>The current time on the system.</td>
</tr>
<tr>
<td>Uptime</td>
<td>The number of days (if applicable), hours, and minutes since the system was last started.</td>
</tr>
<tr>
<td>Memory Usage</td>
<td>The percentage of system memory that is being used.</td>
</tr>
<tr>
<td>Load Average</td>
<td>The average number of processes in the CPU queue for the past 1 minute, 5 minutes, and 15 minutes.</td>
</tr>
</tbody>
</table>
The Disk Usage Section

The Disk Usage section of the Statistics page provides a quick synopsis of disk usage, both by category and by partition status. If you have a malware storage pack installed on a device, you can also check its partition status. You can monitor this page from time to time to ensure that enough disk space is available for system processes and the database.

Tip
You can also use the Disk Usage health monitor on the Firepower Management Center to monitor disk usage and alert on low disk space conditions.

The Processes Section

The Processes section of the Statistics page allows you to see the processes that are currently running on an appliance. It provides general process information and specific information for each running process. You can use the Firepower Management Center’s web interface to view the process status for any managed device.

Note that there are two different types of processes that run on an appliance: daemons and executable files. Daemons always run, and executable files are run when required.

Process Status Fields

When you expand the Processes section of the Statistics page, you can also view the following:

Cpu(s)
Lists the following CPU usage information:
• user process usage percentage
• system process usage percentage
• nice usage percentage (CPU usage of processes that have a negative nice value, indicating a higher priority). Nice values indicate the scheduled priority for system processes and can range between -20 (highest priority) and 19 (lowest priority).
• idle usage percentage

Mem
Lists the following memory usage information:
- total number of kilobytes in memory
- total number of used kilobytes in memory
- total number of free kilobytes in memory
- total number of buffered kilobytes in memory

**Swap**

Lists the following swap usage information:

- total number of kilobytes in swap
- total number of used kilobytes in swap
- total number of free kilobytes in swap
- total number of cached kilobytes in swap

The following table describes each column that appears in the Processes section.

*Table 43: Process List Columns*

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pid</td>
<td>The process ID number</td>
</tr>
<tr>
<td>Username</td>
<td>The name of the user or group running the process</td>
</tr>
<tr>
<td>Pri</td>
<td>The process priority</td>
</tr>
<tr>
<td>Nice</td>
<td>The <em>nice</em> value, which is a value that indicates the scheduling priority of a process. Values range between -20 (highest priority) and 19 (lowest priority)</td>
</tr>
<tr>
<td>Size</td>
<td>The memory size used by the process (in kilobytes unless the value is followed by ( m ), which indicates megabytes)</td>
</tr>
<tr>
<td>Res</td>
<td>The amount of resident paging files in memory (in kilobytes unless the value is followed by ( m ), which indicates megabytes)</td>
</tr>
</tbody>
</table>
System Daemons

Daemons continually run on an appliance. They ensure that services are available and spawn processes when required. The following table lists daemons that you may see on the Process Status page and provides a brief description of their functionality.

The table below is not an exhaustive list of all processes that may run on an appliance.

<table>
<thead>
<tr>
<th>Daemon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crond</td>
<td>Manages the execution of scheduled commands (cron jobs)</td>
</tr>
<tr>
<td>dhclient</td>
<td>Manages dynamic host IP addressing</td>
</tr>
<tr>
<td>Daemon</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>fpcollect</td>
<td>Manages the collection of client and server fingerprints</td>
</tr>
<tr>
<td>httpd</td>
<td>Manages the HTTP (Apache web server) process</td>
</tr>
<tr>
<td>httpsd</td>
<td>Manages the HTTPS (Apache web server with SSL) service, and checks for working SSL and valid certificate authentication; runs in the background to provide secure web access to the appliance</td>
</tr>
<tr>
<td>keventd</td>
<td>Manages Linux kernel event notification messages</td>
</tr>
<tr>
<td>klogd</td>
<td>Manages the interception and logging of Linux kernel messages</td>
</tr>
<tr>
<td>kswapd</td>
<td>Manages Linux kernel swap memory</td>
</tr>
<tr>
<td>kupdated</td>
<td>Manages the Linux kernel update process, which performs disk synchronization</td>
</tr>
<tr>
<td>mysqld</td>
<td>Manages database processes</td>
</tr>
<tr>
<td>ntpd</td>
<td>Manages the Network Time Protocol (NTP) process</td>
</tr>
<tr>
<td>pm</td>
<td>Manages all Firepower System processes, starts required processes, restarts any process that fails unexpectedly</td>
</tr>
<tr>
<td>reportd</td>
<td>Manages reports</td>
</tr>
<tr>
<td>safe_mysqld</td>
<td>Manages safe mode operation of the database; restarts the database daemon if an error occurs and logs runtime information to a file</td>
</tr>
<tr>
<td>SFDataCorrelator</td>
<td>Manages data transmission</td>
</tr>
<tr>
<td>sfstreamer (FMC only)</td>
<td>Manages connections to third-party client applications that use the Event Streamer</td>
</tr>
<tr>
<td>sfmgr</td>
<td>Provides the RPC service for remotely managing and configuring an appliance using an sftunnel connection to the appliance</td>
</tr>
<tr>
<td>SFRemEDIATED (FMC only)</td>
<td>Manages remediation responses</td>
</tr>
<tr>
<td>sftimeserviced (FMC only)</td>
<td>Forwards time synchronization messages to managed devices</td>
</tr>
</tbody>
</table>
 Daemon | Description
--- | ---
 sfmbervice | Provides access to the sfmb message broker process running on a remote appliance, using an sf_tunnel connection to the appliance. Currently used only by health monitoring to send health events and alerts from a managed device to a Firepower Management Center.
 sftroughd | Listens for connections on incoming sockets and then invokes the correct executable (typically the Cisco message broker, sfmb) to handle the request.
 sf_tunnel | Provides the secure communication channel for all processes requiring communication with a remote appliance.
 sshd | Manages the Secure Shell (SSH) process; runs in the background to provide SSH access to the appliance.
 syslogd | Manages the system logging (syslog) process.

Executables and System Utilities

There are a number of executables on the system that run when executed by other processes or through user action. The following table describes the executables that you may see on the Process Status page.

Table 45: System Executables and Utilities

<table>
<thead>
<tr>
<th>Executable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>awk</td>
<td>Utility that executes programs written in the awk programming language</td>
</tr>
<tr>
<td>bash</td>
<td>GNU Bourne-Again Shell</td>
</tr>
<tr>
<td>cat</td>
<td>Utility that reads files and writes content to standard output</td>
</tr>
<tr>
<td>chown</td>

### The SFDataCorrelator Process Statistics Section

On a Firepower Management Center, you can view statistics about the Data Correlator and network discovery processes for the current day. As the managed devices perform data acquisition, decoding, and analysis, the network discovery process correlates the data with the fingerprint and vulnerability databases, then produces...
binary files that are processed by the Data Correlator running on the Firepower Management Center. The Data Correlator analyzes the information from the binary files, generates events, and creates network maps.

The statistics that appear for network discovery and the Data Correlator are averages for the current day, using statistics gathered between 12:00 AM and 11:59 PM for each device.

The following table describes the statistics displayed for the Data Correlator process.

Table 46: Data Correlator Process Statistics

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Events/Sec</td>
<td>Number of discovery events that the Data Correlator receives and processes per second</td>
</tr>
<tr>
<td>Connections/Sec</td>
<td>Number of connections that the Data Correlator receives and processes per second</td>
</tr>
<tr>
<td>CPU Usage — User (%)</td>
<td>Average percentage of CPU time spent on user processes for the current day</td>
</tr>
<tr>
<td>CPU Usage — System (%)</td>
<td>Average percentage of CPU time spent on system processes for the current day</td>
</tr>
<tr>
<td>VmSize (KB)</td>
<td>Average size of memory allocated to the Data Correlator for the current day, in kilobytes</td>
</tr>
<tr>
<td>VmRSS (KB)</td>
<td>Average amount of memory used by the Data Correlator for the current day, in kilobytes</td>
</tr>
</tbody>
</table>

The Intrusion Event Information Section

On both the Firepower Management Center and managed devices, you can view summary information about intrusion events on the Statistics page. This information includes the date and time of the last intrusion event, the total number of events that have occurred in the past hour and the past day, and the total number of events in the database.

The information in the Intrusion Event Information section of the Statistics page is based on intrusion events stored on the managed device rather than those sent to the Firepower Management Center. No intrusion event information is listed on this page if the managed device cannot (or is configured not to) store intrusion events locally.

The following table describes the statistics displayed in the Intrusion Event Information section of the Statistics page.

Table 47: Intrusion Event Information

<table>
<thead>
<tr>
<th>Statistic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last Alert Was</td>
<td>The date and time that the last event occurred</td>
</tr>
</tbody>
</table>
### Viewing System Statistics

On the Firepower Management Center, the web interface displays statistics for the FMC and any devices it manages. On 7000 and 8000 Series devices, the system displays statistics for that device only.

**Before you begin**

You must be an Admin or Maintenance user and be in the Global domain to view system statistics.

<table>
<thead>
<tr>
<th>Statistic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Events Last Hour</td>
<td>The total number of events that occurred in the past hour</td>
</tr>
<tr>
<td>Total Events Last Day</td>
<td>The total number of events that occurred in the past twenty-four hours</td>
</tr>
<tr>
<td>Total Events in Database</td>
<td>The total number of events in the events database</td>
</tr>
</tbody>
</table>

#### Step 1
Choose **System > Monitoring > Statistics**.

#### Step 2
(FMC only) Choose a device from the **Select Device(s)** list, and click **Select Devices**.

#### Step 3
View available statistics.

#### Step 4
In the Disk Usage section, you can:

- Hover your pointer over a disk usage category in the **By Category** stacked bar to view (in order):
  - the percentage of available disk space used by that category
  - the actual storage space on the disk
  - the total disk space available for that category

- Click the down arrow next to **By Partition** to expand it. If you have a malware storage pack installed, the `/var/storage` partition usage is displayed.

#### Step 5
(Optional) Click the arrow next to **Processes** to view the information described in **Process Status Fields, on page 328**.
The following topics describe how to audit activity on your system:

- The System Log, on page 337
- About System Auditing, on page 339

The System Log

The System Log (syslog) page provides you with system log information for the appliance.

You can audit activity on your system in two ways. The appliances that are part of the Firepower System generate an audit record for each user interaction with the web interface, and also record system status messages in the system log.

The system log displays each message generated by the system. The following items are listed in order:

- the date that the message was generated
- the time that the message was generated
- the host that generated the message
- the message itself

Viewing the System Log

System log information is local. For example, you cannot use the Firepower Management Center to view system status messages in the system logs on your managed devices.

You can filter messages using most syntax accepted by the UNIX file search utility Grep. This includes using Grep-compatible regular expressions for pattern matching.

Before you begin

You must be an Admin or Maintenance user and be in the Global domain to view system statistics.

Step 1  Choose System > Monitoring > Syslog.
Step 2  To search for specific message content in the system log:
a) Enter a word or query in the filter field as described in Syntax for System Log Filters, on page 338. Only Grep-compatible search syntax is supported.

Examples:

To search for all log entries that contain the user name “Admin,” use Admin.

To search for all log entries that are generated on November 27, use Nov[[:space:]]*27 or Nov.*27 (but not Nov 27 or Nov*27).

To search for all log entries that contain authorization debugging information on November 5, use Nov[[:space:]]*5.*AUTH.*DEBUG.

b) To make your search case-sensitive, select Case-sensitive. (By default, filters are not case-sensitive.)

c) To search for all system log messages that do not meet the criteria you entered, select Exclusion.

d) Click Go.

Syntax for System Log Filters

The following table shows the regular expression syntax you can use in System Log filters:

<table>
<thead>
<tr>
<th>Syntax Component</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>.</td>
<td>Matches any character or white space</td>
<td>Adm. matches Admin, AdmiN, Admi1, and Admi6</td>
</tr>
<tr>
<td>[[:alpha:]]</td>
<td>Matches any alphabetic character</td>
<td>[[:alpha:]]s matches Admin, badmin, and cadmin</td>
</tr>
<tr>
<td>[[:upper:]]</td>
<td>Matches any uppercase alphabetic character</td>
<td>[[:upper:]]s matches Admin, Badmin, and Cadmin</td>
</tr>
<tr>
<td>[[:lower:]]</td>
<td>Matches any lowercase alphabetic character</td>
<td>[[:lower:]]s matches admin, badmin, and cadmin</td>
</tr>
<tr>
<td>[[:digit:]]</td>
<td>Matches any numeric character</td>
<td>[[:digit:]]s matches 0dmin, 1dmin, and 2dmin</td>
</tr>
<tr>
<td>[[:alnum:]]</td>
<td>Matches any alphanumeric character</td>
<td>[[:alnum:]]s matches 1dmin, admin, 2dmin, and badmin</td>
</tr>
<tr>
<td>[[:space:]]</td>
<td>Matches any white space, including tabs</td>
<td>Feb[[:space:]]s matches logs from February 29th</td>
</tr>
<tr>
<td>*</td>
<td>Matches zero or more instances of the character or expression it follows</td>
<td>ab* matches a, ab, abb, ca, cab, and cabb</td>
</tr>
<tr>
<td>?</td>
<td>Matches zero or one instances</td>
<td>ab? matches a or ab</td>
</tr>
</tbody>
</table>
About System Auditing

The appliances that are part of the Firepower System generate an audit record for each user interaction with the web interface.

Related Topics
Standard Reports, on page 2273

Audit Records

Firepower Management Centers and 7000 and 8000 Series devices log read-only auditing information for user activity. Audit logs are presented in a standard event view that allows you to view, sort, and filter audit log messages based on any item in the audit view. You can easily delete and report on audit information and can view detailed reports of the changes that users make.

The audit log stores a maximum of 100,000 entries. When the number of audit log entries exceeds 100,000, the appliance prunes the oldest records from the database to reduce the number to 100,000.

Note
If you reboot a 7000 or 8000 Series device, then log into the auxiliary CLI as soon as you are able, any commands you execute are not recorded in the audit log until the local web interface is available.

Viewing Audit Records

On a Firepower Management Center or 7000 and 8000 Series devices, you can view a table of audit records. The predefined audit workflow includes a single table view of events. You can manipulate the table view depending on the information you are looking for. You can also create a custom workflow that displays only the information that matches your specific needs.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Before you begin
You must be an Admin user to perform this procedure.

**Step 1**
Access the audit log workflow using **System > Monitoring > Audit**.

**Step 2**
If no events appear, you may need to adjust the time range. For more information, see **Event Time Constraints, on page 2416**.
**Note**  
Events that were generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.

**Step 3**  
You have the following choices:

- To learn more about the contents of the columns in the table, see *The System Log*, on page 337.
- To sort and constrain events on the current workflow page, see *Using Table View Pages*, on page 2408.
- To navigate between pages in the current workflow, keeping the current constraints, click the appropriate page link at the top left of the workflow page. For more information, see *Using Workflows*, on page 2400.
- To drill down to the next page in the workflow, see *Using Drill-Down Pages*, on page 2407.
- To constrain on a specific value, click a value within a row. If you click a value on a drill-down page, you move to the next page and constrain on the value. Note that clicking a value within a row in a table view constrains the table view and does **not** drill down to the next page. See *Event View Constraints*, on page 2423 for more information.

**Tip**  
Table views always include “Table View” in the page name.

- To delete audit records, check the check boxes next to events you want to delete, then click **Delete**, or click **Delete All** to delete all events in the current constrained view.
- To bookmark the current page so you can quickly return to it, click **Bookmark This Page**. For more information, see *Bookmarks*, on page 2426.
- To navigate to the bookmark management page, click **View Bookmarks**. For more information, see *Bookmarks*, on page 2426.
- To generate a report based on the data in the current view, click **Report Designer**. For more information, see *Creating a Report Template from an Event View*, on page 2276.
- To view a summary of a change recorded in the audit log, click **Compare** next to applicable events in the **Message** column. For more information, see *Using the Audit Log to Examine Changes*, on page 342.

**Audit Log Workflow Fields**

The following table describes the audit log fields that can be viewed and searched.

**Table 49: Audit Log Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time</td>
<td>Time and date that the appliance generated the audit record.</td>
</tr>
<tr>
<td>User</td>
<td>User name of the user that triggered the audit event.</td>
</tr>
</tbody>
</table>
| Subsystem | The full menu path the user followed to generate the audit record. For example, **System > Monitoring > Audit** is the menu path to view the audit log.  
In a few cases where a menu path is not relevant, the Subsystem field displays only the event type. For example, **Login** classifies user login attempts. |
The action the user performed or the button the user clicked on the page. For example, Page View signifies that the user simply viewed the page indicated in the Subsystem, while Save means that the user clicked the Save button on the page. Changes made to the Firepower System appear with a Compare icon that you can click to see a summary of the changes.

IP address associated with the host used by the user. Note: When searching this field you must type a specific IP address; you cannot use IP ranges when searching audit logs.

The current domain of the user when the audit event was triggered. This field is only present if you have ever configured the Firepower Management Center for multitenancy.

Specifies whether to view audit records of configuration changes in the search results. (yes or no)

The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable.

Related Topics
- Event Searches, on page 2429

The Audit Events Table View

You can change the layout of the event view or constrain the events in the view by a field value. When disabling columns, after you click the Close (x) in the column heading that you want to hide, in the pop-up window that appears, click Apply. When you disable a column, it is disabled for the duration of your session (unless you add it back later). Note that when you disable the first column, the Count column is added.

To hide or show other columns, or to add a disabled column back to the view, select or clear the appropriate check boxes before you click Apply.

Clicking a value within a row in a table view constrains the table view and does not drill down to the next page in the workflow.

Tip
Table views always include “Table View” in the page name.
Using the Audit Log to Examine Changes

You can use the audit log to view detailed reports of changes to your system. These reports compare the current configuration of your system to its most recent configuration before a particular change.

The Compare Configurations page displays the differences between the system configuration before changes and the running configuration in a side-by-side format. The audit event type, time of last modification, and name of the user who made the change are displayed in the title bar above each configuration.

Differences between the two configurations are highlighted:

- Blue indicates that the highlighted setting is different in the two configurations, and the difference is noted in red text.
- Green indicates that the highlighted setting appears in one configuration but not the other.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Before you begin

You must be an Admin user to perform this procedure.

---

**Step 1**

Choose System > Monitoring > Audit.

**Step 2**

Click Compare next to an applicable audit log event in the Message column.

**Tip**

You can navigate through changes individually by clicking Previous or Next above the title bar. If the change summary is more than one page long, you can also use the scroll bar on the right to view additional changes.

---

Suppressing Audit Records

If your auditing policy does not require that you audit specific types of user interactions with the Firepower System, you can prevent those interactions from generating audit records on a Firepower Management Center or 7000 and 8000 Series devices. For example, by default, each time a user views the online help, the Firepower System generates an audit record. If you do not need to keep a record of these interactions, you can automatically suppress them.

To configure audit event suppression, you must have access to an appliance’s admin user account, and you must be able to either access the appliance’s console or open a secure shell.

**Caution**

Make sure that only authorized personnel have access to the appliance and to its admin account.

Before you begin

You must be an Admin user to perform this procedure.
In the /etc/sf directory, create one or more AuditBlock files in the following form, where type is one of the types described in Audit Block Types, on page 343:

**AuditBlock.type**

**Note** If you create an AuditBlock.type file for a specific type of audit message, but later decide that you no longer want to suppress them, you must delete the contents of the AuditBlock.type file but leave the file itself on the Firepower System.

### Audit Block Types

The contents for each audit block type must be in a specific format, as described in the following table. Make sure you use the correct capitalization for the file names. Note also that the contents of the files are case sensitive.

Note that when you add an AuditBlock file, an audit record with a subsystem of Audit and a message of Audit Filter type Changed is added to the audit events. For security reasons, this audit record cannot be suppressed.

**Table 50: Audit Block Types**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>Create a file named AuditBlock.address and include, one per line, each IP address that you want to suppress from the audit log. You can use partial IP addresses provided that they map from the beginning of the address. For example, the partial address 10.1.1 matches addresses from 10.1.1.0 through 10.1.1.255.</td>
</tr>
<tr>
<td>Message</td>
<td>Create a file named AuditBlock.message and include, one per line, the message substrings that you want to suppress. Note that substrings are matched so that if you include backup in your file, all messages that include the word backup are suppressed.</td>
</tr>
<tr>
<td>Subsystem</td>
<td>Create a file named AuditBlock.subsystem and include, one per line, each subsystem that you want to suppress. Note that substrings are not matched. You must use exact strings. See Audited Subsystems, on page 344 for a list of subsystems that are audited.</td>
</tr>
</tbody>
</table>

**About Sending Audit Logs to an External Location**

To send audit logs to an external location from the FMC, see:

- Audit Logs, on page 1059
- Audit Log Certificate, on page 1062

For Classic devices, see:

- Stream Audit Logs from Classic Devices, on page 1096
- Require Valid Audit Log Server Certificates for Classic Devices, on page 1097
- Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device, on page 1105
CHAPTER 17

Troubleshooting the System

The following topics describe ways to diagnose problems you may encounter with the Firepower System:

• First Steps for Troubleshooting, on page 347
• System Messages, on page 347
• View Basic System Information, on page 350
• Managing System Messages, on page 350
• Memory Usage Thresholds for Health Monitor Alerts, on page 354
• Disk Usage and Drain of Events Health Monitor Alerts, on page 355
• Health Monitor Reports for Troubleshooting, on page 358
• General Troubleshooting, on page 360
• Connection-based Troubleshooting, on page 360
• Advanced Troubleshooting for the Firepower Threat Defense Device, on page 361
• Feature-Specific Troubleshooting, on page 367

First Steps for Troubleshooting

• Before you make changes to try to fix a problem, generate a troubleshooting file to capture the original problem. See Health Monitor Reports for Troubleshooting, on page 358 and its subsections.
  You may need this troubleshooting file if you need to contact Cisco TAC for support.

  • Start your investigation by looking at error and warning messages in the Message Center. See System Messages, on page 347

  • Look for applicable Tech Notes and other troubleshooting resources under the "Troubleshoot and Alerts" heading on the product documentation page for your product. See Top-Level Documentation Listing Pages for FMC Deployments, on page 14.

System Messages

When you need to track down problems occurring in the Firepower System, the Message Center is the place to start your investigation. This feature allows you to view the messages that the Firepower System continually generates about system activities and status.
To open the Message Center, click on the System Status icon, located to the immediate right of the Deploy button in the main menu. This icon can take one of the following forms, depending on the system status:

- **Indicates One or More Errors** — Indicates one or more errors and any number of warnings are present on the system.

- **Indicates One or More Warnings** — Indicates one or more warnings and no errors are present on the system.

- **Indicates No Warnings** — Indicates no warnings or errors are present on the system.

If a number is displayed with the icon, it indicates the total current number of error or warning messages.

To close the Message Center, click anywhere outside of it within the Firepower System web interface.

In addition to the Message Center, the web interface displays pop-up notifications in immediate response to your activities and ongoing system activities. Some pop-up notifications automatically disappear after five seconds, while others are “sticky,” meaning they display until you explicitly dismiss them by clicking **Dismiss** (×). Click the **Dismiss** link at the top of the notifications list to dismiss all notifications at once.

**Tip**

Hovering your cursor over a non-sticky pop-up notification causes it to be sticky.

The system determines which messages it displays to users in pop-up notifications and the Message Center based on their licenses, domains, and access roles.

## Message Types

The Message Center displays messages reporting system activities and status organized into three different tabs:

### Deployments

This tab displays current status related to configuration deployment for each appliance in your system, grouped by domain. The Firepower System reports the following deployment status values on this tab. You can get additional detail about the deployment jobs by clicking **Show History**.

- **Running (Spinning)** — The configuration is in the process of deploying.

- **Success** — The configuration has successfully been deployed.

- **Warning** (⚠️) — Warning deployment statuses contribute to the message count displayed with the **Warning System Status icon**.

- **Failure** — The configuration has failed to deploy; see Out-of-Date Policies, on page 392. Failed deployments contribute to the message count displayed with the **Error System Status icon**.

### Health

This tab displays current health status information for each appliance in your system, grouped by domain. Health status is generated by health modules as described in About Health Monitoring, on page 299. The Firepower System reports the following health status values on this tab:

- **Warning** (⚠️) — Indicates that warning limits have been exceeded for a health module on an appliance and the problem has not been corrected. The Health Monitoring page indicates these
conditions with a **Yellow Triangle** (⚠️). Warning statuses contribute to the message count displayed with the **Warning System Status icon**.

- **Critical (⚠️)** — Indicates that critical limits have been exceeded for a health module on an appliance and the problem has not been corrected. The Health Monitoring page indicates these conditions with a **Critical (⚠️) icon**. Critical statuses contribute to the message count displayed with the **Error System Status icon**.

- **Error (❌)** — Indicates that a health monitoring module has failed on an appliance and has not been successfully re-run since the failure occurred. The Health Monitoring page indicates these conditions with a **Error icon**. Error statuses contribute to the message count displayed with the **Error System Status icon**.

You can click on links in the Health tab to view related detailed information on the Health Monitoring page. If there are no current health status conditions, the Health tab displays no messages.

**Tasks**

In the Firepower System, you can perform certain tasks (such as configuration backups or update installation) that can require some time to complete. This tab displays the status of these long-running tasks, and can include tasks initiated by you or, if you have appropriate access, other users of the system. The tab presents messages in reverse chronological order based on the most recent update time for each message. Some task status messages include links to more detailed information about the task in question. The Firepower System reports the following task status values on this tab:

- **Waiting()** — Indicates a task that is waiting to run until another in-progress task is complete. This message type displays an updating progress bar.

- **Running** — Indicates a task that is in-progress. This message type displays an updating progress bar.

- **Retrying** — Indicates a task that is automatically retrying. Note that not all tasks are permitted to try again. This message type displays an updating progress bar.

- **Success** — Indicates a task that has completed successfully.

- **Failure** — Indicates a task that did not complete successfully. Failed tasks contribute to the message count displayed with the **Error System Status icon**.

- **Stopped or Suspended** — Indicates a task that was interrupted due to a system update. Stopped tasks cannot be resumed. After normal operations are restored, start the task again.

- **Skipped** — A process in progress prevented the task from starting. Try again to start the task.

New messages appear in this tab as new tasks are started. As tasks complete (status success, failure, or stopped), this tab continues to display messages with final status indicated until you remove them. Cisco recommends you remove messages to reduce clutter in the Tasks tab as well as the message database.

**Message Management**

From the Message Center you can:

- Configure pop-up notification behavior (choosing whether to display them).
• Display additional task status messages from the system database (if any are available that have not been removed).

• Remove individual task status messages. (This affects all users who can view the removed messages.)

• Remove task status messages in bulk. (This affects all users who can view the removed messages.)

Tip
Cisco recommends that you periodically remove accumulated task status messages from the Task tab to reduce clutter in the display as well the database. When the number of messages in the database approaches 100,000, the system automatically deletes task status messages that you have removed.

View Basic System Information
The About page displays information about your appliance, including the model, serial number, and version information for various components of the Firepower System. It also includes Cisco copyright information.

Step 1 Click Help in the toolbar at the top of the page.
Step 2 Choose About.

View Appliance Information
Choose System > Configuration.

Managing System Messages
Step 1 Click System Status to display the Message Center.
Step 2 You have the following choices:

• Click Deployments to view messages related to configuration deployments. See Viewing Deployment Messages, on page 351. You must be an Admin user or have the Deploy Configuration to Devices permission to view these messages.

• Click Health to view messages related to the health of your Firepower Management Center and the devices registered to it. See Viewing Health Messages, on page 352. You must be an Admin user or have the Health permission to view these messages.

• Click Tasks to view or manage messages related to long-running tasks. See Viewing Task Messages, on page 352 or Managing Task Messages, on page 353. Everyone can see their own tasks. To see the tasks of other users, you must be an Admin user or have the View Other Users’ Tasks permission.
• Click Cog (odega) in the upper right corner of the Message Center to configure pop-up notification behavior. See Configuring Notification Behavior, on page 353.

Viewing Deployment Messages

You must be an Admin user or have the Deploy Configuration to Devices permission to view these messages.

Step 1
Click System Status to display the Message Center.

Step 2
Click Deployments.

Step 3
You have the following choices:
- Click total to view all current deployment statuses.
- Click a status value to view only messages with that deployment status.
- Hover your cursor over the time elapsed indicator for a message (for example, 1m 5s) to view the elapsed time, and start and stop times for the deployment.

Step 4
Click show deployment history to view more detailed information about the deployment jobs.

The Deployment History table lists the deployment jobs in the left column in reverse chronological order.

a) Select a deployment job.

The table in the right column shows each device that was included in the job, and the deployment status per device.

b) To view responses from the device, and commands sent to the device during deployment, click download in the Transcript column for the device.

The transcript includes the following sections:
- Snort Apply—If there are any failures or responses from Snort-related policies, messages appear in this section. Normally, the section is empty.
- CLI Apply—This section covers features that are configured using commands sent to the Lina process.
- Infrastructure Messages—This section shows the status of different deployment modules.

In the CLI Apply section, the deployment transcript includes commands sent to the device, and any responses returned from the device. These responses can be informative messages or error messages. For failed deployments, look for messages that indicate errors with the commands. Examining these errors can be particularly helpful if you are using FlexConfig policies to configure customized features. These errors can help you correct the script in the FlexConfig object that is trying to configure the commands.

Note
There is no distinction made in the transcript between commands sent for managed features and those generated from FlexConfig policies.

For example, the following sequence shows that Firepower Management Center (FMC) sent commands to configure GigabitEthernet0/0 with the logical name outside. The device responded that it automatically set the security level to 0. FTD does not use the security level for anything.

--------- CLI APPLY ---------

FMC >> interface GigabitEthernet0/0
Viewing Health Messages

You must be an Admin user or have the Health permission to view these messages.

**Step 1**  Click System Status to display the Message Center.
**Step 2**  Click Health.
**Step 3**  You have the following choices:

- Click **total** to view all current health statuses.
- Click on a status value to view only messages with that status.
- Hover your cursor over the relative time indicator for a message (for example, **3 day(s) ago**) to view the time of the most recent update for that message.
- To view detailed health status information for a particular message, click the message.
- To view complete health status on the Health Monitoring page, click Health Monitor.

**Related Topics**

[About Health Monitoring](#), on page 299

Viewing Task Messages

Everyone can see their own tasks. To see the tasks of other users, you must be an Admin user or have the View Other Users’ Tasks permission.

**Step 1**  Click System Status to display the Message Center.
**Step 2**  Click **Tasks**.
**Step 3**  You have the following choices:

- Click **total** to view all current task statuses.
- Click a status value to view only messages for tasks with that status.

**Note**  Messages for stopped tasks appear only in the total list of task status messages. You cannot filter on stopped tasks.

- Hover your cursor over the relative time indicator for a message (e.g., **3 day(s) ago**) to view the time of the most recent update for that message.
- Click any link within a message to view more information about the task.
Managing Task Messages

Everyone can see their own tasks. To see the tasks of other users, you must be an Admin user or have the View Other Users' Tasks permission.

Step 1  Click System Status to display the Message Center.
Step 2  Click Tasks.
Step 3 You have the following choices:
  • If more task status messages are available for display, click on Fetch more messages at the bottom of the message list to retrieve them.
  • To remove a single message for a completed task (status stopped, success, or failure), click on Remove (x) next to the message.
  • To remove all messages for all tasks that have completed (status stopped, success, or failure), filter the messages on total and click on Remove all completed tasks.
  • To remove all messages for all tasks that have completed successfully, filter the messages on success, and click on Remove all successful tasks.
  • To remove all messages for all tasks that have failed, filter the messages on failure, and click on Remove all failed tasks.

Configuring Notification Behavior

Note  This setting affects all pop-up notifications and persists between login sessions.

Step 1  Click System Status to display the Message Center.
Step 2  Click Cog ( ) in the upper right corner of the Message Center.
Step 3 To enable or disable pop-up notification display, click the Show notifications slider.
Step 4 Click Cog ( ) again to hide the slider.
Step 5  Click System Status again to close the Message Center.
Memory Usage Thresholds for Health Monitor Alerts

The Memory Usage health module compares memory usage on an appliance to the limits configured for the module and alerts when usage exceeds the levels. The module monitors data from managed devices and from the FMC itself.

Two configurable thresholds for memory usage, Critical and Warning, can be set as a percentage of memory used. When these thresholds are exceeded, a health alarm is generated with the severity level specified. However, the health alarm system does not calculate these thresholds in an exact manner.

With high memory devices, certain processes are expected to use a larger percentage of total system memory than in a low memory footprint device. The design is to use as much of the physical memory as possible while leaving a small value of memory free for ancillary processes.

Compare two devices, one with 32 GB of memory and one with 4 GB of memory. In the device with 32 GB of memory, 5% of memory (1.6GB) is a much larger value of memory to leave for ancillary processes than in the device with 4 GB of memory (5% of 4GB = 200MB).

To account for the higher percentage use of system memory by certain processes, the FMC calculates the total memory to include both total physical memory and total swap memory. Thus the enforced memory threshold for the user-configured threshold input can result in a Health Event where the “Value” column of the event does not match the value that was entered to determine the exceeded threshold.

The following table shows examples of user-input thresholds and the enforced thresholds, depending on the installed system memory.

---

### Disk Usage and Drain of Events Health Monitor Alerts

The Disk Usage health module compares disk usage on a managed device’s hard drive and malware storage pack to the limits configured for the module and alerts when usage exceeds the percentages configured for the module. This module also alerts when the system excessively deletes files in monitored disk usage categories, or when disk usage excluding those categories reaches excessive levels, based on module thresholds.

This topic describes the symptoms and troubleshooting guidelines for two health alerts generated by the Disk Usage health module:

- Frequent Drain of Events
- Drain of Unprocessed Events

The disk manager process manages the disk usage of a device. Each type of file monitored by the disk manager is assigned a silo. Based on the amount of disk space available on the system the disk manager computes a High Water Mark (HWM) and a Low Water Mark (LWM) for each silo.

To display detailed disk usage information for each part of the system, including silos, LWMs, and HWMs, use the `show disk-manager` command.

### Examples

Following is an example of the disk manager information.

```
> show disk-manager
Silo                          | Used         | Minimum     | Maximum     |
Temporary Files               | 0 KB         | 499.197 MB  | 1.950 GB    |
Action Queue Results          | 0 KB         | 499.197 MB  | 1.950 GB    |
User Identity Events          | 0 KB         | 499.197 MB  | 1.950 GB    |
UI Caches                     | 4 KB         | 1.462 GB    | 2.925 GB    |
Backups                       | 0 KB         | 3.900 GB    | 9.750 GB    |
Updates                       | 0 KB         | 5.850 GB    | 14.625 GB   |
Other Detection Engine        | 0 KB         | 2.925 GB    | 5.850 GB    |
Performance Statistics        | 33 KB        | 998.395 MB  | 11.700 GB   |
Other Events                  | 0 KB         | 1.950 GB    | 3.900 GB    |
IP Reputation & URL Filtering | 0 KB         | 2.437 GB    | 4.875 GB    |
Archives & Cores & File Logs | 0 KB         | 3.900 GB    | 19.500 GB   |
Unified Low Priority Events   | 1.329 MB     | 4.875 GB    | 24.375 GB   |
RNA Events                    | 0 KB         | 3.900 GB    | 15.600 GB   |
File Capture                  | 0 KB         | 9.750 GB    | 19.500 GB   |
Unified High Priority Events  | 0 KB         | 14.625 GB   | 34.125 GB   |
IPS Events                    | 0 KB         | 11.700 GB   | 29.250 GB   |
```
Health Alert Format

When the Health Monitor process on the FMC runs (once every 5 minutes or when a manual run is triggered) the Disk Usage module looks into the diskmanager.log file and, if the correct conditions are met, the respective health alert is triggered.

The structures of these health alerts are as follows:

- Frequent drain of <SILO NAME>
- Drain of unprocessed events from <SILO NAME>

For example,

- Frequent drain of Low Priority Events
- Drain of unprocessed events from Low Priority Events

It’s possible for any silo to generate a Frequent drain of <SILO NAME> health alert. However, the most commonly seen are the alerts related to events. Among the event silos, the Low Priority Events are often seen because these type of events are generated by the device more frequently.

A Frequent drain of <SILO NAME> event has a Warning severity level when seen in relation to an event-related silo, because events will be queued to be sent to the FMC. For a non-event related silo, such as the Backups silo, the alert has a Critical severity level because this information is lost.

Important

Only event silos generate a Drain of unprocessed events from <SILO NAME> health alert. This alert always has Critical severity level.

Additional symptoms besides the alerts can include:

- Slowness on the FMC user interface
- Loss of events

Common Troubleshoot Scenarios

A Frequent drain of <SILO NAME> event is caused by too much input into the silo for its size. In this case, the disk manager drains (purges) that file at least twice in the last 5-minute interval. In an event type silo, this is typically caused by excessive logging of that event type.

In the case of a Drain of unprocessed events of <SILO NAME> health alert, this can also be caused by a bottleneck in the event processing path.

There are three potential bottlenecks with respect to these Disk Usage alerts:

- Excessive logging — The EventHandler process on FTD is oversubscribed (it reads slower than what Snort writes).
- Sftunnel bottleneck — The Eventing interface is unstable or oversubscribed.
- SFDDataCorrelator bottleneck — The data transmission channel between the FMC and the managed device is oversubscribed.
**Excessive Logging**

One of the most common causes for the health alerts of this type is excessive input. The difference between the Low Water Mark (LWM) and High Water Mark (HWM) gathered from the `show disk-manager` command shows how much space there is available to take on that silo to go from LWM (freshly drained) to the HWM value. If there are frequent drain of events (with or without unprocessed events) the first thing to review is the logging configuration.

- Check for double logging — Double logging scenarios can be identified if you look at the correlator `perfstats` on the FMC:

  ```
  admin@FMC:~$ sudo perfstats -Cq < /var/sf/rna/correlator-stats/now
  ```

- Check logging settings for the ACP — Review the logging settings of the Access Control Policy (ACP). If logging both "Beginning" and "End" of connection, log only the end as it will include everything included when the beginning is logged as well as reduce the amount of events.

  Ensure that you follow the best practices described in Best Practices for Connection Logging, on page 2468.

**Communications Bottleneck – Sftunnel**

Sftunnel is responsible for encrypted communications between the FMC and the managed device. Events are sent over the tunnel to the FMC. Connectivity issues and/or instability in the communication channel (sftunnel) between the managed device and the FMC can be due to:

- Sftunnel is down or is unstable (flaps).

  Ensure that the FMC and the managed device have reachability between their management interfaces on TCP port 8305.

  The sftunnel process should be stable and should not restart unexpectedly. Verify this by checking the `/var/log/message` file and search for messages that contain the `sftunneld` string.

- Sftunnel is oversubscribed.

  Review trend data from the Heath Monitor and look for signs of oversubscription of the FMC’s management interface, which can be a spike in management traffic or a constant oversubscription.

  Use as a secondary management interface for Firepower-eventing. To use this interface, you must configure its IP address and other parameters at the FTD CLI using the `configure network management-interface` command.

**Communications Bottleneck – SFDdataCorrelator**

The SFDdataCorrelator manages data transmission between the FMC and the managed device; on the FMC, it analyzes binary files created by the system to generate events, connection data, and network maps. The first step is to review the `diskmanager.log` file for important information to be gathered, such as:

- The frequency of the drain.

- The number of files with Unprocessed Events drained.

- The occurrence of the drain with Unprocessed Events.
Each time the disk manager process runs, it generates an entry for each of the different silos on its own log file, which is located under `/ngfw/var/log/diskmanager.log`. Information gathered from the diskmanager.log (in CSV format) can be used to help narrow the search for a cause.

Additional troubleshooting steps:

- The command `stats_unified.pl` can help you determine if the managed device does have some data which needs to be sent to FMC. This condition can happen when the managed device and the FMC experience a connectivity issue. The managed device stores the log data onto a hard drive.

  ```bash
  admin@FMC:~$ sudo stats_unified.pl
  ```

- The `manage_procs.pl` command can reconfigure the correlator on the FMC side.

  ```bash
  root@FMC:~# manage_procs.pl
  ```

**Before You Contact Cisco Technical Assistance Center (TAC)**

It is highly recommended to collect these items before you contact Cisco TAC:

- Screenshots of the health alerts seen.
- Troubleshoot file generated from the FMC.
- Troubleshoot file generated from the affected managed device.
- Date and Time when the problem was first seen.
- Information about any recent changes done to the policies (if applicable).

The output of the `stats_unified.pl` command as described in the *Communications Bottleneck — SFDataCorrelator*, on page 357.

## Health Monitor Reports for Troubleshooting

In some cases, if you have a problem with your appliance, Support may ask you to supply troubleshooting files to help them diagnose the problem. The system can produce troubleshooting files with information targeted to specific functional areas, as well as advanced troubleshooting files you retrieve in cooperation with Support. You can select any of the options listed in the table below to customize the contents of a troubleshooting file for a specific function.

Note that some options overlap in terms of the data they report, but the troubleshooting files will not contain redundant copies, regardless of what options you select.

### Table 53: Selectable Troubleshoot Options

<table>
<thead>
<tr>
<th>This option...</th>
<th>Reports...</th>
</tr>
</thead>
<tbody>
<tr>

**Producing Troubleshooting Files for Specific System Functions**

You can generate and download customized troubleshooting files that you can send to Support.

In a multidomain deployment, you can generate and download troubleshooting files for devices in descendant domains.

⚠️ **Caution**

Generating troubleshooting files for lower-memory devices can trigger Automatic Application Bypass (AAB) when AAB is enabled. At a minimum, triggering AAB restarts the Snort process, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 for more information. In some such cases, triggering AAB can render the device temporarily inoperable. If inoperability persists, contact Cisco Technical Assistance Center (TAC), who can propose a solution appropriate to your deployment. Susceptible devices include Firepower 7010, 7020, and 7030; ASA 5508-X, 5516-X, 5515-X, and 5525-X; NGIPSv.

**Before you begin**

You must be an Admin, Maintenance, Security Analyst, or Security Analyst (Read Only) user to perform this task.

**Step 1** Perform the steps in Viewing Appliance Health Monitors, on page 317.

**Step 2** Click Generate Troubleshooting Files.

**Step 3** Choose All Data to generate all possible troubleshooting data, or check individual boxes as described in Viewing Task Messages, on page 352.

**Step 4** Click OK.

**Step 5** View task messages in the Message Center; see Viewing Task Messages, on page 352.

**Step 6** Find the task that corresponds to the troubleshooting files you generated.
**Downloading Advanced Troubleshooting Files**

In a multidomain deployment, you can generate and download troubleshooting files for devices in descendant domains. You can download files from the Firepower Management Center only from the Global domain.

**Before you begin**

You must be an Admin, Maintenance, Security Analyst, or Security Analyst (Read Only) user to perform this task.

---

**Step 1** View the health monitor for the appliance; see Viewing Appliance Health Monitors, on page 317.

**Step 2** Click Advanced Troubleshooting.

**Step 3** In File Download, enter the filename supplied by Support.

**Step 4** Click Download.

**Step 5** Follow your browser’s prompts to download the file.

**Note** For managed devices, the system renames the file by prepending the device name to the file name.

**Step 6** Follow the directions from Support to send the troubleshooting files to Cisco.

---

**General Troubleshooting**

An internal power failure (hardware failure, power surge, and so on) or an external power failure (unplugged cord) can result in an ungraceful shutdown or reboot of the system. This can result in data corruption.

**Connection-based Troubleshooting**

Connection-based troubleshooting or debugging provides uniform debugging across modules to collect appropriate logs for a specific connection. It also supports level-based debugging up to seven levels and enables uniform log collection mechanism across modules. Connection-based debugging supports the following:

- A common connection-based debugging subsystem to troubleshoot issues in Firepower Threat Defense
- Uniform format for debug messages across modules
- Persistent debug messages across reboots
- End-to-end debugging across modules based on an existing connection
Note
Connection-based debugging is not supported on Firepower 2100 Series devices.

For more information about the troubleshooting connections, see Troubleshoot a Connection, on page 361.

Troubleshoot a Connection

Step 1  Configure a filter to identify a connection using the debug packet condition command.
Example:
Debug packet condition match tcp 192.168.100.177 255.255.255.255 192.168.102.177 255.255.255.255

Step 2  Enable debugs for the interested modules and the corresponding levels. Enter the debug packet command.
Example:
Debug packet acl 5

Step 3  Start debugging the packets using the following command:
debug packet start

Step 4  Fetch the debug messages from database to analyze the debug messages using the following command:
show packet debugs

Step 5  Stop debugging the packets using the following command:
debug packet stop

Advanced Troubleshooting for the Firepower Threat Defense Device

You can use Packet Tracer and Packet Capture features for performing an in-depth troubleshooting analysis on a Firepower Threat Defense device. Packet-tracer allows a firewall administrator to inject a virtual packet into the security appliance and track the flow from ingress to egress. Along the way, the packet is evaluated against flow and route lookups, ACLs, protocol inspection, NAT, and intrusion detection. The power of the utility comes from the ability to simulate real-world traffic by specifying source and destination addresses with protocol and port information. Packet capture is available with the trace option, which provides you with a verdict as to whether the packet is dropped or successful.

For more information about the troubleshooting files, see Downloading Advanced Troubleshooting Files, on page 360.
Using the FTD CLI from the Web Interface

You can execute selected FTD command line interface (CLI) commands from the Firepower Management Center web interface. These commands are ping, traceroute, and show (except for show history and show banner).

In a multidomain deployment, you can enter FTD CLI commands through the Firepower Management Center web interface for managed devices in descendant domains.

**Note**
In deployments using Firepower Management Center high availability, this feature is available only in the active Firepower Management Center.

For more information on the FTD CLI, see the *Command Reference for Firepower Threat Defense*.

**Before you begin**
You must be an Admin, Maintenance, or Security Analyst user to use the CLI.

---

**Step 1**
View the health monitor for the appliance; see Viewing Appliance Health Monitors, on page 317.

**Step 2**
Click Advanced Troubleshooting.

**Step 3**
Click Threat Defense CLI.

**Step 4**
From the Command drop-down list, select a command.

**Step 5**
Optionally, enter command parameters in the Parameters text box.

**Step 6**
Click Execute to view the command output.

---

Packet Tracer Overview

Using the packet tracer, you can test your policy configuration by modeling a packet based on source and destination addressing, and protocol characteristics. The trace does a policy lookup to test access rules, NAT, routing, access policies and rate limiting policies, to check if the packet would be permitted or denied. The packet flow is simulated based on interfaces, source address, destination address, ports and protocols. By testing packets this way, you can see the results of your policies and test whether the types of traffic you want to allow or deny are handled as desired. Besides verifying your configuration, you can use the tracer to debug unexpected behavior, such as packets being denied when they should be allowed. To simulate the packet fully, packet tracer traces the data path; slow-path and fast-path modules. Processing is transacted based on per-session and per-packet basis. Tracing packets and capture with trace log the tracing data on per packet basis when the Next-Generation Firewall (NGFW) processes packets per-session or per-packet.

**Use the Packet Tracer**
You can use packet tracer on Firepower Threat Defense devices. You must be an Admin or Maintenance user to use this tool.

---

**Step 1**
On the Firepower Management Center, choose Devices > Device Management.
Step 2 Select a device.
Step 3 Click troubleshooting. The Health Monitor page appears.
Step 4 Click Advanced Troubleshooting.
Step 5 Click Packet Tracer.
Step 6 Select the Packet type for the trace, and specify the protocol characteristics:
- **ICMP**—Enter the ICMP type, ICMP code (0-255), and optionally, the ICMP identifier.
- **TCP/UDP/SCTP**—Enter the source and destination port numbers.
- **IP**—Enter the protocol number, 0-255.
Step 7 Select the ingress Interface for the packet trace.
Step 8 Select the Source type for the packet trace, and enter the source IP address.
Source and destination types include IPv4, IPv6, and fully-qualified domain names (FQDN). You can specify IPv4 or IPv6 addresses and FQDN, if you use Cisco TrustSec.
Step 9 Select the Source Port for the packet trace.
Step 10 Select the Destination type for the packet trace, and enter the destination IP address.
Step 11 Select the Destination Port for the packet trace.
Step 12 Optionally, if you want to trace a packet where the Security Group Tag (SGT) value is embedded in the Layer 2 CMD header (TrustSec), enter a valid SGT number.
Step 13 If you want packet tracer to enter a parent interface, which is later redirected to a sub-interface, enter a VLAN ID. This value is optional for non-sub-interfaces only, since all the interface types can be configured on a sub-interface.
Step 14 Specify a Destination MAC Address for the packet trace.
If the Firepower Threat Defense device is running in transparent firewall mode, and the ingress interface is VTEP, Destination MAC Address is required if you enter a value in VLAN ID. Whereas if the interface is a bridge group member, Destination MAC Address is optional if you enter a VLAN ID value, but required if you do not enter a VLAN ID value.
If the Firepower Threat Defense is running in routed firewall mode, VLAN ID and Destination MAC Address are optional if the input interface is a bridge group member.
Step 15 Select the Output Format for the packet logs.
Step 16 Click Start.

Packet Capture Overview

The packet capture feature with trace option allows real packets that are captured on the ingress interface to be traced through the system. The trace information is displayed at a later stage. These packets are not dropped on the egress interface, as they are real data-path traffic. Packet capture for Firepower Threat Defense devices supports troubleshooting and analysis of data packets.

Once the packet is acquired, Snort detects the tracing flag that is enabled in the packet. Snort writes tracer elements, through which the packet traverses. Snort verdict as a result of capturing packets can be one of the following:
Table 54: Snort Verdicts

<table>
<thead>
<tr>
<th>Verdict</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pass</td>
<td>Allow analyzed packet.</td>
</tr>
<tr>
<td>Block</td>
<td>Packet not forwarded.</td>
</tr>
<tr>
<td>Replace</td>
<td>Packet modified.</td>
</tr>
<tr>
<td>White list</td>
<td>Flow passed without inspection.</td>
</tr>
<tr>
<td>Blacklist</td>
<td>Flow was blocked.</td>
</tr>
<tr>
<td>Ignore</td>
<td>Flow was blocked; occurs only for sessions with flows blocked on passive interfaces.</td>
</tr>
<tr>
<td>Retry</td>
<td>Flow is stalled, waiting on an enamelware or URL category/reputation query. In the event of a timeout, processing continues with an unknown result: in the case of enamelware, the file is allowed; in the case of URL category/reputation, AC rule lookup continues with an uncategorized and unknown reputation.</td>
</tr>
</tbody>
</table>

Based on the Snort verdict, the packets are dropped or allowed. For example, the packet is dropped if the Snort verdict is **Blacklist**, and the subsequent packets in the session are dropped before reaching Snort. When the Snort verdict is **Block** or **Blacklist**, the **Drop Reason** can be one of the following:

Table 55: Drop Reasons

<table>
<thead>
<tr>
<th>Blocked or Flow Blocked by...</th>
<th>Cause</th>

</tbody>
</table>

The packet capture feature allows you to capture and download packets that are stored in the system memory. However, the buffer size is limited to 32 MB due to memory constraint. Systems capable of handling very high volume of packet captures exceed the maximum buffer size quickly and thereby the necessity of increasing the packet capture limit is required. It is achieved by using the secondary memory (by creating a file to write the capture data). The maximum supported file size is 10 GB.

When the file-size is configured, the captured data gets stored to the file and the file name is assigned based on the capture name recapture.

The file-size option is used when you need to capture packets with the size limit more than 32 MB.

For information, see the Command Reference for Firepower Threat Defense.
Use the Capture Trace

Packet capture data includes information from Snort and preprocessors about verdicts and actions the system takes while processing a packet. Multiple packet captures are possible at a time. You can configure the system to modify, delete, clear, and save captures.

Note
Capturing packet data requires packet copy. This operation may cause delays while processing packets and may also degrade the packet throughput. Cisco recommends that you use packet filters to capture specific traffic data.

The saved traffic data can be downloaded in pcap or ASCII file formats.

Before you begin
You can use packet capture on Firepower Threat Defense devices. You must be an Admin or Maintenance user to use this tool.

Step 1
On the Firepower Management Center, choose Devices > Device Management.

Step 2
Select a device.

Step 3
Click troubleshooting.
The Health Monitor page appears.

Step 4
Click Advanced Troubleshooting.

Step 5
Select Capture w/Trace.

Step 6
Click Add Capture.

Step 7
Enter the Name for capturing the trace.

Step 8
Select the Interface for the capturing the trace.

Step 9
Specify Match Criteria details:
   a) Select the Protocol.
   b) Enter the IP address for the Source Host.
   c) Enter the IP address for the Destination Host.
   d) (Optional) Check SGT number check box, and enter a Security Group Tag (SGT).

Step 10
Specify Buffer details:
   a) (Optional) Enter a maximum Packet Size.
   b) (Optional) Enter a minimum Buffer Size.
   c) Select either Continuous Capture if you want the traffic captured without interruption, or Stop when full if you want the capture to stop when the maximum buffer size is reached.
   d) Select Trace if you want to capture the details for each packet.
   e) (Optional) Check Trace Count check box. Default value is 50. You can enter values in the range of 1-1000.

Step 11
Click Save.
# Feature-Specific Troubleshooting

See the following table for feature-specific troubleshooting tips and techniques.

Deployment Management

• Domain Management, on page 371
• Policy Management, on page 379
• Rule Management: Common Characteristics, on page 399
• Reusable Objects, on page 433
• Firepower Threat Defense Certificate-Based Authentication, on page 531
Domain Management

The following topics describe how to manage multitenancy using domains:

- Introduction to Multitenancy Using Domains, on page 371
- Requirements and Prerequisites for Domains, on page 374
- Managing Domains, on page 374
- Creating New Domains, on page 375
- Moving Data Between Domains, on page 376
- Moving Devices Between Domains, on page 376

Introduction to Multitenancy Using Domains

The Firepower System allows you to implement multitenancy using *domains*. Domains segment user access to managed devices, configurations, and events. You can create up to 50 subdomains under a top-level Global domain, in two or three levels.

When you log into the Firepower Management Center, you log into a single domain, called the *current domain*. Depending on your user account, you may be able to switch to other domains.

In addition to any restrictions imposed by your user role, your current domain level can also limit your ability to modify various Firepower System configurations. The system limits most management tasks, like system software updates, to the Global domain.

The system limits other tasks to *leaf domains*, which are domains with no subdomains. For example, you must associate each managed device with a leaf domain, and perform device management tasks from the context of that leaf domain.

Each leaf domain builds its own network map, based on the discovery data collected by that leaf domain’s devices. Events reported by a managed device (connection, intrusion, malware, and so on) are also associated with the device's leaf domain.

One Domain Level: Global

If you do not configure multitenancy, all devices, configurations, and events belong to the Global domain, which in this scenario is also a leaf domain. Except for domain management, the system hides domain-specific configurations and analysis options until you add subdomains.
Two Domain Levels: Global and Second-Level

In a two-level multidomain deployment, the Global domain has direct descendant domains only. For example, a managed security service provider (MSSP) can use a single Firepower Management Center to manage network security for multiple customers:

- Administrators at the MSSP logging into the Global domain, cannot view or edit customers’ deployments. They must log into respective second-level named subdomains to manage the customers' deployment.

- Administrators for each customer can log into second-level named subdomains to manage only the devices, configurations, and events applicable to their organizations. These local administrators cannot view or affect the deployments of other customers of the MSSP.

Three Domain Levels: Global, Second-Level, and Third-Level

In a three-level multidomain deployment, the Global domain has subdomains, at least one of which has its own subdomain. To extend the previous example, consider a scenario where an MSSP customer—already restricted to a subdomain—wants to further segment its deployment. This customer wants to separately manage two classes of device: devices placed on network edges and devices placed internally:

- Administrators for the customer logging into the second-level subdomain cannot view or edit the customer's edge network deployments. They must log into the respective leaf domain to manage the devices deployed on the network edge.

- Administrators for the customer’s edge network can log into a third-level (leaf) domain to manage only the devices, configurations, and events applicable to devices deployed on the network edge. Similarly, administrators for the customer’s internal network can log into a different third-level domain to manage internal devices, configurations, and events. Edge and internal administrators cannot view each other’s deployment.

Note

In an FMC that uses multi-tenancy, the SSO configuration can be applied only at the global domain level, and applies to the global domain and all subdomains.

Domains Terminology

This documentation uses the following terms when describing domains and multidomain deployments:

Global Domain

In a multidomain deployment, the top-level domain. If you do not configure multitennancy, all devices, configurations, and events belong to the Global domain. Administrators in the Global domain can manage the entire Firepower System deployment.

Subdomain

A second or third-level domain.

Second-level domain

A child of the Global domain. Second-level domains can be leaf domains, or they can have subdomains.

Third-level domain

A child of a second-level domain. Third-level domains are always leaf domains.
Leaf domain
A domain with no subdomains. Each device must belong to a leaf domain.

Descendant domain
A domain descending from the current domain in the hierarchy.

Child domain
A domain’s direct descendant.

Ancestor domain
A domain from which the current domain descends.

Parent domain
A domain’s direct ancestor.

Sibling domain
A domain with the same parent.

Current domain
The domain you are logged into now. The system displays the name of the current domain before your username at the top right of the web interface. Unless your user role is restricted, you can edit configurations in the current domain.

Domain Properties
To modify a domain's properties, you must have Administrator access in that domain's parent domain.

Name and Description
Each domain must have a unique name within its hierarchy. A description is optional.

Parent Domain
Second- and third-level domains have a parent domain. You cannot change a domain's parent after you create the domain.

Devices
Only leaf domains may contain devices. In other words, a domain may contain subdomains or devices, but not both. You cannot save a deployment where a non-leaf domain directly controls a device.

In the domain editor, the web interface displays available and selected devices according to their current place in your domain hierarchy.

Host Limit
The number of hosts a Firepower Management Center can monitor, and therefore store in network maps, depends on its model. In a multidomain deployment, leaf domains share the available pool of monitored hosts, but have separate network maps.

To ensure that each leaf domain can populate its network map, you can set host limits at each subdomain level. If you set a domain's host limit to 0, the domain shares in the general pool.

Setting the host limit has a different effect at each domain level:
• Leaf — For a leaf domain, a host limit is a simple limit on the number of hosts the leaf domain can monitor.

• Second Level — For a second-level domain that manages third-level leaf domains, a host limit represents the total number of hosts that the leaf domains can monitor. The leaf domains share the pool of available hosts.

• Global — For the Global domain, the host limit is equal to the total number of hosts a Firepower Management Center can monitor. You cannot change it.

The sum of subdomains’ host limits can add up to more than their parent domain's host limit. For example, if the Global domain host limit is 150,000, you can configure multiple subdomains each with a host limit of 100,000. Any of those domains, but not all, can monitor 100,000 hosts.

The network discovery policy controls what happens when you detect a new host after you reach the host limit; you can drop the new host, or replace the host that has been inactive for the longest time. Because each leaf domain has its own network discovery policy, each leaf domain governs its own behavior when the system discovers a new host.

If you reduce the host limit for a domain and its network map contains more hosts than the new limit, the system deletes the hosts that have been inactive the longest.

### User Roles

- Admin

## Managing Domains

To modify a domain's properties, you must have Administrator access in that domain's parent domain.

**Step 1** Choose **System > Domains**.

**Step 2** Manage your domains:

- **Add** — Click **Add Domain**, or click **Add Subdomain** next to the parent domain; see [Creating New Domains](#), on page 375.
• Edit — Click Edit (✏️) next to the domain you want to modify; see Domain Properties, on page 373.
• Delete — Click Delete (🗑️) next to the empty domain you want to delete, then confirm your choice. Move devices from domains you want to delete by editing their destination domain.

Step 3 When you are done making changes to the domain structure and all devices are associated with leaf domains, click Save to implement your changes.

Step 4 If prompted, make additional changes:
• If you changed a leaf domain to a parent domain, move or delete the old network map; see Moving Data Between Domains, on page 376.
• If you moved devices between domains and must assign new policies and security zones or interface groups, see Moving Devices Between Domains, on page 376.

What to do next

• Configure user roles and policies (access control, network discovery, and so on) for any new domains. Update device properties as needed.
• Deploy configuration changes; see Deploy Configuration Changes, on page 382.

Creating New Domains

You can create up to 50 subdomains under a top-level Global domain, in two or three levels.

You must assign all devices to a leaf domain before you can implement the domain configuration. When you add a subdomain to a leaf domain, the domain stops being a leaf domain and you must reassign its devices.

Step 1 In a Global or a second-level domain, choose System > Domains.
Step 2 Click Add Domain, or click Add Subdomain next to the parent domain.
Step 3 Enter a Name and Description.
Step 4 Choose a Parent Domain.
Step 5 On Devices, choose the Available Devices to add to the domain, then click Add to Domain or drag and drop into the list of Selected Devices.
Step 6 Optionally, click Advanced to limit the number of hosts the new domain may monitor; see Domain Properties, on page 373.
Step 7 Click Save to return to the domain management page.
The system warns you if any devices are assigned to non-leaf domains. Click Create New Domain to create a new domain for those devices. Click Keep Unassigned if you plan to move the devices to existing domains.
Step 8 When you are done making changes to the domain structure and all devices are associated with leaf domains, click Save to implement your changes.
Step 9 If prompted, make additional changes:
• If you changed a leaf domain to a parent domain, move or delete the old network map; see Moving Data Between Domains, on page 376.
• If you moved devices between domains and must assign new policies and security zones or interface groups, see [Moving Devices Between Domains, on page 376.]

---

**What to do next**

- Configure user roles and policies (access control, network discovery, and so on) for any new domains. Update device properties as needed.
- Deploy configuration changes; see [Deploy Configuration Changes, on page 382.]

---

**Moving Data Between Domains**

Because events and network maps are associated with leaf domains, when you change a leaf domain to a parent domain, you have two choices:

- Move the network map and associated events to a new leaf domain.
- Delete the network map but retain the events. In this case, the events remain associated with the parent domain until the system prunes events as needed or as configured. Or, you can delete old events manually.

**Before you begin**

Implement a domain configuration where a former leaf domain is now a parent domain; see [Managing Domains, on page 374.]

---

**Step 1**

For each former leaf domain that is now a parent domain:

- Choose a new **Leaf Domain** to inherit the **Parent Domain**'s events and network map.
- Choose **None** to delete the parent domain's network map, but retain old events.

**Step 2**

Click **Save**.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 382.]

---

**Moving Devices Between Domains**

You can move devices between domains when you are in the global domain or a second-level domain. Moving a device between domains can affect the configurations and policies applied to the device. The system automatically retains and updates what it can. It deletes what it cannot update, namely, object overrides, dynamic routing configuration, static routes, IP pool associated with the diagnostic interface, and DDNS.

When you assign a remote access VPN policy to a device, you can move the device from one domain to another, only if the target domain is a descendant of the domain in which remote access VPN is configured.
You can move the device into any child domain without deleting the enrolled certificate on the device.

Specifically:

• If the health policy applied to a moved device is inaccessible in the new domain, you can choose a new health policy.

• If the access control policy assigned to a moved device is not valid or accessible in the new domain, choose a new policy. Every device must have an assigned access control policy.

• If the interfaces on the moved device belong to a security zone that is inaccessible in the new domain, you can choose a new zone.

• Interfaces are removed from:
  • Security zones that are inaccessible in the new domain and not used in an access control policy.
  • All interface groups.

If devices require a policy update but you do not need to move interfaces between zones, the system displays a message stating that zone configurations are up to date. For example, if a device’s interfaces belong to a security zone configured in a common ancestor domain, you do not need to update zone configurations when you move devices from subdomain to subdomain.

Before you begin

• Implement a domain configuration where you moved a device from domain to domain and now must assign new policies and security zones; see Managing Domains, on page 374.

Step 1  In the Move Devices dialog box, under Select Device(s) to Configure, check the device you want to configure. Check multiple devices to assign the same health and access control policies.

Step 2  Choose an Access Control Policy to apply to the device, or choose New Policy to create a new policy.

Step 3  Choose a Health Policy to apply to the device, or choose None to leave the device without a health policy.

Step 4  If prompted to assign interfaces to new zones, choose a New Security Zone for each listed interface, or choose None to assign it later.

Step 5  After you configure all affected devices, click Save to save policy and zone assignments.

Step 6  Click Save to implement the domain configuration.

What to do next

• Update other configurations on the moved device that were affected by the move.

• Deploy configuration changes; see Deploy Configuration Changes, on page 382.
CHAPTER 19

Policy Management

The following topics describe how to manage various policies on the Firepower Management Center:

Policy Deployment

After you configure your deployment, and any time you change that configuration, you must deploy the changes to affected devices. You can view deployment status in the Message Center.

Deploying updates the following components:
• Device and interface configurations
Best Practices for Deploying Configuration Changes

The following are guidelines for deploying configuration changes.

**Inline vs Passive Deployments**

Do not apply inline configurations to devices deployed passively, and vice versa.

**Time to Deploy and Memory Limitations**

The time it takes to deploy depends on multiple factors, including (but not limited to):

- The configurations you send to the device. For example, if you dramatically increase the number of Security Intelligence entries you block, deploy can take longer.

- Device model and memory. On lower-memory devices, deploying can take longer. For example, it can take up to five minutes to deploy to a Firepower 7010, 7020, or 7030 device.

Do not exceed the capability of your devices. If you exceed the maximum number of rules or policies supported by a target device, the system displays a warning. The maximum depends on a number of factors—not only memory and the number of processors on the device, but also on policy and rule complexity. For information on optimizing policies and rules, see Best Practices for Access Control Rules, on page 1372.

**Interruptions to Traffic Flow and Inspection During Deploy**

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 and Configurations that Restart the Snort Process When Deployed or Activated, on page 388.
For Firepower Threat Defense devices, the **Inspect Interruption** column in the Deploy dialog warns you when deploying might interrupt traffic flow or inspection. You can either proceed with, cancel, or delay deployment; see **Restart Warnings for Firepower Threat Defense Devices**, on page 381 for more information.

⚠️ **Caution**

We **strongly** recommend you deploy in a maintenance window or at a time when interruptions will have the least impact.

---

**Auto-Enabling Application Detectors**

If you are performing application control but disable required detectors, the system automatically enables the appropriate system-provided detectors upon policy deploy. If none exist, the system enables the most recently modified user-defined detector for the application.

**Asset Rediscovery with Network Discovery Policy Changes**

When you deploy changes to a network discovery policy, the system deletes and then rediscovers MAC address, TTL, and hops information from the network map for the hosts in your monitored networks. Also, the affected managed devices discard any discovery data that has not yet been sent to the Firepower Management Center.

**Related Topics**

- Snort® Restart Scenarios, on page 385

---

**Restart Warnings for Firepower Threat Defense Devices**

When you deploy, the **Inspect Interruption** column in the deploy dialog specifies whether a deployed configuration restarts the Snort process on a Firepower Threat Defense device. When the traffic inspection engine referred to as the **Snort process** restarts, inspection is interrupted until the process resumes. Whether traffic is interrupted or passes without inspection during the interruption depends on how the device handles traffic. Note that you can proceed with the deployment, cancel the deployment and modify the configuration, or delay the deployment until a time when deploying would have the least impact on your network.

When the **Inspect Interruption** column indicates **Yes** and you expand the device configuration listing, the system highlights in red along with a **Restart icon** any specific configuration type that would restart the Snort process. When you hover your mouse over these configurations, a message informs you that deploying the configuration may interrupt traffic.

The following table summarizes how the deploy dialog displays inspection interruption warnings.
Table 57: Inspection Interruption Indicators

<table>
<thead>
<tr>
<th>Type</th>
<th>Inspect Interruption</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FTD</td>
<td><code>Inspect Interruption (Yes)</code></td>
<td>At least one configuration would interrupt inspection on the device if deployed, and might interrupt traffic depending on how the device handles traffic. You can expand the device configuration listing for more information.</td>
</tr>
<tr>
<td></td>
<td><code>No</code></td>
<td>Deployed configurations will not interrupt traffic on the device.</td>
</tr>
<tr>
<td></td>
<td><code>Undetermined</code></td>
<td>The system cannot determine if a deployed configuration may interrupt traffic on the device, and displays a <strong>Device Warning icon</strong> next to the device. Undetermined status is displayed before the first deployment after a software upgrade, or in some cases during a Support call.</td>
</tr>
<tr>
<td></td>
<td>Errors (⚠)</td>
<td>The system cannot determine the status due to an internal error. Cancel the operation and click <strong>Deploy</strong> again to allow the system to redetermine the <strong>Inspect Interruption</strong> status. If the problem persists, contact Support.</td>
</tr>
<tr>
<td>sensor</td>
<td><code>--</code></td>
<td>The device identified as <em>sensor</em> is not a Firepower Threat Defense device; the system does not determine if a deployed configuration may interrupt traffic on this device.</td>
</tr>
</tbody>
</table>

For information on all configurations that restart the Snort process for all device types, see Configurations that Restart the Snort Process When Deployed or Activated, on page 388.

### Deploy Configuration Changes

After you change configurations, deploy them to the affected devices. We strongly recommend that you deploy in a maintenance window or at a time when any interruptions to traffic flow and inspection will have the least impact.

⚠ Caution

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 and Configurations that Restart the Snort Process When Deployed or Activated, on page 388.
Before you begin

- Review the guidelines described in Best Practices for Deploying Configuration Changes, on page 380.
- Be sure all managed devices use the same revision of the Security Zones object. If you have edited security zone objects: Do not deploy configuration changes to any device until you edit the zone setting for interfaces on all devices you want to sync. You must deploy to all managed devices at the same time. See Synchronizing Security Zone Object Revisions, on page 549.

Step 1
On the Firepower Management Center menu bar, click Deploy.

The Deploy Policies dialog lists devices with out-of-date configurations. The Version at the top of the dialog specifies when you last made configuration changes.

Step 2
Identify and choose the devices where you want to deploy configuration changes.

- Sort—Sort the device list by clicking a column heading.

  See Restart Warnings for Firepower Threat Defense Devices, on page 381 for information on columns that help you identify configurations that interrupt traffic inspection and might interrupt traffic when deployed to Firepower Threat Defense devices.

  See Configurations that Restart the Snort Process When Deployed or Activated, on page 388 for information on configurations that interrupt traffic inspection and might interrupt traffic when deployed to all devices.

- Expand—Click Plus to expand a device listing to view the configuration changes to be deployed. The system marks out-of-date policies with an Index.

  When the status in the Inspect Interruption column indicates (Yes) that deploying will interrupt inspection, and perhaps traffic, on a Firepower Threat Defense device, the expanded list highlights in red the configurations causing the interruption.

- Filter—Filter the device list. Click the arrow in the right corner of any column heading:

  - Inspect Interruption column—From the Filters drop-down list check the desired filter options. You can choose more than one option.

    For more information on restart warnings, see Restart Warnings for Firepower Threat Defense Devices, on page 381.

    - All other columns—Enter text in the Filters text box, and press Enter.

    Check or uncheck Filters to activate or deactivate the filter.

- Modify—Click Cog (⚙️) in the upper-right corner and, from the Columns drop-down list, check or uncheck columns to display.

- Arrange—Place the mouse on a column heading to drag and drop the column in your preferred order.

Step 3
Click Deploy.

Step 4
If the system identifies errors or warnings in the changes to be deployed, it displays them in the Errors and Warnings for Requested Deployment window.

You have the following choices:

- Proceed—Continue deploying without resolving warning conditions. You cannot proceed if the system identifies errors.
• Cancel—Exit without deploying. Resolve the error and warning conditions, and attempt to deploy the configuration again.

### What to do next

- (Optional) Monitor deployment status; see Viewing Deployment Messages, on page 351.
- If deploy fails, see Best Practices for Deploying Configuration Changes, on page 380.
- During deployment, if there is a deployment failure due to any reason, there is a possibility that the failure may impact traffic. However, it depends on certain conditions. If there are specific configuration changes in the deployment, the deployment failure may lead to traffic being interrupted. See the following table to know what configuration changes may cause traffic interruption when deployment fails.

<table>
<thead>
<tr>
<th>Configuration Changes</th>
<th>Exists?</th>
<th>Traffic Impacted?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat Defense Service changes in an access control policy</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>VRF</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Interface</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>QoS</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Note** The configuration changes interrupting traffic during deployment is valid only if both the FMC and FTD are of version 6.2.3 or higher.

**Related Topics**

Snort® Restart Scenarios, on page 385

### Redeploy Existing Configurations to a Device

You can force-deploy existing (unchanged) configurations to a single managed device. We *strongly* recommend you deploy in a maintenance window or at a time when any interruptions to traffic flow and inspection will have the least impact.

**Caution** When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 and Configurations that Restart the Snort Process When Deployed or Activated, on page 388.

**Before you begin**

Review the guidelines described in Best Practices for Deploying Configuration Changes, on page 380.
Step 1  Choose Devices > Device Management.

Step 2  Click Edit next to the device where you want to force deployment.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  Click Device.

Step 4  Click Edit next to the General section heading.

Step 5  Click Force Deploy.

Note  Force-deploy takes more time than the regular deployment because it involves the complete generation of the policy rules to be deployed on the FTD.

Step 6  Click Deploy.

The system identifies any errors or warnings with the configurations you are deploying. You can click Proceed to continue without resolving warning conditions. However, you cannot proceed if the system identifies an error.

What to do next

• (Optional) Monitor deployment status; see Viewing Deployment Messages, on page 351.

• If deploy fails, see Best Practices for Deploying Configuration Changes, on page 380.

Related Topics

Snort® Restart Scenarios, on page 385

Snort® Restart Scenarios

When the traffic inspection engine referred to as the Snort process on a managed device restarts, inspection is interrupted until the process resumes. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 for more information. Additionally, resource demands may result in a small number of packets dropping without inspection when you deploy, regardless of whether the Snort process restarts.

Any of the scenarios in the following table cause the Snort process to restart.

<table>
<thead>
<tr>
<th>Restart Scenario</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deploying a specific configuration that requires the Snort process to restart.</td>
<td>Configurations that Restart the Snort Process When Deployed or Activated, on page 388</td>

<td>Changes that Immediately Restart the Snort Process, on page 390</td>
</tr>
<tr>
<td>Traffic-activation of the currently deployed Automatic Application Bypass (AAB) configuration.</td>
<td>Configure Automatic Application Bypass, on page 265</td>
</tr>
</tbody>
</table>
Inspect Traffic During Policy Apply

Inspect traffic during policy apply is an advanced access control policy general setting that allows managed devices to inspect traffic while deploying configuration changes; this is the case unless a configuration that you deploy requires the Snort process to restart. You can configure this option as follows:

- **Enabled** — Traffic is inspected during the deployment unless certain configurations require the Snort process to restart.

  When the configurations you deploy do not require a Snort restart, the system initially uses the currently deployed access control policy to inspect traffic, and switches during deployment to the access control policy you are deploying.

- **Disabled** — Traffic is not inspected during the deployment. The Snort process always restarts when you deploy.

The following graphic illustrates how Snort restarts can occur when you enable or disable inspect traffic during policy apply.

![Snort Restart Traffic Behavior Diagram](image)

**Caution**

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 and Configurations that Restart the Snort Process When Deployed or Activated, on page 388.

Snort® Restart Traffic Behavior

The following tables explain how different devices handle traffic when the Snort process restarts.

**Table 59: FTD and FTD Virtual Restart Traffic Effects**

<table>
<thead>
<tr>
<th>Interface Configuration</th>
<th>Restart Traffic Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>inline: Snort Fail Open: Down: disabled</td>
<td>dropped</td>
</tr>
</tbody>
</table>
**Interface Configuration** | **Restart Traffic Behavior**
--- | ---
inline: **Snort Fail Open: Down**: enabled | passed without inspection
routed, transparent (including EtherChannel, redundant, subinterface) when **preserve-connection** is enabled (**configure snort preserve-connection enable**; default) | existing TCP/UDP flows: passed without inspection so long as at least one packet arrives while Snort is down
new TCP/UDP flows and all non-TCP/UDP flows: dropped
Note that the following traffic drops even when **preserve-connection** is enabled:
- plaintext, passthrough prefilter tunnel traffic that matches an **Analyze** rule action or an **Analyze all tunnel traffic** default policy action
- connections that do not match an access control rule and are instead handled by the default action.
- decrypted TLS/SSL traffic
- a safe search flow
- a captive portal flow
routed, transparent (including EtherChannel, redundant, subinterface) when either of the following occurs:
- the **preserve-connection** CLI command is disabled (**configure snort preserve-connection disable**)
- the FTD version (6.2.1, 6.2.2, 6.2.2.x, or a version earlier than 6.2.0.2) does not support this command | dropped
inline: tap mode | egress packet immediately, copy bypasses Snort
passive | uninterrupted, not inspected

---

**Table 60: 7000 and 8000 Series, NGIPSv Restart Traffic Effects**

--- | ---
**Interface Configuration** | **Restart Traffic Behavior**
--- | ---
inline: **Failsafe** enabled or disabled | passed without inspection
A few packets might drop if **Failsafe** is disabled and Snort is busy but not down.
inline: tap mode | egress packet immediately, copy bypasses Snort
passive | uninterrupted, not inspected
### Table 61: ASA FirePOWER Restart Traffic Effects

<table>
<thead>
<tr>
<th>Interface Configuration</th>
<th>Restart Traffic Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>routed, switched (7000 and 8000 Series only)</td>
<td>dropped</td>
</tr>
<tr>
<td>routed or transparent with fail-open</td>
<td>passed without inspection</td>
</tr>
<tr>
<td>routed or transparent with fail-close</td>
<td>dropped</td>
</tr>
</tbody>
</table>

### Note

In addition to traffic handling when the Snort process is down while it restarts, traffic can also pass without inspection or drop when the Snort process is busy, depending on the configuration of the Failsafe option (see Inline Sets on the Firepower System, on page 556) or the Snort Fail Open Busy option (see Configure an Inline Set, on page 701). A device supports either the Failsafe option or the Snort Fail Open option, but not both.

### Note

When the Snort process is busy but not down during configuration deployment, some packets may drop on routed, switched, or transparent interfaces if the total CPU load exceeds 60 percent.

### Configurations that Restart the Snort Process When Deployed or Activated

Deploying any of the following configurations except AAB restarts the Snort process as described. Deploying AAB does not cause a restart, but excessive packet latency activates the currently deployed AAB configuration, causing a partial restart of the Snort process.

#### Access Control Policy Advanced Settings

- Deploy when **Inspect Traffic During Policy Apply** is disabled.
- Add or remove an SSL policy.

#### File Policy

Deploy the first or last of any one of the following configurations; note that while otherwise deploying these file policy configurations does not cause a restart, deploying non-file-policy configurations can cause restarts.

- Take either of the following actions:
  - Enable or disable **Inspect Archives** when the deployed access control policy includes at least one file policy.
  - Add the first or remove the last file policy rule when **Inspect Archives** is enabled (note that at least one rule is required for **Inspect Archives** to be meaningful).
  - Enable or disable **Store files in a Detect Files or Block Files** rule.
• Add the first or remove the last active file rule that combines the Malware Cloud Lookup or Block Malware rule action with an analysis option (Spero Analysis or MSEXE, Dynamic Analysis, or Local Malware Analysis) or a store files option (Malware, Unknown, Clean, or Custom).

Note that access control rules that deploy these file policy configurations to security zones or tunnel zones cause a restart only when your configuration meets the following conditions:

• Source or destination security zones in your access control rule must match the security zones associated with interfaces on the target devices.

• Unless the destination zone in your access control rule is any, a source tunnel zone in the rule must match a tunnel zone assigned to a tunnel rule in the prefilter policy.

Identity Policy

• When SSL decryption is disabled (that is, when the access control policy does not include an SSL policy), add the first or remove the last active authentication rule.

An active authentication rule has either an Active Authentication rule action, or a Passive Authentication rule action with Use active authentication if passive or VPN identity cannot be established selected.

Network Discovery

• Enable or disable non-authoritative, traffic-based user detection over the HTTP, FTP, or MDNS protocols, using the network discovery policy.

Device Management

• Routing: Add a routed interface pair or virtual router to a 7000 or 8000 Series device.

• VPN: Add or remove a VPN on a 7000 or 8000 Series device.

⚠️ Caution

The system does not warn you that the Snort process restarts when you add or remove a VPN on a 7000 or 8000 Series device.

• MTU: Change the highest MTU value among all non-management interfaces on a device.

• 7000/8000 series high availability: Change a high-availability state sharing option. The system does not warn you that the Snort process restarts on the primary and secondary devices.

• Automatic Application Bypass (AAB): The currently deployed AAB configuration activates when a malfunction of the Snort process or a device misconfiguration causes a single packet to use an excessive amount of processing time. The result is a partial restart of the Snort process to alleviate extremely high latency or prevent a complete traffic stall. This partial restart causes a few packets to pass without inspection, or drop, depending on how the device handles traffic.

Updates

• System update: Deploy configurations the first time after a software update that includes a new version of the Snort binary or data acquisition library (DAQ).
• VDB: Deploying configurations the first time after installing a vulnerability database (VDB) update that includes changes applicable to managed devices will require a detection engine restart and may result in a temporary traffic interruption. For these, a message warns you when you select the Firepower Management Center to begin installing. The deploy dialog provides additional warnings for Firepower Threat Defense devices when VDB changes are pending. VDB updates that apply only to the Firepower Management Center do not cause detection engine restarts, and you cannot deploy them.

Related Topics

Snort® Restart Scenarios, on page 385

Changes that Immediately Restart the Snort Process

The following changes immediately restart the Snort process without going through the deploy process. How the restart affects traffic depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 for more information.

• Take any of the following actions involving applications or application detectors:
  • Activate or deactivate a system or custom application detector.
  • Delete an activated custom detector.
  • **Save and Reactivate** an activated custom detector.
  • Create a user-defined application.

A message warns you that continuing restarts the Snort process, and allows you to cancel; the restart occurs on any managed device in the current domain or in any of its child domains.

• Create or break a Firepower Threat Defense high availability pair—A message warns you that continuing to create a high availability pair restarts the Snort process on the primary and secondary devices and allows you to cancel.

• Restart the Snort process in the 7000 or 8000 Series user interface (**System > Configuration > Process**)—The system prompts you for confirmation and allows you to cancel.

Policy Comparison

To review policy changes for compliance with your organization's standards or to optimize system performance, you can examine the differences between two policies or between a saved policy and the running configuration.

You can compare the following policy types:

• DNS
• File
• Health
• Identity
• Intrusion
• Network Analysis
• SSL

The comparison view displays both policies in a side-by-side format. Differences between the two policies are highlighted:

• Blue indicates that the highlighted setting is different in the two policies, and the difference is noted in red text.

• Green indicates that the highlighted setting appears in one policy but not the other.

Comparing Policies

You can compare policies only if you have access rights and any required licenses for the specific policy, and you are in the correct domain for configuring the policy.

Step 1
Access the management page for the policy you want to compare:

• DNS—Policies > Access Control > DNS
• File—Policies > Access Control > Malware & File
• Health—System > Health > Policy
• Identity—Policies > Access Control > Identity
• Intrusion—Policies > Access Control > Intrusion
• Network Analysis—Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy

Note
If your custom user role limits access to the first path listed here, use the second path to access the policy.

Step 2
Click Compare Policies.

Step 3
From the Compare Against drop-down list, choose the type of comparison you want to make:

• To compare two different policies, choose Other Policy.
• To compare two revisions of the same policy, choose Other Revision.
• To compare another policy to the currently active policy, choose Running Configuration.

Step 4
Depending on the comparison type you choose, you have the following choices:

• If you are comparing two different policies, choose the policies you want to compare from the Policy A and Policy B drop-down lists.
• If you are comparing the running configuration to another policy, choose the second policy from the Policy B drop-down list.

Step 5
Click OK.

Step 6
Review the comparison results:

• Comparison Viewer—To use the comparison viewer to navigate individually through policy differences, click Previous or Next above the title bar.
• Comparison Report—To generate a PDF report that lists the differences between the two policies, click **Comparison Report**.

---

**Policy Reports**

For most policies, you can generate two kinds of reports. A report on a single policy provides details on the policy's current saved configuration, while a comparison report lists only the differences between two policies. You can generate a single-policy report for all policy types except health.

**Note** Intrusion policy reports combine the settings in the base policy with the settings of the policy layers, and make no distinction between which settings originated in the base policy or policy layer.

---

**Generating Current Policy Reports**

You can generate policy reports only if you have access rights and any required licenses for the specific policy, and you are in the correct domain for configuring the policy.

---

**Step 1** Access the management page for the policy for which you want to generate a report:

- Access Control—Policies > Access Control
- DNS—Policies > Access Control > DNS
- File—Policies > Access Control > Malware & File
- Health—System > Health > Policy
- Identity—Policies > Access Control > Identity
- Intrusion—Policies > Access Control > Intrusion
- NAT for 7000 & 8000 Series devices—Devices > NAT
- Network Analysis—Policies > Access Control, then click Network Analysis Policy or Policies > Access Control > Intrusion, then click Network Analysis Policy

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

- SSL—Policies > Access Control > SSL

**Step 2** Click **Report** next to the policy for which you want to generate a report.

---

**Out-of-Date Policies**

The Firepower System marks out-of-date policies with red status text that indicates how many of its targeted devices need a policy update. To clear this status, you must re-deploy the policy to the devices.

Configuration changes that require a policy re-deploy include:
• Modifying an access control policy: any changes to access control rules, the default action, policy targets, Security Intelligence filtering, advanced options including preprocessing, and so on.

• Modifying any of the policies that the access control policy invokes: the SSL policy, network analysis policies, intrusion policies, file policies, identity policies, or DNS policies.

• Changing any reusable object or configuration used in an access control policy or policies it invokes:
  • network, port, VLAN tag, URL, and geolocation objects
  • Security Intelligence lists and feeds
  • application filters or detectors
  • intrusion policy variable sets
  • file lists
  • decryption-related objects and security zones

• Updating the system software, intrusion rules, or the vulnerability database (VDB).

Keep in mind that you can change some of these configurations from multiple places in the web interface. For example, you can modify security zones using the object manager (Objects > Object Management), but modifying an interface type in a device’s configuration (Devices > Device Management) can also change a zone and require a policy re-deploy.

Note that the following updates do not require policy re-deploy:
  • automatic updates to Security Intelligence feeds and additions to the Security Intelligence global Block or Do Not Block list using the context menu
  • automatic updates to URL filtering data
  • scheduled geolocation database (GeoDB) updates

Performance Considerations for Limited Deployments

Host, application, and user discovery data allow the system to create a complete, up-to-the-minute profile of your network. The system can also act as an intrusion detection and prevention system (IPS), analyzing network traffic for intrusions and exploits and, optionally, dropping offending packets.

Combining discovery and IPS gives context to your network activity and allows you to take advantage of many features, including:
  • impact flags and indications of compromise, which can tell you which of your hosts are vulnerable to a particular exploit, attack, or piece of malware
  • adaptive profile updates and Firepower recommendations, which allow you to examine traffic differently depending on the destination host
  • correlation, which allows you to respond to intrusions (and other events) differently depending on the affected host

However, if your organization is interested in performing only IPS, or only discovery, there are a few configurations that can optimize the performance of the system.
Discovery Without Intrusion Prevention

The discovery feature allows you to monitor network traffic and determine the number and types of hosts (including network devices) on your network, as well as the operating systems, active applications, and open ports on those hosts. You can also configure managed devices to monitor user activity on your network. You can use discovery data to perform traffic profiling, assess network compliance, and respond to policy violations.

In a basic deployment (discovery and simple, network-based access control only), you can improve a device’s performance by following a few important guidelines when configuring its access control policy.

**Note**
You must use an access control policy, even if it simply allows all traffic. The network discovery policy can only examine traffic that the access control policy allows to pass.

First, make sure your access control policy does not require complex processing and uses only simple, network-based criteria to handle network traffic. You must implement all of the following guidelines; misconfiguring any one of these options eliminates the performance benefit:

- Do not use the Security Intelligence feature. Remove any populated global Block or Do Not Block list from the policy’s Security Intelligence configuration.
- Do not include access control rules with Monitor or Interactive Block actions. Use only Allow, Trust, and Block rules. Keep in mind that allowed traffic can be inspected by discovery; trusted and blocked traffic cannot.
- Do not include access control rules with application, user, URL, ISE attribute, or geolocation-based network conditions. Use only simple network-based conditions: zone, IP address, VLAN tag, and port.
- Do not include access control rules that perform file, malware, or intrusion inspection. In other words, do not associate a file policy or intrusion policy with any access control rule.
- In the Advanced settings for the access control policy, make sure that Intrusion Policy used before Access Control rule is determined is set to No Rules Active.
- Select Network Discovery Only as the policy’s default action. Do not choose a default action for the policy that performs intrusion inspection.

In conjunction with the access control policy, you can configure and deploy the network discovery policy, which specifies the network segments, ports, and zones that the system examines for discovery data, as well as whether hosts, applications, and users are discovered on the segments, ports, and zones.

**Related Topics**
Inspection of Packets That Pass Before Traffic Is Identified, on page 1880

Intrusion Prevention Without Discovery

Disabling discovery if you don't need it (for example, in an IPS-only deployment) can improve performance. To disable discovery you must implement all of these changes:

- Delete all rules from your network discovery policy.
- Use only simple network-based conditions to perform access control: zone, IP address, VLAN tag, and port.
Do not perform any kind of Security Intelligence, application, user, URL, or geolocation control. Although you can disable storage of discovery data, the system still must collect and examine it to implement those features.

- Disable network and URL-based Security Intelligence by deleting all Block and Do Not Block lists from your access control policy's Security Intelligence configuration, including the default Global lists.
- Disable DNS-based Security Intelligence by deleting or disabling all rules in the associated DNS policy, including the default Global Do-Not-Block List for DNS and Global Block List for DNS rules.

After you deploy, new discovery halts on target devices. The system gradually deletes information in the network map according to your timeout preferences. Or, you can purge all discovery data immediately.

Chapter 20

Rule Management: Common Characteristics

The following topics describe how to manage common characteristics of rules in various policies on the Firepower Management Center:

- Requirements and Prerequisites for Rule Management, on page 399
- Introduction to Rules, on page 399
- Rule Condition Types, on page 401
- Searching for Rules, on page 429
- Filtering Rules by Device, on page 429
- Identify Rules with Issues, on page 430
- Rule and Other Policy Warnings, on page 431
- History for Rule Management: Common Characteristics, on page 432

Requirements and Prerequisites for Rule Management

Model Support
Any.

Supported Domains
Any

User Roles
- Admin
- Access Admin
- Network Admin

Introduction to Rules

Rules in various policies exert granular control over network traffic. The system evaluates traffic against rules in the order that you specify, using a first-match algorithm.
Although these rules may include other configurations that are not consistent across policies, they share many basic characteristics and configuration mechanics, including:

- **Conditions:** Rule conditions specify the traffic that each rule handles. You can configure each rule with multiple conditions. Traffic must match all conditions to match the rule.

- **Action:** A rule's action determines how the system handles matching traffic. Note that even if a rule does not have an Action list you can choose from, the rule still has an associated action. For example, a custom network analysis rule uses a network analysis policy as its "action." As another example, QoS rules do not have an explicit action because all QoS rules do the same thing: rate limit traffic.

- **Position:** A rule's position determines its evaluation order. When using a policy to evaluate traffic, the system matches traffic to rules in the order you specify. Usually, the system handles traffic according to the first rule where all the rule's conditions match the traffic. (Monitor rules, which are designed to track and log, are an exception.) Proper rule order reduces the resources required to process network traffic, and prevents rule preemption.

- **Category:** To organize some rule types, you can create custom rule categories in each parent policy.

- **Logging:** For many rules, logging settings govern whether and how the system logs connections handled by the rule. Some rules (such as identity and network analysis rules) do not include logging settings because the rules neither determine the final disposition of connections, nor are they specifically designed to log connections. As another example, QoS rules do not include logging settings; you cannot log a connection simply because it was rate limited.

- **Comments:** For some rule types, each time you save changes, you can add comments. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change.

---

**Tip**

A right-click menu in many policy editors provides shortcuts to many rule management options, including editing, deleting, moving, enabling, and disabling.

---

**Rules with Shared Characteristics**

This chapter documents many common aspects of the following rules and configurations. For information on non-shared configurations, see:

- **Access control rules:** [Access Control Rules](#), page 1395
- **Prefilter rules:** [Tunnel and Prefilter Rule Components](#), page 1459
- **Tunnel rules:** [Tunnel and Prefilter Rule Components](#), page 1459
- **SSL rules:** [Creating and Modifying TLS/SSL Rules](#), page 1528
- **DNS rules:** [Creating and Editing DNS Rules](#), page 1445
- **Identity rules:** [Create an Identity Rule](#), page 2165
- **Network analysis rules:** [Configuring Network Analysis Rules](#), page 1883
- **QoS rules:** [Configuring QoS Rules](#), page 722
- **Intelligent Application Bypass (IAB):** [Intelligent Application Bypass](#), page 1469
• Application filters: Application Filters, on page 446

Rules without Shared Characteristics

Rules whose configurations are not documented in this chapter include:

• Intrusion rules: Tuning Intrusion Policies Using Rules, on page 1701

• File and malware rules: File Rules, on page 1595

• Correlation rules: Configuring Correlation Rules, on page 2212

• NAT rules (Classic): NAT for 7000 and 8000 Series Devices, on page 1169

• NAT rules (Firepower Threat Defense): Network Address Translation (NAT) for Firepower Threat Defense, on page 1187

• 8000 Series fastpath rules: Configure Fastpath Rules (8000 Series), on page 266

Rule Condition Types

The following table describes the common rule conditions documented in this chapter, and lists the configurations where they are used.

<table>

Rule Condition Mechanics

Rule conditions specify the traffic that each rule handles. You can configure each rule with multiple conditions, and traffic must match all conditions to match the rule. The available condition types depend on the rule type.

In rule editors, each condition type has its own tab page. Build conditions by choosing the traffic characteristics you want to match. In general, choose criteria from one or two lists of available items on the left, then add or combine those criteria into one or two lists of selected items on the right. For example, in URL conditions in access control rules, you can combine URL category and reputation criteria to create a single group of websites to block.

To help you build conditions, you can match traffic using various system-provided and custom configurations, including realms, ISE attributes, and various types of objects and object groups. Often, you can manually specify rule criteria.

Leave matching criteria empty whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against every combination of the contents of the criteria you specify.

Caution

Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use specific conditions (such as networks and IP addresses) should be ordered before rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this Wikipedia article.

Source and Destination Criteria

Where a rule involves source and destination criteria (zones, networks, ports), usually you can use either or both criteria as constraints. If you use both, matching traffic must originate from one of the specified source zones, networks, or ports and leave through one of the destination zones, networks, or ports.

Items per Condition

You can add up to 50 items to each condition. For rules with source and destination criteria, you can use up to 50 of each. Traffic that matches any of the selected items matches the condition.

Simple Rule Mechanics

In rule editors, you have the following general choices. For detailed instructions on building conditions, see the topics for each condition type.
• Choose Item—Click an item or check its check box. Often you can use Ctrl or Shift to choose multiple items, or right-click to Select All.

• Search—Enter criteria in the search field. The list updates as you type. The system searches item names and, for objects and object groups, their values. Click Reload (珪) or Clear (∗) to clear the search.

• Add Predefined Item—After you choose one or more available items, click an Add button or drag and drop. The system prevents you from adding invalid items: duplicates, invalid combinations, and so on.

• Add Manual Item—Click the field under the Selected items list, enter a valid value, and click Add. When you add ports, you may also choose a protocol from the drop-down list.

• Create Object—Click Add (珪) to create a new, reusable object that you can immediately use in the condition you are building, then manage in the object manager. When using this method to add application filters on the fly, you cannot save a filter that includes another user-created filter.

• Delete—Click the Delete (🗑) for an item, or choose one or more items and right-click to Delete Selected.

Interface Conditions

Interface rule conditions control traffic by its source and destination interfaces.

Depending on the rule type and the devices in your deployment, you can use predefined interface objects called security zones or interface groups to build interface conditions. Interface objects segment your network to help you manage and classify traffic flow by grouping interfaces across multiple devices; see Interface Objects: Interface Groups and Security Zones, on page 450.

Tip

Constraining rules by interface is one of the best ways to improve system performance. If a rule excludes all of a device’s interfaces, that rule does not affect that device's performance.

Just as all interfaces in an interface object must be of the same type (all inline, passive, switched, routed, or ASA FirePOWER), all interface objects used in an interface condition must be of the same type. Because devices deployed passively do not transmit traffic, in passive deployments you cannot constrain rules by destination interface.

Tunnel Zones vs Security Zones

In some configurations, you can use tunnel zones instead of security zones to constrain interface conditions. Tunnel zones allow you to use prefiltering to tailor subsequent traffic handling to certain types of encapsulated connections.

Note

If a configuration supports tunnel zone constraints, a rezoned connection—a connection with an assigned tunnel zone—does not match security zone constraints. For more information, see Tunnel Zones and Prefiltering, on page 1461.
### Rules with Interface Conditions

</tbody>
</table>

### Example: Access Control Using Security Zones

Consider a deployment where you want hosts to have unrestricted access to the internet, but you nevertheless want to protect them by inspecting incoming traffic for intrusions and malware.

First, create two security zones: Internal and External. Then, assign interface pairs on one or more devices to those zones, with one interface in each pair in the Internal zone and one in the External zone. Hosts connected to the network on the Internal side represent your protected assets.

#### Note

You are not required to group all internal (or external) interfaces into a single zone. Choose the grouping that makes sense for your deployment and security policies.

Then, configure an access control rule with a destination zone condition set to Internal. This simple rule matches traffic that leaves the device from any interface in the Internal zone. To inspect matching traffic for intrusions and malware, choose a rule action of **Allow**, then associate the rule with an intrusion and a file policy.

### Configuring Interface Conditions

#### Before you begin

- (Access control only) If you want to constrain traffic by tunnel zones instead of security zones, make sure the associated prefilter policy assigns those zones; see **Associating Other Policies with Access Control**, on page 1391.

#### Step 1

In the rule editor, click the following for interface conditions:
• Interface groups and security zones (tunnel, prefilter, QoS)—Click **Interface Objects**.
• Security zones (access control, SSL, DNS, identity, network analysis)—Click **Zones**.
• Tunnel zones (access control)—Click **Zones**.

**Step 2**
Find and choose the interfaces you want to add from the Available Interface Objects or Available Zones list.

(Access control only) To match connections in rezoned tunnels, choose tunnel zones instead of security zones. You cannot use tunnel and security zones in the same rule. For more information, see Tunnel Zones and Prefiltering, on page 1461.

**Step 3**
Click **Add to Source** or **Add to Destination**, or drag and drop.

**Step 4**
Save or continue editing the rule.

---

**What to do next**

• (Access control only) If you rezoned tunnels during prefiltering, configure additional rules if necessary to ensure complete coverage. Connections in rezoned tunnels do **not** match rules with security zone constraints. For more information, see Using Tunnel Zones, on page 1462.

• Deploy configuration changes; see Deploy Configuration Changes, on page 382.

---

**Network Conditions**

Network rule conditions control traffic by its source and destination IP address, using inner headers. Tunnel rules, which use outer headers, have tunnel endpoint conditions instead of network conditions.

You can use predefined objects to build network conditions, or manually specify individual IP addresses or address blocks.

---

**Note**

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Leave matching criteria empty whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against every combination of the contents of the criteria you specify.

---

**Geolocation in Network Conditions**

Some rules can match traffic using the geographical location of the source or destination. If a rule type supports geolocation, you can mix network and geolocation criteria. To ensure you are using up-to-date geolocation data to filter your traffic, Cisco strongly recommends you regularly update the geolocation database (GeoDB).

**Original Client in Network Conditions (Filtering Proxied Traffic)**

For some rules, you can handle proxied traffic based on the originating client. Use a source network condition to specify proxy servers, then add an original client constraint to specify original client IP addresses. The system uses a packet's X-Forwarded-For (XFF), True-Client-IP, or custom-defined HTTP header field to determine original client IP.
Traffic matches the rule if the proxy's IP address matches the rule's source network constraint, and the original client's IP address matches the rule's original client constraint. For example, to allow traffic from a specific original client address, but only if it uses a specific proxy, create three access control rules:

Access Control Rule 1: Blocks non-proxied traffic from a specific IP address (209.165.201.1)
- Source Networks: 209.165.201.1
- Original Client Networks: none/any
- Action: Block

Access Control Rule 2: Allows proxied traffic from the same IP address, but only if the proxy server for that traffic is one you choose (209.165.200.225 or 209.165.200.238)
- Source Networks: 209.165.200.225 and 209.165.200.238
- Original Client Networks: 209.165.201.1
- Action: Allow

Access Control Rule 3: Blocks proxied traffic from the same IP address if it uses any other proxy server.
- Source Networks: any
- Original Client Networks: 209.165.201.1
- Action: Block

<table>
<thead>
<tr>
<th>Rule Type</th>
<th>Supports Geolocation Constrains?</th>
<th>Supports Original Client Constrains?</th>

<td>no</td>
<td>no</td>
</tr>
<tr>
<td>QoS</td>
<td>yes</td>
<td>yes</td>
</tr>
</tbody>
</table>

**Configuring Network Conditions**

**Step 1**  In the rule editor, click Networks.

**Step 2**  Find and choose the predefined networks you want to add from the Available Networks list.

If the rule supports geolocation, you can mix network and geolocation criteria in the same rule:
- Networks—Click Networks to choose networks.
- Geolocation—Click Geolocation to choose geolocation objects.

**Step 3**  (Optional) If the rule supports original client constraints, under Source Networks, configure the rule to handle proxied traffic based on its original client:
• Source/Proxy—Click **Source** to specify proxy servers.
• Original Client—Click **Original Client** to add a network as an original client constraint. In proxied connections, the original client's IP address must match one of these networks to match the rule.

**Step 4**
Click **Add to Source**, **Add to Original Client**, or **Add to Destination**, or drag and drop.

**Step 5**
Add networks that you want to specify manually. Enter a source, original client, or destination IP address or address block, then click **Add**.

**Note**
The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

**Step 6**
Save or continue editing the rule.

---

**Example: Network Condition in an Access Control Rule**

The following graphic shows the network condition for an access control rule that blocks connections originating from your internal network and attempting to access resources either in North Korea or on 93.184.216.119 (example.com).

In this example, a network object group called Private Networks (that comprises the IPv4 and IPv6 Private Networks network objects, not shown) represents your internal networks. The example also manually specifies the example.com IP address, and uses a system-provided North Korea geolocation object to represent North Korea IP addresses.

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

---

**Tunnel Endpoint Conditions**

Tunnel endpoint conditions are specific to tunnel rules. They are similar to the network conditions for other rule types.

Tunnel endpoint conditions control certain types of plaintext, passthrough tunnels (see Encapsulation Conditions, on page 412) by their source and destination IP address, using outer encapsulation headers. These are the IP addresses of the tunnel endpoints—the routed interfaces of the network devices on either side of the tunnel.

Tunnel rules are bidirectional by default, and handle all matching tunnels between any of the source endpoints and any of the destination endpoints. However, you can configure unidirectional tunnel rules that match source-to-destination traffic only; see Tunnel and Prefilter Rule Components, on page 1459.

You can use predefined network objects to build tunnel endpoint conditions, or manually specify individual IP addresses or address blocks.
The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

**Configuring Tunnel Endpoint Conditions**

Tunnel endpoint conditions apply to Firepower Threat Defense devices only.

**Step 1** In the rule editor, click **Tunnel Endpoints**.

**Step 2** Find and choose the predefined networks you want to add from the **Available Tunnel Endpoints** list.

Because tunnel endpoints are simply the IP addresses of the routed interfaces of the network devices on either side of the tunnel, you can use network objects to build tunnel endpoint conditions.

**Step 3** Click **Add to Source** or **Add to Destination**, or drag and drop.

Tunnel rules are bidirectional by default so they can handle all traffic between the two endpoints. However, if you choose to **Match tunnels only from source**, the tunnel rule matches source-to-destination traffic only.

**Step 4** Add endpoints that you want to specify manually. Enter a source or destination IP address or address block, then click **Add**.

**Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

**Step 5** Save or continue editing the rule.

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes, on page 382**.

**VLAN Conditions**

VLAN rule conditions control VLAN-tagged traffic, including Q-in-Q (stacked VLAN) traffic. The system uses the innermost VLAN tag to filter VLAN traffic, with the exception of the prefilter policy, which uses the outermost VLAN tag in its rules.

Note the following Q-in-Q support:

- NGIPSv, Firepower 7000, Firepower 8000—Supports Q-in-Q for all interface types.
- ASA FirePOWER module—Does not support Q-in-Q (supports only one VLAN tag).
- FTD on Firepower 4100/9300—Does not support Q-in-Q (supports only one VLAN tag).
- FTD on all other models:
  - Inline sets and passive interfaces—Supports Q-in-Q, up to 2 VLAN tags.
• Firewall interfaces—Does not support Q-in-Q (supports only one VLAN tag).

You can use predefined objects to build VLAN conditions, or manually enter any VLAN tag from 1 to 4094. Use a hyphen to specify a range of VLAN tags.

You can specify a maximum of 50 VLAN conditions.

---

**Note**

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal VLAN tags to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

---

**Rules with VLAN Conditions**

The following rule types support VLAN conditions:

- Access control

  ---

  **Note**
  
  For FTD, VLAN tags in access rules only apply to inline sets; they cannot be used in access rules applied to firewall interfaces.

- Tunnel and prefilter (uses outermost VLAN tag)
- SSL
- DNS
- Identity
- Network analysis

---

**Port and ICMP Code Conditions**

Port conditions allow you to control traffic by its source and destination ports. Depending on the rule type, “port” can represent any of the following:

- TCP and UDP—You can control TCP and UDP traffic based on the transport layer protocol. The system represents this configuration using the protocol number in parentheses, plus an optional associated port or port range. For example: TCP(6)/22.
- ICMP—You can control ICMP and ICMPv6 (IPv6-ICMP) traffic based on its internet layer protocol plus an optional type and code. For example: ICMP(1):3:3.
- No port—You can control traffic using other protocols that do not use ports.

Leave matching criteria empty whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against every combination of the contents of the criteria you specify.
Best Practices for Port-Based Rules

Specifying ports is the traditional way to target applications. However, applications can be configured to use unique ports to bypass access control blocks. Thus, whenever possible, use application filtering criteria rather than port criteria to target traffic.

Application filtering is also recommended for applications, like FTD, that open separate channels dynamically for control vs. data flow. Using port-based access control rules can prevent these kinds of applications from performing correctly, and could result in blocking desirable connections.

Using Source and Destination Port Constraints

If you add both source and destination port constraints, you can only add ports that share a single transport protocol (TCP or UDP). For example, if you add DNS over TCP as a source port, you can add Yahoo Messenger Voice Chat (TCP) as a destination port but not Yahoo Messenger Voice Chat (UDP).

If you add only source ports or only destination ports, you can add ports that use different transport protocols. For example, you can add both DNS over TCP and DNS over UDP as source port conditions in a single access control rule.

Matching Non-TCP Traffic with Port Conditions

Although you can configure port conditions to match non-TCP traffic, there are some restrictions:

- Access control rules—For Classic devices, you can match GRE-encapsulated traffic with an access control rule by using the GRE (47) protocol as a destination port condition. To a GRE-constrained rule, you can add only network-based conditions: zone, IP address, port, and VLAN tag. Also, the system uses outer headers to match all traffic in access control policies with GRE-constrained rules. For Firepower Threat Defense devices, use tunnel rules in the prefilter policy to control GRE-encapsulated traffic.

- SSL rules—SSL rules support TCP port conditions only.

  
  Caution
  Adding the first or removing the last active authentication rule when SSL decryption is disabled (that is, when the access control policy does not include an SSL policy) restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 for more information.

  Note that an active authentication rule has either an Active Authentication rule action, or a Passive Authentication rule action with Use active authentication if passive or VPN identity cannot be established selected.

  - IMCP echo—A destination ICMP port with the type set to 0 or a destination ICMPv6 port with the type set to 129 only matches unsolicited echo replies. ICMP echo replies sent in response to ICMP echo requests are ignored. For a rule to match on any ICMP echo, use ICMP type 8 or ICMPv6 type 128.

Rules with Port Conditions

The following rules support port conditions:

- Access control
• Prefilter
• SSL (supports TCP traffic only)
• Identity (active authentication supports TCP traffic only)
• QoS

Configuring Port Conditions

Step 1  In the rule editor, click **Ports**.
Step 2  Find and choose the predefined ports you want to add from the **Available Ports** list.
Step 3  Click **Add to Source** or **Add to Destination**, or drag and drop.
Step 4  Add any source or destination ports that you want to specify manually:
  • Source—Choose a **Protocol**, enter a single **Port** from 0 to 65535, and click **Add**.
  • Destination (non-ICMP)—Choose or enter a **Protocol**. If you do not want to specify a protocol, or if you choose **TCP** or **UDP**, enter a single **Port** from 0 to 65535. Click **Add**.
  • Destination (ICMP)—Choose **ICMP** or **IPv6-ICMP** from the **Protocol** drop down list, then choose a **Type** and related **Code** in the pop-up window that appears. For more information on ICMP types and codes, see the Internet Assigned Numbers Authority (IANA) website.

Step 5  Save or continue editing the rule.

What to do next
  • Deploy configuration changes; see Deploy Configuration Changes, on page 382.

Encapsulation Conditions

Encapsulation conditions are specific to tunnel rules.

These conditions control certain types of plaintext, passthrough tunnels by their encapsulation protocol. You must choose at least one protocol to match before you can save the rule. You can choose:
  • GRE (47)
  • IP-in-IP (4)
  • IPv6-in-IP (41)
  • Teredo (UDP (17)/3455)

Application Conditions (Application Control)

When the system analyzes IP traffic, it can identify and classify the commonly used applications on your network. This discovery-based application awareness is the basis for application control—the ability to control application traffic.
System-provided application filters help you perform application control by organizing applications according to basic characteristics: type, risk, business relevance, category, and tags. You can create reusable user-defined filters based on combinations of the system-provided filters, or on custom combinations of applications.

At least one detector must be enabled for each application rule condition in the policy. If no detector is enabled for an application, the system automatically enables all system-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application. For more information about application detectors, see Application Detector Fundamentals, on page 2086.

You can use both application filters and individually specified applications to ensure complete coverage. However, understand the following note before you order your access control rules.

As part of application control, you can also use access control rules to enforce content restriction (such as Safe Search and YouTube EDU).

---

**Caution**

Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use specific conditions (such as networks and IP addresses) should be ordered before rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this Wikipedia article.

**Benefits of Application Filters**

Application filters help you quickly configure application control. For example, you can easily use system-provided filters to create an access control rule that identifies and blocks all high risk, low business relevance applications. If a user attempts to use one of those applications, the system blocks the session.

Using application filters simplifies policy creation and administration. It assures you that the system controls application traffic as expected. Because Cisco frequently updates and adds application detectors via system and vulnerability database (VDB) updates, you can ensure that the system uses up-to-date detectors to monitor application traffic. You can also create your own detectors and assign characteristics to the applications they detect, automatically adding them to existing filters.

**Configurations with Application Conditions**

The configurations in the following table help you perform application control. The table also shows how you can constrain application control, depending on the configuration.

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Type, Risk, Relevance, Category</th>
<th>Tags</th>
<th>User-Defined Filters</th>
<th>Content Restriction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access control rules</td>
<td>yes</td>
<td>yes</td>
<td>yes</td>
<td>yes</td>
</tr>
</tbody>
</table>
### Configuring Application Conditions and Filters

To build an application condition or filter, choose the applications whose traffic you want to control from a list of available applications. Optionally (and recommended), constrain the available applications using filters. You can use filters and individually specified applications in the same condition.

#### Before you begin
- Adaptive profiling **must** be enabled (its default state) as described in Configuring Adaptive Profiles, on page 2022 for access control rules to perform application control.
- For Classic device models, you must have the Control license to configure these conditions.

#### Step 1
Invoke the rule or configuration editor:
- Access control, SSL, QoS rule condition—In the rule editor, click **Applications**.
- Identity rule condition—In the rule editor, click **Realms & Settings** and enable active authentication; see Create an Identity Rule, on page 2165.
- Application filter—On the Application Filters page of the object manager, add or edit an application filter. Provide a unique **Name** for the filter.
- Intelligent Application Bypass (IAB)—In the access control policy editor, click **Advanced**, edit IAB settings, then click **Bypassable Applications and Filters**.
Step 2  (Optional) For an access control rule, enable content restriction features by clicking dimmed for Safe search (✓) or YouTube EDU (✓) and setting related options.

For additional configuration requirements, see Using Access Control Rules to Enforce Content Restriction, on page 1479.

In most cases, enabling content restriction populates the condition's Selected Applications and Filters list with the appropriate values. The system does not automatically populate the list if applications or filters related to content restriction are already present in the list when you enable content restriction.

Continue with the procedure to refine your application and filter selections, or skip to saving the rule.

Step 3  Find and choose the applications you want to add from the Available Applications list.

To constrain the applications displayed in Available Applications, choose one or more Application Filters or search for individual applications.

Tip  Click Information (✓) next to an application to display summary information and internet search links. Unlock marks applications that the system can identify only in decrypted traffic.

When you choose filters, singly or in combination, the Available Applications list updates to display only the applications that meet your criteria. You can choose system-provided filters in combination, but not user-defined filters.

- Multiple filters for the same characteristic (risk, business relevance, and so on)—Application traffic must match only one of the filters. For example, if you choose both the medium and high-risk filters, the Available Applications list displays all medium and high-risk applications.

- Filters for different application characteristics—Application traffic must match both filter types. For example, if you choose both the high-risk and low business relevance filters, the Available Applications list displays only applications that meet both criteria.

Step 4  Click Add to Rule, or drag and drop.

Tip  Before you add more filters and applications, click Clear Filters to clear your current choices.

The web interface lists filters added to a condition above and separately from individually added applications.

Step 5  Save or continue editing the rule or configuration.

Example: Application Condition in an Access Control Rule

The following graphic shows the application condition for an access control rule that blocks a user-defined application filter for MyCompany, all applications with high risk and low business relevance, gaming applications, and some individually selected applications.
Application Characteristics

The system characterizes each application that it detects using the criteria described in the following table. Use these characteristics as application filters.

Table 62: Application Characteristics

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Application protocols represent communications between hosts.</td>
<td>HTTP and SSH are application protocols. Web browsers and email clients are clients. MPEG video and Facebook are web applications.</td>
</tr>
<tr>
<td></td>
<td>Clients represent software running on a host.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Web applications represent the content or requested URL for HTTP traffic.</td>
<td></td>
</tr>
<tr>
<td>Risk</td>
<td>The likelihood that the application is being used for purposes that might be against your organization’s security policy.</td>
<td>Peer-to-peer applications tend to have a very high risk.</td>
</tr>
<tr>
<td>Business Relevance</td>
<td>The likelihood that the application is being used within the context of your organization’s business operations, as opposed to recreationally.</td>
<td>Gaming applications tend to have a very low business relevance.</td>
</tr>
<tr>
<td>Category</td>
<td>A general classification for the application that describes its most essential function. Each application belongs to at least one category.</td>
<td>Facebook is in the social networking category.</td>
</tr>
<tr>
<td>Tag</td>
<td>Additional information about the application. Applications can have any number of tags, including none.</td>
<td>Video streaming web applications often are tagged high bandwidth and displays ads.</td>
</tr>
</tbody>
</table>
Best Practices for Application Control

Keep in mind the following guidelines and limitations for application control:

**Ensuring that Adaptive Profiling is Enabled**
If adaptive profiling is not enabled (its default state), access control rules cannot perform application control.

**Automatically Enabling Application Detectors**
If no detector is enabled for an application you want to detect, the system automatically enables all system-provided detectors for the application. If none exist, the system enables the most recently modified user-defined detector for the application.

**Configure Your Policy to Examine the Packets That Must Pass Before an Application Is Identified**
The system cannot perform application control, including Intelligent Application Bypass (IAB) and rate limiting, before *both* of the following occur:

- A monitored connection is established between a client and server
- The system identifies the application in the session

This identification should occur in 3 to 5 packets, or after the server certificate exchange in the SSL handshake if the traffic is encrypted.

*Important!* To ensure that your system examines these initial packets, see Specify a Policy to Handle Packets That Pass Before Traffic Identification, on page 1880.

If early traffic matches all other criteria but application identification is incomplete, the system allows the packet to pass and the connection to be established (or the SSL handshake to complete). After the system completes its identification, the system applies the appropriate action to the remaining session traffic.

**Create Separate Rules for URL and Application Filtering**
Create separate rules for URL and application filtering whenever possible, because combining application and URL criteria can lead to unexpected results, especially for encrypted traffic.

Rules that include both application and URL criteria should come after application-only or URL-only rules, unless the application+URL rule is acting as an exception to a more general application-only or URL-only rule.

**URL Rules Before Application and Other Rules**
For the most effective URL matching, place rules that include URL conditions before other rules, particularly if the URL rules are block rules and the other rules meet both of the following criteria:

- They include application conditions.
- The traffic to be inspected is encrypted.

**Application Control for Encrypted and Decrypted Traffic**
The system can identify and filter encrypted and decrypted traffic:
• Encrypted traffic—The system can detect application traffic encrypted with StartTLS, including SMTPS, POPS, FTPS, TelnetS, and IMAPS. In addition, it can identify certain encrypted applications based on the Server Name Indication in the TLS ClientHello message, or the subject distinguished name value from the server certificate. These applications are tagged SSL Protocol; in an SSL rule, you can choose only these applications. Applications without this tag can only be detected in unencrypted or decrypted traffic.

• Decrypted traffic—The system assigns the decrypted traffic tag to applications that the system can detect in decrypted traffic only, not encrypted or unencrypted.

**Exempting Applications from Active Authorization**

In an identity policy, you can exempt certain applications from active authentication, allowing traffic to continue to access control. These applications are tagged User-Agent Exclusion. In an identity rule, you can choose only these applications.

**Handling Application Traffic Packets Without Payloads**

When performing access control, the system applies the default policy action to packets that do not have a payload in a connection where an application is identified.

**Handling Referred Application Traffic**

To handle traffic referred by a web server, such as advertisement traffic, match the referred application rather than the referring application.

**Controlling Application Traffic That Uses Multiple Protocols (Skype, Zoho)**

Some applications use multiple protocols. To control their traffic, make sure your access control policy covers all relevant options. For example:

• Skype—To control Skype traffic, choose the Skype tag from the Application Filters list rather than selecting individual applications. This ensures that the system can detect and control all Skype traffic the same way.

• Zoho—To control Zoho mail, choose both Zoho and Zoho mail from the Available Application list.

**Search Engines Supported for Content Restriction Features**

The system supports Safe Search filtering for specific search engines only. The system assigns the safesearch supported tag to application traffic from these search engines.

**Controlling Evasive Application Traffic**

See Application-Specific Notes and Limitations, on page 420.

**Additional Guidelines for Rule Ordering for Application Control**

For guidelines about rule ordering for application control, see Best Practices for Configuring Application Control, on page 419.

**Related Topics**

  Inspection of Packets That Pass Before Traffic Is Identified, on page 1880
Special Considerations for Application Detection, on page 2089

**Best Practices for Configuring Application Control**

We recommend controlling applications' access to the network as follows:

- To allow or block application access from a less secure network to a more secure network: Use **Port** (Selected Destination Port) conditions on the access control rule

  For example, allow ICMP traffic from the internet (less secure) to an internal network (more secure.)

- To allow or block applications being accessed by user groups: Use **Application** conditions on the access control rule

  For example, block Facebook from being accessed by members of the Contractors group

---

⚠️ **Caution**

Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use *specific* conditions (such as networks and IP addresses) should be ordered *before* rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this [Wikipedia article](https://en.wikipedia.org/wiki/OSI_model).

The following table provides an example of how to set up your access control rules:

<table>
<thead>
<tr>
<th>Type of control</th>
<th>Action</th>
<th>Zones, Networks, VLAN Tags</th>
<th>Users</th>
<th>Applications</th>
<th>Ports</th>
<th>URLs</th>
<th>SGT/ISE Attributes</th>
<th>Inspection, Logging, Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application from more secure to less secure network when application uses a port (for example, SSH)</td>
<td>Your choice (Allow in this example)</td>
<td>Destination zones or networks using the outside interface</td>
<td>Any</td>
<td>Do not set</td>
<td>Available Ports: SSH Add to Selected Destination Ports</td>
<td>Any</td>
<td>Use only with ISE/ISE-PIC.</td>
<td>Any</td>
</tr>
<tr>
<td>Application from more secure to less secure network when application does not use a port (for example, ICMP)</td>
<td>Your choice (Allow in this example)</td>
<td>Destination zones or networks using the outside interface</td>
<td>Any</td>
<td>Do not set</td>
<td>Selected Destination Ports Protocol: ICMP Type: Any</td>
<td>Do not set</td>
<td>Use only with ISE/ISE-PIC.</td>
<td>Any</td>
</tr>
</tbody>
</table>
### Application-Specific Notes and Limitations

- **Office 365 Admin Portal:**
  
  Limitation: If the access policy has logging enabled at the beginning as well as at the end, the first packet will be detected as Office 365 and the end of connection will be detected as Office 365 Admin Portal. This should not affect blocking.

- **Skype:**

  See Best Practices for Application Control, on page 417

- **GoToMeeting**

  In order to fully detect GoToMeeting, your rule must include all of the following applications:
  - GoToMeeting
  - Citrix Online
  - Citrix GoToMeeting Platform
  - LogMeIn
  - STUN

- **Zoho:**

  See Best Practices for Application Control, on page 417

- **Evasive applications such as Bittorrent, Tor, Psiphon, and Ultrasurf:**

  For evasive applications, only the highest-confidence scenarios are detected by default. If you need to take action on this traffic (such as block or implement QoS), it may be necessary to configure more aggressive detection with better effectiveness. To do this, contact TAC to review your configurations as these changes may result in false positives.

- **WeChat:**

  It is not possible to selectively block WeChat Media if you allow WeChat.

### Troubleshoot Application Control Rules

If your application control rules don't function as you expect, use the guidelines discussed in this section.

We recommend controlling applications' access to the network as follows:
• To allow or block application access from a less secure network to a more secure network: Use **Port** (Selected Destination Port) conditions on the access control rule

For example, allow ICMP traffic from the internet (less secure) to an internal network (more secure.)

• To allow or block applications being accessed by user groups: Use **Application** conditions on the access control rule

For example, block Facebook from being accessed by members of the Contractors group

---

**Caution**

Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use **specific** conditions (such as networks and IP addresses) should be ordered **before** rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this [Wikipedia article](https://en.wikipedia.org/wiki/Open_Systems_Interconnect).

The following table provides an example of how to set up your access control rules:

<table>
<thead>
<tr>
<th>Type of control</th>
<th>Action</th>
<th>Zones, Networks, VLAN Tags</th>
<th>Users</th>
<th>Applications</th>
<th>Ports</th>
<th>URLs</th>
<th>SGT/ISE Attributes</th>
<th>Inspection, Logging, Comments</th>
</tr>
</thead>
<tbody>

<td>Your choice <em>(Allow in this example)</em></td>
<td>Destination zones or networks using the outside interface</td>
<td>Any</td>
<td>Do not set</td>
<td>Selected Destination Ports Protocol: ICMP Type: Any</td>
<td>Do not set</td>
<td>Use only with ISE/ISE-PIC.</td>
<td>Any</td>
</tr>
</tbody>
</table>
URL Conditions (URL Filtering)

Use URL conditions to control the websites that users on your network can access.

For complete information, see URL Filtering, on page 1409.

User, Realm, and ISE Attribute Conditions (User Control)

You can perform user control with the authoritative user identity data collected by the Firepower System.

Identity sources monitor users as they log in and out, or as they authenticate using Microsoft Active Directory (AD) or LDAP credentials. You can then configure rules that use this collected identity data to handle traffic based on the logged-in authoritative user associated with a monitored host. A user remains associated with a host until the user logs off (as reported by an identity source), a realm times out the session, or you delete the user data from the system's database.

For information on the authoritative user identity sources supported in your version of the Firepower System, see About User Identity Sources, on page 2036.

You can use the following rule conditions to perform user control:

- User and realm conditions—Match traffic based on the logged-in authoritative user of a host. You can control traffic based on realms, individual users, or the groups those users belong to.
- ISE attribute conditions—Match traffic based on a user's ISE-assigned Security Group Tag (SGT), Device Type (also referred to as Endpoint Profile), or Location IP (also referred to as Endpoint Location). Requires that you configure ISE as an identity source.

Note

The ISE-PIC identity source does not provide ISE attribute data.
In some rules, custom SGT conditions can match traffic tagged with SGT attributes that were not assigned by ISE. This is not considered user control, and only works if you are not using ISE as an identity source; see Custom SGT Conditions, on page 427.

### Rules with User Conditions

- The Captive Portal Identity Source, on page 2137

### User Control Prerequisites

#### Configure Identity Sources/Authentication Methods

Configure identity sources for the types of authentication you want to perform. For more information, see About User Identity Sources, on page 2036.

If you configure an ISE/ISE/PIC, user agent, or TS Agent device to monitor a large number of user groups, or if you have a very large number of users mapped to hosts on your network, the system may drop user mappings based on groups, due to your Firepower Management Center user limit. As a result, rules with realm, user, or user group conditions may not match traffic as expected.

#### Configure Realms

Configure a realm for each AD or LDAP server you want to monitor, including your ISE/ISE-PIC, User Agent, and TS Agent servers, and perform a user download. For more information, see Create a Realm, on page 2107.

If you are configuring an ISE SGT attribute rule condition, configuring a realm is optional. The ISE SGT attribute rule condition can be configured in policies with or without an associated identity policy (where realms are invoked).

When you configure a realm, you specify the users and user groups whose activity you want to monitor. Including a user group automatically includes all of that group’s members, including members of any secondary groups. However, if you want to use the secondary group as a rule criterion, you must explicitly include the secondary group in the realm configuration.
For each realm, you can enable automatic download of user data to refresh authoritative data for users and user groups.

**Create Identity Policies**
Create an identity policy to associate the realm with an authentication method, and associate that policy with access control. For more information, see Create an Identity Policy, on page 2168.

Policies that perform user control on a device (access control, SSL, QoS) share an identity policy. That identity policy determines the realms, users, and groups that you can use in rules affecting traffic on those devices.

Before you configure a user condition in a QoS rule, you must make sure the devices targeted by the QoS policy are using the correct identity policy, as defined in the access control policy deployed to the devices. Because the QoS policy and access control policy deployed to the same device are not explicitly linked, the QoS rule editor can allow you to choose invalid realms, users, and groups. These invalid elements are those from identity policies that exist on the Firepower Management Center, but that are not applied to the QoS-targeted devices. If you use these elements, the system cannot determine that you made an invalid choice until deploy-time.

**Configuring User and Realm Conditions**

You can constrain a rule by realm, or by users and user groups within that realm.

**Before you begin**
- Fulfill the user control prerequisites described in User, Realm, and ISE Attribute Conditions (User Control), on page 422.
- For Classic device models, you must have the Control license to configure these conditions.

**Step 1**
In the rule editor, click **Users**.

**Step 2**
(Optional) Find and choose the realm you want to use from the **Available Realms**.

**Step 3**
(Optional) Further constrain the rule by choosing users and groups from the **Available Users** list.

**Step 4**
Click **Add to Rule**, or drag and drop.

**Step 5**
Save or continue editing the rule.

**What to do next**
- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

**Configuring ISE Attribute Conditions**

**Before you begin**
- Fulfill the user control prerequisites described in User, Realm, and ISE Attribute Conditions (User Control), on page 422.
- For Classic device models, you must have the Control license to configure these conditions.
Step 1  In the rule editor, click the following for ISE attribute conditions:
  • Access control—Click **SGT/ISE Attributes**.

You can use ISE-assigned Security Group Tags (SGTs) to constrain ISE attribute conditions. To use custom SGTs in access control rules, see **Custom SGT Conditions**, on page 427.

Step 2  Find and choose the ISE attributes you want to use from the **Available Attributes** list:
  • Security Group Tag (SGT)
  • Device Type (also referred to as Endpoint Profile)
  • QoS—Click **ISE Attributes**.
  • Location IP (also referred to as Endpoint Location)

Step 3  Further constrain the rule by choosing attribute metadata from the **Available Metadata** list. Or, keep the default: **any**.

Step 4  Click **Add to Rule**, or drag and drop.

Step 5  (Optional) Constrain the rule with an IP address in the **Add a Location IP Address** field, then click **Add**.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

Step 6  Save or continue editing the rule.

---

**What to do next**
- Deploy configuration changes; see **Deploy Configuration Changes**, on page 382.

**Troubleshoot User Control**

If you notice unexpected user rule behavior, consider tuning your rule, identity source, or realm configurations. For other related troubleshooting information, see:
- **Troubleshoot the User Agent Identity Source**, on page 2161
- **Troubleshoot the ISE/ISE-PIC or Cisco TrustSec Issues**, on page 2134
- **Troubleshoot the TS Agent Identity Source**, on page 2156
- **Troubleshoot the Captive Portal Identity Source**, on page 2148
- **Troubleshoot Realms and User Downloads**, on page 2119

**Rules targeting realms, users, or user groups are not matching traffic**

If you configure a TS Agent, user agent, or ISE/ISE-PIC device to monitor a large number of user groups, or if you have a very large number of users mapped to hosts on your network, the system may drop user records due to your Firepower Management Center user limit. As a result, rules with user conditions may not match traffic as expected.
**Rules targeting user groups or users within user groups are not matching traffic as expected**

If you configure a rule with a user group condition, your LDAP or Active Directory server must have user groups configured. The system cannot perform user group control if the server organizes the users in basic object hierarchy.

**Rules targeting users in secondary groups are not matching traffic as expected**

If you configure a rule with a user group condition that includes or excludes users who are members of a secondary group on your Active Directory server, your server may be limiting the number of users it reports.

By default, Active Directory servers limit the number of users they report from secondary groups. You must customize this limit so that all of the users in your secondary groups are reported to the Firepower Management Center and eligible for use in rules with user conditions.

**Rules are not matching users when seen for the first time**

After the system detects activity from a previously-unseen user, the system retrieves information about them from the server. Until the system successfully retrieves this information, activity seen by this user is not handled by matching rules. Instead, the user session is handled by the next rule it matches (or the policy's default action, if applicable).

For example, this might explain when:

- Users who are members of user groups are not matching rules with user group conditions.
- Users who were reported by a TS Agent, user agent, or ISE/ISE-PIC device are not matching rules, when the server used for user data retrieval is an Active Directory server.

Note that this might also cause the system to delay the display of user data in event views and analysis tools.

**Rules are not matching all ISE users**

This is expected behavior. You can perform user control on ISE users who were authenticated by an Active Directory domain controller. You cannot perform user control on ISE users who were authenticated by an LDAP, RADIUS, or RSA domain controller.

**Rules are not matching all ISE/ISE-PIC users**

This is expected behavior. You can perform user control on ISE/ISE-PIC users who were authenticated by an Active Directory domain controller. You cannot perform user control on ISE/ISE-PIC users who were authenticated by an LDAP, RADIUS, or RSA domain controller.

**Users and groups using too much memory**

If processing users and groups is using too much memory, messages similar to the following are displayed in `/var/log/messages`:

```
UserGroup [WARN] User/Group mem usage is above 80 percent
```

Another message displays the percentage of memory used by users and groups.

If these messages persist, you have the following options:

- Limit the users processed by your access control policy.
- Upgrade your managed device to a model with more memory.
External Attributes Conditions

External attributes include the following:

- Dynamic objects
- SGT objects
- Location IP objects
- Device type objects
- Endpoint profile objects

External attributes can be used as source criteria and destination criteria in access control rules. Use the following guidelines:

- Objects of different types are ANDed together
- Objects of a similar type are ORed together

For example, if you choose source destination criteria SGT 1, SGT 2, and device type 1; the rule is matched if device type 1 is detected on either SGT 1 or SGT 2.

Related Topics
 Configure External Attributes Conditions

Custom SGT Conditions

If you do not configure ISE/ISE-PIC as an identity source, you can control traffic using Security Group Tags (SGTs) that were not assigned by ISE. SGTs specify the privileges of traffic sources within a trusted network.

Custom SGT rule conditions use manually created SGT objects to filter traffic, rather than ISE SGTs obtained from the system's connection to an ISE server. These manually created SGT objects correspond to the SGT attributes on the traffic you want to control. Controlling traffic using custom SGTs is not considered user control.

Rules with Custom SGT Conditions

The following rules support custom SGT conditions:

- Access control
- QoS

ISE SGT vs Custom SGT Rule Conditions

Some rules allow you to control traffic based on assigned SGT. Depending on the rule type and your identity source configuration, you can use either ISE-assigned SGTs or custom SGTs to match traffic with assigned SGT attributes.

Note

If you use ISE SGTs to match traffic, even if a packet does not have an assigned SGT attribute, the packet still matches an ISE SGT rule if the SGT associated with the packet's source IP address is known in ISE.
Autotransition from Custom SGTs to ISE SGTs

If you create rules that match custom SGTs, then configure ISE/ISE-PIC as an identity source, the system:

- Disables Security Group Tag options in the object manager. Although the system retains existing SGT objects, you cannot modify them or add new ones.
- Retains existing rules with custom SGT conditions. However, these rules do not match traffic. You also cannot add additional custom SGT criteria to existing rules, or create new rules with custom SGT conditions.

If you configure ISE, Cisco recommends that you delete or disable existing rules with custom SGT conditions. Instead, use ISE attribute conditions to match traffic with SGT attributes.

Configuring Custom SGT Conditions

The following procedure describes how to filter traffic tagged with SGT attributes that were not assigned by ISE. This is not considered user control, and only works if you are not using ISE/ISE-PIC as an identity source; see ISE SGT vs Custom SGT Rule Conditions, on page 427.

### Before you begin

- Disable ISE/ISE-PIC connections. Custom SGT matching does not work if you use ISE/ISE-PIC as an identity source.
- Configure Security Group Tag objects that correspond with the SGTs you want to match; see Creating Security Group Tag Objects, on page 447.
- For Classic device models, you must have the Control license to configure these conditions.

### Step 1
In the rule editor, click SGT/ISE Attributes.

### Step 2
Choose Security Group Tag from the Available Attributes list.

### Step 3
In the Available Metadata list, find and choose a custom SGT object.

If you choose Any, the rule matches all traffic with an SGT attribute. For example, you might choose this value if you want an access control rule to block traffic from hosts that are not configured for TrustSec.

### Step 4
Click Add to Rule, or drag and drop.
Step 5 Save or continue editing the rule.

What to do next
- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

Troubleshooting Custom SGT Conditions
If you notice unexpected rule behavior, consider tuning your custom SGT object configuration.

Security Group Tag objects unavailable
Custom SGT objects are only available if you do not configure ISE/ISE-PIC as an identity source. For more information, see Autotransition from Custom SGTs to ISE SGTs, on page 428.

Searching for Rules
In many policies, you can search for and within rules. The system matches your input to rule names and condition values, including objects and object groups.
You cannot search for values in a Security Intelligence or URL list or feed.

Step 1 In the policy editor, click Rules.
Step 2 Click Search Rules, enter a complete or partial search string, then press Enter.
The matching value is highlighted for each matching rule. A status message displays the current match and the total number of matches.
Step 3 View the rules you are interested in.
To navigate between matching rules, click Next-Match or Previous-Match.

What to do next
- Before you begin a new search, click Clear (×) to clear the search and any highlighting.

Filtering Rules by Device
Some policy editors allow you to filter your rule view by affected devices.
Filter by device only works for rules that use zones or interface groups. (Otherwise a rule applies to all devices.)
The system uses a rule's interface constraints to determine if the rule affects a device. If you constrain a rule by interface (security zone or interface group condition), the device where that interface is located is affected by that rule. Rules with no interface constraint apply to any interface, and therefore every device.
QoS rules are always constrained by interface.
**Identify Rules with Issues**

The system will flag each rule that will prevent deploy (these are marked with a red icon) or that will never match traffic because another rule above it in the rule order will match instead (these are marked with a yellow icon).

---

**Important**
The system does not flag rules that partially match other rules, which may also prevent some subsequent rules from matching.

---

**Step 1**  
Select **Policies > Access Control > Access Control**.

**Step 2**  
Click a policy name.

**Step 3**  
Do one or both of the following:

- Look for **Show Warnings** near the top of the window.
  
  If the system has not identified issues, this button will not appear.
  
  If there are issues, click this button to open a list of all rules with issues.
  
  To see all issues, click both tabs (Rule Errors and Rule Warnings).
  
  To locate a rule in the table of rules below, click the rule name in the error or warnings list.

- Select the **Show Rule Conflicts** check box.
  
  This will indicate each problem rule in the list with an Error (red) or Warning (yellow).
  
  If necessary, scroll down to see all rules in the policy.

---

**Related Topics**

- Create and Edit Access Control Rules, on page 1400
- Configure Prefiltering, on page 1457
- Configuring QoS Rules, on page 722
- Configure NAT for Threat Defense, on page 1201
Step 4  To view issue details, hover your pointer over the icon.
Step 5  Look for duplications that are not flagged because they are only partial matches and address them.
Step 6  If you make changes, you must click **Save** or deselect and reselect **Show Rule Conflicts** to evaluate the changed rules for conflicts.

What to do next
- Address any issues you see by removing or modifying the problematic rule.
- Examine your SSL and QoS policies for similar errors and warnings and address those issues.

## Rule and Other Policy Warnings

Policy and rule editors use icons to mark configurations that could adversely affect traffic analysis and flow. Depending on the issue, the system may warn you when you deploy or prevent you from deploying entirely.

### Tip
Hover your pointer over an icon to read the warning, error, or informational text.

### Table 63: Policy Error Icons

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Errors (.ReportingError) error</td>
<td>If a rule or configuration has an error, you cannot deploy until you correct the issue, even if you disable any affected rules.</td>
<td>A rule that performs category and reputation-based URL filtering is valid until you target a device that does not have a URL Filtering license. At that point, an error icon appears next to the rule, and you cannot deploy until you edit or delete the rule, retarget the policy, or enable the license.</td>
</tr>
<tr>
<td>Warning (.ReportingWarning) warning</td>
<td>You can deploy a policy that displays rule or other warnings. However, misconfigurations marked with warnings have no effect. If you disable a rule with a warning, the warning icon disappears. It reappears if you enable the rule without correcting the underlying issue.</td>
<td>Preempted rules or rules that cannot match traffic due to misconfiguration have no effect. This includes conditions using empty object groups, application filters that match no applications, excluded LDAP users, invalid ports, and so on. However, if a warning icon marks a licensing error or model mismatch, you cannot deploy until you correct the issue.</td>
</tr>
<tr>
<td>Information (.ReportingInformation) information</td>
<td>Information icons convey helpful information about configurations that may affect the flow of traffic. These issues do not prevent you from deploying.</td>
<td>With application control, the system might skip matching the first few packets of a connection against some rules, until the system identifies the application or web traffic in that connection. This allows connections to be established so that applications and HTTP requests can be identified.</td>
</tr>

Introduction to Reusable Objects

For increased flexibility and web interface ease-of-use, the Firepower System uses named objects, which are reusable configurations that associate a name with a value. When you want to use that value, use the named object instead. The system supports object use in various places in the web interface, including many policies and rules, event searches, reports, dashboards, and so on. The system provides many predefined objects that represent frequently used configurations.

Use the object manager to create and manage objects. Many configurations that use objects also allow you to create objects on the fly, as needed. You can also use the object manager to:

- View the policies, settings, and other objects where a network, port, VLAN, or URL object is used; see Viewing Objects and Their Usage, on page 437.
- Group objects to reference multiple objects with a single configuration; see Object Groups, on page 438.
- Override object values for selected devices or, in a multidomain deployment, selected domains; see Object Overrides, on page 439.

After you edit an object used in an active policy, you must redeploy the changed configuration for your changes to take effect. You cannot delete an object that is in use by an active policy.

An object is configured on a managed device if, and only if, the object is used in a policy that is assigned to that device. If you remove an object from all policies assigned to a given device, the object is also removed from the device configuration on the next deployment, and subsequent changes to the object are not reflected in the device configuration.

Object Types

The following table lists the objects you can create in the Firepower System, and indicates whether each object type can be grouped or configured to allow overrides.

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Groupable?</th>
<th>Allows Overrides?</th>
</tr>

**Objects and Multitenancy**

In a multidomain deployment, you can create objects in Global and descendant domains with the exception of Security Group Tag (SGT) objects, which you can create only in the Global domain. The system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which you cannot edit, with the exception of security zones and interface groups.
Because security zones and interface groups are tied to device interfaces, which you configure at the leaf level, administrators in descendant domains can view and edit zones and groups created in ancestor domains. Subdomain users can add and delete interfaces from ancestor zones and groups, but cannot delete or rename the zones/groups.

Object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

For objects that support grouping, you can group objects in the current domain with objects inherited from ancestor domains.

Object overrides allow you to define device-specific or domain-specific values for certain types of object, including network, port, VLAN tag, and URL. In a multidomain deployment, you can define a default value for an object in an ancestor domain, but allow administrators in descendant domains to add override values for that object.

The Object Manager

You can use the object manager to create and manage objects and object groups.

The object manager displays 20 objects or groups per page. If you have more than 20 of any type of object or group, use the navigation links at the bottom of the page to view additional pages. You can also go to a specific page or click Refresh to refresh your view.

By default, the page lists objects and groups alphabetically by name. You can filter the objects on the page by name or value.

Editing Objects

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Step 1
Choose Objects > Object Management.

Step 2
Choose an object type from the list; see Introduction to Reusable Objects, on page 434.

Step 3
Click Edit (-pencil) next to the object you want to edit.

If View (-eye) appears instead, the object belongs to an ancestor domain and has been configured not to allow overrides, or you do not have permission to modify the object.

Step 4
Modify the object settings as desired.

Step 5
If you are editing a variable set, manage the variables in the set; see Managing Variables, on page 465.

Step 6
For objects that can be configured to allow overrides:

• If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 441. You can change this setting only for objects that belong to the current domain.
• If you want to add override values to this object, expand the Override section and click Add; see Adding Object Overrides, on page 441.

Step 7 Click Save.

Step 8 If you are editing a variable set, and that set is in use by an access control policy, click Yes to confirm that you want to save your changes.

What to do next
• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Viewing Objects and Their Usage

You can view usage details of objects on the Object Management page. The network, port, VLAN, and URL object types are the only object types that provide this functionality.

Note In a multidomain deployment, you can view objects from any other domain. However, to find usage of objects in a descendant domain, switch to that domain.

Step 1 Choose Objects > Object Management.

Step 2 Choose one of the following object types:
  • Network
  • Port
  • VLAN Tag
  • URL

Step 3 Click Find Usage (_find) next to the object.

The Object Usage window displays a list of all the policies, objects, and other settings where the object is in use. Click any of the listed items to know more about the object usage. For policies and some other settings where the object is used, you can click the corresponding links to visit the respective UI pages.

Filtering Objects or Object Groups

In a multidomain deployment, the system displays objects created in the current and ancestor domains, which you can filter.

Step 1 Choose Objects > Object Management.
Step 2 Enter your filter criteria in the Filter field. The page updates as you type to display matching items.
You can use the following wildcards:
  - The asterisk (*) matches zero or more occurrences of a character.
  - The caret (^) matches content at the beginning of a string.
  - The dollar sign ($) matches content at the end of a string.

Step 3 Check the Show Unused Object check box to view the objects and the object groups that are unused anywhere in the system.

Note
  - In case an object is a part of an unused object group, the object is considered as used. However, the unused object group is displayed when the Show Unused Object check box is checked.
  - The Show Unused Object check box is available only for network, port, URL and VLAN tag object types.

Object Groups

Grouping objects allows you to reference multiple objects with a single configuration. The system allows you to use objects and object groups interchangeably in the web interface. For example, anywhere you would use a port object, you can also use a port object group.

You can group network, port, VLAN tag, URL, and PKI objects. Network object groups can be nested, that is, you can add a network object group to another network object group up to 10 levels.

Objects and object groups of the same type cannot have the same name. In a multidomain deployment, the names of object groups must be unique within the domain hierarchy. Note that the system may identify a conflict with the name of an object group you cannot view in your current domain.

When you edit an object group used in a policy (for example, a network object group used in an access control policy), you must re-deploy the changed configuration for your changes to take effect.

Deleting a group does not delete the objects in the group, just their association with each other. Additionally, you cannot delete a group that is in use in an active policy. For example, you cannot delete a VLAN tag group that you are using in a VLAN condition in a saved access control policy.

Grouping Reusable Objects

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

You can group objects in the current domain with objects inherited from ancestor domains.

Step 1 Choose Objects > Object Management.
Step 2 If the object type you want to group is Network, Port, URL, or VLAN Tag:
  a) Choose the object type from the list of object types.
  b) Choose Add Group from the Add [Object Type] drop-down list.
Step 3  If the object type you want to group is **Distinguished Name**:
a) Expand the **Distinguished Name** node.
b) Choose **Object Groups**.
c) Click **Add Distinguished Name Group**.

Step 4  If the object type you want to group is **PKI**:
a) Expand the **PKI** node.
b) Choose one of the following:
   • **Internal CA Groups**
   • **Trusted CA Groups**
   • **Internal Cert Groups**
   • **External Cert Groups**
c) Click **Add [Object Type] Group**.

Step 5  Enter a unique **Name**.

Step 6  Choose one or more objects from the list, and click **Add**.
You can also:
   • Use the filter field **Search** (％) to search for existing objects to include, which updates as you type to display matching items. Click **Reload** (🗂) above the search field or click **Clear** (×) in the search field to clear the search string.
   • Click **Add** (➕) to create objects on the fly if no existing objects meet your needs.

Step 7  Optionally for **Network**, **Port**, **URL**, and **VLAN Tag** groups:
   • Enter a **Description**.
   • Check the **Allow Overrides** check box to allow overrides for this object group; see **Allowing Object Overrides**, on page 441.

Step 8  Click **Save**.

---

**What to do next**

• If an active policy references your object group, deploy configuration changes; see **Deploy Configuration Changes**, on page 382.

---

**Object Overrides**

An object override allows you to define an alternate value for an object, which the system uses for the devices you specify.

You can create an object whose definition works for most devices, and then use overrides to specify modifications to the object for the few devices that need different definitions. You can also create an object that needs to be overridden for all devices, but its use allows you to create a single policy for all devices. Object overrides allow you to create a smaller set of shared policies for use across devices without giving up the ability to alter policies when needed for individual devices.
For example, you might want to deny ICMP traffic to the different departments in your company, each of which is connected to a different network. You can do this by defining an access control policy with a rule that includes a network object called Departmental Network. By allowing overrides for this object, you can then create overrides on each relevant device that specifies the actual network where that device is connected.

In a multidomain deployment, you can define a default value for an object in an ancestor domain and allow administrators in descendant domains to add override values for that object. For example, a managed security service provider (MSSP) might use a single Firepower Management Center to manage network security for multiple customers. Administrators at the MSSP can define an object in the Global domain for use in all customers' deployments. Administrators for each customer can log into descendant domains to override that object for their organizations. These local administrators cannot view or affect the override values of other customers of the MSSP.

You can target an object override to a specific domain. In this case, the system uses the object override value for all devices in the targeted domain unless you override it at the device level.

From the object manager, you can choose an object that can be overridden and define a list of device-level or domain-level overrides for that object.

You can use object overrides with the following object types only:

- Network
- Port
- VLAN tag
- URL
- SLA Monitor
- Prefix List
- Route Map
- Access List
- AS Path
- Community List
- Policy List
- PKI Enrollment
- Key Chain

If you can override an object, the Override column appears for the object type in the object manager. Possible values for this column include:

- Green checkmark — indicates that you can create overrides for the object and no overrides have been added yet
- Red X — indicates that you cannot create overrides for the object
- Number — represents a count of the overrides that have been added to that object (for example, "2" indicates two overrides have been added)
Managing Object Overrides

Step 1  Choose Objects > Object Management.
Step 2  Choose from the list of object types; see Introduction to Reusable Objects, on page 434.
Step 3  Click Edit (Edit) next to the object you want to edit.

If View (View) appears instead, the object belongs to an ancestor domain and has been configured not to allow overrides, or you do not have permission to modify the object.

Step 4  Manage the object overrides:
  • Add—Add object overrides; see Adding Object Overrides, on page 441.
  • Allow—Allow object overrides; see Allowing Object Overrides, on page 441.
  • Delete—In the object editor, click Delete (Trash Can) next to the override you want to remove.
  • Edit—Edit object overrides; see Editing Object Overrides, on page 442.

Allowing Object Overrides

Step 1  In the object editor, check the Allow Overrides check box.
Step 2  Click Save.

What to do next
Add object override values; see Adding Object Overrides, on page 441.

Adding Object Overrides

Before you begin
Allow object overrides; see Allowing Object Overrides, on page 441.

Step 1  In the object editor, expand the Override section.
Step 2  Click Add.
Step 3  On Targets, choose domains or devices in the Available Devices and Domains list and click Add.
Step 4  On the Override tab, enter a Name.
Step 5  Optionally, enter a Description.
Step 6  Enter an override value.

Example:
For a network object, enter a network value.

Step 7  Click Add.
Step 8  Click Save.

What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Editing Object Overrides

You can modify the description and the value of an existing override, but you cannot modify the existing target list. Instead, you must add a new override with new targets, which replaces the existing override.

Step 1  In the object editor, expand the Override section.
Step 2  Click Edit (📝) next to the override you want to modify.
Step 3  Optionally, modify the Description.
Step 4  Modify the override value.
Step 5  Click Save to save the override.
Step 6  Click Save to save the object.

What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Network Objects

A network object represents one or more IP addresses. You can use network objects and groups in various places in the system’s web interface, including access control policies, network variables, identity rules, network discovery rules, event searches, reports, and so on.

When you configure an option that requires a network object, the list is automatically filtered to show only those objects that are valid for the option. For example, some options require host objects, while other options require subnets.

A network object can be one of the following types:

Host

A single IP address.

IPv4 example:

209.165.200.225

IPv6 example:

2001:DB8::0DB8:800:200C:417A or 2001:DB8:0:0:0DB8:800:200C:417A
**Range**

A range of IP addresses.

IPv4 example:

209.165.200.225-209.165.200.250

IPv6 example:

2001:db8:0:cd30::1-2001:db8:0:cd30::1000

**Network**

An address block, also known as a subnet.

IPv4 example:

209.165.200.224/27

IPv6 example:

2001:DB8:0:CD30::/60

---

**Note**

Security Intelligence ignores IP address blocks using a /0 netmask.

**FQDN**

A single fully-qualified domain name (FQDN). FQDN resolution in only IPv4 address, only IPv6 address, and both IPv4 and IPv6 addresses are supported.

For example:

www.example.com

---

**Note**

- FQDNs must begin and end with a digit or letter. Only letters, digits, and hyphens are allowed as internal characters in an FQDN.

- You can use FQDN objects only in access control rules and prefilter rules. The rules match the IP address obtained for the FQDN through a DNS lookup. The first instance of the FQDN resolution occurs when the FQDN object is deployed in an access control policy. To use an FQDN network object, ensure you have configured the DNS server settings in DNS Server Group Objects, on page 502 and the DNS platform settings in Configure DNS, on page 1113.

**Group**

A group of network objects or other network object groups.

For example:

209.165.200.225
209.165.201.1
209.165.202.129

You can create nested groups by adding one network object group to another network object group. You can nest up to 10 levels of groups.
Creating Network Objects

Step 1 Choose Objects > Object Management.
Step 2 Choose Network from the list of object types.
Step 3 Choose Add Object from the Add Network drop-down menu.
Step 4 Enter a Name.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

Step 5 Optionally, enter a Description.
Step 6 In the Network field, select the required option and enter an appropriate value; see Network Objects, on page 442.
Step 7 (FQDN objects only) Select the DNS resolution from the Lookup drop-down menu to determine whether you want the IPv4, IPv6, or both IPv4 and IPv6 addresses associated with the FQDN.
Step 8 Manage overrides for the object:
  • If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 441.
  • If you want to add override values to this object, expand the Override section and click Add; see Adding Object Overrides, on page 441.
Step 9 Click Save.

What to do next
  • If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Port Objects

Port objects represent different protocols in slightly different ways:

TCP and UDP

A port object represents the transport layer protocol, with the protocol number in parentheses, plus an optional associated port or port range. For example: TCP (6) / 22.

ICMP and ICMPv6 (IPv6-ICMP)

A port object represents the Internet layer protocol plus an optional type and code. For example:

ICMP (1) : 3 : 3.

You can restrict an ICMP or IPv6-ICMP port object by type and, if applicable, code. For more information on ICMP types and codes, see:

• http://www.iana.org/assignments/icmp-parameters/icmp-parameters.xml
• http://www.iana.org/assignments/icmpv6-parameters/icmpv6-parameters.xml
Other

A port object can represent other protocols that do not use ports.

The Firepower System provides default port objects for well-known ports. You cannot modify or delete these default objects. You can create custom port objects in addition to the default objects.

You can use port objects and groups in various places in the system’s web interface, including access control policies, identity rules, network discovery rules, port variables, and event searches. For example, if your organization uses a custom client that uses a specific range of ports and causes the system to generate excessive and misleading events, you can configure your network discovery policy to exclude monitoring those ports.

When using port objects, observe the following guidelines:

• You cannot add any protocol other than TCP or UDP for source port conditions in access control rules. Also, you cannot mix transport protocols when setting both source and destination port conditions in a rule.

• If you add an unsupported protocol to a port object group used in a source port condition, the rule where it is used does not take effect on the managed device when the configuration is deployed.

• If you create a port object containing both TCP and UDP ports, then add it as a source port condition in a rule, you cannot add a destination port, and vice versa.

Creating Port Objects

Step 1  Choose Objects > Object Management.
Step 2  Choose Port from the list of object types.
Step 3  Choose Add Object from the Add Port drop-down list.
Step 4  Enter a Name.
Step 5  Choose a Protocol.
Step 6  Depending on the protocol you chose, constrain by Port, or choose an ICMP Type and Code.

You can enter ports from 1 to 65535. Use a hyphen to specify a port range. You must constrain the object by port if you chose to match All protocols, using the Other drop-down list.

Step 7  Manage overrides for the object:

• If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 441.

• If you want to add override values to this object, expand the Override section and click Add; see Adding Object Overrides, on page 441.

Step 8  Click Save.

What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.
Tunnel Zones

A tunnel zone represents certain types of plaintext, passthrough tunnels that you explicitly tag for special analysis. A tunnel zone is not an interface object, even though you can use it as an interface constraint in some configurations.

For detailed information, see Tunnel Zones and Prefiltering, on page 1461.

Application Filters

System-provided application filters help you perform application control by organizing applications according to basic characteristics: type, risk, business relevance, category, and tags. In the object manager, you can create and manage reusable user-defined application filters based on combinations of the system-provided filters, or on custom combinations of applications. For detailed information, see Application Conditions (Application Control), on page 412.

VLAN Tag Objects

Each VLAN tag object you configure represents a VLAN tag or range of tags. You can group VLAN tag objects. Groups represent multiple objects; using a range of VLAN tags in a single object is not considered a group in this sense.

You can use VLAN tag objects and groups in various places in the system’s web interface, including rules and event searches. For example, you could write an access control rule that applies only to a specific VLAN.

Creating VLAN Tag Objects

Step 1  Choose Objects > Object Management.

Step 2  Choose VLAN Tag from the list of object types.

Step 3  Choose Add Object from the Add VLAN Tag drop-down list.

Step 4  Enter a Name.

Step 5  Enter a Description.

Step 6  Enter a value in the VLAN Tag field. Use a hyphen to specify a range of VLAN tags.

Step 7  Manage overrides for the object:
  - If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 441.
  - If you want to add override values to this object, expand the Override section and click Add; see Adding Object Overrides, on page 441.

Step 8  Click Save.
What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Security Group Tag Objects

A Security Group Tag (SGT) object specifies a single SGT value. You can use SGT objects in rules to control traffic with SGT attributes that were not assigned by Cisco ISE. You cannot group or override SGT objects.

Related Topics
- Autotransition from Custom SGTs to ISE SGTs, on page 428
- Custom SGT Conditions, on page 427
- ISE SGT vs Custom SGT Rule Conditions, on page 427

Creating Security Group Tag Objects

You can create these objects in the global domain only. To use the object on Classic devices, you must have the Control license. For Smart Licensed devices, any license will do.

Before you begin

- Disable ISE/ISE-PIC connections. You cannot create custom SGT objects if you use ISE/ISE-PIC as an identity source.

Step 1   Click Objects > Object Management.
Step 2   Click Security Group Tag from the list of object types.
Step 3   Click Add Security Group Tag.
Step 4   Enter a Name.
Step 5   Optionally, enter a Description.
Step 6   In the Tag field, enter a single SGT.
Step 7   Click Save.

What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Related Topics
- Autotransition from Custom SGTs to ISE SGTs, on page 428
- Custom SGT Conditions, on page 427
- ISE SGT vs Custom SGT Rule Conditions, on page 427
URL Objects

Important
For best practices for using this and similar options in Security Intelligence configurations and for URL rules in access control and QoS policies, see Manual URL Filtering Options, on page 1419.

A URL object defines a single URL or IP address, whereas a URL group object can define more than one URL or address. You can use URL objects and groups in various places in the system’s web interface, including access control policies and event searches.

When creating URL objects, keep the following points in mind:

- If you do not include a path (that is, there is no / character in the URL), the match is based on the server’s hostname only. The hostname is considered a match if it comes after the :// separator, or after any dot in the hostname. For example, ign.com matches ign.com and www.ign.com, but it does not match verisign.com.

- If you include one or more / character, the entire URL string is used for a substring match, including the server name, path, and any query parameters. However, we recommend that you do not use manual URL filtering to block or allow individual web pages or parts of sites, as servers can be reorganized and pages moved to new paths. Substring matching can also lead to unexpected matches, where the string you include in the URL object also matches paths on unintended servers or strings within query parameters.

- The system disregards the encryption protocol (HTTP vs HTTPS). In other words, if you block a website, both HTTP and HTTPS traffic to that website is blocked, unless you use an application condition to target a specific protocol. When creating a URL object, you do not need to specify the protocol when creating an object. For example, use example.com rather than http://example.com.

- If you plan to use a URL object to match HTTPS traffic in an access control rule, create the object using the subject common name in the public key certificate used to encrypt the traffic. Also, the system disregards subdomains within the subject common name, so do not include subdomain information. For example, use example.com rather than www.example.com.

However, please understand that the subject common name in the certificate might be completely unrelated to a web site’s domain name. For example, the subject common name in the certificate for youtube.com is *.google.com (this of course might change at any time). You will get more consistent results if you use the SSL Decryption policy to decrypt HTTPS traffic so that URL filtering rules work on decrypted traffic.

Note
URL objects will not match HTTPS traffic if the browser resumes a TLS session because the certificate information is no longer available. Thus, even if you carefully configure the URL object, you might get inconsistent results for HTTPS connections.
Creating URL Objects

Step 1  Choose Objects > Object Management.
Step 2  Choose URL from the list of object types.
Step 3  Choose Add Object from the Add URL drop-down list.
Step 4  Enter a Name.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

Step 5  Optionally, enter a Description.
Step 6  Enter the URL or IP address.
Step 7  Manage overrides for the object:
   • If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 441.
   • If you want to add override values to this object, expand the Override section and click Add; see Adding Object Overrides, on page 441.

Step 8  Click Save.

What to do next
   • If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Geolocation Objects

Each geolocation object you configure represents one or more countries or continents that the system has identified as the source or destination of traffic on your monitored network. You can use geolocation objects in various places in the system’s web interface, including access control policies, SSL policies, and event searches. For example, you could write an access control rule that blocks traffic to or from certain countries.

To ensure that you are using up-to-date information to filter your network traffic, Cisco strongly recommends that you regularly update your Geolocation Database (GeoDB).

Creating Geolocation Objects

Step 1  Choose Objects > Object Management.
Step 2  Choose Geolocation from the list of object types.
Step 3  Click Add Geolocation.
Step 4  Enter a Name.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
Step 5  Check the check boxes for the countries and continents you want to include in your geolocation object. Checking a continent chooses all countries within that continent, as well as any countries that GeoDB updates may add under that continent in the future. Unchecking any country under a continent unchecks the continent. You can choose any combination of countries and continents.

Step 6  Click Save.

What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Interface Objects: Interface Groups and Security Zones

Interface objects segment your network to help you manage and classify traffic flow. An interface object simply groups interfaces. These groups may span multiple devices; you can also configure multiple interface objects on a single device.

There are two types of interface objects:

• Security zones—An interface can belong to only one security zone.

• Interface groups—An interface can belong to multiple interface groups (and to one security zone).

  You can use interface groups in Firepower Threat Defense NAT policies, prefilter policies, and QoS policies.

Although tunnel zones are not interface objects, you can use them in place of security zones in certain configurations; see Tunnel Zones and Prefiltering, on page 1461.

All interfaces in an interface object must be of the same type: all inline, passive, switched, routed, or ASA FirePOWER. After you create an interface object, you cannot change the type of interfaces it contains.

The Interface Objects page of the object manager lists the security zones and interface groups configured on your managed devices. The page also displays the type of interfaces in each interface object, and you can expand each interface object to view which interfaces on which devices belong to each object.

Note

Create inline sets before you add security zones for the interfaces in the inline set; otherwise security zones are removed and you must add them again.

Model-Specific Notes and Warnings

During initial configuration of a 7000 or 8000 Series device, the system creates security zones based on the detection mode you selected for the device. For example, the system creates a Passive zone in passive deployments, while in inline deployments the system creates External and Internal zones. When you register the device to the Firepower Management Center, those security zones are added to the FMC.
Interface Objects and Multitenancy

In a multidomain deployment, you can create interface objects at any level. An interface object created in an ancestor domain can contain interfaces that reside on devices in different domains. In this situation, subdomain users viewing the ancestor interface object configuration in the object manager can see only the interfaces in their domain.

Unless restricted by role, subdomain users can view and edit interface objects created in ancestor domains. Subdomain users can add and delete interfaces from these interface objects. They cannot, however, delete or rename the interface objects. You can neither view nor edit interface objects created in descendant domains.

Creating Security Zone and Interface Group Objects

Tip
You can create empty interface objects and add interfaces to them later. To add an interface, the interface must have a name. You can also create security zones (but not interface groups) while configuring interfaces in Devices > Device Management.

Before you begin

- Understand the usage requirements and restrictions for each type of interface object. See Interface Objects: Interface Groups and Security Zones, on page 450.
- Carefully determine the interface objects you need. You cannot change an existing security zone to an interface group or vice-versa; instead you must create a new interface object.

Step 1 Choose Objects > Object Management.
Step 2 Choose Interface from the list of object types.
Step 3 Click Add > Security Zone or Add > Interface Group.
Step 4 Enter a Name.
Step 5 Choose an Interface Type.
Step 6 From the Device > Interfaces drop-down list, choose a device that contains interfaces you want to add.

When you create or edit a security zone, the Device > Interfaces drop-down list displays the cluster names for high availability devices. Choose the cluster that contains the interfaces you want to add.

Step 7 Choose one or more interfaces.
Step 8 Click Add to add the interfaces you chose, grouped by device.
Step 9 Click Save.

What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.
Time Range Objects

Use time range objects to define time periods that you will use to determine when rules apply.

Creating Time Range Objects

If you want a policy to apply only during a specified time range, create a time range object, then specify that object in the policy. Note that this object works on FTD devices only.

You can specify time range objects only in policy types listed at the bottom of this topic.

Step 1
Choose Objects > Object Management.

Step 2
Choose Time Range from the list of object types.

Step 3
Click Add Time Range.

Step 4
Enter values.

Observe the following guidelines:

- If you see a red error box around the object name you have entered, mouse over the Name field to see naming restrictions.
- All times are in UTC.
- Enter times using a 24-hour clock. For example, enter 1:30 PM as 13:30.
- To specify a single continuous range, such as typical weekend hours (Fridays at 5 pm through Mondays at 8 am, including evenings and nights), choose Range Type Range.
- To specify part of multiple days, such as Monday through Friday from 8 am to 5 pm (excluding evenings, nights, and early mornings every day), choose Range Type Daily Interval.
- You can specify up to 28 time periods in a single object.
- To specify multiple noncontiguous times of day or different hours for different days, create multiple recurring intervals. For example, to apply a policy at all times other than standard working hours, create a single time range object with the following two recurring intervals:
  - A Daily Interval for Monday through Friday from 5 pm through 8 am, and
  - A Range recurring interval for Friday at 5 pm through Monday at 8 am.

Step 5
Click Save.

What to do next

In a VPN group policy object, specify the time range object using the Access Hours field. For details, see Configure Group Policy Objects, on page 519 and Group Policy Advanced Options, on page 524.
**Variable Sets**

Variables represent values commonly used in intrusion rules to identify source and destination IP addresses and ports. You can also use variables in intrusion policies to represent IP addresses in rule suppressions, adaptive profile updates, and dynamic rule states.

---

**Tip**

Preprocessor rules can trigger events regardless of the hosts defined by network variables used in intrusion rules.

---

You use variable sets to manage, customize, and group your variables. You can use the default variable set provided by the system or create your own custom sets. Within any set you can modify predefined default variables and add and modify user-defined variables.

Most of the shared object rules and standard text rules that the Firepower System provides use predefined default variables to define networks and port numbers. For example, the majority of the rules use the variable `@HOME_NET` to specify the protected network and the variable `@EXTERNAL_NET` to specify the unprotected (or outside) network. In addition, specialized rules often use other predefined variables. For example, rules that detect exploits against web servers use the `@HTTP_SERVERS` and `@HTTP_PORTS` variables.

Rules are more effective when variables more accurately reflect your network environment. At a minimum, you should modify default variables in the default set. By ensuring that a variable such as `@HOME_NET` correctly defines your network and `@HTTP_SERVERS` includes all web servers on your network, processing is optimized and all relevant systems are monitored for suspicious activity.

To use your variables, you link variable sets to intrusion policies associated with access control rules or with the default action of an access control policy. By default, the default variable set is linked to all intrusion policies used by access control policies.

Adding a variable to any set adds it to all sets; that is, each variable set is a collection of all variables currently configured on your system. Within any variable set, you can add user-defined variables and customize the value of any variable.

Initially, the Firepower System provides a single, default variable set comprised of predefined default values. Each variable in the default set is initially set to its default value, which for a predefined variable is the value set by the Cisco Talos Intelligence Group (Talos) and provided in rule updates.

Although you can leave predefined default variables configured to their default values, Cisco recommends that you modify a subset of predefined variables.

You could work with variables only in the default set, but in many cases you can benefit most by adding one or more custom sets, configuring different variable values in different sets, and perhaps even adding new variables.

When using multiple sets, it is important to remember that the current value of any variable in the default set determines the default value of the variable in all other sets.

When you select **Variable Sets** on the Object Manager page, the object manager lists the default variable set and any custom sets you created.

On a freshly installed system, the default variable set is comprised only of the default variables predefined by Cisco.
Each variable set includes the default variables provided by the system and all custom variables you have added from any variable set. Note that you can edit the default set, but you cannot rename or delete the default set.

In a multidomain deployment, the system generates a default variable set for each subdomain.

---

**Caution**

Importing an access control or an intrusion policy overwrites existing default variables in the default variable set with the imported default variables. If your existing default variable set contains a custom variable not present in the imported default variable set, the unique variable is preserved.

---

**Related Topics**

- Managing Variables, on page 465
- Managing Variable Sets, on page 464

---

**Variable Sets in Intrusion Policies**

By default, the Firepower System links the default variable set to all intrusion policies used in an access control policy. When you deploy an access control policy that uses an intrusion policy, intrusion rules that you have enabled in the intrusion policy use the variable values in the linked variable set.

When you modify a custom variable set used by an intrusion policy in an access control policy, the system reflects the status for that policy as out-of-date on the Access Control Policy page. You must re-deploy the access control policy to implement changes in your variable set. When you modify the default set, the system reflects the status of all access control policies that use intrusion policies as out-of-date, and you must re-deploy all access control policies to implement your changes.

---

**Variables**

Variables belong to one of the following categories:

**Default Variables**

Variables provided by the Firepower System. You cannot rename or delete a default variable, and you cannot change its default value. However, you can create a customized version of a default variable.

**Customized Variables**

Variables you create. These variables can include:

- **customized default variables**

  When you edit the value for a default variable, the system moves the variable from the Default Variables area to the Customized Variables area. Because variable values in the default set determine the default values of variables in custom sets, customizing a default variable in the default set modifies the default value of the variable in all other sets.

- **user-defined variables**

  You can add and delete your own variables, customize their values within different variable sets, and reset customized variables to their default values. When you reset a user-defined variable, it remains in the Customized Variables area.

User-defined variables can be one of the following types:
• *network* variables specify the IP addresses of hosts in your network traffic.

• *port* variables specify TCP or UDP ports in network traffic, including the value *any* for either type.

For example, if you create custom standard text rules, you might also want to add your own user-defined variables to more accurately reflect your traffic or as shortcuts to simplify the rule creation process. Alternatively, if you create a rule that you want to inspect traffic in the “demilitarized zone” (or DMZ) only, you can create a variable named $DMZ whose value lists the server IP addresses that are exposed. You can then use the $DMZ variable in any rule written for this zone.

**Advanced Variables**

Variables provided by the Firepower System under specific conditions. These variables have a very limited deployment.

**Predefined Default Variables**

By default, the Firepower System provides a single default variable set, which is comprised of predefined default variables. The Cisco Talos Intelligence Group (Talos) uses rule updates to provide new and updated intrusion rules and other intrusion policy elements, including default variables.

Because many intrusion rules provided by the system use predefined default variables, you should set appropriate values for these variables. Depending on how you use variable sets to identify traffic on your network, you can modify the values for these default variables in any or all variable sets.

---

**Caution**

Importing an access control or an intrusion policy overwrites existing default variables in the default variable set with the imported default variables. If your existing default variable set contains a custom variable not present in the imported default variable set, the unique variable is preserved.

---

The following table describes the variables provided by the system and indicates which variables you typically would modify. For assistance determining how to tailor variables to your network, contact Professional Services or Support.

**Table 64: System-Provided Variables**

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Description</th>
<th>Modify?</th>
</tr>

</table>
### Network Variables

Network variables represent IP addresses you can use in intrusion rules that you enable in an intrusion policy and in intrusion policy rule suppressions, dynamic rule states, and adaptive profile updates. Network variables differ from network objects and network object groups in that network variables are specific to intrusion policies and intrusion rules, whereas you can use network objects and groups to represent IP addresses in various places in the system’s web interface, including access control policies, network variables, intrusion rules, network discovery rules, event searches, reports, and so on.

You can use network variables in the following configurations to specify the IP addresses of hosts on your network:

- **intrusion rules**—Intrusion rule **Source IPs** and **Destination IPs** header fields allow you to restrict packet inspection to the packets originating from or destined to specific IP addresses.

- **suppressions**—The **Network** field in source or destination intrusion rule suppressions allows you to suppress intrusion event notifications when a specific IP address or range of IP addresses triggers an intrusion rule or preprocessor.

- **dynamic rule states**—The **Network** field in source or destination dynamic rule states allows you to detect when too many matches for an intrusion rule or preprocessor rule occur in a given time period.

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Description</th>
<th>Modify?</th>
</tr>
</thead>
<tbody>
<tr>
<td>$SNORT_BPF</td>
<td>Identifies a legacy advanced variable that appears only when it existed on your system in a Firepower System software release before Version 5.3.0 that you subsequently upgraded to Version 5.3.0 or greater.</td>
<td>No, you can only view or delete this variable. You cannot edit it or recover it after deleting it.</td>
</tr>
<tr>
<td>$SQL_SERVERS</td>
<td>Defines database servers on your network, and is used in rules that address database-targeted exploits.</td>
<td>Yes, if you run SQL servers.</td>
</tr>

<td>Yes, if you run Telnet servers.</td>
</tr>
<tr>
<td>$USER_CONF</td>
<td>Provides a general tool that allows you to configure one or more features not otherwise available via the web interface. Conflicting or duplicate $USER_CONF configurations will halt the system.</td>
<td>No, only as instructed in a feature description or with the guidance of Support.</td>
</tr>
</tbody>
</table>
• adaptive profile updates—When you enable adaptive profile updates, the adaptive profiles **Networks** field identifies hosts where you want to improve reassembly of packet fragments and TCP streams in passive deployments.

When you use variables in the fields identified in this section, the variable set you link to an intrusion policy determines the variable values in the network traffic handled by an access control policy that uses the intrusion policy.

You can add any combination of the following network configurations to a variable:

- any combination of network variables, network objects, and network object groups that you select from the list of available networks
- individual network objects that you add from the New Variable or Edit Variable page, and can then add to your variable and to other existing and future variables
- literal, single IP addresses or address blocks

You can list multiple literal IP addresses and address blocks by adding each individually. You can list IPv4 and IPv6 addresses and address blocks alone or in any combination. When specifying IPv6 addresses, you can use any addressing convention defined in RFC 4291.

The default value for included networks in any variable you add is the word *any*, which indicates any IPv4 or IPv6 address. The default value for excluded networks is *none*, which indicates no network. You can also specify the address :: in a literal value to indicate any IPv6 address in the list of included networks, or no IPv6 addresses in the list of exclusions.

Adding networks to the excluded list negates the specified addresses and address blocks. That is, you can match any IP address with the exception of the excluded IP address or address blocks.

For example, excluding the literal address 192.168.1.1 specifies any IP address other than 192.168.1.1, and excluding 2001:db8:ca2e::fa4c specifies any IP address other than 2001:db8:ca2e::fa4c.

You can exclude any combination of networks using literal or available networks. For example, excluding the literal values 192.168.1.1 and 192.168.1.5 includes any IP address other than 192.168.1.1 or 192.168.1.5. That is, the system interprets this as “not 192.168.1.1 and not 192.168.1.5,” which matches any IP address other than those listed between brackets.

Note the following points when adding or editing network variables:

- You cannot logically exclude the value *any* which, if excluded, would indicate no address. For example, you cannot add a variable with the value *any* to the list of excluded networks.
- Network variables identify traffic for the specified intrusion rule and intrusion policy features. Note that preprocessors can trigger events regardless of the hosts defined by network variables used in intrusion rules.
- Excluded values must resolve to a subset of included values. For example, you cannot include the address block 192.168.5.0/24 and exclude 192.168.6.0/24.

**Port Variables**

Port variables represent TCP and UDP ports you can use in the **Source Port** and **Destination Port** header fields in intrusion rules that you enable in an intrusion policy. Port variables differ from port objects and port object groups in that port variables are specific to intrusion rules. You can create port objects for protocols...
other than TCP and UDP, and you can use port objects in various places in the system’s web interface, including port variables, access control policies, network discovery rules, and event searches.

You can use port variables in the intrusion rule Source Port and Destination Port header fields to restrict packet inspection to packets originating from or destined to specific TCP or UDP ports.

When you use variables in these fields, the variable set you link to the intrusion policy associated with an access control rule or policy determines the values for these variables in the network traffic where you deploy the access control policy.

You can add any combination of the following port configurations to a variable:

• any combination of port variables and port objects that you select from the list of available ports

  Note that the list of available ports does not display port object groups, and you cannot add these to variables.

• individual port objects that you add from the New Variable or Edit Variable page, and can then add to your variable and to other existing and future variables

  Only TCP and UDP ports, including the value any for either type, are valid variable values. If you use the new or edit variables page to add a valid port object that is not a valid variable value, the object is added to the system but is not displayed in the list of available objects. When you use the object manager to edit a port object that is used in a variable, you can only change its value to a valid variable value.

• single, literal port values and port ranges

  You must separate port ranges with a dash (-). Port ranges indicated with a colon (:) are supported for backward compatibility, but you cannot use a colon in port variables that you create.

  You can list multiple literal port values and ranges by adding each individually in any combination.

Note the following points when adding or editing port variables:

• The default value for included ports in any variable you add is the word any, which indicates any port or port range. The default value for excluded ports is none, which indicates no ports.

  Tip
  To create a variable with the value any, name and save the variable without adding a specific value.

• You cannot logically exclude the value any which, if excluded, would indicate no ports. For example, you cannot save a variable set when you add a variable with the value any to the list of excluded ports.

• Adding ports to the excluded list negates the specified ports and port ranges. That is, you can match any port with the exception of the excluded ports or port ranges.

• Excluded values must resolve to a subset of included values. For example, you cannot include the port range 10-50 and exclude port 60.

Advanced Variables

Advanced variables allow you to configure features that you cannot otherwise configure via the web interface. The Firepower System currently provides only one advanced variable, the USER_CONF variable.
**USER_CONF**

USER_CONF provides a general tool that allows you to configure one or more features not otherwise available via the web interface.

---

**Caution**

Do **not** use the advanced variable USER_CONF to configure an intrusion policy feature unless you are instructed to do so in the feature description or by Support. Conflicting or duplicate configurations will halt the system.

When editing USER_CONF, you can type up to 4096 total characters on a single line; the line wraps automatically. You can include any number of valid instructions or lines until you reach the 8192 maximum character length for a variable or a physical limit such as disk space. Use the backslash (\) line continuation character after any complete argument in a command directive.

Resetting USER_CONF empties it.

---

**Variable Reset**

You can reset a variable to its default value on the variable set new or edit variables page. The following table summarizes the basic principles of resetting variables.

<table>
<thead>
<tr>
<th>Resetting this variable type...</th>
<th>In this set type...</th>
<th>Resets it to...</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>default</td>
<td>the rule update value</td>
</tr>
<tr>
<td>user-defined</td>
<td>default</td>
<td>any</td>
</tr>
<tr>
<td>default or user-defined</td>
<td>custom</td>
<td>the current default set value (modified or unmodified)</td>
</tr>
</tbody>
</table>

Resetting a variable in a custom set simply resets it to the current value for that variable in the default set. Conversely, resetting or modifying the value of a variable in the default set always updates the default value of that variable in all custom sets. When the reset icon is grayed out, indicating that you cannot reset the variable, this means that the variable has no customized value in that set. Unless you have customized the value for a variable in a custom set, a change to the variable in the default set updates the value used in any intrusion policy where you have linked the variable set.

---

**Note**

It is good practice when you modify a variable in the default set to assess how the change affects any intrusion policy that uses the variable in a linked custom set, especially when you have not customized the variable value in the custom set.

You can hover your pointer over the **Reset icon** in a variable set to see the reset value. When the customized value and the reset value are the same, this indicates one of the following:

- you are in the custom or default set where you added the variable with the value any
- you are in the custom set where you added the variable with an explicit value and elected to use the configured value as the default value
Adding Variables to Sets

Adding a variable to a variable set adds it to all other sets. When you add a variable from a custom set, you must choose whether to use the configured value as the customized value in the default set:

- **If you use the configured value** (for example, 192.168.0.0/16), the variable is added to the default set using the configured value as a customized value with a default value of any. Because the current value in the default set determines the default value in other sets, the initial, default value in other custom sets is the configured value (which in the example is 192.168.0.0/16).

- **If you do not use the configured value**, the variable is added to the default set using only the default value any and, consequently, the initial, default value in other custom sets is any.

Example: Adding User-Defined Variables to Default Sets

The following diagram illustrates set interactions when you add the user-defined variable Var1 to the default set with the value 192.168.1.0/24.

You can customize the value of Var1 in any set. In Custom Set 2 where Var1 has not been customized, its value is 192.168.1.0/24. In Custom Set 1 the customized value 192.168.2.0/24 of Var1 overrides the default value. Resetting a user-defined variable in the default set resets its default value to any in all sets.

It is important to note in this example that, if you do not update Var1 in Custom Set 2, further customizing or resetting Var1 in the default set consequently updates the current, default value of Var1 in Custom Set 2, thereby affecting any intrusion policy linked to the variable set.

Although not shown in the example, note that interactions between sets are the same for user-defined variables and default variables except that resetting a default variable in the default set resets it to the value configured by Cisco in the current rule update.

Example: Adding User-Defined Variables to Custom Sets

The next two examples illustrate variable set interactions when you add a user-defined variable to a custom set. When you save the new variable, you are prompted whether to use the configured value as the default value for other sets. In the following example, you elect to use the configured value.

Note that, except for the origin of Var1 from Custom Set 1, this example is identical to the example above where you added Var1 to the default set. Adding the customized value 192.168.1.0/24 for Var1 to Custom
Set 1 copies the value to the default set as a customized value with a default value of any. Thereafter, Var1 values and interactions are the same as if you had added Var1 to the default set. As with the previous example, keep in mind that further customizing or resetting Var1 in the default set consequently updates the current, default value of Var1 in Custom Set 2, thereby affecting any intrusion policy linked to the variable set.

In the next example, you add Var1 with the value 192.168.1.0/24 to Custom Set 1 as in the previous example, but you elect not to use the configured value of Var1 as the default value in other sets.

This approach adds Var1 to all sets with a default value of any. After adding Var1, you can customize its value in any set. An advantage of this approach is that, by not initially customizing Var1 in the default set, you decrease your risk of customizing the value in the default set and thus inadvertently changing the current value in a set such as Custom Set 2 where you have not customized Var1.

### Nesting Variables

You can nest variables so long as the nesting is not circular. Nested, negated variables are not supported.

#### Valid Nested Variables

In this example, SMTP_SERVERS, HTTP_SERVERS, and OTHER_SERVERS are valid nested variables.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Included Networks</th>
<th>Excluded Networks</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMTP_SERVERS</td>
<td>customized default</td>
<td>10.1.1.1</td>
<td>—</td>
</tr>
<tr>
<td>HTTP_SERVERS</td>
<td>customized default</td>
<td>10.1.1.2</td>
<td>—</td>
</tr>
<tr>
<td>OTHER_SERVERS</td>
<td>user-defined</td>
<td>10.2.2.0/24</td>
<td>—</td>
</tr>
<tr>
<td>HOME_NET</td>
<td>customized default</td>
<td>10.1.1.0/24</td>
<td>SMTP_SERVERS HTTP_SERVERS</td>
</tr>
</tbody>
</table>

#### An Invalid Nested Variable

In this example, HOME_NET is an invalid nested variable because the nesting of HOME_NET is circular; that is, the definition of OTHER_SERVERS includes HOME_NET, so you would be nesting HOME_NET in itself.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Included Networks</th>
<th>Excluded Networks</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMTP_SERVERS</td>
<td>customized default</td>
<td>10.1.1.1</td>
<td>—</td>
</tr>
</tbody>
</table>
### An Unsupported Nested, Negated Variable

Because nested, negated variables are not supported, you cannot use the variable `NONCORE_NET` as shown in this example to represent IP addresses that are outside of your protected networks.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Included Networks</th>
<th>Excluded Networks</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOME_NET</td>
<td>customized default</td>
<td>10.1.0.0/16, 10.2.0.0/16, 10.3.0.0/16</td>
<td>—</td>
</tr>
<tr>
<td>EXTERNAL_NET</td>
<td>customized default</td>
<td>—</td>
<td>HOME_NET</td>
</tr>
<tr>
<td>DMZ_NET</td>
<td>user-defined</td>
<td>10.4.0.0/16</td>
<td>—</td>
</tr>
<tr>
<td>NOT_DMZ_NET</td>
<td>user-defined</td>
<td>—</td>
<td>DMZ_NET</td>
</tr>
<tr>
<td>NONCORE_NET</td>
<td>user-defined</td>
<td>EXTERNAL_NET, NOT_DMZ_NET</td>
<td>—</td>
</tr>
</tbody>
</table>

### Alternative to an Unsupported Nested, Negated Variable

As an alternative to the example above, you could represent IP addresses that are outside of your protected networks by creating the variable `NONCORE_NET` as shown in this example.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Included Networks</th>

Managing Variable Sets

To use variable sets, you must have the Threat license (for FTD devices) or the Protection license (all other device types).

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

**Step 1** Choose **Objects > Object Management**.

**Step 2** Choose **Variable Set** from the list of object types.

**Step 3** Manage your variable sets:

- Add — If you want to add a custom variable set, click **Add Variable Set**; see **Creating Variable Sets**, on page 464.

- Delete — If you want to delete a custom variable set, click **Delete** (Trash Can) next to the variable set, then click **Yes**. You cannot delete the default variable set or variable sets belonging to ancestor domains.

  **Note** Variables created in a variable set you delete are not deleted or otherwise affected in other sets.

- Edit — If you want to edit a variable set, click **Edit** (Pencil) next to the variable set you want to modify; see **Editing Objects**, on page 436.

- Filter — If you want to filter variable sets by name, begin entering a name; as you type, the page refreshes to display matching names. If you want to clear name filtering, click **Clear** (Clear) in the filter field.

- Manage Variables — To manage the variables included in variable sets, see **Managing Variables**, on page 465.

**Creating Variable Sets**

**Step 1** Choose **Objects > Object Management**.

**Step 2** Choose **Variable Set** from the list of object types.

**Step 3** Click **Add Variable Set**.

**Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

**Step 5** Optionally, enter a **Description**.

**Step 6** Manage the variables in the set; see **Managing Variables**, on page 465.

**Step 7** Click **Save**.

**What to do next**

- If an active policy references your object, deploy configuration changes; see **Deploy Configuration Changes**, on page 382.
Managing Variables

You must have the Threat license (for FTD devices) or the Protection license (all other device types).

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Step 1 Choose Objects > Object Management.

Step 2 Choose Variable Set from the list of object types.

Step 3 Click Edit ( MODIFY) next to the variable set you want to edit.

If View (VIEW) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 4 Manage your variables:

- Display — If you want to display the complete value for a variable, hover your pointer over the value in the Value column next to the variable.
- Add — If you want to add a variable, click Add; see Adding Variables, on page 466.
- Delete — Click Delete (DEL) next to the variable. If you have saved the variable set since adding the variable, click Yes to confirm that you want to delete the variable.

You cannot delete the following:

- default variables
- user-defined variables that are used by intrusion rules or other variables
- variables belonging to ancestor domains

- Edit — Click Edit ( MODIFY) next to the variable you want to edit; see Editing Variables, on page 466.
- Reset — If you want to reset a modified variable to its default value, click Reset next to a modified variable. If reset is dimmed, one of the following is true:
  - The current value is already the default value.
  - The configuration belongs to an ancestor domain.

  **Tip** Hover your pointer over an active reset to display the default value.

Step 5 Click Save to save the variable set. If the variable set is in use by an access control policy, click Yes to confirm that you want to save your changes.

Because the current value in the default set determines the default value in all other sets, modifying or resetting a variable in the default set changes the current value in other sets where you have not customized the default value.

**What to do next**

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.
Adding Variables

You must have the Threat license (for FTD devices) or the Protection license (all other device types).

| Step 1 | In the variable set editor, click Add. |
| Step 2 | Enter a unique variable Name. |
| Step 3 | From the Type drop-down list, choose either Network or Port. |
| Step 4 | Specify values for the variable: |

- If you want to move items from the list of available networks or ports to the list of included or excluded items, you can choose one or more items and then drag and drop, or click Include or Exclude.

  **Tip** If addresses or ports in the included and excluded lists for a network or port variable overlap, excluded addresses or ports take precedence.

- Enter a single literal value, then click Add. For network variables, you can enter a single IP address or address block. For port variables you can add a single port or port range, separating the upper and lower values with a hyphen (-). Repeat this step as needed to enter multiple literal values.

- If you want to remove an item from the included or excluded lists, click Delete (삭제) next to the item.

  **Note** The list of items to include or exclude can be comprised of any combination of literal strings and existing variables, objects, and network object groups in the case of network variables.

| Step 5 | Click Save to save the variable. If you are adding a new variable from a custom set, you have the following options: |

  - Click Yes to add the variable using the configured value as the customized value in the default set and, consequently, the default value in other custom sets.

  - Click No to add the variable as the default value of any in the default set and, consequently, in other custom sets.

| Step 6 | Click Save to save the variable set. Your changes are saved, and any access control policy the variable set is linked to displays an out-of-date status. |

What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Editing Variables

You must have the Threat license (for FTD devices) or the Protection license (all other device types).

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

You can edit both custom and default variables.

You cannot change the Name or Type values in an existing variable.
Step 1  In the variable set editor, click Edit (edit) next to the variable you want to modify. If View (view) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

Step 2  Modify the variable:

• If you want to move items from the list of available networks or ports to the list of included or excluded items, you can select one or more items and then drag and drop, or click Include or Exclude.

  Tip  If addresses or ports in the included and excluded lists for a network or port variable overlap, excluded addresses or ports take precedence.

  • Enter a single literal value, then click Add. For network variables, you can enter a single IP address or address block. For port variables you can add a single port or port range, separating the upper and lower values with a hyphen (-). Repeat this step as needed to enter multiple literal values.

  • If you want to remove an item from the included or excluded lists, click Delete (delete) next to the item.

Note  The list of items to include or exclude can be comprised of any combination of literal strings and existing variables, objects, and network object groups in the case of network variables.

Step 3  Click Save to save the variable.

Step 4  Click Save to save the variable set. If the variable set is in use by an access control policy, click Yes to confirm that you want to save your changes. Your changes are saved, and any access control policy the variable set is linked to displays an out-of-date status.

What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Security Intelligence Lists and Feeds

Security Intelligence functionality requires the Threat license (for FTD devices) or the Protection license (all other device types).

Security Intelligence lists and feeds are collections of IP addresses, domain names, and URLs that you can use to quickly filter traffic that matches an entry on a list or feed.

• A list is a static collection that you manage manually.

• A feed is a dynamic collection that updates on an interval over HTTP or HTTPS.

Security Intelligence lists/feeds are grouped into:

• DNS (Domain names )

• Network (IP addresses)

• URLs
System-Provided Feeds

Cisco provides the following feeds as Security Intelligence objects:

- Security Intelligence feeds updated regularly with the latest threat intelligence from Talos:
  - Cisco-DNS-and-URL-Intelligence-Feed (under DNS Lists and Feeds)
  - Cisco-Intelligence-Feed (for IP addresses, under Network Lists and Feeds)

You cannot delete the system-provided feeds, but you can change the frequency of (or disable) their updates.

- Cisco-TID-Feed (under Network Lists and Feeds)
  This feed is not used in the Security Intelligence tab of the access control policy.
  Instead, you must enable and configure Cisco Threat Intelligence Director (TID) to use this feed, which is a collection of TID observables data.
  Use this object to set how frequently this data is published to TID elements.
  For more information, see Cisco Threat Intelligence Director (TID), on page 1619.

Predefined Lists: Global Block Lists and Global Do Not Block Lists

The system ships with predefined global Block lists and Do Not Block lists for domains (DNS), IP addresses (Networks), and URLs.

These lists are empty until you populate them. To build these lists, see Global and Domain Security Intelligence Lists, on page 469.

By default, access control and DNS policies use these lists as part of Security Intelligence.

Custom Feeds

You can use third-party feeds, or use a custom internal feed to easily maintain an enterprise-wide Block list in a large deployment with multiple Firepower Management Center appliances.

See Custom Security Intelligence Feeds, on page 474.

Custom Lists

Custom lists can augment and fine-tune feeds and the Global lists.

See Custom Security Intelligence Lists, on page 476.

Where Security Intelligence Lists and Feeds Are Used

- IP address and address blocks—Use Block and Do Not Block lists in access control policies, as part of Security Intelligence.

- Domain Names—Use Block and Do Not Block lists in DNS policies, as part of Security Intelligence.

- URLs—Use Block and Do Not Block lists in access control policies, as part of Security Intelligence.
  You can also use URL lists in access control and QoS rules, whose analysis and traffic handling phases occur after Security Intelligence.
How to Modify Security Intelligence Objects

To add or delete entries on a Block list, Do Not Block list, feed, or sinkhole object:

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Edit Capabilities</th>
<th>Requires Redeploy After Edit?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default (but custom-populated) Block lists and Do Not Block lists: Global, descendant, and domain-specific</td>
<td>Add entries using the context menu. Delete entries using the object manager.</td>
<td>No after adding entries. Yes after deleting entries.</td>
</tr>
<tr>
<td>Custom Block and Do Not Block lists</td>
<td>Upload new and replacement lists using the object manager.</td>
<td>Yes</td>
</tr>
<tr>
<td>System-provided Intelligence Feeds</td>
<td>Disable or change update frequency using the object manager.</td>
<td>No</td>
</tr>
<tr>
<td>Custom feeds</td>
<td>Fully modify using the object manager.</td>
<td>No</td>
</tr>
<tr>
<td>Sinkhole</td>
<td>Fully modify using the object manager.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Global and Domain Security Intelligence Lists

Firepower Management Center ships with empty Global Block and Do-Not-Block lists to which you can instantly add URLs, domains, and IP addresses from events on your network at any time. These lists allow you to use Security Intelligence to always block particular connections, or to exempt particular connections from blocking by Security Intelligence, allowing them to be evaluated by other threat detection processes that you have configured.

For example, if you notice a set of routable IP addresses in intrusion events associated with exploit attempts, you can immediately block those IP addresses. Although it may take a few minutes for your changes to propagate, you do not have to redeploy.

By default, Access control and DNS policies use these Global lists, which apply to all security zones. You can opt not to use these lists on a per-policy basis.

Note

These options apply to Security Intelligence only. Security Intelligence cannot block traffic that has already been fastpathed. Similarly, adding an item to a Security Intelligence Do Not Block list does not automatically trust or fastpath matching traffic. For more information, see About Security Intelligence, on page 1429.

In a multidomain deployment, you can choose the Firepower System domains where you want to enforce blocking, or exempting from Security Intelligence blocking, by adding items to Domain lists as well as the Global lists; see Security Intelligence Lists and Multitenancy, on page 469.

Security Intelligence Lists and Multitenancy

In a multidomain deployment, the Global domain owns the Global Block lists and Do Not Block lists. Only Global administrators can add to or remove items from the Global lists. So that subdomain users can add networks, domain names, and URLs to Block and Do Not Block lists, multitenancy adds:
• Domain lists—Block or Do Not Block lists whose contents apply to a particular subdomain only. The Global lists are Domain lists for the Global domain.

• Descendant Domain lists—Block or Do Not Block lists that aggregate the Domain lists of the current domain’s descendants.

**Domain Lists**

In addition to being able to access (but not edit) the Global lists, each subdomain has its own named lists, the contents of which apply only to that subdomain. For example, a subdomain named Company A owns:

- Domain Block list - Company A and Domain Do Not Block list - Company A
- Domain Block list for DNS - Company A, Domain Do Not Block list for DNS - Company A
- Domain Block list for URL - Company A, Domain Do Not Block list for URL - Company A

Any administrator at or above the current domain can populate these lists. You can use the context menu to add an item to the Block or Do Not Block list in the current and all descendant domains. However, only an administrator in the associated domain can remove an item from a Domain list.

For example, a Global administrator could choose to add the same IP address to the Block list in the Global domain and Company A’s domain, but not add it to the Block list in Company B’s domain. This action would add the same IP address to:

- Global Block list (where it can be removed only by Global administrators)
- Domain Block list - Company A (where it can be removed only by Company A administrators)

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

**Descendant Domain Lists**

A Descendant Domain list is a Do Not Block list or Block list that aggregates the Domain lists of the current domain’s descendants. Leaf domains do not have Descendant Domain lists.

Descendant Domain lists are useful because a higher-level domain administrator can enforce general Security Intelligence settings, while still allowing subdomain users to add items to a Block or Do Not Block list in their own deployment.

For example, the Global domain has the following Descendant Domain lists:

- Descendant Block lists - Global, Descendant Do Not Block lists - Global
- Descendant Block lists for DNS - Global, Descendant Do Not Block lists for DNS - Global
- Descendant Block lists for URL - Global, Descendant Do Not Block lists for URL - Global

---

**Note**

Descendant Domain lists do not appear in the object manager because they are symbolic aggregations, not hand-populated lists. They appear where you can use them: in access control and DNS policies.
Add Entries to Global Security Intelligence Lists

When reviewing events and dashboards, you can instantly block future traffic involving IP addresses, domains, and URLs that appear in those events by adding them to a predefined Block list.

Similarly, if Security Intelligence is blocking traffic that you want evaluated by threat detection processes subsequent to Security Intelligence blocking, you can add IP addresses, domains, and URLs from events to a predefined Do Not Block list.

Traffic is evaluated against entries on these lists during the Security Intelligence phase of threat detection.

For more information about these lists, see Global and Domain Security Intelligence Lists, on page 469.

Before you begin

Because adding an entry to a Security Intelligence list affects access control, you must have one of the following user roles:

- Administrator
- A combination of roles: Network Admin or Access Admin, plus Security Analyst and Security Approver
- A custom role with both Modify Access Control Policy and Deploy Configuration to Devices permissions

If appropriate, verify that these lists are used in the policies in which you expect them to be used.

Step 1

Navigate to an event that includes an IP address, domain, or URL that you want to always block using Security Intelligence, or exempt from Security Intelligence blocking.

Step 2

Right-click the IP address, domain, or URL and choose the appropriate option:

<table>
<thead>
<tr>
<th>Target Item</th>
<th>Context Menu Option</th>
<th>Affected Global Lists</th>
</tr>
</thead>
<tbody>
<tr>
<td>An IP address</td>
<td>Blacklist Now</td>
<td>Global Block List</td>
</tr>
<tr>
<td></td>
<td>Whitelist Now</td>
<td>Global Whitelist</td>
</tr>
<tr>
<td>A URL</td>
<td>Blacklist HTTP/S Connections to URL Now</td>
<td>Global Block List for URL</td>
</tr>
<tr>
<td></td>
<td>Whitelist HTTP/S Connections to URL Now</td>
<td>Global Whitelist for URL</td>
</tr>
<tr>
<td>An entire domain</td>
<td>Blacklist HTTP/S Connections to Domain Now</td>
<td>Global Block List for URL</td>
</tr>
<tr>
<td></td>
<td>Whitelist HTTP/S Connections to Domain Now</td>
<td>Global Whitelist for URL</td>
</tr>
<tr>
<td>DNS requests for an entire domain</td>
<td>Blacklist DNS Requests to Domain Now</td>
<td>Global Block List for DNS</td>
</tr>
<tr>
<td></td>
<td>Whitelist DNS Requests to Domain Now</td>
<td>Global Whitelist for DNS</td>
</tr>
</tbody>
</table>

What to do next

You do NOT need to redeploy for these changes to take effect.

If you want to delete an item from a list, see Delete Entries from Global Security Intelligence Lists, on page 472.
Delete Entries from Global Security Intelligence Lists

Note
- In multi-domain deployments, the names of these lists may not be "Global." For more information, see Security Intelligence Lists and Multitenancy, on page 469.
- To add entries to these lists, see Add Entries to Global Security Intelligence Lists, on page 471.

Step 1 Choose Objects > Object Management.
Step 2 Click Security Intelligence.
Step 3 Click the appropriate option:
  - Network Lists and Feeds (for IP addresses)
  - DNS Lists and Feeds (for domain names)
  - URL Lists and Feeds
Step 4 Click the pencil beside the Global Block or Global Do-Not-Block list.
Step 5 Click the trash button beside the entry to delete.

List and Feed Updates for Security Intelligence

List and feed updates replace the existing list or feed file with the contents of the new file. Contents of existing and new files are not merged.

If the system downloads a corrupt feed or a feed with no recognizable entries, the system continues using the old feed data (unless it is the first download). However, if the system can recognize even one entry in the feed, it uses the entries it can recognize.

By default, each feed updates the Management Center every two hours; you can modify this frequency. Any updates the Management Center receives are passed immediately to managed devices. In addition, managed devices poll the FMC every 30 minutes for changes. You cannot modify this frequency.

In a multidomain deployment, the system-provided feeds belong to the Global domain and can be modified only by an administrator in that domain. You can modify the update frequency for custom feeds belonging to your domain.

To modify feed update intervals, see Changing the Update Frequency for Security Intelligence Feeds, on page 472.

Changing the Update Frequency for Security Intelligence Feeds

You can specify the intervals at which the Firepower Management Center updates Security Intelligence Feeds.

For details about feed updates, see List and Feed Updates for Security Intelligence, on page 472.

Step 1 Choose Objects > Object Management.
Step 2  Expand the **Security Intelligence** node, then choose the feed type whose frequency you want to change. The system-provided URL feed is combined with the domain feed under **DNS Lists and Feeds**.

Step 3  Next to the feed you want to update, click **Edit (✓)**.

If **View (✓) appears instead**, the object belongs to an ancestor domain, or you do not have permission to modify the object.

Step 4  Edit the **Update Frequency**.

Step 5  Click **Save**.

---

**Custom Security Intelligence Lists and Feeds**

**Custom Lists and Feeds: Requirements**

**List and Feed Formatting**

Each list or feed must be a simple text file no larger than 500MB. List files must have the .txt extension. Include one entry or comment per line: one IP address, one URL, one domain name.

**Tip**

The number of entries you can include is limited by the maximum size of the file. For example, a URL list with no comments and an average URL length of 100 characters (including Punycode or percent Unicode representations and newlines) can contain more than 5.24 million entries.

In a DNS list entry, you can specify an asterisk (*) wildcard character for a domain label. All labels match the wildcard. For example, an entry of **www.example.* matches both www.example.com** and **www.example.co**.

If you add comment lines within the source file, they must start with the pound (#) character. If you upload a source file with comments, the system removes your comments during upload. Source files you download contain all your entries without your comments.

**Feed URL**

When you configure a feed, you specify its location using a URL; the URL cannot be Punycode-encoded.

**URL Lists and Feeds: URL Syntax and Matching Criteria**

Security Intelligence URL lists and feeds, including custom lists and feeds and entries in the global Block list and Do Not Block list, can include the following, which have the matching behavior as described:

- **Hostnames**
  
  For example, **www.example.com**.

- **URLs**
  
  **example.com** matches **example.com** and all subdomains, including **www.example.com**, **eu.example.com**, **example.com/abc**, and **www.example.com/def** -- but NOT **example.co.uk** or **examplexyz.com** or **example.com.malicious-site.com**.
You can also include an entire URL path, such as

• A slash at the end of a URL to specify an exact match
  example.com/ matches ONLY example.com; it does NOT match www.example.com or any other URL.

• A wildcard (*) to represent any domain in a URL
  An asterisk can represent a complete domain string separated by dots, but not a partial domain string, and not any part of the URL following the first slash.

Valid examples:
  • *.example.com
  • www.*.com
  • example.*
    (This will match example.com and example.org and example.de, for example, but NOT example.co.uk)
  • *.example.*
  • example.*/

Invalid examples:
  • example*.com
  • example.com/*

• IP addresses (IPv4)
  For IPv6 addresses, or to use ranges or CIDR notation, use the Security Intelligence Network object.
  You can include one or more wildcards representing an octet, for example 10.10.10.* or 10.10.*.*.

See also Custom Security Intelligence Lists, on page 476.

Custom Security Intelligence Feeds

Custom or third-party Security Intelligence feeds allow you to augment the system-provided Intelligence Feeds with other regularly-updated reputable Block lists and Do Not Block lists on the Internet. You can also set up an internal feed, which is useful if you want to update multiple Firepower Management Center appliances in your deployment using one source list.

Note

You cannot add address blocks to Block or Do Not Block lists using a /0 netmask in a Security Intelligence feed. If you want to monitor or block all traffic targeted by a policy, use an access control rule with the Monitor or Block rule action, respectively, and a default value of any for the Source Networks and Destination Networks.

See requirements at Custom Lists and Feeds: Requirements, on page 473.
You also can configure the system to use an md5 checksum to determine whether to download an updated feed. If the checksum has not changed since the last time the system downloaded the feed, the system does not need to re-download it. You may want to use md5 checksums for internal feeds, especially if they are large. The md5 checksum must be stored in a simple text file with only the checksum. Comments are not supported.

---

**Note**
The system does **not** perform peer SSL certificate verification when downloading custom feeds, nor does the system support the use of certificate bundles or self-signed certificates to verify the remote peer.

---

If you want strict control over when the system updates a feed from the Internet, you can disable automatic updates for that feed. However, automatic updates ensure the most up-to-date, relevant data.

Manually updating Security Intelligence feeds updates all feeds, including the Intelligence Feeds.

### Creating Security Intelligence Feeds
You must have the Threat license (for FTD devices) or the Protection license (all other device types).

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose <strong>Objects &gt; Object Management</strong>.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Expand the <strong>Security Intelligence</strong> node, then choose a feed type you want to add.</td>
</tr>
</tbody>
</table>
| Step 3 | Click the option appropriate to the feed type you chose above:  
  - Add Network Lists and Feeds (for IP addresses)  
  - Add DNS Lists and Feeds  
  - Add URL Lists and Feeds |
| Step 4 | Enter a **Name** for the feed. |
|        | In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain. |
| Step 5 | Choose **Feed** from the **Type** drop-down list. |
| Step 6 | Enter a **Feed URL**. |
| Step 7 | (Optional) Enter an **MD5 URL**. |
|        | This is used to determine whether the feed contents have changed since the last update, so the system does not download unchanged feeds. |
| Step 8 | Choose an **Update Frequency**. |
| Step 9 | Click **Save**. |
|        | Unless you disabled feed updates, the system attempts to download and verify the feed. |

### Manually Updating Security Intelligence Feeds
You must have the Threat license (for FTD devices) or the Protection license (all other device types).

**Before you begin**
At least one device must already be added to the management center.
Step 1 Choose Objects > Object Management.
Step 2 Expand the Security Intelligence node, then choose a feed type.
Step 3 Click Update Feeds, then confirm.
Step 4 Click OK.

After the Firepower Management Center downloads and verifies the feed updates, it communicates any changes to its managed devices. Your deployment begins filtering traffic using the updated feeds.

Custom Security Intelligence Lists

Security Intelligence lists are simple static lists of IP addresses and address blocks, URLs, or domain names that you manually upload to the system. Custom lists are useful if you want to augment and fine-tune feeds or one of the global lists, for a single Firepower Management Center’s managed devices.

For example, if a reputable feed improperly blocks your access to vital resources but is overall useful to your organization, you can create a custom Do Not Block list that contains only the improperly classified IP addresses, rather than removing the IP address feed object from the access control policy’s Block list.

Note

You cannot add address blocks to a Block or Do Not Block list using a /0 netmask in a Security Intelligence list. If you want to monitor or block all traffic targeted by a policy, use an access control rule with the Monitor or Block rule action, respectively, and a default value of any for the Source Networks and Destination Networks.

Regarding list entry formatting, note the following:

• Netmasks for address blocks can be integers from 0 to 32 or 0 to 128, for IPv4 and IPv6, respectively.
• Unicode in domain names must be encoded in Punycode format, and are case insensitive.
• Characters in domain names are case-insensitive.
• Unicode in URLs should be encoded in percent-encoding format.
• Characters in URL subdirectories are case-sensitive.
• List entries that start with the pound sign (#) are treated as comments.
• See additional formatting requirements at Custom Lists and Feeds: Requirements, on page 473.

Regarding matching list entries, note the following:

• The system matches sub-level domains if a higher-level domain exists in a URL or DNS list. For example, if you add example.com to a DNS list, the system matches both www.example.com and test.example.com.
• The system does not perform DNS lookups (forward or reverse) on DNS or URL list entries. For example, if you add http://192.168.0.2 to a URL list, and it resolves to http://www.example.com, the system only matches http://192.168.0.2, not http://www.example.com.
Uploading New Security Intelligence Lists to the Firepower Management Center

To modify a Security Intelligence list, you must make your changes to the source file and upload a new copy. You cannot modify the file’s contents using the web interface. If you do not have access to the source file, download a copy from the system.

Step 1 Choose Objects > Object Management.
Step 2 Expand the Security Intelligence node, then choose a list type.
Step 3 Click the option appropriate to the list you chose above:
  • Add Network Lists and Feeds (for IP addresses)
  • Add DNS Lists and Feeds
  • Add URL Lists and Feeds
Step 4 Enter a Name.
   In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
Step 5 From the Type drop-down list, choose List.
Step 6 Click Browse to browse to the list .txt file, then click Upload.
Step 7 Click Save.

What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Updating Security Intelligence Lists

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Step 1 Choose Objects > Object Management.
Step 2 Expand the Security Intelligence node, then choose a list type.
Step 3 Next to the list you want to update, click Edit (✎).
   If View (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
Step 4 If you need a copy of the list to edit, click Download, then follow your browser’s prompts to save the list as a text file.
Step 5 Make changes to the list as necessary.
Step 6 On the Security Intelligence pop-up window, click Browse to browse to the modified list, then click Upload.
Step 7 Click Save.
What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Sinkhole Objects

A sinkhole object represents either a DNS server that gives non-routeable addresses for all domain names within the sinkhole, or an IP address that does not resolve to a server. You can reference the sinkhole object within a DNS policy rule to redirect matching traffic to the sinkhole. You must assign the object both an IPv4 address and an IPv6 address.

Creating Sinkhole Objects

You must have the Threat license (for FTD devices) or the Protection license (all other device types).

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Choose Objects &gt; Object Management.</td>
</tr>
<tr>
<td>2</td>
<td>Choose Sinkhole from the list of object types.</td>
</tr>
<tr>
<td>3</td>
<td>Click Add Sinkhole.</td>
</tr>

</tbody>
</table>

File Lists

If you use AMP for Networks, and the AMP cloud incorrectly identifies a file’s disposition, you can add the file to a file list to better detect the file in the future. These files are specified using SHA-256 hash values. Each file list can contain up to 10000 unique SHA-256 values.

There are two predefined categories of file lists:

**Clean List**

If you add a file to this list, the system treats it as if the AMP cloud assigned a clean disposition.

**Custom Detection List**

If you add a file to this list, the system treats it as if the AMP cloud assigned a malware disposition.
In a multidomain deployment, a clean list and custom detection list is present for each domain. In lower-level domains, you can view but not modify ancestor’s lists.

Because you manually specify the blocking behavior for the files included in these lists, the system does not query the AMP cloud for these files’ dispositions. You must configure a rule in the file policy with either a Malware Cloud Lookup or Block Malware action and a matching file type to calculate a file’s SHA value.

Caution

Do not include malware on the clean list. The clean list overrides both the AMP cloud and the custom detection list.

Source Files for File Lists

You can add multiple SHA-256 values to a file list by uploading a comma-separated value (CSV) source file containing a list of SHA-256 values and descriptions. The Firepower Management Center validates the contents and populates the file list with valid SHA-256 values.

The source file must be a simple text file with a .csv file name extension. Any header must start with a pound sign (#); it is treated as a comment and not uploaded. Each entry should contain a single SHA-256 value followed by a description and end with either the LF or CR+LF Newline character. The system ignores any additional information in the entry.

Note the following:

• Deleting a source file from the file list also removes all associated SHA-256 hashes from the file list.

• You cannot upload multiple files to a file list if the successful source file upload results in the file list containing more than 10000 distinct SHA-256 values.

• The system truncates descriptions exceeding 256 characters to the first 256 characters on upload. If the description contains commas, you must use an escape character (\,). If no description is included, the source file name is used instead.

• All non-duplicate SHA-256 values are added to the file list. If a file list contains a SHA-256 value, and you upload a source file containing that value, the newly uploaded value does not modify the existing SHA-256 value. When viewing captured files, file events, or malware events related to the SHA-256 value, any threat name or description is derived from the individual SHA-256 value.

• The system does not upload invalid SHA-256 values in a source file.

• If multiple uploaded source files contain an entry for the same SHA-256 value, the system uses the most recent value.

• If a source file contains multiple entries for the same SHA-256 value, the system uses the last one.

• You cannot directly edit a source file within the object manager. To make changes, you must first modify your source file directly, delete the copy on the system, then upload the modified source file.

• The number of entries associated with a source file refers to the number of distinct SHA-256 values. If you delete a source file from a file list, the total number of SHA-256 entries the file list contains decreases by the number of valid entries in the source file.
Adding Individual SHA-256 Values to File Lists

You must have the Malware license for this procedure.

You can submit a file’s SHA-256 value to add it to a file list. You cannot add duplicate SHA-256 values.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Before you begin

• Right-click a file or malware event from the event view, choose Show Full Text in the context menu, and copy the full SHA-256 value for pasting into the file list.

Step 1
Choose Objects > Object Management.

Step 2
Choose File List from the list of object types.

Step 3
Click Edit ( ) next to the clean list or custom detection list where you want to add a file.

If View ( ) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

Step 4
Choose Enter SHA Value from the Add by drop-down list.

Step 5
Enter a description of the source file in the Description field.

Step 6
Enter or paste the file’s entire value in the SHA-256 field. The system does not support matching partial values.

Step 7
Click Add.

Step 8
Click Save.

What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Note
After configuration changes are deployed, the system no longer queries the AMP cloud for files on the list.

Uploading Individual Files to File Lists

You must have the Malware license for this procedure.

If you have a copy of the file you want to add to a file list, you can upload the file to the Firepower Management Center for analysis; the system calculates the file’s SHA-256 value and adds the file to the list. The system does not enforce a limit on the size of files for SHA-256 calculation.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.
### Uploading Source Files to File Lists

You must have the Malware license for this procedure.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

**Step 1** Choose **Objects > Object Management**.

**Step 2** Click **File List**.

**Step 3** Click **Edit** next to the file list where you want to add values from a source file.

If **View** appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

**Step 4** In the **Add by** drop-down list, choose **List of SHAs**.

**Step 5** Optionally, enter a description of the source file in the **Description** field. If you do not enter a description, the system uses the file name.

**Step 6** Click **Browse** to browse to the source file, then click **Upload and Add List**.

**Step 7** Click **Save**.
What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Note
After you deploy the policies, the system no longer queries the AMP cloud for files on the list.

Editing SHA-256 Values in File Lists

You must have the Malware license for this procedure.

You can edit or delete individual SHA-256 values on a file list. Note that you cannot directly edit a source file within the object manager. To make changes, you must first modify your source file directly, delete the copy on the system, then upload the modified source file.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Step 1
Choose Objects > Object Management.

Step 2
Click File List.

Step 3
Click Edit (✎) next to the clean list or custom detection list where you want to modify a file.

If View (🔗) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

Step 4
You can:

• Click Edit (✎) next to the SHA-256 value you want to change, and modify the SHA-256 or Description values as desired.

• Click Delete (❌) next to the SHA-256 value you want to delete.

Step 5
Click Save to update the file entry in the list.

Step 6
Click Save to save the file list.

What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Note
After configuration changes are deployed, the system no longer queries the AMP cloud for files on the list.

**Downloading Source Files from File Lists**

You must have the Malware license for this procedure.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

*Step 1*  
Choose **Objects > Object Management**.

*Step 2*  
Choose **File List** from the list of object types.

*Step 3*  
Click **Edit** next to the clean list or custom detection list where you want to download a source file.

If **View** appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

*Step 4*  
Next to the source file you want to download, click **View**.

*Step 5*  
Click **Download SHA List** and follow the prompts to save the source file.

*Step 6*  
Click **Close**.

---

**Cipher Suite Lists**

A cipher suite list is an object comprised of several cipher suites. Each predefined cipher suite value represents a cipher suite used to negotiate an SSL- or TLS-encrypted session. You can use cipher suites and cipher suite lists in SSL rules to control encrypted traffic based on whether the client and server negotiated the SSL session using that cipher suite. If you add a cipher suite list to an SSL rule, SSL sessions negotiated with any of the cipher suites in the list match the rule.

---

*Note*  
Although you can use cipher suites in the web interface in the same places as cipher suite lists, you cannot add, modify, or delete cipher suites.

---

**Creating Cipher Suite Lists**

You can use these objects with any device type except NGIPSv.

*Step 1*  
Choose **Objects > Object Management**.

*Step 2*  
Choose **Cipher Suite List** from the list of object types.

*Step 3*  
Click **Add Cipher Suites**.

*Step 4*  
Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

*Step 5*  
Choose one or more cipher suites from the **Available Ciphers** list.
Distinguished Name Objects

Each distinguished name object represents the distinguished name listed for a public key certificate’s subject or issuer. You can use distinguished name objects and groups in SSL rules to control encrypted traffic based on whether the client and server negotiated the SSL session using a server certificate with the distinguished name as subject or issuer.

Your distinguished name object can contain the common name attribute (CN). If you add a common name without “CN=” then the system prepends “CN=” before saving the object.

You can also add a distinguished name with one of each attribute listed in the following table, separated by commas.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
<th>Allowed Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>Country Code</td>
<td>two alphabetic characters</td>
</tr>
<tr>
<td>CN</td>
<td>Common Name</td>
<td>up to 64 alphanumeric, backslash (/), hyphen (-), quotation (“”), or asterisk (*) characters, or spaces</td>
</tr>
<tr>
<td>O</td>
<td>Organization</td>
<td>up to 64 alphanumeric, backslash (/), hyphen (-), quotation (“”), or asterisk (*) characters, or spaces</td>
</tr>
<tr>
<td>OU</td>
<td>Organizational Unit</td>
<td>up to 64 alphanumeric, backslash (/), hyphen (-), quotation (“”), or asterisk (*) characters, or spaces</td>
</tr>
</tbody>
</table>

You can define one or more asterisks (*) as wild cards in an attribute. In a common name attribute, you can define one or more asterisks per domain name label. Wild cards match only within that label, though you can define multiple labels with wild cards. See the following table for examples.

What to do next

• If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.
Table 67: Common Name Attribute Wild Card Examples

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Matches</th>
<th>Does Not Match</th>
</tr>
</thead>
<tbody>
<tr>
<td>CN=&quot;*ample.com&quot;</td>
<td>example.com</td>
<td>mail.example.com example.text.com ampleexam.com</td>
</tr>
<tr>
<td>CN=&quot;exam*.com&quot;</td>
<td>example.com</td>
<td>mail.example.com example.text.com ampleexam.com</td>
</tr>
<tr>
<td>CN=&quot;xamp*.com&quot;</td>
<td>example.com</td>
<td>mail.example.com example.text.com ampleexam.com</td>
</tr>
<tr>
<td>CN=&quot;*example.com&quot;</td>
<td>mail.example.com</td>
<td>example.com example.text.com ampleexam.com</td>
</tr>
<tr>
<td>CN=&quot;*.com&quot;</td>
<td>ampleexam.com</td>
<td>mail.example.com example.text.com</td>
</tr>
<tr>
<td>CN=&quot;<em>.</em>.com&quot;</td>
<td>mail.example.com example.text.com ampleexam.com</td>
<td>example.com</td>
</tr>
</tbody>
</table>

Creating Distinguished Name Objects

You can use these objects with any device type except NGIPSv.

Step 1 Choose Objects > Object Management.
Step 2 Expand the Distinguished Name node, and choose Individual Objects.
Step 3 Click Add Distinguished Name.
Step 4 Enter a Name.
   In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
Step 5 In the DN field, enter a value for the distinguished name or common name. You have the following options:
   - If you add a distinguished name, you can include one of each attribute listed in Distinguished Name Objects, on page 484 separated by commas.
   - If you add a common name, you can include multiple labels and wild cards.
Step 6 Click Save.
What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

PKI Objects

PKI Objects for SSL Application

PKI objects represent the public key certificates and paired private keys required to support your deployment. Internal and trusted CA objects consist of certificate authority (CA) certificates; internal CA objects also contain the private key paired with the certificate. Internal and external certificate objects consist of server certificates; internal certificate objects also contain the private key paired with the certificate.

If you use trusted certificate authority objects and internal certificate objects to configure a connection to ISE/ISE-PIC, you can use ISE/ISE-PIC as an identity source.

If you use internal certificate objects to configure captive portal, the system can authenticate the identity of your captive portal device when connecting to users’ web browsers.

If you use trusted certificate authority objects to configure realms, you can configure secure connections to LDAP or AD servers.

If you use PKI objects in SSL rules, you can match traffic encrypted with:

- the certificate in an external certificate object
- a certificate either signed by the CA in a trusted CA object, or within the CA’s chain of trust

If you use PKI objects in SSL rules, you can decrypt:

- outgoing traffic by re-signing the server certificate with an internal CA object
- incoming traffic using the known private key in an internal certificate object

You can manually input certificate and key information, upload a file containing that information, or in some cases, generate a new CA certificate and private key.

When you view a list of PKI objects in the object manager, the system displays the certificate’s Subject distinguished name as the object value. Hover your pointer over the value to view the full certificate Subject distinguished name. To view other certificate details, edit the PKI object.

Note

The Firepower Management Center and managed devices encrypt all private keys stored in internal CA objects and internal certificate objects with a randomly generated key before saving them. If you upload private keys that are password protected, the appliance decrypts the key using the user-supplied password, then reencrypts it with the randomly generated key before saving it.

PKI Objects for Certificate Enrollment

A certificate enrollment object contains the Certification Authority (CA) server information and enrollment parameters that are required for creating Certificate Signing Requests (CSRs) and obtaining Identity Certificates from the specified CA. These activities occur in your Private Key Infrastructure (PKI).
The certificate enrollment object may also includes certificate revocation information. For more information on PKI, digital certificates, and certificate enrollment see PKI Infrastructure and Digital Certificates, on page 884.

Internal Certificate Authority Objects

Each internal certificate authority (CA) object you configure represents the CA public key certificate of a CA your organization controls. The object consists of the object name, CA certificate, and paired private key. You can use internal CA objects and groups in SSL rules to decrypt outgoing encrypted traffic by re-signing the server certificate with the internal CA.

Note

If you reference an internal CA object in a Decrypt - Resign SSL rule and the rule matches an encrypted session, the user’s browser may warn that the certificate is not trusted while negotiating the SSL handshake. To avoid this, add the internal CA object certificate to either the client or domain list of trusted root certificates.

You can create an internal CA object in the following ways:

- import an existing RSA-based or elliptic curve-based CA certificate and private key
- generate a new self-signed RSA-based CA certificate and private key
- generate an unsigned RSA-based CA certificate and private key. You must submit a certificate signing request (CSR) to another CA to sign the certificate before using the internal CA object.

After you create an internal CA object containing a signed certificate, you can download the CA certificate and private key. The system encrypts downloaded certificates and private keys with a user-provided password.

Whether system-generated or user-created, you can modify the internal CA object name, but cannot modify other object properties.

You cannot delete an internal CA object that is in use. Additionally, after you edit an internal CA object used in an SSL policy, the associated access control policy goes out-of-date. You must re-deploy the access control policy for your changes to take effect.

CA Certificate and Private Key Import

You can configure an internal CA object by importing an X.509 v3 CA certificate and private key. You can upload files encoded in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

If the private key file is password-protected, you can supply the decryption password. If the certificate and key are encoded in the PEM format, you can also copy and paste the information.

You can upload only files that contain proper certificate or key information, and that are paired with each other. The system validates the pair before saving the object.
If you configure a rule with the Decrypt - Resign action, the rule matches traffic based on the referenced internal CA certificate’s encryption algorithm type, in addition to any configured rule conditions. You must upload an elliptic curve-based CA certificate to decrypt outgoing traffic encrypted with an elliptic curve-based algorithm, for example.

Importing a CA Certificate and Private Key

You can use these objects with any device type except NGIPSv.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

**Step 1** Choose **Objects > Object Management**.

**Step 2** Expand the **PKI** node, and choose **Internal CAs**.

**Step 3** Click **Import CA**.

**Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

**Step 5** Above the **Certificate Data** field, click **Browse** to upload a DER or PEM-encoded X.509 v3 CA certificate file.

**Step 6** Above the **Key** field, click **Browse** to upload a DER or PEM-encoded paired private key file.

**Step 7** If the uploaded file is password-protected, check the **Encrypted, and the password is:** check box, and enter the password.

**Step 8** Click **Save**.

**What to do next**

- If an active policy references your object, deploy configuration changes; see **Deploy Configuration Changes**, on page 382.

Generating a New CA Certificate and Private Key

You can use these objects with any device type except NGIPSv.

You can configure an internal CA object by providing identification information to generate a self-signed RSA-based CA certificate and private key.

The generated CA certificate is valid for ten years. The Valid From date is a week before generation.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

**Step 1** Choose **Objects > Object Management**.

**Step 2** Expand the **PKI** node, and choose **Internal CAs**.
Step 3  Click **Generate CA**.

Step 4  Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

Step 5  Enter the identification attributes.

Step 6  Click **Generate self-signed CA**.

---

**New Signed Certificates**

You can configure an internal CA object by obtaining a signed certificate from a CA. This involves two steps:

- Provide identification information to configure the internal CA object. This generates an unsigned certificate and paired private key, and creates a certificate signing request (CSR) to a CA you specify.
- After the CA issues the signed certificate, upload it to the internal CA object, replacing the unsigned certificate.

You can only reference an internal CA object in an SSL rule if it contains a signed certificate.

**Creating an Unsigned CA Certificate and CSR**

You can use these objects with any device type except NGIPSv.

Step 1  Choose **Objects > Object Management**.

Step 2  Expand the **PKI** node, and choose **Internal CAs**.

Step 3  Click **Generate CA**.

Step 4  Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

Step 5  Enter the identification attributes.

Step 6  Click **Generate CSR**.

Step 7  Copy the CSR to submit to a CA.

Step 8  Click **OK**.

---

**What to do next**

- You must upload a signed certificate issued by a CA as described in **Uploading a Signed Certificate Issued in Response to a CSR**, on page 489

**Uploading a Signed Certificate Issued in Response to a CSR**

You can use these objects with any device type except NGIPSv.
In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Once uploaded, the signed certificate can be referenced in SSL rules.

---

**Step 1** Choose **Objects > Object Management**.

**Step 2** Expand the **PKI** node, and choose **Internal CAs**.

**Step 3** Click **Edit** next to the CA object containing the unsigned certificate awaiting the CSR.

**Step 4** Click **Install Certificate**.

**Step 5** Click **Browse** to upload a DER or PEM-encoded X.509 v3 CA certificate file.

**Step 6** If the uploaded file is password protected, check the **Encrypted, and the password is:** check box, and enter the password.

**Step 7** Click **Save** to upload a signed certificate to the CA object.

---

**What to do next**

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

---

**CA Certificate and Private Key Downloads**

You can back up or transfer a CA certificate and paired private key by downloading a file containing the certificate and key information from an internal CA object.

---

**Caution**

Always store downloaded key information in a secure location.

---

The system encrypts the private key stored in an internal CA object with a randomly generated key before saving it to disk. If you download a certificate and private key from an internal CA object, the system first decrypts the information before creating a file containing the certificate and private key information. You must then provide a password the system uses to encrypt the downloaded file.

---

**Caution**

Private keys downloaded as part of a system backup are decrypted, then stored in the unencrypted backup file.

---

**Downloading a CA Certificate and Private Key**

You can use these objects with any device type except NGIPSv.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

You can download CA certificates for both the current domain and ancestor domains.
Step 1  Choose **Objects > Object Management**.
Step 2  Expand the **PKI** node, and choose **Internal CAs**.
Step 3  Next to the internal CA object whose certificate and private key you want to download, click **Edit**.
In a multidomain deployment, click **View** to download the certificate and private key for an object in an ancestor domain.
Step 4  Click **Download**.
Step 5  Enter an encryption password in the **Password** and **Confirm Password** fields.
Step 6  Click **OK**.

---

**Trusted Certificate Authority Objects**

Each trusted certificate authority (CA) object you configure represents a CA public key certificate belonging to a trusted CA. The object consists of the object name and CA public key certificate. You can use external CA objects and groups in:

- your SSL policy to control traffic encrypted with a certificate signed either by the trusted CA, or any CA within the chain of trust.
- your realm configurations to establish secure connections to LDAP or AD servers.
- your ISE/ISE-PIC connection. Select trusted certificate authority objects for the **pxGrid Server CA** and **MNT Server CA** fields.

After you create the trusted CA object, you can modify the name and add certificate revocation lists (CRL), but cannot modify other object properties. There is no limit on the number of CRLs you can add to an object. If you want to modify a CRL you have uploaded to an object, you must delete the object and recreate it.

---

**Note**

Adding a CRL to an object has no effect when the object is used in your ISE/ISE-PIC integration configuration.

You cannot delete a trusted CA object that is in use. Additionally, after you edit a trusted CA object that is in use, the associated access control policy goes out-of-date. You must re-deploy the access control policy for your changes to take effect.

---

**Trusted CA Object**

You can configure an external CA object by uploading an X.509 v3 CA certificate. You can upload a file encoded in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

If the file is password-protected, you must supply the decryption password. If the certificate is encoded in the PEM format, you can also copy and paste the information.
You can upload a CA certificate only if the file contains proper certificate information; the system validates the certificate before saving the object.

Adding a Trusted CA Object

You can use these objects with any device type except NGIPSv.

**Step 1** Choose **Objects > Object Management**.

**Step 2** Expand the **PKI** node, and choose **Trusted CAs**.

**Step 3** Click **Add Trusted CAs**.

**Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

**Step 5** Click **Browse** to upload a DER or PEM-encoded X.509 v3 CA certificate file.

**Step 6** If the file is password-protected, check the **Encrypted, and the password is:** check box, and enter the password.

**Step 7** Click **Save**.

What to do next

- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Certificate Revocation Lists in Trusted CA Objects

You can upload CRLs to a trusted CA object. If you reference that trusted CA object in an SSL policy, you can control encrypted traffic based on whether the CA that issued the session encryption certificate subsequently revoked the certificate. You can upload files encoded in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

After you add the CRL, you can view the list of revoked certificates. If you want to modify a CRL you have uploaded to an object, you must delete the object and recreate it.

You can upload only files that contain a proper CRL. There is no limit to the number of CRLs you can add to a trusted CA object. However, you must save the object each time you upload a CRL, before adding another CRL.

**Note**

Adding a CRL to an object has no effect when the object is used in your ISE/ISE-PIC integration configuration.

Adding a Certificate Revocation List to a Trusted CA Object

You can use these objects with any device type except NGIPSv.
In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

**Note**
Adding a CRL to an object has no effect when the object is used in your ISE/ISE-PIC integration configuration.

---

**Step 1** Choose Objects > Object Management.
**Step 2** Expand the PKI node, and choose Trusted CAs.
**Step 3** Click Edit (📝) next to a trusted CA object.

If View (👁️) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 4** Click Add CRL to upload a DER or PEM-encoded CRL file.
**Step 5** Click OK.

---

**What to do next**
- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

---

**External Certificate Objects**

Each external certificate object you configure represents a server public key certificate that does not belong to your organization. The object consists of the object name and certificate. You can use external certificate objects and groups in SSL rules to control traffic encrypted with the server certificate. For example, you can upload a self-signed server certificate that you trust, but cannot verify with a trusted CA certificate.

You can configure an external certificate object by uploading an X.509 v3 server certificate. You can upload a file in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

You can upload only files that contain proper server certificate information; the system validates the file before saving the object. If the certificate is encoded in the PEM format, you can also copy and paste the information.

**Adding External Certificate Objects**

You can use these objects with any device type except NGIPSv.

---

**Step 1** Choose Objects > Object Management.
**Step 2** Expand the PKI node, and choose External Certs.
Step 3  Click Add External Cert.
Step 4  Enter a Name.
In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
Step 5  Above the Certificate Data field, click Browse to upload a DER or PEM-encoded X.509 v3 server certificate file.
Step 6  Click Save.

What to do next
- If an active policy references your object, deploy configuration changes; see Deploy Configuration Changes, on page 382.

Internal Certificate Objects

Each internal certificate object you configure represents a server public key certificate belonging to your organization. The object consists of the object name, public key certificate, and paired private key. You can use internal certificate objects and groups in:
- your SSL rules to decrypt traffic incoming to one of your organization’s servers using the known private key.
- your ISE/ISE-PIC connection. Select an internal certificate object for the MC Server Certificate field.
- your captive portal configuration to authenticate the identity of your captive portal device when connecting to users' web browsers. Select an internal certificate object for the Server Certificate field.

You can configure an internal certificate object by uploading an X.509 v3 RSA-based or elliptic curve-based server certificate and paired private key. You can upload a file in one of the following supported formats:
- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

If the file is password-protected, you must supply the decryption password. If the certificate and key are encoded in the PEM format, you can also copy and paste the information.

You can upload only files that contain proper certificate or key information, and that are paired with each other. The system validates the pair before saving the object.

After you create the internal certificate object, you can modify the name, but cannot modify other object properties.

You cannot delete an internal certificate object that is in use. Additionally, after you edit an internal certificate object that is in use, the associated access control policy goes out-of-date. You must re-deploy the access control policy for your changes to take effect.

Adding Internal Certificate Objects

You can use these objects with any device type except NGIPSv.
Step 1 Choose Objects > Object Management.
Step 2 Expand the PKI node, and choose Internal Certs.
Step 3 Click Add Internal Cert.
Step 4 Enter a Name.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

Step 5 Above the Certificate Data field, click Browse to upload a DER or PEM-encoded X.509v3 server certificate file.
Step 6 Above the Key field, or click Browse to upload a DER or PEM-encoded paired private key file.
Step 7 If the uploaded private key file is password-protected, check the Encrypted, and the password is: check box, and enter the password.
Step 8 Click Save.

Certificate Enrollment Objects

Trustpoints let you manage and track CAs and certificates. A trustpoint is a representation of a CA or identity pair. A trustpoint includes the identity of the CA, CA-specific configuration parameters, and an association with one, enrolled identity certificate.

A certificate enrollment object contains the Certification Authority (CA) server information and enrollment parameters that are required for creating Certificate Signing Requests (CSRs) and obtaining Identity Certificates from the specified CA. These activities occur in your Private Key Infrastructure (PKI).

The certificate enrollment object may also include certificate revocation information. For more information on PKI, digital certificates, and certificate enrollment see PKI Infrastructure and Digital Certificates, on page 884.

How to Use Certificate Enrollment Objects

Certificate Enrollment Objects are used to enroll your managed devices into your PKI infrastructure, and create trustpoints (CA objects) on devices that support VPN connections by doing the following:

1. Define parameters for CA authentication and enrollment in a Certificate Enrollment Object. Specify shared parameters and use the override facility to specify unique object setting for different devices.

2. Associate and install this object on each managed device that requires the identity certificate. On the device, it becomes a trustpoint.

   When a certificate enrollment object is associated with and then installed on a device, the process of certificate enrollment starts immediately. The process is automatic for self-signed, SCEP, and PKCS12 file enrollment types, meaning it does not require any additional administrator action. Manual certificate enrollment requires extra administrator action.

3. Specify the created trustpoint in your VPN configuration.

Managing Certificate Enrollment Objects

To manage certificate enrollment objects, go to Objects > Object Management, then from the navigation pane choose PKI > Cert Enrollment. The following information is shown:
• Existing certificate enrollment objects are listed in the Name column.
  Use the search field (the magnifying glass) to filter the list.

• The enrollment type of each object is shown in the Type column. The following enrollment methods can be used:
  • Self Signed — The managed device generates its own self signed root certificate.
  • SCEP — (Default) Simple Certificate Enrollment Protocol is used by the device to obtain an identity certificate from the CA.
  • Manual — The process of enrolling is carried out manually by the administrator.
  • PKCS12 File — Import a PKCS12 file on a Firepower Threat Defense managed device that supports VPN connectivity. A PKCS#12, or PFX or P12 file holds the server certificate, any intermediate certificates, and the private key in one encrypted file. Enter the Passphrase value for decryption.

• The Override column indicates whether the object allows overrides (a green check mark) or not (a red X). If a number is displayed, it is the number of overrides in place.

  Use the Override option to customize the object settings for each device that is part of the VPN configuration. Overriding makes each device's trustpoint details unique. Typically the Common Name or Subject is overridden for each device in the VPN configuration.

  See Object Overrides, on page 439 for details and procedures on overriding objects of any type.

• Edit a previously created certificate enrollment object by clicking on the edit icon (a pencil). Editing can only be done if the enrollment object is not associated with any managed devices. Refer to the adding instructions for editing a certificate enrollment object. Failed enrollment objects can be edited.

• Delete a previously created certificate enrollment object by clicking on the delete icon (a trash can). You cannot delete a certificate enrollment object if it is associated with any managed device.

Press (+) Add Cert Enrollment to open the Add Cert Enrollment dialog and configure a Certificate Enrollment Object, see Adding Certificate Enrollment Objects, on page 496. Then install the certificate on each managed, headend device.

Installing a Certificate Using a PKCS12 File, on page 535

Adding Certificate Enrollment Objects
You can use these objects with FTD devices. You must have Admin or Network Admin privileges to do this task.

Step 1 Open the Add Cert Enrollment dialog:

• Directly from Object Management: In the Objects > Object Management screen, choose PKI > Cert Enrollment from the navigation pane, and press Add Cert Enrollment.

• While configuring a managed device: In the Devices > Certificates screen, choose Add > Add New Certificate and click (+) for the Certificate Enrollment field.
Step 2 Enter the Name, and optionally, a Description of this enrollment object.
When enrollment is complete, this name is the name of the trustpoint on the managed devices with which it is associated.

Step 3 Open the CA Information tab and choose the Enrollment Type.

- **Self-Signed Certificate**—The managed device, acting as a CA, generates its own self-signed root certificate. No other information is needed in this pane.

  **Note** When enrolling a self-signed certificate you must specify the Common Name (CN) in the certificate parameters.

- **Manual**—Paste an obtained CA certificate in the CA Certificate box. You can also obtain a CA certificate by copying it from another device.

- **PKCS12 File**—Import a PKCS12 file on a FTD managed device that supports VPN connectivity. A PKCS#12, or PFX, file holds a server certificate, intermediate certificates, and a private key in one encrypted file. Enter the Passphrase value for decryption.

This information is placed in the certificate and is readable by any party who receives the certificate from the router.

Step 5 (Optional) Open the Key tab and specify the Key information. See Certificate Enrollment Object Key Options, on page 499.

Step 6 (Optional) Click the Revocation tab, and specify the revocation options: See Certificate Enrollment Object Revocation Options, on page 500.

Step 7 **Allow Overrides** of this object if desired. See Object Overrides, on page 439 for a full description of object overrides.

---

**What to do next**

Associate and install the enrollment object on a device to create a trustpoint on that device.

**Related Topics**

- Installing a Certificate Using Self-Signed Enrollment, on page 533
- Installing a Certificate Using SCEP Enrollment, on page 534
- Installing a Certificate Using Manual Enrollment, on page 534
- Installing a Certificate Using a PKCS12 File, on page 535

**Certificate Enrollment Object SCEP Options**

**Firepower Management Center Navigation Path**

Objects > Object Management, then from the navigation pane choose PKI > PKI Enrollment. Press (+) Add PKI Enrollment to open the Add PKI Enrollment dialog, and select the CA Information tab.

**Fields**

- **Enrollment Type**—set to SCEP.
**Enrollment URL**—The URL of the CA server to which devices should attempt to enroll.

Use an HTTP URL in the form of `http://CA_name:port`, where `CA_name` is the host DNS name or IP address of the CA server. The port number is mandatory.

**Note**

If the SCEP Server is referred with hostname/FQDN, configure DNS Server using FlexConfig object.

If the CA cgi-bin script location at the CA is not the default (`/cgi-bin/pkiclient.exe`), you must also include the nonstandard script location in the URL, in the form of `http://CA_name:port/script_location`, where `script_location` is the full path to the CA scripts.

**Challenge Password / Confirm Password**—The password used by the CA server to validate the identity of the device. You can obtain the password by contacting the CA server directly or by entering the following address in a web browser: `http://URLHostName/certsrv/mscep/mscep.dll`. The password is good for 60 minutes from the time you obtain it from the CA server. Therefore, it is important that you deploy the password as soon as possible after you create it.

**Retry Period**—The interval between certificate request attempts, in minutes. Value can be 1 to 60 minutes. The default is 1 minute.

**Retry Count**—The number of retries that should be made if no certificate is issued upon the first request. Value can be 1 to 100. The default is 10.

**CA Certificate Source**—Specify how the CA certificate will be obtained.

- **Retrieve Using SCEP** (Default, and only supported option)—Retrieve the certificate from the CA server using the Simple Certificate Enrollment Process (SCEP). Using SCEP requires a connection between your device and the CA server. Ensure there is a route from your device to the CA server before beginning the enrollment process.

**Fingerprint**—When retrieving the CA certificate using SCEP, you may enter the fingerprint for the CA server. Using the fingerprint to verify the authenticity of the CA server’s certificate helps prevent an unauthorized party from substituting a fake certificate in place of the real one. Enter the **Fingerprint** for the CA server in hexadecimal format. If the value you enter does not match the fingerprint on the certificate, the certificate is rejected. Obtain the CA’s fingerprint by contacting the server directly, or by entering the following address in a web browser: `http://<URLHostName>/certsrv/mscep/mscep.dll`.

**Certificate Enrollment Object Certificate Parameters**

Specify additional information in certificate requests sent to the CA server. This information is placed in the certificate and can be viewed by any party who receives the certificate from the router.

**Firepower Management Center Navigation Path**

**Objects > Object Management**, then from the navigation pane choose **PKI > PKI Enrollment**. Press (+) **Add PKI Enrollment** to open the **Add PKI Enrollment** dialog, and select the **Certificate Parameters** tab.

**Fields**

Enter all information using the standard LDAP X.500 format.

- **Include FQDN**—Whether to include the device’s fully qualified domain name (FQDN) in the certificate request. Choices are:
• Use Device Hostname as FQDN
• Don’t use FQDN in certificate
• Custom FQDN—Select this and then specify it in the Custom FQDN field that displays.

• Include Device’s IP Address—The interface whose IP address is included in the certificate request.
• Common Name (CN)—The X.500 common name to include in the certificate.

Note
When enrolling a self-signed certificate you must specify the Common Name (CN) in the certificate parameters.

• Organization Unit (OU)—The name of the organization unit (for example, a department name) to include in the certificate.
• Organization (O)—The organization or company name to include in the certificate.
• Locality (L)—The locality to include in the certificate.
• State (ST)—The state or province to include in the certificate.
• County Code (C)—The country to include in the certificate. These codes conform to ISO 3166 country abbreviations, for example "US" for the United States of America.
• Email (E)—The email address to include in the certificate.
• Include Device’s Serial Number—Whether to include the serial number of the device in the certificate. The CA uses the serial number to either authenticate certificates or to later associate a certificate with a particular device. If you are in doubt, include the serial number, as it is useful for debugging purposes.

Certificate Enrollment Object Key Options

Firepower Management Center Navigation Path

Objects > Object Management, then from the navigation pane choose PKI > Cert Enrollment. Press (+) Add Cert Enrollment to open the Add Cert Enrollment dialog, and select the Key tab.

Fields
• Key Type—RSA, ECDSA, EDDSA.
• Key Name—If the key pair you want to associate with the certificate already exists, this field specifies the name of that key pair. If the key pair does not exist, this field specifies the name to assign to the key pair that will be generated during enrollment. If you do not specify a name, the fully qualified domain name (FQDN) key pair is used instead.
• Key Size—If the key pair does not exist, defines the desired key size (modulus), in bits. The recommended size is 1024. The larger the modulus size, the more secure the key. However, keys with larger modulus sizes take longer to generate (a minute or more when larger than 512 bits) and longer to process when exchanged.
Advanced Settings—Select **Ignore IPsec Key Usage** if you do not want to validate values in the key usage and extended key usage extensions of IPsec remote client certificates. You can suppress key usage checking on IPsec client certificates. By default this option is not enabled.

**Note**
For site-to-site VPN connection, if you use a Windows Certificate Authority (CA), the default Application Policies extension is **IP security IKE intermediate**. If you are using this default setting, you must select the **Ignore IPsec Key Usage** option for the object you select. Otherwise, the endpoints cannot complete the site-to-site VPN connection.

## Certificate Enrollment Object Revocation Options

Specify whether to check the revocation status of a certificate by choosing and configuring the method. Revocation checking is off by default, neither method (CRL or OCSP) is checked.

### Firepower Management Center Navigation Path

Objects > Object Management, then from the navigation pane choose **PKI > PKI Enrollment**. Press (+) Add PKI Enrollment to open the Add PKI Enrollment dialog, and select the **Revocation** tab.

### Fields

- **Enable Certificate Revocation Lists**—Check to enable CRL checking.
  - **Use CRL distribution point from the certificate**—Check to obtain the revocation lists distribution URL from the certificate.
  - **Use static URL configured**—Check this to add a static, pre-defined distribution URL for revocation lists. Then add the URLs.
    - **CRL Server URLs**—The URL of the LDAP server from which the CRL can be downloaded. This URL must start with `ldap://`, and include a port number in the URL.
- **Enable Online Certificate Status Protocol (OCSP)**—Check to enable OCSP checking.
  - **OCSP Server URL**—The URL of the OCSP server checking for revocation if you require OCSP checks. This URL must start with `http://`.
  - **Consider the certificate valid if revocation information can not be reached**—Checked by default. Uncheck if you do not want to allow this.

## Key Chain Objects

To enhance data security and protection of devices, rotating keys for authenticating IGP peers that have a duration of 180 days or less is introduced. The rotating keys prevent any malicious user from guessing the keys used for routing protocol authentication and thereby protecting the network from advertising incorrect routes and redirecting traffic. Changing the keys frequently reduces the risk of them eventually being guessed. When configuring authentication for routing protocols that provide key chains, configure the keys in a key chain to have overlapping lifetimes. This helps to prevent loss of key-secured communication due to absence
of an active key. The rotating keys are applicable only for OSPFv2 protocol. If the key lifetime expires and no active keys are found, OSPF uses the last valid key to maintain the adjacency with peers.

Note

Only MD5 cryptographic algorithm is used for authentication.

**Lifetime of a Key**

To maintain stable communications, each device stores key chain authentication keys and uses more than one key for a feature at the same time. Based on the send and accept lifetimes of a key, key chain management provides a secured mechanism to handle key rollover. The device uses the lifetimes of keys to determine which keys in a key chain are active.

Each key in a key chain has two lifetimes:

- **Accept lifetime**—The time interval within which the device accepts the key during key exchange with another device.
- **Send lifetime**—The time interval within which the device sends the key during key exchange with another device.

During a key send lifetime, the device sends routing update packets with the key. The device does not accept communication from other devices when the key sent is not within the accept lifetime of the key on the device.

If lifetimes are not configured then it is equivalent to configuring MD5 authentication key without timelines.

**Key Selection**

- When key chain has more than one valid key, OSPF selects the key that has the maximum life time.
- Key having an infinite lifetime is preferred.
- If keys have the same lifetime, then key with the higher key ID is preferred.

**Creating Key Chain Objects**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose <strong>Objects</strong> &gt; <strong>Object Management</strong>.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Choose <strong>Key Chain</strong> from the list of object types.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click <strong>Add Key Chain</strong>.</td>
</tr>
<tr>
<td>Step 4</td>
<td>In the Add Key Chain Object dialog box, enter a name for the key chain in the <strong>Name</strong> field. The name must start with an underscore or alphabet, followed by alphanumeric characters or special characters(-, _, +, .).</td>
</tr>
<tr>
<td>Step 5</td>
<td>To add a key to the key chain, click <strong>Add</strong>.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Specify the key identifier in the <strong>Key ID</strong> field. The key id value can be between 0 and 255. Use the value 0 only when you want to signal an invalid key.</td>
</tr>
<tr>
<td>Step 7</td>
<td>The <strong>Algorithm</strong> field and the <strong>Crypto Encryption Type</strong> field displays the supported algorithm and the encryption type, namely MD5 and Plain Text respectively.</td>
</tr>
</tbody>
</table>
Step 8 Enter the password in the **Crypto Key String** field, and re-enter the password in the **Confirm Crypto Key String** field.

- The password can be of a maximum length of 80 characters.
- The passwords cannot be a single digit nor those starting with a digit followed by a white space. For example, "0 pass" or "1" are invalid.

Step 9 To set the time interval for a device to accept/send the key during key exchange with another device, provide the lifetime values in the **Accept Lifetime** and **Send Lifetime** fields:

**Note** The Date Time values default to UTC time zones.

The end time can be the duration, the absolute time when the accept/send lifetime ends, or never expires. The default end time is DateTime.

Following are the validation rules for the start and end values:

- Start lifetime cannot be null when the end lifetime is specified.
- The start lifetime for accept or send lifetime must be earlier than the respective end lifetime.

Step 10 Click **Add**.

Repeat steps 5 to 10 to create keys. Create a minimum of two keys for a key chain with overlapping lifetimes. This helps to prevent loss of key-secured communication due to absence of an active key.

Step 11 Manage overrides for the object:

- If you want to allow overrides for this object, check the **Allow Overrides** check box; see **Allowing Object Overrides**, on page 441.
- If you want to add override values to this object, expand the Override section and click **Add**; see **Adding Object Overrides**, on page 441.

Step 12 Click **Save**.

---

**What to do next**

- If an active policy references your object, deploy configuration changes; see **Deploy Configuration Changes**, on page 382.

**DNS Server Group Objects**

Domain Name System (DNS) servers resolve fully-qualified domain names (FQDN), such as www.example.com, to IP addresses.

**Creating DNS Server Group Objects**

You can use these objects with any device type except NGIPSv.
Step 1  Choose Objects > Object Management.
Step 2  Click DNS Server Group from the network objects list.
Step 3  Click Add DNS Server Group.
Step 4  Enter a Name.
In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
Step 5  Optionally, enter the Default Domain that will be used to append to the host names that are not fully-qualified.
Step 6  The default Timeout and Retries values are pre-populated. Change these values if necessary.
  • Retries—The number of times, from 0 to 10, to retry the list of DNS servers when the system does not receive a response. The default is 2.
  • Timeout—The number of seconds, from 1 to 30, to wait before trying the next DNS server. The default is 2 seconds. Each time the system retries the list of servers, this timeout doubles.
Step 7  Enter the DNS Servers that will be a part of this group, either in IPv4 or IPv6 format as comma separated entries. A maximum of 6 DNS servers can belong to one group.
Step 8  Click Save.

What to do next
The DNS servers configured in the DNS server group should be assigned to interface objects in the DNS platform settings. For more information, see Configure DNS, on page 1113.

SLA Monitor Objects

Each Internet Protocol Service Level Agreement (SLA) monitor defines a connectivity policy to a monitored address and tracks the availability of a route to the address. The route is periodically checked for availability by sending ICMP echo requests and waiting for the response. If the requests time out, the route is removed from the routing table and replaced with a backup route. SLA monitoring jobs start immediately after deployment and continue to run unless you remove the SLA monitor from the device configuration (that is, they do not age out). The Internet Protocol Service Level Agreement (SLA) Monitor Object is used in the Route Tracking field of an IPv4 Static Route Policy. IPv6 routes do not have the option to use SLA monitor via route tracking.

You can use these objects with FTD devices.

Step 1  Select Objects > Object Management and choose SLA Monitor from the table of contents.
Step 2  Click Add SLA Monitor.
Step 3  Enter a name for the object in the Name field.
Step 4  (Optional) Enter a description for the object in the Description field.
Step 5  Enter the frequency of ICMP echo request transmissions, in seconds, in the Frequency field. Valid values range from 1 to 604800 seconds (7 days). The default is 60 seconds.
The frequency cannot be less than the timeout value; you must convert frequency to milliseconds to compare the values.

**Step 6**
Enter the ID number of the SLA operation in the **SLA Monitor ID** field. Values range from 1 to 2147483647. You can create a maximum of 2000 SLA operations on a device. Each ID number must be unique to the policy and the device configuration.

**Step 7**
Enter the amount of time that must pass after an ICMP echo request before a rising threshold is declared, in milliseconds, in the **Threshold** field. Valid values range from 0 to 2147483647 milliseconds. The default is 5000 milliseconds. The threshold value is used only to indicate events that exceed the defined value. You can use these events to evaluate the proper timeout value. It is not a direct indicator of the reachability of the monitored address.

*Note* The threshold value should not exceed the timeout value.

**Step 8**
Enter the amount of time that the SLA operation waits for a response to the ICMP echo requests, in milliseconds, in the **Timeout** field. Values range from 0 to 604800000 milliseconds (7 days). The default is 5000 milliseconds. If a response is not received from the monitored address within the amount of time defined in this field, the static route is removed from the routing table and replaced by the backup route.

*Note* The timeout value cannot exceed the frequency value (adjust the frequency value to milliseconds to compare the numbers).

**Step 9**
Enter the size of the ICMP request packet payload, in bytes, in the **Data Size** field. Values range from 0 to 16384 bytes. The default is 28 bytes, which creates a total ICMP packet of 64 bytes. Do not set this value higher than the maximum allowed by the protocol or the Path Maximum Transmission Unit (PMTU). For purposes of reachability, you might need to increase the default data size to detect PMTU changes between the source and the target. A low PMTU can affect session performance and, if detected, might indicate that the secondary path should be used.

**Step 10**
Enter a value for type of service (ToS) defined in the IP header of the ICMP request packet in the **ToS** field. Values range from 0 to 255. The default is 0. This field contains information such as delay, precedence, reliability, and so on. It can be used by other devices on the network for policy routing and features such as committed access rate.

**Step 11**
Enter the number of packets that are sent in the **Number of Packets** field. Values range from 1 to 100. The default is 1 packet.

*Note* Increase the default number of packets if you are concerned that packet loss might falsely cause the Firepower Threat Defense device to believe that the monitored address cannot be reached.

**Step 12**
Enter the IP address that is being monitored for availability by the SLA operation, in the **Monitored Address** field.

**Step 13**
The **Available Zones** list displays both zones and interface groups. In the **Zones/Interfaces** list, add the zones or interface groups that contain the interfaces through which the device communicates with the management station. To specify a single interface, you need to create a zone or the interface groups for the interface; see **Creating Security Zone and Interface Group Objects**, on page 451. The host will be configured on a device only if the device includes the selected interfaces or zones.

**Step 14**
Click **Save**.

---

**Prefix Lists**

You can create prefix list objects for IPv4 and IPv6 to use when you are configuring route maps, policy maps, OSPF Filtering, or BGP Neighbor Filtering.
Configure IPv6 Prefix List

Use the Configure IPv6 Prefix list page to create, copy and edit prefix list objects. You can create prefix list objects to use when you are configuring route maps, policy maps, OSPF Filtering, or BGP Neighbor Filtering. You can use this object with FTD devices.

**Step 1** Select Objects > Object Management and choose Prefix Lists > IPv6 Prefix List from the table of contents.

**Step 2** Click Add Prefix List.

**Step 3** Enter a name for the prefix list object in the Name field on the New Prefix List Object window.

**Step 4** Click Add on the New Prefix List Object window.

**Step 5** Select the appropriate action, Allow or Block from the Action drop-down list, to indicate the redistribution access.

**Step 6** Enter a unique number that indicates the position a new prefix list entry will have in the list of prefix list entries already configured for this object, in the Sequence No. field. If left blank, the sequence number will default to five more than the largest sequence number currently in use.

**Step 7** Specify the IPv6 address in the IP address/mask length format in the IP address field. The mask length must be a valid value between 1-128.

**Step 8** Enter the minimum prefix length in the Minimum Prefix Length field. The value must be greater than the mask length and less than or equal to the Maximum Prefix Length, if specified.

**Step 9** Enter the maximum prefix length in the Maximum Prefix Length field. The value must be greater than or equal to the Minimum Prefix Length, if present, or greater than the mask length if the Minimum Prefix Length is not specified.

**Step 10** Click Add.

**Step 11** If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 441.

**Step 12** Click Save.

Configure IPv4 Prefix List

Use the Configure IPv4 Prefix list page to create, copy and edit prefix list objects. You can create prefix list objects to use when you are configuring route maps, policy maps, OSPF Filtering, or BGP Neighbor Filtering. You can use this object with FTD devices.

**Step 1** Select Objects > Object Management and choose Prefix Lists > IPv4 Prefix List from the table of contents.

**Step 2** Click Add Prefix List.

**Step 3** Enter a name for the prefix list object in the Name field on the New Prefix List Object window.

**Step 4** Click Add.

**Step 5** Select the appropriate action, Allow or Block from the Action drop-down list, to indicate the redistribution access.

**Step 6** Enter a unique number that indicates the position a new prefix list entry will have in the list of prefix list entries already configured for this object, in the Sequence No. field. If left blank, the sequence number will default to five more than the largest sequence number currently in use.

**Step 7** Specify the IPv4 address in the IP address/mask length format in the IP address field. The mask length must be a valid value between 1 - 32.
Step 8 Enter the minimum prefix length in the Minimum Prefix Length field. The value must be greater than the mask length and less than or equal to the Maximum Prefix Length, if specified.

Step 9 Enter the maximum prefix length in the Maximum Prefix Length field. The value must be greater than or equal to the Minimum Prefix Length, if present, or greater than the mask length if the Minimum Prefix Length is not specified.

Step 10 Click Add.

Step 11 If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 441.

Step 12 Click Save.

Route Maps

Route maps are used when redistributing routes into any routing process. They are also used when generating a default route into a routing process. A route map defines which of the routes from the specified routing protocol are allowed to be redistributed into the target routing process. Configure a route map, to create a new route map entry for a Route Map object or to edit an existing one.

You can use this object with FTD devices.

Before you begin

A Route Map may use one or more of these objects; it is not mandatory to add all these objects. Create and use any of these objects as required, to configure your route map.

- Add ACLs.
- Add Prefix Lists.
- Add AS Path.
- Add Community Lists.
- Add Policy Lists.

Step 1 Select Objects > Object Management and choose Route Map from the table of contents.

Step 2 Click Add Route Map.

Step 3 Click Add on the New Route Map Object window.

Step 4 In the Sequence No. field, enter a number, between 0 and 65535, that indicates the position a new route map entry will have in the list of route maps entries already configured for this route map object.

Note We recommend that you number clauses in intervals of at least 10 to reserve numbering space in case you need to insert clauses in the future.

Step 5 Select the appropriate action, Allow or Block from the Redistribution drop-down list, to indicate the redistribution access.

Step 6 Click the Match Clauses tab to match (routes/traffic) based on the following criteria, which you select in the table of contents:

- Security Zones — Match traffic based on the (ingress/egress) interfaces. You can select zones and add them, or type in interface names and add them.
• IPv4 — Match IPv4 (routes/traffic) based on the following criteria; select the tab to define the criteria.
  a. Click the Address tab to match routes based on the route address. For IPv4 addresses, choose whether to use an Access list or Prefix list for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.
  b. Click the Next Hop tab to match routes based on the next hop address of a route. For IPv4 addresses, choose whether to use an access list or Prefix list for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.
  c. Click the Route Source tab to match routes based on the advertising source address of the route. For IPv4 addresses, choose whether to use an access list or Prefix list for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.

• IPv6 — Match IPv6 (routes/traffic) based on the route address, next-hop address or advertising source address of route.

• BGP — Match BGP (routes/traffic) based on the following criteria; select the tab to define the criteria.
  a. Click the AS Path tab to enable matching the BGP autonomous system path access list with the specified path access list. If you specify more than one path access list, then the route can match either path access list.
  b. Click the Community List tab to enable matching the BGP community with the specified community. If you specify more than one community, then the route can match either community. Any route that does not match at least one Match community will not be advertised for outbound route maps.
  c. Click the Policy List tab to configure a route map to evaluate and process a BGP policy. When multiple policy lists perform matching within a route map entry, all policy lists match on the incoming attribute only.

• Others — Match routes or traffic based on the following criteria.
  a. Enter the metric values to use for matching in the Metric Route Value field, to enable matching the metric of a route. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified metric. The metric values can range from 0 to 4294967295.
  b. Enter the tag values to use for matching in the Tag Values field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified security group tag. The tag values can range from 0 to 4294967295.
  c. Check the appropriate Route Type option to enable matching of the route type. Valid route types are External1, External2, Internal, Local, NSSA-External1, and NSSA-External2. You can choose more than one route type from the list.

Step 7 Click the Set Clauses tab to set routes/traffic based on the following criteria, which you select in the table of contents:

• Metric Values — Set either Bandwidth, all of the values or none of the values.
  a. Enter a metric value or bandwidth in Kbits per second in the Bandwidth field. Valid values are an integer value in the range from 0 to 4294967295.
  b. Select to specify the type of metric for the destination routing protocol, from the Metric Type drop-down list. Valid values are: internal, type-1, or type-2.

• BGP Clauses — Set BGP routes based on the following criteria; select the tab to define the criteria.
  a. Click the AS Path tab to modify an autonomous system path for BGP routes.
1. Enter an AS path number in the **Prepend AS Path** field to prepend an arbitrary autonomous system path string to BGP routes. Usually the local AS number is prepended multiple times, increasing the autonomous system path length. If you specify more than one AS path number then the route can prepend either AS number.

2. Enter an AS path number in the **Prepend Last AS to AS Path** field to prepend the AS path with the last AS number. Enter a value for the AS number from 1 to 10.

3. Check the **Convert route tag into AS path** check box to convert the tag of a route into an autonomous system path.

b. Click the **Community List** tab to set the community attributes.

   1. Click the **None** radio button, to remove the community attribute from the prefixes that pass the route map.
   
   2. Click the **Specific Community** radio button, to enter a community number, if applicable. Valid values are from 1 to 4294967295.
   
   3. Check the **Add to existing communities** check box, to add the community to the already existing communities.
   
   4. Select the **Internet**, **No-Advertise**, or **No-Export** check-boxes to use one of the well-known communities.

c. Click the **Others** tab to set additional attributes.

   1. Check the **Set Automatic Tag** check-box to automatically compute the tag value.
   
   2. Enter a preference value for the autonomous system path in the **Set Local Preference** field. Enter a value between 0 and 4294967295.
   
   3. Enter a BGP weight for the routing table in the **Set Weight** field. Enter a value between 0 and 65535.
   
   4. Select to specify the BGP origin code. Valid values are **Local IGP**, **Local IGP and Incomplete**.
   
   5. In the IPv4 Settings section, specify a next hop IPv4 address of the next hop to which packets are output. It need not be an adjacent router. If you specify more than one IPv4 address then the packets can output at either IP address.

   Select to specify an IPv4 prefix list in the **Prefix List** drop-down list.

   6. In the IPv6 Settings section, specify a next hop IPv6 address of the next hop to which packets are output. It need not be an adjacent router. If you specify more than one IPv6 address then the packets can output at either IP address.

   Select to specify an IPv6 prefix in the **Prefix List** drop-down list.

**Step 8**
Click Add.

**Step 9**
If you want to allow overrides for this object, check the **Allow Overrides** check box; see Allowing Object Overides, on page 441.

**Step 10**
Click Save.
Access List

An access list object, also known as an access control list (ACL), selects the traffic to which a service will apply. You use these objects when configuring particular features, such as route maps, for FTD devices. Traffic identified as allowed by the ACL is provided the service, whereas “blocked” traffic is excluded from the service. Excluding traffic from a service does not necessarily mean that it is dropped altogether.

You can configure the following types of ACL:

- **Extended**—Identifies traffic based on source and destination address and ports. Supports IPv4 and IPv6 addresses, which you can mix in a given rule.
- **Standard**—Identifies traffic based on destination address only. Supports IPv4 only.

An ACL is composed of one or more access control entry (ACE), or rule. The order of ACEs is important. When the ACL is evaluated to determine if a packet matches an “allowed” ACE, the packet is tested against each ACE in the order in which the entries are listed. After a match is found, no more ACEs are checked. For example, if you want to “allow” 10.100.10.1, but “block” the rest of 10.100.10.0/24, the allow entry must come before the block entry. In general, place more specific rules at the top of an ACL.

Packets that do not match an “allow” entry are considered to be blocked.

The following topics explain how to configure ACL objects.

Configure Extended ACL Objects

Use extended ACL objects when you want to match traffic based on source and destination addresses, protocol and port, or if the traffic is IPv6.

**Step 1**
Select **Objects > Object Management** and choose **Access Control Lists > Extended** from the table of contents.

**Step 2**
Do one of the following:

- Click **Add Extended ACL** to create a new object.
- Click **Edit** (✓) to edit an existing object.

**Step 3**
In the Extended ACL Object dialog box, enter a name for the object (no spaces allowed), and configure the access control entries:

a) Do one of the following:

- Click **Add** to create a new entry.

- Click **Edit** (✓) to edit an existing entry.

The right-click menu also includes options to cut, copy, and paste entries, or to delete them.

b) Select the **Action**, whether to Allow (match) or Block (not match) the traffic criteria.

**Note**
The **Logging**, **Log Level**, and **Log Interval** options are used for access rules only (ACLs attached to interfaces or applied globally). Because ACL objects are not used for access rules, leave these values at their defaults.
c) Configure the source and destination addresses on the **Network** tab using any of the following techniques:

- Select the desired network objects or groups from the Available list and click **Add to Source** or **Add to Destination**. You can create new objects by clicking the + button above the list. You can mix IPv4 and IPv6 addresses.

- Type an address in the edit box below the source or destination list and click **Add**. You can specify a single host address (such as 10.100.10.5 or 2001:DB8::0DB8:800:200C:417A), or a subnet (in 10.100.10.0/24 or 10.100.10.0 255.255.255.0 format, or for IPv6, 2001:DB8:0:CD30::/60).

d) Click the **Port** tab and configure the service using any of the following techniques.

- Select the desired port objects from the Available list and click **Add to Source** or **Add to Destination**. You can create new objects by clicking the + button above the list. The object can specify TCP/UDP ports, ICMP/ICMPv6 message types, or other protocols (including “any”). However, the source port, which you typically would leave empty, accepts TCP/UDP only. You cannot select port groups.

- Type or select a port or protocol in the edit box below the source or destination list and click **Add**.

  **Note** To get an entry that applies to all IP traffic, select a destination port object that specifies “all” protocols.

e) Click **Add** to add the entry to the object.
f) If necessary, click and drag the entry to move it up or down in the rule order to the desired location.

Repeat the process to create or edit additional entries in the object.

**Step 4** If you want to allow overrides for this object, check the **Allow Overrides** check box; see **Allowing Object Overrides**, on page 441.

**Step 5** Click **Save**.

---

**Configure Standard ACL Objects**

Use standard ACL objects when you want to match traffic based on destination IPv4 address only. Otherwise, use extended ACLs.

**Step 1** Select **Objects** > **Object Management** and choose **Access Control Lists** > **Standard** from the table of contents.

**Step 2** Do one of the following:

- Click **Add Standard ACL** to create a new object.

- Click **Edit (✎)** to edit an existing object.

**Step 3** In the Standard ACL Object dialog box, enter a name for the object (no spaces allowed), and configure the access control entries:

a) Do one of the following:

- Click **Add** to create a new entry.

- Click **Edit (✎)** to edit an existing entry.
The right-click menu also includes options to cut, copy, and paste entries, or to delete them.

**b)** For each access control entry, configure the following properties:

- **Action**—Whether to Allow (match) or Block (not match) the traffic criteria.
- **Network**—Add the IPv4 network objects or groups that identify the destination of the traffic.

**c)** Click **Add** to add the entry to the object.

**d)** If necessary, click and drag the entry to move it up or down in the rule order to the desired location.

Repeat the process to create or edit additional entries in the object.

**Step 4** If you want to allow overrides for this object, check the **Allow Overrides** check box; see **Allowing Object Overrides**, on page 441.

**Step 5** Click **Save**.

---

**AS Path Objects**

An AS Path is a mandatory attribute to set up BGP. It is a sequence of AS numbers through which a network can be accessed. An AS-PATH is a sequence of intermediate AS numbers between source and destination routers that form a directed route for packets to travel. Neighboring autonomous systems (ASes) use BGP to exchange and update messages about how to reach different AS prefixes. After each router makes a new local decision on the best route to a destination, it will send that route, or path information, along with the accompanying distance metrics and path attributes, to each of its peers. As this information travels through the network, each router along the path prepends its unique AS number to a list of ASes in the BGP message. This list is the route's AS-PATH. An AS-PATH along with an AS prefix, provides a specific handle for a one-way transit route through the network. Use the Configure AS Path page to create, copy and edit autonomous system (AS) path policy objects. You can create AS path objects to use when you are configuring route maps, policy maps, or BGP Neighbor Filtering. An AS path filter allows you to filter the routing update message by using regular expressions.

You can use this object with FTD devices.

**Step 1** Select **Objects > Object Management** and choose **AS Path** from the table of contents.

**Step 2** Click **Add AS Path**.

**Step 3** Enter a name for the AS Path object in the **Name** field. Valid values are between 1 and 500.

**Step 4** Click **Add** on the **New AS Path Object** window.

a) Select the Allow or Block options from the **Action** drop-down list to indicate redistribution access.

b) Specify the regular expression that defines the AS path filter in the **Regular Expression** field.

c) Click **Add**.

**Step 5** If you want to allow overrides for this object, check the **Allow Overrides** check box; see **Allowing Object Overrides**, on page 441.

**Step 6** Click **Save**.
Community Lists

A Community is an optional transitive BGP attribute. A community is a group of destinations that share some common attribute. It is used for route tagging. The BGP community attribute is a numerical value that can be assigned to a specific prefix and advertised to other neighbors. Communities can be used to mark a set of prefixes that share a common attribute. Upstream providers can use these markers to apply a common routing policy such as filtering or assigning a specific local preference or modifying other attributes. Use the Configure Community Lists page to create, copy and edit community list policy objects. You can create community list objects to use when you are configuring route maps or policy maps. You can use community lists to create groups of communities to use in a match clause of a route map. The community list is an ordered list of matching statements. Destinations are matched against the rules until a match is found.

You can use this object with FTD devices.

**Step 1** Select Objects > Object Management and choose Community List from the table of contents.

**Step 2** Click Add Community List.

**Step 3** In the Name field, specify a name for the community list object.

**Step 4** Click Add on the New Community List Object window.

**Step 5** Select the Standard radio button to indicate the community rule type.

Standard community lists are used to specify well-known communities and community numbers.

**Note** You cannot have entries using Standard and entries using Expanded community rule types in the same Community List object.

a) Select the Allow or Block options from the Action drop-down list to indicate redistribution access.

b) In the Communities field, specify a community number. Valid values can be from 1 to 4294967295 or from 0:1 to 65534:65535.

c) Select the appropriate Route Type.

- **Internet** — Select to specify the Internet well-known community. Routes with this community are advertised to all peers (internal and external).
- **No Advertise** — Select to specify the no-advertise well-known community. Routes with this community are not advertised to any peer (internal or external).
- **No Export** — Select to specify the no-export well-known community. Routes with this community are advertised to only peers in the same autonomous system or to only other sub-autonomous systems within a confederation. These routes are not advertised to external peers.

**Step 6** Select the Expanded radio button to indicate the community rule type.

Expanded community lists are used to filter communities using a regular expression. Regular expressions are used to specify patterns to match COMMUNITIES attributes.

a) Select the Allow or Block options from the Action drop-down list to indicate redistribution access.

b) Specify the regular expression in the Expressions field.

**Step 7** Click Add.

**Step 8** If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 441.
**Policy Lists**

Use the Configure Policy List page to create, copy, and edit policy list policy objects. You can create policy list objects to use when you are configuring route maps. When a policy list is referenced within a route map, all of the match statements within the policy list are evaluated and processed. Two or more policy lists can be configured with a route map. A policy list can also coexist with any other preexisting match and set statements that are configured within the same route map but outside of the policy list. When multiple policy lists perform matching within a route map entry, all policy lists match on the incoming attribute only.

You can use this object with FTD devices.

---

**Step 1**  
Select **Objects > Object Management** and choose **Policy List** from the table of contents.

**Step 2**  
Click **Add Policy List**.

**Step 3**  
Enter a name for the policy list object in the **Name** field. Object names are not case-sensitive.

**Step 4**  
Select whether to allow or block access for matching conditions from the **Action** drop-down list.

**Step 5**  
Click the **Interface** tab to distribute routes that have their next hop out of one of the interfaces specified.

In the **Zones/Interfaces** list, add the zones that contain the interfaces through which the device communicates with the management station. For interfaces not in a zone, you can type the interface name into the field below the **Selected Zone/Interface** list and click **Add**. The host will be configured on a device only if the device includes the selected interfaces or zones.

**Step 6**  
Click the **Address** tab to redistribute any routes that have a destination address that is permitted by a standard access list or prefix list.

Choose whether to use an **Access List** or **Prefix List** for matching and then enter or select the Standard Access List Objects or Prefix list objects you want to use for matching.

**Step 7**  
Click the **Next Hop** tab to redistribute any routes that have a next hop router address passed by one of the access lists or prefix lists specified.

Choose whether to use an **Access List** or **Prefix List** for matching and then enter or select the Standard Access List Objects or Prefix list objects you want to use for matching.

**Step 8**  
Click the **Route Source** tab to redistribute routes that have been advertised by routers and access servers at the address specified by the access lists or prefix list.

Choose whether to use an **Access List** or **Prefix List** for matching and then enter or select the Standard Access List Objects or Prefix list objects you want to use for matching.

**Step 9**  
Click the **AS Path** tab to match a BGP autonomous system path. If you specify more than one AS path, then the route can match either AS path.

**Step 10**  
Click the **Community Rule** tab to enable matching the BGP community with the specified community. If you specify more than one community, then the route can match either community. To enable matching the BGP community exactly with the specified community, check the **Match the specified community exactly** check box.

**Step 11**  
Click the **Metric & tag** tab to match the metric and security group tag of a route.
a) Enter the metric values to use for matching in the Metric field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified metric. The metric values can range from 0 to 4294967295.

b) Enter the tag values to use for matching in the Tag field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified security group tag. The tag values can range from 0 to 4294967295.

Step 12 If you want to allow overrides for this object, check the Allow Overrides check box; see Allowing Object Overrides, on page 441.

Step 13 Click Save.

VPN Objects

You can use the following VPN objects on FTD devices. To use these objects, you must have Admin privileges, and your Smart License account must satisfy export controls. You can configure these objects in leaf domains only.

FTD IKE Policies

Internet Key Exchange (IKE) is a key management protocol that is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and automatically establish IPsec security associations (SAs). The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes SAs for other applications, such as IPsec. Both phases use proposals when they negotiate a connection. An IKE proposal is a set of algorithms that two peers use to secure the negotiation between them. IKE negotiation begins by each peer agreeing on a common (shared) IKE policy. This policy states which security parameters are used to protect subsequent IKE negotiations.

For IKEv1, IKE proposals contain a single set of algorithms and a modulus group. You can create multiple, prioritized policies to ensure that at least one policy matches a remote peer’s policy. Unlike IKEv1, in an IKEv2 proposal, you can select multiple algorithms and modulus groups in one policy. Since peers choose during the Phase 1 negotiation, this makes it possible to create a single IKE proposal, but consider multiple, different proposals to give higher priority to your most desired options. For IKEv2, the policy object does not specify authentication, other policies must define the authentication requirements.

An IKE policy is required when you configure a site-to-site IPsec VPN. For more information, see Firepower Threat Defense VPN, on page 875.

Configure IKEv1 Policy Objects

Use the IKEv1 Policy page to create, delete, or edit an IKEv1 policy object. These policy objects contain the parameters required for IKEv1 policies.

Step 1 Choose Objects > Object Management and then VPN > IKEv1 Policy from the table of contents. Previously configured policies are listed including system defined defaults. Depending on your level of access, you may Edit ( ), View View ( ), or Delete ( ) a proposal.
Step 2  (Optional) Choose Add (>Add IKEv1 Policy to create a new policy object.

Step 3  Enter a Name for this policy. A maximum of 128 characters is allowed.

Step 4  (Optional) Enter a Description for this proposal. A maximum of 1,024 characters is allowed.

Step 5  Enter the Priority value of the IKE policy.

The priority value determines the order of the IKE policy compared by the two negotiating peers when attempting to find a common security association (SA). If the remote IPsec peer does not support the parameters selected in your first priority policy, it tries to use the parameters defined in the next lowest priority. Valid values range from 1 to 65,535. The lower the number, the higher the priority. If you leave this field blank, Management Center assigns the lowest unassigned value starting with 1, then 5, then continuing in increments of 5.

Step 6  Choose the Encryption method.

When deciding which encryption and Hash Algorithms to use for the IKEv1 policy, your choice is limited to algorithms supported by the peer devices. For an extranet device in the VPN topology, you must choose the algorithm that matches both peers. For IKEv1, select one of the options. For a full explanation of the options, see Deciding Which Encryption Algorithm to Use, on page 881.

Step 7  Choose the Hash Algorithm that creates a Message Digest, which is used to ensure message integrity.

When deciding which encryption and Hash Algorithms to use for the IKEv1 proposal, your choice is limited to algorithms supported by the managed devices. For an extranet device in the VPN topology, you must choose the algorithm that matches both peers. For a full explanation of the options, see Deciding Which Hash Algorithms to Use, on page 882.

Step 8  Set the Diffie-Hellman Group.

The Diffie-Hellman group to use for encryption. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. Select the group that you want to allow in the VPN. For a full explanation of the options, see Deciding Which Diffie-Hellman Modulus Group to Use, on page 883.

Step 9  Set the Lifetime of the security association (SA), in seconds. You can specify a value from 120 to 2,147,483,647 seconds. The default is 86400.

When the lifetime is exceeded, the SA expires and must be renegotiated between the two peers. Generally, the shorter the lifetime (up to a point), the more secure your IKE negotiations. However, with longer lifetimes, future IPsec security associations can be set up more quickly than with shorter lifetimes.

Step 10  Set the Authentication Method to use between the two peers.

- **Preshared Key**—Preshared keys allow for a secret key to be shared between two peers and to be used by IKE during the authentication phase. If one of the participating peers is not configured with the same preshared key, the IKE SA cannot be established.

- **Certificate**—When you use Certificates as the authentication method for VPN connections, peers obtain digital certificates from a CA server in your PKI infrastructure, and trade them to authenticate each other.

Note  In a VPN topology that supports IKEv1, the Authentication Method specified in the chosen IKEv1 Policy object becomes the default in the IKEv1 Authentication Type setting. These values must match, otherwise, your configuration will error.

Step 11  Click Save
The new IKEv1 policy is added to the list.
Configure IKEv2 Policy Objects

Use the IKEv2 policy dialog box to create, delete, and edit an IKEv2 policy object. These policy objects contain the parameters required for IKEv2 policies.

**Step 1**
Choose **Objects > Object Management** and then **VPN > IKEv2 Policy** from the table of contents.

Previously configured policies are listed including system defined defaults. Depending on your level of access, you may **Edit ( ), View ( ), or Delete ( )** a policy.

**Step 2**
Choose **Add ( ) Add IKEv2 Policy** to create a new policy.

**Step 3**
Enter a **Name** for this policy.

The name of the policy object. A maximum of 128 characters is allowed.

**Step 4**
Enter a **Description** for this policy.

A description of the policy object. A maximum of 1024 characters is allowed.

**Step 5**
Enter the **Priority**.

The priority value of the IKE proposal. The priority value determines the order of the IKE proposals compared by the two negotiating peers when attempting to find a common security association (SA). If the remote IPsec peer does not support the parameters selected in your first priority policy, it tries to use the parameters defined in the next lowest priority policy. Valid values range from 1 to 65535. The lower the number, the higher the priority. If you leave this field blank, Management Center assigns the lowest unassigned value starting with 1, then 5, then continuing in increments of 5.

**Step 6**
Set the **Lifetime** of the security association (SA), in seconds. You can specify a value from 120 to 2,147,483,647 seconds. The default is 86400.

When the lifetime is exceeded, the SA expires and must be renegotiated between the two peers. Generally, the shorter the lifetime (up to a point), the more secure your IKE negotiations. However, with longer lifetimes, future IPsec security associations can be set up more quickly than with shorter lifetimes.

**Step 7**
Choose the **Integrity Algorithms** portion of the Hash Algorithm used in the IKE policy. The Hash Algorithm creates a Message Digest, which is used to ensure message integrity.

When deciding which encryption and Hash Algorithms to use for the IKEv2 proposal, your choice is limited to algorithms supported by the managed devices. For an extranet device in the VPN topology, you must choose the algorithm that matches both peers. Select all the algorithms that you want to allow in the VPN. For a full explanation of the options, see **Deciding Which Hash Algorithms to Use**, on page 882.

**Step 8**
Choose the **Encryption Algorithm** used to establish the Phase 1 SA for protecting Phase 2 negotiations.

When deciding which encryption and Hash Algorithms to use for the IKEv2 proposal, your choice is limited to algorithms supported by the managed devices. For an extranet device in the VPN topology, you must choose the algorithm that matches both peers. Select all the algorithms that you want to allow in the VPN. For a full explanation of the options, see **Deciding Which Encryption Algorithm to Use**, on page 881.

**Step 9**
Choose the **PRF Algorithm**.

The pseudorandom function (PRF) portion of the Hash Algorithm used in the IKE policy. In IKEv1, the Integrity and PRF algorithms are not separated, but in IKEv2, you can specify different algorithms for these elements. Select all of
the algorithms that you want to allow in the VPN. For a full explanation of the options, see Deciding Which Hash Algorithms to Use, on page 882.

**Step 10** Select and **Add a DH Group**.

The Diffie-Hellman group used for encryption. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. Select the groups that you want to allow in the VPN. For a full explanation of the options, see Deciding Which Diffie-Hellman Modulus Group to Use, on page 883.

**Step 11** Click **Save**

If a valid combination of choices has been selected the new IKEv2 policy is added to the list. If not, errors are displayed and you must make changes accordingly to successfully save this policy.

### FTD IPsec Proposals

IPsec Proposals (or Transform Sets) are used when configuring VPN topologies. During the IPsec security association negotiation with ISAKMP, the peers agree to use a particular proposal to protect a particular data flow. The proposal must be the same for both peers.

There are separate IPsec proposal objects based on the IKE version, IKEv1, or IKEv2:

- When you create an IKEv1 IPsec Proposal (Transform Set) object, you select the mode in which IPsec operates, and define the required encryption and authentication types. You can select single options for the algorithms. If you want to support multiple combinations in a VPN, create multiple IKEv1 IPsec Proposal objects.

- When you create an IKEv2 IPsec Proposal object, you can select all of the encryption and Hash Algorithms allowed in a VPN. During IKEv2 negotiations, the peers select the most appropriate options that each support.

The Encapsulating Security Protocol (ESP) is used for both IKEv1 and IKEv2 IPsec Proposals. It provides authentication, encryption, and antireplay services. ESP is IP protocol type 50.

---

**Note**

We recommend using both encryption and authentication on IPsec tunnels.

### Configure IKEv1 IPsec Proposal Objects

**Step 1** Choose **Objects > Object Management** and then **VPN > IPsec IKEv1 Proposal** from the table of contents.

Previously configured Proposals are listed including system defined defaults. Depending on your level of access, you may **Edit (✏)**, View **View (¶)**, or **Delete (🗑)** a Proposal.

**Step 2** Choose **Add ( свобoda)**Add IPsec IKEv1 Proposal to create a new Proposal.

**Step 3** Enter a **Name** for this Proposal

The name of the policy object. A maximum of 128 characters is allowed.

**Step 4** Enter a **Description** for this Proposal.
Configure IKEv2 IPsec Proposal Objects

Step 1 Choose Objects > Object Management and then VPN > IKEv2 IPsec Proposal from the table of contents.

Previously configured Proposals are listed including system defined defaults. Depending on your level of access, you may Edit Edit ( ), View View ( ), or Delete Delete ( ) a Proposal.

Step 2 Choose Add (Add IKEv2 IPsec Proposal to create a new Proposal.

Step 3 Enter a Name for this Proposal.

The name of the policy object. A maximum of 128 characters is allowed.

Step 4 Enter a Description for this Proposal.

A description of the policy object. A maximum of 1024 characters is allowed.

Step 5 Choose the ESP Hash method, the hash or integrity algorithm to use in the Proposal for authentication.

Note FTD does not support IPSec tunnels with NULL encryption. Make sure that you do not choose NULL encryption for IPSec IKEv2 proposal.

For IKEv2, select all the options you want to support for ESP Hash. For a full explanation of the options, see Deciding Which Hash Algorithms to Use, on page 882.

Step 6 Choose the ESP Encryption method. The Encapsulating Security Protocol (ESP) encryption algorithm for this Proposal.

For IKEv2, click Select to open a dialog box where you can select all of the options you want to support. When deciding which encryption and Hash Algorithms to use for the IPsec proposal, your choice is limited to algorithms supported by the devices in the VPN. For a full explanation of the options, see Deciding Which Encryption Algorithm to Use, on page 881.

Step 7 Click Save

The new Proposal is added to the list.
FTD Group Policy Objects

A group policy is a set of attribute and value pairs, stored in a group policy object, that define the remote access VPN experience. For example, in the group policy object, you configure general attributes such as addresses, protocols, and connection settings.

The group policy applied to a user is determined when the VPN tunnel is being established. The RADIUS authorization server assigns the group policy, or it is obtained from the current connection profile.

Note

There is no group policy attribute inheritance on the FTD. A group policy object is used, in its entirety, for a user. The group policy object identified by the AAA server upon login is used, or, if that is not specified, the default group policy configured for the VPN connection is used. The provided default group policy can be set to your default values, but will only be used if it is assigned to a connection profile and no other group policy has been identified for the user.

To use group objects, you must have one of these AnyConnect licenses associated with your Smart License account with Export-Controlled Features enabled:

- AnyConnect VPN Only
- AnyConnect Plus
- AnyConnect Apex

Related Topics

Configure Group Policy Objects, on page 519

Configure Group Policy Objects

See FTD Group Policy Objects, on page 519.

Step 1
Choose Objects > Object Management > VPN > Group Policy.
Previously configured policies are listed including the system default. Depending on your level of access, you may edit, view, or delete a group policy.

Step 2
Click Add Group Policy or choose a current policy to edit.

Step 3
Enter a Name and optionally a Description for this policy.
The name can be up to 64 characters, spaces are allowed. The description can be up to 1,024 characters.

Step 4
Specify the General parameters for this Group Policy as described in Group Policy General Options, on page 520.

Step 5
Specify the AnyConnect parameters for this Group Policy as described in Group Policy AnyConnect Options, on page 522.

Step 6
Specify the Advanced parameters for this Group Policy as described in Group Policy Advanced Options, on page 524.

Step 7
Click Save.
The new Group Policy is added to the list.
What to do next

Add the group policy object to a remote access VPN connection profile.

Group Policy General Options

Navigation Path

Objects > Object Management > VPN > Group Policy, click Click Add Group Policy or choose a current policy to edit, then select the General tab.

VPN Protocols Fields

Specify the types of Remote Access VPN tunnels that can be used when applying this group policy. SSL or IPsec IKEv2.

IP Address Pools

Specifies the IPv4 address assignment that is applied based on address pools that are specific to user-groups in Remote Access VPN. For Remote Access VPN, you can assign IP address from specific address pools for identified user groups using RADIUS/ISE for authorization. You can seamlessly perform policy enforcement for user or user groups in systems which are not identity-aware, by configuring particular Group Policy as RADIUS Authorization attribute (GroupPolicy/Class), for a particular user group. For example, you have to select a specific address pool for contractors and policy enforcement using those addresses to allow restricted access to internal network.

The order of preference that Firepower Threat Defense device assigns the IPv4 Address Pools to the clients:

1. RADIUS attribute for IPv4Address Pool
2. RADIUS attribute for Group Policy
3. Address Pool in Group Policy mapped to a Connection Profile
4. IPv4Address Pool in Connection Profile

Some limitations around using IP address pools in Group Policy:

• IPv6 address pool is not supported.
• Maximum of six IPv4 address pools can be configured in a Group Policy.
• Deployment failures are seen when address pools in use are modified. You must logoff all the users before making any changes to the address pools.
• When address pools are renamed or overlapping address pools are configured, deployment could fail. You must deploy the changes by removing the old address pool and later deploying the changed address pool.

Some troubleshooting commands:

• show ip local pool <address-pool-name>
• show vpn-sessiondb detail anyconnect
• vpn-sessiondb logoff all noconfirm
Banner Fields

Specifies the banner text to present to users at login. The length can be up to 491 characters. There is no default value. The IPsec VPN client supports full HTML for the banner, however, the AnyConnect client supports only partial HTML. To ensure that the banner displays properly to remote users, use the \n tag for IPsec clients, and the <BR> tag for SSL clients.

DNS/WINS Fields

Domain Naming System (DNS) and Windows Internet Naming System (WINS) servers. Used for AnyConnect client name resolution.

- **Primary DNS Server** and **Secondary DNS Server**—Choose or create a Network Object which defines the IPv4 or IPv6 addresses of the DNS servers you want this group to use.

- **Primary WINS Server** and **Secondary WINS Server**—Choose or create a Network Object containing the IP addresses of the WINS servers you want this group to use.

- **DHCP Network Scope**—Choose or create a Network Object containing the IPv4 address of the DHCP Network for this group. This setting does not support IPv6, address ranges, or subnet specifications. If not set properly, deployment of the VPN policy fails.

  **Note**

  The DHCP network scope must be a routable IP address and not a subset of the DHCP pool. The DHCP server determines the subnet this IP address belongs to and assigns an IP address from that pool. You can use any IP address as the dhcp network scope, but it may require that static routes be added to the network.

  LINK-SELECTION (RFC 3527) and SUBNET-SELECTION (RFC 3011) are currently not supported.

- **Default Domain**—Name of the default domain. Specify a top-level domain, for example, example.com.

Split Tunneling Fields

Split tunneling directs some network traffic through the VPN tunnel (encrypted) and the remaining network traffic outside the VPN tunnel (unencrypted or “in the clear”).

- **IPv4 Split Tunneling / IPv6 Split Tunneling**—By default, split tunneling is not enabled. For both IPv4 and IPv6 it is set to Allow all traffic over tunnel. Left as is, all traffic from the endpoint goes over the VPN connection.

  To configure split tunneling, choose the Tunnel networks specified below or Exclude networks specified below policy. Then configure an access control list for that policy.

- **Split Tunnel Network List Type**—Choose the type of Access List you are using. Then choose or create a Standard Access List or Extended Access List. See Access List, on page 509 for details.

- **DNS Request Split Tunneling**—Also known as Split DNS. Configure the DNS behaviour expected in your environment.

  By default, split DNS is not enabled and set to Send DNS request as per split tunnel policy. Choosing Always send DNS request over tunnel forces all DNS requests to be sent over the tunnel to the private network.
To configure split DNS, choose **Send only specified domains over tunnel**, and enter the list of domain names in the **Domain List** field. These requests are resolved through the split tunnel to the private network. All other names are resolved using the public DNS server. Enter up to ten entries in the list of domains, separated by commas. The entire string can be no longer than 255 characters.

**Related Topics**

Configure Group Policy Objects, on page 519

**Group Policy AnyConnect Options**

These specifications apply to the operation of the AnyConnect VPN client.

**Navigation**

Objects > Object Management > VPN > Group Policy. Click Add Group Policy or choose a current policy to edit. Then select the AnyConnect tab.

**Profile Fields**

**Profile**—Choose or create a file object containing an AnyConnect Client Profile. See FTD File Objects, on page 524 for object creation details.

An AnyConnect Client Profile is a group of configuration parameters stored in an XML file. The AnyConnect software client uses it to configure the connection entries that appear in the client's user interface. These parameters (XML tags) also configure settings to enable more AnyConnect features.

Use the GUI-based AnyConnect Profile Editor, an independent configuration tool, to create an AnyConnect Client Profile. See the AnyConnect Profile Editor chapter in the appropriate release of the Cisco AnyConnect Secure Mobility Client Administrator Guide for details.

**SSL Settings Fields**

- **SSL Compression**—Whether to enable data compression, and if so, the method of data compression to use, Deflate, or LZS. SSL Compression is Disabled by default.
  
  Data compression speeds up transmission rates, but also increases the memory requirement and CPU usage for each user session. Therefore, decreasing the overall throughput of the security appliance.

- **DTLS Compression**—Whether to compress Datagram Transport Layer Security (DTLS) connections for this group using LZS or not. DTLS Compression is Disabled by default.

- **MTU Size**—The maximum transmission unit (MTU) size for SSL VPN connections established by the Cisco AnyConnect VPN Client. Default is 1406 Bytes, valid range is 576 to 1462 Bytes.
  
  - **Ignore DF Bit**—Whether to ignore the Don't Fragment (DF) bit in packets that need fragmentation. Allows the forced fragmentation of packets that have the DF bit set, allowing them to pass through the tunnel.

**Connection Settings Fields**

- **Enable Keepalive Messages between AnyConnect Client and VPN gateway**. And its **Interval** setting.—Whether to exchange keepalive messages between peers to demonstrate that they are available to send and receive data in the tunnel. Default is enabled. Keepalive messages transmit at set intervals.
If enabled, enter the time interval (in seconds) that the remote client waits between sending IKE keepalive packets. The default interval is 20 seconds, the valid range is 15 to 600 seconds.

- **Enable Dead Peer Detection on ...**. And their **Interval** settings.—Dead Peer Detection (DPD) ensures that the VPN secure gateway or the VPN client quickly detects when the peer is no longer responding, and the connection has failed. Default is enabled for both the gateway and the client. DPD messages transmit at set intervals. If enabled, enter the time interval (in seconds) that the remote client waits between sending DPD messages. The default interval is 30 seconds, the valid range is 5 to 3600 seconds.

- **Enable Client Bypass Protocol**—Allows you to configure how the secure gateway manages IPv4 traffic (when it is expecting only IPv6 traffic), or how it manages IPv6 traffic (when it is expecting only IPv4 traffic).

  When the AnyConnect client makes a VPN connection to the headend, the headend assigns it an IPv4, IPv6, or both an IPv4 and IPv6 address. If the headend assigns the AnyConnect connection only an IPv4 address or only an IPv6 address, you can configure the Client Bypass Protocol to drop network traffic for which the headend did not assign an IP address (default, disabled, not checked), or allow that traffic to bypass the headend and be sent from the client unencrypted or "in the clear" (enabled, checked).

  For example, assume that the secure gateway assigns only an IPv4 address to an AnyConnect connection and the endpoint is dual-stacked. When the endpoint attempts to reach an IPv6 address, if Client Bypass Protocol is disabled, the IPv6 traffic is dropped; however, if Client Bypass Protocol is enabled, the IPv6 traffic is sent from the client in the clear.

- **SSL rekey**—Enables the client to rekey the connection, renegotiating the crypto keys and initialization vectors, increasing the security of the connection. This is disabled by default. When enabled, the renegotiation can be done at a specified interval and rekey the existing tunnel or create a new tunnel by setting the following fields:

  - **Method**—Available when SSL rekey is enabled. Create a **New Tunnel** (default), or renegotiate, the **Existing Tunnel**'s specifications.
  - **Interval**—Available when SSL rekey is enabled. Set to a default of 4 minutes with a range of 4-10080 minutes (1 week).

- **Client Firewall Rules**—Use the Client Firewall Rules to configure firewall settings for the VPN client's platform. Rules are based on criteria such as source address, destination address, and protocol. Extended Access Control List building block objects are used to define the traffic filter criteria. Choose or create an Extended ACL for this group policy. Define a **Private Network Rule** to control data flowing to the private network, a **Public Network Rule** to control data flowing "in the clear", outside of the established VPN tunnel, or both.

  **Note**

  Ensure that the ACL contains only TCP/UDP/ICMP/IP ports and source network as any, any-ipv4 or any-ipv6.

  Only VPN clients running Microsoft Windows can use these firewall settings.

**Related Topics**

[Configure Group Policy Objects](#), on page 519
Group Policy Advanced Options

Navigation Path

Objects > Object Management > VPN > Group Policy, click Click Add Group Policy or choose a current policy to edit, then select the Advanced tab.

Traffic Filter Fields

• **Access List Filter**—Filters consist of rules that determine whether to allow or block tunneled data packets coming through the VPN connection. Rules are based on criteria such as source address, destination address, and protocol. Extended Access Control List building block objects are used to define the traffic filter criteria. Choose or create a new Extended ACL for this group policy.

• **Restrict VPN to VLAN**—Also called “VLAN mapping,” this parameter specifies the egress VLAN interface for sessions to which this group policy applies. The ASA forwards all traffic from this group to the selected VLAN.

Use this attribute to assign a VLAN to the group policy to simplify access control. Assigning a value to this attribute is an alternative to using ACLs to filter traffic on a session. In addition to the default value (Unrestricted), the drop-down list shows only the VLANs that are configured in this ASA. Allowed values range from 1 to 4094.

Session Settings Fields

• **Access Hours**—Choose or create a time range object. This object specifies the range of time this group policy is available to be applied to a remote access user. See Time Range Objects, on page 452 for details.

• **Simultaneous Logins Per User**—Specifies the maximum number of simultaneous logins allowed for a user. The default value is 3. The minimum value is 0, which disables login and prevents user access. Allowing several simultaneous connections may compromise security and affect performance.

• **Maximum Connection Time / Alert Interval**—Specifies the maximum user connection time in minutes. At the end of this time, the system stops the connection. The minimum is 1 minute). The Alert interval specifies the interval of time before maximum connection time is reached to display a message to the user.

• **Idle Timeout / Alert Interval**—Specifies this user’s idle timeout period in minutes. If there is no communication activity on the user connection in this period, the system stops the connection. The minimum time is 1 minute. The default is 30 minutes. The Alert interval specifies the interval of time before idle time is reached to display a message to the user.

FTD File Objects

Use the Add and Edit File Object dialog boxes to create, and edit file objects. File objects represent files used in configurations, typically for remote access VPN policies. They can contain AnyConnect Client Profile and AnyConnect Client Image files.

When you create a file object, the Firepower Management Center makes a copy of the file in its repository. These files are backed up whenever you create a backup of the database, and they are restored if you restore
the database. When copying a file to the Firepower Management Center platform to be used in a file object, do not copy the file directly to the file repository.

When you deploy configurations that specify a file object, the associated file is downloaded to the device in the appropriate directory.

You can click one of the following options against each file:

- **Download** — Click to download an AnyConnect file.
- **Edit** — Modify the file object details.
- **Delete** — Delete an AnyConnect file object. When you delete a file object, the associated file is not deleted from the file repository, only the object is deleted.

**Navigation Path**

**Objects > Object Management > VPN > AnyConnect File > Add AnyConnect File.**

**Fields**

- **Name** and **Description** — Enter the name, up to 128 characters, and an optional description to identify this file object.

- **File Name** and **File Type** — The name and full path of the file, and its type. Click **Browse** to select the file, and choose the corresponding type.

  Only the **AnyConnect Client Image** and **AnyConnect Client Profile** types are valid, and they must be located on the Firepower Management Center platform to include them in a file object.

**Related Topics**

- Cisco AnyConnect Secure Mobility Client Image, on page 929
- Group Policy AnyConnect Options, on page 522

**FTD Certificate Map Objects**

Certificate Map objects are a named set of certificate matching rules. These objects are used to provide an association between a received certificate and a Remote Access VPN connection profile. Connection Profiles and Certificate Map objects are both part of a remote access VPN policy. If a received certificate matches the rules contained in the certificate map, the connection is "mapped", or associated with the specified connection profile. The rules are in priority order, they are matched in the order they are shown in the UI. The matching ends when the first rule within the Certificate Map object results in a match.

**Navigation**

**Objects > Object Management > VPN > Certificate Map**

**Fields**

- **Name** — Identify this object so it can be referred to from other configurations, such as Remote Access VPN.

- **Mapping Criteria** — Specify the contents of the certificate to evaluate. If the certificate satisfies these rules, the user will be mapped to the connection profile containing this object.
• **Component**—Select the component of the client certificate to use for the matching rule.

• **Field**—Select the field for the matching rule according to the Subject or the Issuer of the client certificate.

If the Field is set to *Alternative Subject* or *Extended Key Usage* the Component will be frozen as Whole Field

• **Operator**—Select the operator for the matching rule as follows:
  - Equals—The certificate component must match the entered value. If they do not match exactly, the connection is denied.
  - Contains—The certificate component must contain the entered value. If the component does not contain the value, the connection is denied.
  - Does Not Equal—The certificate component cannot equal the entered value. For example, for a selected certificate component of Country, and an entered value of US, if the client country value equals US, then the connection is denied.
  - Does Not Contain—The certificate component cannot contain the entered value. For example, for a selected certificate component of Country, and an entered value of US, if the client country value contains US, the connection is denied.

• **Value**—The value of the matching rule. The value entered is associated with the selected component and operator.

Configure Certificate Maps, on page 931

---

**Address Pools**

You can configure IP address pools for both IPv4 and IPv6 that can be used for the Diagnostic interface with clustering, or for VPN remote access profiles.

You can use this object with FTD devices.

---

**Step 1**  Select **Objects > Object Management > Address Pools > IPv4 Pools**.

**Step 2**  Click **Add IPv4 Pools**, and configure the following fields:

- **Name**—Enter the name of the address pool. It can be up to 64 characters
- **Description**—Add an optional description for this pool.
- **IP Address**—Enter a range of addresses available in the pool. Use dotted decimal notation and a dash between the beginning and the end address, for example: 10.10.147.100-10.10.147.177.
- **Mask**—Identifies the subnet on which this IP address pool resides.
- **Allow Overrides**—Check this check box to enable object overrides. Click the expand arrow to show the Overrides table. You can add a new override by clicking **Add**. See **Object Overrides, on page 439** for more information.

**Step 3**  Click **Save**.
Step 4
Click Add IPv6 Pools, and configure the following fields:

- **Name**—Enter the name of the address pool. It can be up to 64 characters.
- **Description**—Add an optional description for this pool.
- **IPv6 Address**—Enter the first IP address available in the configured pool and the prefix length in bits. For example: 2001:DB8::1/64.
- **Number of Addresses**—Identifies the number of IPv6 addresses, starting at the Starting IP Address, that are in the pool.
- **Allow Overrides**—Check this check box to enable overrides. Click the expand arrow to show the Overrides table. You can add a new override by clicking Add. See Object Overrides, on page 439 for more information.

Step 5
Click Save.

---

### FlexConfig Objects

Use FlexConfig policy objects in FlexConfig policies to provide customized configuration of features on FTD devices that you cannot otherwise configure using Firepower Management Center. For more information on FlexConfig policies, see FlexConfig Policy Overview, on page 991.

You can configure the following types of objects for FlexConfig.

**Text Objects**

Text objects define free-form text strings that you use as variables in a FlexConfig object. These objects can have single values or be a list of multiple values.

There are several predefined text objects that are used in the predefined FlexConfig objects. If you use the associated FlexConfig object, you simply need to edit the contents of the text object to customize how the FlexConfig object configures a given device. When editing a predefined object, it is in general a better option to create device overrides for each device you are configuring, rather than directly change the default values of these objects. This helps avoid unintended consequences if another user wants to use the same FlexConfig object for a different set of devices.

For information on configuring text objects, see Configure FlexConfig Text Objects, on page 1017.

**FlexConfig Objects**

FlexConfig Objects include device configuration commands, variables, and scripting language instructions. During configuration deployment, these instructions are processed to create a sequence of configuration commands with customized parameters to configure specific features on the target devices.

These instructions are either configured before (prepended) the system configures features defined in regular Firepower Management Center policies and settings, or after (appended). Any FlexConfig that depends on Firepower Management Center-configured objects (for example, a network object) must be appended to the configuration deployment, or the needed objects would not be configured before the FlexConfig needed to refer to the objects.

For more information on configuring FlexConfig objects, see Configure FlexConfig Objects, on page 1013.
RADIUS Server Groups

RADIUS Server Group objects contain one or more references to RADIUS servers. These servers are used to authenticate users logging in through Remote Access VPN connections.

You can use this object with FTD devices.

Before you begin

Note: You cannot override RADIUS Server Group Objects.

Step 1 Select Objects > Object Management > RADIUS Server Group.
All currently configured RADIUS Server Group objects will be listed. Use the filter to narrow down the list.

Step 2 Choose and edit a listed RADIUS Server Group object, or add a new one.
See RADIUS Server Options, on page 529 and RADIUS Server Group Options, on page 528 to configure this object.

Step 3 Click Save

RADIUS Server Group Options

Navigation Path
Objects > Object Management > RADIUS Server Group. Choose and edit a configured RADIUS Server Group object or add a new one.

Fields

- Name and Description—Enter a name and optionally, a description to identify this RADIUS Server Group object.

- Group Accounting Mode—The method for sending accounting messages to the RADIUS servers in the group. Choose Single, accounting messages are sent to a single server in the group, this is the default. Or, Simultaneous, accounting messages are sent to all servers in the group simultaneously.

- Retry Interval—The interval between attempts to contact the RADIUS servers. Values range from 1 to 10 seconds.

- Realms(Optional)—Specify or select the Active Directory (AD) realm this RADIUS server group is associated with. This realm is then selected in identity policies to access the associated RADIUS server group when determining the VPN authentication identity source for a traffic flow. This realm effectively provides a bridge from the identity policy to this Radius server group. If no realm is associated with this RADIUS server group, the RADIUS server group cannot be reached to determine the VPN authentication identity source for a traffic flow in an identity policy.
• **Enable authorize only**—If this RADIUS server group is not being used for authentication, but is being used for authorization or accounting, check this field to enable authorize-only mode for the RADIUS server group.

Authorize only mode eliminates the need of including the RADIUS server password in the Access-Request. Thus, the password, configured for the individual RADIUS servers, is ignored.

• **Enable interim account update** and **Interval**—Enables the generation of RADIUS interim-accounting-update messages in order to inform the RADIUS server of newly assigned IP addresses. Set the length, in hours, of the interval between periodic accounting updates in the Interval field. The valid range is 1 to 120 and the default value is 24.

• **Enable Dynamic Authorization** and **Port**—Enables the RADIUS dynamic authorization or change of authorization (CoA) services for this RADIUS server group. Specify the listening port for RADIUS CoA requests in the Port field. The valid range is 1024 to 65535 and the default value is 1700. Once defined, the corresponding RADIUS server group will be registered for CoA notification and it listens to the port for the CoA policy updates from the Cisco Identity Services Engine (ISE).

• **RADIUS Servers**—See **RADIUS Server Options**, on page 529.

**Related Topics**

**RADIUS Server Groups**, on page 528

**RADIUS Server Options**

**Navigation Path**

**Objects > Object Management > RADIUS Server Group**. Choose and edit a listed RADIUS Server Group object or add a new one. Then, in the RADIUS Server Group dialog, choose and edit a listed RADIUS Server or add a new one.

**Fields**

• **IP Address/Hostname**—The network object that identifies the hostname or IP address of the RADIUS server to which authentication requests will be sent. You may only select one, to add additional servers, add additional RADIUS Server to the RADIUS Server Group list.

  **Note** Firepower Threat Defense now supports IPv6 IP addresses for RADIUS authentication.

• **Authentication Port**—The port on which RADIUS authentication and authorization are performed. The default is 1812.

• **Key** and **Confirm Key**—The shared secret that is used to encrypt data between the managed device (client) and the RADIUS server.

  The key is a case-sensitive, alphanumeric string of up to 127 characters. Special characters are permitted.

  The key you define in this field must match the key on the RADIUS server. Enter the key again in the Confirm field.

• **Accounting Port**—The port on which RADIUS accounting is performed. The default is 1813.
• **Timeout**—Session timeout for authentication.

  **Note** The timeout value must be 60 seconds or more for RADIUS two factor authentication. The default timeout value is 10 seconds.

• **Connect Using**—Establishes connectivity from Firepower Threat Defense to a RADIUS server using a route lookup or using a specific interface. Select **Routing** to use the routing table. Or select **Specific Interface** and choose a security zone/interface group or the Diagnostic interface (the default).

• **Redirect ACL**—Select the redirect ACL from the list or add a new one.

  **Note** This is the name of the ACL defined in Firepower Threat Defense to decide the traffic to be redirected. The Redirect ACL name here must be the same as the `redirect-acl` name in ISE server. When you configure the ACL object, ensure that you select Block action for ISE and DNS servers, and Allow action for the rest of the servers.

Requirements and Prerequisites for FTD Certificate-Based Authentication

Model Support
FTD

Supported Domains
Any

User Roles
Admin
Network Admin
Firepower Threat Defense VPN Certificate Guidelines and Limitations

- When a PKI enrollment object is associated with and then installed on a device, the certificate enrollment process starts immediately. The process is automatic for self-signed and SCEP enrollment types; it does not require any additional administrator's action. Manual certificate enrollment requires administrator's action.
- When the certificate enrollment is complete, a trustpoint exists on the device with the same name as the certificate enrollment object. Use this trustpoint in the configuration of your VPN Authentication Method.
- FTD devices support certificate enrollment using Microsoft Certificate Authority (CA) Service, and CA Services provided on Cisco Adaptive Security Appliances (ASA) and Cisco IOS Router.
- FTD devices cannot be configured as a certificate authority (CA).

Guidelines for Certificate Management Across Domains and Devices

- Certificate enrollment can be done in a child or parent domain.
- When enrollment is done from a parent domain, the certificate enrollment object also needs to be in the same domain. If the trustpoint on a device is overridden in the child domain, the overridden value will be deployed on the device.
- When the certificate enrollment is done on a device in a leaf domain, the enrollment will be visible to the parent domain or another child domain. Also, adding additional certificates is possible.
- When a leaf domain is deleted, certificate enrollments on the contained devices will be automatically removed.
- Once a device has certificates enrolled in one domain, it will be allowed to be enrolled in any other domain. The certificates can be added in the the other domain.
- When you move a device from one domain to another, the certificates also get moved accordingly. You will receive an alert to delete the enrollments on these devices.

Managing FTD Certificates

See PKI Infrastructure and Digital Certificates, on page 884 for an introduction to Digital Certificates.
See Certificate Enrollment Objects, on page 495 for a description of the objects used to enroll and obtain certificates on managed devices.

Step 1 Select Devices > Certificates.
You can see the following columns for each device listed on this screen:

- **Name**—Lists the devices that already have trustpoints associated with them. Expand the device to see the list of associated trustpoints.
- **Domain**—Displays the certificates that are enrolled in a specific domain.
- **Enrollment Type**—Displays the type of enrollment used for a trustpoint.

- **Status**—Provides the status of the **CA Certificate** and **Identity Certificate**. You can view the certificate contents, when **Available**, by clicking the magnifying glass.

  If the enrollment fails, click status to view the failure message.

- Refresh (circling arrows) a certificate on a managed device. Refreshing a certificate would synchronize the Firepower Threat Defense device certificate status to the Firepower Management Center.

- **Using re-enroll**, enroll the identity certificate.

  During the course of any policy deployment, if the certificate enrollment process fails, enroll the identity certificate again using the re-enroll option.

- Delete (trash can) a configured certificate.

---

**Step 2** Choose (+) **Add** to associate and install an enrollment object on a device.

When a certificate enrollment object is associated with and then installed on a device, the process of certificate enrollment starts immediately. The process is automatic for self-signed and SCEP enrollment types, meaning it does not require any additional administrator action. Manual certificate enrollment requires extra administrator action.

**Note** The certificate enrollment on a device does not block the user interface and the enrollment process gets executed in the background, enabling the user to perform certificate enrollment on other devices in parallel. The progress of these parallel operations can be monitored on the same user interface. The respective icons display the certificate enrollment status.

---

**Related Topics**

- Installing a Certificate Using Self-Signed Enrollment, on page 533
- Installing a Certificate Using SCEP Enrollment, on page 534
- Installing a Certificate Using Manual Enrollment, on page 534
- Installing a Certificate Using a PKCS12 File, on page 535

---

**Installing a Certificate Using Self-Signed Enrollment**

**Step 1** On the **Devices > Certificates** screen, choose **Add** to open the **Add New Certificate** dialog.

**Step 2** Choose a device from the **Device** drop-down list.

**Step 3** Associate a certificate enrollment object with this device in one of the following ways:

- Choose a Certificate Enrollment Object of the type Self-Signed from the drop-down list.
- Click (+), to add a new Certificate Enrollment Object, see Adding Certificate Enrollment Objects, on page 496.

**Step 4** Press **Add** to start the Self Signed, automatic, enrollment process.

For self signed enrollment type trustpoints, the **CA Certificate** status will always be displayed, since the managed device is acting as its own CA and does not need a CA certificate to generate its own Identity Certificate.

The **Identity Certificate** will go from InProgress to Available as the device creates its own self signed identity certificate.
Step 5  
Click the magnifying glass to view the self-signed Identity Certificate created for this device.

---

### What to do next

When enrollment is complete, a trustpoint exists on the device with the same name as the certificate enrollment object. Use this trustpoint in the configuration of your Site to Site and Remote Access VPN Authentication Method.

---

### Installing a Certificate Using SCEP Enrollment

#### Before you begin

- **Note**: Using SCEP enrollment establishes a direct connection between the managed device and the CA server. So be sure your device is connected to the CA server before beginning the enrollment process.

#### Step 1

On the Devices > Certificates screen, choose Add to open the Add New Certificate dialog.

#### Step 2

Choose a device from the Device drop-down list.

#### Step 3

Associate a certificate enrollment object with this device in one of the following ways:

- Choose a Certificate Enrollment Object of the type SCEP from the drop-down list.
- Click (+), to add a new Certificate Enrollment Object, see Adding Certificate Enrollment Objects, on page 496.

#### Step 4

Press Add, to start the automatic enrollment process.

For SCEP enrollment type trustpoints, the CA Certificate status will transition from InProgress to Available as the CA Certificate is obtained from the CA server and installed on the device.

The Identity Certificate will go from InProgress to Available as the device obtains its identity certificate using SCEP from the specified CA. Sometimes, a manual refresh might be required to obtain the identity certificate.

#### Step 5

Click the magnifying glass to view the Identity Certificate created and installed on this device.

---

### What to do next

When enrollment is complete, a trustpoint exists on the device with the same name as the certificate enrollment object. Use this trustpoint in the configuration of your Site to Site and Remote Access VPN Authentication Method.

---

### Installing a Certificate Using Manual Enrollment

#### Step 1

On the Devices > Certificates screen, choose Add to open the Add New Certificate dialog.
Step 2  Choose a device from the **Device** drop-down list.

Step 3  Associate a certificate enrollment object with this device in one of the following ways:

- Choose a Certificate Enrollment Object of the type Manual from the drop-down list.
- Click (+), to add a new Certificate Enrollment Object, see *Adding Certificate Enrollment Objects, on page 496.*

Step 4  Press **Add** to start the enrollment process.

Step 5  Execute the appropriate activity with your PKI CA Server to obtain an identity certificate.

  a)  Click **Identity Certificate** warning to view and copy the CSR.
  b)  Execute the appropriate activity with your PKI CA Server to obtain an identity certificate using this CSR.

  This activity is completely independent of the Firepower Management Center or the managed device. When complete, you will have an Identity Certificate for the managed device. You can place it in a file.

  c)  To finish the manual process, install the obtained identity certificate onto the managed device.

  Return to the Firepower Management Center dialog and select **Browse Identity Certificate** to choose the identity certificate file.

Step 6  Select **Import** to import the Identity Certificate.

The Identity Certificate status will be **Available** when the import complete.

Step 7  Click the magnifying glass to view the **Identity Certificate** for this device.

---

**What to do next**

When enrollment is complete, a trustpoint exists on the device with the same name as the certificate enrollment object. Use this trustpoint in the configuration of your Site to Site and Remote Access VPN Authentication Method.

---

**Installing a Certificate Using a PKCS12 File**

Step 1  Go to **Devices > Certificates** screen, choose **Add** to open the **Add New Certificate** dialog.

Step 2  Choose a pre-configured managed device from the **Device** drop down list.

Step 3  Associate a certificate enrollment object with this device in one of the following ways:

  - Choose a Certificate Enrollment Object of the PKCS type from the drop-down list.
  - Click (+), to add a new Certificate Enrollment Object, see *Adding Certificate Enrollment Objects, on page 496.*

Step 4  Press **Add**.

The CA Certificate and Identity Certificate status will go from **In Progress** to **Available** as it installs the PKCS12 file on the device.

**Note**  When you upload the PKCS12 file for the first time, the file is stored in Firepower Management Center as part of the CertEnrollment object. For any failed enrollments due to a wrong passphrase or failed deployment, retry enrolling the PKCS12 certificate without uploading the file again. A PKCS12 file size should not be larger than 24K.
Step 5  Once Available, click the magnifying glass to view the Identity Certificate for this device.

What to do next

The certificate (trustpoint) on the managed device is named the same as the PKCS#12 file. Use this certificate in your VPN authentication configuration.

Troubleshooting FTD Certificates

See Firepower Threat Defense VPN Certificate Guidelines and Limitations, on page 532 to determine if variations in your certificate enrollment environment may be causing a problem. Then consider the following:

• Ensure there is a route to the CA Server from the device.
  If the CA Server’s host name is given in the Enrollment Object, use Flex Config to configure DNS appropriately to reach the server. Alternatively, use the IP Address of the CA Server.

• If you are using a Microsoft 2012 CA Server, the default IPsec Template is not accepted by the managed device and must be changed.
  To configure a working template, follow these steps as you use MS CA documentation as a reference.
  1. Duplicate the IPsec (Offline Request) template.
  2. In Extensions > Application policies, select IP security end system, instead of the IP security IKE intermediate.
  3. Set the permissions and the template name.
  4. Add the new template and change the registry settings to reflect the new template name.

Remote Management Configuration (Classic Devices)

All Devices Except 7000 and 8000 Series

For information on configuring remote management for devices that use Classic licenses, see the quick start guide for your device.

7000 and 8000 Series Devices

Configure remote management of a 7000 or 8000 Series device using its local web interface, before you register the device to the FMC.
Before you can manage a Firepower device, you must set up a two-way, SSL-encrypted communication channel between the device and the Firepower Management Center. The appliances use the channel to share configuration and event information. High availability peers also use the channel, which is by default on port 8305/tcp.

To enable communications between two appliances, you must provide a way for the appliances to recognize each other, as follows:

- The hostname or IP address of the appliance with which you are trying to establish communication.
  - In NAT environments, even if the other appliance does not have a routable address, you must provide a hostname or an IP address either when you are configuring remote management, or when you are adding the managed appliance.
- A self-generated alphanumeric registration key up to 37 characters in length that identifies the connection.
- An optional unique alphanumeric NAT ID that can help establish communications in a NAT environment.
  - The NAT ID must be unique among all NAT IDs used to register managed appliances.

### Configuring Remote Management on a Managed Device

This procedure applies to 7000 & 8000 Series devices.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>On the web interface for the device you want to manage, choose <strong>System &gt; Integration &gt; Remote Management</strong>.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click <strong>Remote Management</strong>, if it is not already displaying.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click <strong>Add Manager</strong>.</td>
</tr>
</tbody>
</table>
| Step 4 | In the **Management Host** field, enter one of the following for the Firepower Management Center that you want to use to manage this appliance:  
  - The IP address  
  - The fully qualified domain name or the name that resolves through the local DNS to a valid IP address (that is, the host name)  
  - **Caution** Use a host name rather than an IP address if your network uses DHCP to assign IP addresses. |
| Step 5 | In the **Registration Key** field, enter the registration key that you want to use to set up communications between appliances. |
| Step 6 | For NAT environments, in the **Unique NAT ID** field, enter a **unique** alphanumeric NAT ID that you want to use to set up communications between appliances. |
| Step 7 | Click **Save**. |

### What to do next

- Wait until the appliances confirm that they can communicate with each other and the Pending Registration status appears.
- Add this device to the Firepower Management Center; see Add a Device to the FMC, on page 252.
**Editing Remote Management on a Managed Device**

This procedure applies to 7000 & 8000 Series devices.

When editing a remote manager, note that:

- The **Host** field specifies the fully qualified domain name or the name that resolves through the local DNS to a valid IP address (that is, the host name).

- The **Name** field specifies the display name of the managing appliance, which is used only within the context of the Firepower System. Entering a different display name does not change the host name for the managing device.

---

**Step 1**
On the web interface for the device, choose **System > Integration**.

**Step 2**
Click **Remote Management**, if it is not already displaying.

**Step 3**
You can:

- Disable remote management — Click the slider next to the manager to enable or disable it. Disabling management blocks the connection between the Firepower Management Center and the device, but does **not** delete the device from the Firepower Management Center. If you no longer want to manage a device, see Delete a Device from the FMC, on page 255.

- Edit manager information — Click **Edit (edit)** next to the manager you want to modify, modify the **Name** and **Host** fields, and click **Save**.

---

**Changing the Management Port**

Appliances communicate using a two-way, SSL-encrypted communication channel, which by default is on port 8305.

Although Cisco **strongly** recommends that you keep the default setting, you can choose a different port if the management port conflicts with other communications on your network. Usually, changes to the management port are made during installation.

---

**Caution**

If you change the management port, you must change it for all appliances in your deployment that need to communicate with each other.

You must perform this task in the global domain.

---

**Step 1**
Choose **System > Configuration**.

**Step 2**
Click **Management Interfaces**.

**Step 3**
In the **Shared Settings** section, enter the port number that you want to use in the **Remote Management Port** field.

**Step 4**
Click **Save**.
What to do next

Repeat this procedure for every appliance in your deployment that must communicate with this appliance.

Interface Configuration Settings

The Interfaces page of the appliance editor displays detailed interface configuration information. The page is composed of the physical hardware view and the interfaces table view, which allow you to drill down to configuration details. You can add and edit interfaces from this page.

The Physical Hardware View

The top of the Interfaces page provides a graphical representation of the physical hardware view of a 7000 or 8000 Series device.

Use the physical hardware view to:

• view a network module’s type, part number, and serial number
• select an interface in the interfaces table view
• open an interface editor
• view the name of the interface, the type of interface, whether the interface has link, the interface’s speed setting, and whether the interface is currently in bypass mode
• view the details about an error or warning

The Interfaces Page

The interfaces page lists all the available interfaces you have on a device. The table includes an expandable navigation tree you can use to view all configured interfaces. You can click the arrow icon next to an interface to collapse or expand the interface to hide or view its subcomponents. The interfaces table view also provides summarized information about each interface.
Each interface type is represented by a unique icon that indicates its type and link state (if applicable). You can hover your pointer over the name or the icon to view a tooltip with additional information. The interface icons are described in Interface Icons, on page 544.

The icons use a badging convention to indicate the current link state of the interface, which may be one of three states:

- **Error**
- **Fault**
- **Not available**

Logical interfaces have the same link state as their parent physical interface. ASA FirePOWER modules do not display link state. Note that disabled interfaces are represented by semi-transparent icons.

Interface names, which appear to the right of the icons, are auto-generated with the exception of hybrid and ASA FirePOWER interfaces, which are user-defined. Note that for ASA FirePOWER interfaces, the system displays only interfaces that are enabled, named, and have link.

Physical interfaces display the name of the physical interface. Logical interfaces display the name of the physical interface and the assigned VLAN tag.

ASA FirePOWER interfaces display the name of the security context and the name of the interface if there are multiple security contexts. If there is only one security context, the system displays only the name of the interface.

<table>
<thead>

### Using the Physical Hardware View

This task applies to 7000 & 8000 Series devices.
Step 1 Choose Devices > Device Management.

Step 2 Click edit Edit (펜) next to the device you want to manage.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Use the graphical interface to:

- Choose — If you want to choose an interface, click interface. The system highlights the related entry in the interface table.
- Edit — If you want to open an interface editor, double-click interface.
- View error or warning information — If you want to view the details about an error or warning, hover your cursor over the affected port on the network module.
- View interface information — If you want to view the name of the interface, the type of interface, whether the interface has link, the interface’s speed setting, and whether the interface is currently in bypass mode, hover your cursor over the interface.
- View network module information — If you want to view a network module’s type, part number, and serial number, hover your cursor over the dark circle in the lower left corner of the network module.

Configuring Sensing Interfaces

You can configure the sensing interfaces of a managed device, according to your Firepower deployment, from the Interfaces page of the appliance editor. Note that you can only configure a total of 1024 interfaces on a managed device.

Note

The Firepower Management Center does not display ASA interfaces when the ASA FirePOWER is deployed in SPAN port mode.

Step 1 Choose Devices > Device Management.

Step 2 Next to the device where you want to configure an interface, click Edit (펜).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click Edit (펜) next to the interface you want to configure.

Step 4 Use the interface editor to configure the sensing interface:

- HA Link — If you want an interface configured on each member of a high-availability pair of 7000/8000 series devices to act as a redundant communications channel between the devices; also called a high availability link interface, click HA Link and proceed as described in Configuring HA Link Interfaces, on page 546.

- Inline — If you want an interface configured to handle traffic in an inline deployment, click Inline and proceed as described in Configuring Inline Interfaces, on page 555.

- Passive — If you want an interface configured to analyze traffic in a passive deployment, click Passive and proceed as described in Configuring Passive Interfaces, on page 552.
Configuring HA Link Interfaces

After you establish a 7000 or 8000 Series device high-availability pair, you should configure a physical interface as a high availability (HA) link interface. This link acts as a redundant communications channel for sharing health information between the paired devices. When you configure an HA link interface on one device, you automatically configure an interface on the second device. You must configure both HA links on the same broadcast domain.

Dynamic NAT relies on dynamically allocating IP addresses and ports to map to other IP addresses and ports. Without an HA link, these mappings are lost in a failover, causing all translated connections to fail as they are routed through the now-active device in the high-availability pair.

Similarly, 7000 or 8000 Series devices with high-availability state sharing, dynamic NAT, or VPN require an HA link interface.

Step 1 Choose Devices > Device Management.

Step 2 Next to the peer where you want to configure the HA link interface, click Edit ( ).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Next to the interface you want to configure as a HA link interface, click Edit ( ).

Step 4 Click HA Link.

Step 5 Check the Enabled check box.

If you clear the check box, the system administratively takes down the interface, disabling it.

Step 6 From the Mode drop-down list, choose an option to designate the link mode, or choose Autonegotiation to specify that the interface is configured to autonegotiate speed and duplex settings.

Step 7 From the MDI/MDIX drop-down list, choose an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.

Normally, MDI/MDIX is set to Auto-MDIX, which automatically handles switching between MDI and MDIX to attain link.

Step 8 Enter a maximum transmission unit (MTU) in the MTU field.

The range of MTU values can vary depending on the model of the managed device and the interface type. See MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 548 for more information.
Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 386 for more information.

**Caution**

Step 9  Click **Save**.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

**Related Topics**

- Snort® Restart Scenarios, on page 385
- MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 548

---

**Disabling Interfaces**

You can disable an interface by setting the interface type to **None**. Disabled interfaces appear grayed out in the interface list.

This procedure applies to NGIPSv and 7000 & 8000 Series devices.

**Step 1**  Choose **Devices > Device Management**.

**Step 2**  Next to the device where you want to disable the interface, click **Edit**.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3**  Next to the interface you want to disable, click **Edit**.

**Step 4**  Click **None**.

**Step 5**  Click **Save**.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

---

**Managing Cisco ASA FirePOWER Interfaces**

When editing an ASA FirePOWER interface, you can configure only the interface’s security zone from the Firepower Management Center.

You fully configure ASA FirePOWER interfaces using the ASA-specific software and CLI. If you edit an ASA FirePOWER and switch from multiple context mode to single context mode (or visa versa), the ASA FirePOWER renames all of its interfaces. You must reconfigure all Firepower System security zones, correlation rules, and related configurations to use the updated ASA FirePOWER interface names. For more information about ASA FirePOWER interface configuration, see the ASA documentation.
You cannot change the type of ASA FirePOWER interface, nor can you disable the interface from the Firepower Management Center.

**Step 1**  
Choose **Devices > Device Management**.

**Step 2**  
Next to the device where you want to edit the interface, click **Edit (✏)**.  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3**  
Click **Interfaces** if it is not already displaying.

**Step 4**  
Next to the interface you want to edit, click **Edit (✏)**.

**Step 5**  
Choose an existing security zone from the **Security Zone** drop-down list, or choose **New** to add a new security zone.

**Step 6**  
Click **Save** to configure the security zone.

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes**, on page 382.

## MTU Ranges for 7000 and 8000 Series Devices and NGIPSv

Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See **Snort® Restart Traffic Behavior**, on page 386 for more information.

**Note**  
The system trims 18 bytes from the configured MTU value. Do not set the IPv4 MTU lower than 594 or the IPv6 MTU lower than 1298.

### MTU Ranges

<table>
<thead>

</tr>
<tr>
<td></td>
<td>576-9922 (all others)</td>
</tr>
<tr>
<td>NGIPSv</td>
<td>576-9018 (all interfaces, inline sets)</td>
</tr>
</tbody>
</table>

**Related Topics**

About the MTU, on page 685
Synchronizing Security Zone Object Revisions

When you update a security zone object, the system saves a new revision of the object. As a result, if you have managed devices in the same security zone that have different revisions of the security zone object configured in the interfaces, you may log what appear to be duplicate connections.

If you notice duplicate connection reporting, you can update all managed devices to use the same revision of the object.

This procedure applies to NGIPSv and 7000 & 8000 Series devices.

Step 1 Choose Devices > Device Management.

Step 2 Next to the device where you want to update the security zone selection, click Edit (-pencil).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 For each interface logging duplicate connection events, change the Security Zone to another zone, click Save, then change it back to the desired zone, and click Save again.

Step 4 Repeat steps 2 through 3 for each device logging duplicate events. You must edit all devices before you continue.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

Caution

Do not deploy configuration changes to any device until you edit the zone setting for interfaces on all devices you want to sync. You must deploy to all managed devices at the same time.
Synchronizing Security Zone Object Revisions
IPS Device Deployments and Configuration

The following topics describe how to configure your device in an IPS deployment:

- Introduction to IPS Device Deployment and Configuration, on page 551
- License Requirements for IPS Device Deployment, on page 551
- Requirements and Prerequisites for IPS Device Deployment, on page 551
- Passive IPS Deployments, on page 552
- Inline IPS Deployments, on page 553

Introduction to IPS Device Deployment and Configuration

You can configure your device in either a passive or inline IPS deployment. In a passive deployment, you deploy the system out of band from the flow of network traffic. In an inline deployment, you configure the system transparently on a network segment by binding two ports together.

License Requirements for IPS Device Deployment

**FTD License**
Threat

**Classic License**
Protection

Requirements and Prerequisites for IPS Device Deployment

**Model Support**
Any.

**Supported Domains**
Leaf.
**User Roles**

- Admin
- Network Admin

**Passive IPS Deployments**

In a passive IPS deployment, the Firepower System monitors traffic flowing across a network using a switch SPAN (or mirror) port. The SPAN port allows for traffic to be copied from other ports on the switch. This provides the system visibility within the network without being in the flow of network traffic. When configured in a passive deployment, the system cannot take certain actions such as blocking or shaping traffic. Passive interfaces receive all traffic unconditionally, and no traffic received on these interfaces is retransmitted. Passive interfaces support both local SPAN and remote SPAN (RSPAN) traffic.

---

**Note**

Outbound traffic includes flow control packets. Because of this, passive interfaces on your appliances may show outbound traffic and, depending on your configuration, generate events; this is expected behavior.

---

**Passive Interfaces on the Firepower System**

You can configure one or more physical ports on a managed device as passive interfaces.

When you enable a passive interface to monitor traffic, you designate mode and MDI/MDIX settings, which are available only for copper interfaces. Interfaces on 8000 Series appliances do not support half-duplex options.

When you disable a passive interface, users can no longer access it for security purposes.

The range of MTU values can vary depending on the model of the managed device and the interface type.

---

**Caution**

Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 386 for more information.

---

**Related Topics**

- [MTU Ranges for 7000 and 8000 Series Devices and NGIPSv](#), on page 548
- [Snort® Restart Scenarios](#), on page 385

**Configuring Passive Interfaces**

**Step 1** Choose **Devices > Device Management**.

**Step 2** Click **Edit** (✏️) next to the device where you want to configure the passive interface.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click **Edit** (✍️) next to the interface you want to configure as a passive interface.

**Step 4** Click **Passive**.

**Step 5** If you want to associate the passive interface with a security zone, do one of the following:

- Choose an existing security zone from the **Security Zone** drop-down list.
- Choose **New** to add a new security zone; see Creating Security Zone and Interface Group Objects, on page 451.

**Step 6** Check the Enabled check box.

If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.

**Step 7** 7000 & 8000 Series only: From the **Mode** drop-down list, designate the link mode, or choose **Autonegotiation** to specify that the interface is configured to automatically negotiate speed and duplex settings.

Mode settings are available only for copper interfaces.

Interfaces on 8000 Series appliances do not support half-duplex options.

**Step 8** 7000 & 8000 Series only: From the **MDI/MDIX** drop-down list, designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDI.

MDI/MDIX settings are available only for copper interfaces.

By default, MDI/MDIX is set to **Auto-MDI**, which automatically handles switching between MDI and MDIX to attain link.

**Step 9** Enter a maximum transmission unit (MTU) in the **MTU** field.

The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 386 for more information.

**Step 10** Click **Save**.

---

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

---

**Inline IPS Deployments**

In an inline IPS deployment, you configure the Firepower System transparently on a network segment by binding two ports together. This allows the system to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of an inline set unless explicitly dropped.
For the system to affect traffic, you must deploy relevant configurations to managed devices using routed, switched, or transparent interfaces, or inline interface pairs.

You can configure the interfaces on your managed device to route traffic between a host on your network and external hosts through different inline interface pairs, depending on whether the device traffic is inbound or outbound. This is an asynchronous routing configuration. If you deploy asynchronous routing but you include only one interface pair in an inline set, the device might not correctly analyze your network traffic because it might see only half of the traffic.

Adding multiple inline interface pairs to the same inline interface set allows the system to identify the inbound and outbound traffic as part of the same traffic flow. For passive interfaces only, you can also achieve this by including the interface pairs in the same security zone.

When the system generates a connection event from traffic passing through an asynchronous routing configuration, the event may identify an ingress and egress interface from the same inline interface pair. The configuration in the following diagram, for example, would generate a connection event identifying `eth3` as the ingress interface and `eth2` as the egress interface. This is expected behavior in this configuration.
If you assign multiple interface pairs to a single inline interface set but you experience issues with duplicate traffic, reconfigure to help the system uniquely identify packets. For example, you could reassign your interface pairs to separate inline sets or modify your security zones.

For devices with inline sets, a software bridge is automatically set up to transport packets after the device restarts. If the device is restarting, there is no software bridge running anywhere. If you enable bypass mode on the inline set, it goes into hardware bypass while the device is restarting. In that case, you may lose a few seconds of packets as the system goes down and comes back up, due to renegotiation of link with the device. However, the system will pass traffic while Snort is restarting.

- Snort® Restart Scenarios, on page 385

## Inline Interfaces on the Firepower System

You can configure one or more physical ports on a managed device as inline interfaces. You must assign a pair of inline interfaces to an inline set before they can handle traffic in an inline deployment.

**Note:**
- The system warns you if you set the interfaces in an inline pair to different speeds or if the interfaces negotiate to different speeds.
- If you configure an interface as an inline interface, the adjacent port on its NetMod automatically becomes an inline interface as well to complete the pair.
- To configure inline interfaces on an NGIPSv device, you must create the inline pair using adjacent interfaces.

## Configuring Inline Interfaces

**Step 1** Choose Devices > Device Management.

**Step 2** Click Edit (📝) next to the device where you want to configure the interface.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click Edit (📝) next to the interface you want to configure.

**Step 4** Click Inline.

**Step 5** If you want to associate the inline interface with a security zone, do one of the following:
- Choose an existing security zone from the Security Zone drop-down list.
- Choose New to add a new security zone; see Creating Security Zone and Interface Group Objects, on page 451.

**Step 6** Choose an existing inline set from the Inline Set drop-down list, or choose New to add a new inline set.

**Note** If you add a new inline set, you must configure it after you set up the inline interface; see Adding Inline Sets, on page 558.
Step 7 Check the **Enabled** check box.

If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.

Step 8 7000 & 8000 Series only: From the **Mode** drop-down list, designate the link mode, or choose **Autonegotiation** to specify that the interface is configured to automatically negotiate speed and duplex settings.

Mode settings are available only for copper interfaces.

Interfaces on 8000 Series appliances do not support half-duplex options.

Step 9 7000 & 8000 Series only: From the **MDI/MDIX** drop-down list, designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.

MDI/MDIX settings are available only for copper interfaces.

By default, MDI/MDIX is set to **Auto-MDIX**, which automatically handles switching between MDI and MDIX to attain link.

Step 10 Click **Save**.

---

**What to do next**

- Deploy configuration changes; see **Deploy Configuration Changes, on page 382**.

---

**Inline Sets on the Firepower System**

Before you can use inline interfaces in an inline deployment, you must configure inline sets and assign inline interface pairs to them. An inline set is a grouping of one or more inline interface pairs on a device; an inline interface pair can belong to only one inline set at a time.

The **Inline Sets** tab of the Device Management page displays a list of all inline sets you have configured on a device.

You can add inline sets from the **Inline Sets** tab of the Device Management page or you can add inline sets as you configure inline interfaces.

You can assign **only** inline interface pairs to an inline set. If you want to create an inline set before you configure the inline interfaces on your managed devices, you can create an empty inline set and add interfaces to it later. You can use alphanumeric characters and spaces when you type a name for an inline set.

---

**Note**

Create inline sets before you add security zones for the interfaces in the inline set; otherwise security zones are removed and you must add them again.

---

**Name**

The name of the inline set.

**Interfaces**

A list of all inline interface pairs assigned to the inline set. A pair is not available when you disable either interface in the pair from the Interfaces tab.
**MTU**

The maximum transmission unit for the inline set. The range of MTU values can vary depending on the model of the managed device and the interface type.

---

**Caution**

Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 386 for more information.

---

**Failsafe**

Behavior of the interface on a 7000 or 8000 Series or NGIPSv device when the Snort process is busy or down.

- **Enabled**—New and existing flows pass without inspection when the Snort process is busy or down.
- **Disabled**—New and existing flows drop when the Snort process is busy and pass without inspection when the Snort process is down.

The Snort process can be busy when traffic buffers are full, indicating that there is more traffic than the managed device can handle, or because of other software issues.

The Snort process goes down when you deploy a configuration that requires it to restart. See Configurations that Restart the Snort Process When Deployed or Activated, on page 388 for more information.

---

**Note**

When traffic passes without inspection, features that rely on the Snort process do not function. These include application control and deep inspection. The system performs only basic access control using simple, easily determined transport and network layer characteristics.

---

**Bypass Mode**

Firepower 7000 or 8000 Series only: The configured bypass mode of the inline set. This setting determines how the relays in the inline interfaces respond when an interface fails. The bypass mode allows traffic to continue to pass through the interfaces. The non-bypass mode blocks traffic.

---

**Caution**

In bypass mode, you may lose a few packets when you reboot the appliance. You cannot configure bypass mode for inline sets on 7000 or 8000 Series devices in a high-availability pair, for non-bypass NetMods on 8000 Series devices, or for SFP modules on Firepower 7115 or 7125 devices.

---

**Related Topics**

- MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 548
- Snort® Restart Scenarios, on page 385
Viewing Inline Sets

**Step 1** Choose Devices > Device Management.

**Step 2** Click Edit (✏️) next to the device where you want to view the inline sets.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click Inline Sets.

---

Adding Inline Sets

**Step 1** Choose Devices > Device Management.

**Step 2** Click Edit (✏️) next to the device where you want to add the inline set.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click Inline Sets.

**Step 4** Click Add Inline Set.

**Step 5** Enter a Name.

**Step 6** Next to Interfaces, choose one or more inline interface pairs, then click Add Selected. To add all interface pairs to the inline set, click Add All.

**Tip** To remove inline interfaces from the inline set, choose one or more inline interface pairs and click Remove Selected. To remove all interface pairs from the inline set, click Remove All. Disabling either interface in a pair from Interfaces also removes the pair.

**Step 7** Enter a maximum transmission unit (MTU) in the MTU field.

The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See Snort® Restart Traffic Behavior, on page 386 for more information.

**Step 8** If you want to specify that traffic is allowed to bypass detection and continue through the device when the Snort process is busy or down, choose Failsafe. See Inline Sets on the Firepower System, on page 556 for more information.

Enabling Failsafe on a device with inline sets greatly decreases the risk of dropped packets if the internal traffic buffers are full, but your device may still drop packets in certain conditions. In the worst case, the device may experience a temporary network outage.

**Step 9** (7000/8000 series only) Specify the bypass mode.

- Click Bypass to allow traffic to continue to pass through the interfaces.
- Click Non-Bypass to block traffic.
You cannot configure bypass mode for inline sets on 7000 or 8000 Series devices in high-availability pairs, inline sets on an NGIPSv device, for non-bypass NetMods on 8000 Series devices, or for SFP modules on Firepower 7115 or 7125 devices.

**Step 10**
Optionally, configure advanced settings; see Advanced Inline Set Options, on page 559.

**Step 11**
Click **OK**.

---

**What to do next**

Deploy configuration changes; see Deploy Configuration Changes, on page 382.

**Related Topics**

- MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 548
- Snort® Restart Scenarios, on page 385

---

**Advanced Inline Set Options**

There are a number of advanced options you may consider as you configure inline sets.

**Tap Mode**

Tap mode is available on 7000 and 8000 Series devices when you create an inline or inline with fail-open interface set.

With tap mode, the device is deployed inline, but instead of the packet flow passing through the device, a copy of each packet is sent to the device and the network traffic flow is undisturbed. Because you are working with copies of packets rather than the packets themselves, rules that you set to drop and rules that use the replace keyword do not affect the packet stream. However, rules of these types do generate intrusion events when they are triggered, and the table view of intrusion events indicates that the triggering packets would have dropped in an inline deployment.

There are benefits to using tap mode with devices that are deployed inline. For example, you can set up the cabling between the device and the network as if the device were inline and analyze the kinds of intrusion events the device generates. Based on the results, you can modify your intrusion policy and add the drop rules that best protect your network without impacting its efficiency. When you are ready to deploy the device inline, you can disable tap mode and begin dropping suspicious traffic without having to reconfigure the cabling between the device and the network.

Note that you cannot enable this option and strict TCP enforcement on the same inline set.

**Propagate Link State**

**Note**

Link state propagation is not supported on virtual devices. Only 7000 and 8000 Series devices support link state propagation.

Link state propagation is a feature for inline sets configured in bypass mode and non-bypass mode so both pairs of an inline set track state. Link state propagation is available for both copper and fiber configurable bypass interfaces.
Link state propagation automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down. When the downed interface comes back up, the second interface automatically comes back up, also. In other words, if the link state of one interface changes, the appliance senses the change and updates the link state of the other interface to match it. Note that appliances require up to 4 seconds to propagate link state changes.

Link state propagation is especially useful in resilient network environments where routers are configured to reroute traffic automatically around network devices that are in a failure state.

You cannot disable link state propagation for inline sets configured on 7000 and 8000 Series devices in high-availability pairs.

**Transparent Inline Mode**

Transparent Inline Mode option allows the device to act as a “bump in the wire” and means that the device forwards all the network traffic it sees, regardless of its source and destination. You cannot disable this option on 7000 and 8000 Series devices.

**Strict TCP Enforcement**

To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed. Strict enforcement also blocks:

- non-SYN TCP packets for connections where the three-way handshake was not completed
- non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK
- non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established
- SYN packets on an established TCP connection from either the initiator or the responder

**Configuring Advanced Inline Set Options**

2. Click Edit (📝) next to the device where you want to edit the inline set.
   - In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
3. Click Inline Sets.
4. Click Edit (📝) next to the inline set you want to edit.
5. Click Advanced.
6. Configure options as described in Advanced Inline Set Options, on page 559.

**Note** Link state propagation and strict TCP enforcement are not supported on virtual devices.
Step 7  Click OK.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

Deleting Inline Sets

When you delete an inline set, any inline interfaces assigned to the set become available for inclusion in another set. The interfaces are not deleted.

Step 1  Choose Devices > Device Management.

Step 2  Next to the device where you want to delete the inline set, click Edit (กด).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  Click Inline Sets.

Step 4  Next to the inline set you want to delete, click Delete (ลบ).

Step 5  When prompted, confirm that you want to delete the inline set.

What to do next

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

- Device High Availability State Sharing, on page 574
- Device High Availability State Sharing Statistics for Troubleshooting, on page 577
- Separating Device High-Availability Pairs, on page 580

About 7000 and 8000 Series Device High Availability

With 7000 and 8000 Series device high availability, you can establish redundancy of networking functionality and configuration data between two peer devices or two peer device stacks.

You achieve configuration redundancy by configuring two peer devices or two peer device stacks into a high-availability pair to act as a single logical system for policy deploys, system updates, and registration. The system automatically synchronizes other configuration data.

Note

Static routes, non-SFRP IP addresses, and routing priorities are not synchronized between the peer devices or peer device stacks. Each peer device or peer device stack maintains its own routing intelligence.

Related Topics

SFRP
Advanced Virtual Switch Settings, on page 1291
Device High Availability Requirements

Before you can configure a 7000 and 8000 Series device high-availability pair, the following must be true:

- You can only pair single devices with single devices or device stacks with device stacks.
- Both devices or device stacks must have normal health status, be running the same software, and have the same licenses. See Using the Health Monitor, on page 316 for more information. In particular, the devices cannot have hardware failures that would cause them to enter maintenance mode and trigger a failover.

**Note**

After you pair the devices, you cannot change the license options for individual paired devices, but you can change the license for the entire high-availability pair.

- Interfaces must be configured on each device or each primary device in a stack.
- Both devices or the primary members of the device stacks must be the same model and have identical copper or fiber interfaces.
- Device stacks must have identical hardware configurations, except for an installed malware storage pack. For example, you can pair a Firepower 8290 with another 8290. None, one, or all devices in either stack might have a malware storage pack.

**Caution**

Do not attempt to install a hard drive that was not supplied by Cisco in your device. Installing an unsupported hard drive may damage the device. Malware storage pack kits are available for purchase only from Cisco, and are for use only with 8000 Series devices. Contact Support if you require assistance with the malware storage pack. See the Firepower System Malware Storage Pack Guide for more information.

- If the devices are targeted by NAT policies, both peers must have the same NAT policy.
- In a multidomain deployment, you can only establish 7000 or 8000 Series device high-availability or device stacks within a leaf domain.

**Note**

After failover and recovery, SFRP preempts to the primary node.

Device High Availability Failover and Maintenance Mode

With a 7000 and 8000 Series device high availability, the system fails over either manually or automatically. You manually trigger failover by placing one of the paired devices or stacks in maintenance mode.

Automatic failover occurs after the health of the active device or stack becomes compromised, during a system update, or after a user with Administrator privileges shuts down the device. Automatic failover also occurs after an active device or device stack experiences NMSB failure, NFE failure, hardware failure, firmware
failure, critical process failure, a disk full condition, or link failure between two stacked devices. If the health of the standby device or stack becomes similarly compromised, the system does not fail over and enters a degraded state. The system also does not fail over when one of the devices or device stacks is in maintenance mode. Note that disconnecting the stacking cable from an active stack sends that stack into maintenance mode. Shutting down the secondary device in an active stack also sends that stack into maintenance mode.

Note

If the active member of the high-availability pair goes into maintenance mode and the active role fails over to the other pair member, when the original active pair member is restored to normal operation it does not automatically reclaim the active role.

Configuration Deployment and Upgrade Behavior for High-Availability Pairs

This topic describes upgrade and deployment behavior for 7000 and 8000 Series devices (and stacks) in high availability pairs.

Behavior During Deploy

You deploy configuration changes to the members of a high availability pair at the same time. Deploy either succeeds or fails for both peers. The Firepower Management Center deploys to the active device; if that succeeds then changes are deployed to the standby.

Caution

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 and Configurations that Restart the Snort Process When Deployed or Activated, on page 388.

Behavior During Upgrade

You should not experience interruptions in traffic flow or inspection while upgrading devices (or device stacks) in high availability pairs. To ensure continuity of operations, they upgrade one at a time. Devices operate in maintenance mode while they upgrade.

Which peer upgrades first depends on your deployment:

• Routed or switched—Standby upgrades first. The devices switch roles, then the new standby upgrades. When the upgrade completes, the devices' roles remain switched. If you want to preserve the active/standby roles, manually switch the roles before you upgrade. That way, the upgrade process switches them back.

• Access control only—Active upgrades first. When the upgrade completes, the active and standby maintain their old roles.

Deployment Types and Device High Availability

You determine how to configure 7000 or 8000 Series device high availability depending on your Firepower System deployment: passive, inline, routed, or switched. You can also deploy your system in multiple roles at once. Of the four deployment types, only passive deployments require that you configure devices or stacks
using high availability to provide redundancy. You can establish network redundancy for the other deployment types with or without device high availability. For a brief overview on high availability in each deployment type, see the sections below.

**Note**

You can achieve Layer 3 redundancy without using device high availability by using the Cisco Redundancy Protocol (SFRP). SFRP allows devices to act as redundant gateways for specified IP addresses. With network redundancy, you configure two devices or stacks to provide identical network connections, ensuring connectivity for other hosts on the network.

**Passive Deployment Redundancy**

Passive interfaces are generally connected to tap ports on central switches, which allows them to analyze all of the traffic flowing across the switch. If multiple devices are connected to the same tap feed, the system generates events from each of the devices. When configured in a high-availability pair, devices act as either active or standby, which allows the system to analyze traffic even in the event of a system failure while also preventing duplicate events.

**Inline Deployment Redundancy**

Because an inline set has no control over the routing of the packets being passed through it, it must always be active in a deployment. Therefore, redundancy relies on external systems to route traffic correctly. You can configure redundant inline sets with or without 7000 or 8000 Series device high availability.

To deploy redundant inline sets, you configure the network topology so that it allows traffic to pass through only one of the inline sets while preventing circular routing. If one of the inline sets fails, the surrounding network infrastructure detects the loss of connectivity to the gateway address and adjusts the routes to send traffic through the redundant set.

**Routed Deployment Redundancy**

Hosts in an IP network must use a well-known gateway address to send traffic to different networks. Establishing redundancy in a routed deployment requires that routed interfaces share the gateway addresses so that only one interface handles traffic for that address at any given time. To accomplish this, you must maintain an equal number of IP addresses on a virtual router. One interface advertises the address. If that interface goes down, the standby interface begins advertising the address.

In devices that are not members of a high-availability pair, you use SFRP to establish redundancy by configuring gateway IP addresses shared between multiple routed interfaces. You can configure SFRP with or without 7000 or 8000 Series device high availability. You can also establish redundancy using dynamic routing such as OSPF or RIP.

**Switched Deployment Redundancy**

You establish redundancy in a switched deployment using the Spanning Tree Protocol (STP), one of the advanced virtual switch settings. STP is a protocol that manages the topology of bridged networks. It is specifically designed to allow redundant links to provide automatic standby for switched interfaces without configuring standby links. Devices in a switched deployment rely on STP to manage traffic between redundant interfaces. Two devices connected to the same broadcast network receive traffic based on the topology calculated by STP.
Cisco strongly recommends that you enable STP when configuring a virtual switch that you plan to deploy in a 7000 or 8000 Series device high-availability pair.

7000/8000 Series High Availability Configuration

When establishing 7000 or 8000 Series device high availability, you designate one of the devices or stacks as active and the other as standby. The system applies a merged configuration to the paired devices. If there is a conflict, the system applies the configuration from the device or stack you designated as active.

After you pair the devices, you cannot change the license options for individual paired devices, but you can change the license for the entire high availability pair. If there are interface attributes that need to be set on switched interfaces or routed interfaces, the system establishes the high availability pair, but sets it to a pending status. After you configure the necessary attributes, the system completes the high availability pair and sets it to a normal status.

After you establish a high availability pair, the system treats the peer devices or stacks as a single device on the Device Management page. Device high availability pairs display the High Availability icon ( ) in the appliance list. Any configuration changes you make are synchronized between the paired devices. The Device Management page displays which device or stack in the high availability pair is active, which changes after manual or automatic failover.

Removing registration of a device high availability pair from a Firepower Management Center removes registration from both devices or stacks. You remove a device high availability pair from the FMC as you would an individual managed device.

You can then register the high availability pair on another FMC. To register single devices from a high availability pair, you add remote management to the active device in the pair and then add that device to the FMC, which adds the whole pair. To register stacked devices in a high availability pair, you add remote management to the primary device of the either stack and then add that device to the FMC, which adds the whole pair.

After you establish a device high availability pair, you should configure a high-availability link interface.

Establishing Firepower 7000/8000 Series High Availability

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>

</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>
This procedure describes establishing a 7000 & 8000 Series device high-availability pair. For information on establishing Firepower Threat Defense high availability, see Add a Firepower Threat Defense High Availability Pair, on page 742.

When establishing a 7000 & 8000 Series device high-availability pair, you designate one of the devices or stacks as active and the other as standby. The system applies a merged configuration to the paired devices. If there is a conflict, the system applies the configuration from the device or stack you designated as active.

In a multidomain deployment, devices in a high-availability pair must belong to the same domain.

**Before you begin**

Confirm that all requirements are met; see Device High Availability Requirements, on page 566.

**What to do next**

Create an HA Link interface on each of the devices in the high-availability pair if you plan to set up HA state sharing, dynamic NAT, or VPN with the devices. For more information on HA link interfaces, see Configuring HA Link Interfaces, on page 546.

### Editing Device High Availability

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you establish a 7000 or 8000 Series device high-availability pair, most changes you make to the device configuration also change the configuration of the whole high-availability pair.

You can view the status of the high-availability pair by hovering your pointer over the status icon in the General section. You can also view which device or stack is the active peer and standby peer in the pair.

**Step 1** Choose **Devices > Device Management**.
Step 2  Next to the device high availability pair where you want to edit the configuration, click the edit icon (edit icon).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  Use the sections on the High Availability page to make changes to the high-availability pair configuration as you would a single device configuration.

### Configuring Individual Devices in a High-Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you establish a 7000 or 8000 Series device high-availability pair, you can still configure some attributes for each device within the pair. You can make changes to a paired device just as you would to a single device.

Step 1  Choose Devices > Device Management.
Step 2  Next to the device high-availability pair where you want to edit the configuration, click the edit icon (edit icon).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  Click the Devices tab.

Step 4  From the Selected Device drop-down list, choose the device you want to modify.

Step 5  Use the sections on the Devices page to make changes to the individual paired device as you would a single device.

### Configuring Individual Device Stacks in a High-Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>Firepower 8140, Firepower 8200 family, Firepower 8300 family</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you configure stacked 8000 Series devices into a high-availability pair, the system limits the stack attributes that you can edit. You can edit the name of a stack in a paired stack. In addition, you can edit the network configuration of the stack, as described in Configuring Interfaces on a Device in a High-Availability Pair, on page 572.

Step 1  Choose Devices > Device Management.
Step 2  Next to the device high-availability pair where you want to edit the configuration, click the edit icon (edit icon).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the **Stacks** tab.

**Step 4** From the **Selected Device** drop-down list, choose the stack you want to modify.

**Step 5** Next to the **General** section, click the edit icon (-pencil).

**Step 6** Enter a **Name**.

**Step 7** Click **Save**.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 382.

---

## Configuring Interfaces on a Device in a High-Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>

<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

You can configure interfaces on individual devices in a 7000 or 8000 Series device high-availability pair. However, you must also configure an equivalent interface on the peer device in the pair. For paired stacks, you configure identical interfaces on the primary devices of the stacks. When you configure virtual routers, you select the stack where you want to configure the routers.

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device high-availability pair where you want to configure interfaces, click the edit icon (-pencil).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the **Interfaces** tab.

**Step 4** From the **Selected Device** drop-down list, choose the device you want to modify.

**Step 5** Configure interfaces as you would on an individual device.

## Switching the Active Peer in a Device High-Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>
After you establish a 7000 or 8000 Series device high-availability pair, you can manually switch the active and standby peer devices or stacks.

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the device high-availability pair where you want to change the active peer, click the Switch Active Peer icon ( энергию).

**Step 3** You can:

- Click Yes to immediately make the standby peer the active peer in the high-availability pair.
- Click No to cancel and return to the Device Management page.

### Placing a High-Availability Peer into Maintenance Mode

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you establish a 7000 or 8000 Series device high-availability pair, you can manually trigger failover by placing one of the peers into maintenance mode to perform maintenance on the devices. In maintenance mode, the system administratively takes down all interfaces except for the management interface. After maintenance is completed, you can re-enable the peer to resume normal operation.

**Note** You should not place both peers in a high-availability pair into maintenance mode at the same time. Doing so will prevent that pair from inspecting traffic.

**Step 1** Choose Devices > Device Management.

**Step 2** Next to the peer you want to place in maintenance mode, click the toggle maintenance mode icon ( энергия).

**Step 3** Click Yes to confirm maintenance mode.

**What to do next**

- When maintenance is complete, click the toggle maintenance mode icon ( энергия) again to bring the peer out of maintenance mode.
Replacing a Device in a Stack in a High-Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>Firepower 8140, 8200 family, 8300 family</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you place a stack that is a member of a high-availability pair into maintenance mode, you can replace a secondary device in the stack for another device. You can only select devices that are not currently stacked or paired. The new device must follow the same guidelines for establishing a device stack.

Step 1
Choose Devices > Device Management.

Step 2
Next to the stack member you want to place into maintenance mode, click the toggle maintenance mode icon (UPS).

Step 3
Click Yes to confirm maintenance mode.

Step 4
Click the replace device icon (trash can).

Step 5
Choose the Replacement Device from the drop-down list.

Step 6
Click Replace to replace the device.

Step 7
Click the toggle maintenance mode icon (UPS) again to bring the stack immediately out of maintenance mode.

Note: You do not need to re-deploy the device configuration.

Device High Availability State Sharing

Device high availability state sharing allows devices or stacks in high-availability pairs to synchronize as much state as necessary, so that if either device or stack fails, the other peer can take over with no interruption to traffic flow. Without state sharing, the following features may not fail over properly:

- Strict TCP enforcement
- Unidirectional access control rules
- Blocking persistence

Note, however, that enabling state sharing slows system performance.

You must configure and enable HA link interfaces on both devices or the primary stacked devices in the high-availability pair before you can configure high availability state sharing. Firepower 82xx Family and 83xx Family devices require a 10G HA link, while other model devices require a 1G HA link.

You must disable state sharing before you can modify the HA link interfaces.
If paired devices fail over, the system terminates all existing SSL-encrypted sessions on the active device. Even if you establish high availability state sharing, these sessions must be renegotiated on the standby device. If the server establishing the SSL session supports session reuse and the standby device does not have the SSL session ID, it cannot renegotiate the session.

Strict TCP Enforcement

When you enable strict TCP enforcement for a domain, the system drops any packets that are out of order on TCP sessions. For example, the system drops non-SYN packets received on an unestablished connection. With state sharing, devices in the high-availability pair allow TCP sessions to continue after failover without having to reestablish the connection, even if strict TCP enforcement is enabled. You can enable strict TCP enforcement on inline sets, virtual routers, and virtual switches.

Unidirectional Access Control Rules

If you have configured unidirectional access control rules, network traffic may match a different access control rule than intended when the system reevaluates a connection midstream after failover. For example, consider if you have a policy containing the following two access control rules:

Rule 1: Allow from 192.168.1.0/24 to 192.168.2.0/24
Rule 2: Block all

Without state sharing, if an allowed connection from 192.168.1.1 to 192.168.2.1 is still active following a failover and the next packet is seen as a response packet, the system denies the connection. With state sharing, a midstream pickup would match the existing connection and continue to be allowed.

Blocking Persistence

While many connections are blocked on the first packet based on access control rules or other factors, there are cases where the system allows some number of packets through before determining that the connection should be blocked. With state sharing, the system immediately blocks the connection on the peer device or stack as well.

When establishing state sharing for a high-availability pair, you can configure the following options:

Enabled

Click the check box to enable state sharing. Clear the check box to disable state sharing.

Minimum Flow Lifetime

Specify the minimum time (in milliseconds) for a session before the system sends any synchronization messages for it. You can use any integer from 0 to 65535. The system does not synchronize any sessions that have not met the minimum flow lifetime, and the system synchronizes only when a packet is received for the connection.

Minimum Sync. Interval

Specify the minimum time (in milliseconds) between update messages for a session. You can use any integer from 0 to 65535. The minimum synchronization interval prevents synchronization messages for a given connection from being sent more frequently than the configured value after the connection reaches the minimum lifetime.
Maximum HTTP URL Length

Specify the maximum characters for the URL the system synchronizes between the paired devices. You may use any integer from 0 to 225.

### Establishing Device High-Availability State Sharing

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/N Network Admin</td>
</tr>
</tbody>
</table>

Device high-availability state sharing allows 7000 or 8000 Series devices or stacks in high-availability pairs to synchronize as much state as necessary, so that if either device or stack fails, the other peer can take over with no interruption to traffic flow.

**Caution**

Modifying a high-availability state sharing option on a 7000 or 8000 Series device restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 for more information.

---

**Step 1**

Configure HA link interfaces for each device in the device high-availability pair; see Configuring HA Link Interfaces, on page 546.

**Step 2**

Choose Devices > Device Management.

**Step 3**

Next to the device high-availability pair you want to edit, click the edit icon ( ).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 4**

In the State Sharing section, click the edit icon ( ).

**Step 5**

Decrease the state sharing values to improve paired peer readiness, or increase the values to allow better performance. We recommend you use the default values, unless your deployment presents a good reason to change them.

**Step 6**

Click OK.

---

**What to do next**

Deploy configuration changes; see Deploy Configuration Changes, on page 382.

**Related Topics**

- Configuring HA Link Interfaces, on page 546
- Snort® Restart Scenarios, on page 385
Device High Availability State Sharing Statistics for Troubleshooting

The sections below describe the statistics you can view for each device and how you can use them to troubleshoot your state sharing configuration for 7000 and 8000 Series device high-availability pairs.

**Messages Received (Unicast)**

Messages received are the number of high availability synchronization messages received from the paired peer.

The value should be close to the number of messages sent by the peer. During active use, the values may not match, but should be close. If traffic stops, the values should become stable and the messages received will match the messages sent.

For troubleshooting, you should view both the messages received and the messages sent, compare the rate of increase, and make sure the values are close. The sent value on each peer should be incrementing at approximately the same rate as the received value on the opposite peer.

Contact Support if the received messages stop incrementing or increment slower than the messages sent by the peer.

**Packets Received**

The system batches multiple messages into single packets in order to decrease overhead. The Packets Received counter displays the total number of these data packets, as well as other control packets that have been received by a device.

The value should be close to the number of packets sent by the peer device. During active use, the values may not match, but should be close. Because the number of messages received should be close and incrementing at the same rate as the number of messages sent by the peer, the number of packets received should have the same behavior.

For troubleshooting, you should view both the packets received and the messages sent, compare the rate of increase, and make sure the values are increasing at the same rate. If the sent value on the paired peer is incrementing, the received value on the device should also increase at the same rate.

Contact Support if the received packets stop incrementing or increment slower than the messages sent by the peer.

**Total Bytes Received**

Total bytes received are the number of bytes that make up the packets received by the peer.

The value should be close to the number of bytes sent by the other peer. During active use, the values may not match, but should be close.

For troubleshooting, you should view both the total bytes received and the messages sent, compare the rate of increase, and make sure the values are increasing at the same rate. If the sent value on the paired peer is incrementing, the received value on the device should also increase at the same rate.

Contact Support if the received bytes stop incrementing or increment slower than the messages sent by the peer.
**Protocol Bytes Received**

Protocol bytes received are the number of bytes of protocol overhead received, which includes everything but the payload of session state synchronization messages.

The value should be close to the number of bytes sent by the peer. During active use, the values may not match, but should be close.

For troubleshooting, you should view the total bytes received to discover how much actual state data is being shared in comparison to protocol data. If the protocol data is a large percentage of the data being sent, you can adjust the minimum sync interval.

Contact Support if the protocol bytes received increment at a similar rate to the total bytes received. Protocol bytes received should be minimal in relation to the total bytes received.

**Messages Sent**

Messages sent are the number of high availability synchronization messages sent to the paired peer.

This data is useful in comparison to the number of messages received. During active use, the values may not match, but should be close.

For troubleshooting, you should view both the messages received and the messages sent, compare the rate of increase, and make sure the values are close.

Contact Support if the messages sent increment at a similar rate to the total bytes received.

**Bytes Sent**

Bytes sent are the total number of bytes sent that make up the high availability synchronization messages sent to the peer.

This data are useful in comparison to the number of messages received. During active use, the values may not match, but should be close. The number of bytes received on the peer should be close to, but not more than this value.

Contact Support if the total bytes received is not incrementing at about the same rate as the bytes sent.

**Tx Errors**

Tx errors are the number of memory allocation failures the system encounters when trying to allocate space for messages to be sent to the paired peer.

This value should be zero at all times on both peers. Contact Support if this number is not zero or if the number steadily increases, which indicates the system has encountered an error where it cannot allocate memory.

**Tx Overruns**

Tx overruns are the number of times the system attempts and fails to place a message into the transit queue.

This value should be zero at all times on both peers. When the value is not zero or is steadily increasing, it indicates that the system is sharing too much data across the HA link that cannot be sent quickly enough.

You should increase the HA link MTU if it was previously set below the default value (9918 or 9922). You can change the minimum flow lifetime and minimum synchronization interval settings to reduce the amount of data shared across the HA link to prevent the number from incrementing.

Contact Support if this value persists or continues to increase.
Recent Logs

The system log displays the most recent high availability synchronization messages. The log should not display any ERROR or WARN messages. It should remain comparable between the peers, such as the same number of sockets being connected.

However, the data displayed may be opposite in some instances, for example, one peer reports that it received a connection from the other peer and references different IP addresses. The log provides a comprehensive view of the high availability state sharing connection, and any errors within the connection.

Contact Support if the log displays an ERROR or WARN message, or any message that does not appear to be purely informational.

Viewing Device High Availability State Sharing Statistics

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you establish state sharing, you can view the following information about the configuration in the State Sharing section of the High Availability page:

- The HA link interface that is being used and its current link state
- Detailed synchronization statistics for troubleshooting issues

The state sharing statistics are primarily counters for different aspects of the high availability synchronization traffic sent and received, along with some other error counters. In addition, you can view the latest system logs for each device in the high-availability pair.

Step 1  Choose Devices > Device Management.

Step 2  Next to the device high-availability pair you want to edit, click the edit icon (✏).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  In the State Sharing section, click the view statistics icon (🔍).

Step 4  Choose a Device to view if your high-availability pair is composed of device stacks.

Step 5  You can:

- Click Refresh to update the statistics.
- Click View to view the latest data log for each device in the high-availability pair.
Separating Device High-Availability Pairs

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>

<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>7000 &amp; 8000 Series</td>
<td>Any</td>
<td>Admin/Network</td>
</tr>
</tbody>
</table>

When you separate, or "break," a 7000 or 8000 Series device high-availability pair:

- The active peer (device or stack) retains full deployment functionality
- The standby peer (device or stack) loses its interface configurations and fails over to the active peer, unless you choose to leave the interface configurations active, in which case the standby peer resumes normal operation.
- The standby peer always loses the configuration of passive interfaces.
- Any peer in maintenance mode resumes normal operation.

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the high-availability pair you want to break, click the Break HA icon (§).

**Step 3** Optionally, check the check box to remove the interface configurations on the standby peer. This step administratively takes down all interfaces except for the management interface.

**Step 4** Click **Yes**.
8000 Series Device Stacking

The following topics describe how to work with Firepower 8000 Series device stacks in the Firepower System:

• About Device Stacks, on page 581
• Device Stack Configuration, on page 583
• Establishing Device Stacks, on page 584
• Editing Device Stacks, on page 585
• Replacing a Device in a Stack, on page 585
• Replacing a Device in a Stack in a High-Availability Pair, on page 586
• Configuring Individual Devices in a Stack, on page 586
• Configuring Interfaces on a Stacked Device, on page 587
• Separating Stacked Devices, on page 587
• Replacing a Device in a Stack, on page 588

About Device Stacks

You can increase the amount of traffic inspected on a network segment by using devices in a stacked configuration. For each stacked configuration, all devices in the stack must have the same hardware. However, none, some, or all devices might have an installed malware storage pack. The devices must also be from the same device family based on the following stacked configurations:

The stacked configuration is supported for Firepower 8140, Firepower 8200 family, Firepower 8300 family devices.

For the 81xx Family:

• two Firepower 8140s

For the 82xx Family:

• up to four Firepower 8250s
• a Firepower 8260 (a primary device and a secondary device)
• a Firepower 8270 (a primary device with 40G capacity and two secondary devices)
• a Firepower 8290 (a primary device with 40G capacity and three secondary devices)
For the 83xx Family:

- up to four Firepower 8350s
- up to four AMP8350s
- a Firepower 8360 (a primary device with 40G capacity and a secondary device)
- an AMP8360 (a primary device with 40G capacity and a secondary device)
- a Firepower 8370 (a primary device with 40G capacity and two secondary devices)
- an AMP8370 (a primary device with 40G capacity and two secondary devices)
- a Firepower 8390 (a primary device with 40G capacity and three secondary devices)
- an AMP8390 (a primary device with 40G capacity and three secondary devices)

For more information about stacked configurations, see the Cisco Firepower 8000 Series Getting Started Guide. For more information about the malware storage pack, see the Firepower System Malware Storage Pack Guide.

Caution

Do not attempt to install a hard drive that was not supplied by Cisco in your device. Installing an unsupported hard drive may damage the device. Malware storage pack kits are available for purchase only from Cisco, and are for use only with 8000 Series devices. Contact Support if you require assistance with the malware storage pack. See the Firepower System Malware Storage Pack Guide for more information.

When you establish a stacked configuration, you combine the resources of each stacked device into a single, shared configuration.

You designate one device as the primary device, where you configure the interfaces for the entire stack. You designate the other devices as secondary. Secondary devices must not be currently sensing any traffic and must not have link on any interface.

Connect the primary device to the network segment you want to analyze in the same way you would configure a single device. Connect the secondary devices to the primary device using the stacked device cabling instructions found in the Cisco Firepower 8000 Series Getting Started Guide.

All devices in the stacked configuration must have the same hardware, run the same software version, and have the same licenses. If the devices are targeted by NAT policies, both the primary and secondary device must have the same NAT policy. You must deploy updates to the entire stack from the Firepower Management Center. If an update fails on one or more devices in the stack, the stack enters a mixed-version state. You cannot deploy policies to or update a stack in a mixed-version state. To correct this state, you can break the stack or remove individual devices with different versions, update the individual devices, then reestablish the stacked configuration. After you stack the devices, you can change the licenses only for the entire stack at once.

After you establish the stacked configuration, the devices act like a single, shared configuration. If the primary device fails, no traffic is passed to the secondary devices. Health alerts are generated indicating that the stacking heartbeat has failed on the secondary devices.

If the secondary device in a stack fails, inline sets with configurable bypass enabled go into bypass mode on the primary device. For all other configurations, the system continues to load balance traffic to the failed secondary device. In either case, a health alert is generated to indicate loss of link.
You can use a device stack as you would a single device in your deployment, with a few exceptions. If you have 7000 or 8000 Series devices in a high-availability pair, you cannot stack a device high-availability pair or a device in a high-availability pair. You also cannot configure NAT on a device stack.

### Note
If you use eStreamer to stream event data from stacked devices to an external client application, collect the data from each device and ensure that you configure each device identically. The eStreamer settings are not automatically synchronized between stacked devices.

In a multidomain deployment, you can only stack devices that belong to the same domain.

**Related Topics**
- About Health Monitoring, on page 299

## Device Stack Configuration

You can increase the amount of traffic inspected on a network segment by stacking two Firepower 8140 devices, up to four Firepower 8250s, a Firepower 8260, a Firepower 8270, a Firepower 8290, up to four Firepower 8350s, a Firepower 8360, a Firepower 8370, or a Firepower 8390 and using their combined resources in a single, shared, configuration. If you have 7000 or 8000 Series devices in a high-availability pair, you cannot stack a device high-availability pair or a device in a high-availability pair. However, you can configure two device stacks into a high-availability pair.

After you establish a device stack, the system treats the devices as a single device on the Device Management page. Device stacks display the stack icon ( altında) in the appliance list.

Removing registration of a device stack from a Firepower Management Center also removes registration from both devices. You delete stacked devices from the Firepower Management Center as you would a single managed device; you can then register the stack on another Firepower Management Center. You only need to register one of the stacked devices on the new Firepower Management Center for the entire stack to appear.

After you establish the device stack, you cannot change which devices are primary or secondary unless you break and reestablish the stack. However, you can:

- add secondary devices to an existing stack of two or three Firepower 8250s, a Firepower 8260, or a Firepower 8270 up to the limit of four Firepower 8250s in a stack
- add secondary devices to an existing stack of two or three Firepower 8350s, a Firepower 8360, or a Firepower 8370 up to the limit of four Firepower 8350s in a stack

For additional devices, the primary device in the stack must have the necessary stacking NetMods for additional cabled devices. For example, if you have a Firepower 8260 where the primary only has a single stacking NetMod, you cannot add another secondary device to this stack. You add secondary devices to an existing stack in the same manner that you initially establish a stacked device configuration.
Establishing Device Stacks

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>Firepower 8140, 8200 family, 8300 family</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

All devices in a stack must be of the same hardware model (for example, a Firepower 8140 with another 8140). You can stack a total of four devices (one primary device and up to three secondary devices) in the 8200 family and in the 8300 family.

In a multidomain deployment, all devices in the stack must belong to the same domain.

**Before you begin**

- Decide which unit will be the primary device.
- Confirm that the units are cabled properly before designating the primary/secondary relationship. For information about cabling, see the Cisco Firepower 8000 Series Getting Started Guide.

---

**Step 1** Choose Devices > Device Management.

**Step 2** From the Add drop-down menu, choose Add Stack.

**Step 3** From the Primary drop-down list, choose the device that you cabled for primary operation.

**Note** If you choose a device that is not cabled as the primary device, you cannot perform the next series of steps.

**Step 4** Enter a Name.

**Step 5** Click Add to choose the devices you want to include in the stack.

**Step 6** From the Slot on Primary Device drop-down list, choose the stacking network module that connects the primary device to the secondary device.

**Step 7** From the Secondary Device drop-down list, choose the device you cabled for secondary operation.

**Step 8** From the Slot on Secondary Device drop-down list, choose the stacking network module that connects the secondary device to the primary device.

**Step 9** Click Add.

**Step 10** Repeat steps 5 through 9 if you are adding secondary devices to an existing stack of Firepower 8250s, a Firepower 8260, a Firepower 8270, an existing stack of Firepower 8350s, a Firepower 8360, or a Firepower 8370.

**Step 11** Click Stack to establish the device stack or to add secondary devices. Note that this process takes a few minutes as the process synchronizes system data.

<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you establish a device stack, most changes you make to the device configuration also change the configuration of the entire stack. On the Stack page of the appliance editor, you can make changes to the stack configuration as on the Device page of a single device.

You can change the display name of the stack, enable and disable licenses, view system and health policies, and configure advanced settings.

**Step 1** Choose Devices > Device Management.
**Step 2** Next to the stacked device where you want to edit the configuration, click the edit icon (✏️).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
**Step 3** Use the sections on the Stack page to make changes to the stacked configuration as you would a single device configuration.

Replacing a Device in a Stack

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>

</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>FirePOWER 8140, 8200 family, 8300 family</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

If the Firepower Management Center cannot communicate with the device, you must connect to the device and use CLI commands to separate the stack and unregister the device. For more information, see stacking disable and delete CLI commands in the relevant chapter: Classic Device CLI Configuration Commands, on page 2718.

To replace a device within a stack:

**Step 1** Select the stack with the device to replace and break that stack. For more information, see Separating Stacked Devices, on page 587.
**Step 2** Unregister the device from the Firepower Management Center. For more information, see Delete a Device from the FMC, on page 255.
**Step 3** Register the replacement device to the Firepower Management Center. For more information, see Add a Device to the FMC, on page 252.
Replacing a Device in a Stack in a High-Availability Pair

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Control</td>
<td>Firepower 8140, 8200 family, 8300 family</td>
<td>Any</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you place a stack that is a member of a high-availability pair into maintenance mode, you can replace a secondary device in the stack for another device. You can only select devices that are not currently stacked or paired. The new device must follow the same guidelines for establishing a device stack.

Configuring Individual Devices in a Stack

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Any</td>
<td>Firepower 8140, Firepower 8200 family, Firepower 8300 family</td>
<td>Leaf only</td>
<td>Admin/Network Admin</td>
</tr>
</tbody>
</table>

After you establish a device stack, you can still configure some attributes for an individual device within the stack. You can make changes to a device configured in a stack as you would for a single device. You can change the display name of a device, view system settings, shut down or restart a device, view health information, and edit device management settings.
Step 2  Next to the stacked device where you want to edit the configuration, click the edit icon ( ).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3  Click the Device tab.
Step 4  From the Selected Device drop-down list, choose the device you want to modify.
Step 5  Use the sections on the Devices page to make changes to the individual stacked device as you would a single device.

### Configuring Interfaces on a Stacked Device

<table>
<thead>
<tr>

With the exception of the management interface, you configure stacked device interfaces on the Interfaces page of the primary device in the stack. You can choose any device in the stack to configure the management interface.

The Interfaces page of a Firepower stacked device includes the hardware and interfaces views that you find on an individual device.

Step 1  Choose Devices > Device Management.
Step 2  Next to the primary stacked device, click the edit icon ( ).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Step 3  Click the Interfaces tab.
Step 4  From the Selected Device drop-down list, choose the device you want to modify.
Step 5  Configure interfaces as you would on an individual device; see Configuring Sensing Interfaces, on page 545.

</table>
If you no longer need to use a stacked configuration for your devices, you can break the stack and separate the devices.

**Note** If a stacked device fails, or if communication fails between member devices of a stack, you cannot separate the stacked devices using the Firepower Management Center web interface. In this case, use the auxiliary CLI command `configure stacking disable` to remove the stack configuration from each device individually.

---

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device stack you want to break, click the break stack icon (钯).

**Tip** To remove a secondary device from a stack of three or more Firepower 8250 devices without breaking the stack, click the remove from stack icon (钯). Removing the secondary device causes a brief disruption of traffic inspection, traffic flow, or link state as the system reconfigures the stack for operation without the extra device.

**Step 3** Click **Yes** to separate the device stack.

---

### Replacing a Device in a Stack

<table>

</tbody>
</table>

If the Firepower Management Center cannot communicate with the device, you must connect to the device and use CLI commands to separate the stack and unregister the device. For more information, see `stacking disable` and `delete` CLI commands in the relevant chapter: Classic Device CLI Configuration Commands, on page 2718.

To replace a device within a stack:

---

**Step 1** Select the stack with the device to replace and break that stack. For more information, see Separating Stacked Devices, on page 587.

**Step 2** Unregister the device from the Firepower Management Center. For more information, see Delete a Device from the FMC, on page 255.

**Step 3** Register the replacement device to the Firepower Management Center. For more information, see Add a Device to the FMC, on page 252.

**Step 4** Create a device stack that includes the replacement device. For more information, see Establishing Device Stacks, on page 584.

Firepower Threat Defense Getting Started

- Transparent or Routed Firewall Mode for Firepower Threat Defense, on page 591
- Logical Devices for the Firepower Threat Defense on the Firepower 4100/9300, on page 603
Transparent or Routed Firewall Mode for Firepower Threat Defense

This chapter describes how to set the firewall mode to routed or transparent, as well as how the firewall works in each firewall mode.

Note
The firewall mode only affects regular firewall interfaces, and not IPS-only interfaces such as inline sets or passive interfaces. IPS-only interfaces can be used in both firewall modes. See Inline Sets and Passive Interfaces for Firepower Threat Defense, on page 695 for more information about IPS-only interfaces. Inline sets might be familiar to you as "transparent inline sets," but the inline interface type is unrelated to the transparent firewall mode described in this chapter or the firewall-type interfaces.

- About the Firewall Mode, on page 591
- Default Settings, on page 599
- Guidelines for Firewall Mode, on page 599
- Set the Firewall Mode, on page 600

About the Firewall Mode

The Firepower Threat Defense device supports two firewall modes for regular firewall interfaces: Routed Firewall mode and Transparent Firewall mode.

About Routed Firewall Mode

In routed mode, the Firepower Threat Defense device is considered to be a router hop in the network. Each interface that you want to route between is on a different subnet.

With Integrated Routing and Bridging, you can use a "bridge group" where you group together multiple interfaces on a network, and the Firepower Threat Defense device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. The Firepower Threat Defense device routes between BVIs and regular routed interfaces. If you do not need clustering or EtherChannel or redundant member interfaces, you might consider using routed mode instead of transparent mode. In routed mode, you can have one or more isolated bridge groups like in transparent mode, but also have normal routed interfaces as well for a mixed deployment.
About Transparent Firewall Mode

Traditionally, a firewall is a routed hop and acts as a default gateway for hosts that connect to one of its screened subnets. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices. However, like any other firewall, access control between interfaces is controlled, and all of the usual firewall checks are in place.

Layer 2 connectivity is achieved by using a "bridge group" where you group together the inside and outside interfaces for a network, and the Firepower Threat Defense device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. You can have multiple bridge groups for multiple networks. In transparent mode, these bridge groups cannot communicate with each other.

Using the Transparent Firewall in Your Network

The Firepower Threat Defense device connects the same network between its interfaces. Because the firewall is not a routed hop, you can easily introduce a transparent firewall into an existing network.

The following figure shows a typical transparent firewall network where the outside devices are on the same subnet as the inside devices. The inside router and hosts appear to be directly connected to the outside router.

Figure 7: Transparent Firewall Network

Diagnostic Interface

In addition to each Bridge Virtual Interface (BVI) IP address, you can add a separate Diagnostic slot/port interface that is not part of any bridge group, and that allows only management traffic to the Firepower Threat Defense device.
Passing Traffic For Routed-Mode Features

For features that are not directly supported on the transparent firewall, you can allow traffic to pass through so that upstream and downstream routers can support the functionality. For example, by using an access rule, you can allow DHCP traffic (instead of the unsupported DHCP relay feature) or multicast traffic such as that created by IP/TV. You can also establish routing protocol adjacencies through a transparent firewall; you can allow OSPF, RIP, EIGRP, or BGP traffic through based on an access rule. Likewise, protocols like HSRP or VRRP can pass through the Firepower Threat Defense device.

About Bridge Groups

A bridge group is a group of interfaces that the Firepower Threat Defense device bridges instead of routes. Bridge groups are supported in both transparent and routed firewall mode. Like any other firewall interfaces, access control between interfaces is controlled, and all of the usual firewall checks are in place.

Bridge Virtual Interface (BVI)

Each bridge group includes a Bridge Virtual Interface (BVI). The Firepower Threat Defense device uses the BVI IP address as the source address for packets originating from the bridge group. The BVI IP address must be on the same subnet as the bridge group member interfaces. The BVI does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.

In transparent mode: Only bridge group member interfaces are named and can be used with interface-based features.

In routed mode: The BVI acts as the gateway between the bridge group and other routed interfaces. To route between bridge groups/routed interfaces, you must name the BVI. For some interface-based features, you can use the BVI itself:

- DHCPv4 server—Only the BVI supports the DHCPv4 server configuration.
- Static routes—You can configure static routes for the BVI; you cannot configure static routes for the member interfaces.
- Syslog server and other traffic sourced from the Firepower Threat Defense device—When specifying a syslog server (or SNMP server, or other service where the traffic is sourced from the Firepower Threat Defense device), you can specify either the BVI or a member interface.

If you do not name the BVI in routed mode, then the Firepower Threat Defense device does not route bridge group traffic. This configuration replicates transparent firewall mode for the bridge group. If you do not need clustering or EtherChannel or redundant member interfaces, you might consider using routed mode instead. In routed mode, you can have one or more isolated bridge groups like in transparent mode, but also have normal routed interfaces as well for a mixed deployment.

Bridge Groups in Transparent Firewall Mode

Bridge group traffic is isolated from other bridge groups; traffic is not routed to another bridge group within the Firepower Threat Defense device, and traffic must exit the Firepower Threat Defense device before it is routed by an external router back to another bridge group in the Firepower Threat Defense device. Although the bridging functions are separate for each bridge group, many other functions are shared between all bridge groups. For example, all bridge groups share a syslog server or AAA server configuration.

You can include multiple interfaces per bridge group. See Guidelines for Firewall Mode, on page 599 for the exact number of bridge groups and interfaces supported. If you use more than 2 interfaces per bridge group,
you can control communication between multiple segments on the same network, and not just between inside and outside. For example, if you have three inside segments that you do not want to communicate with each other, you can put each segment on a separate interface, and only allow them to communicate with the outside interface. Or you can customize the access rules between interfaces to allow only as much access as desired.

The following figure shows two networks connected to the Firepower Threat Defense device, which has two bridge groups.

**Figure 8: Transparent Firewall Network with Two Bridge Groups**

Bridge Group Traffic can be routed to other bridge groups or routed interfaces. You can choose to isolate bridge group traffic by not assigning a name to the BVI interface for the bridge group. If you name the BVI, then the BVI participates in routing like any other regular interface.

One use for a bridge group in routed mode is to use extra interfaces on the FTD instead of an external switch. For example, the default configuration for some devices include an outside interface as a regular interface, and then all other interfaces assigned to the inside bridge group. Because the purpose of this bridge group is to replace an external switch, you need to configure an access policy so all bridge group interfaces can freely communicate.
Figure 9: Routed Firewall Network with an Inside Bridge Group and an Outside Routed Interface

**Allowing Layer 3 Traffic**

- Unicast IPv4 and IPv6 traffic requires an access rule to be allowed through the bridge group.
- ARPs are allowed through the bridge group in both directions without an access rule. ARP traffic can be controlled by ARP inspection.
- IPv6 neighbor discovery and router solicitation packets can be passed using access rules.
- Broadcast and multicast traffic can be passed using access rules.

**Allowed MAC Addresses**

The following destination MAC addresses are allowed through the bridge group if allowed by your access policy (see *Allowing Layer 3 Traffic, on page 595*). Any MAC address not on this list is dropped.

- TRUE broadcast destination MAC address equal to FFFF.FFFF.FFFF
- IPv4 multicast MAC addresses from 0100.5E00.0000 to 0100.5EFE.FFFF
- IPv6 multicast MAC addresses from 3333.0000.0000 to 3333.FFFF.FFFF
- BPDU multicast address equal to 0100.0CCC.CCCC

**BPDU Handling**

To prevent loops using the Spanning Tree Protocol, BPDUs are passed by default.

By default BPDUs are also forwarded for advanced inspection, which is unnecessary for this type of packet, and which can cause problems if they are blocked due to an inspection restart, for example. We recommend
that you always exempt BPDUs from advanced inspection. To do so, use FlexConfig to configure an EtherType ACL that trusts BPDUs and exempts them from advanced inspection on each member interface. See FlexConfig Policies for Firepower Threat Defense, on page 991.

The FlexConfig object should deploy the following commands, where you replace `<if-name>` with an interface name. Add as many access-group commands as needed to cover each bridge group member interface on the device. You can also choose a different name for the ACL.

```
access-list permit-bpdu ethertype trust bpdu
access-group permit-bpdu in interface <if-name>
```

### MAC Address vs. Route Lookups

For traffic within a bridge group, the outgoing interface of a packet is determined by performing a destination MAC address lookup instead of a route lookup.

Route lookups, however, are necessary for the following situations:

- Traffic originating on the Firepower Threat Defense device—Add a default/static route on the Firepower Threat Defense device for traffic destined for a remote network where a syslog server, for example, is located.

- Voice over IP (VoIP) and TFTP traffic, and the endpoint is at least one hop away—Add a static route on the Firepower Threat Defense device for traffic destined for the remote endpoint so that secondary connections are successful. The Firepower Threat Defense device creates a temporary "pinhole" in the access control policy to allow the secondary connection; and because the connection might use a different set of IP addresses than the primary connection, the Firepower Threat Defense device needs to perform a route lookup to install the pinhole on the correct interface.

Affected applications include:

- H.323
- RTSP
- SIP
- Skinny (SCCP)
- SQL*Net
- SunRPC
- TFTP

- Traffic at least one hop away for which the Firepower Threat Defense device performs NAT—Configure a static route on the Firepower Threat Defense device for traffic destined for the remote network. You also need a static route on the upstream router for traffic destined for the mapped addresses to be sent to the Firepower Threat Defense device.

This routing requirement is also true for embedded IP addresses for VoIP and DNS with NAT enabled, and the embedded IP addresses are at least one hop away. The Firepower Threat Defense device needs to identify the correct egress interface so it can perform the translation.
Unsupported Features for Bridge Groups in Transparent Mode

The following table lists the features are not supported in bridge groups in transparent mode.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic DNS</td>
<td>—</td>
</tr>
<tr>
<td>DHCP relay</td>
<td>The transparent firewall can act as a DHCPv4 server, but it does not support DHCP relay. DHCP relay is not required because you can allow DHCP traffic to pass through using two access rules: one that allows DCHP requests from the inside interface to the outside, and one that allows the replies from the server in the other direction.</td>
</tr>
</tbody>
</table>
Dynamic routing protocols

You can, however, add static routes for traffic originating on the Firepower Threat Defense device for bridge group member interfaces. You can also allow dynamic routing protocols through the Firepower Threat Defense device using an access rule.

Multicast IP routing

You can allow multicast traffic through the Firepower Threat Defense device by allowing it in an access rule.

QoS

—

VPN termination for through traffic

The transparent firewall supports site-to-site VPN tunnels for management connections only on bridge group member interfaces. It does not terminate VPN connections for traffic through the Firepower Threat Defense device. You can pass VPN traffic through the ASA using an access rule, but it does not terminate non-management connections.

### Unsupported Features for Bridge Groups in Routed Mode

The following table lists the features are not supported in bridge groups in routed mode.

**Table 70: Unsupported Features in Routed Mode**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>VPN termination for through traffic</td>
<td>You cannot terminate a VPN connection on the BVI. Non-bridge group interfaces support VPN. Bridge group member interfaces support site-to-site VPN tunnels for management connections only. It does not terminate VPN connections for traffic through the Firepower Threat Defense device. You can pass VPN traffic through the bridge group using an access rule, but it does not terminate non-management connections.</td>
</tr>
</tbody>
</table>

**Default Settings**

**Bridge Group Defaults**

By default, all ARP packets are passed within the bridge group.

**Guidelines for Firewall Mode**

**Model Guidelines**

- For the Firepower Threat Defense Virtual on VMware with bridged ixebevf interfaces, bridge groups are not supported.
- For the Firepower 2100 series, bridge groups are not supported in routed mode.

**Bridge Group Guidelines (Transparent and Routed Mode)**

- You can create up to 250 bridge groups, with 64 interfaces per bridge group.
- Each directly-connected network must be on the same subnet.
- The Firepower Threat Defense device does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.
- For IPv4, an IP address for the BVI is required for each bridge group for both management traffic and for traffic to pass through the Firepower Threat Defense device. IPv6 addresses are supported, but not required for the BVI.
- You can only configure IPv6 addresses manually.
- The BVI IP address must be on the same subnet as the connected network. You cannot set the subnet to a host subnet (255.255.255.255).
- Management interfaces are not supported as bridge group members.
- For the Firepower 4100/9300, data-sharing interfaces are not supported as bridge group members.
- In transparent mode, you must use at least 1 bridge group; data interfaces must belong to a bridge group.
• In transparent mode, do not specify the BVI IP address as the default gateway for connected devices; devices need to specify the router on the other side of the Firepower Threat Defense device as the default gateway.

• In transparent mode, the default route, which is required to provide a return path for management traffic, is only applied to management traffic from one bridge group network. This is because the default route specifies an interface in the bridge group as well as the router IP address on the bridge group network, and you can only define one default route. If you have management traffic from more than one bridge group network, you need to specify a regular static route that identifies the network from which you expect management traffic.

• In transparent mode, PPPoE is not supported for the Diagnostic interface.

• In routed mode, to route between bridge groups and other routed interfaces, you must name the BVI.

• In routed mode, FTD-defined EtherChannel interfaces are not supported as bridge group members. EtherChannels on the Firepower 4100/9300 can be bridge group members.

• Bidirectional Forwarding Detection (BFD) echo packets are not allowed through the FTD when using bridge group members. If there are two neighbors on either side of the FTD running BFD, then the FTD will drop BFD echo packets because they have the same source and destination IP address and appear to be part of a LAND attack.

### Set the Firewall Mode

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
</table>
| Any           | N/A             | FTD               | Any               | Admin
|               |                 |                   |                   | Access Admin
|               |                 |                   |                   | Network Admin|

You can set the firewall mode when you perform the initial system setup at the CLI. We recommend setting the firewall mode during setup because changing the firewall mode erases your configuration to ensure you do not have incompatible settings. If you need to change the firewall mode later, you must do so from the CLI.

**Step 1**

Deregister the FTD device from the FMC.

You cannot change the mode until you deregister the device.

a) Choose Devices > Device Management.
b) Select the device from the list of managed devices.
c) Delete the device (click Trash can), confirm, and wait for system to remove the device.

**Step 2**

Access the FTD device CLI, preferably from the console port.

If you use SSH to the diagnostic interface, then changing the mode erases your interface configuration and you will be disconnected. You should instead connect to the management interface.

**Step 3**

Change the firewall mode:

`configure firewall [routed | transparent]`
Example:

> configure firewall transparent
This will destroy the current interface configurations, are you sure that you want to proceed? [y/N] y
The firewall mode was changed successfully.

Step 4  Re-register with the FMC:

configure manager add \{hostname | ip_address | DONTRESOLVE\} reg_key [nat_id]

where:

• \{hostname | ip_address | DONTRESOLVE\} specifies either the fully qualified host name or IP address of the FMC. If the FMC is not directly addressable, use DONTRESOLVE.

• reg_key is the unique alphanumeric registration key required to register a device to the FMC.

• nat_id is an optional alphanumeric string used during the registration process between the FMC and the device. It is required if the hostname is set to DONTRESOLVE.
Set the Firewall Mode
Logical Devices for the Firepower Threat Defense on the Firepower 4100/9300

The Firepower 4100/9300 is a flexible security platform on which you can install one or more logical devices. Before you can add the FTD to the FMC, you must configure chassis interfaces, add a logical device, and assign interfaces to the device on the Firepower 4100/9300 chassis using the Firepower Chassis Manager or the FXOS CLI. This chapter describes basic interface configuration and how to add a standalone or High Availability logical device using the Firepower Chassis Manager. To add a clustered logical device, see Clustering for the Firepower Threat Defense, on page 753. To use the FXOS CLI, see the FXOS CLI configuration guide. For more advanced FXOS procedures and troubleshooting, see the FXOS configuration guide.

- About Firepower Interfaces, on page 603
- About Logical Devices, on page 616
- Licenses for Container Instances, on page 624
- Requirements and Prerequisites for Logical Devices, on page 625
- Guidelines and Limitations for Logical Devices, on page 628
- Configure Interfaces, on page 631
- Configure Logical Devices, on page 635
- History for Firepower Threat Defense Logical Devices, on page 645

About Firepower Interfaces

The Firepower 4100/9300 chassis supports physical interfaces, VLAN subinterfaces for container instances, and EtherChannel (port-channel) interfaces. EtherChannel interfaces can include up to 16 member interfaces of the same type.

Chassis Management Interface

The chassis management interface is used for management of the FXOS Chassis by SSH or Firepower Chassis Manager. This interface appears at the top of the Interfaces tab as MGMT, and you can only enable or disable this interface on the Interfaces tab. This interface is separate from the mgmt-type interface that you assign to the logical devices for application management.

To configure parameters for this interface, you must configure them from the CLI. To view information about this interface in the FXOS CLI, connect to local management and show the management port:
Interface Types

Each interface can be one of the following types:

- **Data**—Use for regular data. Data interfaces cannot be shared between logical devices, and logical devices cannot communicate over the backplane to other logical devices. For traffic on Data interfaces, all traffic must exit the chassis on one interface and return on another interface to reach another logical device.

- **Data-sharing**—Use for regular data. Only supported with container instances, these data interfaces can be shared by one or more logical devices/container instances (FTD only). Each container instance can communicate over the backplane with all other instances that share this interface. Shared interfaces can affect the number of container instances you can deploy. Shared interfaces are not supported for bridge group member interfaces (in transparent mode or routed mode), inline sets, passive interfaces, or failover links.

- **Mgmt**—Use to manage application instances. These interfaces can be shared by one or more logical devices to access external hosts; logical devices cannot communicate over this interface with other logical devices that share the interface. You can only assign one management interface per logical device. For ASA: You can later enable management from a data interface; but you must assign a Management interface to the logical device even if you don't intend to use it after you enable data management. For information about the separate chassis management interface, see Chassis Management Interface, on page 603.

- **Firepower-eventing**—Use as a secondary management interface for FTD devices. To use this interface, you must configure its IP address and other parameters at the FTD CLI. For example, you can separate management traffic from events (such as web events). See the FMC configuration guide for more information. Firepower-eventing interfaces can be shared by one or more logical devices to access external hosts; logical devices cannot communicate over this interface with other logical devices that share the interface.

- **Cluster**—Use as the cluster control link for a clustered logical device. By default, the cluster control link is automatically created on Port-channel 48. The Cluster type is only supported on EtherChannel interfaces.

FXOS Interfaces vs. Application Interfaces

The Firepower 4100/9300 manages the basic Ethernet settings of physical interfaces, VLAN subinterfaces for container instances, and EtherChannel (port-channel) interfaces. Within the application, you configure higher level settings. For example, you can only create EtherChannels in FXOS; but you can assign an IP address to the EtherChannel within the application.

The following sections describe the interaction between FXOS and the application for interfaces.
VLAN Subinterfaces

For all logical devices, you can create VLAN subinterfaces within the application.

For container instances only, you can also create VLAN subinterfaces in FXOS (on interfaces without FXOS subinterfaces). Application-defined subinterfaces are not subject to the FXOS limit. Choosing in which operating system to create subinterfaces depends on your network deployment and personal preference. For example, to share a subinterface, you must create the subinterface in FXOS. Another scenario that favors FXOS subinterfaces comprises allocating separate subinterface groups on a single interface to multiple instances. For example, you want to use Port-channel1 with VLAN 2–11 on instance A, VLAN 12–21 on instance B, and VLAN 22–31 on instance C. If you create these subinterfaces within the application, then you would have to share the parent interface in FXOS, which may not be desirable. See the following illustration that shows the three ways you can accomplish this scenario:
Independent Interface States in the Chassis and in the Application

You can administratively enable and disable interfaces in both the chassis and in the application. For an interface to be operational, the interface must be enabled in both operating systems. Because the interface state is controlled independently, you may have a mismatch between the chassis and application.

The default state of an interface within the application depends on the type of interface. For example, the physical interface or EtherChannel is disabled by default within the application, but a subinterface is enabled by default.
Shared Interface Scalability

Container instances can share data-sharing type interfaces. This capability lets you conserve physical interface usage as well as support flexible networking deployments. When you share an interface, the chassis uses unique MAC addresses to forward traffic to the correct instance. However, shared interfaces can cause the forwarding table to grow large due to the need for a full mesh topology within the chassis (every instance must be able to communicate with every other instance that is sharing the same interface). Therefore, there are limits to how many interfaces you can share.

In addition to the forwarding table, the chassis maintains a VLAN group table for VLAN subinterface forwarding. Depending on the number of parent interfaces and other deployment decisions, you can create up to 500 VLAN subinterfaces.

See the following limits for shared interface allocation:

Shared Interface Best Practices

For optimal scalability of the forwarding table, share as few interfaces as possible. Instead, you can create up to 500 VLAN subinterfaces on one or more physical interfaces, and then divide the VLANs among the container instances.

When sharing interfaces, follow these practices in the order of most scalable to least scalable:

1. Best—Share subinterfaces under a single parent, and use the same set of subinterfaces with the same group of instances.
For example, create a large EtherChannel to bundle all of your like-kind interfaces together, and then share subinterfaces of that EtherChannel: Port-Channel1.2, 3, and 4 instead of Port-Channel2, Port-Channel3, and Port-Channel4. When you share subinterfaces from a single parent, the VLAN group table provides better scaling of the forwarding table than when sharing physical/EtherChannel interfaces or subinterfaces across parents.

**Figure 12: Best: Shared Subinterface Group on One Parent**

If you do not share the same set of subinterfaces with a group of instances, your configuration can cause more resource usage (more VLAN groups). For example, share Port-Channel1.2, 3, and 4 with instances 1, 2, and 3 (one VLAN group) instead of sharing Port-Channel1.2 and 3 with instances 1 and 2, while sharing Port-Channel1.3 and 4 with instance 3 (two VLAN groups).

**Figure 13: Good: Sharing Multiple Subinterface Groups on One Parent**

2. Fair—Share subinterfaces across parents.

For example, share Port-Channel1.2, Port-Channel2.3, and Port-Channel3.4 instead of Port-Channel2, Port-Channel4, and Port-Channel4. Although this usage is not as efficient as only sharing subinterfaces on the same parent, it still takes advantage of VLAN groups.
3. Worst—Share individual parent interfaces (physical or EtherChannel). This method uses the most forwarding table entries.

Figure 15: Worst: Shared Parent Interfaces

Shared Interface Usage Examples

See the following tables for examples of interface sharing and scalability. The below scenarios assume use of one physical/EtherChannel interface for management shared across all instances, and another physical or EtherChannel interface with dedicated subinterfaces for use with High Availability.

- Table 71: Physical/EtherChannel Interfaces and Instances on a Firepower 9300 with Three SM-44s, on page 610
- Table 72: Subinterfaces on One Parent and Instances on a Firepower 9300 with Three SM-44s, on page 611
- Table 73: Physical/EtherChannel Interfaces and Instances on a Firepower 9300 with One SM-44, on page 613
- Table 74: Subinterfaces on One Parent and Instances on a Firepower 9300 with One SM-44, on page 614

Firepower 9300 with Three SM-44s

The following table applies to three SM-44 security modules on a 9300 using only physical interfaces or EtherChannels. Without subinterfaces, the maximum number of interfaces are limited. Moreover, sharing multiple physical interfaces uses more forwarding table resources than sharing multiple subinterfaces.
Each SM-44 module can support up to 14 instances. Instances are split between modules as necessary to stay within limits.

*Firepower Threat Defense Getting Started*

*Shared Interface Usage Examples*
### Shared Interface Usage Examples

The following table applies to the Firepower 9300 with one SM-44 using subinterfaces on a single parent physical interface. For example, create a large EtherChannel to bundle all of your like-kind interfaces together, and then share subinterfaces of that EtherChannel. Sharing multiple physical interfaces uses more forwarding table resources than sharing multiple subinterfaces.

The Firepower 9300 with one SM-44 can support up to 14 instances.

**Viewing Shared Interface Resources**

To view forwarding table and VLAN group usage, see the Devices & Network > Interface Forwarding Utilization area. For example:
Inline Set Link State Propagation for the Firepower Threat Defense

An inline set acts like a bump on the wire, and binds two interfaces together to slot into an existing network. This function allows the system to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of an inline set unless explicitly dropped.

When you configure an inline set in the FTD application and enable link state propagation, the FTD sends inline set membership to the FXOS chassis. Link state propagation means that the chassis automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down. When the downed interface comes back up, the second interface automatically comes back up, also. In other words, if the link state of one interface changes, the chassis senses the change and updates the link state of the other interface to match it. Note that the chassis requires up to 4 seconds to propagate link state changes. Link state propagation is especially useful in resilient network environments where routers are configured to reroute traffic automatically around network devices that are in a failure state.

About Logical Devices

A logical device lets you run one application instance (either ASA or Firepower Threat Defense) and also one optional decorator application (Radware DefensePro) to form a service chain.

When you add a logical device, you also define the application instance type and version, assign interfaces, and configure bootstrap settings that are pushed to the application configuration.

Note

For the Firepower 9300, you can install different application types (ASA and FTD) on separate modules in the chassis. You can also run different versions of an application instance type on separate modules.

Standalone and Clustered Logical Devices

You can add the following logical device types:

- **Standalone**—A standalone logical device operates as a standalone unit or as a unit in a High Availability pair.
• Cluster—A clustered logical device lets you group multiple units together, providing all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices. Multiple module devices, like the Firepower 9300, support intra-chassis clustering. For the Firepower 9300, all three modules must participate in the cluster.

Logical Device Application Instances: Container and Native

Application instances run in the following deployment types:

• Native instance—A native instance uses all of the resources (CPU, RAM, and disk space) of the security module/engine, so you can only install one native instance.

• Container instance—A container instance uses a subset of resources of the security module/engine, so you can install multiple container instances. Multi-instance capability is only supported for the Firepower Threat Defense using FMC; it is not supported for the ASA.

Note
Multi-instance capability is similar to ASA multiple context mode, although the implementation is different. Multiple context mode partitions a single application instance, while multi-instance capability allows independent container instances. Container instances allow hard resource separation, separate configuration management, separate reboots, separate software updates, and full Firepower Threat Defense feature support. Multiple context mode, due to shared resources, supports more contexts on a given platform. Multiple context mode is not available on the Firepower Threat Defense.

For the Firepower 9300, you can use a native instance on some modules, and container instances on the other module(s).

Container Instance Interfaces

To provide flexible physical interface use for container instances, you can create VLAN subinterfaces in FXOS and also share interfaces (VLAN or physical) between multiple instances. Native instances cannot use VLAN subinterfaces or shared interfaces. See Shared Interface Scalability, on page 607 and Add a VLAN Subinterface for Container Instances, on page 634.

How the Chassis Classifies Packets

Each packet that enters the chassis must be classified, so that the chassis can determine to which instance to send a packet.

• Unique Interfaces—If only one instance is associated with the ingress interface, the chassis classifies the packet into that instance. For bridge group member interfaces (in transparent mode or routed mode), inline sets, or passive interfaces, this method is used to classify packets at all times.

• Unique MAC Addresses—The chassis automatically generates unique MAC addresses for all interfaces, including shared interfaces. If multiple instances share an interface, then the classifier uses unique MAC addresses assigned to the interface in each instance. An upstream router cannot route directly to an instance without unique MAC addresses. You can also set the MAC addresses manually when you configure each interface within the application. However, even if you are not sharing a subinterface, if
you manually configure MAC addresses, make sure you use unique MAC addresses for all subinterfaces on the same parent interface to ensure proper classification.

**Note**

If the destination MAC address is a multicast or broadcast MAC address, the packet is duplicated and delivered to each instance.

**Classification Examples**

The following figure shows multiple instances sharing an outside interface. The classifier assigns the packet to Instance C because Instance C includes the MAC address to which the router sends the packet.

*Figure 16: Packet Classification with a Shared Interface Using MAC Addresses*

Note that all new incoming traffic must be classified, even from inside networks. The following figure shows a host on the Instance C inside network accessing the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/2.3, which is assigned to Instance C.
For transparent firewalls, you must use unique interfaces. The following figure shows a packet destined to a host on the Instance C inside network from the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/2.3, which is assigned to Instance C.
For inline sets, you must use unique interfaces and they must be physical interfaces or EtherChannels. The following figure shows a packet destined to a host on the Instance C inside network from the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/5, which is assigned to Instance C.
Cascading Container Instances

Placing a container instance directly in front of another instance is called *cascading container instances*; the outside interface of one instance is the same interface as the inside interface of another instance. You might want to cascade instances if you want to simplify the configuration of some instances by configuring shared parameters in the top instance.

The following figure shows a gateway instance with two instances behind the gateway.
The following example includes three container instances in routed firewall mode. They include the following interfaces:

- **Management**—All instances use the Port-Channel1 interface (management type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Within each application, the interface uses a unique IP address on the same management network.

- **Inside**—Each instance uses a subinterface on Port-Channel2 (data type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Each subinterface is on a separate network.

- **Outside**—All instances use the Port-Channel3 interface (data-sharing type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Within each application, the interface uses a unique IP address on the same outside network.

- **Failover**—Each instance uses a subinterface on Port-Channel4 (data type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Each subinterface is on a separate network.
Automatic MAC Addresses for Container Instance Interfaces

The FXOS chassis automatically generates MAC addresses for container instance interfaces, and guarantees that a shared interface in each instance uses a unique MAC address.

If you manually assign a MAC address to a shared interface within the application, then the manually-assigned MAC address is used. If you later remove the manual MAC address, the autogenerated address is used. In the rare circumstance that the generated MAC address conflicts with another private MAC address in your network, we suggest that you manually set the MAC address for the interface within the application.

Because autogenerated addresses start with A2, you should not start manual MAC addresses with A2 due to the risk of overlapping addresses.

Note

Even if you are not sharing a subinterface, if you manually configure MAC addresses, make sure you use unique MAC addresses for all subinterfaces on the same parent interface to ensure proper classification.

The FXOS chassis generates the MAC address using the following format:

A2xx.yyzz.zzzz

Where xx.yy is a user-defined prefix or a system-defined prefix, and zz.zzzz is an internal counter generated by the chassis. The system-defined prefix matches the lower 2 bytes of the first MAC address in the burned-in MAC address pool that is programmed into the IDPROM. Use `connect fxos`, then `show module` to view the MAC address pool. For example, if the range of MAC addresses shown for module 1 is b0aa.772f.00bf to b0aa.772f.00bf, then the system prefix will be f0bf.

The user-defined prefix is an integer that is converted into hexadecimal. For an example of how the user-defined prefix is used, if you set a prefix of 77, then the chassis converts 77 into the hexadecimal value 004D (yyxx). When used in the MAC address, the prefix is reversed (xxyy) to match the chassis native form:
Container Instance Resource Management

To specify resource usage per container instance, create one or more resource profiles in FXOS. When you deploy the logical device/application instance, you specify the resource profile that you want to use. The resource profile sets the number of CPU cores; RAM is dynamically allocated according to the number of cores, and disk space is set to 40 GB per instance. To view the available resources per model, see Requirements and Prerequisites for Container Instances, on page 626. To add a resource profile, see Add a Resource Profile for Container Instances, on page 635.

Performance Scaling Factor for Multi-Instance Capability

The maximum throughput (connections, VPN sessions, and TLS proxy sessions) for a platform is calculated for a native instance’s use of memory and CPU (and this value is shown in show resource usage). If you use multiple instances, then you need to calculate the throughput based on the percentage of CPU cores that you assign to the instance. For example, if you use a container instance with 50% of the cores, then you should initially calculate 50% of the throughput. Moreover, the throughput available to a container instance may be less than that available to a native instance.

Container Instances and High Availability

You can use High Availability using a container instance on 2 separate chassis; for example, if you have 2 chassis, each with 10 instances, you can create 10 High Availability pairs. Note that High Availability is not configured in FXOS; configure each High Availability pair in the application manager.

For detailed requirements, see Requirements and Prerequisites for High Availability, on page 627 and Add a High Availability Pair, on page 641.

Note

Clustering is not supported.

Licenses for Container Instances

All licenses are consumed per security engine/chassis (for the Firepower 4100) or per security module (for the Firepower 9300), and not per container instance. See the following details:

• Base licenses are automatically assigned: one per security module/engine.

• Feature licenses are manually assigned to each instance; but you only consume one license per feature per security module/engine. For example, for the Firepower 9300 with 3 security modules, you only need one URL Filtering license per module for a total of 3 licenses, regardless of the number of instances in use.
• For High Availability, see License Requirements for FTD Devices in a High Availability Pair, on page 728.

Requirements and Prerequisites for Logical Devices

See the following sections for requirements and prerequisites.

Requirements and Prerequisites for Hardware and Software Combinations

The Firepower 4100/9300 supports multiple models, security modules, application types, and high availability and scalability features. See the following requirements for allowed combinations.

Firepower 9300 Requirements

The Firepower 9300 includes 3 security module slots and multiple types of security modules. See the following requirements:

• Security Module Types—You can install modules of different types in the Firepower 9300. For example, you can install the SM-36 as module 1, SM-40 as module 2, and SM-44 as module 3.

• Clustering—All security modules in the cluster, whether it is intra-chassis or inter-chassis, must be the same type. You can have different quantities of installed security modules in each chassis, although all modules present in the chassis must belong to the cluster including any empty slots. For example, you
can install 2 SM-36s in chassis 1, and 3 SM-36s in chassis 2. You cannot use clustering if you install 1 SM-24 and 2 SM-36s in the same chassis.

- High Availability—High Availability is only supported between same-type modules on the Firepower 9300. However, the two chassis can include mixed modules. For example, each chassis has an SM-36, SM-40, and SM-44. You can create High Availability pairs between the SM-36 modules, between the SM-40 modules, and between the SM-44 modules.

- ASA and FTD application types—You can install different application types on separate modules in the chassis. For example, you can install ASA on module 1 and module 2, and FTD on module 3.

- ASA or FTD versions—You can run different versions of an application instance type on separate modules, or as separate container instances on the same module. For example, you can install FTD 6.3 on module 1, FTD 6.4 on module 2, and FTD 6.5 on module 3.

**Firepower 4100 Requirements**

The Firepower 4100 comes in multiple models. See the following requirements:

- Native and Container instances—When you install a container instance on a Firepower 4100, that device can only support other container instances. A native instance uses all of the resources for a device, so you can only install a single native instance on the device.

- Clustering—All chassis in the cluster must be the same model.

- High Availability—High Availability is only supported between same-type models.

- ASA and FTD application types—The Firepower 4100 can only run a single application type.

- FTD container instance versions—You can run different versions of FTD as separate container instances on the same module.

**Requirements and Prerequisites for Container Instances**

**Supported Application Types**

- Firepower Threat Defense

**Maximum Container Instances and Resources per Model**

For each container instance, you can specify the number of CPU cores to assign to the instance. RAM is dynamically allocated according to the number of cores, and disk space is set to 40 GB per instance.

**Table 77: Maximum Container Instances and Resources per Model**

<table>
<thead>
<tr>

### Firepower Management Center Requirements

For all instances on a Firepower 4100 chassis or Firepower 9300 module, you must use the same Firepower Management Center (FMC) due to the licensing implementation.

### Requirements and Prerequisites for High Availability

- The two units in a High Availability Failover configuration must:
  - Be on a separate chassis; intra-chassis High Availability for the Firepower 9300 is not supported.
  - Be the same model.
  - Have the same interfaces assigned to the High Availability logical devices.
  - Have the same number and types of interfaces. All interfaces must be preconfigured in FXOS identically before you enable High Availability.

- High Availability is only supported between same-type modules on the Firepower 9300; but the two chassis can include mixed modules. For example, each chassis has an SM-36, SM-40, and SM-44. You can create High Availability pairs between the SM-36 modules, between the SM-40 modules, and between the SM-44 modules.

- For container instances, each unit must use the same resource profile attributes.
For other High Availability system requirements, see High Availability System Requirements, on page 727.

Guidelines and Limitations for Logical Devices

See the following sections for guidelines and limitations.

Guidelines and Limitations for Firepower Interfaces

VLAN Subinterfaces

- Subinterfaces (and the parent interfaces) can only be assigned to container instances.

Note

If you assign a parent interface to a container instance, it only passes untagged (non-VLAN) traffic. Do not assign the parent interface unless you intend to pass untagged traffic.

- Subinterfaces are supported on Data or Data-sharing type interfaces.
- You can create between 250 and 500 subinterfaces per chassis using up to 500 VLAN IDs, depending on your network deployment.
- See the following limitations within the logical device application; keep these limitations in mind when planning your interface allocation.
  - You cannot use subinterfaces for an FTD inline set or as a passive interface.
  - If you use a subinterface for the failover link, then all subinterfaces on that parent, and the parent itself, are restricted for use as failover links. You cannot use some subinterfaces as failover links, and some as regular data interfaces.

Data-sharing Interfaces

- You cannot use a data-sharing interface with a native instance.
- Maximum 14 instances per shared interface. For example, you can allocate Ethernet1/1 to Instance1 through Instance14.

Maximum 10 shared interfaces per instance. For example, you can allocate Ethernet1/1.1 through Ethernet1/1.10 to Instance1.
• See the following limitations within the logical device application; keep these limitations in mind when planning your interface allocation.
  • You cannot use a data-sharing interface with a transparent firewall mode device.
  • You cannot use a data-sharing interface with FTD inline sets or passive interfaces.
  • You cannot use a data-sharing interface for the failover link.

**Inline Sets for FTD**
- Supported for physical interfaces (both regular and breakout ports) and EtherChannels. Subinterfaces are not supported.
- Link state propagation is supported.

**Hardware Bypass**
- Supported for the FTD; you can use them as regular interfaces for the ASA.
- The FTD only supports Hardware Bypass with inline sets.
- Hardware Bypass-capable interfaces cannot be configured for breakout ports.
- You cannot include Hardware Bypass interfaces in an EtherChannel and use them for Hardware Bypass; you can use them as regular interfaces in an EtherChannel.
• Hardware Bypass is not supported with High Availability.

Default MAC Addresses

For native instances:

Default MAC address assignments depend on the type of interface.

• Physical interfaces—The physical interface uses the burned-in MAC address.

• EtherChannels—For an EtherChannel, all interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. The port-channel interface uses a unique MAC address from a pool; interface membership does not affect the MAC address.

For container instances:

• MAC addresses for all interfaces are taken from a MAC address pool. For subinterfaces, if you decide to manually configure MAC addresses, make sure you use unique MAC addresses for all subinterfaces on the same parent interface to ensure proper classification. See Automatic MAC Addresses for Container Instance Interfaces, on page 623.

General Guidelines and Limitations

Firewall Mode

You can set the firewall mode to routed or transparent in the bootstrap configuration for the FTD.

High Availability

• Configure high availability within the application configuration.

• You can use any data interfaces as the failover and state links. Data-sharing interfaces are not supported.

Multi-Instance and Context Mode

• Multiple context mode is only supported on the ASA.

• Multi-instance capability with container instances is only available for the FTD.

• For FTD container instances, a single Firepower Management Center must manage all instances on a security module/engine.

• For FTD container instances, the following features are not supported:

  • Clustering

  • Radware DefensePro link decorator

  • FTD configuration backup and restore using FMC

  • FMC UCAPL/CC mode

  • Flow offload to hardware
Configure Interfaces

By default, physical interfaces are disabled. You can enable interfaces, add EtherChannels, add VLAN subinterfaces, and edit interface properties.

Enable or Disable an Interface

You can change the Admin State of each interface to be enabled or disabled. By default, physical interfaces are disabled. For VLAN subinterfaces, the admin state is inherited from the parent interface.

Step 1
Choose Interfaces to open the Interfaces page.

The Interfaces page shows a visual representation of the currently installed interfaces at the top of the page and provides a listing of the installed interfaces in the table below.

Step 2
To enable the interface, click the disabled Slider disabled ( ) so that it changes to the enabled Slider enabled ( ).

Click Yes to confirm the change. The corresponding interface in the visual representation changes from gray to green.

Step 3
To disable the interface, click the enabled Slider enabled ( ) so that it changes to the disabled Slider disabled ( ).

Click Yes to confirm the change. The corresponding interface in the visual representation changes from green to gray.

Configure a Physical Interface

You can physically enable and disable interfaces, as well as set the interface speed and duplex. To use an interface, it must be physically enabled in FXOS and logically enabled in the application.

Before you begin

• Interfaces that are already a member of an EtherChannel cannot be modified individually. Be sure to configure settings before you add it to the EtherChannel.

Step 1
Choose Interfaces to open the Interfaces page.

The All Interfaces page shows a visual representation of the currently installed interfaces at the top of the page and provides a listing of the installed interfaces in the table below.

Step 2
Click Edit in the row for the interface you want to edit to open the Edit Interface dialog box.

Step 3
To enable the interface, check the Enable check box. To disable the interface, uncheck the Enable check box.

Step 4
Choose the interface Type:

See Interface Types, on page 604 for details about interface type usage.

• Data
Add an EtherChannel (Port Channel)

An EtherChannel (also known as a port channel) can include up to 16 member interfaces of the same media type and capacity, and must be set to the same speed and duplex. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface. The Link Aggregation Control Protocol (LACP) aggregates interfaces by exchanging the Link Aggregation Control Protocol Data Units (LACPDUs) between two network devices.

You can configure each physical Data or Data-sharing interface in an EtherChannel to be:

- **Active**—Sends and receives LACP updates. An active EtherChannel can establish connectivity with either an active or a passive EtherChannel. You should use the active mode unless you need to minimize the amount of LACP traffic.

- **On**—The EtherChannel is always on, and LACP is not used. An “on” EtherChannel can only establish a connection with another “on” EtherChannel.

**Note**

It may take up to three minutes for an EtherChannel to come up to an operational state if you change its mode from On to Active or from Active to On.

Non-data interfaces only support active mode.

LACP coordinates the automatic addition and deletion of links to the EtherChannel without user intervention. It also handles misconfigurations and checks that both ends of member interfaces are connected to the correct channel group. “On” mode cannot use standby interfaces in the channel group when an interface goes down, and the connectivity and configurations are not checked.

When the Firepower 4100/9300 chassis creates an EtherChannel, the EtherChannel stays in a **Suspended** state for Active LACP mode or a **Down** state for On LACP mode until you assign it to a logical device, even if the physical link is up. The EtherChannel will be brought out of this **Suspended** state in the following situations:

- The EtherChannel is added as a data or management interface for a standalone logical device.
• The EtherChannel is added as a management interface or cluster control link for a logical device that is part of a cluster.

• The EtherChannel is added as a data interface for a logical device that is part of a cluster and at least one unit has joined the cluster.

Note that the EtherChannel does not come up until you assign it to a logical device. If the EtherChannel is removed from the logical device or the logical device is deleted, the EtherChannel will revert to a Suspended or Down state.

---

**Step 1**
Choose **Interfaces** to open the Interfaces page.

The **All Interfaces** page shows a visual representation of the currently installed interfaces at the top of the page and provides a listing of the installed interfaces in the table below.

**Step 2**
Click **Add Port Channel** above the interfaces table to open the Add Port Channel dialog box.

**Step 3**
Enter an ID for the port channel in the **Port Channel ID** field. Valid values are between 1 and 47.

Port-channel 48 is reserved for the cluster control link when you deploy a clustered logical device. If you do not want to use Port-channel 48 for the cluster control link, you can delete it and configure a Cluster type EtherChannel with a different ID. You can only add one Cluster type EtherChannel. For intra-chassis clustering, do not assign any interfaces to the Cluster EtherChannel.

**Step 4**
To enable the port channel, check the **Enable** check box. To disable the port channel, uncheck the **Enable** check box.

**Step 5**
Choose the interface **Type**:

See **Interface Types, on page 604** for details about interface type usage.

- **Data**
- **Data-sharing**—For container instances only.
- **Mgmt**
- **Firepower-eventing**—For FTD only.
- **Cluster**

**Step 6**
Set the required **Admin Speed** for the member interfaces from the drop-down list.

If you add a member interface that is not at the specified speed, it will not successfully join the port channel.

**Step 7**
For Data or Data-sharing interfaces, choose the LACP port-channel **Mode**, **Active** or **On**.

For non-Data or non-Data-sharing interfaces, the mode is always active.

**Step 8**
Set the required **Admin Duplex** for the member interfaces, **Full Duplex** or **Half Duplex**.

If you add a member interface that is configured with the specified duplex, it will not successfully join the port channel.

**Step 9**
To add an interface to the port channel, select the interface in the **Available Interface** list and click **Add Interface** to move the interface to the Member ID list.

You can add up to 16 member interfaces of the same media type and capacity. The member interfaces must be set to the same speed and duplex, and must match the speed and duplex that you configured for this port channel. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface.
You can add multiple interfaces at one time. To select multiple individual interfaces, click on the desired interfaces while holding down the Ctrl key. To select a range of interfaces, select the first interface in the range, and then, while holding down the Shift key, click to select the last interface in the range.

**Step 10**
To remove an interface from the port channel, click the Delete button to the right of the interface in the Member ID list.

**Step 11**
Click OK.

---

## Add a VLAN Subinterface for Container Instances

You can add between 250 and 500 VLAN subinterfaces to the chassis, depending on your network deployment. VLAN IDs per interface must be unique, and within a container instance, VLAN IDs must be unique across all assigned interfaces. You can reuse VLAN IDs on separate interfaces as long as they are assigned to different container instances. However, each subinterface still counts towards the limit even though it uses the same ID.

You can also add subinterfaces within the application. For more information on when to use FXOS subinterfaces vs. application subinterfaces, see FXOS Interfaces vs. Application Interfaces, on page 604.

---

**Step 1**
Choose Interfaces to open the All Interfaces tab.

The All Interfaces tab shows a visual representation of the currently installed interfaces at the top of the page and provides a listing of the installed interfaces in the table below.

**Step 2**
Click Add New > Subinterface to open the Add Subinterface dialog box.

**Step 3**
Choose the interface Type:

- Data
- Data-sharing

The type is independent of the parent interface type; you can have a Data-sharing parent and a Data subinterface, for example.

**Step 4**
Choose the parent Interface from the drop-down list.

You cannot add a subinterface to a physical interface that is currently allocated to a logical device. If other subinterfaces of the parent are allocated, you can add a new subinterface as long as the parent interface itself is not allocated.

**Step 5**
Enter a Subinterface ID, between 1 and 4294967295.

This ID will be appended to the parent interface ID as interface_id.subinterface_id. For example, if you add a subinterface to Ethernet1/1 with the ID of 100, then the subinterface ID will be: Ethernet1/1.100. This ID is not the same as the VLAN ID, although you can set them to match for convenience.

**Step 6**
Set the VLAN ID between 1 and 4095.

**Step 7**
Click OK.
Expand the parent interface to view all subinterfaces under it.

## Configure Logical Devices

Add a standalone logical device or a High Availability pair on the Firepower 4100/9300 chassis.

For clustering, see Clustering for the Firepower Threat Defense, on page 753.

### Add a Resource Profile for Container Instances

To specify resource usage per container instance, create one or more resource profiles. When you deploy the logical device/application instance, you specify the resource profile that you want to use. The resource profile sets the number of CPU cores; RAM is dynamically allocated according to the number of cores, and disk space is set to 40 GB per instance.

- The minimum number of cores is 6.

**Note**

Instances with a smaller number of cores might experience relatively higher CPU utilization than those with larger numbers of cores. Instances with a smaller number of cores are more sensitive to traffic load changes. If you experience traffic drops, try assigning more cores.

- You can assign cores as an even number (6, 8, 10, 12, 14 etc.) up to the maximum. Note that we do not recommend using 8 cores; performance for 8 cores is only slightly better than for 6 cores.

- The maximum number of cores available depends on the security module/chassis model; see Requirements and Prerequisites for Container Instances, on page 626.

The chassis includes a default resource profile called "Default-Small," which includes the minimum number of cores. You can change the definition of this profile, and even delete it if it is not in use. Note that this profile is created when the chassis reloads and no other profile exists on the system.

You cannot change the resource profile settings if it is currently in use. You must disable any instances that use it, then change the resource profile, and finally reenable the instance. If you resize instances in an established High Availability pair, then you should make all members the same size as soon as possible.

If you change the resource profile settings after you add the FTD instance to the FMC, then update the inventory for each unit on the FMC Devices > Device Management > Device > System > Inventory dialog box.

**Step 1**

Choose Platform Settings > Resource Profiles, and click Add.

The Add Resource Profile dialog box appears.

**Step 2**

Set the following parameters.

- **Name**—Sets the name of the profile between 1 and 64 characters. Note that you cannot change the name of this profile after you add it.
Add a Standalone Firepower Threat Defense

Standalone logical devices work either alone or in a High Availability pair. On the Firepower 9300 with multiple security modules, you can deploy either a cluster or standalone devices. The cluster must use all modules, so you cannot mix and match a 2-module cluster plus a single standalone device, for example.

You can use native instances on some modules, and container instances on the other module(s).

Before you begin

- Download the application image you want to use for the logical device from Cisco.com, and then upload that image to the Firepower 4100/9300 chassis.

  Note

  For the Firepower 9300, you can install different application types (ASA and FTD) on separate modules in the chassis. You can also run different versions of an application instance type on separate modules.

- Configure a management interface to use with the logical device. The management interface is required. Note that this management interface is not the same as the chassis management port that is used only for chassis management (and that appears at the top of the Interfaces tab as MGMT).

- You must also configure at least one Data type interface. Optionally, you can also create a firepower-eventing interface to carry all event traffic (such as web events). See Interface Types, on page 604 for more information.

- For container instances, if you do not want to use the default profile, add a resource profile according to Add a Resource Profile for Container Instances, on page 635.

- For container instances, before you can install a container instance for the first time, you must reinitialize the security module/engine so that the disk has the correct formatting. Choose Security Modules or Security Engine, and click the Reinitialize icon. An existing logical device will be deleted and then reinstalled as a new device, losing any local application configuration. If you are replacing a native instance with container instances, you will need to delete the native instance in any case. You cannot automatically migrate a native instance to a container instance.

- Gather the following information:
  - Interface IDs for this device
  - Management interface IP address and network mask
  - Gateway IP address
  - FMC IP address and/or NAT ID of your choosing
• DNS server IP address
• FTD hostname and domain name

Step 1
Choose Logical Devices.

Step 2
Click Add Device, and set the following parameters:

- Provide a Device Name.
  This name is used by the chassis supervisor to configure management settings and to assign interfaces; it is not the device name used in the application configuration.

- For the Template, choose Cisco Firepower Threat Defense.

- Choose the Image Version.

- Choose the Instance Type: Container or Native.
  A native instance uses all of the resources (CPU, RAM, and disk space) of the security module/engine, so you can only install one native instance. A container instance uses a subset of resources of the security module/engine, so you can install multiple container instances.

- For the Usage, click the Standalone radio button.

- Click OK.
  You see the Provisioning - device name window.

Step 3
Expand the Data Ports area, and click each interface that you want to assign to the device.
You can only assign data and data-sharing interfaces that you previously enabled on the **Interfaces** page. You will later enable and configure these interfaces in FMC, including setting the IP addresses.

You can only assign up to 10 data-sharing interfaces to a container instance. Also, each data-sharing interface can be assigned to at most 14 container instances. A data-sharing interface is indicated by the sharing icon (●).

Hardware Bypass-capable ports are shown with the following icon: [Hardware Bypass icon]. For certain interface modules, you can enable the Hardware Bypass feature for Inline Set interfaces only (see the FMC configuration guide). Hardware Bypass ensures that traffic continues to flow between an inline interface pair during a power outage. This feature can be used to maintain network connectivity in the case of software or hardware failures. If you do not assign both interfaces in a Hardware Bypass pair, you see a warning message to make sure your assignment is intentional. You do not need to use the Hardware Bypass feature, so you can assign single interfaces if you prefer.

**Step 4**

Click the device icon in the center of the screen.

A dialog box appears where you can configure initial bootstrap settings. These settings are meant for initial deployment only, or for disaster recovery. For normal operation, you can later change most values in the application CLI configuration.

**Step 5**

On the **General Information** page, complete the following:
a) (For the Firepower 9300) Under **Security Module Selection** click the security module that you want to use for this logical device.

b) For a container instance, specify the **Resource Profile**.

   If you later assign a different resource profile, then the instance will reload, which can take approximately 5 minutes. Note that for established High Availability pairs, if you assign a different-sized resource profile, be sure to make all members the same size as soon as possible.

c) Choose the **Management Interface**.

   This interface is used to manage the logical device. This interface is separate from the chassis management port.

d) Choose the management interface **Address Type**: **IPv4 only**, **IPv6 only**, or **IPv4 and IPv6**.

e) Configure the **Management IP** address.

   Set a unique IP address for this interface.

f) Enter a **Network Mask** or **Prefix Length**.

g) Enter a **Network Gateway** address.

**Step 6** On the **Settings** tab, complete the following:
a) Enter the **Firepower Management Center IP** of the managing FMC. If you do not know the FMC IP address, leave this field blank and enter a passphrase in the **Firepower Management Center NAT ID** field.

b) For a container instance, **Permit Expert mode from FTD SSH sessions**: Yes or No. Expert Mode provides FTD shell access for advanced troubleshooting.

   If you choose Yes for this option, then users who access the container instance directly from an SSH session can enter Expert Mode. If you choose No, then only users who access the container instance from the FXOS CLI can enter Expert Mode. We recommend choosing No to increase isolation between instances.

   Use Expert Mode only if a documented procedure tells you it is required, or if the Cisco Technical Assistance Center asks you to use it. To enter this mode, use the `expert` command in the FTD CLI.

c) Enter the **Search Domains** as a comma-separated list.

d) Choose the **Firewall Mode**: Transparent or Routed.

   In routed mode, the FTD is considered to be a router hop in the network. Each interface that you want to route between is on a different subnet. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices.

   The firewall mode is only set at initial deployment. If you re-apply the bootstrap settings, this setting is not used.

e) Enter the **DNS Servers** as a comma-separated list.

   The FTD uses DNS if you specify a hostname for the FMC, for example.

f) Enter the **Fully Qualified Hostname** for the FTD.

g) Enter a **Registration Key** to be shared between the FMC and the device during registration.

   You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the FTD.

h) Enter a **Password** for the FTD admin user for CLI access.

i) Choose the **Eventing Interface** on which Firepower events should be sent. If not specified, the management interface will be used.
This interface must be defined as a Firepower-eventing interface.

**Step 7** On the **Agreement** tab, read and accept the end user license agreement (EULA).

**Step 8** Click **OK** to close the configuration dialog box.

**Step 9** Click **Save**.

The chassis deploys the logical device by downloading the specified software version and pushing the bootstrap configuration and management interface settings to the application instance. Check the **Logical Devices** page for the status of the new logical device. When the logical device shows its **Status** as **online**, you can start configuring the security policy in the application.

**Step 10** See the FMC configuration guide to add the FTD as a managed device and start configuring your security policy.

### Add a High Availability Pair

FTD High Availability (also known as failover) is configured within the application, not in FXOS. However, to prepare your chassis for high availability, see the following steps.

**Before you begin**

See **Requirements and Prerequisites for High Availability**, on page 627.

**Step 1** Allocate the same interfaces to each logical device.

**Step 2** Allocate 1 or 2 data interfaces for the failover and state link(s).

These interfaces exchange high availability traffic between the 2 chassis. We recommend that you use a 10 GB data interface for a combined failover and state link. If you have available interfaces, you can use separate failover and state links; the state link requires the most bandwidth. You cannot use the management-type interface for the failover or state link. We recommend that you use a switch between the chassis, with no other device on the same network segment as the failover interfaces.

For container instances, data-sharing interfaces are not supported for the failover link. We recommend that you create subinterfaces on a parent interface or EtherChannel, and assign a subinterface for each instance to use as a failover link. Note that you must use all subinterfaces on the same parent as failover links. You cannot use one subinterface as a failover link and then use other subinterfaces (or the parent interface) as regular data interfaces.

**Step 3** Enable High Availability on the logical devices. See **High Availability for Firepower Threat Defense**, on page 727.
Step 4 If you need to make interface changes after you enable High Availability, perform the changes on the standby unit first, and then perform the changes on the active unit.

Change an Interface on a Firepower Threat Defense Logical Device

You can allocate or unallocate an interface, or replace a management interface on the FTD logical device. You can then sync the interface configuration in FMC.

Adding a new interface, or deleting an unused interface has minimal impact on the FTD configuration. However, deleting an interface that is used in your security policy will impact the configuration. Interfaces can be referenced directly in many places in the FTD configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Policies that refer to security zones are not affected. You can also edit the membership of an allocated EtherChannel without affecting the logical device or requiring a sync on the FMC.

Deleting an interface will delete any configuration associated with that interface.

Before you begin

• Configure your interfaces, and add any EtherChannels according to Configure a Physical Interface, on page 631 and Add an EtherChannel (Port Channel), on page 632.

• If you want to add an already-allocated interface to an EtherChannel (for example, all interfaces are allocated by default to a cluster), you need to unallocate the interface from the logical device first, then add the interface to the EtherChannel. For a new EtherChannel, you can then allocate the EtherChannel to the device.

• If you want to replace the management or firepower eventing interface with a management EtherChannel, then you need to create the EtherChannel with at least 1 unallocated data member interface, and then replace the current management interface with the EtherChannel. After the FTD reboots (management interface changes cause a reboot), and you sync the configuration in FMC, you can add the (now unallocated) management interface to the EtherChannel as well.

• For clustering or High Availability, make sure you add or remove the interface on all units before you sync the configuration in the FMC. We recommend that you make the interface changes on the data/standby unit(s) first, and then on the control/active unit. Note that new interfaces are added in an administratively down state, so they do not affect interface monitoring.

Step 1 In the Firepower Chassis Manager, choose Logical Devices.

Step 2 Click the Edit icon at the top right to edit the logical device.

Step 3 Allocate a new data interface by selecting the interface in the Data Ports area.

Do not delete any interfaces yet.
**Step 4** Replace the management or eventing interface:

For these types of interfaces, the device reboots after you save your changes.

a) Click the device icon in the center of the page.

b) On the **General** or **Cluster Information** tab, choose the new **Management Interface** from the drop-down list.

c) On the **Settings** tab, choose the new **Eventing Interface** from the drop-down list.

d) Click **OK**.

If you change the IP address of the Management interface, then you must also change the IP address for the device in the Firepower Management Center: go to **Devices > Device Management > Device/Cluster**. In the **Management** area, set the IP address to match the bootstrap configuration address.

**Step 5** Click **Save**.

**Step 6** Sync the interfaces in FMC.

a) Log into the FMC.

b) Select **Devices > Device Management** and click **Edit** for your FTD device. The **Interfaces** page is selected by default.

c) Click the **Sync Device** button on the top left of the **Interfaces** page.

d) After the changes are detected, you will see a red banner on the **Interfaces** page indicating that the interface configuration has changed. Click the **Click to know more** link to view the interface changes.

e) If you plan to delete an interface, manually transfer any interface configuration from the old interface to the new interface.

   Because you have not yet deleted any interfaces, you can refer to the existing configuration. You will have additional opportunity to fix the configuration after you delete the old interface and re-run the validation. The validation will show you all locations in which the old interface is still used.

f) Click **Validate Changes** to make sure your policy will still work with the interface changes.

   If there are any errors, you need to change your policy and rerun the validation.

g) Click **Save**.

h) Select the devices and click **Deploy** to deploy the policy to the assigned devices. The changes are not active until you deploy them.

**Step 7** In Firepower Chassis Manager, unallocate a data interface by de-selecting the interface in the **Data Ports** area.
Step 8  Click Save.

Step 9  Sync the interfaces again in FMC.

---

**Connect to the Console of the Application**

Use the following procedure to connect to the console of the application.

---

**Step 1**  Connect to the module CLI using a console connection or a Telnet connection.

```
connect module slot_number {console | telnet}
```

To connect to the security engine of a device that does not support multiple security modules, always use 1 as the `slot_number`.

The benefits of using a Telnet connection is that you can have multiple sessions to the module at the same time, and the connection speed is faster.

**Example:**

```
Firepower# connect module 1 console
Telnet escape character is '~'.
Trying 127.5.1.1... Connected to 127.5.1.1.
Escape character is '~'.

CISCO Serial Over LAN:
Close Network Connection to Exit

Firepower-module1>
```

**Step 2**  Connect to the application console.

```
connect ftd name
```

To view the instance names, enter the command without a name.

**Example:**

```
Firepower-module1> connect ftd ftd1
```
Connecting to ftd(ftd-native) console... enter exit to return to bootCLI
 [...] >

**Step 3**  Exit the application console to the FXOS module CLI.
• FTD—Enter **exit**

**Step 4**  Return to the supervisor level of the FXOS CLI.

**Exit the console:**

- Enter ~
  You exit to the Telnet application.
- To exit the Telnet application, enter:
  telnet>**quit**

**Exit the Telnet session:**
- Enter **Ctrl-]**.

---

### History for Firepower Threat Defense Logical Devices

| Cluster control link customizable IP Address for the Firepower 4100/9300 | 6.3     | By default, the cluster control link uses the 127.2.0.0/16 network. You can now set the network when you deploy the cluster in FXOS. The chassis auto-generates the cluster control link interface IP address for each unit based on the chassis ID and slot ID: 127.2.chassis_id.slot_id. However, some networking deployments do not allow 127.2.0.0/16 traffic to pass. Therefore, you can now set a custom /16 subnet for the cluster control link in FXOS except for loopback (127.0.0.0/8) and multicast (224.0.0.0/4) addresses. New/modified Firepower Chassis Manager screens:  
  - Logical Devices > Add Device > Cluster Information > CCL Subnet IP field New/Modified FXOS commands: set cluster-control-link network Supported platforms: Firepower 4100/9300 |
| Support for data EtherChannels in On mode    | 6.3     | You can now set data and data-sharing EtherChannels to either Active LACP mode or to On mode. Other types of EtherChannels only support Active mode. New/Modified Firepower Chassis Manager screens:  
  - Interfaces > All Interfaces > Edit Port Channel > Mode New/Modified FXOS commands: set port-channel-mode Supported platforms: Firepower 4100/9300 |
| Support for EtherChannels in FTD inline sets | 6.2     | You can now use EtherChannels in a FTD inline set. Supported platforms: Firepower 4100/9300                                                                                                                                                                                                                                           |
| Inter-chassis clustering for 6 FTD modules   | 6.2     | You can now enable inter-chassis clustering for the FTD. You can include up to 6 modules in up to 6 chassis. New/modified Firepower Chassis Manager screens:  
  - Logical Devices > Configuration Supported platforms: Firepower 4100/9300 |
| Hardware bypass support on the Firepower 4100/9300 for supported network modules | 6.1     | Hardware Bypass ensures that traffic continues to flow between an inline interface pair during a power outage. This feature can be used to maintain network connectivity in the case of software or hardware failures. New/Modified screens:  
  - Devices > Device Management > Interfaces > Edit Physical Interface Supported platforms: Firepower 4100/9300 |
When you configure an inline set in the FTD application and enable link state propagation, the FTD sends inline set membership to the FXOS chassis. Link state propagation means that the chassis automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down.

New/Modified FXOS commands: `show fault |grep link-down`, `show interface detail`

Supported platforms: Firepower 4100/9300

CHAPTER 29

Interface Overview for Firepower Threat Defense

The FTD device includes data interfaces that you can configure in different modes, as well as a management/diagnostic interface.

- Default Settings for Interfaces, on page 654
- Enable the Physical Interface and Configure Ethernet Settings, on page 655
- Sync Interface Changes with the Firepower Management Center, on page 656

Management/Diagnostic Interface

The physical management interface is shared between the Diagnostic logical interface and the Management logical interface.

Management Interface

The Management interface is separate from the other interfaces on the device. It is used to set up and register the device to the Firepower Management Center. It uses its own IP address and static routing. You can configure its settings at the CLI using the `configure network` command. If you change the IP address at the CLI after you add it to the Firepower Management Center, you can match the IP address in the Firepower Management Center in the Devices > Device Management > Devices > Management area.

Diagnostic Interface

The Diagnostic logical interface can be configured along with the rest of the data interfaces on the Devices > Device Management > Interfaces screen. Using the Diagnostic interface is optional (see the routed and transparent mode deployments for scenarios). The Diagnostic interface only allows management traffic, and does not allow through traffic. It does not support SSH; you can SSH to data interfaces or to the Management interface only. The Diagnostic interface is useful for SNMP or syslog monitoring.
Interface Mode and Types

You can deploy FTD interfaces in two modes: Regular firewall mode and IPS-only mode. You can include both firewall and IPS-only interfaces on the same device.

Regular Firewall Mode

Firewall mode interfaces subject traffic to firewall functions such as maintaining flows, tracking flow states at both IP and TCP layers, IP defragmentation, and TCP normalization. You can also optionally configure IPS functions for this traffic according to your security policy.

The types of firewall interfaces you can configure depends on the firewall mode set for the device: routed or transparent mode. See Transparent or Routed Firewall Mode for Firepower Threat Defense, on page 591 for more information.

- Routed mode interfaces (routed firewall mode only)—Each interface that you want to route between is on a different subnet.
- Bridge group interfaces (routed and transparent firewall mode)—You can group together multiple interfaces on a network, and the Firepower Threat Defense device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. In routed mode, the Firepower Threat Defense device routes between BVIs and regular routed interfaces. In transparent mode, each bridge group is separate and cannot communicate with each other.

IPS-Only Mode

IPS-only mode interfaces bypass many firewall checks and only support IPS security policy. You might want to implement IPS-only interfaces if you have a separate firewall protecting these interfaces and do not want the overhead of firewall functions.

Note

The firewall mode only affects regular firewall interfaces, and not IPS-only interfaces such as inline sets or passive interfaces. IPS-only interfaces can be used in both firewall modes.

IPS-only interfaces can be deployed as the following types:

- Inline Set, with optional Tap mode—An inline set acts like a bump on the wire, and binds two interfaces together to slot into an existing network. This function allows the FTD to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of an inline set unless explicitly dropped.

With tap mode, the FTD is deployed inline, but the network traffic flow is undisturbed. Instead, the FTD makes a copy of each packet so that it can analyze the packets. Note that rules of these types do generate intrusion events when they are triggered, and the table view of intrusion events indicates that the triggering packets would have dropped in an inline deployment. There are benefits to using tap mode with FTDs that are deployed inline. For example, you can set up the cabling between the FTD and the network as if the FTD were inline and analyze the kinds of intrusion events the FTD generates. Based on the results, you can modify your intrusion policy and add the drop rules that best protect your network without impacting its efficiency. When you are ready to deploy the FTD inline, you can disable tap mode and
begin dropping suspicious traffic without having to reconfigure the cabling between the FTD and the network.

Note

Tap mode significantly impacts FTD performance, depending on the traffic.

Note

Inline sets might be familiar to you as "transparent inline sets," but the inline interface type is unrelated to the transparent firewall mode or the firewall-type interfaces.

• Passive or ERSPAN Passive—Passive interfaces monitor traffic flowing across a network using a switch SPAN or mirror port. The SPAN or mirror port allows for traffic to be copied from other ports on the switch. This function provides the system visibility within the network without being in the flow of network traffic. When you configure the FTD in a passive deployment, the FTD cannot take certain actions such as blocking or shaping traffic. Passive interfaces receive all traffic unconditionally, and no traffic received on these interfaces is retransmitted. Encapsulated remote switched port analyzer (ERSPAN) interfaces allow you to monitor traffic from source ports distributed over multiple switches, and uses GRE to encapsulate the traffic. ERSPAN interfaces are only allowed when the FTD is in routed firewall mode.

Security Zones and Interface Groups

Each interface can be assigned to a security zone and/or interface group. You then apply your security policy based on zones or groups. For example, you can assign the "inside" interface to the "inside" zone; and the "outside" interface to the "outside" zone. You can configure your access control policy to enable traffic to go from inside to outside, but not from outside to inside, for example. Note that the interface or zone name itself does not provide any default behavior in regards to the security policy, we recommend using names that are self-describing to avoid mistakes in future configuration. A good name signifies a logical segment or traffic specification, for example:

• Names of internal interfaces—InsideV110, InsideV160, InsideV195
• Names of DMZ interfaces—DMZV11, DMZV12, DMZV-TEST
• Names of external interfaces—Outside-ASN78, Outside-ASN91

Some policies only support security zones, while other policies support zones and groups. For specifics, see Interface Objects: Interface Groups and Security Zones, on page 450. You can create security zones and interface groups on the Objects page. You can also add a zone when you are configuring the interface. You can only add interfaces to the correct zone type for your interface, either Passive, Inline, Routed, or Switched zone types.

Note

Policies that apply to any zone (a global policy) apply to interfaces in zones as well as any interfaces that are not assigned to a zone.
The Diagnostic/Management interface does not belong to a zone or interface group.

**Auto-MDI/MDIX Feature**

For RJ-45 interfaces, the default auto-negotiation setting also includes the Auto-MDI/MDIX feature. Auto-MDI/MDIX eliminates the need for crossover cabling by performing an internal crossover when a straight cable is detected during the auto-negotiation phase. Either the speed or duplex must be set to auto-negotiate to enable Auto-MDI/MDIX for the interface. If you explicitly set both the speed and duplex to a fixed value, thus disabling auto-negotiation for both settings, then Auto-MDI/MDIX is also disabled. For Gigabit Ethernet, when the speed and duplex are set to 1000 and full, then the interface always auto-negotiates; therefore Auto-MDI/MDIX is always enabled and you cannot disable it.

**Default Settings for Interfaces**

This section lists default settings for interfaces.

**Default State of Interfaces**

The default state of an interface depends on the type.

- Physical interfaces—Disabled. The exception is the Diagnostic interface that is enabled for initial setup.
- Redundant Interfaces—Enabled. However, for traffic to pass through the redundant interface, the member physical interfaces must also be enabled.
- VLAN subinterfaces—Enabled. However, for traffic to pass through the subinterface, the physical interface must also be enabled.
- EtherChannel port-channel interfaces (ASA models)—Enabled. However, for traffic to pass through the EtherChannel, the channel group physical interfaces must also be enabled.
- EtherChannel port-channel interfaces (Firepower models)—Disabled.

---

**Note**

For the Firepower 4100/9300, you can administratively enable and disable interfaces in both the chassis and in the FMC. For an interface to be operational, the interface must be enabled in both operating systems. Because the interface state is controlled independently, you may have a mismatch between the chassis and FMC.

**Default Speed and Duplex**

By default, the speed and duplex for copper (RJ-45) interfaces are set to auto-negotiate.
Enable the Physical Interface and Configure Ethernet Settings

<table>

</tbody>
</table>

This section describes how to:

- Enable the physical interface. By default, physical interfaces are disabled (with the exception of the Diagnostic interface).

- Set a specific speed and duplex. By default, speed and duplex are set to Auto.

This procedure only covers a small subset of Interface settings. Refrain from setting other parameters at this point. For example, you cannot name an interface that you want to use as part of an EtherChannel or redundant interface.

**Note**

For the Firepower 4100/9300, you configure basic interface settings in FXOS. See Configure a Physical Interface, on page 631 for more information.

**Before you begin**

If you changed the physical interfaces on the device after you added it to the FMC, you need to refresh the interface listing by clicking Sync Interfaces from device on the top left of Interfaces.

---

**Step 1**
Select Devices > Device Management and click Edit ( 修改 ) for your FTD device. The Interfaces page is selected by default.

**Step 2**
Click Edit ( 修改 ) for the interface you want to edit.

**Step 3**
Enable the interface by checking the Enabled check box.

**Step 4**
(Optional) Add a description in the Description field. The description can be up to 200 characters on a single line, without carriage returns.

**Step 5**
(Optional) Set the duplex and speed by clicking Hardware Configuration.

- **Duplex**—Choose Auto to have the interface negotiate the duplex (Auto is only available for RJ-45 interfaces), or pick a specific duplex: Half, Full.

- **Speed**—Choose Auto to have the interface negotiate the speed (Auto is only available for RJ-45 interfaces), or pick a specific speed: 10, 100, 1000, 10000 Mbps. For SFP interfaces, depending on your hardware, you can select No Negotiate to set the speed to 1000 and disable link negotiation.

**Step 6**
In the Mode drop-down list, choose one of the following:

- **None**—Choose this setting for regular firewall interfaces and inline sets. The mode will automatically be changed to Routed, Switched, or Inline based on further configuration.
• **Passive**—Choose this setting for passive IPS-only interfaces.

• **Erspan**—Choose this setting for ERSPAN passive IPS-only interfaces.

**Step 7**  
Click **OK**.

**Step 8**  
Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

### Sync Interface Changes with the Firepower Management Center

Interface configuration changes on the device can cause the FMC and the device to get out of sync. The FMC can detect interface changes by one of the following methods:

- Event sent from the device
- Sync when you deploy from the FMC

  If the FMC detects interface changes when it attempts to deploy, the deploy will fail. You must first accept the interface changes.

- Manual sync

When the FMC detects changes, the **Interface** page shows status (removed, changed, or added) to the left of each interface.

Adding a new interface, or deleting an unused interface has minimal impact on the FTD configuration. However, deleting an interface that is used in your security policy will impact the configuration. Interfaces can be referenced directly in many places in the FTD configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Deleting an interface will delete any configuration associated with that interface. Policies that refer to security zones are not affected. You can also edit the membership of an allocated EtherChannel without affecting the logical device or requiring a sync on the FMC.

This procedure describes how to manually sync device changes if required and how to acknowledge the detected changes. If device changes are temporary, you should not save the changes in the FMC; you should wait until the device is stable, and then re-sync.

**Before you begin**

- **Model Support**—FTD
- **User Roles**:
  - Admin
  - Access Admin
  - Network Admin

**Step 1**  
Select **Devices > Device Management** and click **Edit** for your FTD device. The **Interfaces** page is selected by default.
Step 2  If required, click Sync Device on the top left of Interfaces.

Step 3  After the changes are detected, see the following steps.

a) You will see a red banner on Interfaces indicating that the interface configuration has changed. Click the Click to know more link to view the interface changes.

b) Click Validate Changes to make sure your policy will still work with the interface changes.

   If there are any errors, you need to change your policy and rerun the validation.

c) Click Save.

   You can now click Deploy and deploy the policy to assigned devices.
Sync Interface Changes with the Firepower Management Center
CHAPTER 30

Regular Firewall Interfaces for Firepower Threat Defense

This chapter includes regular firewall FTD interface configuration including EtherChannels, VLAN subinterfaces, IP addressing, and more.

**Note**

For initial interface configuration on the Firepower 4100/9300, see Configure Interfaces, on page 631.

Configure EtherChannel and Redundant Interfaces

This section tells how to configure EtherChannels and redundant interfaces.
About EtherChannels and Redundant Interfaces

This section describes EtherChannels and Redundant Interfaces.

About Redundant Interfaces (ASA Platform Only)

A logical redundant interface consists of a pair of physical interfaces: an active and a standby interface. When the active interface fails, the standby interface becomes active and starts passing traffic. You can configure a redundant interface to increase the Firepower Threat Defense device reliability.

You can configure up to 8 redundant interface pairs.

Redundant Interface MAC Address

The redundant interface uses the MAC address of the first physical interface that you add. If you change the order of the member interfaces in the configuration, then the MAC address changes to match the MAC address of the interface that is now listed first. Alternatively, you can assign a manual MAC address to the redundant interface, which is used regardless of the member interface MAC addresses. When the active interface fails over to the standby, the same MAC address is maintained so that traffic is not disrupted.

About EtherChannels

An 802.3ad EtherChannel is a logical interface (called a port-channel interface) consisting of a bundle of individual Ethernet links (a channel group) so that you increase the bandwidth for a single network. A port channel interface is used in the same way as a physical interface when you configure interface-related features.

You can configure up to 48 EtherChannels, depending on how many interfaces your model supports.

Channel Group Interfaces

Each channel group can have up to 16 active interfaces, except for the Firepower 1000 or 2100, which supports 8 active interfaces. For switches that support only 8 active interfaces, you can assign up to 16 interfaces to a channel group: while only 8 interfaces can be active, the remaining interfaces can act as standby links in case of interface failure. For 16 active interfaces, be sure that your switch supports the feature (for example, the Cisco Nexus 7000 with F2-Series 10 Gigabit Ethernet Module).

All interfaces in the channel group must be the same type and speed. The first interface added to the channel group determines the correct type and speed.

The EtherChannel aggregates the traffic across all the available active interfaces in the channel. The interface is selected using a proprietary hash algorithm, based on source or destination MAC addresses, IP addresses, TCP and UDP port numbers and VLAN numbers.
Connecting to an EtherChannel on Another Device

The device to which you connect the FTD EtherChannel must also support 802.3ad EtherChannels; for example, you can connect to the Catalyst 6500 switch or the Cisco Nexus 7000.

When the switch is part of a Virtual Switching System (VSS) or Virtual Port Channel (vPC), then you can connect FTD interfaces within the same EtherChannel to separate switches in the VSS/vPC. The switch interfaces are members of the same EtherChannel port-channel interface, because the separate switches act like a single switch.

Figure 21: Connecting to a VSS/vPC

![Diagram of VSS/vPC](image)

**Note**

If the FTD is in transparent firewall mode, and you place the FTD between two sets of VSS/vPC switches, then be sure to disable Unidirectional Link Detection (UDLD) on any switch ports connected to the FTD with an EtherChannel. If you enable UDLD, then a switch port may receive UDLD packets sourced from both switches in the other VSS/vPC pair. The receiving switch will place the receiving interface in a down state with the reason "UDLD Neighbor mismatch".

If you use the FTD in an Active/Standby failover deployment, then you need to create separate EtherChannels on the switches in the VSS/vPC, one for each FTD. On each FTD, a single EtherChannel connects to both switches. Even if you could group all switch interfaces into a single EtherChannel connecting to both FTD (in this case, the EtherChannel will not be established because of the separate FTD system IDs), a single EtherChannel would not be desirable because you do not want traffic sent to the standby FTD.
Link Aggregation Control Protocol

The Link Aggregation Control Protocol (LACP) aggregates interfaces by exchanging the Link Aggregation Control Protocol Data Units (LACPDUs) between two network devices.

You can configure each physical interface in an EtherChannel to be:

- **Active**—Sends and receives LACP updates. An active EtherChannel can establish connectivity with either an active or a passive EtherChannel. You should use the active mode unless you need to minimize the amount of LACP traffic.
- **Passive**—Receives LACP updates. A passive EtherChannel can only establish connectivity with an active EtherChannel. Not supported on Firepower hardware models.
- **On**—The EtherChannel is always on, and LACP is not used. An “on” EtherChannel can only establish a connection with another “on” EtherChannel.

LACP coordinates the automatic addition and deletion of links to the EtherChannel without user intervention. It also handles misconfigurations and checks that both ends of member interfaces are connected to the correct channel group. “On” mode cannot use standby interfaces in the channel group when an interface goes down, and the connectivity and configurations are not checked.

Load Balancing

The FTD distributes packets to the interfaces in the EtherChannel by hashing the source and destination IP address of the packet (this criteria is configurable). The resulting hash is divided by the number of active links in a modulo operation where the resulting remainder determines which interface owns the flow. All packets with a hash_value mod active_links result of 0 go to the first interface in the EtherChannel, packets with a result of 1 go to the second interface, packets with a result of 2 go to the third interface, and so on. For example, if you have 15 active links, then the modulo operation provides values from 0 to 14. For 6 active links, the values are 0 to 5, and so on.

If an active interface goes down and is not replaced by a standby interface, then traffic is rebalanced between the remaining links. The failure is masked from both Spanning Tree at Layer 2 and the routing table at Layer 3, so the switchover is transparent to other network devices.
**EtherChannel MAC Address**

All interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links.

The port-channel interface uses the lowest numbered channel group interface MAC address as the port-channel MAC address. Alternatively you can manually configure a MAC address for the port-channel interface. We recommend manually configuring a unique MAC address in case the group channel interface membership changes. If you remove the interface that was providing the port-channel MAC address, then the port-channel MAC address changes to the next lowest numbered interface, thus causing traffic disruption.

**Guidelines for EtherChannels and Redundant Interfaces**

**Bridge Group**

In routed mode, FMC-defined EtherChannels are not supported as bridge group members. EtherChannels on the Firepower 4100/9300 can be bridge group members.

**High Availability**

- When you use a redundant or EtherChannel interface as a High Availability link, it must be pre-configured on both units in the High Availability pair; you cannot configure it on the primary unit and expect it to replicate to the secondary unit because the High Availability link itself is required for replication.

- If you use a redundant or EtherChannel interface for the state link, no special configuration is required; the configuration can replicate from the primary unit as normal. For the Firepower 4100/9300 chassis, all interfaces, including EtherChannels, need to be pre-configured on both units.

- You can monitor redundant or EtherChannel interfaces for High Availability. When an active member interface fails over to a standby interface, this activity does not cause the redundant or EtherChannel interface to appear to be failed when being monitored for device-level High Availability. Only when all physical interfaces fail does the redundant or EtherChannel interface appear to be failed (for an EtherChannel interface, the number of member interfaces allowed to fail is configurable).

- If you use an EtherChannel interface for a High Availability or state link, then to prevent out-of-order packets, only one interface in the EtherChannel is used. If that interface fails, then the next interface in the EtherChannel is used. You cannot alter the EtherChannel configuration while it in use as a High Availability link. To alter the configuration, you need to temporarily disable High Availability, which prevents High Availability from occurring for the duration.

**Model Support**

- You cannot add EtherChannels in FMC for the Firepower 4100/9300 or FTDv. The Firepower 4100/9300 supports EtherChannels, but you must perform all hardware configuration of EtherChannels in FXOS on the chassis.

- Redundant interfaces are only supported on the ASA 5500-X platform; they are not supported on the Firepower 1000, Firepower 2100, Firepower 4100/9300, and FTDv.

- You cannot use Firepower 1010 switch ports or VLAN interfaces in EtherChannels.
General Redundant Interface Guidelines

- You can configure up to 8 redundant interface pairs.
- All FTD configuration refers to the logical redundant interface instead of the member physical interfaces.
- You cannot use a redundant interface as part of an EtherChannel, nor can you use an EtherChannel as part of a redundant interface. You cannot use the same physical interfaces in a redundant interface and an EtherChannel interface. You can, however, configure both types on the FTD if they do not use the same physical interfaces.
- If you shut down the active interface, then the standby interface becomes active.
- Redundant interfaces do not support Diagnostic slot/port interfaces as members. You can, however, set a redundant interface comprised of non-Diagnostic interfaces as management-only.

General EtherChannel Guidelines

- You can configure up to 48 EtherChannels, depending on how many interfaces are available on your model.
- Each channel group can have up to 16 active interfaces, except for the Firepower 1000 or 2100, which supports 8 active interfaces. For switches that support only 8 active interfaces, you can assign up to 16 interfaces to a channel group: while only 8 interfaces can be active, the remaining interfaces can act as standby links in case of interface failure. For 16 active interfaces, be sure that your switch supports the feature (for example, the Cisco Nexus 7000 with F2-Series 10 Gigabit Ethernet Module).
- All interfaces in the channel group must be the same media type and capacity, and must be set to the same speed and duplex. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface.
- The device to which you connect the FTD EtherChannel must also support 802.3ad EtherChannels.
- The FTD does not support LACPDUs that are VLAN-tagged. If you enable native VLAN tagging on the neighboring switch using the Cisco IOS `vlan dot1Q tag native` command, then the FTD will drop the tagged LACPDUs. Be sure to disable native VLAN tagging on the neighboring switch.
- ASA 5500-X models, Firepower 1000, and Firepower 2100 do not support LACP rate fast; LACP always uses the normal rate. This setting is not configurable. Note that the Firepower 4100/9300, which configures EtherChannels in FXOS, has the LACP rate set to fast by default; on these platforms, the rate is configurable.
- In Cisco IOS software versions earlier than 15.1(1)S2, the FTD did not support connecting an EtherChannel to a switch stack. With default switch settings, if the FTD EtherChannel is connected cross stack, and if the primary switch is powered down, then the EtherChannel connected to the remaining switch will not come up. To improve compatibility, set the `stack-mac persistent timer` command to a large enough value to account for reload time; for example, 8 minutes or 0 for indefinite. Or, you can upgrade to more a more stable switch software version, such as 15.1(1)S2.
- All FTD configuration refers to the logical EtherChannel interface instead of the member physical interfaces.
- You cannot use a redundant interface as part of an EtherChannel, nor can you use an EtherChannel as part of a redundant interface. You cannot use the same physical interfaces in a redundant interface and
an EtherChannel interface. You can, however, configure both types on the FTD if they do not use the same physical interfaces.

Configure a Redundant Interface (ASA Platform Only)

<td></td>
<td></td>
<td>Network Admin</td>
</tr>
</tbody>
</table>

A logical redundant interface consists of a pair of physical interfaces: an active and a standby interface. When the active interface fails, the standby interface becomes active and starts passing traffic. You can configure a redundant interface to increase the FTD reliability. By default, redundant interfaces are enabled.

- You can configure up to 8 redundant interface pairs.
- Both member interfaces must be of the same physical type. For example, both must be GigabitEthernet.

Note

Redundant interfaces are not supported on the Firepower platform; only ASA 5500-X models support redundant interfaces.

Before you begin

- You cannot add a physical interface to the redundant interface if you configured a name for it. You must first remove the name.

Caution

If you are using a physical interface already in your configuration, removing the name will clear any configuration that refers to the interface.

Step 1
Select Devices > Device Management and click Edit (✔️) for your FTD device. The Interfaces page is selected by default.

Step 2
Enable the member interfaces according to Enable the Physical Interface and Configure Ethernet Settings, on page 655.

Step 3
Click Add Interfaces > Redundant Interface.

Step 4
On the General tab, set the following parameters:

a) Redundant ID—Set an integer between 1 and 8.

b) Primary Interface—Choose an interface from the drop-down list. After you add the interface, any configuration for it (such as an IP address) is removed.

c) Secondary Interface—The second interface must be the same physical type as the first interface.

Step 5
Click OK.

Step 6
Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

This section describes how to create an EtherChannel port-channel interface, assign interfaces to the EtherChannel, and customize the EtherChannel.

Guidelines

• You can configure up to 48 EtherChannels, depending on the number of interfaces for your model.

• Each channel group can have up to 16 active interfaces, except for the Firepower 1000 or 2100, which supports 8 active interfaces. For switches that support only 8 active interfaces, you can assign up to 16 interfaces to a channel group; while only 8 interfaces can be active, the remaining interfaces can act as standby links in case of interface failure.

• All interfaces in the channel group must be the same type, speed, and duplex. Half duplex is not supported.

Note
For the Firepower 4100/9300, you configure EtherChannels in FXOS. See Add an EtherChannel (Port Channel), on page 632 for more information.

Before you begin

• You cannot add a physical interface to the channel group if you configured a name for it. You must first remove the name.

Note
If you are using a physical interface already in your configuration, removing the name will clear any configuration that refers to the interface.

Step 1
Select Devices > Device Management and click Edit ( Sociology ) for your FTD device. The Interfaces page is selected by default.

Step 2
Enable the member interfaces according to Enable the Physical Interface and Configure Ethernet Settings, on page 655.

Step 3
Click Add Interfaces > Ether Channel Interface.

Step 4
On the General tab, set the Ether Channel ID to a number between 1 and 48 (1 and 8 for the Firepower 1010).
Step 5  In the **Available Interfaces** area, click an interface and then click **Add** to move it to the **Selected Interfaces** area. Repeat for all interfaces that you want to make members.

Make sure all interfaces are the same type and speed. The first interface you add determines the type and speed of the EtherChannel. Any non-matching interfaces you add will be put into a suspended state. The FMC does not prevent you from adding non-matching interfaces.

Step 6  (Optional) Click the **Advanced** tab to customize the EtherChannel. Set the following parameters on the **Information** sub-tab:

- (ASA 5500-X models only) **Load Balancing**—Select the criteria used to load balance the packets across the group channel interfaces. By default, the FTD device balances the packet load on interfaces according to the source and destination IP address of the packet. If you want to change the properties on which the packet is categorized, choose a different set of criteria. For example, if your traffic is biased heavily towards the same source and destination IP addresses, then the traffic assignment to interfaces in the EtherChannel will be unbalanced. Changing to a different algorithm can result in more evenly distributed traffic. For more information about load balancing, see *Load Balancing*, on page 662.

- **LACP Mode**—Choose Active, Passive, or On. We recommend using Active mode (the default).

- (ASA 5500-X models only) **Active Physical Interface: Range**—From the left drop-down list, choose the minimum number of active interfaces required for the EtherChannel to be active, between 1 and 16. The default is 1. From the right drop-down list, choose the maximum number of active interfaces allowed in the EtherChannel, between 1 and 16. The default is 16. If your switch does not support 16 active interfaces, be sure to set this command to 8 or fewer.

- **Active Mac Address**—Set a manual MAC address if desired. The mac_address is in H.H.H format, where H is a 16-bit hexadecimal digit. For example, the MAC address 00-0C-F1-42-4C-DE is entered as 000C.F142.4CDE.

Step 7  (Optional) Click the **Hardware Configuration** tab and set the Duplex and Speed to override these settings for all member interfaces. This method provides a shortcut to set these parameters because these parameters must match for all interfaces in the channel group.

Step 8  Click **OK**.

Step 9  Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Step 10  (Optional) Add a VLAN subinterface. See *Add a Subinterface*, on page 669.

Step 11  Configure the routed or transparent mode interface parameters. See *Configure Routed Mode Interfaces*, on page 672 or *Configure Bridge Group Interfaces*, on page 674.

**Configure VLAN Subinterfaces and 802.1Q Trunking**

VLAN subinterfaces let you divide a physical, redundant, or EtherChannel interface into multiple logical interfaces that are tagged with different VLAN IDs. An interface with one or more VLAN subinterfaces is automatically configured as an 802.1Q trunk. Because VLANs let you keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or devices.
Guidelines and Limitations for VLAN Subinterfaces

High Availability

You cannot use a subinterface for the failover or state link. The exception is that you can use a subinterface defined on the Firepower 4100/9300 chassis for container instances.

Additional Guidelines

• Preventing untagged packets on the physical interface—If you use subinterfaces, you typically do not also want the physical interface to pass traffic, because the physical interface passes untagged packets. This property is also true for the active physical interface in a redundant interface pair and for EtherChannel links. Because the physical, redundant, or EtherChannel interface must be enabled for the subinterface to pass traffic, ensure that the physical, redundant, or EtherChannel interface does not pass traffic by not configuring a name for the interface. If you want to let the physical, redundant, or EtherChannel interface pass untagged packets, you can configure the name as usual.

• You cannot configure subinterfaces on the Diagnostic interface.

• All subinterfaces on the same parent interface must be either bridge group members or routed interfaces; you cannot mix and match.

• The FTD does not support the Dynamic Trunking Protocol (DTP), so you must configure the connected switch port to trunk unconditionally.

• You might want to assign unique MAC addresses to subinterfaces defined on the FTD, because they use the same burned-in MAC address of the parent interface. For example, your service provider might perform access control based on the MAC address. Also, because IPv6 link-local addresses are generated based on the MAC address, assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the FTD.

Maximum Number of VLAN Subinterfaces by Device Model

The device model limits the maximum number of VLAN subinterfaces that you can configure. Note that you can configure subinterfaces on data interfaces only, you cannot configure them on the management interface.

The following table explains the limits for each device model.

<table>
<thead>
<tr>
<th>Model</th>
<th>Maximum VLAN Subinterfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firepower 1010</td>
<td>60</td>

</tr>
</tbody>
</table>

Add one or more subinterfaces to a physical, redundant, or port-channel interface.

For the Firepower 4100/9300, you can configure subinterfaces in FXOS for use with container instances; see Add a VLAN Subinterface for Container Instances, on page 634. These subinterfaces appear in the the FMC interface list. You can also add subinterfaces in FMC, but only on parent interfaces that do not already have subinterfaces defined in FXOS.

**Note**
The parent physical interface passes untagged packets. You may not want to pass untagged packets, so be sure not to include the parent interface in your security policy.

**Step 1**
Select Devices > Device Management and click Edit (edit) for your FTD device. The Interfaces page is selected by default.

**Step 2**
Enable the parent interface according to Enable the Physical Interface and Configure Ethernet Settings, on page 655.

**Step 3**
Click Add Interfaces > Sub Interface.

**Step 4**
On General, set the following parameters:

a) **Interface**—Choose the physical, redundant, or port-channel interface to which you want to add the subinterface.

b) **Sub-Interface ID**—Enter the subinterface ID as an integer between 1 and 4294967295. The number of subinterfaces allowed depends on your platform. You cannot change the ID after you set it.

c) **VLAN ID**—Enter the VLAN ID between 1 and 4094 that will be used to tag the packets on this subinterface.

This VLAN ID must be unique.

**Step 5**
Click OK.
**Configure Routed and Transparent Mode Interfaces**

This section includes tasks to complete the regular interface configuration for all models in routed or transparent firewall mode.

**About Routed and Transparent Mode Interfaces**

Firewall mode interfaces subject traffic to firewall functions such as maintaining flows, tracking flow states at both IP and TCP layers, IP defragmentation, and TCP normalization. You can also optionally configure IPS functions for this traffic according to your security policy.

The types of firewall interfaces you can configure depends on the firewall mode set for the device: routed or transparent mode. See Transparent or Routed Firewall Mode for Firepower Threat Defense, on page 591 for more information.

- **Routed mode interfaces (routed firewall mode only)**—Each interface that you want to route between is on a different subnet.

- **Bridge group interfaces (routed and transparent firewall mode)**—You can group together multiple interfaces on a network, and the Firepower Threat Defense device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. In routed mode, the Firepower Threat Defense device routes between BVIs and regular routed interfaces. In transparent mode, each bridge group is separate and cannot communicate with each other.

**Dual IP Stack (IPv4 and IPv6)**

The Firepower Threat Defense device supports both IPv6 and IPv4 addresses on an interface. Make sure you configure a default route for both IPv4 and IPv6.

**Guidelines and Limitations for Routed and Transparent Mode Interfaces**

**High Availability**

- Do not configure failover links with the procedures in this chapter. See the High Availability chapter for more information.

- When you use High Availability, you must set the IP address and standby address for data interfaces manually; DHCP and PPPoE are not supported. Set the standby IP addresses on the Devices > Device Management > High Availability tab in the Monitored Interfaces area. See the High Availability chapter for more information.
IPv6

- IPv6 is supported on all interfaces.
- You can only configure IPv6 addresses manually in transparent mode.
- The Firepower Threat Defense device does not support IPv6 anycast addresses.

Model Guidelines

- For the Firepower Threat Defense Virtual on VMware with bridged ixgbevf interfaces, bridge groups are not supported.
- For the Firepower 2100 series, bridge groups are not supported in routed mode.

Transparent Mode and Bridge Group Guidelines

- You can create up to 250 bridge groups, with 64 interfaces per bridge group.
- Each directly-connected network must be on the same subnet.
- The Firepower Threat Defense device does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.
- For IPv4, an IP address for the BVI is required for each bridge group for both management traffic and for traffic to pass through the Firepower Threat Defense device. IPv6 addresses are supported, but not required for the BVI.
- You can only configure IPv6 addresses manually.
- The BVI IP address must be on the same subnet as the connected network. You cannot set the subnet to a host subnet (255.255.255.255).
- Management interfaces are not supported as bridge group members.
- For the Firepower 4100/9300, data-sharing interfaces are not supported as bridge group members.
- In transparent mode, you must use at least 1 bridge group; data interfaces must belong to a bridge group.
- In transparent mode, do not specify the BVI IP address as the default gateway for connected devices; devices need to specify the router on the other side of the Firepower Threat Defense device as the default gateway.
- In transparent mode, the default route, which is required to provide a return path for management traffic, is only applied to management traffic from one bridge group network. This is because the default route specifies an interface in the bridge group as well as the router IP address on the bridge group network, and you can only define one default route. If you have management traffic from more than one bridge group network, you need to specify a regular static route that identifies the network from which you expect management traffic.
- In transparent mode, PPPoE is not supported for the Diagnostic interface.
- In routed mode, to route between bridge groups and other routed interfaces, you must name the BVI.
- In routed mode, FTD-defined EtherChannel interfaces are not supported as bridge group members. EtherChannels on the Firepower 4100/9300 can be bridge group members.
- Bidirectional Forwarding Detection (BFD) echo packets are not allowed through the FTD when using bridge group members. If there are two neighbors on either side of the FTD running BFD, then the FTD will drop BFD echo packets because they have the same source and destination IP address and appear to be part of a LAND attack.

**Additional Guidelines and Requirements**

- The FTD supports only one 802.1Q header in a packet and does not support multiple headers (known as Q-in-Q support) for firewall interfaces. **Note:** For inline sets and passive interfaces, the FTD supports Q-in-Q up to two 802.1Q headers in a packet, with the exception of the Firepower 4100/9300, which only supports one 802.1Q header.

**Configure Routed Mode Interfaces**

This procedure describes how to set the name, security zone, and IPv4 address.

**Before you begin**

- **Firepower 4100/9300**
  1. Configure a Physical Interface, on page 631
  2. (Optional) Configure any special interfaces.
    - Add an EtherChannel (Port Channel), on page 632
    - Add a VLAN Subinterface for Container Instances, on page 634 in FXOS
    - Add a Subinterface, on page 669 in FMC
  
- (Optional) **All other models:**
  - Configure a Redundant Interface (ASA Platform Only), on page 665
  - Configure an EtherChannel, on page 666
  - Add a Subinterface, on page 669

**Step 1**

Select Devices > Device Management and click **Edit** (isman_0_0_0) for your FTD device. The Interfaces page is selected by default.

**Step 2**

Click **Edit** (isman_0_0_0) for the interface you want to edit.

**Step 3**

In the **Name** field, enter a name up to 48 characters in length.

**Step 4**

Enable the interface by checking the **Enabled** check box.

**Step 5**

(Optional) Set this interface to **Management Only** to limit traffic to management traffic; through-the-box traffic is not allowed.

**Step 6**

(Optional) Add a description in the **Description** field.

The description can be up to 200 characters on a single line, without carriage returns.

**Step 7**

In the **Mode** drop-down list, choose **None**.
Regular firewall interfaces have the mode set to None. The other modes are for IPS-only interface types.

**Step 8**

From the Security Zone drop-down list, choose a security zone or add a new one by clicking **New**.

The routed interface is a Routed-type interface, and can only belong to Routed-type zones.

**Step 9**

See **Configure the MTU, on page 688** for information about the **MTU**.

**Step 10**

Click the IPv4 tab. To set the IP address, use one of the following options from the IP Type drop-down list.

High Availability and clustering interfaces only support static IP address configuration; DHCP and PPPoE are not supported.

- **Use Static IP**—Enter the IP address and subnet mask. For High Availability, you can only use a static IP address. Set the standby IP address on the Devices > Device Management > High Availability tab in the Monitored Interfaces area. If you do not set the standby IP address, the active unit cannot monitor the standby interface using network tests; it can only track the link state.

- **Use DHCP**—Configure the following optional parameters:
  - **Obtain default route using DHCP**—Obtains the default route from the DHCP server.
  - **DHCP route metric**—Assigns an administrative distance to the learned route, between 1 and 255. The default administrative distance for the learned routes is 1.

- **Use PPPoE**—If the interface is connected to a DSL, cable modem, or other connection to your ISP, and your ISP uses PPPoE to provide your IP address, configure the following parameters:
  - **VPDN Group Name**—Specify a group name of your choice to represent this connection.
  - **PPPoE User Name**—Specify the username provided by your ISP.
  - **PPPoE Password/Confirm Password**—Specify and confirm the password provided by your ISP.
  - **PPP Authentication**—Choose PAP, CHAP, or MSCHAP.

    PAP passes a cleartext username and password during authentication and is not secure. With CHAP, the client returns the encrypted [challenge plus password], with a cleartext username in response to the server challenge. CHAP is more secure than PAP, but it does not encrypt data. MSCHAP is similar to CHAP but is more secure because the server stores and compares only encrypted passwords rather than cleartext passwords as in CHAP. MSCHAP also generates a key for data encryption by MPPE.

  - **PPPoE route metric**—Assign an administrative distance to the learned route. Valid values are from 1 to 255. By default, the administrative distance for the learned routes is 1.

  - **Enable Route Settings**—To manually configure the PPPoE IP address, check this box and then enter the **IP Address**.

If you select the Enable Route Settings check box and leave the IP Address blank, the **ip address pppoe setroute** command is applied as shown in this example:

```
interface GigabitEthernet0/2
nameif inside2_pppoe
crts manual
  propagate sgt preserve-untag
  policy static sgt disabled trusted
security-level 0
pppoe client vpdn group test
pppoe client route distance 10
ip address pppoe setroute
```
• **Store Username and Password in Flash**—Stores the username and password in flash memory.

The FTD device stores the username and password in a special location of NVRAM.

**Step 11**  
(Optional) See Configure IPv6 Addressing, on page 678 to configure IPv6 addressing on the IPv6 tab.

**Step 12**  
(Optional) See Configure the MAC Address, on page 689 to manually configure the MAC address on the Advanced tab.

**Step 13**  
(Optional) Set the duplex and speed by clicking the Hardware Configuration tab.

 - **Duplex**—Choose Full, Half, or Auto. Auto is the default when the interface supports it. For example, you cannot select Auto for the SFP interfaces on a Firepower 2100 series device.

 - **Speed**—Choose 10, 100, 1000, or Auto. Auto is the default. The type of interface limits the options you can select. For example, on Firepower 2100 series devices, you can select 10, 100, or 1000 (1Gbps) for GigabitEthernet ports, and 1000 or 10000 (10 Gbps) for SFP ports. Note that the SFP interfaces on Firepower 2100 series devices do not support Auto.

**Step 14**  
Click **OK**.

**Step 15**  
Click **Save**.  
You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

**Configure Bridge Group Interfaces**

A bridge group is a group of interfaces that the Firepower Threat Defense device bridges instead of routes. Bridge groups are supported in both transparent and routed firewall mode. For more information about bridge groups, see About Bridge Groups, on page 593.

To configure bridge groups and associated interfaces, perform these steps.

**Configure General Bridge Group Member Interface Parameters**

This procedure describes how to set the name and security zone for each bridge group member interface. The same bridge group can include different types of interfaces: physical interfaces, VLAN subinterfaces, EtherChannels, and redundant interfaces. The Diagnostic interface is not supported. In routed mode, EtherChannels are not supported. For the Firepower 4100/9300, data-sharing type interfaces are not supported.

**Before you begin**

 - **Firepower 4100/9300**
   1. Configure a Physical Interface, on page 631
   2. (Optional) Configure any special interfaces.
      - Add an EtherChannel (Port Channel), on page 632
      - Add a VLAN Subinterface for Container Instances, on page 634 in FXOS
      - Add a Subinterface, on page 669 in FMC
Step 1 Select Devices > Device Management and click Edit (️) for your FTD device. The Interfaces page is selected by default.

Step 2 Click Edit (️) for the interface you want to edit.

Step 3 In the Name field, enter a name up to 48 characters in length.

Step 4 Enable the interface by checking the Enabled check box.

Step 5 (Optional) Set this interface to Management Only to limit traffic to management traffic; through-the-box traffic is not allowed.

Step 6 (Optional) Add a description in the Description field.

Step 7 In the Mode drop-down list, choose None.

Step 8 From the Security Zone drop-down list, choose a security zone or add a new one by clicking New.

Step 9 See Configure the MTU, on page 688 for information about the MTU.

Step 10 (Optional) Set the duplex and speed by clicking the Hardware Configuration tab.

Step 11 (Optional) See Configure IPv6 Addressing, on page 678 to configure IPv6 addressing on the IPv6 tab.

Step 12 (Optional) See Configure the MAC Address, on page 689 to manually configure the MAC address on the Advanced tab.

Step 13 Click OK.

Step 14 Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.
Configure the Bridge Virtual Interface (BVI)

Each bridge group requires a BVI for which you configure an IP address. The FTD uses this IP address as the source address for packets originating from the bridge group. The BVI IP address must be on the same subnet as the connected network. For IPv4 traffic, the BVI IP address is required to pass any traffic. For IPv6 traffic, you must, at a minimum, configure the link-local addresses to pass traffic, but a global management address is recommended for full functionality, including remote management and other management operations.

For routed mode, if you provide a name for the BVI, then the BVI participates in routing. Without a name, the bridge group remains isolated as in transparent firewall mode.

Note
For a separate Diagnostic interface, a non-configurable bridge group (ID 301) is automatically added to your configuration. This bridge group is not included in the bridge group limit.

Before you begin
You cannot add the BVI to a security zone; therefore, you cannot apply Access Control policies to the BVI. You must apply your policy to the bridge group member interfaces based on their zones.

Step 1 Select Devices > Device Management and click Edit (ือ) for your FTD device. The Interfaces page is selected by default.
Step 2 Choose Add Interfaces > Bridge Group Interface.
Step 3 (Routed Mode) In the Name field, enter a name up to 48 characters in length.
You must name the BVI if you want to route traffic outside the bridge group members, for example, to the outside interface or to members of other bridge groups. The name is not case-sensitive.
Step 4 In the Bridge Group ID field, enter the bridge group ID between 1 and 250.
Step 5 In the Description field, enter a description for this bridge group.
Step 6 On the Interfaces tab, click an interface and then click Add to move it to the Selected Interfaces area. Repeat for all interfaces that you want to make members of the bridge group.
Step 7 (Transparent Mode) Click the IPv4 tab. In the IP Address field, enter the IPv4 address and subnet mask.
Do not assign a host address (/32 or 255.255.255.255) to the BVI. Also, do not use other subnets that contain fewer than 3 host addresses (one each for the upstream router, downstream router, and transparent firewall) such as a /30 subnet (255.255.255.252). The FTD device drops all ARP packets to or from the first and last addresses in a subnet. For example, if you use a /30 subnet and assign a reserved address from that subnet to the upstream router, then the FTD device drops the ARP request from the downstream router to the upstream router.
For High Availability, set the standby IP address on the Devices > Device Management > High Availability tab in the Monitored Interfaces area. If you do not set the standby IP address, the active unit cannot monitor the standby interface using network tests; it can only track the link state.
Step 8 (Routed Mode) Click the IPv4 tab. To set the IP address, use one of the following options from the IP Type drop-down list.
High Availability and clustering interfaces only support static IP address configuration; DHCP is not supported.

- Use Static IP—Enter the IP address and subnet mask. For High Availability, you can only use a static IP address. Set the standby IP address on the Devices > Device Management > High Availability tab in the Monitored Interfaces area.
Interfaces area. If you do not set the standby IP address, the active unit cannot monitor the standby interface using network tests; it can only track the link state.

- Use DHCP—Configure the following optional parameters:
  - Obtain default route using DHCP—Obtains the default route from the DHCP server.
  - DHCP route metric—Assigns an administrative distance to the learned route, between 1 and 255. The default administrative distance for the learned routes is 1.

**Step 9** (Optional) See Configure IPv6 Addressing, on page 678 to configure IPv6 addressing.

**Step 10** (Optional) See Add a Static ARP Entry, on page 690 and Add a Static MAC Address and Disable MAC Learning for a Bridge Group, on page 691 (for transparent mode only) to configure the ARP and MAC settings.

**Step 11** Click OK.

**Step 12** Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

**Configure a Diagnostic (Management) Interface for Transparent Mode**

In transparent firewall mode, all interfaces must belong to a bridge group. The only exception is the Diagnostic slot/port interface. For the Firepower 4100/9300 chassis, the diagnostic interface ID depends on the mgmt-type interface that you assigned to the FTD logical device. You cannot use any other interface types as diagnostic interfaces. You can configure one diagnostic interface.

**Before you begin**

Do not assign this interface to a bridge group; a non-configurable bridge group (ID 301) is automatically added to your configuration. This bridge group is not included in the bridge group limit.

**Step 1** Select Devices > Device Management and click Edit (✎) for your FTD device. The Interfaces page is selected by default.

**Step 2** Click Edit (✎) for the Diagnostic interface.

**Step 3** In the Name field, enter a name up to 48 characters in length.

**Step 4** Click the IPv4 tab. To set the IP address, use one of the following options from the IP Type drop-down list.

- Use Static IP—Enter the IP address and subnet mask.
- Use DHCP—Configure the following optional parameters:
  - Obtain default route using DHCP—Obtains the default route from the DHCP server.
  - DHCP route metric—Assigns an administrative distance to the learned route, between 1 and 255. The default administrative distance for the learned routes is 1.

- Use PPPoE—Configure the following parameters:
  - VPDN Group Name—Specify a group name.
  - PPPoE User Name—Specify the username provided by your ISP.
Configure IPv6 Addressing

This section describes how to configure IPv6 addressing in routed and transparent mode.

About IPv6

This section includes information about IPv6.

IPv6 Addressing

You can configure two types of unicast addresses for IPv6:

- Global—The global address is a public address that you can use on the public network. For a bridge group, this address needs to be configured for the BVI, and not per member interface. You can also configure a global IPv6 address for the management interface in transparent mode.

- Link-local—The link-local address is a private address that you can only use on the directly-connected network. Routers do not forward packets using link-local addresses; they are only for communication on a particular physical network segment. They can be used for address configuration or for the Neighbor...
Discovery functions such as address resolution. In a bridge group, only member interfaces have link-local addresses; the BVI does not have a link-local address.

At a minimum, you need to configure a link-local address for IPv6 to operate. If you configure a global address, a link-local address is automatically configured on the interface, so you do not also need to specifically configure a link-local address. For bridge group member interfaces, when you configure the global address on the BVI, the Firepower Threat Defense device automatically generates link-local addresses for member interfaces. If you do not configure a global address, then you need to configure the link-local address, either automatically or manually.

**Modified EUI-64 Interface IDs**

RFC 3513: Internet Protocol Version 6 (IPv6) Addressing Architecture requires that the interface identifier portion of all unicast IPv6 addresses, except those that start with binary value 000, be 64 bits long and be constructed in Modified EUI-64 format. The Firepower Threat Defense device can enforce this requirement for hosts attached to the local link.

When this feature is enabled on an interface, the source addresses of IPv6 packets received on that interface are verified against the source MAC addresses to ensure that the interface identifiers use the Modified EUI-64 format. If the IPv6 packets do not use the Modified EUI-64 format for the interface identifier, the packets are dropped and the following system log message is generated:

325003: EUI-64 source address check failed.

The address format verification is only performed when a flow is created. Packets from an existing flow are not checked. Additionally, the address verification can only be performed for hosts on the local link.

**Configure a Global IPv6 Address**

To configure a global IPv6 address for any routed mode interface and for the transparent or routed mode BVI, perform the following steps.

---

**Note**

Configuring the global address automatically configures the link-local address, so you do not need to configure it separately. For bridge groups, configuring the global address on the BVI automatically configures link-local addresses on all member interfaces.

For subinterfaces defined on the FTD, we recommend that you also set the MAC address manually, because they use the same burned-in MAC address of the parent interface. IPv6 link-local addresses are generated based on the MAC address, so assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the FTD. See **Configure the MAC Address**, on page 689.

---

**Before you begin**

For IPv6 neighbor discovery for bridge groups, you must explicitly allow Neighbor Solicitation (ICMPv6 type 135) and Neighbor Advertisement (ICMPv6 type 136) packets through the FTD bridge group member interfaces using a bidirectional access rule.
**Step 1** Select **Devices > Device Management** and click **Edit** for your FTD device. The **Interfaces** page is selected by default.

**Step 2** Click **Edit** for the interface you want to edit.

**Step 3** Click the **IPv6** page.

For routed mode, the **Basic** page is selected by default. For transparent mode, the **Address** page is selected by default.

**Step 4** On the **Basic** page, check **Enable IPv6**.

**Step 5** Configure the global IPv6 address using one of the following methods.

- **(Routed interface) Stateless autoconfiguration**—Check the **Autoconfiguration** check box.

  Enabling stateless autoconfiguration on the interface configures IPv6 addresses based upon prefixes received in Router Advertisement messages. A link-local address, based on the Modified EUI-64 interface ID, is automatically generated for the interface when stateless autoconfiguration is enabled.

  Although RFC 4862 specifies that hosts configured for stateless autoconfiguration do not send Router Advertisement messages, the FTD device does send Router Advertisement messages in this case. Uncheck the **IPv6 > Settings > Enable RA** check box to suppress messages.

- **Manual configuration**—To manually configure a global IPv6 address:

  a. Click the **Address** page, and click **Add Address**.

     The **Add Address** dialog box appears.

  b. In the **Address** field, enter either a full global IPv6 address, including the interface ID, or enter the IPv6 prefix, along with the IPv6 prefix length. (Routed Mode) If you only enter the prefix, then be sure to check the **Enforce EUI-64** check box to generate the interface ID using the Modified EUI-64 format. For example, 2001:0DB8::BA98:0:3210/48 (full address) or 2001:0DB8::/48 (prefix, with EUI 64 checked).

     For High Availability (if you did not set **Enforce EUI 64**), set the standby IP address on the **Devices > Device Management > High Availability** page in the **Monitored Interfaces** area. If you do not set the standby IP address, the active unit cannot monitor the standby interface using network tests; it can only track the link state.

**Step 6** For Routed interfaces, you can optionally set the following values on the **Basic** page:

- To enforce the use of Modified EUI-64 format interface identifiers in IPv6 addresses on a local link, check the **Enforce EUI-64** check box.

- To manually set the link-local address, enter an address in the **Link-Local address** field.

  A link-local address should start with FE8, FE9, FEA, or FEB, for example fe80::20d:88ff:feee:6a82. If you do not want to configure a global address, and only need to configure a link-local address, you have the option of manually defining the link-local address. Note that we recommend automatically assigning the link-local address based on the Modified EUI-64 format. For example, if other devices enforce the use of the Modified EUI-64 format, then a manually-assigned link-local address may cause packets to be dropped.

- Check the **Enable DHCP for address config** check box to set the Managed Address Config flag in the IPv6 router advertisement packet.

  This flag in IPv6 router advertisements informs IPv6 autoconfiguration clients that they should use DHCPv6 to obtain addresses, in addition to the derived stateless autoconfiguration address.
• Check the **Enable DHCP for non-address config** check box to set the Other Address Config flag in the IPv6 router advertisement packet.

This flag in IPv6 router advertisements informs IPv6 autoconfiguration clients that they should use DHCPv6 to obtain additional information from DHCPv6, such as the DNS server address.

**Step 7**
For Routed interfaces, see **Configure IPv6 Neighbor Discovery, on page 681** to configure settings on the **Prefixes** and **Settings** pages. For BVI interfaces, see the following parameters on the **Settings** page:

- **DAD attempts**—The maximum number of DAD attempts, between 1 and 600. Set the value to 0 to disable duplicate address detection (DAD) processing. This setting configures the number of consecutive neighbor solicitation messages that are sent on an interface while DAD is performed on IPv6 addresses. 1 attempt is the default.

- **NS Interval**—The interval between IPv6 neighbor solicitation retransmissions on an interface, between 1000 and 3600000 ms. The default value is 1000 ms.

- **Reachable Time**—The amount of time that a remote IPv6 node is considered reachable after a reachability confirmation event has occurred, between 0 and 3600000 ms. The default value is 0 ms. When 0 is used for the value, the reachable time is sent as undetermined. It is up to the receiving devices to set and track the reachable time value. The neighbor reachable time enables detecting unavailable neighbors. Shorter configured times enable detecting unavailable neighbors more quickly, however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.

**Step 8**
Click OK.

**Step 9**
Click Save.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

**Configure IPv6 Neighbor Discovery**

</tbody>
</table>

The IPv6 neighbor discovery process uses ICMPv6 messages and solicited-node multicast addresses to determine the link-layer address of a neighbor on the same network (local link), verify the readability of a neighbor, and keep track of neighboring routers.

Nodes (hosts) use neighbor discovery to determine the link-layer addresses for neighbors known to reside on attached links and to quickly purge cached values that become invalid. Hosts also use neighbor discovery to find neighboring routers that are willing to forward packets on their behalf. In addition, nodes use the protocol to actively keep track of which neighbors are reachable and which are not, and to detect changed link-layer addresses. When a router or the path to a router fails, a host actively searches for functioning alternates.

**Before you begin**

Supported in Routed mode only. For IPv6 neighbor settings supported in transparent mode, see **Configure a Global IPv6 Address, on page 679**.
Step 1 Select **Devices > Device Management** and click **Edit** for your FTD device. The **Interfaces** page is selected by default.

Step 2 Click **Edit** for the interface you want to edit.

Step 3 Click **IPv6**, and then **Prefixes**.

Step 4 (Optional) To configure which IPv6 prefixes are included in IPv6 router advertisements, perform the following steps:

a) Click **Add Prefix**.

b) In the **Address** field, enter the IPv6 address with the prefix length or check the **Default** check box to use the default prefix.

c) (Optional) Uncheck the **Advertisement** check box to indicate that the IPv6 prefix is not advertised.

d) Check the **Off Link** check box to indicate that the specified prefix is assigned to the link. Nodes sending traffic to addresses that contain the specified prefix consider the destination to be locally reachable on the link. This prefix should not be used for on-link determination.

e) To use the specified prefix for autoconfiguration, check the **Autoconfiguration** check box.

f) For the **Prefix Lifetime**, click **Duration** or **Expiration Date**.

   - **Duration**—Enter a **Preferred Lifetime** for the prefix in seconds. This setting is the amount of time that the specified IPv6 prefix is advertised as being valid. The maximum value represents infinity. Valid values are from 0 to 4294967295. Enter a **Valid Lifetime** for the prefix in seconds. This setting is the amount of time that the specified IPv6 prefix is advertised as being preferred. The maximum value represents infinity. Valid values are from 0 to 4294967295. The default setting is 604800 (seven days). Alternatively, check the **Infinite** checkbox to set an unlimited duration.

   - **Expiration Date**—Choose a **Valid** and **Preferred** date and time.

g) Click **OK**.

Step 5 Click **Settings**.

Step 6 (Optional) Set the maximum number of **DAD attempts**, between 1 and 600. 1 attempt is the default. Set the value to 0 to disable duplicate address detection (DAD) processing.

This setting configures the number of consecutive neighbor solicitation messages that are sent on an interface while DAD is performed on IPv6 addresses.

During the stateless autoconfiguration process, Duplicate Address Detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces.

When a duplicate address is identified, the state of the address is set to DUPLICATE, the address is not used, and the following error message is generated:

```
325002: Duplicate address ipv6_address/MAC_address on interface
```

If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface. If the duplicate address is a global address, the address is not used.

Step 7 (Optional) Configure the interval between IPv6 neighbor solicitation retransmissions in the **NS Interval** field, between 1000 and 3600000 ms.

The default value is 1000 ms.
Neighborsolicitation messages (ICMPv6 Type 135) are sent on the local link by nodes attempting to discover the link-layer addresses of other nodes on the local link. After receiving a neighbor solicitation message, the destination node replies by sending a neighbor advertisement message (ICPMv6 Type 136) on the local link.

After the source node receives the neighbor advertisement, the source node and destination node can communicate. Neighbor solicitation messages are also used to verify the reachability of a neighbor after the link-layer address of a neighbor is identified. When a node wants to verifying the reachability of a neighbor, the destination address in a neighbor solicitation message is the unicast address of the neighbor.

Neighbor advertisement messages are also sent when there is a change in the link-layer address of a node on a local link.

**Step 8**  
(Optional) Configure the amount of time that a remote IPv6 node is considered reachable after a reachability confirmation event has occurred in the **Reachable Time** field, between 0 and 3600000 ms.

The default value is 0 ms. When 0 is used for the value, the reachable time is sent as undetermined. It is up to the receiving devices to set and track the reachable time value.

The neighbor reachable time enables detecting unavailable neighbors. Shorter configured times enable detecting unavailable neighbors more quickly, however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.

**Step 9**  
(Optional) To suppress the router advertisement transmissions, uncheck the **Enable RA** check box. If you enable router advertisement transmissions, you can set the RA lifetime and interval.

Router advertisement messages (ICMPv6 Type 134) are automatically sent in response to router solicitation messages (ICMPv6 Type 133). Router solicitation messages are sent by hosts at system startup so that the host can immediately autoconfigure without needing to wait for the next scheduled router advertisement message.

You may want to disable these messages on any interface for which you do not want the Firepower Threat Defense device to supply the IPv6 prefix (for example, the outside interface).

- **RA Lifetime**—Configure the router lifetime value in IPv6 router advertisements, between 0 and 9000 seconds.
  - The default is 1800 seconds.

- **RA Interval**—Configure the interval between IPv6 router advertisement transmissions, between 3 and 1800 seconds.
  - The default is 200 seconds.

**Step 10**  
Click **OK**.

**Step 11**  
Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

**Configure Advanced Interface Settings**

This section describes how to configure MAC addresses for regular firewall mode interfaces, how to set the maximum transmission unit (MTU), and how to set other advanced parameters.
About Advanced Interface Configuration

This section describes advanced interface settings.

About MAC Addresses

You can manually assign MAC addresses to override the default. For container instances, the FXOS chassis automatically generates unique MAC addresses for all interfaces.

---

**Note**

You might want to assign unique MAC addresses to subinterfaces defined on the FTD, because they use the same burned-in MAC address of the parent interface. For example, your service provider might perform access control based on the MAC address. Also, because IPv6 link-local addresses are generated based on the MAC address, assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the FTD.

---

**Note**

For container instances, even if you are not sharing a subinterface, if you manually configure MAC addresses, make sure you use unique MAC addresses for all subinterfaces on the same parent interface to ensure proper classification.

Default MAC Addresses

**For native instances:**

Default MAC address assignments depend on the type of interface.

- **Physical interfaces**—The physical interface uses the burned-in MAC address.

- **Redundant interfaces**—A redundant interface uses the MAC address of the first physical interface that you add. If you change the order of the member interfaces in the configuration, then the MAC address changes to match the MAC address of the interface that is now listed first. If you assign a MAC address to the redundant interface, then it is used regardless of the member interface MAC addresses.

- **EtherChannels (Firepower Models)**—For an EtherChannel, all interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. The port-channel interface uses a unique MAC address from a pool; interface membership does not affect the MAC address.

- **EtherChannels (ASA Models)**—The port-channel interface uses the lowest-numbered channel group interface MAC address as the port-channel MAC address. Alternatively you can configure a MAC address for the port-channel interface. We recommend configuring a unique MAC address in case the group channel interface membership changes. If you remove the interface that was providing the port-channel MAC address, then the port-channel MAC address changes to the next lowest numbered interface, thus causing traffic disruption.

- **Subinterfaces (FTD-defined)**—All subinterfaces of a physical interface use the same burned-in MAC address. You might want to assign unique MAC addresses to subinterfaces. For example, your service provider might perform access control based on the MAC address. Also, because IPv6 link-local addresses are generated based on the MAC address, assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the FTD.
For container instances:

- MAC addresses for all interfaces are taken from a MAC address pool. For subinterfaces, if you decide to manually configure MAC addresses, make sure you use unique MAC addresses for all subinterfaces on the same parent interface to ensure proper classification. See Automatic MAC Addresses for Container Instance Interfaces, on page 623.

### About the MTU

The MTU specifies the maximum frame payload size that the Firepower Threat Defense device can transmit on a given Ethernet interface. The MTU value is the frame size without Ethernet headers, VLAN tagging, or other overhead. For example, when you set the MTU to 1500, the expected frame size is 1518 bytes including the headers, or 1522 when using VLAN. Do not set the MTU value higher to accommodate these headers.

#### Path MTU Discovery

The Firepower Threat Defense device supports Path MTU Discovery (as defined in RFC 1191), which lets all devices in a network path between two hosts coordinate the MTU so they can standardize on the lowest MTU in the path.

#### Default MTU

The default MTU on the Firepower Threat Defense device is 1500 bytes. This value does not include the 18-22 bytes for the Ethernet header, VLAN tagging, or other overhead.

#### MTU and Fragmentation

For IPv4, if an outgoing IP packet is larger than the specified MTU, it is fragmented into 2 or more frames. Fragments are reassembled at the destination (and sometimes at intermediate hops), and fragmentation can cause performance degradation. For IPv6, packets are typically not allowed to be fragmented at all. Therefore, your IP packets should fit within the MTU size to avoid fragmentation.

For TCP packets, the endpoints typically use their MTU to determine the TCP maximum segment size (MTU - 40, for example). If additional TCP headers are added along the way, for example for site-to-site VPN tunnels, then the TCP MSS might need to be adjusted down by the tunneling entity. See About the TCP MSS, on page 686.

For UDP or ICMP, the application should take the MTU into account to avoid fragmentation.

---

**Note**

The Firepower Threat Defense device can receive frames larger than the configured MTU as long as there is room in memory.

### MTU and Jumbo Frames

A larger MTU lets you send larger packets. Larger packets might be more efficient for your network. See the following guidelines:

- Matching MTUs on the traffic path—We recommend that you set the MTU on all FTD interfaces and other device interfaces along the traffic path to be the same. Matching MTUs prevents intermediate devices from fragmenting the packets.

- Accommodating jumbo frames—You can set the MTU up to 9198 bytes. The maximum is 9000 for the Firepower Threat Defense Virtual and 9184 for the Firepower 4100/9300.
About the TCP MSS

The TCP maximum segment size (MSS) is the size of the TCP payload before any TCP and IP headers are added. UDP packets are not affected. The client and the server exchange TCP MSS values during the three-way handshake when establishing the connection.

You can set the TCP MSS on the Firepower Threat Defense device for through traffic using the Sysopt_Basic object in FlexConfig; see FlexConfig Policies for Firepower Threat Defense, on page 991; by default, the maximum TCP MSS is set to 1380 bytes. This setting is useful when the Firepower Threat Defense device needs to add to the size of the packet for IPsec VPN encapsulation. However, for non-IPsec endpoints, you should disable the maximum TCP MSS on the Firepower Threat Defense device.

If you set a maximum TCP MSS, if either endpoint of a connection requests a TCP MSS that is larger than the value set on the Firepower Threat Defense device, then the Firepower Threat Defense device overwrites the TCP MSS in the request packet with the Firepower Threat Defense device maximum. If the host or server does not request a TCP MSS, then the Firepower Threat Defense device assumes the RFC 793-default value of 536 bytes (IPv4) or 1220 bytes (IPv6), but does not modify the packet. For example, you leave the default MTU as 1500 bytes. A host requests an MSS of 1500 minus the TCP and IP header length, which sets the MSS to 1460. If the Firepower Threat Defense device maximum TCP MSS is 1380 (the default), then the Firepower Threat Defense device changes the MSS value in the TCP request packet to 1380. The server then sends packets with 1380-byte payloads. The Firepower Threat Defense device can then add up to 120 bytes of headers to the packet and still fit in the MTU size of 1500.

You can also configure the minimum TCP MSS; if a host or server requests a very small TCP MSS, the Firepower Threat Defense device can adjust the value up. By default, the minimum TCP MSS is not enabled.

For to-the-box traffic, including for SSL VPN connections, this setting does not apply. The Firepower Threat Defense device uses the MTU to derive the TCP MSS: MTU - 40 (IPv4) or MTU - 60 (IPv6).

Default TCP MSS

By default, the maximum TCP MSS on the Firepower Threat Defense device is 1380 bytes. This default accommodates IPv4 IPsec VPN connections where the headers can equal up to 120 bytes; this value fits within the default MTU of 1500 bytes.

Suggested Maximum TCP MSS Setting

The default TCP MSS assumes the Firepower Threat Defense device acts as an IPv4 IPsec VPN endpoint and has an MTU of 1500. When the Firepower Threat Defense device acts as an IPv4 IPsec VPN endpoint, it needs to accommodate up to 120 bytes for TCP and IP headers.

If you change the MTU value, use IPv6, or do not use the Firepower Threat Defense device as an IPsec VPN endpoint, then you should change the TCP MSS setting using the Sysopt_Basic object in FlexConfig; see FlexConfig Policies for Firepower Threat Defense, on page 991. See the following guidelines:

• Normal traffic—Disable the TCP MSS limit and accept the value established between connection endpoints. Because connection endpoints typically derive the TCP MSS from the MTU, non-IPsec packets usually fit this TCP MSS.

• IPv4 IPsec endpoint traffic—Set the maximum TCP MSS to the MTU - 120. For example, if you use jumbo frames and set the MTU to 9000, then you need to set the TCP MSS to 8880 to take advantage of the new MTU.

• IPv6 IPsec endpoint traffic—Set the maximum TCP MSS to the MTU - 140.
ARP Inspection for Bridge Group Traffic

By default, all ARP packets are allowed between bridge group members. You can control the flow of ARP packets by enabling ARP inspection.

ARP inspection prevents malicious users from impersonating other hosts or routers (known as ARP spoofing). ARP spoofing can enable a “man-in-the-middle” attack. For example, a host sends an ARP request to the gateway router; the gateway router responds with the gateway router MAC address. The attacker, however, sends another ARP response to the host with the attacker MAC address instead of the router MAC address. The attacker can now intercept all the host traffic before forwarding it on to the router.

ARP inspection ensures that an attacker cannot send an ARP response with the attacker MAC address, so long as the correct MAC address and the associated IP address are in the static ARP table.

When you enable ARP inspection, the Firepower Threat Defense device compares the MAC address, IP address, and source interface in all ARP packets to static entries in the ARP table, and takes the following actions:

- If the IP address, MAC address, and source interface match an ARP entry, the packet is passed through.
- If there is a mismatch between the MAC address, the IP address, or the interface, then the Firepower Threat Defense device drops the packet.
- If the ARP packet does not match any entries in the static ARP table, then you can set the Firepower Threat Defense device to either forward the packet out all interfaces (flood), or to drop the packet.

**Note**
The dedicated Diagnostic interface never floods packets even if this parameter is set to flood.

MAC Address Table

When you use bridge groups, the FTD learns and builds a MAC address table in a similar way as a normal bridge or switch: when a device sends a packet through the bridge group, the FTD adds the MAC address to its table. The table associates the MAC address with the source interface so that the FTD knows to send any packets addressed to the device out the correct interface. Because traffic between bridge group members is subject to the FTD security policy, if the destination MAC address of a packet is not in the table, the FTD does not flood the original packet on all interfaces as a normal bridge does. Instead, it generates the following packets for directly-connected devices or for remote devices:

- Packets for directly-connected devices—The FTD generates an ARP request for the destination IP address, so that it can learn which interface receives the ARP response.
- Packets for remote devices—The FTD generates a ping to the destination IP address so that it can learn which interface receives the ping reply.

The original packet is dropped.

Default Settings

- If you enable ARP inspection, the default setting is to flood non-matching packets.
- The default timeout value for dynamic MAC address table entries is 5 minutes.
• By default, each interface automatically learns the MAC addresses of entering traffic, and the Firepower Threat Defense device adds corresponding entries to the MAC address table.

Note

Firepower Threat Defense device generates a reset packet to reset a connection that is denied by a stateful inspection engine. Here, the destination MAC address of the packet is not determined based on the ARP table lookup but instead it is taken directly from the packets (connections) that are being denied.

Guidelines for ARP Inspection and the MAC Address Table

• ARP inspection is only supported for bridge groups.

• MAC address table configuration is only supported for bridge groups.

Configure the MTU

Customize the MTU on the interface, for example, to allow jumbo frames.

Caution

Changing the highest MTU value on the device for a data interface restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all data interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. This caution does not apply to the Diagnostic interface or management-only interfaces. See Snort® Restart Traffic Behavior, on page 386 for more information.

Before you begin

• Changing the MTU above 1500 bytes automatically enables jumbo frames; for ASA models, you must reload the system before you can use jumbo frames.

• If you use an interface in an inline set, the MTU setting is not used. However, the jumbo frame setting is relevant to inline sets; jumbo frames enable the inline interfaces to receive packets up to 9000 bytes. To enable jumbo frames, you must set the MTU of any interface above 1500 bytes.

Step 1

Select Devices > Device Management and click Edit (-pencil) for your FTD device. The Interfaces page is selected by default.

Step 2

Click Edit (-pencil) for the interface you want to edit.

Step 3

On the General tab, set the MTU between 64 and 9198 bytes; the maximum is 9000 for the Firepower Threat Defense Virtual and 9184 for the FTD on the Firepower 4100/9300 chassis.

The default is 1500 bytes.

Step 4

Click OK.

Step 5

Click Save.
You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

### Step 6
For ASA models, if you set the MTU above 1500 bytes, reload the system to enable jumbo frames.

---

**Configure the MAC Address**

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

You might need to manually assign a MAC address. You can also set the Active and Standby MAC addresses on the **Devices > Device Management > High Availability** tab. If you set the MAC address for an interface on both screens, the addresses on the **Interfaces > Advanced** tab take precedence.

**Note**

For container instances, even if you are not sharing a subinterface, if you manually configure MAC addresses, make sure you use unique MAC addresses for all subinterfaces on the same parent interface to ensure proper classification.

---

**Step 1**
Select **Devices > Device Management** and click **Edit ()** for your FTD device. The **Interfaces** page is selected by default.

**Step 2**
Click **Edit ()** for the interface you want to edit.

**Step 3**
Click the **Advanced** tab.
The **Information** tab is selected.

**Step 4**
In the **Active MAC Address** field, enter a MAC address in H.H.H format, where H is a 16-bit hexadecimal digit.
For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 00C.F142.4CDE. The MAC address must not have the multicast bit set, that is, the second hexadecimal digit from the left cannot be an odd number.

**Step 5**
In the **Standby MAC Address** field, enter a MAC address for use with High Availability.
If the active unit fails over and the standby unit becomes active, the new active unit starts using the active MAC addresses to minimize network disruption, while the old active unit uses the standby address.

**Step 6**
Click **OK**.

**Step 7**
Click **Save**.
You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
Add a Static ARP Entry

<table>
<thead>
<tr>
<th>Smart License</th>
<th>Classic License</th>
<th>Supported Devices</th>
<th>Supported Domains</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>N/A</td>
<td>FTD</td>
<td>Any</td>
<td>Admin Access Admin Network Admin</td>
</tr>
</tbody>
</table>

By default, all ARP packets are allowed between bridge group members. You can control the flow of ARP packets by enabling ARP inspection (see Configure ARP Inspection, on page 1111). ARP inspection compares ARP packets with static ARP entries in the ARP table.

For routed interfaces, you can enter static ARP entries, but normally dynamic entries are sufficient. For routed interfaces, the ARP table is used to deliver packets to directly-connected hosts. Although senders identify a packet destination by an IP address, the actual delivery of the packet on Ethernet relies on the Ethernet MAC address. When a router or host wants to deliver a packet on a directly connected network, it sends an ARP request asking for the MAC address associated with the IP address, and then delivers the packet to the MAC address according to the ARP response. The host or router keeps an ARP table so it does not have to send ARP requests for every packet it needs to deliver. The ARP table is dynamically updated whenever ARP responses are sent on the network, and if an entry is not used for a period of time, it times out. If an entry is incorrect (for example, the MAC address changes for a given IP address), the entry needs to time out before it can be updated with the new information.

For transparent mode, the FTD only uses dynamic ARP entries in the ARP table for traffic to and from the FTD device, such as management traffic.

Before you begin

This screen is only available for named interfaces.

---

**Step 1** Select Devices > Device Management and click Edit () for your FTD device. The Interfaces page is selected by default.

**Step 2** Click Edit () for the interface you want to edit.

**Step 3** Click the Advanced tab, and then click the ARP tab (called ARP and MAC for transparent mode).

**Step 4** Click Add ARP Config.
The Add ARP Config dialog box appears.

**Step 5** In the IP Address field, enter the IP address of the host.

**Step 6** In the MAC Address field, enter the MAC address of the host; for example, 00e0.1e4e.3d8b.

**Step 7** To perform proxy ARP for this address, check the Enable Alias check box.

If the FTD device receives an ARP request for the specified IP address, then it responds with the specified MAC address.

**Step 8** Click OK, and then click OK again to exit the Advanced settings.

**Step 9** Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.
Add a Static MAC Address and Disable MAC Learning for a Bridge Group

Normally, MAC addresses are added to the MAC address table dynamically as traffic from a particular MAC address enters an interface. You can disable MAC address learning; however, unless you statically add MAC addresses to the table, no traffic can pass through the FTD device. You can also add static MAC addresses to the MAC address table. One benefit to adding static entries is to guard against MAC spoofing. If a client with the same MAC address as a static entry attempts to send traffic to an interface that does not match the static entry, then the FTD device drops the traffic and generates a system message. When you add a static ARP entry (see Add a Static ARP Entry, on page 690), a static MAC address entry is automatically added to the MAC address table.

Before you begin
This screen is only available for named interfaces.

Step 1
Select Devices > Device Management and click Edit (edithandle) for your FTD device. The Interfaces page is selected by default.

Step 2
Click Edit (edithandle) for the interface you want to edit.

Step 3
Click the Advanced tab, and then click the ARP and MAC tab.

Step 4
(Optional) Disable MAC learning by unchecking the Enable MAC Learning check box.

Step 5
To add a static MAC address, click Add MAC Config.
The Add MAC Config dialog box appears.

Step 6
In the MAC Address field, enter the MAC address of the host; for example, 00e0.1e4e.3d8b. Click OK.

Step 7
Click OK to exit the Advanced settings.

Step 8
Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

Set Security Configuration Parameters

This section describes how to prevent IP spoofing, allow full fragment reassembly, and override the default fragment setting set for at the device level in Platform Settings.

Anti-Spoofing
This section lets you enable Unicast Reverse Path Forwarding on an interface. Unicast RPF guards against IP spoofing (a packet uses an incorrect source IP address to obscure its true source) by ensuring that all packets have a source IP address that matches the correct source interface according to the routing table.

Normally, the FTD device only looks at the destination address when determining where to forward the packet. Unicast RPF instructs the device to also look at the source address; this is why it is called Reverse Path Forwarding. For any traffic that you want to allow through the FTD device, the device routing table must include a route back to the source address. See RFC 2267 for more information.

For outside traffic, for example, the FTD device can use the default route to satisfy the Unicast RPF protection. If traffic enters from an outside interface, and the source address is not known to the routing table, the device uses the default route to correctly identify the outside interface as the source interface.

If traffic enters the outside interface from an address that is known to the routing table, but is associated with the inside interface, then the FTD device drops the packet. Similarly, if traffic enters the inside interface from an unknown source address, the device drops the packet because the matching route (the default route) indicates the outside interface.

Unicast RPF is implemented as follows:

- ICMP packets have no session, so each packet is checked.
- UDP and TCP have sessions, so the initial packet requires a reverse route lookup. Subsequent packets arriving during the session are checked using an existing state maintained as part of the session. Non-initial packets are checked to ensure they arrived on the same interface used by the initial packet.

Fragment per Packet

By default, the FTD device allows up to 24 fragments per IP packet, and up to 200 fragments awaiting reassembly. You might need to let fragments on your network if you have an application that routinely fragments packets, such as NFS over UDP. However, if you do not have an application that fragments traffic, we recommend that you do not allow fragments through the FTD device. Fragmented packets are often used as DoS attacks.

Fragment Reassembly

The FTD device performs the following fragment reassembly processes:

- IP fragments are collected until a fragment set is formed or until a timeout interval has elapsed.
- If a fragment set is formed, integrity checks are performed on the set. These checks include no overlapping, no tail overflow, and no chain overflow.
- IP fragments that terminate at the FTD device are always fully reassembled.
- If Full Fragment Reassembly is disabled (the default), the fragment set is forwarded to the transport layer for further processing.
- If Full Fragment Reassembly is enabled, the fragment set is first coalesced into a single IP packet. The single IP packet is then forwarded to the transport layer for further processing.

Before you begin

This screen is only available for named interfaces.
Step 1  Select Devices > Device Management and click Edit (🔒) for your FTD device. The Interfaces page is selected by default.

Step 2  Click Edit (🔒) for the interface you want to edit.

Step 3  Click the Advanced tab, and then click the Security Configuration tab.

Step 4  To enable Unicast Reverse Path Forwarding, check the Anti-Spoofing check box.

Step 5  To enable full fragment reassembly, check the Full Fragment Reassembly check box.

Step 6  To change the number of fragments allowed per packet, check the Override Default Fragment Setting check box, and set the following values:

- **Size**—Set the maximum number of packets that can be in the IP reassembly database waiting for reassembly. The default is 200. Set this value to 1 to disable fragments.
- **Chain**—Set the maximum number of packets into which a full IP packet can be fragmented. The default is 24 packets.
- **Timeout**—Set the maximum number of seconds to wait for an entire fragmented packet to arrive. The timer starts after the first fragment of a packet arrives. If all fragments of the packet do not arrive by the number of seconds specified, all fragments of the packet that were already received will be discarded. The default is 5 seconds.

Step 7  Click OK.

Step 8  Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

<tr>
<td>Integrated Routing and Bridging</td>
<td>6.2.0</td>
<td>Integrated Routing and Bridging provides the ability to route between a bridge group and a routed interface. A bridge group is a group of interfaces that the FTD bridges instead of routes. The FTD is not a true bridge in that the FTD continues to act as a firewall: access control between interfaces is controlled, and all of the usual firewall checks are in place. Previously, you could only configure bridge groups in transparent firewall mode, where you cannot route between bridge groups. This feature lets you configure bridge groups in routed firewall mode, and to route between bridge groups and between a bridge group and a routed interface. The bridge group participates in routing by using a Bridge Virtual Interface (BVI) to act as a gateway for the bridge group. Integrated Routing and Bridging provides an alternative to using an external Layer 2 switch if you have extra interfaces on the FTD to assign to the bridge group. In routed mode, the BVI can be a named interface and can participate separately from member interfaces in some features, such as access rules and DHCP server. The following features that are supported in transparent mode are not supported in routed mode: clustering. The following features are also not supported on BVIs: dynamic routing and multicast routing. <strong>New/Modified screens:</strong></td>

CHAPTER 31

Inline Sets and Passive Interfaces for Firepower Threat Defense

You can configure IPS-only passive interfaces, passive ERSPAN interfaces, and inline sets. IPS-only mode interfaces bypass many firewall checks and only support IPS security policy. You might want to implement IPS-only interfaces if you have a separate firewall protecting these interfaces and do not want the overhead of firewall functions.

- About IPS Interfaces, on page 695
- Requirements and Prerequisites for Inline Sets, on page 697
- Guidelines for Inline Sets and Passive Interfaces, on page 698
- Configure a Passive Interface, on page 699
- Configure an Inline Set, on page 701
- History for Inline Sets and Passive Interfaces for Firepower Threat Defense, on page 703

About IPS Interfaces

This section describes IPS interfaces.

IPS Interface Types

IPS-only mode interfaces bypass many firewall checks and only support IPS security policy. You might want to implement IPS-only interfaces if you have a separate firewall protecting these interfaces and do not want the overhead of firewall functions.

Note

The firewall mode only affects regular firewall interfaces, and not IPS-only interfaces such as inline sets or passive interfaces. IPS-only interfaces can be used in both firewall modes.

IPS-only interfaces can be deployed as the following types:

- Inline Set, with optional Tap mode—An inline set acts like a bump on the wire, and binds two interfaces together to slot into an existing network. This function allows the FTD to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of an inline set unless explicitly dropped.
With tap mode, the FTD is deployed inline, but the network traffic flow is undisturbed. Instead, the FTD makes a copy of each packet so that it can analyze the packets. Note that rules of these types do generate intrusion events when they are triggered, and the table view of intrusion events indicates that the triggering packets would have dropped in an inline deployment. There are benefits to using tap mode with FTDs that are deployed inline. For example, you can set up the cabling between the FTD and the network as if the FTD were inline and analyze the kinds of intrusion events the FTD generates. Based on the results, you can modify your intrusion policy and add the drop rules that best protect your network without impacting its efficiency. When you are ready to deploy the FTD inline, you can disable tap mode and begin dropping suspicious traffic without having to reconfigure the cabling between the FTD and the network.

---

**Note**

Tap mode *significantly* impacts FTD performance, depending on the traffic.

---

**Note**

Inline sets might be familiar to you as "transparent inline sets," but the inline interface type is unrelated to the transparent firewall mode or the firewall-type interfaces.

---

- Passive or ERSAN Passive—Passive interfaces monitor traffic flowing across a network using a switch SPAN or mirror port. The SPAN or mirror port allows for traffic to be copied from other ports on the switch. This function provides the system visibility within the network without being in the flow of network traffic. When you configure the FTD in a passive deployment, the FTD cannot take certain actions such as blocking or shaping traffic. Passive interfaces receive all traffic unconditionally, and no traffic received on these interfaces is retransmitted. Encapsulated remote switched port analyzer (ERSAN) interfaces allow you to monitor traffic from source ports distributed over multiple switches, and uses GRE to encapsulate the traffic. ERSAN interfaces are only allowed when the FTD is in routed firewall mode.

---

### About Hardware Bypass for Inline Sets

For certain interface modules on the Firepower 9300, 4100, and 2100 series (see Requirements and Prerequisites for Inline Sets, on page 697), you can enable the Hardware Bypass feature. Hardware Bypass ensures that traffic continues to flow between an inline interface pair during a power outage. This feature can be used to maintain network connectivity in the case of software or hardware failures.

### Hardware Bypass Triggers

Hardware Bypass can be triggered in the following scenarios:

- FTD application crash
- FTD application reboot
- Security Module reboot
- Firepower chassis crash
- Firepower chassis reboot or upgrade
• Manual trigger
• Firepower chassis power loss
• Security Module power loss

Note
Hardware bypass is intended for unplanned/unexpected failure scenarios, and is not automatically triggered during planned software upgrades. Hardware bypass only engages at the end of a planned upgrade process, when the FTD application reboots.

Hardware Bypass Switchover

When switching from normal operation to hardware bypass or from hardware bypass back to normal operation, traffic may be interrupted for several seconds. A number of factors can affect the length of the interruption; for example, copper port auto-negotiation; behavior of the optical link partner such as how it handles link faults and de-bounce timing; spanning tree protocol convergence; dynamic routing protocol convergence; and so on. During this time, you may experience dropped connections.

You may also experience dropped connections due to application identification errors when analyzing connections midstream after the return to normal operations.

Snort Fail Open vs. Hardware Bypass

For inline sets other than those in tap mode, you can use the Snort Fail Open option to either drop traffic or allow traffic to pass without inspection when the Snort process is busy or down. Snort Fail Open is supported on all inline sets except those in tap mode, not just on interfaces that support Hardware Bypass.

The Hardware Bypass functionality allows traffic to flow during a hardware failure, including a complete power outage, and certain limited software failures. A software failure that triggers Snort Fail Open does not trigger a Hardware Bypass.

Hardware Bypass Status

If the system has power, then the Bypass LED indicates the Hardware Bypass status. See the Firepower chassis hardware installation guide for LED descriptions.

Requirements and Prerequisites for Inline Sets

Model Support
FTD

User Roles
• Admin
• Access Admin
• Network Admin
Hardware Bypass Support

The FTD supports Hardware Bypass for interface pairs on specific network modules on the following models:

- Firepower 9300
- Firepower 4100 series
- Firepower 2100 series

The ISA 3000 has a separate implementation for Hardware Bypass, which you can enable using FlexConfig only (see FlexConfig Policies for Firepower Threat Defense, on page 991). Do not use this chapter to configure ISA 3000 Hardware Bypass.

The supported Hardware Bypass network modules for these models include:

- Firepower 6-port 1G SX FTW Network Module single-wide (FPR-NM-6X1SX-F)
- Firepower 6-port 10G SR FTW Network Module single-wide (FPR-NM-6X10SR-F)
- Firepower 6-port 10G LR FTW Network Module single-wide (FPR-NM-6X10LR-F)
- Firepower 2-port 40G SR FTW Network Module single-wide (FPR-NM-2X40G-F)
- Firepower 8-port 1G Copper FTW Network Module single-wide (FPR-NM-8X1G-F)

Hardware Bypass can only use the following port pairs:

- 1 & 2
- 3 & 4
- 5 & 6
- 7 & 8

Guidelines for Inline Sets and Passive Interfaces

Firewall Mode

- ERSPAN interfaces are only allowed when the device is in routed firewall mode.

General Guidelines

- Inline sets and passive interfaces support physical interfaces and EtherChannels only, and cannot use redundant interfaces, VLANs, and so on. Firepower 4100/9300 subinterfaces are also not supported for IPS-only interfaces.
- Inline sets and passive interfaces are supported in intra-chassis and inter-chassis clustering.
- Bidirectional Forwarding Detection (BFD) echo packets are not allowed through the FTD when using inline sets. If there are two neighbors on either side of the FTD running BFD, then the FTD will drop
BFD echo packets because they have the same source and destination IP address and appear to be part of a LAND attack.

• For inline sets and passive interfaces, the FTD supports up to two 802.1Q headers in a packet (also known as Q-in-Q support), with the exception of the Firepower 4100/9300, which only supports one 802.1Q header. **Note:** Firewall-type interfaces do not support Q-in-Q, and only support one 802.1Q header.

**Hardware Bypass Guidelines**

• Hardware Bypass ports are supported only for inline sets.

• Hardware Bypass ports cannot be part of an EtherChannel.

• Supported with intra-chassis clustering. Ports are placed in Hardware Bypass mode when the last unit in the chassis fails. Inter-chassis clustering is not supported.

• If all units in the cluster fail, then Hardware Bypass is triggered on the final unit, and traffic continues to pass. When units come back up, Hardware Bypass returns to standby mode. However, when you use rules that match application traffic, those connections may be dropped and need to be reestablished. Connections are dropped because state information is not retained on the cluster unit, and the unit cannot identify the traffic as belonging to an allowed application. To avoid a traffic drop, use a port-based rule instead of an application-based rule, if appropriate for your deployment.

• Hardware Bypass is not supported in high availability mode.

**Unsupported Firewall Features on IPS Interfaces**

• DHCP server
• DHCP relay
• DHCP client
• TCP Intercept
• Routing
• NAT
• VPN
• Application inspection
• QoS
• NetFlow
• VXLAN

**Configure a Passive Interface**

This section describes how to:

• Enable the interface. By default, interfaces are disabled.
Configure a Passive Interface

- Set the interface mode to Passive or ERSPAN. For ERSPAN interfaces, you will set the ERSPAN parameters and the IP address.
- Change the MTU. By default, the MTU is set to 1500 bytes. For more information about the MTU, see About the MTU, on page 685.
- Set a specific speed and duplex (if available). By default, speed and duplex are set to Auto.

Note
For the Firepower Threat Defense on the FXOS chassis, you configure basic interface settings on the Firepower 4100/9300 chassis. See Configure a Physical Interface, on page 631 for more information.

---

Step 1
Select Devices > Device Management and click Edit ( ) for your FTD device. The Interfaces page is selected by default.

Step 2
Click Edit ( ) for the interface you want to edit.

Step 3
In the Mode drop-down list, choose Passive or Erspan.

Step 4
Enable the interface by checking the Enabled check box.

Step 5
In the Name field, enter a name up to 48 characters in length.

Step 6
From the Security Zone drop-down list, choose a security zone or add a new one by clicking New.

Step 7
(Optional) Add a description in the Description field.
The description can be up to 200 characters on a single line, without carriage returns.

Step 8
(Optional) On General, set the MTU between 64 and 9198 bytes; for the Firepower Threat Defense Virtual and Firepower Threat Defense on the FXOS chassis, the maximum is 9000 bytes.
The default is 1500 bytes.

Step 9
For ERSPAN interfaces, set the following parameters:
- Flow Id—Configure the ID used by the source and destination sessions to identify the ERSPAN traffic, between 1 and 1023. This ID must also be entered in the ERSPAN destination session configuration.
- Source IP—Configure the IP address used as the source of the ERSPAN traffic.

Step 10
For ERSPAN interfaces, set the IPv4 address and mask on IPv4.

Step 11
(Optional) Set the duplex and speed by clicking Hardware Configuration.
The exact speed and duplex options depend on your hardware.
- Duplex—Choose Full, Half, or Auto. Auto is the default.
- Speed—Choose 10, 100, 1000, or Auto. Auto is the default.

Step 12
Click OK.

Step 13
Click Save.
You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.
**Configure an Inline Set**

This section enables and names two physical interfaces that you can add to an inline set. You can also optionally enable Hardware Bypass for supported interface pairs.

---

**Note**

For the Firepower Threat Defense on the FXOS chassis, you configure basic interface settings on the Firepower 4100/9300 chassis. See Configure a Physical Interface, on page 631 for more information.

---

**Before you begin**

- We recommend that you set STP PortFast for STP-enabled switches that connect to Firepower Threat Defense inline pair interfaces. This setting is especially useful for Hardware Bypass configurations and can reduce bypass times.

---

**Step 1**
Select Devices > Device Management and click Edit ();} for your FTD device. The Interfaces page is selected by default.

**Step 2**
Click Edit ();} for the interface you want to edit.

**Step 3**
In the Mode drop-down list, choose None.
After you add this interface to an inline set, this field will show Inline for the mode.

**Step 4**
Enable the interface by checking the Enabled check box.

**Step 5**
In the Name field, enter a name up to 48 characters in length.
Do not set the security zone yet; you must set it after you create the inline set later in this procedure.

**Step 6**
(Optional) Add a description in the Description field.
The description can be up to 200 characters on a single line, without carriage returns.

**Step 7**
(Optional) Set the duplex and speed by clicking Hardware Configuration.
The exact speed and duplex options depend on your hardware.
- **Duplex**—Choose Full, Half, or Auto. Auto is the default.
- **Speed**—Choose 10, 100, 1000, or Auto. Auto is the default.

**Step 8**
Click OK.
Do not set any other settings for this interface.

**Step 9**
Click Edit ();} for the second interface you want to add to the inline set.

**Step 10**
Configure the settings as for the first interface.

**Step 11**
Click Inline Sets.

**Step 12**
Click Add Inline Set.
The Add Inline Set dialog box appears with General selected.

**Step 13**
In the Name field, enter a name for the set.
Step 14  (Optional) Change the MTU to enable jumbo frames.

For inline sets, the MTU setting is not used. However, the jumbo frame setting is relevant to inline sets; jumbo frames enable the inline interfaces to receive packets up to 9000 bytes. To enable jumbo frames, you must set the MTU of any interface on the device above 1500 bytes.

Step 15  (Optional) For the Bypass mode, choose one of the following options:

- **Disabled**—Set Hardware Bypass to disabled for interfaces where Hardware Bypass is supported, or use interfaces where Hardware Bypass is not supported.
- **Standby**—Set Hardware Bypass to the standby state on supported interfaces. Only pairs of Hardware Bypass interfaces are shown. In the standby state, the interfaces remain in normal operation until there is a trigger event.
- **Bypass-Force**—Manually forces the interface pair to go into a bypass state. Inline Sets shows Yes for any interface pairs that are in Bypass-Force mode.

Step 16  In the Available Interfaces Pairs area, click a pair and then click Add to move it to the Selected Interface Pair area. All possible pairings between named and enabled interfaces with the mode set to None show in this area.

Step 17  (Optional) Click Advanced to set the following optional parameters:

- **Tap Mode**—Set to inline tap mode.

  Note that you cannot enable this option and strict TCP enforcement on the same inline set.

  **Note**  Tap mode significantly impacts FTD performance, depending on the traffic.

- **Propagate Link State**—Configure link state propagation.

  Link state propagation automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down. When the downed interface comes back up, the second interface automatically comes back up, also. In other words, if the link state of one interface changes, the device senses the change and updates the link state of the other interface to match it. Note that devices require up to 4 seconds to propagate link state changes. Link state propagation is especially useful in resilient network environments where routers are configured to reroute traffic automatically around network devices that are in a failure state.

- **Strict TCP Enforcement**—To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed.

  Strict enforcement also blocks:

  - Non-SYN TCP packets for connections where the three-way handshake was not completed
  - Non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK
  - Non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established
  - SYN packets on an established TCP connection from either the initiator or the responder

- **Snort Fail Open**—Enable or disable either or both of the Busy and Down options if you want new and existing traffic to pass without inspection (enabled) or drop (disabled) when the Snort process is busy or down.

  By default, traffic passes without inspection when the Snort process is down, and drops when it is busy.

  When the Snort process is:
• Busy—It cannot process traffic fast enough because traffic buffers are full, indicating that there is more traffic than the device can handle, or because of other software resource issues.

• Down—It is restarting because you deployed a configuration that requires it to restart. See Configurations that Restart the Snort Process When Deployed or Activated, on page 388.

When the Snort process is down and comes back up, it inspects new connections. To prevent false positives and false negatives, it does not inspect existing connections on inline, routed, or transparent interfaces because initial session information might have been lost while it was down.

Note When Snort fails open, features that rely on the Snort process do not function. These include application control and deep inspection. The system performs only basic access control using simple, easily determined transport and network layer characteristics.

Step 18 Click Interfaces.
Step 19 Click Edit (📝) for one of the member interfaces.
Step 20 From the Security Zone drop-down list, choose a security zone or add a new one by clicking New.

You can only set the zone after you add the interface to the inline set; adding it to an inline set configures the mode to Inline and lets you choose inline-type security zones.

Step 21 Click OK.
Step 22 Set the security zone for the second interface.
Step 23 Click Save.

You can now click Deploy and deploy the policy to assigned devices. The changes are not active until you deploy them.

CHAPTER 32

DHCP and DDNS Services for Threat Defense

The following topics explain DHCP and DDNS services and how to configure them on Threat Defense devices.

• About DHCP and DDNS Services, on page 705
• Requirements and Prerequisites for DHCP and DDNS, on page 706
• Guidelines for DHCP and DDNS Services, on page 706
• Configure the DHCP Server, on page 708
• Configure the DHCP Relay Agent, on page 709
• Configure Dynamic DNS, on page 710

About DHCP and DDNS Services

The following topics describe the DHCP server, DHCP relay agent, and DDNS update.

About the DHCPv4 Server

DHCP provides network configuration parameters, such as IP addresses, to DHCP clients. The Firepower Threat Defense device can provide a DHCP server to DHCP clients attached to Firepower Threat Defense device interfaces. The DHCP server provides network configuration parameters directly to DHCP clients.

An IPv4 DHCP client uses a broadcast rather than a multicast address to reach the server. The DHCP client listens for messages on UDP port 68; the DHCP server listens for messages on UDP port 67.

The DHCP server for IPv6 is not supported; you can, however, enable DHCP relay for IPv6 traffic.

DHCP Options

DHCP provides a framework for passing configuration information to hosts on a TCP/IP network. The configuration parameters are carried in tagged items that are stored in the Options field of the DHCP message and the data are also called options. Vendor information is also stored in Options, and all of the vendor information extensions can be used as DHCP options.

For example, Cisco IP Phones download their configuration from a TFTP server. When a Cisco IP Phone starts, if it does not have both the IP address and TFTP server IP address preconfigured, it sends a request with option 150 or 66 to the DHCP server to obtain this information.

• DHCP option 150 provides the IP addresses of a list of TFTP servers.

• DHCP option 66 gives the IP address or the hostname of a single TFTP server.
• DHCP option 3 sets the default route.

A single request might include both options 150 and 66. In this case, the ASA DHCP server provides values for both options in the response if they are already configured on the ASA.

You can use advanced DHCP options to provide DNS, WINS, and domain name parameters to DHCP clients; DHCP option 15 is used for the DNS domain suffix. You can also use the DHCP automatic configuration setting to obtain these values or define them manually. When you use more than one method to define this information, it is passed to DHCP clients in the following sequence:

1. Manually configured settings.
2. Advanced DHCP options settings.
3. DHCP automatic configuration settings.

For example, you can manually define the domain name that you want the DHCP clients to receive and then enable DHCP automatic configuration. Although DHCP automatic configuration discovers the domain together with the DNS and WINS servers, the manually defined domain name is passed to DHCP clients with the discovered DNS and WINS server names, because the domain name discovered by the DHCP automatic configuration process is superseded by the manually defined domain name.

**About the DHCP Relay Agent**

You can configure a DHCP relay agent to forward DHCP requests received on an interface to one or more DHCP servers. DHCP clients use UDP broadcasts to send their initial DHCPDISCOVER messages because they do not have information about the network to which they are attached. If the client is on a network segment that does not include a server, UDP broadcasts normally are not forwarded by the Firepower Threat Defense device because it does not forward broadcast traffic. The DHCP relay agent lets you configure the interface of the Firepower Threat Defense device that is receiving the broadcasts to forward DHCP requests to a DHCP server on another interface.

**Requirements and Prerequisites for DHCP and DDNS**

**Model Support**

FTD

**User Roles**

• Admin
• Access Admin
• Network Admin

**Guidelines for DHCP and DDNS Services**

This section includes guidelines and limitations that you should check before configuring DHCP and DDNS services.
Firewall Mode

- DHCP Relay is not supported in transparent firewall mode or in routed mode on the BVI or bridge group member interface.

- DHCP Server is supported in transparent firewall mode on a bridge group member interface. In routed mode, the DHCP server is supported on the BVI interface, not the bridge group member interface. The BVI must have a name for the DHCP server to operate.

- DDNS is not supported in transparent firewall mode or in routed mode on the BVI or bridge group member interface.

IPv6

Does not support IPv6 for DHCP server; IPv6 for DHCP relay is supported.

DHCPv4 Server

- The maximum available DHCP pool is 256 addresses.

- You can configure only one DHCP server on each interface. Each interface can have its own pool of addresses to use. However the other DHCP settings, such as DNS servers, domain name, options, ping timeout, and WINS servers, are configured globally and used by the DHCP server on all interfaces.

- You cannot configure an interface as a DHCP client if that interface also has DHCP server enabled; you must use a static IP address.

- You cannot configure both a DHCP server and DHCP relay on the same device, even if you want to enable them on different interfaces; you can only configure one type of service.

- Firepower Threat Defense device does not support QIP DHCP servers for use with the DHCP proxy service.

- The DHCP server does not support BOOTP requests.

DHCP Relay

- You can configure a maximum of 10 DHCPv4 relay servers, global and interface-specific servers combined, with a maximum of 4 servers per interface.

- You can configure a maximum of 10 DHCPv6 relay servers. Interface-specific servers for IPv6 are not supported.

- You cannot configure both a DHCP server and DHCP relay on the same device, even if you want to enable them on different interfaces; you can only configure one type of service.

- DHCP relay services are not available in transparent firewall mode. You can, however, allow DHCP traffic through using an access rule. To allow DHCP requests and replies through the Firepower Threat Defense device, you need to configure two access rules, one that allows DHCP requests from the inside interface to the outside (UDP destination port 67), and one that allows the replies from the server in the other direction (UDP destination port 68).

- For IPv4, clients must be directly-connected to the Firepower Threat Defense device and cannot send requests through another relay agent or a router. For IPv6, the Firepower Threat Defense device supports packets from another relay server.
• The DHCP clients must be on different interfaces from the DHCP servers to which the Firepower Threat Defense device relays requests.

• You cannot enable DHCP Relay on an interface in a traffic zone.

• DHCP relay is not supported on Virtual Tunnel Interfaces (VTIs).

Configure the DHCP Server

See the following steps to configure a DHCP server.

**Step 1** Choose Devices > Device Management, and edit the FTD device.

**Step 2** Select DHCP > DHCP Server.

**Step 3** Configure the following DHCP server options:

  • **Ping Timeout** — The amount of time in milliseconds that Firepower Threat Defense device waits to time out a DHCP ping attempt. Valid values range from 10 to 10000 milliseconds. The default value is 50 milliseconds. To avoid address conflicts, the Firepower Threat Defense device sends two ICMP ping packets to an address before assigning that address to a DHCP client.

  • **Lease Length** — The amount of time in seconds that the client may use its allocated IP address before the lease expires. Valid values range from 300 to 1048575 seconds. The default value is 3600 seconds (1 hour).

  • (Routed mode) **Auto-configuration** — Enables DHCP auto configuration on the Firepower Threat Defense device. Auto-configuration enables the DHCP server to provide the DHCP clients with the DNS server, domain name, and WINS server information obtained from a DHCP client running on the specified interface. Otherwise, you can disable auto configuration and add the values yourself in Step 4.

  • (Routed mode) **Interface** — Specifies the interface to be used for auto configuration.

**Step 4** To override auto-configured settings, do the following:

  • Enter the domain name of the interface. For example, your device may be in the Your_Company domain.

  • From the drop-down list, choose the DNS servers (primary and secondary) configured for the interface. To add a new DNS server, see Creating Network Objects, on page 444.

  • From the drop-down list, choose the WINS servers (primary and secondary) configured for the interface. To add a new WINS server, see Creating Network Objects, on page 444.

**Step 5** Select Server, click Add, and configure the following options:

  • **Interface** — Choose the interface from the drop-down list. In transparent mode, specify a named bridge group member interface. In routed mode, specify a named routed interface or a named BVI; do not specify the bridge group member interface. Note that each bridge group member interface for the BVI must also be named for the DHCP server to operate.

  • **Address Pool** — The range of IP addresses from lowest to highest that is used by the DHCP server. The range of IP addresses must be on the same subnet as the selected interface and cannot include the IP address of the interface itself.

  • **Enable DHCP Server** — Enables the DHCP server on the selected interface.
Step 6 Click **OK** to save the DHCP server configuration.

Step 7 (Optional) Select **Advanced**, click **Add**, and specify the type of information you want the option to return to the DHCP client:

- **Option Code** — The Firepower Threat Defense device supports the DHCP options listed in RFC 2132, RFC 2562, and RFC 5510 to send information. All DHCP options (1 through 255) are supported except for 1, 12, 50–54, 58–59, 61, 67, and 82. See [About the DHCPv4 Server, on page 705](#) for more information on DHCP option codes.

  **Note** The Firepower Threat Defense device does not verify that the option type and value that you provide match the expected type and value for the option code, as defined in RFC 2132. For more information about option codes and their associated types and expected values, see RFC 2132.

- **Type** — DHCP option type. Available options include **IP**, **ASCII**, and **HEX**. If you chose IP, you must add IP addresses in the IP Address fields. If you chose ASCII, you must add the ASCII value in the ASCII field. If you chose HEX, you must add the HEX value in the HEX field.

- **IP Address 1** and **IP Address 2** — The IP address(es) to be returned with this option code. To add a new IP address, see [Creating Network Objects, on page 444](#).

- **ASCII** — The ASCII value that is returned to the DHCP client. The string cannot include spaces.

- **HEX** — The HEX value that is returned to the DHCP client. The string must have an even number of digits and no spaces. You do not need to use a 0x prefix.

Step 8 Click **OK** to save the option code configuration.

Step 9 Click **Save** on the DHCP page to save your changes.

---

**Configure the DHCP Relay Agent**

You can configure a DHCP relay agent to forward DHCP requests received on an interface to one or more DHCP servers. DHCP clients use UDP broadcasts to send their initial DHCPDISCOVER messages because they do not have information about the network to which they are attached. If the client is on a network segment that does not include a server, UDP broadcasts normally are not forwarded by the Firepower Threat Defense device because it does not forward broadcast traffic.

You can remedy this situation by configuring the interface of the Firepower Threat Defense device that is receiving the broadcasts to forward DHCP requests to a DHCP server on another interface.

**Note**

DHCP Relay is not supported in transparent firewall mode.

---

**Step 1** Choose **Devices > Device Management**, and edit the FTD device.

**Step 2** Select **DHCP > DHCP Relay**.

**Step 3** In the **Timeout** field, enter the amount of time in seconds that the Firepower Threat Defense device waits to time out the DHCP relay agent. Valid values range from 1 to 3600 seconds. The default value is 60 seconds.

The timeout is for address negotiation through the local DHCP Relay agent.
Step 4  On **DHCP Relay Agent**, click **Add**, and configure the following options:

- **Interface**—The interface connected to the DHCP clients.
- **Enable IPv4 Relay**—Enables IPv4 DHCP Relay for this interface.
- **Set Route**—(For IPv4) Changes the default gateway address in the DHCP message from the server to that of the Firepower Threat Defense device interface that is closest to the DHCP client, which relayed the original DHCP request. This action allows the client to set its default route to point to the Firepower Threat Defense device even if the DHCP server specifies a different router. If there is no default router option in the packet, the Firepower Threat Defense device adds one containing the interface address.
- **Enable IPv6 Relay**—Enables IPv6 DHCP Relay for this interface.

Step 5  Click **OK** to save the DHCP relay agent changes.

Step 6  On **DHCP Servers**, click **Add**, and configure the following options:

Add the IPv4 and IPv6 server addresses as separate entries, even if they belong to the same server.

- **Server**—The IP address of the DHCP server. Chose an IP address from the drop-down list. To add a new one, see Creating Network Objects, on page 444
- **Interface**—The interface to which the specified DHCP server is attached. The DHCP Relay agent and the DHCP server cannot be configured on the same interface.

Step 7  Click **OK** to save the DHCP server changes.

Step 8  Click **Save** on the DHCP page to save your changes.

---

**Configure Dynamic DNS**

When an interface uses DHCP IP addressing, the assigned IP address can change when the DHCP lease is renewed. When the interface needs to be reachable using a fully qualified domain name (FQDN), the IP address change can cause the DNS server resource records (RRs) to become stale. Dynamic DNS (DDNS) provides a mechanism to update DNS RRs whenever the IP address or hostname changes. You can also use DDNS for static or PPPoE IP addressing.

DDNS updates the following RRs on the DNS server: the A RR includes the name-to-IP address mapping, while the PTR RR maps addresses to names.

The FTD supports the DDNS update method is defined by RFC 2136. It does not support the Web update method. With this method, the FTD and the DHCP server use DNS requests to update the DNS RRs. The FTD or DHCP server sends a DNS request to its local DNS server for information about the hostname and, based on the response, determines the main DNS server that owns the RRs. The FTD or DHCP server then sends an update request directly to the main DNS server. See the following typical scenarios.

- The FTD updates the A RR, and the DHCP server updates the PTR RR.

  Typically, the FTD "owns" the A RR, while the DHCP server "owns" the PTR RR, so both entities need to request updates separately. When the IP address or hostname changes, the FTD sends a DHCP request to the DHCP server to inform it that it needs to request a PTR RR update.

- The DHCP server updates both the A and PTR RR.
Use this scenario if the FTD does not have the authority to update the A RR. When the IP address or hostname changes, the FTD sends a DHCP request to the DHCP server to inform it that it needs to request an A and PTR RR update.

You can configure different ownership depending on your security needs and the requirements of the main DNS server. For example, for a static address, the FTD should own the updates for both records.

The DDNS page also supports setting DHCP server settings relating to DDNS.

**Note**

DDNS is not supported on the BVI or bridge group member interfaces.

**Before you begin**

- Configure a DNS server group on **Objects > Object Management > DNS Server Group**, and then enable the group for the interface on **Devices > Platform Settings > DNS**. See Configure DNS, on page 1113.

- Configure the device hostname. You can configure the hostname when you perform the FTD initial setup, or by using the **configure network hostname** command. If you do not specify the hostname per interface, then the device hostname is used.

**Step 1** Choose **Devices > Device Management**, and edit the FTD device.

**Step 2** Choose **DHCP > DDNS**.

**Step 3** Configure a DDNS update method to enable DNS requests from the FTD.

You do not need to configure a DDNS update method if the DHCP server will perform all requests.

a) On **DDNS Update Methods**, click **Add**.

b) Set the **Method Name**.

c) (Optional) Configure the **Update Interval** between DNS requests. By default when all values are set to 0, update requests are sent whenever the IP address or hostname changes. To send requests regularly, set the **Days** (0-364), **Hours**, **Minutes**, and **Seconds**.

d) Set the **Update Records** you want the FTD to update.

   This setting only affects the records you want to update directly from the FTD; to determine the records you want the DHCP server to update, configure the DHCP client settings per interface or globally. See Step **Step 4**, on page 711.

   - **Not Defined**—Disables DNS updates from the FTD.

   - **Both A and PTR Records**—Sets the FTD to update both A and PTR RRIs. Use this option for static or PPPoE IP addressing.

   - **A Records**—Sets the FTD to update the A RR only. Use this option if you want the DHCP server to update the PTR RR.

   e) Click **OK**.

f) Assign this method to the interface in **Step 4**, on page 711.

**Step 4** Configure interface settings for DDNS, including setting the update method, DHCP client settings, and the hostname for this interface.
a) On DDNS Interface Settings, click Add.
b) Choose the Interface from the drop-down list.
c) Choose the Method Name that you created on the DDNS Update Methods page.
   You do not need to assign a method if you want the DHCP server to perform all updates.
d) Set the Host Name for this interface.
   If you do not set the hostname, the device hostname is used. If you do not specify an FQDN, then the default domain from the DNS server group is appended (for static or PPPoE IP addressing) or the domain name from the DHCP server is appended (for DHCP IP addressing).
e) Configure the DHCP Client requests DHCP server to update requests to determine which records you want the DHCP server to update.
   The FTD sends DHCP client requests to the DHCP server. Note that the DHCP server must also be configured to support DDNS. The server can be configured to honor the client requests, or it can override the client (in which case, it will reply to the client so the client does not also try to perform updates that the server is performing).
   For static or PPPoE IP addressing, these settings are ignored.

   **Note** You can also set these values globally for all interfaces on the DDNS page. The per-interface settings take precedence over the global settings.

   • **Not Selected**—Disables DDNS requests to the DHCP server. Even if the client does not request DDNS updates, the DHCP server can be configured to send updates anyway.
   
   • **No Update**—Requests the DHCP server not to perform updates. This setting works in conjunction with a DDNS update method with **Both A and PTR Records** enabled.
   
   • **Only PTR**—Requests that the DHCP server perform the PTR RR update. This setting works in conjunction with a DDNS update method with **A Records** enabled.
   
   • **Both A and PTR Records**—Requests that the DHCP server perform both A and PTR RR updates. This setting does not require a DDNS update method to be associated with the interface.

f) Click OK.

   **Note** The Dynamic DNS Update settings relate to DHCP server settings when you enable a DHCP server on the FTD. See Step Step 5, on page 712 for more information.

**Step 5**

If you enable the DHCP server on an FTD, you can configure DHCP server settings for DDNS.

To enable the DHCP server, see Configure the DHCP Server, on page 708). You can configure the server behavior when DHCP clients use the standard DDNS update method. If the server performs any updates, then if the client lease expires (and is not renewed), the server will request that the DNS server remove the RRs for which it was responsible.

a) You can configure server settings globally or per interface. For global settings, see the main DDNS page. For per-interface settings, see the DDNS Interface Settings page. Interface settings take precedence over global settings.

b) Configure which DNS RRs you want the DHCP server to update under Dynamic DNS Update.

   • **Not Selected**—DDNS updates are disabled, even if the client requests them.

   • **Only PTR**—Enables DDNS updates. If you enable the **Override DHCP Client Requests** setting, then the server will only update the PTR RR. Otherwise, the server will update RRs that the client requests. If the client does not send an update request with the FQDN option, the server will request an update for both A and PTR RRs using the hostname discovered in DHCP option 12.
- **Both A and PTR Records**—Enables DDNS updates. If you enable the **Override DHCP Client Requests** setting, then the server will update both the A and PTR RRs. Otherwise, the server will update RRs that the client requests. If the client does not send an update request with the FQDN option, the server will request an update for both A and PTR RRs using the hostname discovered in DHCP option 12.

c) To override the update actions requested by the DHCP client, check **Override DHCP Client Requests**.

The server will reply to the client that the request was overridden, so the client does not also try to perform updates that the server is performing.

**Step 6** *(Optional) Configure general DHCP client settings. These settings are not related to DDNS, but are related to how the DHCP client behaves.*

a) On the **DDNS** page, check **Enable DHCP Client Broadcast** to request that the DHCP server broadcast the DHCP reply (DHCP option 1).

b) To force a MAC address to be stored inside a DHCP request packet for option 61 instead of the default internally generated string, on **DDNS > DHCP Client ID Interface**, choose the interface from the **Available Interfaces** list, and then click **Add** to move it to the **Selected Interfaces** list.

Some ISPs expect option 61 to be the interface MAC address. If the MAC address is not included in the DHCP request packet, then an IP address will not be assigned. This setting does not directly relate to DDNS, but is a general DHCP client setting.

**Step 7** Click **Save** on the Device page to save your changes.
Configure Dynamic DNS
SNMP for the Firepower 1000/2100

This chapter describes how to configure SNMP for the Firepower 1000/2100.

- About SNMP for the Firepower 1000/2100 Series, on page 715
- Enabling SNMP and Configuring SNMP Properties for Firepower 1000/2100, on page 715
- Creating an SNMP Trap for Firepower 1000/2100, on page 716
- Creating an SNMP User for Firepower 1000/2100, on page 717

About SNMP for the Firepower 1000/2100 Series

The Simple Network Management Protocol (SNMP) is an application-layer protocol that provides a message format for communication between SNMP managers and agents. SNMP provides a standardized framework and a common language used for the monitoring and management of devices in a network.

The SNMP framework consists of three parts:

- An SNMP manager—The system used to control and monitor the activities of network devices using SNMP.

- An SNMP agent—The software component within the Firepower 1000/2100 chassis that maintains the data for the Firepower chassis and reports the data, as needed, to the SNMP manager. The Firepower chassis includes the agent and a collection of MIBs. To enable the SNMP agent and create the relationship between the manager and agent, enable and configure SNMP in the Firepower Management Center.

- A managed information base (MIB)—The collection of managed objects on the SNMP agent.

The Firepower 1000/2100 chassis supports SNMPv1, SNMPv2c and SNMPv3. Both SNMPv1 and SNMPv2c use a community-based form of security.

Enabling SNMP and Configuring SNMP Properties for Firepower 1000/2100

Note

This procedure only applies to Firepower 2100 and Firepower 1000 series devices.
**Step 1**  Choose Devices > Device Management.

**Step 2**  Click SNMP.

**Step 3**  Complete the following fields:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin State check box</td>
<td>Whether SNMP is enabled or disabled. Enable this service only if your system includes integration with an SNMP server.</td>
</tr>
<tr>
<td>Port field</td>
<td>The port on which the Firepower chassis communicates with the SNMP host. You cannot change the default port.</td>
</tr>
<tr>
<td>Community field</td>
<td>The default SNMP v1 or v2 community name or SNMP v3 username the Firepower chassis includes on any trap messages it sends to the SNMP host.</td>
</tr>
<tr>
<td></td>
<td>Enter an alphanumeric string between 1 and 32 characters. Do not use @ (at sign), \ (backslash), &quot; (double quote), ? (question mark) or an empty space. The default is public.</td>
</tr>
<tr>
<td></td>
<td>Note that if the Community field is already set, the text to the right of the empty field reads Set: Yes. If the Community field is not yet populated with a value, the text to the right of the empty field reads Set: No.</td>
</tr>
<tr>
<td>System Admin Name field</td>
<td>The contact person responsible for the SNMP implementation. Enter a string of up to 255 characters, such as an email address or a name and telephone number.</td>
</tr>
<tr>
<td>Location field</td>
<td>The location of the host on which the SNMP agent (server) runs. Enter an alphanumeric string up to 510 characters.</td>
</tr>
</tbody>
</table>

**Step 4**  Click Save.

---

**What to do next**

Create SNMP traps and users.

---

**Creating an SNMP Trap for Firepower 1000/2100**

**Note**

This procedure only applies to Firepower 2100 and Firepower 1000 series devices.

**Step 1**  Choose Devices > Device Management.

**Step 2**  Click SNMP.

**Step 3**  In the SNMP Traps Configuration area, click Add.
Step 4  In the **SNMP Trap Configuration** dialog box, complete the following fields:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Host Name</strong></td>
<td>The hostname or IP address of the SNMP host to which the Firepower chassis should send the trap.</td>
</tr>
<tr>
<td><strong>Community</strong></td>
<td>The SNMP v1 or v2 community name or the SNMP v3 username the Firepower chassis includes when it sends the trap to the SNMP host. This must be the same as the community or username that is configured for the SNMP service. Enter an alphanumeric string between 1 and 32 characters. Do not use @ (at sign), \ (backslash), &quot; (doublequote), ? (question mark) or an empty space.</td>
</tr>
<tr>
<td><strong>Port</strong></td>
<td>The port on which the Firepower chassis communicates with the SNMP host for the trap. Enter an integer between 1 and 65535.</td>
</tr>
<tr>
<td><strong>Version</strong></td>
<td>The SNMP version and model used for the trap. This can be one of the following: V1, V2, V3</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>If you select V2 or V3 for the version, the type of trap to send. This can be one of the following: Traps, Informs</td>
</tr>
<tr>
<td><strong>Privilege</strong></td>
<td>If you select V3 for the version, the privilege associated with the trap. This can be one of the following: Auth—Authentication but no encryption, Noauth—No authentication or encryption, Priv—Authentication and encryption</td>
</tr>
</tbody>
</table>
Step 1 Choose Devices > Device Management.

Step 2 Click SNMP.

Step 3 In the SNMP Users Configuration area, click Add.

Step 4 In the SNMP User Configuration dialog box, complete the following fields:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Username field</td>
<td>The username assigned to the SNMP user. Enter up to 32 letters or numbers. The name must begin with a letter and you can also specify _ (underscore), . (period), @ (at sign), and - (hyphen).</td>
</tr>
<tr>
<td>Auth Algorithm Type field</td>
<td>The authorization type: SHA.</td>
</tr>
<tr>
<td>Use AES-128 checkbox</td>
<td>If checked, this user uses AES-128 encryption.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> SNMPv3 does not support DES. If you leave the AES-128 box unchecked, no privacy encryption will be done and any configured privacy password will have no effect.</td>
</tr>
<tr>
<td>Authentication Password</td>
<td>The password for the user.</td>
</tr>
<tr>
<td>Confirm field</td>
<td>The password again for confirmation purposes.</td>
</tr>
<tr>
<td>Encryption Password field</td>
<td>The privacy password for the user.</td>
</tr>
<tr>
<td>Confirm field</td>
<td>The privacy password again for confirmation purposes.</td>
</tr>
</tbody>
</table>

Step 5 Click OK to close the SNMP User Configuration dialog box.

Step 6 Click Save.
CHAPTER 34

Quality of Service (QoS) for Firepower Threat Defense

The following topics describe how to use the Quality of Service (QoS) feature to police network traffic using Firepower Threat Defense devices:

- Introduction to QoS, on page 719
- About QoS Policies, on page 719
- Requirements and Prerequisites for QoS, on page 720
- Rate Limiting with QoS Policies, on page 720

Introduction to QoS

Quality of Service, or QoS, rate limits (polices) network traffic that is allowed or trusted by access control. The system does not rate limit traffic that was fastpathed.

QoS is supported for routed interfaces on Firepower Threat Defense devices only.

Logging Rate-Limited Connections

There are no logging configurations for QoS. A connection can be rate limited without being logged, and you cannot log a connection simply because it was rate limited. To view QoS information in connection events, you must independently log the ends of the appropriate connections to the Firepower Management Center database; see Other Connections You Can Log, on page 2461.

Connection events for rate-limited connections contain information on how much traffic was dropped, and which QoS configurations limited the traffic. You can view this information in event views (workflows), dashboards, and reports.

About QoS Policies

QoS policies deployed to managed devices govern rate limiting. Each QoS policy can target multiple devices; each device can have one deployed QoS policy at a time.

In a QoS policy, a maximum of 32 QoS rules handle network traffic. The system matches traffic to QoS rules in the order you specify. The system rate limits traffic according to the first rule where all rule conditions match the traffic. Traffic that does not match any of the rules is not rate limited.
You must constrain QoS rules by source or destination (routed) interfaces. The system enforces rate limiting *independently on each* of those interfaces; you cannot specify an aggregate rate limit for a set of interfaces.

QoS rules can also rate limit traffic by other network characteristics, as well as contextual information such as application, URL, user identity, and custom Security Group Tags (SGTs).

You can rate limit download and upload traffic independently. The system determines download and upload directions based on the connection initiator.

---

**Note**

QoS is not subordinate to a main access control configuration; you configure QoS independently. However, the access control and QoS policies deployed to the same device share identity configurations; see [Associating Other Policies with Access Control](#), on page 1391.

---

**QoS Policies and Multitenancy**

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can deploy the same QoS policy to devices in different descendant domains. Administrators in those descendant domains can use this read-only ancestor-deployed QoS policy, or replace it with a local policy.

### Rate Limiting with QoS Policies

To perform policy-based rate limiting, configure and deploy QoS policies to managed devices. Each QoS policy can target multiple devices; each device can have one deployed QoS policy at a time.

Only one person should edit a policy at a time, using a single browser window. If multiple users save the same policy, the last saved changes are retained. For your convenience, the system displays information on who (if anyone) is currently editing each policy. To protect the privacy of your session, a warning appears after 30 minutes of inactivity on the policy editor. After 60 minutes, the system discards your changes.
Creating a QoS Policy

A new QoS policy with no rules performs no rate limiting.

Step 1 Choose Devices > QoS.
Step 2 Click New Policy to create a new QoS policy and, optionally, assign target devices; see Creating a QoS Policy, on page 721.

You can also Copy or Edit an existing policy.

Step 3 Configure QoS rules; see Configuring QoS Rules, on page 722 and Rule Management: Common Characteristics, on page 399.

The Rules in the QoS policy editor lists each rule in evaluation order, and displays a summary of the rule conditions and rate limiting configurations. A right-click menu provides rule management options, including moving, enabling, and disabling.

Helpful in larger deployments, you can Filter by Device to display only the rules that affect a specific device or group of devices. You can also search for and within rules; the system matches text you enter in the Search Rules field to rule names and condition values, including objects and object groups.

Note Properly creating and ordering rules is a complex task, but one that is essential to building an effective deployment. If you do not plan carefully, rules can preempt other rules, require additional licenses, or contain invalid configurations. Icons represent comments, warnings, and errors. If issues exist, click Show Warnings to display a list. For more information, see Best Practices for Access Control Rules, on page 1372.

Step 4 Click Policy Assignments to identify the managed devices targeted by the policy; see Setting Target Devices for a QoS Policy, on page 722.

If you identified target devices during policy creation, verify your choices.

Step 5 Save the QoS policy.
Step 6 Because this feature must allow some packets to pass, you must configure your system to examine those packets. See Best Practices for Handling Packets That Pass Before Traffic Identification, on page 1880 and Specify a Policy to Handle Packets That Pass Before Traffic Identification, on page 1880.

Step 7 Deploy configuration changes; see Deploy Configuration Changes, on page 382.
Setting Target Devices for a QoS Policy

Each QoS policy can target multiple devices; each device can have one deployed QoS policy at a time.

Step 1: In the QoS policy editor, click Policy Assignments.
Step 2: Build your target list:
   - Add—Choose one or more Available Devices, then click Add to Policy or drag and drop into the list of Selected Devices.
   - Delete—Click Delete next to a single device, or choose multiple devices, right-click, then choose Delete Selected.
   - Search—Enter a search string in the search field. Click Clear to clear the search.
Step 3: Click OK to save policy assignments.
Step 4: Click Save to save the policy.

What to do next
   - Deploy configuration changes; see Deploy Configuration Changes, on page 382.

Configuring QoS Rules

When you create or edit a rule, use the upper portion of the rule editor to configure general rule properties. Use the lower portion of the rule editor to configure rule conditions and comments.

Step 1: On Rules of the QoS policy editor:
   - Add Rule—Click Add Rule.
   - Edit Rule—Click Edit.
Step 2: Enter a Name.
Step 3: Configure rule components:
   - Enabled—Specify whether the rule is Enabled.
   - Apply QoS On—Choose the interfaces you want to rate limit, either Interfaces in Destination Interface Objects or Interfaces in Source Interface Objects. Your choice must correspond with a populated interface constraint (not any).
   - Traffic Limit Per Interface—Enter a Download Limit and an Upload Limit in Mbits/sec. The default value of Unlimited prevent matching traffic from being rate limited in that direction.
   - Conditions—Click the corresponding condition you want to add. You must configure a source or destination interface condition, corresponding to your choice for Apply QoS On.
   - Comments—Click Comments. To add a comment click New Comment, enter a comment, and click OK. You can edit or delete this comment until you save the rule.
For detailed information on rule components, see QoS Rule Components, on page 723.

**Step 4**  
Save the rule.

**Step 5**  
In the policy editor, set the rule position. Click and drag or use the right-click menu to cut and paste.

Rules are numbered starting at 1. The system matches traffic to rules in top-down order by ascending rule number. The first rule that traffic matches is the rule that handles that traffic. Proper rule order reduces the resources required to process network traffic and prevents rule preemption.

**Step 6**  
Click Save to save the policy.

---

**What to do next**

- Deploy configuration changes; see Deploy Configuration Changes, on page 382.

**Related Topics**

- Best Practices for Access Control Rules, on page 1372

### QoS Rule Components

**State (Enabled/Disabled)**

By default, rules are enabled. If you disable a rule, the system does not use it and stops generating warnings and errors for that rule.

**Interfaces (Apply QoS On)**

You cannot save a QoS rule that rate limits all traffic. For each QoS rule, you must apply QoS on either:

- Interfaces in Source Interface Objects—Rate limits traffic through the rule's source interfaces. If you choose this option, you must add at least one source interface constraint (cannot be any).
- Interfaces in Destination Interface Objects—Rate limits traffic through the rule's destination interfaces. If you choose this option, you must add at least one destination interface constraint (cannot be any).

**Traffic Limit Per Interface**

A QoS rule enforces rate limiting independently on each of the interfaces you specify with the Apply QoS On option. You cannot specify an aggregate rate limit for a set of interfaces.

You can rate limit traffic by Mbits per second. The default value of Unlimited prevents matching traffic from being rate limited.

You can rate limit download and upload traffic independently. The system determines download and upload directions based on the connection initiator.

If you specify a limit greater than the maximum throughput of an interface, the system does not rate limit matching traffic. Maximum throughput may be affected by an interface’s hardware configuration, which you specify in each device’s properties (Devices > Device Management).
Conditions

Conditions specify the specific traffic the rule handles. You can configure each rule with multiple conditions. Traffic must match all conditions to match the rule. Each condition type has its own tab in the rule editor. You can rate limit traffic using:

- Interface Conditions, on page 404 (routed only; required)
- Network Conditions, on page 406
- Port and ICMP Code Conditions, on page 410
- Application Conditions (Application Control), on page 412
- URL Filtering, on page 1409
- User, Realm, and ISE Attribute Conditions (User Control), on page 422
- Custom SGT Conditions, on page 427

Comments

Each time you save changes to a rule you can add comments. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change.

In the policy editor, the system displays how many comments a rule has. In the rule editor, use the Comments tab to view existing comments and add new ones.

Firepower Threat Defense High Availability and Scalability

• High Availability for Firepower Threat Defense, on page 727
• Clustering for the Firepower Threat Defense, on page 753
High Availability for Firepower Threat Defense

The following topics describe how to configure Active/Standby failover to accomplish high availability of the Cisco Firepower Threat Defense.

- About Firepower Threat Defense High Availability, on page 727
- Requirements and Prerequisites for High Availability, on page 741
- Guidelines for High Availability, on page 741
- Add a Firepower Threat Defense High Availability Pair, on page 742
- Configure Optional High Availability Parameters, on page 744
- Manage High Availability, on page 746
- Monitoring High Availability, on page 750

About Firepower Threat Defense High Availability

Configuring high availability, also called failover, requires two identical Firepower Threat Defense devices connected to each other through a dedicated failover link and, optionally, a state link. Firepower Threat Defense supports Active/Standby failover, where one unit is the active unit and passes traffic. The standby unit does not actively pass traffic, but synchronizes configuration and other state information from the active unit. When a failover occurs, the active unit fails over to the standby unit, which then becomes active.

The health of the active unit (hardware, interfaces, software, and environmental status) is monitored to determine if specific failover conditions are met. If those conditions are met, failover occurs.

Note
High availability is not supported on Firepower Threat Defense Virtual running in the public cloud.

High Availability System Requirements

This section describes the hardware, software, and license requirements for Firepower Threat Defense devices in a High Availability configuration.

Hardware Requirements

The two units in a High Availability configuration must:

- Be the same model. In addition, for container instances, they must use the same resource profile attributes.
For the Firepower 9300, High Availability is only supported between same-type modules; but the two chassis can include mixed modules. For example, each chassis has an SM-36 and SM-44. You can create High Availability pairs between the SM-36 modules and between the SM-44 modules.

If you change the resource profile after you add the High Availability pair to the FMC, update the inventory for each unit on the Devices > Device Management > Device > System > Inventory dialog box.

- Have the same number and types of interfaces.

For the Firepower 4100/9300 chassis, all interfaces must be preconfigured in FXOS identically before you enable High Availability. If you change the interfaces after you enable High Availability, make the interface changes in FXOS on the Standby unit, and then make the same changes on the Active unit.

If you are using units with different flash memory sizes in your High Availability configuration, make sure the unit with the smaller flash memory has enough space to accommodate the software image files and the configuration files. If it does not, configuration synchronization from the unit with the larger flash memory to the unit with the smaller flash memory will fail.

**Software Requirements**

The two units in a High Availability configuration must:

- Be in the same firewall mode (routed or transparent).
- Have the same software version.
- Be in the same domain or group on the Firepower Management Center.
- Have the same NTP configuration. See Configure NTP Time Synchronization for Threat Defense, on page 1148.
- Be fully deployed on the Firepower Management Center with no uncommitted changes.
- Not have DHCP or PPPoE configured in any of their interfaces.

- (Firepower 4100/9300) Have the same flow offload mode, either both enabled or both disabled.

**License Requirements for FTD Devices in a High Availability Pair**

Firepower Threat Defense devices in a high availability configuration must have the same licenses. High availability configurations require two Smart License entitlements; one for each device in the pair.

Before high availability is established, it does not matter which licenses are assigned to the secondary/standby device. During high availability configuration, the Firepower Management Center releases any unnecessary licenses assigned to the standby device and replaces them with identical licenses assigned to the primary/active device. For example, if the active device has a Base license and a Threat license, and the standby device has only a Base license, the Firepower Management Center communicates with the Cisco Smart Software Manager to obtain an available Threat license from your account for the standby device. If your Smart Licenses account does not include enough purchased entitlements, your account becomes Out-of-Compliance until you purchase the correct number of licenses.

In a virtual Firepower Management Center high availability configuration, each FTD to be registered requires an additional Firepower MCv Device license.
Failover and Stateful Failover Links

The failover link and the optional stateful failover link are dedicated connections between the two units. Cisco recommends to use the same interface between two devices in a failover link or a stateful failover link. For example, in a failover link, if you have used eth0 in device 1, use the same interface (eth0) in device 2 as well.

**Failover Link**

The two units in a failover pair constantly communicate over a failover link to determine the operating status of each unit.

**Failover Link Data**

The following information is communicated over the failover link:

- The unit state (active or standby)
- Hello messages (keep-alives)
- Network link status
- MAC address exchange
- Configuration replication and synchronization

**Interface for the Failover Link**

You can use an unused data interface (physical, redundant, or EtherChannel) as the failover link; however, you cannot specify an interface that is currently configured with a name. You also cannot use a subinterface with the exception of a subinterface defined on the Firepower 4100/9300 chassis for container instances. The failover link interface is not configured as a normal networking interface; it exists for failover communication only. This interface can only be used for the failover link (and also for the state link).

The FTD does not support sharing interfaces between user data and the failover link. You also cannot use separate subinterfaces on the same parent for the failover link and for data (Firepower 4100/9300 chassis subinterfaces only). If you use a Firepower 4100/9300 subinterface for the failover link, then all subinterfaces on that parent, and the parent itself, are restricted for use as failover links.

---

**Note**

When using an EtherChannel or Redundant Interface as the failover or state link, you must confirm that the same EtherChannel or Redundant interface with the same member interfaces exists on both devices before establishing high availability.

See the following guidelines for the failover link:

- Firepower 4100/9300—We recommend that you use a 10 GB data interface for the combined failover and state link.
- All other models—1 GB interface is large enough for a combined failover and state link.

For a redundant interface used as the failover link, see the following benefits for added redundancy:

- When a failover unit boots up, it alternates between the member interfaces to detect an active unit.
• If a failover unit stops receiving keepalive messages from its peer on one of the member interfaces, it switches to the other member interface.

For an EtherChannel used as the failover link, to prevent out-of-order packets, only one interface in the EtherChannel is used. If that interface fails, then the next interface in the EtherChannel is used. You cannot alter the EtherChannel configuration while it is in use as a failover link.

Connecting the Failover Link

Connect the failover link in one of the following two ways:

• Using a switch, with no other device on the same network segment (broadcast domain or VLAN) as the failover interfaces of the Firepower Threat Defense device.

• Using an Ethernet cable to connect the units directly, without the need for an external switch.

If you do not use a switch between the units, if the interface fails, the link is brought down on both peers. This condition may hamper troubleshooting efforts because you cannot easily determine which unit has the failed interface and caused the link to come down.

Stateful Failover Link

To use Stateful Failover, you must configure a Stateful Failover link (also known as the state link) to pass connection state information.

Shared with the Failover Link

Sharing a failover link is the best way to conserve interfaces. However, you must consider a dedicated interface for the state link and failover link, if you have a large configuration and a high traffic network.

Dedicated Interface for the Stateful Failover Link

You can use a dedicated data interface (physical, redundant, or EtherChannel) for the state link. See Interface for the Failover Link, on page 729 for requirements for a dedicated state link, and Connecting the Failover Link, on page 730 for information about connecting the state link as well.

For optimum performance when using long distance failover, the latency for the state link should be less than 10 milliseconds and no more than 250 milliseconds. If latency is more than 10 milliseconds, some performance degradation occurs due to retransmission of failover messages.

Avoiding Interrupted Failover and Data Links

We recommend that failover links and data interfaces travel through different paths to decrease the chance that all interfaces fail at the same time. If the failover link is down, the Firepower Threat Defense device can use the data interfaces to determine if a failover is required. Subsequently, the failover operation is suspended until the health of the failover link is restored.

See the following connection scenarios to design a resilient failover network.

Scenario 1—Not Recommended

If a single switch or a set of switches are used to connect both failover and data interfaces between two Firepower Threat Defense devices, then when a switch or inter-switch-link is down, both Firepower Threat Defense devices become active. Therefore, the two connection methods shown in the following figures are not recommended.
Scenario 2—Recommended

We recommend that failover links not use the same switch as the data interfaces. Instead, use a different switch or use a direct cable to connect the failover link, as shown in the following figures.

Scenario 3—Recommended

If the Firepower Threat Defense data interfaces are connected to more than one set of switches, then a failover link can be connected to one of the switches, preferably the switch on the secure (inside) side of network, as shown in the following figure.

Scenario 4—Recommended

The most reliable failover configurations use a redundant interface on the failover link, as shown in the following figures.
MAC Addresses and IP Addresses in High Availability

When you configure your interfaces, you can specify an active IP address and a standby IP address on the same network. Generally, when a failover occurs, the new active unit takes over the active IP addresses and MAC addresses. Because network devices see no change in the MAC to IP address pairing, no ARP entries change or time out anywhere on the network.

Although recommended, the standby address is not required. Without a standby IP address, the active unit cannot perform network tests to check the standby interface health; it can only track the link state. You also cannot connect to the standby unit on that interface for management purposes.

The IP address and MAC address for the state link do not change at failover.
**Active/Standby IP Addresses and MAC Addresses**

For Active/Standby High Availability, see the following for IP address and MAC address usage during a failover event:

1. The active unit always uses the primary unit's IP addresses and MAC addresses.

2. When the active unit fails over, the standby unit assumes the IP addresses and MAC addresses of the failed unit and begins passing traffic.

3. When the failed unit comes back online, it is now in a standby state and takes over the standby IP addresses and MAC addresses.

However, if the secondary unit boots without detecting the primary unit, then the secondary unit becomes the active unit and uses its own MAC addresses, because it does not know the primary unit MAC addresses. When the primary unit becomes available, the secondary (active) unit changes the MAC addresses to those of the primary unit, which can cause an interruption in your network traffic. Similarly, if you swap out the primary unit with new hardware, a new MAC address is used.

Virtual MAC addresses guard against this disruption, because the active MAC addresses are known to the secondary unit at startup, and remain the same in the case of new primary unit hardware. If you do not configure virtual MAC addresses, you might need to clear the ARP tables on connected routers to restore traffic flow. The Firepower Threat Defense device does not send gratuitous ARPs for static NAT addresses when the MAC address changes, so connected routers do not learn of the MAC address change for these addresses.

**Virtual MAC Addresses**

The Firepower Threat Defense device has multiple methods to configure virtual MAC addresses. We recommend using only one method. If you set the MAC address using multiple methods, the MAC address used depends on many variables, and might not be predictable.

For multi-instance capability, the FXOS chassis autogenerates only primary MAC addresses for all interfaces. You can overwrite the generated MAC address with a virtual MAC address with both the primary and secondary MAC addresses, but predefining the secondary MAC address is not essential; setting the secondary MAC address does ensure that to-the-box management traffic is not interrupted in the case of new secondary unit hardware.

**Stateful Failover**

During Stateful Failover, the active unit continually passes per-connection state information to the standby unit. After a failover occurs, the same connection information is available at the new active unit. Supported end-user applications are not required to reconnect to keep the same communication session.

**Supported Features**

For Stateful Failover, the following state information is passed to the standby Firepower Threat Defense device:

- NAT translation table.

- TCP and UDP connections and states, including HTTP connection states. Other types of IP protocols, and ICMP, are not parsed by the active unit, because they get established on the new active unit when a new packet arrives.

- Snort connection states, inspection results, and pin hole information, including strict TCP enforcement.
• The ARP table
• The Layer 2 bridge table (for bridge groups)
• The ISAKMP and IPsec SA table
• GTP PDP connection database
• SIP signaling sessions and pin holes.
• Static and dynamic routing tables—Stateful Failover participates in dynamic routing protocols, like OSPF and EIGRP, so routes that are learned through dynamic routing protocols on the active unit are maintained in a Routing Information Base (RIB) table on the standby unit. Upon a failover event, packets travel normally with minimal disruption to traffic because the active secondary unit initially has rules that mirror the primary unit. Immediately after failover, the re-convergence timer starts on the newly active unit. Then the epoch number for the RIB table increments. During re-convergence, OSPF and EIGRP routes become updated with a new epoch number. Once the timer is expired, stale route entries (determined by the epoch number) are removed from the table. The RIB then contains the newest routing protocol forwarding information on the newly active unit.

Note
Routes are synchronized only for link-up or link-down events on an active unit. If the link goes up or down on the standby unit, dynamic routes sent from the active unit may be lost. This is normal, expected behavior.

• DHCP Server—DHCP address leases are not replicated. However, a DHCP server configured on an interface will send a ping to make sure an address is not being used before granting the address to a DHCP client, so there is no impact to the service. State information is not relevant for DHCP relay or DDNS.

• Access control policy decisions—Decisions related to traffic matching (including URL, URL category, geolocation, and so forth), intrusion detection, malware, and file type are preserved during failover. However, for connections being evaluated at the moment of failover, there are the following caveats:
  • AVC—App-ID verdicts are replicated, but not detection states. Proper synchronization occurs as long as the App-ID verdicts are complete and synchronized before failover occurs.
  • Intrusion detection state—Upon failover, once mid-flow pickup occurs, new inspections are completed, but old states are lost.
  • File malware blocking—The file disposition must become available before failover.
  • File type detection and blocking—The file type must be identified before failover. If failover occurs while the original active device is identifying the file, the file type is not synchronized. Even if your file policy blocks that file type, the new active device downloads the file.

• User identity decisions from the identity policy, including the user-to-IP address mappings gathered passively through the User Agent and ISE Session Directory, and active authentication through captive portal. Users who are actively authenticating at the moment of failover might be prompted to authenticate again.

• Network AMP—Cloud lookups are independent from each device, so failover does not affect this feature in general. Specifically:
• Signature Lookup—If failover occurs in the middle of a file transmission, no file event is generated and no detection occurs.

• File Storage—If failover occurs when the file is being stored, it is stored on the original active device. If the original active device went down while the file was being stored, the file does not get stored.

• File Pre-classification (Local Analysis)—If failover occurs in the middle of pre-classification, detection fails.

• File Dynamic Analysis (Connectivity to the cloud)—If failover occurs, the system might submit the file to the cloud.

• Archive File Support—If failover occurs in the middle of an analysis, the system loses visibility into the file/archive.

• Custom Blocking—If failover occurs, no events are generated.

• Security Intelligence decisions. However, DNS-based decisions that are in process at the moment of failover are not completed.

• RA VPN—Remote access VPN end users do not have to reauthenticate or reconnect the VPN session after a failover. However, applications operating over the VPN connection could lose packets during the failover process and not recover from the packet loss.

Unsupported Features

For Stateful Failover, the following state information is not passed to the standby Firepower Threat Defense device:

• Sessions inside plaintext tunnels such as GRE or IP-in-IP. Sessions inside tunnels are not replicated and the new active node will not be able to reuse existing inspection verdicts to match the correct policy rules.

• Decrypted TLS/SSL connections—The decryption states are not synchronized, and if the active unit fails, then decrypted connections will be reset. New connections will need to be established to the new active unit. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.

• TCP state bypass connections

• Multicast routing.

Bridge Group Requirements for High Availability

There are special considerations for high availability when using bridge groups. When the active unit fails over to the standby unit, the switch port running Spanning Tree Protocol (STP) can go into a blocking state for 30 to 50 seconds when it senses the topology change. To avoid traffic loss on the bridge group member interfaces while the port is in a blocking state, you can configure one of the following workarounds:

• Switch port is in Access mode—Enable the STP PortFast feature on the switch:
interface interface_id
    spanning-tree portfast

The PortFast feature immediately transitions the port into STP forwarding mode upon linkup. The port still participates in STP. So if the port is to be a part of the loop, the port eventually transitions into STP blocking mode.

- If the switch port is in Trunk mode, or you cannot enable STP PortFast, then you can use one of the following less desirable workarounds that impacts failover functionality or STP stability:
  - Disable interface monitoring on the bridge group and member interfaces.
  - Increase the interface hold time in the failover criteria to a high value that will allow STP to converge before the unit fails over.
  - Decrease the STP timers on the switch to allow STP to converge faster than the interface hold time.

Failover Health Monitoring

The Firepower Threat Defense device monitors each unit for overall health and for interface health. This section includes information about how the Firepower Threat Defense device performs tests to determine the state of each unit.

Unit Health Monitoring

The Firepower Threat Defense device determines the health of the other unit by monitoring the failover link with hello messages. When a unit does not receive three consecutive hello messages on the failover link, the unit sends LANTEST messages on each data interface, including the failover link, to validate whether or not the peer is responsive. The action that the Firepower Threat Defense device takes depends on the response from the other unit. See the following possible actions:

- If the Firepower Threat Defense device receives a response on the failover link, then it does not fail over.
- If the Firepower Threat Defense device does not receive a response on the failover link, but it does receive a response on a data interface, then the unit does not failover. The failover link is marked as failed. You should restore the failover link as soon as possible because the unit cannot fail over to the standby while the failover link is down.
- If the Firepower Threat Defense device does not receive a response on any interface, then the standby unit switches to active mode and classifies the other unit as failed.

Interface Monitoring

When a unit does not receive hello messages on a monitored interface for 15 seconds, it runs interface tests. If one of the interface tests fails for an interface, but this same interface on the other unit continues to successfully pass traffic, then the interface is considered to be failed, and the device stops running tests.

If the threshold you define for the number of failed interfaces is met (see Devices > Device Management > High Availability > Failover Trigger Criteria), and the active unit has more failed interfaces than the standby unit, then a failover occurs. If an interface fails on both units, then both interfaces go into the “Unknown” state and do not count towards the failover limit defined by failover interface policy.
An interface becomes operational again if it receives any traffic. A failed device returns to standby mode if the interface failure threshold is no longer met.

If an interface has IPv4 and IPv6 addresses configured on it, the device uses the IPv4 addresses to perform the health monitoring. If an interface has only IPv6 addresses configured on it, then the device uses IPv6 neighbor discovery instead of ARP to perform the health monitoring tests. For the broadcast ping test, the device uses the IPv6 all nodes address (FE02::1).

**Interface Tests**

The Firepower Threat Defense device uses the following interface tests. The duration of each test is approximately 1.5 seconds.

1. **Link Up/Down test**—A test of the interface status. If the Link Up/Down test indicates that the interface is down, then the device considers it failed, and testing stops. If the status is Up, then the device performs the Network Activity test.

2. **Network Activity test**—A received network activity test. At the start of the test, each unit clears its received packet count for its interfaces. As soon as a unit receives any eligible packets during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, the device starts the ARP test.

3. **ARP test**—A test for successful ARP replies. Each unit sends a single ARP request for the IP address in the most recent entry in its ARP table. If the unit receives an ARP reply or other network traffic during the test, then the interface is considered operational. If the unit does not receive an ARP reply, then the device sends a single ARP request for the IP address in the next entry in the ARP table. If the unit receives an ARP reply or other network traffic during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic, and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then the device starts the Broadcast Ping test.

4. **Broadcast Ping test**—A test for successful ping replies. Each unit sends a broadcast ping, and then counts all received packets. If the unit receives any packets during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic, and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then testing starts over again with the ARP test. If both units continue to receive no traffic from the ARP and Broadcast Ping tests, then these tests will continue running in perpetuity.

**Interface Status**

Monitor interfaces can have the following status:

- **Unknown**—Initial status. This status can also mean the status cannot be determined.
- **Normal**—The interface is receiving traffic.
- **Normal (Waiting)**—The interface is up, but has not yet received a hello packet from the corresponding interface on the peer unit.
- **Normal (Not-Monitored)**—The interface is up, but is not monitored by the failover process.
- **Testing**—Hello messages are not heard on the interface for five poll times.
- **Link Down**—The interface or VLAN is administratively down.
• Link Down (Waiting)—The interface or VLAN is administratively down and has not yet received a hello packet from the corresponding interface on the peer unit.

• Link Down (Not-Monitored)—The interface or VLAN is administratively down, but is not monitored by the failover process.

• No Link—The physical link for the interface is down.

• No Link (Waiting)—The physical link for the interface is down and has not yet received a hello packet from the corresponding interface on the peer unit.

• No Link (Not-Monitored)—The physical link for the interface is down, but is not monitored by the failover process.

• Failed—No traffic is received on the interface, yet traffic is heard on the peer interface.

Failover Triggers and Detection Timing

The following events trigger failover in a Firepower high availability pair:

• More than 50% of the Snort instances on the active unit are down.

• Disk space on the active unit is more than 90% full.

• The no failover active command is run on the active unit or the failover active command is run on the standby unit.

• The active unit has more failed interfaces than the standby unit.

• Interface failure on the active device exceeds the threshold configured.

By default, failure of a single interface causes failover. You can change the default value by configuring a threshold for the number of interfaces or a percentage of monitored interfaces that must fail for the failover to occur. If the threshold breaches on the active device, failover occurs. If the threshold breaches on the standby device, the unit moves to Fail state.

To change the default failover criteria, enter the following command in global configuration mode:

```
Table 78:
<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>failover interface-policy num [%]</td>
<td>Changes the default failover criteria. When specifying a specific number of interfaces, the num argument can be from 1 to 250. When specifying a percentage of interfaces, the num argument can be from 1 to 100.</td>
</tr>
</tbody>
</table>
```

The following table shows the failover triggering events and associated failure detection timing. If failover occurs, you can view the reason for the failover in the Message Center, along with various operations pertaining to the high availability pair. You can configure these thresholds to a value within the specified minimum-maximum range.
About Active/Standby Failover

Active/Standby failover lets you use a standby Firepower Threat Defense device to take over the functionality of a failed unit. When the active unit fails, the standby unit becomes the active unit.

Primary/Secondary Roles and Active/Standby Status

When setting up Active/Standby failover, you configure one unit to be primary and the other to be secondary. During configuration, the primary unit's policies are synchronized to the secondary unit. At this point, the two units act as a single device for device and policy configuration. However, for events, dashboards, reports and health monitoring, they continue to display as separate devices.

The main differences between the two units in a failover pair are related to which unit is active and which unit is standby, namely which IP addresses to use and which unit actively passes traffic.

However, a few differences exist between the units based on which unit is primary (as specified in the configuration) and which unit is secondary:

- The primary unit always becomes the active unit if both units start up at the same time (and are of equal operational health).
- The primary unit MAC addresses are always coupled with the active IP addresses. The exception to this rule occurs when the secondary unit becomes active and cannot obtain the primary unit MAC addresses over the failover link. In this case, the secondary unit MAC addresses are used.

Active Unit Determination at Startup

The active unit is determined by the following:

- If a unit boots and detects a peer already running as active, it becomes the standby unit.
- If a unit boots and does not detect a peer, it becomes the active unit.

Table 79: Firepower Threat Defense Failover Times

<table>
<thead>
<tr>
<th>Failover Triggering Event</th>
<th>Minimum</th>
<th>Default</th>
<th>Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active unit loses power, hardware goes down, or the software</td>
<td>800 milliseconds</td>
<td>15 seconds</td>
<td>45 seconds</td>
</tr>
<tr>
<td>reloads or crashes. When any of these occur, the monitored</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>interfaces or failover link do not receive any hello message.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Active unit interface physical link down.</td>
<td>500 milliseconds</td>
<td>5 seconds</td>
<td>15 seconds</td>
</tr>
<tr>
<td>Active unit interface up, but connection problem causes</td>
<td>5 seconds</td>
<td>25 seconds</td>
<td>75 seconds</td>
</tr>
<tr>
<td>interface testing.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
• If both units boot simultaneously, then the primary unit becomes the active unit, and the secondary unit becomes the standby unit.

## Failover Events

In Active/Standby failover, failover occurs on a unit basis.

The following table shows the failover action for each failure event. For each failure event, the table shows the failover policy (failover or no failover), the action taken by the active unit, the action taken by the standby unit, and any special notes about the failover condition and actions.

### Table 80: Failover Events

<table>
<thead>
<tr>
<th>Failure Event</th>
<th>Policy</th>
<th>Active Unit Action</th>
<th>Standby Unit Action</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active unit failed (power or hardware)</td>
<td>Failover</td>
<td>n/a</td>
<td>Become active</td>
<td>No hello messages are received on any monitored interface or the failover link.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Mark active as failed</td>
<td></td>
</tr>
<tr>
<td>Formerly active unit recovers</td>
<td>No failover</td>
<td>Become standby</td>
<td>No action</td>
<td>None.</td>
</tr>
<tr>
<td>Standby unit failed (power or hardware)</td>
<td>No failover</td>
<td>Mark standby as failed</td>
<td>n/a</td>
<td>When the standby unit is marked as failed, then the active unit does not attempt to fail over, even if the interface failure threshold is surpassed.</td>
</tr>
<tr>
<td>Failover link failed during operation</td>
<td>No failover</td>
<td>Mark failover link as failed</td>
<td>Mark failover link as failed</td>
<td>You should restore the failover link as soon as possible because the unit cannot fail over to the standby unit while the failover link is down.</td>
</tr>
<tr>
<td>Failover link failed at startup</td>
<td>No failover</td>
<td>Become active</td>
<td>Become active</td>
<td>If the failover link is down at startup, both units become active.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Mark failover link as failed</td>
<td>Mark failover link as failed</td>
<td></td>
</tr>
<tr>
<td>State link failed</td>
<td>No failover</td>
<td>No action</td>
<td>No action</td>
<td>State information becomes out of date, and sessions are terminated if a failover occurs.</td>
</tr>
<tr>
<td>Interface failure on active unit above threshold</td>
<td>Failover</td>
<td>Mark active as failed</td>
<td>Become active</td>
<td>None.</td>
</tr>
</tbody>
</table>

If the failover link is down at startup, both units become active.
## Requirements and Prerequisites for High Availability

### Model Support
- FTD

### Supported Domains
- Any

### User Roles
- Admin
- Network Admin

## Guidelines for High Availability

### Model Support
- Firepower 9300—Intra-chassis High Availability is not supported.
- The Firepower Threat Defense Virtual on public cloud networks such as Microsoft Azure and Amazon Web Services are not supported with High Availability because Layer 2 connectivity is required.

### Additional Guidelines
- When the active unit fails over to the standby unit, the connected switch port running Spanning Tree Protocol (STP) can go into a blocking state for 30 to 50 seconds when it senses the topology change. To avoid traffic loss while the port is in a blocking state, you can enable the STP PortFast feature on the switch:

  ```
  interface interface_id spanning-tree portfast
  ```

  This workaround applies to switches connected to both routed mode and bridge group interfaces. The PortFast feature immediately transitions the port into STP forwarding mode upon linkup. The port still participates in STP. So if the port is to be a part of the loop, the port eventually transitions into STP blocking mode.
• Configuring port security on the switches connected to the Firepower Threat Defense failover pair can cause communication problems when a failover event occurs. This problem occurs when a secure MAC address configured or learned on one secure port moves to another secure port, a violation is flagged by the switch port security feature.

• For Active/Standby High Availability and a VPN IPsec tunnel, you cannot monitor both the active and standby units using SNMP over the VPN tunnel. The standby unit does not have an active VPN tunnel, and will drop traffic destined for the NMS. You can instead use SNMPv3 with encryption so the IPsec tunnel is not required.

• Immediately after failover, the source address of syslog messages will be the failover interface address for a few seconds.

Add a Firepower Threat Defense High Availability Pair

When establishing an Active/Standby High Availability pair, you designate one of the devices as primary and the other as secondary. The system applies a merged configuration to the paired devices. If there is a conflict, the system applies the configuration from the device you designated as primary.

In a multidomain deployment, devices in a high availability pair must belong to the same domain.

Note
The system uses the failover link to sync configuration, while the stateful failover link is used to sync application content between peers. The failover link and the stateful failover link are in a private IP space and are only used for communication between peers in a high availability pair. After high availability is established, selected interface links and encryption settings cannot be modified without breaking the high availability pair and reconfiguring it.

Caution
Creating or breaking a Firepower Threat Defense high availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 for more information. The system warns you that continuing to create a high availability pair restarts the Snort process on the primary and secondary devices and allows you to cancel.

Before you begin
Confirm that both devices:

• Are the same model.

• Have the same number and type of interfaces.

• Are in the same domain and group.

• Have normal health status and are running the same software.

• Are either in routed or transparent mode.
• Have the same NTP configuration. See Configure NTP Time Synchronization for Threat Defense, on page 1148.
• Are fully deployed with no uncommitted changes.
• Do not have DHCP or PPPoE configured in any of their interfaces.

**Note** The High Availability formation is possible between the two Firepower Threat Defense devices when the certificate available on the primary device is not present on the secondary device. When High Availability is formed, the certificate will be synched on the secondary device.

**Step 1** Add both devices to the Firepower Management Center according to Add a Device to the FMC, on page 252.

**Step 2** Choose Devices > Device Management.

**Step 3** From the Add drop-down menu, choose High Availability.

**Step 4** Enter a display Name for the high availability pair.

**Step 5** Under Device Type, choose Firepower Threat Defense.

**Step 6** Choose the Primary Peer device for the high availability pair.

**Step 7** Choose the Secondary Peer device for the high availability pair.

**Step 8** Click Continue.

**Step 9** Under LAN Failover Link, choose an Interface with enough bandwidth to reserve for failover communications.

**Note** Only interfaces that do not have a logical name and do not belong to a security zone, will be listed in the Interface drop-down in the Add High Availability Pair dialog.

**Step 10** Type any identifying Logical Name.

**Step 11** Type a Primary IP address for the failover link on the active unit. This address should be on an unused subnet.

**Note** 169.254.0.0/16 and fd00:0:0:*::/64 are internally used subnets and cannot be used for the failover or state links.

**Step 12** Optionally, choose Use IPv6 Address.

**Step 13** Type a Secondary IP address for the failover link on the standby unit. This IP address must be in the same subnet as the primary IP address.

**Step 14** If IPv4 addresses are used, type a Subnet Mask that applies to both the primary and secondary IP addresses.

**Step 15** Optionally, under Stateful Failover Link, choose the same Interface, or choose a different interface and enter the high availability configuration information.

**Note** 169.254.0.0/16 and fd00:0:0:*::/64 are internally used subnets and cannot be used for the failover or state links.

**Step 16** Optionally, choose Enabled and choose the Key Generation method for IPsec Encryption between the failover links.

**Step 17** Click OK. This process takes a few minutes as the process synchronizes system data.
What to do next

Ensure to back up the devices. You can use the backup to quickly replace the devices when they fail and to restore the high availability service without being delinked from the Firepower Management Center. For more information, see Backup and Restore, on page 165.

Configure Optional High Availability Parameters

You can view the initial High Availability Configuration on the Firepower Management Center. You cannot edit these settings without breaking the high availability pair and then re-establishing it.

You can edit the Failover Trigger Criteria to improve failover results. Interface Monitoring allows you to determine which interfaces are better suited for failover.

Configure Standby IP Addresses and Interface Monitoring

For each interface, set a standby IP address. Although recommended, the standby address is not required. Without a standby IP address, the active unit cannot perform network tests to check the standby interface health; it can only track the link state.

By default, monitoring is enabled on all physical interfaces with logical names configured. You might want to exclude interfaces attached to less critical networks from affecting your failover policy.

Step 1 Choose Devices > Device Management.

Step 2 Next to the device high-availability pair you want to edit, click the Edit ( ).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click the High Availability tab.

Step 4 In the Monitored Interfaces area, click the Edit ( ) next to the interface you want to edit.

Step 5 Check the Monitor this interface for failures check box.

Step 6 On the IPv4 tab, enter the Standby IP Address.

This address must be a free address on the same network as the active IP address.

Step 7 If you configured the IPv6 address manually, on the IPv6 tab, click the Edit ( ) next to the active IP address, enter the Standby IP Address, and click OK.

This address must be a free address on the same network as the active IP address. For autogenerated and Enforce EUI 64 addresses, the standby address is automatically generated.

Step 8 Click OK.

Edit High Availability Failover Criteria

You can customize failover criteria based on your network deployment.
Step 1 Choose Devices > Device Management.
Step 2 Next to the device high-availability pair you want to edit, click the Edit ( ).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Step 3 Choose High Availability.
Step 4 Next to Failover Trigger Criteria, click the Edit ( ).
Step 5 Under Interface Failure Threshold, choose the number or percentage of interfaces that must fail before the device fails over.
Step 6 Under Hello packet Intervals, choose how often hello packets are sent over the failover link.
Note If you use remote access VPN on the Firepower 2100, use the default hello packet intervals. Otherwise, you might see high CPU usage that can cause a failover to occur.
Step 7 Click OK.

Configure Virtual MAC addresses

You can configure active and standby MAC addresses for failover in two places on the Firepower Management Center:

- The Advanced tab of the Edit Interface page during interface configuration; see Configure the MAC Address, on page 689.
- The Add Interface MAC Address page accessed from the High Availability page; see

If active and standby MAC addresses are configured in both locations, the addresses defined during interface configuration takes preference for failover.

You can minimize loss of traffic during failover by designating active and standby mac addresses to the physical interface. This feature offers redundancy against IP address mapping for failover.

Step 1 Choose Devices > Device Management.
Step 2 Next to the device high-availability pair you want to edit, click Edit ( ).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Step 3 Choose High Availability.
Step 4 Choose Add ( ) next to Interface Mac Addresses.
Step 5 Choose a Physical Interface.
Step 6 Type an Active Interface Mac Address.
Step 7 Type a Standby Interface Mac Address.
Step 8 Click OK.
Manage High Availability

This section describes how to manage High Availability units after you enable High Availability, including how to change the High Availability setup and how to force failover from one unit to another.

Switch the Active Peer in a Firepower Threat Defense High Availability Pair

After you establish a Firepower Threat Defense high availability pair, you can manually switch the active and standby units, effectively forcing failover for reasons such as persistent fault or health events on the current active unit. Both units should be fully deployed before you complete this procedure.

Before you begin

Refresh Node Status in a Firepower Threat Defense High Availability Pair, on page 746. This ensures that the status on the Firepower Threat Defense high availability device pair is in sync with the status on the Firepower Management Center.

Step 1
Choose Devices > Device Management.

Step 2
Next to the high availability pair where you want to change the active peer, click the Switch Active Peer.

Step 3
You can:

• Click Yes to immediately make the standby device the active device in the high availability pair.
• Click No to cancel and return to the Device Management page.

Refresh Node Status in a Firepower Threat Defense High Availability Pair

Whenever active or standby devices in a Firepower Threat Defense high availability pair are rebooted, the Firepower Management Center may not display accurate high availability status for either device. This is because when the device reboots, the high availability status is immediately updated on the device and its corresponding event is sent to the FMC. However, the status may not be updated on the FMC because the communication between the device and the FMC is yet to be established.

Communication failures or weak communication channels between the FMC and devices may result in out of sync data. When you switch the active and standby devices in a high availability pair, the change may not be reflected in the FMC even after a significant time duration.

In these scenarios, you can refresh the high availability node status to obtain accurate information about the active and standby device in a high availability pair.

Step 1
Choose Devices > Device Management.

Step 2
Next to the high availability pair where you want to refresh the node status, click the Refresh HA Node Status.

Step 3
Click Yes to refresh the node status.
Suspend and Resume High Availability

You can suspend a unit in a high availability pair. This is useful when:

- Both units are in an active-active situation and fixing the communication on the failover link does not correct the problem.
- You want to troubleshoot an active or standby unit and do not want the units to fail over during that time.

When you suspend high availability, you stop the pair of devices from behaving as a failover unit. The currently active device remains active, handling all user connections. However, failover criteria are no longer monitored, and the system will never fail over to the now pseudo-standby device. The standby device will retain its configuration, but it will remain inactive.

The key difference between suspending HA and breaking HA is that on a suspended HA device, the high availability configuration is retained. When you break HA, the configuration is erased. Thus, you have the option to resume HA on a suspended system, which enables the existing configuration and makes the two devices function as a failover pair again.

To suspend HA, use the `configure high-availability suspend` command.

```
> configure high-availability suspend
Please ensure that no deployment operation is in progress before suspending high-availability.
Please enter 'YES' to continue if there is no deployment operation in progress and 'NO' if you wish to abort: YES
Successfully suspended high-availability.
```

If you suspend high availability from the active unit, the configuration is suspended on both the active and standby unit. If you suspend it from the standby unit, it is suspended on the standby unit only, but the active unit will not attempt to fail over to a suspended unit.

To resume failover, use the `configure high-availability resume` command.

```
> configure high-availability resume
Successfully resumed high-availability.
```

You can resume a unit only if it is in Suspended state. The unit will negotiate active/standby status with the peer unit.

---

**Note**

Suspending high availability is a temporary state. If you reload a unit, it resumes the high-availability configuration automatically and negotiates the active/standby state with the peer.

---

Replace a Unit in an FTD High Availability Pair

To replace a failed unit in a Firepower Threat Defense high availability pair using a backup file, see Restoring Firepower Appliances, on page 178.
If you do not have a backup of the failed device, you must break high availability. Then, register the replacement device to the Firepower Management Center and reestablish high availability. The process varies depending on whether the device is primary or secondary:

- Replace a Primary FTD HA Unit with no Backup, on page 748
- Replace a Secondary FTD HA Unit with no Backup, on page 748

Replace a Primary FTD HA Unit with no Backup

Follow the steps below to replace a failed primary unit in a Firepower Threat Defense high availability pair. Failing to follow these steps can overwrite the existing high availability configuration.

Caution
Creating or breaking a Firepower Threat Defense high availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 for more information. The system warns you that continuing to create a high availability pair restarts the Snort process on the primary and secondary devices and allows you to cancel.

Step 1
Choose Force Break to separate the high availability pair; see Separate Units in a High Availability Pair, on page 749.

Note
The break operation removes all the configuration related to HA from Firepower Threat Defense and Firepower Management Center, and you need to recreate it manually later. To successfully configure the same HA pair, ensure that you save the IPs, MAC addresses, and monitoring configuration of all the interfaces/subinterfaces prior to executing the HA break operation.

Step 2
Unregister the failed primary Firepower Threat Defense device from the Firepower Management Center; see Delete a Device from the FMC, on page 255.

Step 3
Register the replacement Firepower Threat Defense to the Firepower Management Center; see Add a Device to the FMC, on page 252.

Step 4
Configure high availability, using the existing secondary/active unit as the primary device and the replacement device as the secondary/standby device during registration; see Add a Firepower Threat Defense High Availability Pair, on page 742.

Replace a Secondary FTD HA Unit with no Backup

Follow the steps below to replace a failed secondary unit in a Firepower Threat Defense high availability pair.

Caution
Creating or breaking a Firepower Threat Defense high availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See Snort® Restart Traffic Behavior, on page 386 for more information. The system warns you that continuing to create a high availability pair restarts the Snort process on the primary and secondary devices and allows you to cancel.
Step 1 Choose **Force Break** to separate the high availability pair; see *Separate Units in a High Availability Pair*, on page 749.

**Note** The break operation removes all the configuration related to HA from Firepower Threat Defense and Firepower Management Center, and you need to recreate it manually later. To successfully configure the same HA pair, ensure that you save the IPs, MAC addresses, and monitoring configuration of all the interfaces/subinterfaces prior to executing the HA break operation.

Step 2 Unregister the secondary Firepower Threat Defense device from the Firepower Management Center; see *Delete a Device from the FMC*, on page 255.

Step 3 Register the replacement Firepower Threat Defense to the Firepower Management Center; see *Add a Device to the FMC*, on page 252.

Step 4 Configure high availability, using the existing primary/active unit as the primary device and the replacement device as the secondary/standby device during registration; see *Add a Firepower Threat Defense High Availability Pair*, on page 742.

---

**Separate Units in a High Availability Pair**

When you break a high availability pair, the active device retains full deployed functionality. The standby device loses its failover and interface configurations, and becomes a standalone device.

Policies that were not deployed to the active device prior to the break operation continue to remain un-deployed after the break operation is complete. Deploy the policies on the standalone device, after the break operation is complete.

**Tip** An exception to this is the FlexConfig policy. A FlexConfig policy deployed on the active device may show a deployment failure after the break HA operation. You must alter and re-deploy the FlexConfig policy on the active device.

**Note** If you cannot reach the high availability pair using the Firepower Management Center, use the CLI command `configure high-availability disable` to remove the failover configuration from both devices.

**Before you begin**

*Refresh Node Status in a Firepower Threat Defense High Availability Pair*, on page 746. This ensures that the status on the Firepower Threat Defense high availability device pair is in sync with the status on the Firepower Management Center.

---

**Step 1** Choose **Devices > Device Management.**

**Step 2** Next to the high-availability pair you want to break, click the **Break HA.**

**Step 3** Optionally, check the check box to force break, if the standby peer does not respond.

**Step 4** Click **Yes.** The device high-availability pair is separated.
The Break operation removes the failover configuration from the active and standby devices.

What to do next
(Optional) If you are using a flex-config policy on the active device, alter and re-deploy the flex-config policy to eliminate deployment errors.

Unregister a High Availability Pair

You can delete the pair from the Firepower Management Center and disable High Availability on each unit using the CLI.

Before you begin
This procedure requires CLI access.

Step 1  Choose Devices > Device Management.
Step 2  Next to the high-availability pair you want to unregister, click Delete (Trash Can).
Step 3  Click Yes. The device high availability pair is deleted.
Step 4  On each unit, access the Firepower Threat Defense CLI, and enter the following command:

configure high-availability disable

If you do not enter this command, you cannot re-register the units and form a new HA pair.

Note  Enter this command before you change the firewall mode; if you change the mode, the unit will not later let you enter the configure high-availability disable command, and the Firepower Management Center cannot re-form the HA pair without this command.

Monitoring High Availability

This section lets you monitor the High Availability status.

View Failover History

You can view the failover history of both high availability devices in a single view. The history displays in chronological order and includes the reason for any failover.

Step 1  Choose Devices > Device Management.
Step 2  Next to the device high-availability pair you want to edit, click Edit (Pencil).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Step 3 Choose Summary.
Step 4 Under General, click View ( análitätäri).

**View Stateful Failover Statistics**

You can view the stateful failover link statistics of both the primary and secondary devices in the high availability pair.

---

Step 1 Choose Devices > Device Management.
Step 2 Next to the device high-availability pair you want to edit, click Edit ( análätäri).
   In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
Step 3 Choose High Availability.
Step 4 Under Stateful Failover Link, click View ( análätäri).
Step 5 Choose a device to view statistics.
View Stateful Failover Statistics
Clustering lets you group multiple FTD units together as a single logical device. Clustering is only supported for the FTD device on the Firepower 9300 and the Firepower 4100 series. A cluster provides all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices.

Some features are not supported when using clustering. See Unsupported Features with Clustering, on page 781.

- About Clustering on the Firepower 4100/9300 Chassis, on page 753
- Licenses for Clustering, on page 757
- Requirements and Prerequisites for Clustering, on page 758
- Clustering Guidelines and Limitations, on page 759
- Configure Clustering, on page 762
- FXOS: Remove a Cluster Unit, on page 775
- FMC: Manage Cluster Members, on page 776
- FMC: Monitoring the Cluster, on page 780
- Reference for Clustering, on page 780
- History for Clustering, on page 791

About Clustering on the Firepower 4100/9300 Chassis

The cluster consists of multiple devices acting as a single logical unit. When you deploy a cluster on the Firepower 4100/9300 chassis, it does the following:

- Creates a cluster-control link (by default, port-channel 48) for unit-to-unit communication.
  For intra-chassis clustering (Firepower 9300 only), this link utilizes the Firepower 9300 backplane for cluster communications.
  For inter-chassis clustering, you need to manually assign physical interface(s) to this EtherChannel for communications between chassis.
- Creates the cluster bootstrap configuration within the application.
  When you deploy the cluster, the chassis supervisor pushes a minimal bootstrap configuration to each unit that includes the cluster name, cluster control link interface, and other cluster settings.
• Assigns data interfaces to the cluster as *Spanned* interfaces.

For intra-chassis clustering, spanned interfaces are not limited to EtherChannels, like it is for inter-chassis clustering. The Firepower 9300 supervisor uses EtherChannel technology internally to load-balance traffic to multiple modules on a shared interface, so any data interface type works for Spanned mode. For inter-chassis clustering, you must use Spanned EtherChannels for all data interfaces.

**Note**

Individual interfaces are not supported, with the exception of a management interface.

• Assigns a management interface to all units in the cluster.

The following sections provide more detail about clustering concepts and implementation. See also Reference for Clustering, on page 780.

**Bootstrap Configuration**

When you deploy the cluster, the Firepower 4100/9300 chassis supervisor pushes a minimal bootstrap configuration to each unit that includes the cluster name, cluster control link interface, and other cluster settings.

**Cluster Members**

Cluster members work together to accomplish the sharing of the security policy and traffic flows.

One member of the cluster is the *control* unit. The control unit is determined automatically. All other members are *data* units.

You must perform all configuration on the control unit only; the configuration is then replicated to the data units.

Some features do not scale in a cluster, and the control unit handles all traffic for those features. See Centralized Features for Clustering, on page 781.

**Cluster Control Link**

The cluster control link is automatically created using the Port-channel 48 interface.

For intra-chassis clustering, this interface has no member interfaces. This Cluster type EtherChannel utilizes the Firepower 9300 backplane for cluster communications for intra-chassis clustering. For inter-chassis clustering, you must add one or more interfaces to the EtherChannel.

For a 2-member inter-chassis cluster, do not directly connect the cluster control link from one chassis to the other chassis. If you directly connect the interfaces, then when one unit fails, the cluster control link fails, and thus the remaining healthy unit fails. If you connect the cluster control link through a switch, then the cluster control link remains up for the healthy unit.

Cluster control link traffic includes both control and data traffic.
Size the Cluster Control Link for Inter-Chassis Clustering

If possible, you should size the cluster control link to match the expected throughput of each chassis so the cluster-control link can handle the worst-case scenarios.

Cluster control link traffic is comprised mainly of state update and forwarded packets. The amount of traffic at any given time on the cluster control link varies. The amount of forwarded traffic depends on the load-balancing efficacy or whether there is a lot of traffic for centralized features. For example:

- NAT results in poor load balancing of connections, and the need to rebalance all returning traffic to the correct units.
- When membership changes, the cluster needs to rebalance a large number of connections, thus temporarily using a large amount of cluster control link bandwidth.

A higher-bandwidth cluster control link helps the cluster to converge faster when there are membership changes and prevents throughput bottlenecks.

Note

If your cluster has large amounts of asymmetric (rebalanced) traffic, then you should increase the cluster control link size.

Cluster Control Link Redundancy for Inter-Chassis Clustering

The following diagram shows how to use an EtherChannel as a cluster control link in a Virtual Switching System (VSS) or Virtual Port Channel (vPC) environment. All links in the EtherChannel are active. When the switch is part of a VSS or vPC, then you can connect Firepower 9300 chassis interfaces within the same EtherChannel to separate switches in the VSS or vPC. The switch interfaces are members of the same EtherChannel port-channel interface, because the separate switches act like a single switch. Note that this EtherChannel is device-local, not a Spanned EtherChannel.
Cluster Control Link Reliability for Inter-Chassis Clustering

To ensure cluster control link functionality, be sure the round-trip time (RTT) between units is less than 20 ms. This maximum latency enhances compatibility with cluster members installed at different geographical sites. To check your latency, perform a ping on the cluster control link between units.

The cluster control link must be reliable, with no out-of-order or dropped packets; for example, for inter-site deployment, you should use a dedicated link.

Cluster Control Link Network

The Firepower 4100/9300 chassis auto-generates the cluster control link interface IP address for each unit based on the chassis ID and slot ID: 127.2.chassis_id.slot_id. The cluster control link network cannot include any routers between units; only Layer 2 switching is allowed.

Management Network

We recommend connecting all units to a single management network. This network is separate from the cluster control link.

Management Interface

You must assign a Management type interface to the cluster. This interface is a special individual interface as opposed to a Spanned interface. The management interface lets you connect directly to each unit. This Management logical interface is separate from the other interfaces on the device. It is used to set up and register the device to the Firepower Management Center. It uses its own local authentication, IP address, and static routing. Each cluster member uses a separate IP address on the management network that you set as part of the bootstrap configuration.

The management interface is shared between the Management logical interface and the Diagnostic logical interface. The Diagnostic interface is optional and is not configured as part of the bootstrap configuration. The Diagnostic interface can be configured along with the rest of the data interfaces. If you choose to configure the Diagnostic interface, configure a Main cluster IP address as a fixed address for the cluster that always belongs to the current control unit. You also configure a range of addresses so that each unit, including the current control unit, can use a Local address from the range. The Main cluster IP address provides consistent diagnostic access to an address; when a control unit changes, the Main cluster IP address moves to the new control unit, so access to the cluster continues seamlessly. For outbound management traffic such as TFTP or syslog, each unit, including the control unit, uses the Local IP address to connect to the server.

Cluster Interfaces

For intra-chassis clustering, you can assign both physical interfaces or EtherChannels (also known as port channels) to the cluster. Interfaces assigned to the cluster are Spanned interfaces that load-balance traffic across all members of the cluster.

For inter-chassis clustering, you can only assign data EtherChannels to the cluster. These Spanned EtherChannels include the same member interfaces on each chassis; on the upstream switch, all of these interfaces are included in a single EtherChannel, so the switch does not know that it is connected to multiple devices.

Individual interfaces are not supported, with the exception of a management interface.
Spanned EtherChannels

You can group one or more interfaces per chassis into an EtherChannel that spans all chassis in the cluster. The EtherChannel aggregates the traffic across all the available active interfaces in the channel. A Spanned EtherChannel can be configured in both routed and transparent firewall modes. In routed mode, the EtherChannel is configured as a routed interface with a single IP address. In transparent mode, the IP address is assigned to the BVI, not to the bridge group member interface. The EtherChannel inherently provides load balancing as part of basic operation.

Connecting to a VSS or vPC

We recommend connecting EtherChannels to a VSS or vPC to provide redundancy for your interfaces.

Configuration Replication

All units in the cluster share a single configuration. You can only make configuration changes on the control unit, and changes are automatically synced to all other units in the cluster.

Licenses for Clustering

The FTD uses Smart Licensing. You assign licenses to the cluster as a whole, not to individual units. However, each unit of the cluster consumes a separate license for each feature. The clustering feature itself does not require any licenses.
When you add a cluster member to the FMC, you can specify the feature licenses you want to use for the cluster. You can modify licenses for the cluster in the Devices > Device Management > Cluster > License area.

**Note**
If you add the cluster before the FMC is licensed (and running in Evaluation mode), then when you license the FMC, you can experience traffic disruption when you deploy policy changes to the cluster. Changing to licensed mode causes all data units to leave the cluster and then rejoin.

## Requirements and Prerequisites for Clustering

### Cluster Model Support

The FTD supports clustering on the following models:

- **Firepower 9300**—You can include up to 6 units in the cluster. For example, you can use 1 module in 6 chassis, or 2 modules in 3 chassis, or any combination that provides a maximum of 6 modules. Supports intra-chassis and inter-chassis clustering.

- **Firepower 4100 series**—Supported for up to 6 units using inter-chassis clustering.

### User Roles

- Admin
- Access Admin
- Network Admin

### Inter-Chassis Clustering Hardware and Software Requirements

All chassis in a cluster:

- For the Firepower 4100 series: All chassis must be the same model. For the Firepower 9300: All security modules must be the same type. For example, if you use clustering, all modules in the Firepower 9300 must be SM-40s. You can have different quantities of installed security modules in each chassis, although all modules present in the chassis must belong to the cluster including any empty slots.

- Must run the identical FXOS software except at the time of an image upgrade.

- Must include the same interface configuration for interfaces you assign to the cluster, such as the same Management interface, EtherChannels, active interfaces, speed and duplex, and so on. You can use different network module types on the chassis as long as the capacity matches for the same interface IDs and interfaces can successfully bundle in the same spanned EtherChannel. Note that all data interfaces must be EtherChannels in inter-chassis clustering. If you change the interfaces in FXOS after you enable clustering (by adding or removing interface modules, or configuring EtherChannels, for example), then perform the same changes on each chassis, starting with the data units, and ending with the control unit.

- Must use the same NTP server. For Firepower Threat Defense, the Firepower Management Center must also use the same NTP server. Do not set the time manually.
Switch Requirements for Inter-Chassis Clustering

- Be sure to complete the switch configuration and successfully connect all the EtherChannels from the chassis to the switch(es) before you configure clustering on the Firepower 4100/9300 chassis.
- For supported switch characteristics, see Cisco FXOS Compatibility.

Clustering Guidelines and Limitations

Switches for Inter-Chassis Clustering

- Make sure connected switches match the MTU for both cluster data interfaces and the cluster control link interface. You should configure the cluster control link interface MTU to be at least 100 bytes higher than the data interface MTU, so make sure to configure the cluster control link connecting switch appropriately. Because the cluster control link traffic includes data packet forwarding, the cluster control link needs to accommodate the entire size of a data packet plus cluster traffic overhead.
- For Cisco IOS XR systems, if you want to set a non-default MTU, set the IOS interface MTU to be 14 bytes higher than the cluster device MTU. Otherwise, OSPF adjacency peering attempts may fail unless the mtu-ignore option is used. Note that the cluster device MTU should match the IOS IPv4 MTU. This adjustment is not required for Cisco Catalyst and Cisco Nexus switches.
- On the switch(es) for the cluster control link interfaces, you can optionally enable Spanning Tree PortFast on the switch ports connected to the cluster unit to speed up the join process for new units.
- On the switch, we recommend that you use one of the following EtherChannel load-balancing algorithms: source-dest-ip or source-dest-ip-port (see the Cisco Nexus OS and Cisco IOS port-channel load-balance command). Do not use a vlan keyword in the load-balance algorithm because it can cause unevenly distributed traffic to the devices in a cluster.
- If you change the load-balancing algorithm of the EtherChannel on the switch, the EtherChannel interface on the switch temporarily stops forwarding traffic, and the Spanning Tree Protocol restarts. There will be a delay before traffic starts flowing again.
- Some switches do not support dynamic port priority with LACP (active and standby links). You can disable dynamic port priority to provide better compatibility with Spanned EtherChannels.
- Switches on the cluster control link path should not verify the L4 checksum. Redirected traffic over the cluster control link does not have a correct L4 checksum. Switches that verify the L4 checksum could cause traffic to be dropped.
- Port-channel bundling downtime should not exceed the configured keepalive interval.
- On Supervisor 2T EtherChannels, the default hash distribution algorithm is adaptive. To avoid asymmetric traffic in a VSS design, change the hash algorithm on the port-channel connected to the cluster device to fixed:

  router(config)# port-channel <id> hash-distribution fixed

  Do not change the algorithm globally; you may want to take advantage of the adaptive algorithm for the VSS peer link.
- Firepower 4100/9300 clusters support LACP graceful convergence. So you can leave LACP graceful convergence enabled on connected Cisco Nexus switches.
• When you see slow bundling of a Spanned EtherChannel on the switch, you can enable LACP rate fast for an individual interface on the switch. FXOS EtherChannels have the LACP rate set to fast by default. Note that some switches, such as the Nexus series, do not support LACP rate fast when performing in-service software upgrades (ISSUs), so we do not recommend using ISSUs with clustering.

EtherChannels for Inter-Chassis Clustering

• In Catalyst 3750-X Cisco IOS software versions earlier than 15.1(1)S2, the cluster unit did not support connecting an EtherChannel to a switch stack. With default switch settings, if the cluster unit EtherChannel is connected cross stack, and if the control unit switch is powered down, then the EtherChannel connected to the remaining switch will not come up. To improve compatibility, set the stack-mac persistent timer command to a large enough value to account for reload time; for example, 8 minutes or 0 for indefinite. Or, you can upgrade to more a more stable switch software version, such as 15.1(1)S2.

• Spanned vs. Device-Local EtherChannel Configuration—Be sure to configure the switch appropriately for Spanned EtherChannels vs. Device-local EtherChannels.
  
  • Spanned EtherChannels—For cluster unit Spanned EtherChannels, which span across all members of the cluster, the interfaces are combined into a single EtherChannel on the switch. Make sure each interface is in the same channel group on the switch.
• Device-local EtherChannels—For cluster unit Device-local EtherChannels including any EtherChannels configured for the cluster control link, be sure to configure discrete EtherChannels on the switch; do not combine multiple cluster unit EtherChannels into one EtherChannel on the switch.

**Additional Guidelines**

• When adding a unit to an existing cluster, or when reloading a unit, there will be a temporary, limited packet/connection drop; this is expected behavior. In some cases, the dropped packets can hang connections; for example, dropping a FIN/ACK packet for an FTP connection will make the FTP client hang. In this case, you need to reestablish the FTP connection.

• If you use a Windows 2003 server connected to a Spanned EtherChannel interface, when the syslog server port is down, and the server does not throttle ICMP error messages, then large numbers of ICMP messages are sent back to the cluster. These messages can result in some units of the cluster experiencing high CPU, which can affect performance. We recommend that you throttle ICMP error messages.

• We recommend connecting EtherChannels to a VSS or vPC for redundancy.
Configure Clustering

You can easily deploy the cluster from the Firepower 4100/9300 chassis supervisor. All initial configuration is automatically generated for each unit. You can then add the units to the FMC and group them into a cluster.

FXOS: Add a Firepower Threat Defense Cluster

You can add a single Firepower 9300 chassis as an intra-chassis cluster, or add multiple chassis for inter-chassis clustering.

For inter-chassis clustering, you must configure each chassis separately. Add the cluster on one chassis; you can then copy the bootstrap configuration from the first chassis to the next chassis for ease of deployment.

Create a Firepower Threat Defense Cluster

You can easily deploy the cluster from the Firepower 4100/9300 chassis supervisor. All initial configuration is automatically generated for each unit.

For inter-chassis clustering, you must configure each chassis separately. Deploy the cluster on one chassis; you can then copy the bootstrap configuration from the first chassis to the next chassis for ease of deployment.

In a Firepower 9300 chassis, you must enable clustering for all 3 module slots, even if you do not have a module installed. If you do not configure all 3 modules, the cluster will not come up.

Before you begin

- Download the application image you want to use for the logical device from Cisco.com, and then upload that image to the Firepower 4100/9300 chassis.
- Gather the following information:
  - Management interface ID, IP addresses, and network mask
- Gateway IP address
- FMC IP address and/or NAT ID of your choosing
- DNS server IP address
- FTD hostname and domain name

**Step 1** Configure interfaces.

a) Add at least one Data type interface or EtherChannel (also known as a port-channel) before you deploy the cluster. See Add an EtherChannel (Port Channel), on page 632 or Configure a Physical Interface, on page 631.

For inter-chassis clustering, all data interfaces must be Spanned EtherChannels with at least one member interface. Add the same EtherChannels on each chassis. Combine the member interfaces from all cluster units into a single EtherChannel on the switch. See Clustering Guidelines and Limitations, on page 759 for more information about EtherChannels for inter-chassis clustering.

b) Add a Management type interface or EtherChannel. See Add an EtherChannel (Port Channel), on page 632 or Configure a Physical Interface, on page 631.

The management interface is required. Note that this management interface is not the same as the chassis management interface that is used only for chassis management (in FXOS, you might see the chassis management interface displayed as MGMT, management0, or other similar names).

For inter-chassis clustering, add the same Management interface on each chassis.

c) For inter-chassis clustering, add a member interface to the cluster control link EtherChannel (by default, port-channel 48). See Add an EtherChannel (Port Channel), on page 632.

Do not add a member interface for intra-chassis clustering. If you add a member, the chassis assumes this cluster will be inter-chassis, and will only allow you to use Spanned EtherChannels, for example.

On the Interfaces tab, the port-channel 48 cluster type interface shows the Operation State as **failed** if it does not include any member interfaces. For intra-chassis clustering, this EtherChannel does not require any member interfaces, and you can ignore this Operational State.

Add the same member interfaces on each chassis. The cluster control link is a device-local EtherChannel on each chassis. Use separate EtherChannels on the switch per device. See Clustering Guidelines and Limitations, on page 759 for more information about EtherChannels for inter-chassis clustering.

d) (Optional) Add a Firepower-eventing interface. See Add an EtherChannel (Port Channel), on page 632 or Configure a Physical Interface, on page 631.

This interface is a secondary management interface for FTD devices. To use this interface, you must configure its IP address and other parameters at the FTD CLI. For example, you can separate management traffic from events (such as web events). See the **configure network** commands in the Firepower Threat Defense command reference.

For inter-chassis clustering, add the same eventing interface on each chassis.

**Step 2** Choose Logical Devices.

**Step 3** Click **Add > ClusterAdd Device**, and set the following parameters:
a) Provide a **Device Name**.

   This name is used internally by the chassis supervisor to configure management settings and to assign interfaces; it is not the device name used in the application configuration.

b) For the **Template**, choose **Cisco Firepower Threat Defense**.

c) Choose the **Image Version**.

d) For the **Instance Type**, only the **Native** type is supported.

e) For the **Usage**, click the **Cluster** radio button.

f) Click **OK**.

   You see the Provisioning - device name window.

**Step 4** Choose the interfaces you want to assign to this cluster.

All valid interfaces are assigned by default.

**Step 5** Click the device icon in the center of the screen.

A dialog box appears where you can configure initial bootstrap settings. These settings are meant for initial deployment only, or for disaster recovery. For normal operation, you can later change most values in the application CLI configuration.

**Step 6** On the **Cluster Information** page, complete the following.
<table>
<thead>
<tr>
<th><strong>Cisco Firepower Threat Defense - Bootstrap Configuration</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cluster Information</strong></td>
</tr>
<tr>
<td><strong>Security Module</strong></td>
</tr>
<tr>
<td>Security Module-1, Security Module-2, Security Module-3</td>
</tr>
<tr>
<td><strong>Interface Information</strong></td>
</tr>
<tr>
<td>Chassis ID: 1</td>
</tr>
<tr>
<td>Site ID: 1</td>
</tr>
<tr>
<td>Cluster Key: ****</td>
</tr>
<tr>
<td>Confirm Cluster Key: ****</td>
</tr>
<tr>
<td>Cluster Group Name: cluster1</td>
</tr>
<tr>
<td>Management Interface: ethernet1/4</td>
</tr>
<tr>
<td>CCL Subnet IP: 10.0.0.0</td>
</tr>
</tbody>
</table>

**Figure 30:**

a) For inter-chassis clustering, in the **Chassis ID** field, enter a chassis ID. Each chassis in the cluster must use a unique ID.

   This field only appears if you added a member interface to cluster control link Port-Channel 48.

b) For inter-site clustering, in the **Site ID** field, enter the site ID for this chassis between 1 and 8. FlexConfig feature. Additional inter-site cluster customizations to enhance redundancy and stability, such as director localization, site redundancy, and cluster flow mobility, are only configurable using the Firepower Management Center FlexConfig feature.

c) In the **Cluster Key** field, configure an authentication key for control traffic on the cluster control link.

   The shared secret is an ASCII string from 1 to 63 characters. The shared secret is used to generate the key. This option does not affect datapath traffic, including connection state update and forwarded packets, which are always sent in the clear.

d) Set the **Cluster Group Name**, which is the cluster group name in the logical device configuration.

   The name must be an ASCII string from 1 to 38 characters.

e) Choose the **Management Interface**.

   This interface is used to manage the logical device. This interface is separate from the chassis management port. If you assign a Hardware Bypass-capable interface as the Management interface, you see a warning message to make sure your assignment is intentional.

f) (Optional) Set the **CCL Subnet IP** as \(a.b.0.0\).
By default, the cluster control link uses the 127.2.0.0/16 network. However, some networking deployments do not allow 127.2.0.0/16 traffic to pass. In this case, specify any /16 network address on a unique network for the cluster, except for loopback (127.0.0.0/8) and multicast (224.0.0.0/4) addresses. If you set the value to 0.0.0.0, then the default network is used.

The chassis auto-generates the cluster control link interface IP address for each unit based on the chassis ID and slot ID: \textit{a.b.chassis\_id.slot\_id}.

\textbf{Step 7} On the \textit{Settings} page, complete the following.

\begin{itemize}
  \item[a)] In the \textit{Registration Key} field, enter the key to be shared between the Firepower Management Center and the cluster members during registration.
    
    You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the FTD.
  \item[b)] Enter a \textit{Password} for the FTD admin user for CLI access.
  \item[c)] In the \textit{Firepower Management Center IP} field, enter the IP address of the managing Firepower Management Center. If you do not know the FMC IP address, leave this field blank and enter a passphrase in the \textit{Firepower Management Center NAT ID} field.
  \item[d)] (Optional) In the \textit{Search Domains} field, enter a comma-separated list of search domains for the management network.
  \item[e)] (Optional) From the \textit{Firewall Mode} drop-down list, choose \textit{Transparent} or \textit{Routed}.
    
    In routed mode, the FTD is considered to be a router hop in the network. Each interface that you want to route between is on a different subnet. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices.
    
    The firewall mode is only set at initial deployment. If you re-apply the bootstrap settings, this setting is not used.
\end{itemize}
f) (Optional) In the DNS Servers field, enter a comma-separated list of DNS servers.

The FTD uses DNS if you specify a hostname for the FMC, for example.

g) (Optional) In the Firepower Management Center NAT ID field, enter a passphrase that you will also enter on the FMC when you add the cluster as a new device.

Normally, you need both IP addresses (along with a registration key) for both routing purposes and for authentication: the FMC specifies the device IP address, and the device specifies the FMC IP address. However, if you only know one of the IP addresses, which is the minimum requirement for routing purposes, then you must also specify a unique NAT ID on both sides of the connection to establish trust for the initial communication and to look up the correct registration key. You can specify any text string as the NAT ID, from 1 to 37 characters. The FMC and device use the registration key and NAT ID (instead of IP addresses) to authenticate and authorize for initial registration.

h) (Optional) In the Fully Qualified Hostname field, enter a fully qualified name for the FTD device.

Valid characters are the letters from a to z, the digits from 0 to 9, the dot (.), and the hyphen (-); maximum number of characters is 253.

i) (Optional) From the Eventing Interface drop-down list, choose the interface on which Firepower events should be sent. If not specified, the management interface will be used.

To specify a separate interface to use for Firepower events, you must configure an interface as a **firepower-eventing** interface. If you assign a Hardware Bypass-capable interface as the Eventing interface, you see a warning message to make sure your assignment is intentional.

**Step 8**

On the Interface Information page, configure a management IP address for each security module in the cluster. Select the type of address from the Address Type drop-down list and then complete the following for each security module.

**Note** You must set the IP address for all 3 module slots in a chassis, even if you do not have a module installed. If you do not configure all 3 modules, the cluster will not come up.
a) In the **Management IP** field, configure an IP address. Specify a unique IP address on the same network for each module.

b) Enter a **Network Mask** or **Prefix Length**.

c) Enter a **Network Gateway** address.

**Step 9**  
On the **Agreement** tab, read and accept the end user license agreement (EULA).

**Step 10**  
Click **OK** to close the configuration dialog box.

**Step 11**  
Click **Save**.  

The chassis deploys the logical device by downloading the specified software version and pushing the bootstrap configuration and management interface settings to the application instance. Check the **Logical Devices** page for the status of the new logical device. When the logical device shows its **Status as online**, you can add the remaining cluster chassis, or for intra-chassis clustering start configuring the cluster in the application. You may see the "Security module not responding" status as part of the process; this status is normal and is temporary.
Step 12

For inter-chassis clustering, add the next chassis to the cluster:

a) On the first chassis Firepower Chassis Manager, click the Show Configuration icon at the top right; copy the displayed cluster configuration.

b) Connect to the Firepower Chassis Manager on the next chassis, and add a logical device according to this procedure.

c) Choose Join an Existing Cluster.

d) Click the Copy config check box, and click OK. If you uncheck this check box, you must manually enter the settings to match the first chassis configuration.

e) In the Copy Cluster Details box, paste in the cluster configuration from the first chassis, and click OK.

f) Click the device icon in the center of the screen. The cluster information is mostly pre-filled, but you must change the following settings:

   • Chassis ID—Enter a unique chassis ID.

   • Site ID—For inter-site clustering, enter the site ID for this chassis between 1 and 8. Additional inter-site cluster customizations to enhance redundancy and stability, such as director localization, site redundancy, and cluster flow mobility, are only configurable using the Firepower Management Center FlexConfig feature.

   • Cluster Key—(Not prefilled) Enter the same cluster key.

   • Management IP—Change the management address for each module to be a unique IP address on the same network as the other cluster members.

Click OK.

g) Click Save.

The chassis deploys the logical device by downloading the specified software version and pushing the bootstrap configuration and management interface settings to the application instance. Check the Logical Devices page for each cluster member for the status of the new logical device. When the logical device for each cluster member shows its Status as online, you can start configuring the cluster in the application. You may see the “Security module not responding” status as part of the process; this status is normal and is temporary.
Step 13
Add the control unit to the Firepower Management Center using the management IP address.
All cluster units must be in a successfully-formed cluster on FXOS prior to adding them to Firepower Management Center.
The Firepower Management Center then automatically detects the data units.

Add More Cluster Units
Add or replace a FTD cluster unit in an existing cluster.

Note
The FXOS steps in this procedure only apply to adding a new chassis; if you are adding a new module to a Firepower 9300 where clustering is already enabled, the module will be added automatically. However, you must still add the new module to the Firepower Management Center; skip to the Firepower Management Center steps.

Before you begin
• In the case of a replacement, you must delete the old cluster unit from the Firepower Management Center. When you replace it with a new unit, it is considered to be a new device on the Firepower Management Center.
• The interface configuration must be the same on the new chassis. You can export and import FXOS chassis configuration to make this process easier.

Step 1
On an existing cluster chassis Firepower Chassis Manager, choose Logical Devices to open the Logical Devices page.
Step 2
Click the Show Configuration icon at the top right; copy the displayed cluster configuration.
Step 3
Connect to the Firepower Chassis Manager on the new chassis, and click Add > ClusterAdd Device.
Step 4
For the Device Name, provide a name for the logical device.
Step 5
For the Template, choose Cisco Firepower Threat Defense.
**Step 6**  For the **Image Version**, choose the FTD software version.

**Step 7**  For the **Device Mode**, click the **Cluster** radio button.

**Step 8**  Choose **Join an Existing Cluster**.

**Step 9**  Click the **Copy config** check box, and click **OK**. If you uncheck this check box, you must manually enter the settings to match the first chassis configuration.

**Step 10**  In the **Copy Cluster Details** box, paste in the cluster configuration from the first chassis, and click **OK**.

**Step 11**  Click the device icon in the center of the screen. The cluster information is mostly pre-filled, but you must change the following settings:

- **Chassis ID**—Enter a unique chassis ID.
- **Site ID**—For inter-site clustering, enter the site ID for this chassis between 1 and 8. This feature is only configurable using the Firepower Management Center FlexConfig feature.
- **Cluster Key**—(Not prefilled) Enter the same cluster key.
- **Management IP**—Change the management address for each module to be a unique IP address on the same network as the other cluster members.

Click **OK**.

**Step 12**  Click **Save**.

The chassis deploys the logical device by downloading the specified software version and pushing the bootstrap configuration and management interface settings to the application instance. Check the **Logical Devices** page for each cluster member for the status of the new logical device. When the logical device for each cluster member shows its **Status** as **online**, you can start configuring the cluster in the application. You may see the "Security module not responding" status as part of the process; this status is normal and is temporary.

---

**FMC: Add a Cluster**

Add one of the cluster units as a new device to the Firepower Management Center; the FMC auto-detects all other cluster members.
Before you begin

- This method for adding a cluster requires Firepower Threat Defense Version 6.2 or later. If you need to manage an earlier version device, then refer to the Firepower Management Center configuration guide for that version.

- All cluster units must be in a successfully-formed cluster on FXOS prior to adding the cluster to the Management Center. You should also check which unit is the control unit. Refer to the Firepower Chassis Manager Logical Devices screen or use the Firepower Threat Defense show cluster info command.

Step 1

In the FMC, choose Devices > Device Management, and then choose Add > Add Device to add the control unit using the unit's management IP address you assigned when you deployed the cluster.

a) In the Host field, enter the IP address or hostname of the control unit.

   We recommend adding the control unit for the best performance, but you can add any unit of the cluster.

   If you used a NAT ID during device setup, you may not need to enter this field. For more information, see NAT Environments, on page 246.

b) In the Display Name field, enter a name for the control unit as you want it to display in the FMC.

   This display name is not for the cluster; it is only for the control unit you are adding. You can later change the name of other cluster members and the cluster display name.

c) In the Registration Key field, enter the same registration key that you used when you deployed the cluster in FXOS. The registration key is a one-time-use shared secret.

d) In a multidomain deployment, regardless of your current domain, assign the device to a leaf Domain.

   If your current domain is a leaf domain, the device is automatically added to the current domain. If your current domain is not a leaf domain, post-registration, you must switch to the leaf domain to configure the device.

e) (Optional) Add the device to a device Group.

f) Choose an initial Access Control Policy to deploy to the device upon registration, or create a new policy.

   If you create a new policy, you create a basic policy only. You can later customize the policy as needed.

g) Choose licenses to apply to the device.

h) If you used a NAT ID during device setup, expand the Advanced section and enter the same NAT ID in the Unique NAT ID field.

i) Check the Transfer Packets check box to allow the device to transfer packets to the FMC.

   This option is enabled by default. When events like IPS or Snort are triggered with this option enabled, the device sends event metadata information and packet data to the FMC for inspection. If you disable it, only event information will be sent to the FMC but packet data is not sent.

j) Click Register.

   The FMC identifies and registers the control unit, and then registers all data units. If the control unit does not successfully register, then the cluster is not added. A registration failure can occur if the cluster was not up on the chassis, or because of other connectivity issues. In this case, we recommend that you try re-adding the cluster unit.

   The cluster name shows on the Devices > Device Management page; expand the cluster to see the cluster units.

   A unit that is currently registering shows the loading icon.
You can monitor cluster unit registration by clicking the **Notifications** icon and choosing **Tasks**. The FMC updates the Cluster Registration task as each unit registers. If any units fail to register, see Reconcile Cluster Members, on page 779.

**Step 2**
Configure device-specific settings by clicking the **Edit** for the cluster.

Most configuration can be applied to the cluster as a whole, and not member units in the cluster. For example, you can change the display name per unit, but you can only configure interfaces for the whole cluster.

**Step 3**
On the **Devices > Device Management > Cluster** screen, you see **General, License, System, and Health** settings.

See the following cluster-specific items:

- **General > Name**—Change the cluster display name by clicking the **Edit**.
  
  Then set the **Name** field.

- **General > View cluster status**—Click the **View cluster status** link to open the **Cluster Status** dialog box.
  
  The **Cluster Status** dialog box also lets you retry data unit registration by clicking **Reconcile**.

- **License**—Click **Edit** to set license entitlements.

**Step 4**
On the **Devices > Device Management > Devices**, you can choose each member in the cluster from the top right drop-down menu and configure the following settings.

- **General > Name**—Change the cluster member display name by clicking the **Edit**.
  
  Then set the **Name** field.

- **Management > Host**—If you change the management IP address in the device configuration, you must match the new address in the FMC so that it can reach the device on the network; edit the **Host** address in the **Management** area.

---

**FMC: Configure Cluster, Data, and Diagnostic Interfaces**

This procedure configures basic parameters for each data interface that you assigned to the cluster when you deployed it in FXOS. For inter-chassis clustering, data interfaces are always Spanned EtherChannel interfaces. For the cluster control link interface for inter-chassis clustering, you must increase the MTU from the default. You can also configure the Diagnostic interface, which is the only interface that can run as an individual interface.

---

**Note**
When using Spanned EtherChannels for inter-chassis clustering, the port-channel interface will not come up until clustering is fully enabled. This requirement prevents traffic from being forwarded to a unit that is not an active unit in the cluster.

---

**Step 1**
Choose **Devices > Device Management**, and click **Edit** next to the cluster.

**Step 2**
Click **Interfaces**.
Step 3 Configure the cluster control link.

For inter-chassis clustering, set the cluster control link MTU to be at least 100 bytes higher than the highest MTU of the data interfaces. Because the cluster control link traffic includes data packet forwarding, the cluster control link needs to accommodate the entire size of a data packet plus cluster traffic overhead. We suggest setting the MTU to the maximum of 9184; the minimum value is 1400 bytes. For example, because the maximum MTU is 9184, then the highest data interface MTU can be 9084, while the cluster control link can be set to 9184.

The cluster control link interface is Port-Channel48 by default.

a) Click Edit (🔗) for the cluster control link interface.

b) On the General page, in the MTU field, enter a value between 1400 and 9184. We suggest using the maximum, 9184.

c) Click OK.

Step 4 Configure data interfaces.

a) (Optional) Configure VLAN subinterfaces on the data interface. The rest of this procedure applies to the subinterfaces. See Add a Subinterface, on page 669.

b) Click Edit (🔗) for the data interface.

c) Configure the name, IP address, and other parameters according to Configure Routed Mode Interfaces, on page 672 or Configure Bridge Group Interfaces, on page 674.

Note If the cluster control link interface MTU is not at least 100 bytes higher than the data interface MTU, you will see an error that you must reduce the MTU of the data interface. See step Step 3, on page 774 to increase the cluster control link MTU, after which you can continue configuring the data interfaces.

d) For inter-chassis clusters, set a manual global MAC address for the EtherChannel. Click Advanced, and in the Active Mac Address field, enter a MAC address in H.H.H format, where H is a 16-bit hexadecimal digit.

For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 000C.F142.4CDE. The MAC address must not have the multicast bit set, that is, the second hexadecimal digit from the left cannot be an odd number.

Do not set the Standby Mac Address; it is ignored.

You must configure a MAC address for a Spanned EtherChannel to avoid potential network connectivity problems. With a manually-configured MAC address, the MAC address stays with the current control unit. If you do not configure a MAC address, then if the control unit changes, the new control unit uses a new MAC address for the interface, which can cause a temporary network outage.

e) Click OK. Repeat the above steps for other data interfaces.

Step 5 (Optional) Configure the Diagnostic interface.

The Diagnostic interface is the only interface that can run in Individual interface mode. You can use this interface for syslog messages or SNMP, for example.

a) Choose Objects > Object Management > Address Pools to add an IPv4 and/or IPv6 address pool. See Address Pools, on page 526.

Include at least as many addresses as there are units in the cluster. The Virtual IP address is not a part of this pool, but needs to be on the same network. You cannot determine the exact Local address assigned to each unit in advance.

b) On Devices > Device Management > Interfaces, click Edit (🔗) for the Diagnostic interface.

c) On the IPv4, enter the IP Address and mask. This IP address is a fixed address for the cluster, and always belongs to the current control unit.

d) From the IPv4 Address Pool drop-down list, choose the address pool you created.
On IPv6 > Basic, from the IPv6 Address Pool drop-down list, choose the address pool you created.

Configure other interface settings as normal.

**Step 6**

Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## FXOS: Remove a Cluster Unit

The following sections describe how to remove units temporarily or permanently from the cluster.

**Temporary Removal**

A cluster unit will be automatically removed from the cluster due to a hardware or network failure, for example. This removal is temporary until the conditions are rectified, and it can rejoin the cluster. You can also manually disable clustering.

To check whether a device is currently in the cluster, check the cluster status on the Firepower Chassis Manager Logical Devices page:

[Table]

<table>
<thead>
<tr>
<th>Management Port</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet1/4</td>
<td>online</td>
</tr>
</tbody>
</table>

For FTD using FMC, you should leave the device in the FMC device list so that it can resume full functionality after you reenable clustering.

- Disable clustering in the application—You can disable clustering using the application CLI. Enter the `cluster remove unit name` command to remove any unit other than the one you are logged into. The bootstrap configuration remains intact, as well as the last configuration synced from the control unit, so you can later re-add the unit without losing your configuration. If you enter this command on a data unit to remove the control unit, a new control unit is elected.

  When a device becomes inactive, all data interfaces are shut down; only the Management interface can send and receive traffic. To resume traffic flow, re-enable clustering. The Management interface remains up using the IP address the unit received from the bootstrap configuration. However if you reload, and the unit is still inactive in the cluster, the Management interface is disabled.

  To reenable clustering, on the FTD enter `cluster enable`.

- Disable the application instance—In Firepower Chassis Manager on the Logical Devices page, click the Slider **enabled** (✅). You can later reenable it using the Slider **disabled** (🚫).
• Shut down the security module/engine—In Firepower Chassis Manager on the Security Module/Engine page, click the Power Off icon.

• Shut down the chassis—In Firepower Chassis Manager on the Overview page, click the Shut Down icon.

Permanent Removal

You can permanently remove a cluster member using the following methods.

For FTD using FMC, be sure to remove the unit from the FMC device list after you disable clustering on the chassis.

• Delete the logical device—In Firepower Chassis Manager on the Logical Devices page, click the Delete (Trash Can). You can then deploy a standalone logical device, a new cluster, or even add a new logical device to the same cluster.

• Remove the chassis or security module from service—If you remove a device from service, you can add replacement hardware as a new member of the cluster.

FMC: Manage Cluster Members

After you deploy the cluster, you can change the configuration and manage cluster members.

Add a New Cluster Member

When you add a new cluster member in FXOS, the Firepower Management Center adds the member automatically.

Before you begin

• Make sure the interface configuration is the same on the replacement unit as for the other chassis.

Step 1

Add the new unit to the cluster in FXOS. See the FXOS configuration guide.

Wait for the new unit to be added to the cluster. Refer to the Firepower Chassis Manager Logical Devices screen or use the Firepower Threat Defense show cluster info command to view cluster status.

Step 2

The new cluster member is added automatically. To monitor the registration of the replacement unit, view the following:

• Cluster Status dialog box (which is available from the Devices > Device Management > Cluster tab > General area > View Cluster Status link)—A unit that is joining the cluster on the chassis shows "Joining cluster..." After it joins the cluster, the FMC attempts to register it, and the status changes to "Available for Registration". After it completes registration, the status changes to "In Sync." If the registration fails, the unit will stay at "Available for Registration". In this case, force a re-registration by clicking Reconcile.

• System status > Tasks —The FMC shows all registration events and failures.
**Replace a Cluster Member**

You can replace a cluster member in an existing cluster. The FMC auto-detects the replacement unit. However, you must manually delete the old cluster member in the FMC. This procedure also applies to a unit that was reinitialized; in this case, although the hardware remains the same, it appears to be a new member.

**Before you begin**

- Make sure the interface configuration is the same on the replacement unit as for other chassis.

**Step 1**

For a new chassis, if possible, backup and restore the configuration from the old chassis in FXOS.

If you are replacing a module in a Firepower 9300, you do not need to perform these steps.

If you do not have a backup FXOS configuration from the old chassis, first perform the steps in Add a New Cluster Member, on page 776.

For information about all of the below steps, see the FXOS configuration guide.

a) Use the configuration export feature to export an XML file containing logical device and platform configuration settings for your Firepower 4100/9300 chassis.

b) Import the configuration file to the replacement chassis.

c) Accept the license agreement.

d) If necessary, upgrade the logical device application instance version to match the rest of the cluster.

**Step 2**

In the FMC for the old unit, choose Devices > Device Management, and click Delete (🗑). 

**Step 3**

Confirm that you want to delete the unit.

The unit is removed from the cluster and from the FMC devices list.

**Step 4**

The new or reinitialized cluster member is added automatically. To monitor the registration of the replacement unit, view the following:

- **Cluster Status** dialog box (Devices > Device Management > Cluster page > General area > View Cluster Status link)—A unit that is joining the cluster on the chassis shows "Joining cluster..." After it joins the cluster, the FMC attempts to register it, and the status changes to "Available for Registration". After it completes registration, the status changes to "In Sync." If the registration fails, the unit will stay at "Available for Registration". In this case, force a re-registration by clicking Reconcile.

- **System > Tasks**—The FMC shows all registration events and failures.

- **Devices > Device Management**—When you expand the cluster on the devices listing page, you can see when a unit is registering when it has the loading icon to the left.
Deactivate a Member

You may want to deactivate a member in preparation for deleting the unit, or temporarily for maintenance. This procedure is meant to temporarily deactivate a member; the unit will still appear in the FMC device list.

To deactivate a member other than the unit you are logged into, perform the following steps at the FTD CLI.

When a unit becomes inactive, all data interfaces are shut down; only the Management interface can send and receive traffic. To resume traffic flow, reenable clustering. The Management interface remains up using the IP address the unit received from the bootstrap configuration. However if you reload, and the unit is still inactive in the cluster, the management interface is disabled. You must use the console for any further configuration.

---

**Note**

Step 1
Access the FTD CLI.

Step 2
Remove the unit from the cluster:

```
cluster remove unit unit_name
```

The bootstrap configuration remains intact, as well as the last configuration synched from the control unit, so that you can later re-add the unit without losing your configuration. If you enter this command on a data unit to remove the control unit, a new control unit is elected.

To view member names, enter `cluster remove unit ?`, or enter the `show cluster info` command.

**Example:**

```
> cluster remove unit ?
Current active units in the cluster:
ftd1
tfd2
ftd3
```

```
> cluster remove unit ftdd2
WARNING: Clustering will be disabled on unit ftdd2. To bring it back to the cluster please logon to that unit and re-enable clustering
```

Step 3
To reenable clustering, see Rejoin the Cluster, on page 778.

Rejoin the Cluster

If a unit was removed from the cluster, for example for a failed interface, you must manually rejoin the cluster by accessing the unit CLI. Make sure the failure is resolved before you try to rejoin the cluster. See Rejoining the Cluster, on page 787 for more information about why a unit can be removed from a cluster.

Step 1
Access the CLI of the unit that needs to rejoin the cluster, either from the console port or using SSH to the Management interface. Log in with the username `admin` and the password you set during initial setup.

Step 2
Enable clustering:
cluster enable

## Delete a Data Unit

If you need to permanently remove a cluster member (for example, if you remove a module on the Firepower 9300, or remove a chassis), then you should delete it from the FMC.

Do not delete the member if it is still a healthy part of the cluster, or if you only want to disable the member temporarily. To delete it permanently from the cluster in FXOS, see FXOS: Remove a Cluster Unit, on page 775. If you remove it from the FMC, and it is still part of the cluster, it will continue to pass traffic, and could even become the control unit—a control unit that the FMC can no longer manage.

**Before you begin**

To manually deactivate the unit, see Deactivate a Member, on page 778. Before you delete a unit, the unit must be inactive, either manually or because of a health failure.

### Step 1

Make sure the unit is ready to be deleted from the FMC.

a) Choose Devices > Device Management, and click Edit (✍️) for the cluster.

b) On the Devices > Device Management > Cluster > General area, click the Current Cluster Summary link to open the Cluster Status dialog box.

c) Ensure that the devices you want to delete are in the Available for Deletion state.

   If the status is stale, click Reconcile to force an update.

### Step 2

In the FMC for the data unit you want to delete, choose Devices > Device Management, and click Delete (🗑️).

### Step 3

Confirm that you want to delete the unit.

The unit is removed from the cluster and from the FMC devices list.

## Reconcile Cluster Members

If a cluster member fails to register, you can reconcile the cluster membership from the chassis to the Firepower Management Center. For example, a data unit might fail to register if the FMC is occupied with certain processes, or if there is a network issue.

### Step 1

Choose Devices > Device Management, and click Edit (✍️) for the cluster.

### Step 2

On the Cluster > General area, click the Current Cluster Summary link to open the Cluster Status dialog box.

### Step 3

Click Reconcile.

For more information about the cluster status, see FMC: Monitoring the Cluster, on page 780.
FMC: Monitoring the Cluster

You can monitor the cluster in Firepower Management Center and at the FTD CLI.

- **Cluster Status** dialog box, which is available from the Devices > Device Management > Cluster page > General area > View Cluster Status link.

Cluster member Status includes the following states:

- In Sync.—The unit is registered with the FMC.
- Available for Registration—The unit is part of the cluster, but has not yet registered with the FMC. If a unit fails to register, you can retry registration by clicking **Reconcile**.
- Available for Deletion—The unit is registered with the FMC, but is an inactive member of the cluster. The clustering configuration remains intact if you intend to later re-enable it, or you can delete the unit from the cluster.
- Joining cluster...—The unit is joining the cluster on the chassis, but has not completed joining. After it joins, it will register with the FMC.

To refresh this dialog box, close and reopen it.

- **System** > **Tasks** page.

The Tasks page shows updates of the Cluster Registration task as each unit registers.

- **Devices** > **Device Management** > *cluster_name*.

When you expand the cluster on the devices listing page, you can see all member units, including the control unit shown with its role next to the IP address. For units that are still registering, you can see the loading icon.

- **show cluster** {access-list [acl_name] | conn [count] | cpu [usage] | history | interface-mode | memory | resource usage | service-policy | traffic | xlate count}

To view aggregated data for the entire cluster or other information, use the **show cluster** command.

- **show cluster info** [auto-join | clients | conn-distribution | flow-mobility counters | goid [options] | health | incompatible-config | loadbalance | old-members | packet-distribution | trace [options] | transport {asp | cp}]

To view cluster information, use the **show cluster info** command.

Reference for Clustering

This section includes more information about how clustering operates.

Firepower Threat Defense Features and Clustering

Some FTD features are not supported with clustering, and some are only supported on the control unit. Other features might have caveats for proper usage.
Unsupported Features with Clustering

These features cannot be configured with clustering enabled, and the commands will be rejected.

To view FlexConfig features that are also not supported with clustering, for example WCCP inspection, see the ASA general operations configuration guide. FlexConfig lets you configure many ASA features that are not present in the FMC GUI. See FlexConfig Policies for Firepower Threat Defense, on page 991.

- Remote access VPN (SSL VPN and IPsec VPN)
- DHCP client, server, and proxy. DHCP relay is supported.
- High Availability
- Integrated Routing and Bridging
- Dead Connection Detection (DCD)
- FMC UCAPL/CC mode

Centralized Features for Clustering

The following features are only supported on the control unit, and are not scaled for the cluster.

Traffic for centralized features is forwarded from member units to the control unit over the cluster control link.

If you use the rebalancing feature, traffic for centralized features may be rebalanced to non-control units before the traffic is classified as a centralized feature; if this occurs, the traffic is then sent back to the control unit.

For centralized features, if the control unit fails, all connections are dropped, and you have to re-establish the connections on the new control unit.

- The following application inspections:
  - DCERPC
  - NetBIOS
  - RSH
  - SUNRPC
  - TFTP
  - XDMCP

- Dynamic routing
- Static route monitoring
Dynamic Routing and Clustering

The routing process only runs on the control unit, and routes are learned through the control unit and replicated to secondaries. If a routing packet arrives at a data unit, it is redirected to the control unit.

*Figure 31: Dynamic Routing*

After the data units learn the routes from the control unit, each unit makes forwarding decisions independently. The OSPF LSA database is not synchronized from the control unit to data units. If there is a control unit switchover, the neighboring router will detect a restart; the switchover is not transparent. The OSPF process picks an IP address as its router ID. Although not required, you can assign a static router ID to ensure a consistent router ID is used across the cluster. See the OSPF Non-Stop Forwarding feature to address the interruption.

Connection Settings

Connection limits are enforced cluster-wide. Each unit has an estimate of the cluster-wide counter values based on broadcast messages. Due to efficiency considerations, the configured connection limit across the cluster might not be enforced exactly at the limit number. Each unit may overestimate or underestimate the cluster-wide counter value at any given time. However, the information will get updated over time in a load-balanced cluster.

FTP and Clustering

- If FTP data channel and control channel flows are owned by different cluster members, then the data channel owner will periodically send idle timeout updates to the control channel owner and update the idle timeout value. However, if the control flow owner is reloaded, and the control flow is re-hosted, the parent/child flow relationship will not longer be maintained; the control flow idle timeout will not be updated.
NAT and Clustering

NAT can affect the overall throughput of the cluster. Inbound and outbound NAT packets can be sent to different FTDs in the cluster, because the load balancing algorithm relies on IP addresses and ports, and NAT causes inbound and outbound packets to have different IP addresses and/or ports. When a packet arrives at the FTD that is not the NAT owner, it is forwarded over the cluster control link to the owner, causing large amounts of traffic on the cluster control link. Note that the receiving unit does not create a forwarding flow to the owner, because the NAT owner may not end up creating a connection for the packet depending on the results of security and policy checks.

If you still want to use NAT in clustering, then consider the following guidelines:

• PAT with Port Block Allocation—See the following guidelines for this feature:
  • Maximum-per-host limit is not a cluster-wide limit, and is enforced on each unit individually. Thus, in a 3-node cluster with the maximum-per-host limit configured as 1, if the traffic from a host is load-balanced across all 3 units, then it can get allocated 3 blocks with 1 in each unit.
  • Port blocks created on the backup unit from the backup pools are not accounted for when enforcing the maximum-per-host limit.
  • When a PAT IP address owner goes down, the backup unit will own the PAT IP address, corresponding port blocks, and xlates. If it runs out of ports on its normal PAT address, it can use the address that it took over to service new requests. As the connections eventually time out, the blocks get freed.
  • On-the-fly PAT rule modifications, where the PAT pool is modified with a completely new range of IP addresses, will result in xlate backup creation failures for the xlate backup requests that were still in transit while the new pool became effective. This behavior is not specific to the port block allocation feature, and is a transient PAT pool issue seen only in cluster deployments where the pool is distributed and traffic is load-balanced across the cluster units.

• NAT pool address distribution for dynamic PAT—The control unit evenly pre-distributes addresses across the cluster. If a member receives a connection and they have no addresses assigned, then the connection is forwarded to the control unit for PAT. If a cluster member leaves the cluster (due to failure), a backup member will get the PAT IP address, and if the backup exhausts its normal PAT IP address, it can make use of the new address. Make sure to include at least as many NAT addresses as there are units in the cluster, plus at least one extra address, to ensure that each unit receives an address, and that a failed unit can get a new address if its old address is in use by the member that took over the address. Use the show nat pool cluster command in the device CLI to see the address allocations.

• Reusing a PAT pool in multiple rules—To use the same PAT pool in multiple rules, you must be careful about the interface selection in the rules. You must either use specific interfaces in all rules, or "any" in all rules. You cannot mix specific interfaces and "any" across the rules, or the system might not be able to match return traffic to the right node in the cluster. Using unique PAT pools per rule is the most reliable option.

• No round-robin—Round-robin for a PAT pool is not supported with clustering.

• Dynamic NAT xlates managed by the control unit—The control unit maintains and replicates the xlate table to data units. When a data unit receives a connection that requires dynamic NAT, and the xlate is not in the table, it requests the xlate from the control unit. The data unit owns the connection.
• Stale xlates—The xlate idle time on the connection owner does not get updated. Thus, the idle time might exceed the idle timeout. An idle timer value higher than the configured timeout with a refcnt of 0 is an indication of a stale xlate.

• No static PAT for the following inspections—
  • FTP
  • RSH
  • SQLNET
  • TFTP
  • XDMCP
  • SIP

SIP Inspection and Clustering

A control flow can be created on any unit (due to load balancing); its child data flows must reside on the same unit.

SNMP and Clustering

An SNMP agent polls each individual FTD by its Diagnostic interface Local IP address. You cannot poll consolidated data for the cluster.

You should always use the Local address, and not the Main cluster IP address for SNMP polling. If the SNMP agent polls the Main cluster IP address, if a new control unit is elected, the poll to the new control unit will fail.

Syslog and Clustering

• Each unit in the cluster generates its own syslog messages. You can configure logging so that each unit uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all units in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all units look as if they come from a single unit. If you configure logging to use the local-unit name that is assigned in the cluster bootstrap configuration as the device ID, syslog messages look as if they come from different units.

TLS/SSL Connections and Clustering

The decryption states of TLS/SSL connections are not synchronized, and if the connection owner fails, then the decrypted connections will be reset. New connections will need to be established to a new unit. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.

Cisco TrustSec and Clustering

Only the control unit learns security group tag (SGT) information. The control unit then populates the SGT to data units, and data units can make a match decision for SGT based on the security policy.
VPN and Clustering

Site-to-site VPN is a centralized feature; only the control unit supports VPN connections.

Note

Remote access VPN is not supported with clustering.

VPN functionality is limited to the control unit and does not take advantage of the cluster high availability capabilities. If the control unit fails, all existing VPN connections are lost, and VPN users will see a disruption in service. When a new control unit is elected, you must reestablish the VPN connections.

When you connect a VPN tunnel to a Spanned interface address, connections are automatically forwarded to the control unit.

VPN-related keys and certificates are replicated to all units.

Performance Scaling Factor

When you combine multiple units into a cluster, you can expect the total cluster performance to be approximately:

- 80% of the combined TCP or CPS throughput
- 90% of the combined UDP throughput
- 60% of the combined Ethernet MIX (EMIX) throughput, depending on the traffic mix.

For example, for TCP throughput, the Firepower 9300 with 3 SM-44 modules can handle approximately 135 Gbps of real world firewall traffic when running alone. For 2 chassis, the maximum combined throughput will be approximately 80% of 270 Gbps (2 chassis x 135 Gbps): 216 Gbps.

Control Unit Election

Members of the cluster communicate over the cluster control link to elect a control unit as follows:

1. When you deploy the cluster, each unit broadcasts an election request every 3 seconds.
2. Any other units with a higher priority respond to the election request; the priority is set when you deploy the cluster and is not configurable.
3. If after 45 seconds, a unit does not receive a response from another unit with a higher priority, then it becomes the control unit.

Note

If multiple units tie for the highest priority, the cluster unit name and then the serial number is used to determine the control unit.

4. If a unit later joins the cluster with a higher priority, it does not automatically become the control unit; the existing control unit always remains as the control unit unless it stops responding, at which point a new control unit is elected.
5. In a "split brain" scenario when there are temporarily multiple control units, then the unit with highest priority retains the role while the other units return to data unit roles.

**Note**
You can manually force a unit to become the control unit. For centralized features, if you force a control unit change, then all connections are dropped, and you have to re-establish the connections on the new control unit.

## High Availability Within the Cluster
Clustering provides high availability by monitoring chassis, unit, and interface health and by replicating connection states between units.

### Chassis-Application Monitoring
Chassis-application health monitoring is always enabled. The Firepower 4100/9300 chassis supervisor checks the Firepower Threat Defense application periodically (every second). If the Firepower Threat Defense device is up and cannot communicate with the Firepower 4100/9300 chassis supervisor for 3 seconds, the Firepower Threat Defense device generates a syslog message and leaves the cluster.

If the Firepower 4100/9300 chassis supervisor cannot communicate with the application after 45 seconds, it reloads the Firepower Threat Defense device. If the Firepower Threat Defense device cannot communicate with the supervisor, it removes itself from the cluster.

### Unit Health Monitoring
Each unit periodically sends a broadcast keepaliveheartbeat packet over the cluster control link. If the control unit does not receive any keepaliveheartbeat packets or other packets from a data unit within the timeout period, then the control unit removes the data unit from the cluster. If the data units do not receive packets from the control unit, then a new control unit is elected from the remaining members.

If units cannot reach each other over the cluster control link because of a network failure and not because a unit has actually failed, then the cluster may go into a "split brain" scenario where isolated data units will elect their own control units. For example, if a router fails between two cluster locations, then the original control unit at location 1 will remove the location 2 data units from the cluster. Meanwhile, the units at location 2 will elect their own control unit and form their own cluster. Note that asymmetric traffic may fail in this scenario. After the cluster control link is restored, then the control unit that has the higher priority will keep the control unit’s role. See Control Unit Election, on page 785 for more information.

### Interface Monitoring
Each unit monitors the link status of all hardware interfaces in use, and reports status changes to the control unit. For inter-chassis clustering, Spanned EtherChannels use the cluster Link Aggregation Control Protocol (cLACP). Each chassis monitors the link status and the cLACP protocol messages to determine if the port is still active in the EtherChannel, and informs the Firepower Threat Defense application if the interface is down. All physical interfaces are monitored by default (including the main EtherChannel for EtherChannel interfaces). Only named interfaces that are in an Up state can be monitored. For example, all member ports of an EtherChannel must fail before a named EtherChannel is removed from the cluster.

If a monitored interface fails on a particular unit, but it is active on other units, then the unit is removed from the cluster. The amount of time before the Firepower Threat Defense device removes a member from the
cluster depends on whether the unit is an established member or is joining the cluster. The Firepower Threat Defense device does not monitor interfaces for the first 90 seconds that a unit joins the cluster. Interface status changes during this time will not cause the Firepower Threat Defense device to be removed from the cluster. For an established member, the unit is removed after 500 ms.

For inter-chassis clustering, if you add or delete an EtherChannel from the cluster, interface health-monitoring is suspended for 95 seconds to ensure that you have time to make the changes on each chassis.

**Decorator Application Monitoring**

When you install a decorator application on an interface, such as the Radware DefensePro application, then both the Firepower Threat Defense device and the decorator application must be operational to remain in the cluster. The unit does not join the cluster until both applications are operational. Once in the cluster, the unit monitors the decorator application health every 3 seconds. If the decorator application is down, the unit is removed from the cluster.

**Status After Failure**

When a unit in the cluster fails, the connections hosted by that unit are seamlessly transferred to other units; state information for traffic flows is shared over the control unit’s cluster control link.

If the control unit fails, then another member of the cluster with the highest priority (lowest number) becomes the control unit.

The FTD automatically tries to rejoin the cluster, depending on the failure event.

---

**Note**

When the FTD becomes inactive and fails to automatically rejoin the cluster, all data interfaces are shut down; only the Management/Diagnostic interface can send and receive traffic.

**Rejoining the Cluster**

After a cluster member is removed from the cluster, how it can rejoin the cluster depends on why it was removed:

- Failed cluster control link when initially joining—After you resolve the problem with the cluster control link, you must manually rejoin the cluster by re-enabling clustering.

- Failed cluster control link after joining the cluster—The FTD automatically tries to rejoin every 5 minutes, indefinitely.

- Failed data interface—The FTD automatically tries to rejoin at 5 minutes, then at 10 minutes, and finally at 20 minutes. If the join is not successful after 20 minutes, then the FTD application disables clustering. After you resolve the problem with the data interface, you have to manually enable clustering.

- Failed unit—If the unit was removed from the cluster because of a unit health check failure, then rejoining the cluster depends on the source of the failure. For example, a temporary power failure means the unit will rejoin the cluster when it starts up again as long as the cluster control link is up. The FTD application attempts to rejoin the cluster every 5 seconds.

- Failed Chassis-Application Communication—When the FTD application detects that the chassis-application health has recovered, it tries to rejoin the cluster automatically.
• Internal error—Internal failures include: application sync timeout; inconsistent application statuses; and so on.

• Failed configuration deployment—If you deploy a new configuration from FMC, and the deployment fails on some cluster members but succeeds on others, then the units that failed are removed from the cluster. You must manually rejoin the cluster by re-enabling clustering. If the deployment fails on the control unit, then the deployment is rolled back, and no members are removed.

Data Path Connection State Replication

Every connection has one owner and at least one backup owner in the cluster. The backup owner does not take over the connection in the event of a failure; instead, it stores TCP/UDP state information, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner is usually also the director.

Some traffic requires state information above the TCP or UDP layer. See the following table for clustering support or lack of support for this kind of traffic.

How the Cluster Manages Connections

Connections can be load-balanced to multiple members of the cluster. Connection roles determine how connections are handled in both normal operation and in a high availability situation.

Connection Roles

See the following roles defined for each connection:

• Owner—Usually, the unit that initially receives the connection. The owner maintains the TCP state and processes packets. A connection has only one owner. If the original owner fails, then when new units receive packets from the connection, the director chooses a new owner from those units.

• Backup owner—The unit that stores TCP/UDP state information received from the owner, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner does
not take over the connection in the event of a failure. If the owner becomes unavailable, then the first unit to receive packets from the connection (based on load balancing) contacts the backup owner for the relevant state information so it can become the new owner.

As long as the director (see below) is not the same unit as the owner, then the director is also the backup owner. If the owner chooses itself as the director, then a separate backup owner is chosen.

For inter-chassis clustering on the Firepower 9300, which can include up to 3 cluster units in one chassis, if the backup owner is on the same chassis as the owner, then an additional backup owner will be chosen from another chassis to protect flows from a chassis failure.

• Director—The unit that handles owner lookup requests from forwarders. When the owner receives a new connection, it chooses a director based on a hash of the source/destination IP address and ports, and sends a message to the director to register the new connection. If packets arrive at any unit other than the owner, the unit queries the director about which unit is the owner so it can forward the packets. A connection has only one director. If a director fails, the owner chooses a new director.

As long as the director is not the same unit as the owner, then the director is also the backup owner (see above). If the owner chooses itself as the director, then a separate backup owner is chosen.

• Forwarder—A unit that forwards packets to the owner. If a forwarder receives a packet for a connection it does not own, it queries the director for the owner, and then establishes a flow to the owner for any other packets it receives for this connection. The director can also be a forwarder. Note that if a forwarder receives the SYN-ACK packet, it can derive the owner directly from a SYN cookie in the packet, so it does not need to query the director. (If you disable TCP sequence randomization, the SYN cookie is not used; a query to the director is required.) For short-lived flows such as DNS and ICMP, instead of querying, the forwarder immediately sends the packet to the director, which then sends them to the owner. A connection can have multiple forwarders; the most efficient throughput is achieved by a good load-balancing method where there are no forwarders and all packets of a connection are received by the owner.

\[\text{Note} \quad \text{We do not recommend disabling TCP sequence randomization when using clustering. There is a small chance that some TCP sessions won't be established, because the SYN/ACK packet might be dropped.}\]

• Fragment Owner—For fragmented packets, cluster units that receive a fragment determine a fragment owner using a hash of the fragment source IP address, destination IP address, and the packet ID. All fragments are then forwarded to the fragment owner over the cluster control link. Fragments may be load-balanced to different cluster units, because only the first fragment includes the 5-tuple used in the switch load balance hash. Other fragments do not contain the source and destination ports and may be load-balanced to other cluster units. The fragment owner temporarily reassembles the packet so it can determine the director based on a hash of the source/destination IP address and ports. If it is a new connection, the fragment owner will register to be the connection owner. If it is an existing connection, the fragment owner forwards all fragments to the provided connection owner over the cluster control link. The connection owner will then reassemble all fragments.

New Connection Ownership

When a new connection is directed to a member of the cluster via load balancing, that unit owns both directions of the connection. If any connection packets arrive at a different unit, they are forwarded to the owner unit
over the cluster control link. If a reverse flow arrives at a different unit, it is redirected back to the original unit.

Sample Data Flow

The following example shows the establishment of a new connection.

1. The SYN packet originates from the client and is delivered to one FTD (based on the load balancing method), which becomes the owner. The owner creates a flow, encodes owner information into a SYN cookie, and forwards the packet to the server.

2. The SYN-ACK packet originates from the server and is delivered to a different FTD (based on the load balancing method). This FTD is the forwarder.

3. Because the forwarder does not own the connection, it decodes owner information from the SYN cookie, creates a forwarding flow to the owner, and forwards the SYN-ACK to the owner.

4. The owner sends a state update to the director, and forwards the SYN-ACK to the client.

5. The director receives the state update from the owner, creates a flow to the owner, and records the TCP state information as well as the owner. The director acts as the backup owner for the connection.

6. Any subsequent packets delivered to the forwarder will be forwarded to the owner.

7. If packets are delivered to any additional units, it will query the director for the owner and establish a flow.

8. Any state change for the flow results in a state update from the owner to the director.

### History for Clustering

**Feature** | **Version** | **Details**
--- | --- | ---
Inter-chassis clustering for 6 modules; Firepower 4100 support | 6.2 | With FXOS 2.1.1, you can now enable inter-chassis clustering on the Firepower 9300 and 4100. For the Firepower 9300, you can include up to 6 modules. For example, you can use 1 module in 6 chassis, or 2 modules in 3 chassis, or any combination that provides a maximum of 6 modules. For the Firepower 4100, you can include up to 6 chassis.

**Note** Inter-site clustering is also supported. However, customizations to enhance redundancy and stability, such as site-specific MAC and IP addresses, director localization, site redundancy, and cluster flow mobility, are only configurable using the FlexConfig feature.

No modified screens.
Supported platforms: Firepower Threat Defense on the Firepower 4100/9300

Intra-chassis Clustering for the Firepower 9300 | 6.0.1 | You can cluster up to 3 security modules within the Firepower 9300 chassis. All modules in the chassis must belong to the cluster.

- About Route Maps, on page 802

Path Determination

Routing protocols use metrics to evaluate what path will be the best for a packet to travel. A metric is a standard of measurement, such as path bandwidth, that is used by routing algorithms to determine the optimal path to a destination. To aid the process of path determination, routing algorithms initialize and maintain routing tables, which include route information. Route information varies depending on the routing algorithm used.

Routing algorithms fill routing tables with a variety of information. Destination or next hop associations tell a router that a particular destination can be reached optimally by sending the packet to a particular router representing the next hop on the way to the final destination. When a router receives an incoming packet, it checks the destination address and attempts to associate this address with a next hop.

Routing tables also can include other information, such as data about the desirability of a path. Routers compare metrics to determine optimal routes, and these metrics differ depending on the design of the routing algorithm used.

Routers communicate with one another and maintain their routing tables through the transmission of a variety of messages. The routing update message is one such message that generally consists of all or a portion of a routing table. By analyzing routing updates from all other routers, a router can build a detailed picture of network topology. A link-state advertisement, another example of a message sent between routers, informs other routers of the state of the sender links. Link information also can be used to build a complete picture of network topology to enable routers to determine optimal routes to network destinations.
Supported Route Types

There are several route types that a router can use. The Firepower Threat Defense device uses the following route types:

- Static Versus Dynamic
- Single-Path Versus Multipath
- Flat Versus Hierarchical
- Link-State Versus Distance Vector

Static Versus Dynamic

Static routing algorithms are actually table mappings established by the network administrator. These mappings do not change unless the network administrator alters them. Algorithms that use static routes are simple to design and work well in environments where network traffic is relatively predictable and where network design is relatively simple.

Because static routing systems cannot react to network changes, they generally are considered unsuitable for large, constantly changing networks. Most of the dominant routing algorithms are dynamic routing algorithms, which adjust to changing network circumstances by analyzing incoming routing update messages. If the message indicates that a network change has occurred, the routing software recalculates routes and sends out new routing update messages. These messages permeate the network, stimulating routers to rerun their algorithms and change their routing tables accordingly.

Dynamic routing algorithms can be supplemented with static routes where appropriate. A router of last resort (a default route for a router to which all unroutable packets are sent), for example, can be designated to act as a repository for all unroutable packets, ensuring that all messages are at least handled in some way.

Single-Path Versus Multipath

Some sophisticated routing protocols support multiple paths to the same destination. Unlike single-path algorithms, these multipath algorithms permit traffic multiplexing over multiple lines. The advantages of multipath algorithms are substantially better throughput and reliability, which is generally called load sharing.

Flat Versus Hierarchical

Some routing algorithms operate in a flat space, while others use routing hierarchies. In a flat routing system, the routers are peers of all others. In a hierarchical routing system, some routers form what amounts to a routing backbone. Packets from non-backbone routers travel to the backbone routers, where they are sent through the backbone until they reach the general area of the destination. At this point, they travel from the last backbone router through one or more non-backbone routers to the final destination.

Routing systems often designate logical groups of nodes, called domains, autonomous systems, or areas. In hierarchical systems, some routers in a domain can communicate with routers in other domains, while others can communicate only with routers within their domain. In very large networks, additional hierarchical levels may exist, with routers at the highest hierarchical level forming the routing backbone.
The primary advantage of hierarchical routing is that it mimics the organization of most companies and therefore supports their traffic patterns well. Most network communication occurs within small company groups (domains). Because intradomain routers need to know only about other routers within their domain, their routing algorithms can be simplified, and, depending on the routing algorithm being used, routing update traffic can be reduced accordingly.

**Link-State Versus Distance Vector**

Link-state algorithms (also known as shortest path first algorithms) flood routing information to all nodes in the internetwork. Each router, however, sends only the portion of the routing table that describes the state of its own links. In link-state algorithms, each router builds a picture of the entire network in its routing tables. Distance vector algorithms (also known as Bellman-Ford algorithms) call for each router to send all or some portion of its routing table, but only to its neighbors. In essence, link-state algorithms send small updates everywhere, while distance vector algorithms send larger updates only to neighboring routers. Distance vector algorithms know only about their neighbors. Typically, link-state algorithms are used in conjunction with OSPF routing protocols.

**Supported Internet Protocols for Routing**

The Firepower Threat Defense device supports several Internet protocols for routing. Each protocol is briefly described in this section.

- **Enhanced Interior Gateway Routing Protocol (EIGRP)**
  
  EIGRP is a Cisco proprietary protocol that provides compatibility and seamless interoperation with IGRP routers. An automatic-redistribution mechanism allows IGRP routes to be imported into Enhanced IGRP, and vice versa, so it is possible to add Enhanced IGRP gradually into an existing IGRP network.

- **Open Shortest Path First (OSPF)**
  
  OSPF is a routing protocol developed for Internet Protocol (IP) networks by the interior gateway protocol (IGP) working group of the Internet Engineering Task Force (IETF). OSPF uses a link-state algorithm to build and calculate the shortest path to all known destinations. Each router in an OSPF area includes an identical link-state database, which is a list of each of the router usable interfaces and reachable neighbors.

- **Routing Information Protocol (RIP)**
  
  RIP is a distance-vector protocol that uses hop count as its metric. RIP is widely used for routing traffic in the global Internet and is an interior gateway protocol (IGP), which means that it performs routing within a single autonomous system.

- **Border Gateway Protocol (BGP)**
  
  BGP is an interautonomous system routing protocol. BGP is used to exchange routing information for the Internet and is the protocol used between Internet service providers (ISP). Customers connect to ISPs, and ISPs use BGP to exchange customer and ISP routes. When BGP is used between autonomous systems (AS), the protocol is referred to as External BGP (EBGP). If a service provider is using BGP to exchange routes within an AS, then the protocol is referred to as Interior BGP (IBGP).
Routing Table

The FTD uses separate routing tables for data traffic (through-the-device) and for management traffic (from-the-device). This section describes how the routing tables work. For information about the management routing table, see also Routing Table for Management Traffic, on page 801.

How the Routing Table Is Populated

The FTD routing table can be populated by statically defined routes, directly connected routes, and routes discovered by the dynamic routing protocols. Because the FTD can run multiple routing protocols in addition to having static and connected routes in the routing table, it is possible that the same route is discovered or entered in more than one manner. When two routes to the same destination are put into the routing table, the one that remains in the routing table is determined as follows:

• If the two routes have different network prefix lengths (network masks), then both routes are considered unique and are entered into the routing table. The packet forwarding logic then determines which of the two to use.

For example, if the RIP and OSPF processes discovered the following routes:

- RIP: 192.168.32.0/24
- OSPF: 192.168.32.0/19

Even though OSPF routes have the better administrative distance, both routes are installed in the routing table because each of these routes has a different prefix length (subnet mask). They are considered different destinations and the packet forwarding logic determines which route to use.

• If the FTD learns about multiple paths to the same destination from a single routing protocol, such as RIP, the route with the better metric (as determined by the routing protocol) is entered into the routing table.

Metrics are values associated with specific routes, ranking them from most preferred to least preferred. The parameters used to determine the metrics differ for different routing protocols. The path with the lowest metric is selected as the optimal path and installed in the routing table. If there are multiple paths to the same destination with equal metrics, load balancing is done on these equal cost paths.

• If the FTD learns about a destination from more than one routing protocol, the administrative distances of the routes are compared, and the routes with lower administrative distance are entered into the routing table.

Administrative Distances for Routes

You can change the administrative distances for routes discovered by or redistributed into a routing protocol. If two routes from two different routing protocols have the same administrative distance, then the route with the lower default administrative distance is entered into the routing table. In the case of EIGRP and OSPF routes, if the EIGRP route and the OSPF route have the same administrative distance, then the EIGRP route is chosen by default.

Administrative distance is a route parameter that the Firepower Threat Defense device uses to select the best path when there are two or more different routes to the same destination from two different routing protocols. Because the routing protocols have metrics based on algorithms that are different from the other protocols, it
is not always possible to determine the best path for two routes to the same destination that were generated by different routing protocols.

Each routing protocol is prioritized using an administrative distance value. The following table shows the default administrative distance values for the routing protocols supported by the Firepower Threat Defense device.

<table>
<thead>
<tr>
<th>Route Source</th>
<th>Default Administrative Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connected interface</td>
<td>0</td>
</tr>
<tr>
<td>Static route</td>
<td>1</td>
</tr>
<tr>
<td>EIGRP Summary Route</td>
<td>5</td>
</tr>
<tr>
<td>External BGP</td>
<td>20</td>
</tr>
<tr>
<td>Internal EIGRP</td>
<td>90</td>
</tr>
<tr>
<td>OSPF</td>
<td>110</td>
</tr>
<tr>
<td>IS-IS</td>
<td>115</td>
</tr>
<tr>
<td>RIP</td>
<td>120</td>
</tr>
<tr>
<td>EIGRP external route</td>
<td>170</td>
</tr>
<tr>
<td>Internal and local BGP</td>
<td>200</td>
</tr>
<tr>
<td>Unknown</td>
<td>255</td>
</tr>
</tbody>
</table>

The smaller the administrative distance value, the more preference is given to the protocol. For example, if the Firepower Threat Defense device receives a route to a certain network from both an OSPF routing process (default administrative distance - 110) and a RIP routing process (default administrative distance - 120), the Firepower Threat Defense device chooses the OSPF route because OSPF has a higher preference. In this case, the router adds the OSPF version of the route to the routing table.

In this example, if the source of the OSPF-derived route was lost (for example, due to a power shutdown), the Firepower Threat Defense device would then use the RIP-derived route until the OSPF-derived route reappears.

The administrative distance is a local setting. For example, if you change the administrative distance of routes obtained through OSPF, that change would only affect the routing table for the Firepower Threat Defense device on which the command was entered. The administrative distance is not advertised in routing updates.

Administrative distance does not affect the routing process. The routing processes only advertise the routes that have been discovered by the routing process or redistributed into the routing process. For example, the RIP routing process advertises RIP routes, even if routes discovered by the OSPF routing process are used in the routing table.

**Backup Dynamic and Floating Static Routes**

A backup route is registered when the initial attempt to install the route in the routing table fails because another route was installed instead. If the route that was installed in the routing table fails, the routing table
maintenance process calls each routing protocol process that has registered a backup route and requests them to reinstall the route in the routing table. If there are multiple protocols with registered backup routes for the failed route, the preferred route is chosen based on administrative distance.

Because of this process, you can create floating static routes that are installed in the routing table when the route discovered by a dynamic routing protocol fails. A floating static route is simply a static route configured with a greater administrative distance than the dynamic routing protocols running on the Firepower Threat Defense device. When the corresponding route discovered by a dynamic routing process fails, the static route is installed in the routing table.

How Forwarding Decisions Are Made

Forwarding decisions are made as follows:

- If the destination does not match an entry in the routing table, the packet is forwarded through the interface specified for the default route. If a default route has not been configured, the packet is discarded.
- If the destination matches a single entry in the routing table, the packet is forwarded through the interface associated with that route.
- If the destination matches more than one entry in the routing table, then the packet is forwarded out of the interface associated with the route that has the longer network prefix length.

For example, a packet destined for 192.168.32.1 arrives on an interface with the following routes in the routing table:

- 192.168.32.0/24 gateway 10.1.1.2
- 192.168.32.0/19 gateway 10.1.1.3

In this case, a packet destined to 192.168.32.1 is directed toward 10.1.1.2, because 192.168.32.1 falls within the 192.168.32.0/24 network. It also falls within the other route in the routing table, but 192.168.32.0/24 has the longest prefix within the routing table (24 bits versus 19 bits). Longer prefixes are always preferred over shorter ones when forwarding a packet.

Note

Existing connections continue to use their established interfaces even if a new similar connection would result in different behavior due to a change in routes.

Dynamic Routing and High Availability

Dynamic routes are synchronized on the standby unit when the routing table changes on the active unit. This means that all additions, deletions, or changes on the active unit are immediately propagated to the standby unit. If the standby unit becomes active in an active/standy ready High Availability pair, it will already have an identical routing table as that of the former active unit because routes are synchronized as a part of the High Availability bulk synchronization and continuous replication processes.

Dynamic Routing in Clustering

The routing process only runs on the control unit, and routes are learned through the control unit and replicated to data units. If a routing packet arrives at a data unit, it is redirected to the control unit.
After the data unit learn the routes from the control unit, each unit makes forwarding decisions independently. The OSPF LSA database is not synchronized from the control unit to data units. If there is a control unit switchover, the neighboring router will detect a restart; the switchover is not transparent. The OSPF process picks an IP address as its router ID. Although not required, you can assign a static router ID to ensure a consistent router ID is used across the cluster. See the OSPF Non-Stop Forwarding feature to address the interruption.

Routing Table for Management Traffic

Equal-Cost Multi-Path (ECMP) Routing

The Firepower Threat Defense device supports Equal-Cost Multi-Path (ECMP) routing. You can have up to 8 equal cost static or dynamic routes per interface. For example, you can configure multiple default routes on the outside interface that specify different gateways.

- route for 0.0.0.0 0.0.0.0 through outside to 10.1.1.2
- route for 0.0.0.0 0.0.0.0 through outside to 10.1.1.3
- route for 0.0.0.0 0.0.0.0 through outside to 10.1.1.4
In this case, traffic is load-balanced on the outside interface between 10.1.1.2, 10.1.1.3, and 10.1.1.4. Traffic is distributed among the specified gateways based on an algorithm that hashes the source and destination IP addresses, incoming interface, protocol, source and destination ports.

### About Route Maps

Route maps are used when redistributing routes into an OSPF, RIP, EIGRP or BGP routing process. They are also used when generating a default route into an OSPF routing process. A route map defines which of the routes from the specified routing protocol are allowed to be redistributed into the target routing process.

Route maps have many features in common with widely known ACLs. These are some of the traits common to both:

- They are an ordered sequence of individual statements, and each has a permit or deny result. Evaluation of an ACL or a route map consists of a list scan, in a predetermined order, and an evaluation of the criteria of each statement that matches. A list scan is aborted once the first statement match is found and an action associated with the statement match is performed.

- They are generic mechanisms. Criteria matches and match interpretation are dictated by the way that they are applied and the feature that uses them. The same route map applied to different features might be interpreted differently.

These are some of the differences between route maps and ACLs:

- Route maps are more flexible than ACLs and can verify routes based on criteria which ACLs cannot verify. For example, a route map can verify if the type of route is internal.

- Each ACL ends with an implicit deny statement, by design convention. If the end of a route map is reached during matching attempts, the result depends on the specific application of the route map. Route maps that are applied to redistribution behave the same way as ACLs: if the route does not match any clause in a route map then the route redistribution is denied, as if the route map contained a deny statement at the end.

### Permit and Deny Clauses

Route maps can have permit and deny clauses. The deny clause rejects route matches from redistribution. You can use an ACL as the matching criterion in the route map. Because ACLs also have permit and deny clauses, the following rules apply when a packet matches the ACL:

- ACL permit + route map permit: routes are redistributed.

- ACL permit + route map deny: routes are not redistributed.

- ACL deny + route map permit or deny: the route map clause is not matched, and the next route-map clause is evaluated.

### Match and Set Clause Values

Each route map clause has two types of values:

- A match value selects routes to which this clause should be applied.
- A set value modifies information that will be redistributed into the target protocol.

For each route that is being redistributed, the router first evaluates the match criteria of a clause in the route map. If the match criteria succeeds, then the route is redistributed or rejected as dictated by the permit or deny clause, and some of its attributes might be modified by the values set from the set commands. If the match criteria fail, then this clause is not applicable to the route, and the software proceeds to evaluate the route against the next clause in the route map. Scanning of the route map continues until a clause is found that matches the route or until the end of the route map is reached.

A match or set value in each clause can be missed or repeated several times, if one of these conditions exists:

- If several match entries are present in a clause, all must succeed for a given route in order for that route to match the clause (in other words, the logical AND algorithm is applied for multiple match commands).

- If a match entry refers to several objects in one entry, either of them should match (the logical OR algorithm is applied).

- If a match entry is not present, all routes match the clause.

- If a set entry is not present in a route map permit clause, then the route is redistributed without modification of its current attributes.

---

**Note**

Do not configure a set entry in a route map deny clause because the deny clause prohibits route redistribution—there is no information to modify.

A route map clause without a match or set entry does perform an action. An empty permit clause allows a redistribution of the remaining routes without modification. An empty deny clause does not allow a redistribution of other routes (this is the default action if a route map is completely scanned, but no explicit match is found).
CHAPTER 38

Static and Default Routes for Firepower Threat Defense

This chapter describes how to configure static and default routes on the FTD.

- About Static and Default Routes, on page 805
- Requirements and Prerequisites for Static Routes, on page 807
- Guidelines for Static and Default Routes, on page 808
- Add a Static Route, on page 808

About Static and Default Routes

To route traffic to a non-connected host or network, you must define a route to the host or network, either using static or dynamic routing. Generally, you must configure at least one static route: a default route for all traffic that is not routed by other means to a default network gateway, typically the next hop router.

Default Route

The simplest option is to configure a default static route to send all traffic to an upstream router, relying on the router to route the traffic for you. A default route identifies the gateway IP address to which the FTD device sends all IP packets for which it does not have a learned or static route. A default static route is simply a static route with 0.0.0.0/0 (IPv4) or ::/0 (IPv6) as the destination IP address.

You should always define a default route.

Because the FTD uses separate routing tables for data traffic and for management traffic, you can optionally configure a default route for data traffic and another default route for management traffic. Note that from-the-device traffic uses either the management-only or data routing table by default depending on the type (see Routing Table for Management Traffic, on page 801), but will fall back to the other routing table if a route is not found. Default routes will always match traffic, and will prevent a fall back to the other routing table. In this case, you must specify the interface you want to use for egress traffic if that interface is not in the default routing table. The Diagnostic interface is included in the management-only table. The special Management interface uses a separate Linux routing table, and has its own default route. See the configure network commands.
Static Routes

You might want to use static routes in the following cases:

- Your networks use an unsupported router discovery protocol.
- Your network is small and you can easily manage static routes.
- You do not want the traffic or CPU overhead associated with routing protocols.
- In some cases, a default route is not enough. The default gateway might not be able to reach the destination network, so you must also configure more specific static routes. For example, if the default gateway is outside, then the default route cannot direct traffic to any inside networks that are not directly connected to the FTD device.
- You are using a feature that does not support dynamic routing protocols.

Route to null0 Interface to Drop Unwanted Traffic

Access rules let you filter packets based on the information contained in their headers. A static route to the null0 interface is a complementary solution to access rules. You can use a null0 route to forward unwanted or undesirable traffic so the traffic is dropped.

Static null0 routes have a favorable performance profile. You can also use static null0 routes to prevent routing loops. BGP can leverage the static null0 route for Remotely Triggered Black Hole routing.

Route Priorities

- Routes that identify a specific destination take precedence over the default route.
- When multiple routes exist to the same destination (either static or dynamic), then the administrative distance for the route determines priority. Static routes are set to 1, so they typically are the highest priority routes.
- When you have multiple static routes to the same destination with the same administrative distance, see Equal-Cost Multi-Path (ECMP) Routing, on page 801.
- For traffic emerging from a tunnel with the Tunneled option, this route overrides any other configured or learned default routes.

Transparent Firewall Mode and Bridge Group Routes

For traffic that originates on the Firepower Threat Defense device and is destined through a bridge group member interface for a non-directly connected network, you need to configure either a default route or static routes so the Firepower Threat Defense device knows out of which bridge group member interface to send traffic. Traffic that originates on the Firepower Threat Defense device might include communications to a syslog server or SNMP server. If you have servers that cannot all be reached through a single default route, then you must configure static routes. For transparent mode, you cannot specify the BVI as the gateway interface; only member interfaces can be used. For bridge groups in routed mode, you must specify the BVI in a static route; you cannot specify a member interface. See MAC Address vs. Route Lookups, on page 596 for more information.
Static Route Tracking

One of the problems with static routes is that there is no inherent mechanism for determining if the route is up or down. They remain in the routing table even if the next hop gateway becomes unavailable. Static routes are only removed from the routing table if the associated interface on the Firepower Threat Defense device goes down.

The static route tracking feature provides a method for tracking the availability of a static route and installing a backup route if the primary route should fail. For example, you can define a default route to an ISP gateway and a backup default route to a secondary ISP in case the primary ISP becomes unavailable.

The Firepower Threat Defense device implements static route tracking by associating a static route with a monitoring target host on the destination network that the Firepower Threat Defense device monitors using ICMP echo requests. If an echo reply is not received within a specified time period, the host is considered down, and the associated route is removed from the routing table. An untracked backup route with a higher metric is used in place of the removed route.

When selecting a monitoring target, you need to make sure that it can respond to ICMP echo requests. The target can be any network object that you choose, but you should consider using the following:

- The ISP gateway (for dual ISP support) address
- The next hop gateway address (if you are concerned about the availability of the gateway)
- A server on the target network, such as a syslog server, that the Firepower Threat Defense device needs to communicate with
- A persistent network object on the destination network

Note

A PC that may be shut down at night is not a good choice.

You can configure static route tracking for statically defined routes or default routes obtained through DHCP or PPPoE. You can only enable PPPoE clients on multiple interfaces with route tracking configured.

Guidelines for Static and Default Routes

**Firewall Mode and Bridge Groups**

- In transparent mode, static routes must use the bridge group member interface as the gateway; you cannot specify the BVI.
- In routed mode, you must specify the BVI as the gateway; you cannot specify the member interface.
- Static route tracking is not supported for bridge group member interfaces or on the BVI.

**IPv6**

- Static route tracking is not supported for IPv6.

**Clustering and Multiple Context Mode**

- In clustering, static route tracking is only supported on the primary unit.
- Static route tracking is not supported in multiple context mode.

**Network Object Group**

You cannot use a range of network objects or a network object group having a range of IP addresses while configuring a static route.

### Add a Static Route

A static route defines where to send traffic for specific destination networks. You should at a minimum define a default route. A default route is simply a static route with 0.0.0.0/0 as the destination IP address.

**Step 1** Choose Devices > Device Management, and edit the FTD device.

**Step 2** Click Routing.

**Step 3** Select Static Route.

**Step 4** Click Add Routes.

**Step 5** Click IPv4 or IPv6 depending on the type of static route that you are adding.

**Step 6** Choose the Interface to which this static route applies.

- For transparent mode, choose a bridge group member interface name. For routed mode with bridge groups, you can choose either the bridge group member interface for the BVI name. To “black hole” unwanted traffic, choose the Null0 interface.

**Step 7** In the Available Network list, choose the destination network.

To define a default route, create an object with the address 0.0.0.0/0 and select it here.

**Note** Though you can create and choose a Network Object Group containing a range of IP addresses, FMC does not support using range of network objects while configuring a static route.
Step 8  In the **Gateway** or **IPv6 Gateway** field, enter or choose the gateway router which is the next hop for this route. You can provide an IP address or a Networks/Hosts object.

Step 9  In the **Metric** field, enter the number of hops to the destination network. Valid values range from 1 to 255; the default value is 1. The metric is a measurement of the “expense” of a route, based on the number of hops (hop count) to the network on which a specific host resides. Hop count is the number of networks that a network packet must traverse, including the destination network, before it reaches its final destination. The metric is used to compare routes among different routing protocols. The default administrative distance for static routes is 1, giving it precedence over routes discovered by dynamic routing protocols but not directly connected routes. The default administrative distance for routes discovered by OSPF is 110. If a static route has the same administrative distance as a dynamic route, the static route takes precedence. Connected routes always take precedence over static or dynamically discovered routes.

Step 10  (Optional) For a default route, click the **Tunneled** checkbox to define a separate default route for VPN traffic.

You can define a separate default route for VPN traffic if you want your VPN traffic to use a different default route than your non VPN traffic. For example, traffic incoming from VPN connections can be easily directed towards internal networks, while traffic from internal networks can be directed towards the outside. When you create a default route with the tunneled option, all traffic from a tunnel terminating on the device that cannot be routed using learned or static routes, is sent to this route. You can configure only one default tunneled gateway per device. ECMP for tunneled traffic is not supported.

Step 11  (IPv4 static route only) To monitor route availability, enter or choose the name of an SLA (service level agreement) Monitor object that defines the monitoring policy, in the **Route Tracking** field.

See SLA Monitor Objects, on page 503.

Step 12  Click **Ok**.
Add a Static Route
OSPF for Firepower Threat Defense

This chapter describes how to configure the FTD to route data, perform authentication, and redistribute routing information using the Open Shortest Path First (OSPF) routing protocol.

- OSPF for Firepower Threat Defense, on page 811
- Requirements and Prerequisites for OSPF, on page 814
- Guidelines for OSPF, on page 814
- Configure OSPFv2, on page 816
- Configure OSPFv3, on page 827

About OSPF

OSPF is an interior gateway routing protocol that uses link states rather than distance vectors for path selection. OSPF propagates link-state advertisements rather than routing table updates. Because only LSAs are exchanged instead of the entire routing tables, OSPF networks converge more quickly than RIP networks.

OSPF uses a link-state algorithm to build and calculate the shortest path to all known destinations. Each router in an OSPF area contains an identical link-state database, which is a list of each of the router usable interfaces and reachable neighbors.

The advantages of OSPF over RIP include the following:

- OSPF link-state database updates are sent less frequently than RIP updates, and the link-state database is updated instantly, rather than gradually, as stale information is timed out.

- Routing decisions are based on cost, which is an indication of the overhead required to send packets across a certain interface. The Firepower Threat Defense device calculates the cost of an interface based on link bandwidth rather than the number of hops to the destination. The cost can be configured to specify preferred paths.

The disadvantage of shortest path first algorithms is that they require a lot of CPU cycles and memory.

The Firepower Threat Defense device can run two processes of OSPF protocol simultaneously on different sets of interfaces. You might want to run two processes if you have interfaces that use the same IP addresses.
(NAT allows these interfaces to coexist, but OSPF does not allow overlapping addresses). Or you might want to run one process on the inside and another on the outside, and redistribute a subset of routes between the two processes. Similarly, you might need to segregate private addresses from public addresses.

You can redistribute routes into an OSPF routing process from another OSPF routing process, a RIP routing process, or from static and connected routes configured on OSPF-enabled interfaces.

The Firepower Threat Defense device supports the following OSPF features:

- Intra-area, inter-area, and external (Type I and Type II) routes.
- Virtual links.
- LSA flooding.
- Authentication to OSPF packets (both password and MD5 authentication).
- Configuring the Firepower Threat Defense device as a designated router or a designated backup router. The Firepower Threat Defense device also can be set up as an ABR.
- Stub areas and not-so-stubby areas.
- Area boundary router Type 3 LSA filtering.

OSPF supports MD5 and clear text neighbor authentication. Authentication should be used with all routing protocols when possible because route redistribution between OSPF and other protocols (such as RIP) can potentially be used by attackers to subvert routing information.

If NAT is used, if OSPF is operating on public and private areas, and if address filtering is required, then you need to run two OSPF processes—one process for the public areas and one for the private areas.

A router that has interfaces in multiple areas is called an Area Border Router (ABR). A router that acts as a gateway to redistribute traffic between routers using OSPF and routers using other routing protocols is called an Autonomous System Boundary Router (ASBR).

An ABR uses LSAs to send information about available routes to other OSPF routers. Using ABR Type 3 LSA filtering, you can have separate private and public areas with the ASA acting as an ABR. Type 3 LSAs (inter-area routes) can be filtered from one area to other, which allows you to use NAT and OSPF together without advertising private networks.

---

**Note**

Only Type 3 LSAs can be filtered. If you configure the Firepower Threat Defense device as an ASBR in a private network, it will send Type 5 LSAs describing private networks, which will get flooded to the entire AS, including public areas.

If NAT is employed but OSPF is only running in public areas, then routes to public networks can be redistributed inside the private network, either as default or Type 5 AS external LSAs. However, you need to configure static routes for the private networks protected by the Firepower Threat Defense device. Also, you should not mix public and private networks on the same Firepower Threat Defense device interface.

You can have two OSPF routing processes, one RIP routing process, and one EIGRP routing process running on the Firepower Threat Defense device at the same time.
OSPF Support for Fast Hello Packets

The OSPF Support for Fast Hello Packets feature provides a way to configure the sending of hello packets in intervals less than one second. Such a configuration would result in faster convergence in an Open Shortest Path First (OSPF) network.

Prerequisites for OSPF Support for Fast Hello Packets

OSPF must be configured in the network already or configured at the same time as the OSPF Support for Fast Hello Packets feature.

OSPF Hello Interval and Dead Interval

OSPF hello packets are packets that an OSPF process sends to its OSPF neighbors to maintain connectivity with those neighbors. The hello packets are sent at a configurable interval (in seconds). The defaults are 10 seconds for an Ethernet link and 30 seconds for a non-broadcast link. Hello packets include a list of all neighbors for which a hello packet has been received within the dead interval. The dead interval is also a configurable interval (in seconds), and defaults to four times the value of the hello interval. The value of all hello intervals must be the same within a network. Likewise, the value of all dead intervals must be the same within a network.

These two intervals work together to maintain connectivity by indicating that the link is operational. If a router does not receive a hello packet from a neighbor within the dead interval, it will declare that neighbor to be down.

OSPF Fast Hello Packets

OSPF fast hello packets refer to hello packets being sent at intervals of less than 1 second. To understand fast hello packets, you should already understand the relationship between OSPF hello packets and the dead interval. See OSPF Hello Interval and Dead Interval, on page 813.

OSPF fast hello packets are achieved by using the ospf dead-interval command. The dead interval is set to 1 second, and the hello-multiplier value is set to the number of hello packets you want sent during that 1 second, thus providing subsecond or "fast" hello packets.

When fast hello packets are configured on the interface, the hello interval advertised in the hello packets that are sent out this interface is set to 0. The hello interval in the hello packets received over this interface is ignored.

The dead interval must be consistent on a segment, whether it is set to 1 second (for fast hello packets) or set to any other value. The hello multiplier need not be the same for the entire segment as long as at least one hello packet is sent within the dead interval.

Benefits of OSPF Fast Hello Packets

The benefit of the OSPF Fast Hello Packets feature is that your OSPF network will experience faster convergence time than it would without fast hello packets. This feature allows you to detect lost neighbors within 1 second. It is especially useful in LAN segments, where neighbor loss might not be detected by the Open System Interconnection (OSI) physical layer and data-link layer.
Implementation Differences Between OSPFv2 and OSPFv3

OSPFv3 is not backward compatible with OSPFv2. To use OSPF to route both IPv4 and IPv6 traffic, you must run both OSPFv2 and OSPFv3 at the same time. They coexist with each other, but do not interact with each other.

The additional features that OSPFv3 provides include the following:

- Protocol processing per link.
- Removal of addressing semantics.
- Addition of flooding scope.
- Support for multiple instances per link.
- Use of the IPv6 link-local address for neighbor discovery and other features.
- LSAs expressed as prefix and prefix length.
- Addition of two LSA types.
- Handling of unknown LSA types.
- Authentication support using the IPsec ESP standard for OSPFv3 routing protocol traffic, as specified by RFC-4552.

Requirements and Prerequisites for OSPF

Network Admin

Guidelines for OSPF

Firewall Mode Guidelines
OSPF supports routed firewall mode only. OSPF does not support transparent firewall mode.
High Availability Guidelines

OSPFv2 and OSPFv3 support Stateful High Availability.

IPv6 Guidelines

- OSPFv2 does not support IPv6.
- OSPFv3 supports IPv6.
- OSPFv3 uses IPv6 for authentication.
- The Firepower Threat Defense device installs OSPFv3 routes into the IPv6 RIB, provided it is the best route.

OSPFv3 Hello Packets and GRE

Typically, OSPF traffic does not pass through GRE tunnel. When OSPFv3 on IPv6 is encapsulated inside GRE, the IPv6 header validation for security check such as Multicast Destination fails. The packet is dropped due to the implicit security check validation, as this packet has destination IPv6 multicast.

You may define a pre-filter rule to bypass GRE traffic. However, with pre-filter rule, inner packets would not be interrogated by the inspection engine.

Clustering Guidelines

- OSPFv3 encryption is not supported. An error message appears if you try to configure OSPFv3 encryption in a clustering environment.
- In Spanned interface mode, dynamic routing is not supported on management-only interfaces.
- When a control role change occurs in the cluster, the following behavior occurs:
  - In spanned interface mode, the router process is active only on the control unit and is in a suspended state on the data units. Each cluster unit has the same router ID because the configuration has been synchronized from the control unit. As a result, a neighboring router does not notice any change in the router ID of the cluster during a role change.

Multiprotocol Label Switching (MPLS) and OSPF Guidelines

When a MPLS-configured router sends Link State (LS) update packets containing opaque Type-10 link-state advertisements (LSAs) that include an MPLS header, authentication fails and the appliance silently drops the update packets, rather than acknowledging them. Eventually the peer router will terminate the neighbor relationship because it has not received any acknowledgments.

Make sure that non-stop forwarding (NSF) is disabled on the appliance to ensure that the neighbor relationship remains stable:

- Navigate to the Non Stop Forwarding page in Firepower Management Center (Devices > Device Management (select the desired device) > Routing > OSPF > Advanced > Non Stop Forwarding).
  
  Ensure the Non Stop Forwarding Capability boxes are not checked.
Route Redistribution Guidelines

Redistribution of route maps with IPv4 or IPv6 prefix list on OSPFv2 or OSPFv3 is not supported. Use connected routes on OSPF for redistribution.

Additional Guidelines

- OSPFv2 and OSPFv3 support multiple instances on an interface.
- OSPFv3 supports encryption through ESP headers in a non-clustered environment.
- OSPFv3 supports Non-Payload Encryption.
- OSPFv2 supports Cisco NSF Graceful Restart and IETF NSF Graceful Restart mechanisms as defined in RFCs 4811, 4812 & 3623 respectively.
- OSPFv3 supports Graceful Restart mechanism as defined in RFC 5187.
- There is a limit to the number of intra area (type 1) routes that can be distributed. For these routes, a single type-1 LSA contains all prefixes. Because the system has a limit of 35 KB for packet size, 3000 routes result in a packet that exceeds the limit. Consider 2900 type 1 routes to be the maximum number supported.
  - To avoid adjacency flaps due to route updates being dropped if the route update is larger than the minimum MTU on the link, ensure that you configure the same MTU on the interfaces on both sides of the link.

Configure OSPFv2

This section describes the tasks involved in configuring an OSPFv2 routing process.

Configure OSPF Areas, Ranges, and Virtual Links

You can configure several OSPF area parameters, which include setting authentication, defining stub areas, and assigning specific costs to the default summary route. You can enable up to two OSPF process instances. Each OSPF process has its own associated areas and networks. Authentication provides password-based protection against unauthorized access to an area.

Stub areas are areas into which information on external routes is not sent. Instead, there is a default external route generated by the ABR into the stub area for destinations outside the autonomous system. To take advantage of the OSPF stub area support, default routing must be used in the stub area.

Step 1
Choose Devices > Device Management, and edit the FTD device.

Step 2
Click Routing.

Step 3
Click OSPF.

Step 4
Select Process 1. You can enable up to two OSPF process instances for each context. You must choose an OSPF process to be able to configure the Area parameters.

Step 5
Choose the OSPF role from the drop-down list, and enter a description for it in the next field. The options are Internal, ABR, ASBR, and ABR and ASBR. See About OSPF, on page 811 for a description of the OSPF roles.

Step 6
Select Area > Add.
You can click Edit ( ), or use the right-click menu to cut, copy, paste, insert, and delete areas.

**Step 7** Configure the following area options for each OSPF process:

- **OSPF Process**—Choose 1 or 2.

- **Area ID**—Designation of the area for which routes are to be summarized.

- **Area Type**—Choose one of the following:
  - **Normal**—(Default) Standard OSPF area.
  - **Stub**—A stub area does not have any routers or areas beyond it. Stub areas prevent Autonomous System (AS) External LSAs (Type 5 LSAs) from being flooded into the stub area. When you create a stub area, you can prevent summary LSAs (Types 3 and 4) from being flooded into the area by NOT checking the **Summary Stub** check box.
  - **NSSA**—Makes the area a not-so-stubby area (NSSA). NSSAs accept Type 7 LSAs. You can disable route redistribution by NOT checking the **Redistribute** check box and checking the **Default Information Originate** check box. You can prevent summary LSAs from being flooded into the area by NOT checking the **Summary NSSA** check box.

- **Metric Value**—The metric used for generating the default route. The default value is 10. Valid metric values range from 0 through 16777214.

- **Metric Type**—The metric type is the external link type that is associated with the default route that is advertised into the OSPF routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.

- **Available Network**—Choose one of the available networks and click **Add**, or click **Add ( )** to add a new network object. See Network Objects, on page 442 for the procedure for adding networks.

- **Authentication**—Choose the OSPF authentication:
  - **None**—(Default) Disables OSPF area authentication.
  - **Password**—Provides a clear text password for area authentication, which is not recommended where security is a concern.
  - **MD5**—Allows MD5 authentication.

- **Default Cost**—The default cost for the OSPF area, which is used to determine the shortest paths to the destination. Valid values range from 0 through 65535. The default value is 1.

**Step 8** Click **OK** to save the area configuration.

**Step 9** Select **Range > Add**.

- Choose one of the available networks and whether to advertise, or,

  - **Click Add ( )** to add a new network object. See Network Objects, on page 442 for the procedure for adding networks.

**Step 10** Click **OK** to save the range configuration.

**Step 11** Select **Virtual Link**, click **Add**, and configure the following options for each OSPF process:
• **Peer Router**—Choose the IP address of the peer router. To add a new peer router, click **Add** (○). See Network Objects, on page 442 for the procedure for adding networks.

• **Hello Interval**—The time in seconds between the hello packets sent on an interface. The hello interval is an unsigned integer that is to be advertised in the hello packets. The value must be the same for all routers and access servers on a specific network. Valid values range from 1 through 65535. The default is 10.

The smaller the hello interval, the faster topological changes are detected, but the more traffic is sent on the interface.

• **Transmit Delay**—The estimated time in seconds that is required to send an LSA packet on the interface. The integer value must be greater than zero. Valid values range from 1 through 8192. The default is 1.

LSAs in the update packet have their own ages incremented by this amount before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.

• **Retransmit Interval**—The time in seconds between LSA retransmissions for adjacencies that belong to the interface. The retransmit interval is the expected round-trip delay between any two routers on the attached network. The value must be greater than the expected round-trip delay, and can range from 1 through 65535. The default is 5.

When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links.

• **Dead Interval**—The time in seconds that hello packets are not seen before a neighbor indicates that the router is down. The dead interval is an unsigned integer. The default is four times the hello interval, or 40 seconds. The value must be the same for all routers and access servers that are attached to a common network. Valid values range from 1 through 65535.

• **Authentication**—Choose the OSPF virtual link authentication from the following:
  - **None**—(Default) Disables virtual link area authentication.
  - **Area Authentication**—Enables area authentication using MD5. Click **Add**, and enter the key ID, key, confirm the key, and then click **OK**.
  - **Password**—Provides a clear text password for virtual link authentication, which is not recommended where security is a concern.
  - **MD5**—Allows MD5 authentication. Click **Add**, and enter the key ID, key, confirm the key, and then click **OK**.

  **Note**
  Ensure to enter only numbers as the MD5 key ID.

  - **Key Chain**— Allows key chain authentication. Click **Add**, and create the key chain, and then click **Save**. For detailed procedure, see Creating Key Chain Objects, on page 501. Use the same authentication type (MD5 or Key Chain) and key ID for the peers to establish a successful adjacency.

**Step 12**
Click **OK** to save the virtual link configuration.

**Step 13**
Click **Save** on the Routing page to save your changes.
What to do next
Continue with Configure OSPF Redistribution.

Configure OSPF Redistribution

The Firepower Threat Defense device can control the redistribution of routes between the OSPF routing processes. The rules for redistributing routes from one routing process into an OSPF routing process are displayed. You can redistribute routes discovered by RIP and BGP into the OSPF routing process. You can also redistribute static and connected routes into the OSPF routing process.

Step 1 Choose Devices > Device Management, and edit the FTD device.
Step 2 Click Routing.
Step 3 Click OSPF.
Step 4 Select Distribution > Add.

You can click Edit ( ), or use the right-click menu to cut, copy, past, insert, and delete areas.

Step 5 Configure the following redistribution options for each OSPF process:

• Route Type—Choose one of the following types:
  • Static—Redistributes static routes to the OSPF routing process.
  • Connected—Redistributes connected routes (routes established automatically by virtue of having the IP address enabled on the interface) to the OSPF routing process. Connected routes are redistributed as external to the device. You can select whether to use subnets under the Optional list.
  • OSPF—Redistributes routes from another OSPF routing process, for example, internal, external 1 and 2, NSSA external 1 and 2, or whether to use subnets. You can select these options under the Optional list.
  • BGP—Redistribute routes from the BGP routing process. Add the AS number and whether to use subnets.
  • RIP—Redistributes routes from the RIP routing process. You can select whether to use subnets under the Optional list.

• Metric Value—Metric value for the routes being distributed. The default value is 10. Valid values range from 0 to 16777214.

  When redistributing from one OSPF process to another OSPF process on the same device, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified.

• Metric Type—The metric type is the external link type that is associated with the default route that is advertised into the OSPF routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.

• Tag Value—Tag specifies the 32-bit decimal value attached to each external route that is not used by OSPF itself, but which may be used to communicate information between ASBRs. If none is specified, then the remote autonomous system number is used for routes from BGP and EGP. For other protocols, zero is used. Valid values are from 0 to 4294967295.
Configure OSPF Inter-Area Filtering

ABR type 3 LSA filtering extends the capability of an ABR that is running OSPF to filter type 3 LSAs between different OSPF areas. Once a prefix list is configured, only the specified prefixes are sent from one OSPF area to another OSPF area. All other prefixes are restricted to their OSPF area. You can apply this type of area filtering to traffic going into or coming out of an OSPF area, or to both the incoming and outgoing traffic for that area.

When multiple entries of a prefix list match a given prefix, the entry with the lowest sequence number is used. For efficiency, you may want to put the most common matches or denials near the top of the list by manually assigning them a lower sequence number. By default, sequence numbers are automatically generated in increments of 5, beginning with 5.

Step 1 Choose Devices > Device Management, and edit the FTD device.
Step 2 Click Routing.
Step 3 Click OSPF.
Step 4 Select InterArea > Add.

You can click Edit (✏️), or use the right-click menu to cut, copy, past, insert, and delete inter-areas.

Step 5 Configure the following inter-area filtering options for each OSPF process:
  - **OSPF Process**—Choose 1 or 2.
  - **Area ID**—The area for which routes are to be summarized.
  - **PrefixList**—The name of the prefix. To add a new prefix list object, see Step 5.
  - **Traffic Direction**—Inbound or outbound. Choose Inbound to filter LSAs coming into an OSPF area, or Outbound to filter LSAs coming out of an OSPF area. If you are editing an existing filter entry, you cannot modify this setting.

Step 6 Click Add (لاء), and enter a name for the new prefix list, and whether to allow overrides.

You must configure a prefix list before you can configure a prefix rule.

Step 7 Click Add to configure prefix rules, and configure the following parameters:
  - **Action**—Select Block or Allow for the redistribution access.
Configure OSPF Filter Rules

You can configure ABR Type 3 LSA filters for each OSPF process. ABR Type 3 LSA filters allow only specified prefixes to be sent from one area to another area and restrict all other prefixes. You can apply this type of area filtering out of a specific OSPF area, into a specific OSPF area, or into and out of the same OSPF area at the same time. OSPF ABR Type 3 LSA filtering improves your control of route distribution between OSPF areas.

Step 1 Choose Devices > Device Management, and edit the FTD device.
Step 2 Click Routing.
Step 3 Click OSPF.
Step 4 Select Filter Rule > Add.

You can click Edit ( ), or use the right-click menu to cut, copy, past, insert, and delete filter rules.

Step 5 Configure the following filter rule options for each OSPF process:

- **OSPF Process**—Choose 1 or 2.
- **Access List**—The access list for this OSPF process. To add a new standard access list object, click Add ( ) and see Configure Standard ACL Objects, on page 510.
- **Traffic Direction**—Choose In or Out for the traffic direction being filtered. Choose In to filter LSAs coming into an OSPF area, or Out to filter LSAs coming out of an OSPF area. If you are editing an existing filter entry, you cannot modify this setting.
- **Interface**—The interface for this filter rule.

Step 6 Click OK to save the filter rule configuration.
Step 7 Click Save on the Routing page to save your changes.
Configure OSPF Summary Addresses

When routes from other protocols are redistributed into OSPF, each route is advertised individually in an external LSA. However, you can configure the Firepower Threat Defense device to advertise a single route for all the redistributed routes that are included for a specified network address and mask. This configuration decreases the size of the OSPF link-state database. Routes that match the specified IP address mask pair can be suppressed. The tag value can be used as a match value for controlling redistribution through route maps.

Routes learned from other routing protocols can be summarized. The metric used to advertise the summary is the smallest metric of all the more specific routes. Summary routes help reduce the size of the routing table.

Using summary routes for OSPF causes an OSPF ASBR to advertise one external route as an aggregate for all redistributed routes that are covered by the address. Only routes from other routing protocols that are being redistributed into OSPF can be summarized.

**Step 1** Choose Devices > Device Management, and edit the FTD device.

**Step 2** Click Routing.

**Step 3** Click OSPF.

**Step 4** Select Summary Address > Add.

You can click Edit (✍️) to edit, or use the right-click menu to cut, copy, past, insert, and delete summary addresses.

**Step 5** Configure the following summary address options for each OSPF process:

- **OSPF Process**—Choose 1 or 2.
- **Available Network**—The IP address of the summary address. Select one from the Available networks list and click Add, or to add a new network, click Add (✍️). See Network Objects, on page 442 for the procedure for adding networks.
- **Tag**—A 32-bit decimal value that is attached to each external route. This value is not used by OSPF itself, but may be used to communicate information between ASBRs.
- **Advertise**—Advertise the summary route. Uncheck this check box to suppress routes that fall under the summary address. By default, this check box is checked.

**Step 6** Click OK to save the summary address configuration.

**Step 7** Click Save on the Routing page to save your changes.

**What to do next**

Continue with Configure OSPF Interfaces and Neighbors, on page 823.
Configure OSPF Interfaces and Neighbors

You can change some interface-specific OSPFv2 parameters, if necessary. You are not required to change any of these parameters, but the following interface parameters must be consistent across all routers in an attached network: the hello interval, the dead interval, and the authentication key. If you configure any of these parameters, be sure that the configurations for all routers on your network have compatible values.

You need to define static OSPFv2 neighbors to advertise OSPFv2 routes over a point-to-point, non-broadcast network. This feature lets you broadcast OSPFv2 advertisements across an existing VPN connection without having to encapsulate the advertisements in a GRE tunnel.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Devices &gt; Device Management, and edit the FTD device.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Routing.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click OSPF.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Select Interface &gt; Add.</td>
</tr>
</tbody>
</table>

You can click Edit ( ), or use the right-click menu to cut, copy, past, insert, and delete areas.

Step 5 Configure the following Interface options for each OSPF process:

- **Interface**—The interface you are configuring.
- **Default Cost**—The cost of sending a packet through the interface. The default value is 10.
- **Priority**—Determines the designated router for a network. Valid values range from 0 to 255. The default value is 1. Entering 0 for this setting makes the router ineligible to become the designated router or backup designated router.
  When two routers connect to a network, both attempt to become the designated router. The device with the higher router priority becomes the designated router. If there is a tie, the router with the higher router ID becomes the designated router. This setting does not apply to interfaces that are configured as point-to-point interfaces.
- **MTU Ignore**—OSPF checks whether neighbors are using the same MTU on a common interface. This check is performed when neighbors exchange DBD packets. If the receiving MTU in the DBD packet is higher than the IP MTU configured on the incoming interface, OSPF adjacency is not established.
- **Database Filter**—Use this setting to filter the outgoing LSA interface during synchronization and flooding. By default, OSPF floods new LSAs over all interfaces in the same area, except the interface on which the LSA arrives. In a fully meshed topology, this flooding can waste bandwidth and lead to excessive link and CPU usage. Checking this check box prevents OSPF flooding of the LSA on the selected interface.
- **Hello Interval**—Specifies the interval, in seconds, between hello packets sent on an interface. Valid values range 1–8192 seconds. The default value is 10 seconds.
  The smaller the hello interval, the faster topological changes are detected, but more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface.
- **Transmit Delay**—Estimated time in seconds to send an LSA packet on the interface. Valid values range 1–65535 seconds. The default is 1 second.
  LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.
Configure OSPF Interfaces and Neighbors

• **Retransmit Interval**—Time in seconds between LSA retransmissions for adjacencies that belong to the interface. The time must be greater than the expected round-trip delay between any two routers on the attached network. Valid values range from 1 to 65535 seconds. The default is 5 seconds.

  When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, as needless retransmission can result. The value should be larger for serial lines and virtual links.

• **Dead Interval**—Time period in seconds for which hello packets must not be seen before neighbors indicate that the router is down. The value must be the same for all nodes on the network and can range 1–65535.

• **Hello Multiplier**—Specifies the number of Hello packets to be sent per second. Valid values are 3–20.

• **Point-to-Point**—Lets you transmit OSPF routes over VPN tunnels.

• **Authentication**—Choose the OSPF interface authentication from the following:
  - **None**—(Default) Disables interface authentication.
  - **Area Authentication**—Enables interface authentication using MD5. Click Add, and enter the key ID, key, confirm the key, and then click OK.
  - **Password**—Provides a clear text password for virtual link authentication, which is not recommended where security is a concern.
  - **MD5**—Allows MD5 authentication. Click Add, and enter the key ID, key, confirm the key, and then click OK.
  - **Key Chain**—Allows key chain authentication. Click Add, and create the key chain, and then click Save. For detailed procedure, see Creating Key Chain Objects, on page 501. Use the same authentication type (MD5 or Key Chain) and key ID for the peers to establish a successful adjacency.

  • **Enter Password**—The password you configure if you choose Password as the type of authentication.

  • **Confirm Password**—Confirm the password that you chose.

**Step 6** Select Neighbor > Add.

You can click Edit (), or use the right-click menu to cut, copy, paste, insert, and delete areas.

**Step 7** Configure the following parameters for each OSPF process:

  • **OSPF Process**—Choose 1 or 2.

  • **Neighbor**—Choose one of the neighbors in the drop-down list, or click Add () to add a new neighbor; enter the name, description, network, whether to allow overrides, and then click Save.

  • **Interface**—Choose the interface associated with the neighbor.

**Step 8** Click OK to save the neighbor configuration.

**Step 9** Click Save on the Routing page to save your changes.
Configure OSPF Advanced Properties

The Advanced Properties allows you to configure options, such as syslog message generation, administrative route distances, an LSA timer, and graceful restarts.

Graceful Restarts

The Firepower Threat Defense device may experience some known failure situations that should not affect packet forwarding across the switching platform. The Non-Stop Forwarding (NSF) capability allows data forwarding to continue along known routes, while the routing protocol information is being restored. This capability is useful when there is a scheduled hitless software upgrade. You can configure graceful restart on OSPFv2 by using either using NSF Cisco (RFC 4811 and RFC 4812) or NSF IETF (RFC 3623).

Note

NSF capability is also useful in HA mode and clustering.

Configuring the NSF graceful-restart feature involves two steps; configuring capabilities and configuring a device as NSF-capable or NSF-aware. A NSF-capable device can indicate its own restart activities to neighbors and a NSF-aware device can help a restarting neighbor.

A device can be configured as NSF-capable or NSF-aware, depending on some conditions:

- A device can be configured as NSF-aware irrespective of the mode in which it is.
- A device has to be in either Failover or Spanned Etherchannel (L2) cluster mode to be configured as NSF-capable.
- For a device to be either NSF-aware or NSF-capable, it should be configured with the capability of handling opaque Link State Advertisements (LSAs)/ Link Local Signaling (LLS) block as required.

Step 1 Choose Devices > Device Management, and edit the FTD device.
Step 2 Click Routing.
Step 3 Click OSPF > Advanced Settings.
Step 4 Select General, and configure the following:

- **Router ID**—Choose Automatic or IP address for the router ID. If you choose IP address, enter the IP address in the IP Address field.

- **Ignore LSA MOSPF**—Suppresses syslog messages when the route receives unsupported LSA Type 6 multicast OSPF (MOSPF) packets.

- **RFC 1583 Compatible**—Configures RFC 1583 compatibility as the method used to calculate summary route costs. Routing loops can occur with RFC 1583 compatibility enabled. Disable it to prevent routing loops. All OSPF routers in an OSPF routing domain should have RFC compatibility set identically.

- **Adjacency Changes**—Defines the adjacency changes that cause syslog messages to be sent.

By default, a syslog message is generated when an OSPF neighbor goes up or down. You can configure the router to send a syslog message when an OSPF neighbor goes down and also a syslog for each state.

- **Log Adjacency Changes**—Causes the Firepower Threat Defense device to send a syslog message whenever an OSPF neighbor goes up or down. This setting is checked by default.
Configure OSPF Advanced Properties

- **Log Adjacency Change Details**—Causes the Firepower Threat Defense device to send a syslog message whenever any state change occurs, not just when a neighbor goes up or down. This setting is unchecked by default.

- **Administrative Route Distance**—Allows you to modify the settings that were used to configure administrative route distances for inter-area, intra-area, and external IPv6 routes. The administrative route distance is an integer from 1 to 254. The default is 110.

- **LSA Group Pacing**—Specifies the interval in seconds at which LSAs are collected into a group and refreshed, checksummed, or aged. Valid values range from 10 to 1800. The default value is 240.

- **Enable Default Information Originate**—Check the **Enable** checkbox to generate a default external route into an OSPF routing domain and configure the following options:
  - **Always advertise the default route**—Ensures that the default route is always advertised.
  - **Metric Value**—Metric used for generating the default route. Valid metric values range from 0 to 16777214. The default value is 10.
  - **Metric Type**—The external link type that is associated with the default route that is advertised into the OSPFv3 routing domain. Valid values are 1 (Type 1 external route) and 2 (Type 2 external route). The default is Type 2 external route.
  - **RouteMap**—Choose the routing process that generates the default route if the route map is satisfied or click **Add** to add a new one. See Route Maps to add a new route map.

**Step 5** Click **OK** to save the general configuration.

**Step 6** Select **Non Stop Forwarding**, and configure Cisco NSF graceful restart for OSPFv2, for an NSF-capable or NSF-aware device:

**Note** There are two graceful restart mechanisms for OSPFv2, Cisco NSF and IETF NSF. Only one of these graceful restart mechanisms can be configured at a time for an OSPF instance. An NSF-aware device can be configured as both Cisco NSF helper and IETF NSF helper but a NSF-capable device can be configured in either Cisco NSF or IETF NSF mode at a time for an OSPF instance.

a) Check the **Enable Cisco Non Stop Forwarding Capability** checkbox.
b) (Optional) Check the **Cancel NSF restart when non-NSF-aware neighboring networking devices are detected** checkbox if required.
c) (Optional) Make sure the **Enable Cisco Non Stop Forwarding Helper** mode checkbox is unchecked to disable the helper mode on an NSF-aware device.

**Step 7** Configure IETF NSF Graceful Restart for OSPFv2, for an NSF-capable or NSF-aware device:

a) Check the **Enable IETF Non Stop Forwarding Capability** checkbox.
b) In the **Length of graceful restart interval (seconds)** field, enter the restart interval in seconds. The default value is 120 seconds. For a restart interval below 30 seconds, graceful restart will be terminated.
c) (Optional) Make sure the **Enable IETF nonstop forwarding (NSF) for helper mode** checkbox is unchecked to disable the IETF NSF helper mode on an NSF-aware device.
d) **Enable Strict Link State advertisement checking**—When enabled, it indicates that the helper router will terminate the process of restarting the router if it detects that there is a change to a LSA that would be flooded to the restarting router, or if there is a changed LSA on the retransmission list of the restarting router when the graceful restart process is initiated.
Enable IETF Non Stop Forwarding—Enables non stop forwarding, which allows for the forwarding of data packets to continue along known routes while the routing protocol information is being restored following a switchover. OSPF uses extensions to the OSPF protocol to recover its state from neighboring OSPF devices. For the recovery to work, the neighbors must support the NSF protocol extensions and be willing to act as "helpers" to the device that is restarting. The neighbors must also continue forwarding data traffic to the device that is restarting while protocol state recovery takes place.

Configure OSPFv3

This section describes the tasks involved in configuring an OSPFv3 routing process.

Configure OSPFv3 Areas, Route Summaries, and Virtual Links

To enable OSPFv3, you need to create an OSPFv3 routing process, create an area for OSPFv3, enable an interface for OSPFv3, and then redistribute the route into the targeted OSPFv3 routing process.

Step 1
Choose Devices > Device Management, and edit the FTD device.

Step 2
Select Routing > OSPFv3.

Step 3
By default Enable Process 1 is selected. You can enable up to two OSPF process instances.

Step 4
Chose the OSPFv3 role from the drop-down list, and enter a description for it. The options are Internal, ABR, ASBR, and ABR and ASBR. See About OSPF, on page 811 for descriptions of the OSPFv3 roles.

Step 5
Select Area > Add.

You can click Edit ( ), or use the right-click menu to cut, copy, past, insert, and delete areas.

Step 6
Select General, and configure the following options for each OSPF process:

- **Area ID**—The area for which routes are to be summarized.
- **Cost**—The metric or cost for the summary route, which is used during OSPF SPF calculations to determine the shortest paths to the destination. Valid values range from 0 to 16777215.
- **Type**—Specifies Normal, NSSA, or Stub. If you select Normal, there are no other parameters to configure. If you select Stub, you can choose to send summary LSAs in the area. If you select NSSA, you can configure the next three options:
  - **Allow Sending summary LSA into this area**—Allows the sending of summary LSAs into the area.
  - **Redistribute imports routes to normal and NSSA area**—Allows redistribution to import routes to normal and not to stubby areas.
  - **Defaults information originate**—Generates a default external route into an OSPFv3 routing domain.
- **Metric**—Metric used for generating the default route. The default value is 10. Valid metric values range from 0 to 16777214.
- **Metric Type**—The metric type is the external link type that is associated with the default route that is advertised into the OSPFv3 routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.
Step 7  Click **OK** to save the general configuration.

Step 8  Select **Route Summary > Add Route Summary**.

You can click **Edit** (✏️), or use the right-click menu to cut, copy, past, insert, and delete route summaries.

Step 9  Configure the following route summary options for each OSPF process:

- **IPv6 Prefix/Length** — The IPv6 prefix. To add a new network object, click **Add** (➕). See Network Objects, on page 442 for the procedure for adding networks.

- **Cost** — The metric or cost for the summary route, which is used during OSPF SPF calculations to determine the shortest paths to the destination. Valid values range from 0 to 16777215.

- **Advertise** — Advertises the summary route. Uncheck this check box to suppress routes that fall under the summary address. By default, this check box is checked.

Step 10 Click **OK** to save the route summary configuration.

Step 11  Select **Virtual Link**, click **Add Virtual Link**, and configure the following options for each OSPF process:

- **Peer RouterID** — Choose the IP address of the peer router. To add a new network object, click **Add** (➕). See Network Objects, on page 442 for the procedure for adding networks.

- **TTL Security** — Enables TTL security check. The value for the hop-count is a number from 1 to 254. The default is 1.

OSPF sends outgoing packets with an IP header Time to Live (TTL) value of 255 and discards incoming packets that have TTL values less than a configurable threshold. Because each device that forwards an IP packet decrements the TTL, packets received via a direct (one-hop) connection have a value of 255. Packets that cross two hops have a value of 254, and so on. The receive threshold is configured in terms of the maximum number of hops that a packet may have traveled.

- **Dead Interval** — The time in seconds that hello packets are not seen before a neighbor indicates that the router is down. The default is four times the hello interval, or 40 seconds. Valid values range from 1 to 65535.

The dead interval is an unsigned integer. The value must be the same for all routers and access servers that are attached to a common network.

- **Hello Interval** — The time in seconds between the hello packets sent on an interface. Valid values range from 1 to 65535. The default is 10.

The hello interval is an unsigned integer that is to be advertised in the hello packets. The value must be the same for all routers and access servers on a specific network. The smaller the hello interval, the faster topological changes are detected, but the more traffic is sent on the interface.

- **Retransmit Interval** — The time in seconds between LSA retransmissions for adjacencies that belong to the interface. The retransmit interval is the expected round-trip delay between any two routers on the attached network. The value must be greater than the expected round-trip delay, and can range from 1 to 65535. The default is 5.

When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links.

- **Transmit Delay** — The estimated time in seconds that is required to send an LSA packet on the interface. The integer value must be greater than zero. Valid values range from 1 to 8192. The default is 1.

LSAs in the update packet have their own ages incremented by this amount before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered.
The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.

**Step 12** Click **OK** to save the virtual link configuration.

**Step 13** Click **Save** on the Router page to save your changes.

---

**What to do next**

Continue with Configure OSPFv3 Redistribution.

---

**Configure OSPFv3 Redistribution**

The Firepower Threat Defense device can control the redistribution of routes between the OSPF routing processes. The rules for redistributing routes from one routing process into an OSPF routing process are displayed. You can redistribute routes discovered by RIP and BGP into the OSPF routing process. You can also redistribute static and connected routes into the OSPF routing process.

**Step 1** Choose **Devices** > **Device Management**, and edit the FTD device.

**Step 2** Select **Routing** > **OSPF**.

**Step 3** Select **Redistribution**, and click **Add**.

You can click **Edit** ( ), or use the right-click menu to cut, copy, past, insert, and delete areas.

**Step 4** Configure the following redistribution options for each OSPF process:

- **Source Protocol** — The source protocol from which routes are being redistributed. The supported protocols are connected, OSPF, static, and BGP. If you choose OSPF, you must enter the Process ID in the **Process ID** field. If you choose BCP, you must add the AS number in the **AS Number** field.

- **Metric** — Metric value for the routes being distributed. The default value is 10. Valid values range from 0 to 16777214. When redistributing from one OSPF process to another OSPF process on the same device, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified.

- **Metric Type** — The metric type is the external link type that is associated with the default route that is advertised into the OSPF routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.

- **Tag** — Tag specifies the 32-bit decimal value attached to each external route that is not used by OSPF itself, but which may be used to communicate information between ASBRs. If none is specified, then the remote autonomous system number is used for routes from BGP and EGP. For other protocols, zero is used. Valid values are from 0 to 4294967295.

- **Route Map** — Checks for filtering the importing of routes from the source routing protocol to the current routing protocol. If this parameter is not specified, all routes are redistributed. If this parameter is specified, but no route map tags are listed, no routes are imported. Or you can add a new route map by clicking **Add** ( ). See **Route Maps**, on page 506 for the procedure to add a new route map.

- **Process ID** — The OSPF process ID, either 1 or 2.
The Process ID is enabled the OSPFv3 process is redistributing a route learned by another OSPFv3 process.

**Note**
The Process ID is enabled the OSPFv3 process is redistributing a route learned by another OSPFv3 process.

- **Match**—Enables OSPF routes to be redistributed into other routing domains:
  - **Internal** for routes that are internal to a specific autonomous system.
  - **External 1** for routes that are external to the autonomous system, but are imported into OSPFv3 as Type 1 external routes.
  - **External 2** for routes that are external to the autonomous system, but are imported into OSPFv3 as Type 2 external routes.
  - **NSSA External 1** for routes that are external to the autonomous system, but are imported into OSPFv3 in an NSSA for IPv6 as Type 1 external routes.
  - **NSSA External 2** for routes that are external to the autonomous system, but are imported into OSPFv3 in an NSSA for IPv6 as Type 2 external routes.

**Step 5** Click **OK** to save the redistribution configuration.

**Step 6** Click **Save** on the Routing page to save your changes.

---

**What to do next**
Continue with **Configure OSPFv3 Summary Prefixes**, on page 830.

**Configure OSPFv3 Summary Prefixes**

You can configure the Firepower Threat Defense device to advertise routes that match a specified IPv6 prefix and mask pair.

**Step 1** Choose Devices > Device Management, and edit the FTD device.

**Step 2** Select Routing > OSPFv3.

**Step 3** Select Summary Prefix > Add.

You can click **Edit**, or use the right-click menu to cut, copy, past, insert, and delete summary prefixes.

**Step 4** Configure the following summary prefix options for each OSPF process:

- **IPv6 Prefix/Length**—The IPv6 prefix and prefix length label. Select one from the list or click **Add** to add a new network object. See **Network Objects**, on page 442 for the procedure for adding networks.

- **Advertise**—Advertises routes that match the specified prefix and mask pair. Uncheck this check box to suppress routes that match the specified prefix and mask pair.

- **(Optional)** **Tag**—A value that you can use as a match value for controlling redistribution through route maps.

**Step 5** Click **OK** to save the summary prefix configuration.

**Step 6** Click **Save** on the Routing page to save your changes.
Configure OSPFv3 Interfaces, Authentication, and Neighbors

You can change certain interface-specific OSPFv3 parameters, if necessary. You are not required to change any of these parameters, but the following interface parameters must be consistent across all routers in an attached network: the hello interval and the dead interval. If you configure any of these parameters, be sure that the configurations for all routers on your network have compatible values.

Step 1 Choose Devices > Device Management, and edit the FTD device.
Step 2 Select Routing > OSPFv3.
Step 3 Select Interface > Add.
   You can click Edit to edit, or use the right-click menu to cut, copy, past, insert, and delete areas.
Step 4 Configure the following interface options for each OSPFv3 process:
   • Interface—The interface you are configuring.
   • Enable OSPFv3—Enables OSPFv3.
   • OSPF Process—Choose 1 or 2.
   • Area—The area ID for this process.
   • Instance—Specifies the area instance ID to be assigned to the interface. An interface can have only one OSPFv3 area. You can use the same area on multiple interfaces, and each interface can use a different area instance ID.

Step 5 Select Properties, and configuring the following options for each OSPFv3 process:
   • Filter Outgoing Link Status Advertisements—Filters outgoing LSAs to an OSPFv3 interface. All outgoing LSAs are flooded to the interface by default.
   • Disable MTU mismatch detection—Disables the OSPF MTU mismatch detection when DBD packets are received. OSPF MTU mismatch detection is enabled by default.
   • Flood Reduction—Changes normal LSAs into Do Not Age LSAs, so that they don't get flooded every 3600 seconds across areas.
      OSPF LSAs are refreshed every 3600 seconds. In large OSPF networks, this can lead to large amounts of unnecessary LSA flooding from area to area.
   • Point-to-Point Network—Lets you transmit OSPF routes over VPN tunnels. When an interface is configured as point-to-point, non-broadcast, the following restrictions apply:
      • You can define only one neighbor for the interface.
      • You need to manually configure the neighbor.
      • You need to define a static route pointing to the crypto endpoint.
      • If OSPF over a tunnel is running on the interface, regular OSPF with an upstream router cannot be run on the same interface.
- You should bind the cryptomap to the interface before specifying the OSPF neighbor to ensure that the OSPF updates are passed through the VPN tunnel. If you bind the cryptomap to the interface after specifying the OSPF neighbor, use the `clear local-host all` command to clear OSPF connections so that the OSPF adjacencies can be established over the VPN tunnel.

- **Broadcast**—Specifies that the interface is a broadcast interface. By default, this check box is checked for Ethernet interfaces. Uncheck this check box to designate the interface as a point-to-point, nonbroadcast interface. Specifying an interface as point-to-point, nonbroadcast lets you transmit OSPF routes over VPN tunnels.

- **Cost**—Specifies the cost of sending a packet on the interface. Valid values for this setting range from 0 to 255. The default value is 1. Entering 0 for this setting makes the router ineligible to become the designated router or backup designated router. This setting does not apply to interfaces that are configured as point-to-point, nonbroadcast interfaces.

When two routers connect to a network, both attempt to become the designated router. The device with the higher router priority becomes the designated router. If there is a tie, the router with the higher router ID becomes the designated router.

- **Priority**—Determines the designated router for a network. Valid values range from 0 to 255.

- **Dead Interval**—Time period in seconds for which hello packets must not be seen before neighbors indicate that the router is down. The value must be the same for all nodes on the network and can range from 1 to 65535.

- **Poll Interval**—Time period in seconds between OSPF packets that the router will send before adjacency is established with a neighbor. Once the routing device detects an active neighbor, the hello packet interval changes from the time specified in the poll interval to the time specified in the hello interval. Valid values range from 1 to 65535 seconds.

- **Retransmit Interval**—Time in seconds between LSA retransmissions for adjacencies that belong to the interface. The time must be greater than the expected round-trip delay between any two routers on the attached network. Valid values range from 1 to 65535 seconds. The default is 5 seconds.

- **Transmit Delay**—Estimated time in seconds to send a link-state update packet on the interface. Valid values range from 1 to 65535 seconds. The default is 1 second.

**Step 6**

Click **OK** to save the properties configuration.

**Step 7**

Select **Authentication**, and configure the following options for each OSPFv3 process:

- **Type**—Type of authentication. The available options are Area, Interface, and None. The None option indicates that no authentication is used.

- **Security Parameters Index**—A number from 256 to 4294967295. Configure this if you chose Interface as the type.

- **Authentication**—Type of authentication algorithm. Supported values are SHA-1 and MD5. Configure this if you chose Interface as the type.

- **Authentication Key**—When MD5 authentication is used, the key must be 32 hexadecimal digits (16 bytes) long. When SHA-1 authentication is used, the key must be 40 hexadecimal digits (20 bytes) long.

- **Encrypt Authentication Key**—Enables encryption of the authentication key.

- **Include Encryption**—Enables encryption.

- **Encryption Algorithm**—Type of encryption algorithm. Supported value is DES. The NULL entry indicates no encryption. Configure this if you chose Include Encryption.
• **Encryption Key**—Enter the encryption key. Configure this if you chose Include Encryption.

• **Encrypt Key**—Enables the key to be encrypted.

**Step 8**  
Click OK to save the authentication configuration.

**Step 9**  
Select **Neighbor**, click **Add**, and configure the following options for each OSPFv3 process:

- **Link Local Address**—The IPv6 address of the static neighbor.
- **Cost**—Enables cost. Enter the cost in the **Cost** field, and check the **Filter Outgoing Link State Advertisements** if you want to advertise.
- **(Optional) Poll Interval**—Enables the poll interval. Enter the **Priority** level and the **Poll Interval** in seconds.

**Step 10**  
Click **Add** to add the neighbor.

**Step 11**  
Click **OK** to save the Interface configuration.

---

**Configure OSPFv3 Advanced Properties**

The Advanced Properties allows you to configure options, such as syslog message generation, administrative route distances, passive OSPFv3 routing, LSA timers, and graceful restarts.

**Graceful Restarts**

The Firepower Threat Defense device may experience some known failure situations that should not affect packet forwarding across the switching platform. The Non-Stop Forwarding (NSF) capability allows data forwarding to continue along known routes, while the routing protocol information is being restored. This capability is useful when there is a scheduled hitless software upgrade. You can configure graceful restart on OSPFv3 using graceful-restart (RFC 5187).

---

**Note**  
NSF capability is also useful in HA mode and clustering.

Configuring the NSF graceful-restart feature involves two steps; configuring capabilities and configuring a device as NSF-capable or NSF-aware. A NSF-capable device can indicate its own restart activities to neighbors and a NSF-aware device can help a restarting neighbor.

A device can be configured as NSF-capable or NSF-aware, depending on some conditions:

- A device can be configured as NSF-aware irrespective of the mode in which it is.
- A device has to be in either Failover or Spanned Etherchannel (L2) cluster mode to be configured as NSF-capable.
- For a device to be either NSF-aware or NSF-capable, it should be configured with the capability of handling opaque Link State Advertisements (LSAs)/ Link Local Signaling (LLS) block as required.

**Step 1**  
Choose **Devices** > **Device Management**, and edit the FTD device.

**Step 2**  
Select **Routing** > **OSPFv3** > **Advanced**.
Step 3  
For **Router ID**, choose **Automatic** or **IP address**. If you choose IP address, enter the IP address in the IP Address field.

Step 4  
Check the **Ignore LSA MOSPF** check box if you want to suppress syslog messages when the route receives unsupported LSA Type 6 multicast OSPF (MOSPF) packets.

Step 5  
Select **General**, and configure the following:

- **Adjacency Changes**—Defines the adjacency changes that cause syslog messages to be sent.
  
  By default, a syslog message is generated when an OSPF neighbor goes up or down. You can configure the router to send a syslog message when an OSPF neighbor goes down and also a syslog for each state.

  - **Adjacency Changes**—Causes the Firepower Threat Defense device to send a syslog message whenever an OSPF neighbor goes up or down. This setting is checked by default.

  - **Include Details**—Causes the Firepower Threat Defense device to send a syslog message whenever any state change occurs, not just when a neighbor goes up or down. This setting is unchecked by default.

- **Administrative Route Distances**—Allows you to modify the settings that were used to configure administrative route distances for inter-area, intra-area, and external IPv6 routes. The administrative route distance is an integer from 1 to 254. The default is 110.

- **Default Information Originate**—Check the **Enable** check box to generate a default external route into an OSPFv3 routing domain and configure the following options:

  - **Always Advertise**—Will always advertise the default route whether or not one exists.

  - **Metric**—Metric used for generating the default route. Valid metric values range from 0 to 16777214. The default value is 10.

  - **Metric Type**—The external link type that is associated with the default route that is advertised into the OSPFv3 routing domain. Valid values are 1 (Type 1 external route) and 2 (Type 2 external route). The default is Type 2 external route.

  - **Route Map**—Choose the routing process that generates the default route if the route map is satisfied or click **Add** to add a new one. See Route Maps, on page 506 to add a new route map.

Step 6  
Click **OK** to save the general configuration.

Step 7  
Select **Passive Interface**, select the interfaces on which you want to enable passive OSPFv3 routing from the Available Interfaces list, and click **Add** to move them to the Selected Interfaces list.

Passive routing assists in controlling the advertisement of OSPFv3 routing information and disables the sending and receiving of OSPFv3 routing updates on an interface.

Step 8  
Click **OK** to save the passive interface configuration.

Step 9  
Select **Timer**, and configure the following LSA pacing and SPF calculation timers:

- **Arrival**—Specifies the minimum delay in milliseconds that must pass between acceptance of the same LSA arriving from neighbors. The range is from 0 to 600000 milliseconds. The default is 1000 milliseconds.

- **Flood Pacing**—Specifies the time in milliseconds at which LSAs in the flooding queue are paced in between updates. The configurable range is from 5 to 100 milliseconds. The default value is 33 milliseconds.

- **Group Pacing**—Specifies the interval in seconds at which LSAs are collected into a group and refreshed, check summed, or aged. Valid values range from 10 to 1800. The default value is 240.
• **Retransmission Pacing**—Specifies the time in milliseconds at which LSAs in the retransmission queue are paced. The configurable range is from 5 to 200 milliseconds. The default value is 66 milliseconds.

• **LSA Throttle**—Specifics the delay in milliseconds to generate the first occurrence of the LSA. The default value is 0 millisecond. The minimum specifies the minimum delay in milliseconds to originate the same LSA. The default value is 5000 milliseconds. The maximum specifies the maximum delay in milliseconds to originate the same LSA. The default value is 5000 milliseconds.

  **Note** For LSA throttling, if the minimum or maximum time is less than the first occurrence value, then OSPFv3 automatically corrects to the first occurrence value. Similarly, if the maximum delay specified is less than the minimum delay, then OSPFv3 automatically corrects to the minimum delay value.

• **SPF Throttle**—Specifies the delay in milliseconds to receive a change to the SPF calculation. The default value is 5000 milliseconds. The minimum specifies the delay in milliseconds between the first and second SPF calculations. The default value is 10000 milliseconds. The maximum specifies the maximum wait time in milliseconds for SPF calculations. The default value is 10000 milliseconds.

  **Note** For SPF throttling, if the minimum or maximum time is less than the first occurrence value, then OSPFv3 automatically corrects to the first occurrence value. Similarly, if the maximum delay specified is less than the minimum delay, then OSPFv3 automatically corrects to the minimum delay value.

---

**Step 10** Click **OK** to save the LSA timer configuration.

**Step 11** Select **Non Stop Forwarding**, and check the **Enable graceful-restart helper** check box. This is checked by default. Uncheck this to disable the graceful-restart helper mode on an NSF-aware device.

**Step 12** Check the **Enable link state advertisement** check box to enable strict link state advertisement checking.

When enabled, it indicates that the helper router will terminate the process of restarting the router if it detects that there is a change to a LSA that would be flooded to the restarting router, or if there is a changed LSA on the retransmission list of the restarting router when the graceful restart process is initiated.

**Step 13** Check the **Enable graceful-restart (Use when Spanned Cluster or Failover Configured)** and enter the graceful-restart interval in seconds. The range is 1-1800. The default value is 120 seconds. For a restart interval below 30 seconds, graceful restart will be terminated.

**Step 14** Click **OK** to save the graceful restart configuration.

**Step 15** Click **Save** on the Routing page to save your changes.
Configure OSPFv3 Advanced Properties
BGP for Firepower Threat Defense

This section describes how to configure the FTD to route data, perform authentication, and redistribute routing information using the Border Gateway Protocol (BGP).

- About BGP, on page 837
- Requirements and Prerequisites for BGP, on page 840
- Guidelines for BGP, on page 840
- Configure BGP, on page 841

About BGP

BGP is an inter and intra autonomous system routing protocol. An autonomous system is a network or group of networks under a common administration and with common routing policies. BGP is used to exchange routing information for the Internet and is the protocol used between Internet service providers (ISP).

Routing Table Changes

BGP neighbors exchange full routing information when the TCP connection between neighbors is first established. When changes to the routing table are detected, the BGP routers send to their neighbors only those routes that have changed. BGP routers do not send periodic routing updates, and BGP routing updates advertise only the optimal path to a destination network.

Note

AS loop detection is done by scanning the full AS path (as specified in the AS_PATH attribute), and checking that the AS number of the local system does not appear in the AS path. By default, EBGPs advertise the learned routes to the same peer to prevent additional CPU cycles on the ASA in performing loop checks and to avoid delays in the existing outgoing update tasks.

Routes learned via BGP have properties that are used to determine the best route to a destination, when multiple paths exist to a particular destination. These properties are referred to as BGP attributes and are used in the route selection process:

- Weight—This is a Cisco-defined attribute that is local to a router. The weight attribute is not advertised to neighboring routers. If the router learns about more than one route to the same destination, the route with the highest weight is preferred.
• Local preference—The local preference attribute is used to select an exit point from the local AS. Unlike the weight attribute, the local preference attribute is propagated throughout the local AS. If there are multiple exit points from the AS, the exit point with the highest local preference attribute is used as an exit point for a specific route.

• Multi-exit discriminator—The multi-exit discriminator (MED) or metric attribute is used as a suggestion to an external AS regarding the preferred route into the AS that is advertising the metric. It is referred to as a suggestion because the external AS that is receiving the MEDs may also be using other BGP attributes for route selection. The route with the lower MED metric is preferred.

• Origin—The origin attribute indicates how BGP learned about a particular route. The origin attribute can have one of three possible values and is used in route selection.
  - IGP—The route is interior to the originating AS. This value is set when the network router configuration command is used to inject the route into BGP.
  - EGP—The route is learned via the Exterior Border Gateway Protocol (EBGP).
  - Incomplete—The origin of the route is unknown or learned in some other way. An origin of incomplete occurs when a route is redistributed into BGP.

• AS_path—When a route advertisement passes through an autonomous system, the AS number is added to an ordered list of AS numbers that the route advertisement has traversed. Only the route with the shortest AS_path list is installed in the IP routing table.

• Next hop—The EBGP next-hop attribute is the IP address that is used to reach the advertising router. For EBGP peers, the next-hop address is the IP address of the connection between the peers. For IBGP, the EBGP next-hop address is carried into the local AS.

• Community—The community attribute provides a way of grouping destinations, called communities, to which routing decisions (such as acceptance, preference, and redistribution) can be applied. Route maps are used to set the community attribute. The predefined community attributes are as follows:
  - no-export—Do not advertise this route to EBGP peers.
  - no-advertise—Do not advertise this route to any peer.
  - internet—Advertise this route to the Internet community; all routers in the network belong to it.

**When to Use BGP**

Customer networks, such as universities and corporations, usually employ an Interior Gateway Protocol (IGP) such as OSPF for the exchange of routing information within their networks. Customers connect to ISPs, and ISPs use BGP to exchange customer and ISP routes. When BGP is used between autonomous systems (AS), the protocol is referred to as External BGP (EBGP). If a service provider is using BGP to exchange routes within an AS, then the protocol is referred to as Interior BGP (IBGP).

BGP can also be used for carrying routing information for IPv6 prefix over IPv6 networks.

**BGP Path Selection**

BGP may receive multiple advertisements for the same route from different sources. BGP selects only one path as the best path. When this path is selected, BGP puts the selected path in the IP routing table and
propagates the path to its neighbors. BGP uses the following criteria, in the order presented, to select a path for a destination:

- If the path specifies a next hop that is inaccessible, drop the update.
- Prefer the path with the largest weight.
- If the weights are the same, prefer the path with the largest local preference.
- If the local preferences are the same, prefer the path that was originated by BGP running on this router.
- If no route was originated, prefer the route that has the shortest AS_path.
- If all paths have the same AS_path length, prefer the path with the lowest origin type (where IGP is lower than EGP, and EGP is lower than incomplete).
- If the origin codes are the same, prefer the path with the lowest MED attribute.
- If the paths have the same MED, prefer the external path over the internal path.
- If the paths are still the same, prefer the path through the closest IGP neighbor.
- Determine if multiple paths require installation in the routing table for BGP Multipath, on page 839.
- If both paths are external, prefer the path that was received first (the oldest one).
- Prefer the path with the lowest IP address, as specified by the BGP router ID.
- If the originator or router ID is the same for multiple paths, prefer the path with the minimum cluster list length.
- Prefer the path that comes from the lowest neighbor address.

**BGP Multipath**

BGP Multipath allows installation into the IP routing table of multiple equal-cost BGP paths to the same destination prefix. Traffic to the destination prefix is then shared across all installed paths.

These paths are installed in the table together with the best path for load-sharing. BGP Multipath does not affect best-path selection. For example, a router still designates one of the paths as the best path, according to the algorithm, and advertises this best path to its BGP peers.

In order to be candidates for multipath, paths to the same destination need to have these characteristics equal to the best-path characteristics:

- Weight
- Local preference
- AS-PATH length
- Origin code
- Multi Exit Discriminator (MED)
- One of these:
  - Neighboring AS or sub-AS (before the addition of the BGP Multipaths)
  - AS-PATH (after the addition of the BGP Multipaths)
Some BGP Multipath features put additional requirements on multipath candidates:

- The path should be learned from an external or confederation-external neighbor (eBGP).
- The IGP metric to the BGP next hop should be equal to the best-path IGP metric.

These are the additional requirements for internal BGP (iBGP) multipath candidates:

- The path should be learned from an internal neighbor (iBGP).
- The IGP metric to the BGP next hop should be equal to the best-path IGP metric, unless the router is configured for unequal-cost iBGP multipath.

BGP inserts up to \( n \) most recently received paths from multipath candidates into the IP routing table, where \( n \) is the number of routes to install to the routing table, as specified when you configure BGP Multipath. The default value, when multipath is disabled, is 1.

For unequal-cost load balancing, you can also use BGP Link Bandwidth.

---

**Note**

The equivalent next-hop-self is performed on the best path that is selected among eBGP multipaths before it is forwarded to internal peers.

---

## Requirements and Prerequisites for BGP

### Model Support

- FTD

### Supported Domains

- Any

### User Roles

- Admin
- Access Admin
- Network Admin

---

## Guidelines for BGP

### Firewall Mode Guidelines

Does not support transparent firewall mode. BGP is supported only in routed mode.

### IPv6 Guidelines

Supports IPv6. Graceful restart is not supported for IPv6 address family.
Additional Guidelines

• The system does not add route entry for the IP address received over PPPoE in the CP route table. BGP always looks into CP route table for initiating the TCP session, hence BGP does not form TCP session. Thus, BGP over PPPoE is not supported.

• To avoid adjacency flaps due to route updates being dropped if the route update is larger than the minimum MTU on the link, ensure that you configure the same MTU on the interfaces on both sides of the link.

Configure BGP

To configure BGP, see the following topics:

<table>
<thead>
<tr>
<th>Step</th>
<th>Topic</th>
</tr>

<tr>
<td>7</td>
<td>Configure BGP Redistribution Settings, on page 849</td>
</tr>
<tr>
<td>8</td>
<td>Configure BGP Route Injection Settings, on page 849</td>
</tr>
</tbody>
</table>

Note: The Filtering section is applicable only to IPv4 settings.

Configure BGP Basic Settings

You can set many basic settings for BGP.

Step 1 Choose Devices > Device Management, and edit the FTD device.
Step 2 Select Routing.
Step 3 (For a non-virtual-router-aware device) Select BGP.
Step 4 Select the Enable BGP check box to enable the BGP routing process.
Step 5 In the AS Number field, enter the autonomous system (AS) number for the BGP process. The AS number internally includes multiple autonomous numbers. The AS number can be from 1 to 4294967295 or from 1.0 to 65535.65535. The AS number is a uniquely assigned value, that identifies each network on the Internet.
Step 6 (Optional) Edit the various BGP settings, starting with General. The defaults for these settings are appropriate in most cases, but you can adjust them to fit the needs of your network. Click Edit (pencil) to edit the settings in the group:

a) In the Router ID drop-down list, select Automatic or Manual from the drop-down list. If you choose Automatic, the highest-level IP address on the Firepower Threat Defense device is used as the router ID. To use a fixed router ID, choose Manual and enter an IPv4 address in the IP Address field. The default value is Automatic.
b) Enter the **Number of AS numbers in AS_PATH attribute**. An AS_PATH attribute is a sequence of intermediate AS numbers between source and destination routers that form a directed route for packets to travel. Valid values are between 1 and 254. The default value is None.

c) Check the **Log Neighbor Changes** check box to enable logging of BGP neighbor changes (up or down) and resets. This helps in troubleshooting network connectivity problems and measuring network stability. This is enabled by default.

d) Check the **Use TCP Path MTU Discovery** check box to use the Path MTU determining technique to determine the maximum transmission unit (MTU) size on the network path between two IP hosts. This avoids IP fragmentation. This is enabled by default.

e) Check the **Reset session upon Failover** check box to reset the external BGP session immediately upon link failure. This is enabled by default.

f) Check the **Enforce that the first AS is peer’s AS for EBGP routes** check box to discard incoming updates received from external BGP peers that do not list their AS number as the first segment in the AS_PATH attribute. This prevents a mis-configured or unauthorized peer from misdirecting traffic by advertising a route as if it was sourced from another autonomous system. This is enabled by default.

g) Check the **Use dot notation for AS number** check box to split the full binary 4-byte AS number into two words of 16 bits each, separated by a dot. AS numbers from 0-65553 are represented as decimal numbers and AS numbers larger than 65535 are represented using the dot notation. This is disabled by default.

h) Click **OK**.

---

**Step 7**

(Optional) Edit the **Best Path Selection** section:

a) Enter a value for **Default Local Preference** between 0 and 4294967295. The default value is 100. Higher values indicate higher preference. This preference is sent to all routers and access servers in the local autonomous system.

b) Check the **Allow comparing MED from different neighbors** check box to allow the comparison of Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems. This is disabled by default.

c) Check the **Compare Router ID for identical EBGP paths** check box to compare similar paths received from external BGP peers during the best path selection process and switch the best path to the route with the lowest router ID. This is disabled by default.

d) Check the **Pick the best MED path among paths advertised from the neighboring AS** check box to enable MED comparison among paths learned from confederation peers. The comparison between MEDs is made only if no external autonomous systems are there in the path. This is disabled by default.

e) Check the **Treat missing MED as the least preferred one** check box to consider the missing MED attribute as having a value of infinity, making the path the least desirable; therefore, a path with a missing MED is least preferred. This is disabled by default.

f) Click **OK**.

---

**Step 8**

(Optional) Edit the **Neighbor Timers** section:

a) Enter the time interval for which the BGP neighbor remains active after not sending a keepalive message in the **Keepalive interval** field. At the end of this keepalive interval, the BGP peer is declared dead, if no messages are sent. The default value is 60 seconds.

b) Enter the time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured in the **Hold time** field. The default value is 180 seconds.

c) (Optional) Enter the minimum time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured in the **Min Hold time** field. Specify a value from 0 to 65535.

d) Click **OK**.

---

**Step 9**

(Optional) Edit the **Graceful Restart** section:

**Note**  This section is available only when the Firepower Threat Defense device is in failover or spanned cluster mode. This is done so that there is no drop in packets in the traffic flow, when one of the devices in the failover setup fails.
Configure BGP General Settings

Configure Route maps, Administrative Route Distances, Synchronisation, Next-hop, and packet forwarding. The defaults for these settings are appropriate in most cases, but you can adjust them to fit the needs of your network.

Step 1  On the Device Management page, click Routing.
Step 2  Choose BGP > IPv4 or IPv6.
Step 3  Click General.
Step 4  In General, update the following sections:

a) In the Settings section, enter or select a Route Map object and enter a Scanning Interval for BGP routers for next-hop validation. Valid values are from 5 to 60 seconds. The default value is 60. Click OK.

    Note The Route Map field is applicable only to IPv4 settings

b) In the Routes and Synchronization section, update the following as required, and click OK:

   • (Optional) Generate Default Routes—Select this option to configure default-information originate.
   
   • (Optional) Summarize subnet routes into network-level routes—Select this to configure automatic summarization of subnet routes into network-level routes. This check box is applicable only to IPv4 settings.
   
   • (Optional) Advertise inactive routes—Select this to advertise routes that are not installed in the routing information base (RIB).
   
   • (Optional) Synchronise between BGP and IGP system—Select this to enable synchronization between BGP and your Interior Gateway Protocol (IGP) system. Usually, a BGP speaker does not advertise a route to an external neighbor unless that route is local or exists in the IGP. This feature allows routers and access servers within an autonomous system to have the route before BGP makes it available to other autonomous systems.
   
   • (Optional) Redistribute IBGP into IGP—Select this to configure iBGP redistribution into an interior gateway protocol (IGP), such as OSPF.

c) In the Administrative Route Distances section, update the following as required, and click OK:

   • External — Enter the administrative distance for external BGP routes. Routes are external when learned from an external autonomous system. The range of values for this argument are from 1 to 255. The default value is 20.
Configure BGP Neighbor Settings

A BGP router must connect with each of its peers before exchanging updates. These peers are called BGP neighbors. Use Neighbor to define BGP IPv4 or IPv6 neighbors and neighbor settings.

Step 1  On the Device Management page, click Routing.
Step 2  Choose BGP > IPv4 or IPv6.
Step 3  Click Neighbor.
Step 4  Click Add to define BGP neighbors and neighbor settings.
Step 5  Enter the BGP neighbor IP address. This IP address is added to the BGP neighbor table.
Step 6  Choose the BGP neighbor Interface.

Note  The Interface field is only applicable to IPv6 settings.

Step 7  Enter the autonomous system to which the BGP neighbor belongs, in the Remote AS field.
Step 8  Select the Enabled address check box to enable communication with this BGP neighbor. Further neighbor settings will be configured only if the Enabled address check box is selected.
Step 9  (Optional) Select the Shutdown administratively check box to disable a neighbor or peer group.
Step 10 (Optional) Select the Configure graceful restart check box to enable configuration of the BGP graceful restart capability for this neighbor. After selecting this option, you must use the Graceful Restart (failover/spanned mode) option to specify whether graceful restart should be enabled or disabled for this neighbor.

Note  The graceful restart fields are only applicable to IPv4 settings.
Step 11  (Optional) Select the **BFD Fallover** check box to enable configuration of the BFD support for BGP. This selection registers the BGP neighbor to receive forwarding path detection failure messages from BFD.

Step 12  (Optional) Enter a **Description** for the BGP neighbor.

Step 13  (Optional) In **Filtering Routes**, use access lists, route maps, prefix lists and AS path filters as required, to distribute BGP Neighbor information. Update the following sections:

a) Enter or Select the appropriate incoming or outgoing **Access List** to distribute BGP neighbor information.

   **Note**  Access Lists are only applicable to IPv4 settings.

b) Enter or Select the appropriate incoming or outgoing **Route Maps** to apply a route map to incoming or outgoing routes.

c) Enter or Select the appropriate incoming or outgoing **Prefix List** to distribute BGP neighbor information.

d) Enter or Select the appropriate incoming or outgoing **AS path filter** to distribute BGP neighbor information.

e) Select the **Limit the number of prefixes allowed from the neighbor** to control the number of prefixes that can be received from a neighbor.

   • Enter the maximum number of prefixes allowed from a specific neighbor in the **Maximum Prefixes** field.

   • Enter the percentage (of maximum) at which the router starts to generate a warning message in the **Threshold Level** field. Valid values are integers between 1 and 100. The default value is 75.

f) Select the **Control prefixes received from the peer** check box to specify additional controls for the prefixes received from a peer. Do one of the following

   • Select **Terminate peering when prefix limit is exceeded** to stop the BGP neighbor when the prefix limit is reached. Specify the interval after which the BGP neighbor will restart in the **Restart interval** field.

   • Select **Give only warning message when prefix limit is exceeded** to generate a log message when the maximum prefix limit is exceeded. Here, the BGP neighbor will not be terminated.

g) Click **OK**.

Step 14  (Optional) In **Routes**, specify miscellaneous Neighbor route parameter. Proceed to update the following:

a) Enter the minimum interval (in seconds) between the sending of BGP routing updates in the **Advertisement Interval** field. Valid values are between 1 and 600.

b) Select the **Remove private AS numbers from outbound routing updates** to exclude the private AS numbers from being advertised on outbound routes.

c) Select the **Generate default routes** checkbox to allow the local router to send the default route 0.0.0.0 to a neighbor to use as a default route. Enter or Select the route map that allows the route 0.0.0.0 to be injected conditionally in the **Route map** field.

d) To add conditionally advertised routes, click **Add Row**. In the Add Advertised Route dialog box, do the following:

   1. Add or select a route map in the **Advertise Map** field, that will be advertised if the conditions of the exist map or the non-exist map are met.

   2. Select **Exist Map** and choose a route map from the Route Map Object Selector. This route map is compared with the routes in the BGP table, to determine whether the advertise map route is advertised.

   3. Select **Non-Exist Map** and choose a route map from the Route Map Object Selector. This route map is compared with the routes in the BGP table, to determine whether the advertise map route is advertised.

   4. Click **OK**.
**Step 15**  
In **Timers**, select the **Set Timers for the BGP Peer** check box to set the keepalive frequency, hold time and minimum hold time

- **Keepalive Interval**—Enter the frequency (in seconds) with which the FTD device sends keepalive messages to the neighbor. Valid values are between 0 and 65535. The default value is 60 seconds.

- **Hold time**—Enter the interval (in seconds) after not receiving a keepalive message that the FTD device declares a peer dead. Valid values are between 0 and 65535. The default value is 180 seconds.

- **Min hold time**—(Optional) Enter the minimum interval (in seconds) after not receiving a keepalive message that the FTD device declares a peer dead. Valid values are between 0 and 65535. The default value is 0 seconds.

**Step 16**  
In **Advanced**, update the following:

a) (Optional) Select **Enable Authentication** to enable MD5 authentication on a TCP connection between two BGP peers.

1. Choose an encryption type from the **Enable Encryption** drop-down list.

2. Enter a password in the **Password** field. Reenter the password in the **Confirm** field. The password is case-sensitive and can be up to 25 characters long when the service password-encryption command is enabled and up to 81 characters long when the service password-encryption command is not enabled. The string can contain any alphanumeric characters, including spaces.

   **Note** You cannot specify a password in the format number-space-anything. The space after the number can cause authentication to fail.

b) (Optional) Select the **Send Community attribute to this neighbor** check box to specify that communities attributes should be sent to the BGP neighbor

c) (Optional) Select the **Use FTD as next hop for this neighbor** check box to configure the router as the next-hop for a BGP speaking neighbor or peer group.

d) Select the **Disable Connection Verification** checkbox to disable the connection verification process for eBGP peering sessions that are reachable by a single hop but are configured on a loopback interface or otherwise configured with a non-directly connected IP address. When deselected (default), a BGP routing process will verify the connection of single-hop eBGP peering session (TTL=254) to determine if the eBGP peer is directly connected to the same network segment by default. If the peer is not directly connected to same network segment, connection verification will prevent the peering session from being established.

e) Select **Allow connections with neighbor that is not directly connected** to accept and attempt BGP connections to external peers residing on networks that are not directly connected. (Optional) Enter the time-to-live in the **TTL hops** field. Valid values are between 1 and 254. Alternately, select **Limited number of TTL hops to neighbor**, to secure a BGP peering session. Enter the maximum number of hops that separate eBGP peers in the **TTL hops** field. Valid values are between 1 and 254.

f) (Optional) Select the **Use TCP MTU path discovery** check box to enable a TCP transport session for a BGP session.

g) Choose the TCP connection mode from the **TCP Transport Mode** drop-down list. Options are Default, Active, or Passive.

h) (Optional) Enter a **Weight** for the BGP neighbor connection.

i) Select the **BGP Version** that the FTD device will accept from the drop-down list. The version can be set to 4-Only to force the software to use only Version 4 with the specified neighbor. The default is to use Version 4 and dynamically negotiate down to Version 2 if requested.

**Step 17**  
Update **Migration**, only if AS migration is considered.

**Note** The AS migration customization should be removed after transition has been completed.
a) (Optional) Select the Customize the AS number for routes received from the neighbor check box to customize the AS_PATH attribute for routes received from an eBGP neighbor.

b) Enter the local autonomous system number in the Local AS number field. Valid values are any valid autonomous system number from 1 to 4294967295 or 1.0 to 65535.65535.

c) (Optional) Select the Do not prepend local AS number to routes received from neighbor check box to prevent the local AS number from being prepended to any routes received from eBGP peer.

d) (Optional) Select the Replace real AS number with local AS number in routes received from neighbor check box to replace the real autonomous system number with the local autonomous system number in the eBGP updates. The autonomous system number from the local BGP routing process is not prepended.

e) (Optional) Select the Accept either real AS number or local AS number in routes received from neighbor check box to configure the eBGP neighbor to establish a peering session using the real autonomous system number (from the local BGP routing process) or by using the local autonomous system number.

Step 18  Click OK.
Step 19  Click Save.

---

**Configure BGP Aggregate Address Settings**

BGP neighbors store and exchange routing information and the amount of routing information increases as more BGP speakers are configured. Route aggregation is the process of combining the attributes of several different routes so that only a single route is advertised. Aggregate prefixes use the classless interdomain routing (CIDR) principle to combine contiguous networks into one classless set of IP addresses that can be summarized in routing tables. As a result fewer routes need to be advertised. Use the Add/Edit Aggregate Address dialog box to define the aggregation of specific routes into one route.

---

**Step 1**  When editing a Firepower Threat Defense device, click **Routing**.

**Step 2**  Choose **BGP > IPv4** or **IPv6**.

**Step 3**  Click **Add Aggregate Address**.

**Step 4**  Enter a value for the aggregate timer (in seconds) in the **Aggregate Timer** field. Valid values are 0 or any value between 6 and 60. The default value is 30.

**Step 5**  Click **Add** and update the **Add Aggregate Address** dialog:

a) **Network** — Enter an IPv4 address or select the desired network/hosts objects.

b) **Attribute Map** — (Optional) Enter or select the route map used to set the attribute of the aggregate route.

c) **Advertise Map** — (Optional) Enter or select the route map used to select the routes to create AS_SET origin communities.

d) **Suppress Map** — (Optional) Enter or select the route map used to select the routes to be suppressed.

e) **Generate AS set path Information** — (Optional) Select the check box to enable generation of autonomous system set path information.

f) **Filter all routes from updates** — (Optional) Select the check box to filter all more-specific routes from updates.

g) Click **OK**.

---

**What to do next**

- For BGPv4 settings, proceed to **Configure BGPv4 Filtering Settings, on page 848**
Configure BGPv4 Filtering Settings

Filtering settings are used to filter routes or networks received in incoming BGP updates. Filtering is used to restrict routing information that the router learns or advertises.

Before you begin
Filtering is only applicable for a BGP IPv4 routing policy.

Step 1 On the Device Management page, click Routing.
Step 2 Choose BGP > IPv4.
Step 3 Click Filtering.
Step 4 Click Add and update the Add Filter dialog:
   a) Access List — Select an access control list that defines which networks are to be received and which are to be suppressed in routing updates.
   b) Direction — (Optional) Select a direction that specifies if the filter should be applied to inbound updates or outbound updates.
   c) Protocol — (Optional) Select the routing process for which you want to filter: None, BGP, Connected, OSPF, RIP, or Static.
   d) Process ID — (Optional) Enter the process ID for the OSPF routing protocol.
   e) Click OK.
Step 5 Click Save.

Configure BGP Network Settings

Network settings are used to add networks that will be advertised by the BGP routing process and route maps that will be examined to filter the networks to be advertised.

Step 1 On the Device Management page, click Routing.
Step 2 Choose BGP > IPv4 or IPv6.
Step 3 Click Networks.
Step 4 Click Add and update the Add Networks dialog:
   a) Network — Enter the network to be advertised by the BGP routing processes.
   b) (Optional) Route Map — Enter or select a route map that should be examined to filter the networks to be advertised.
      If not specified, all networks are redistributed.
   c) Click OK.
Step 5 Click Save.
Configure BGP Redistribution Settings

Redistribution settings allow you to define the conditions for redistributing routes from another routing domain into BGP.

Step 1
On the Device Management page, click Routing.

Step 2
Choose BGP > IPv4 or IPv6.

Step 3
Click Redistribution.

Step 4
Click Add and update the Add Redistribution dialog:

a) **Source Protocol** — Select the protocol from which you want to redistribute routes into the BGP domain from the Source Protocol drop-down list.

b) **Process ID** — Enter the identifier for the selected source protocol. Applies to the OSPF protocol.

c) **Metric** — (Optional) Enter a metric for the redistributed route.

d) **Route Map** — Enter or select a route map that should be examined to filter the networks to be redistributed. If not specified, all networks are redistributed.

e) **Match** — The conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions. These options are enabled only when OSPF is chosen as the Source Protocol.

   - Internal
   - External 1
   - External 2
   - NSSA External 1
   - NSSA External 2

f) Click OK.

Configure BGP Route Injection Settings

Route Injection settings allow you to define the routes to be conditionally injected into the BGP routing table.

Step 1
On the Device Management page, click Routing.

Step 2
Choose BGP > IPv4 or IPv6.

Step 3
Click Route Injection.

Step 4
Click Add and update the Add Route Injection dialog:

a) **Inject Map** — Enter or select the route map that specifies the prefixes to inject into the local BGP routing table.

b) **Exist Map** — Enter or select the route map containing the prefixes that the BGP speaker will track.

c) **Injected routes will inherit the attributes of the aggregate route** — Select this to configure the injected route to inherit attributes of the aggregate route.

d) Click OK.
Step 5  Click Save.
CHAPTER 41

RIP for Firepower Threat Defense

This chapter describes how to configure the FTD to route data, perform authentication, and redistribute routing information, using the Routing Information Protocol (RIP).

- About RIP, on page 851
- Requirements and Prerequisites for RIP, on page 852
- Guidelines for RIP, on page 853
- Configure RIP, on page 853

About RIP

The Routing Information Protocol, or RIP, as it is more commonly called, is one of the most enduring of all routing protocols. RIP has four basic components: routing update process, RIP routing metrics, routing stability, and routing timers. Devices that support RIP send routing-update messages at regular intervals and when the network topology changes. These RIP packets include information about the networks that the devices can reach, as well as the number of routers or gateways that a packet must travel through to reach the destination address. RIP generates more traffic than OSPF, but is easier to configure.

RIP is a distance-vector routing protocol that uses hop count as the metric for path selection. When RIP is enabled on an interface, the interface exchanges RIP broadcasts with neighboring devices to dynamically learn about and advertise routes.

The Firepower Threat Defense device supports both RIP Version 1 and RIP Version 2. RIP Version 1 does not send the subnet mask with the routing update. RIP Version 2 sends the subnet mask with the routing update and supports variable-length subnet masks. Additionally, RIP Version 2 supports neighbor authentication when routing updates are exchanged. This authentication ensures that the Firepower Threat Defense device receives reliable routing information from a trusted source.

RIP has advantages over static routes because the initial configuration is simple, and you do not need to update the configuration when the topology changes. The disadvantage to RIP is that there is more network and processing overhead than in static routing.

Routing Update Process

RIP sends routing-update messages at regular intervals and when the network topology changes. When a router receives a routing update that includes changes to an entry, it updates its routing table to reflect the new route. The metric value for the path is increased by 1, and the sender is indicated as the next hop. RIP routers maintain only the best route (the route with the lowest metric value) to a destination. After updating
its routing table, the router immediately begins transmitting routing updates to inform other network routers of the change. These updates are sent independently of the regularly scheduled updates that RIP routers send.

**RIP Routing Metric**

RIP uses a single routing metric (hop count) to measure the distance between the source and a destination network. Each hop in a path from source to destination is assigned a hop count value, which is typically 1. When a router receives a routing update that contains a new or changed destination network entry, the router adds 1 to the metric value indicated in the update and enters the network in the routing table. The IP address of the sender is used as the next hop.

**RIP Stability Features**

RIP prevents routing loops from continuing indefinitely by implementing a limit on the number of hops allowed in a path from the source to a destination. The maximum number of hops in a path is 15. If a router receives a routing update that contains a new or changed entry, and if increasing the metric value by 1 causes the metric to be infinity (that is, 16), the network destination is considered unreachable. The downside of this stability feature is that it limits the maximum diameter of a RIP network to less than 16 hops.

RIP includes a number of other stability features that are common to many routing protocols. These features are designed to provide stability despite potentially rapid changes in network topology. For example, RIP implements the split horizon and hold-down mechanisms to prevent incorrect routing information from being propagated.

**RIP Timers**

RIP uses numerous timers to regulate its performance. These include a routing-update timer, a route-timeout timer, and a route-flush timer. The routing-update timer clocks the interval between periodic routing updates. Generally, it is set to 30 seconds, with a small random amount of time added whenever the timer is reset. This is done to help prevent congestion, which could result from all routers simultaneously attempting to update their neighbors. Each routing table entry has a route-timeout timer associated with it. When the route-timeout timer expires, the route is marked invalid but is retained in the table until the route-flush timer expires.

**Requirements and Prerequisites for RIP**

**Model Support**

FTD

**Supported Domains**

Any

**User Roles**

Admin
Access Admin
Network Admin
Guidelines for RIP

IPv6 Guidelines
Does not support IPv6.

Additional Guidelines
The following information applies to RIP Version 2 only:

- If using neighbor authentication, the authentication key and key ID must be the same on all neighbor devices that provide RIP Version 2 updates to the interface.
- With RIP Version 2, the Firepower Threat Defense device transmits and receives default route updates using the multicast address 224.0.0.9. In passive mode, it receives route updates at that address.
- When RIP Version 2 is configured on an interface, the multicast address 224.0.0.9 is registered on that interface. When a RIP Version 2 configuration is removed from an interface, that multicast address is unregistered.

Limitations

- The Firepower Threat Defense device cannot pass RIP updates between interfaces.
- RIP Version 1 does not support variable-length subnet masks.
- RIP has a maximum hop count of 15. A route with a hop count greater than 15 is considered unreachable.
- RIP convergence is relatively slow compared to other routing protocols.
- You can only enable a single RIP process on the Firepower Threat Defense device.

Configure RIP

RIP is a distance-vector routing protocol that uses hop count as the metric for path selection.

Step 1
Choose Devices > Device Management, and edit the FTD device.

Step 2
Select Routing.

Step 3
Select RIP from the table of contents.

Step 4
Select the Enable RIP check box to configure the RIP settings.

Step 5
Select the RIP versions for sending and receiving RIP updates from the RIP Version drop-down list.

Step 6
(Optional) Select the Generate Default Route check box to generate a default route for distribution, based on the route map that you specify.

a) Specify a route map name to use for generating default routes, in the Route Map field.
   The default route 0.0.0.0/0 is generated for distribution over a certain interface, when the route map, specified in the Route Map field, is present.
Step 7: When Send and Receive Version 2 is the chosen RIP Version, the Enable Auto Summary option is available. When the Enable Auto Summary checkbox is checked, automatic route summarization is enabled. Disable automatic summarization if you must perform routing between disconnected subnets. When automatic summarization is disabled, subnets are advertised.

Note: RIP Version 1 always uses automatic summarization—you cannot disable it.

Step 8: Click Networks. Define one or more networks for RIP routing. Enter IP address(es), or enter or select the desired Network/Hosts objects. There is no limit to the number of networks you can add to the security appliance configuration. Any interface that belongs to a network defined by this command, will participate in the RIP routing process. The RIP routing updates will be sent and received only through interfaces on the specified networks. Also, if the network of an interface is not specified, the interface will not be advertised in any RIP updates.

Note: RIP only supports IPv4 objects.

Step 9: (Optional) Click Passive Interface. Use this option to specify passive interfaces on the appliance, and by extension the active interfaces. The device listens for RIP routing broadcasts on passive interfaces, using that information to populate its routing tables, but does not broadcast routing updates on passive interfaces. Interfaces that are not designated as passive, receive and send updates.

Step 10: Click Redistribution to manage redistribution routes. These are the routes that are being redistributed from other routing processes into the RIP routing process.

a) Click Add to specify redistribution routes.

b) Select the routing protocol to redistribute into the RIP routing process, in the Protocol drop-down list.

Note: For the OSPF protocol, specify a process ID. Similarly, specify an AS path for BGP. When you choose the Connected option in the Protocol drop-down list, you can redistribute, directly connected networks into the RIP routing process.

c) (Optional) If you are redistributing OSPF routes into the RIP routing process, you can select specific types of OSPF routes to redistribute in the Match drop-down list. Ctrl-click to select multiple types:

- Internal – Routes internal to the autonomous system (AS) are redistributed.
- External 1 – Type 1 routes external to the AS are redistributed.
- External 2 – Type 2 routes external to the AS are redistributed.
- NSSA External 1 – Type 1 routes external to a not-so-stubby area (NSSA) are redistributed.
- NSSA External 2 – Type 2 routes external to an NSSA are redistributed

Note: The default is match Internal, External 1, and External 2

d) Select the RIP metric type to apply to the redistributed routes in the Metric drop-down list. The two choices are:

- Transparent – Use the current route metric
- Specified Value – Assign a specific metric value. Enter a specific value from 0-16, in the Metric Value field.
- None – No metric is specified. Do not use any metric value, to apply to redistributed routes.

e) (Optional) Enter the name of a route map that must be satisfied, in the Route Map field before the route can be redistributed into the RIP routing process. Routes are redistributed only if IP address matches an allow statement in the route map address list.
f) Click OK.

**Step 11**

(Optional) Click **Filtering** to manage filters for the RIP policy. In this section, filters are used to prevent routing updates through an interface, control the advertising of routes in routing updates, control the processing of routing updates and filtering sources of routing updates.

a) Click **Add** to add RIP filters.

b) Select the type of traffic to be filtered - Inbound or Outbound in the **Traffic Direction** field.

**Note** If traffic direction is inbound, you can only define an Interface filter.

c) Specify whether the filter is based on an Interface or a Route, by selecting appropriate in the **Filter On** field. If you select Interface, enter or Select the name of the interface on which routing updates are to be filtered. If you select Route, choose the route type:

- Static – Only static routes are filtered.
- Connected – Only connected routes are filtered.
- OSPF – Only OSPFv2 routes discovered by the specified OSPF process are filtered. Enter the Process ID of the OSPF process to be filtered.
- BGP – Only BGPv4 routes discovered by the specified BGP process are filtered. Enter the AS path of the BGP process to be filtered.

d) In the **Access List** field, enter or select the name of one or more access control lists (ACLs) that define the networks to be allowed or removed from RIP route advertisements.

e) Click **OK**.

**Step 12**

(Optional) Click **Broadcast** to add or edit interface configurations. Using Broadcast, you can override the global RIP versions to send or receive per interface. You can also define the authentication parameters per interface if you want to implement authentication to ensure valid RIP updates.

a) Click **Add** to add interface configurations.

b) Enter or Select an interface defined on this appliance in the **Interface** field.

c) In the Send option, select the appropriate boxes to specify sending updates using the RIP **Version 1**, **Version 2**, or both. These options let you override, for the specified interface, the global Send versions specified.

d) In the Receive option, select the appropriate boxes to specify accepting updates using the RIP **Version 1**, **Version 2**, or both. These options let you override, for the specified interface, the global Receive versions specified.

e) Select the **Authentication** used on this interface for RIP broadcasts.

- None – No authentication
- MD5 – Employ MD5
- Clear Text – Employ clear-text authentication

If you choose MD5 or Clear Text, you must also provide the following authentication parameters.

- Key ID – The ID of the authentication key. Valid values are from 0 to 255.
- Key – The key used by the chosen authentication method. Can contain up to 16 characters
- Confirm – Enter the authentication key again, to confirm

f) Click **OK**.
Configure RIP
Multicast Routing for Firepower Threat Defense

This chapter describes how to configure the Firepower Threat Defense device to use the multicast routing protocol.

- About Multicast Routing, on page 857
- Requirements and Prerequisites for Multicast Routing, on page 861
- Guidelines for Multicast Routing, on page 861
- Configure IGMP Features, on page 862
- Configure PIM Features, on page 866
- Configure Multicast Routes, on page 871
- Configure Multicast Boundary Filters, on page 872

About Multicast Routing

Multicast routing is a bandwidth-conserving technology that reduces traffic by simultaneously delivering a single stream of information to thousands of corporate recipients and homes. Applications that take advantage of multicast routing include videoconferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news.

Multicast routing protocols deliver source traffic to multiple receivers without adding any additional burden on the source or the receivers while using the least network bandwidth of any competing technology. Multicast packets are replicated in the network by Firepower Threat Defense device enabled with Protocol Independent Multicast (PIM) and other supporting multicast protocols, which results in the most efficient delivery of data to multiple receivers possible.

The Firepower Threat Defense device supports both stub multicast routing and PIM multicast routing. However, you cannot configure both concurrently on a single Firepower Threat Defense device.

Note

The UDP and non-UDP transports are both supported for multicast routing. However, the non-UDP transport has no FastPath optimization.

IGMP Protocol

IP hosts use the Internet Group Management Protocol (IGMP) to report their group memberships to directly-connected multicast routers. IGMP is used to dynamically register individual hosts in a multicast
group on a particular LAN. Hosts identify group memberships by sending IGMP messages to their local multicast router. Under IGMP, routers listen to IGMP messages and periodically send out queries to discover which groups are active or inactive on a particular subnet.

IGMP uses group addresses (Class D IP address) as group identifiers. Host group address can be in the range of 224.0.0.0 to 239.255.255.255. The address 224.0.0.0 is never assigned to any group. The address 224.0.0.1 is assigned to all systems on a subnet. The address 224.0.0.2 is assigned to all routers on a subnet.

---

**Note**

When you enable multicast routing on the Firepower Threat Defense device, IGMP Version 2 is automatically enabled on all interfaces.

---

**Query Messages to Multicast Groups**

The Firepower Threat Defense device sends query messages to discover which multicast groups have members on the networks attached to the interfaces. Members respond with IGMP report messages indicating that they want to receive multicast packets for specific groups. Query messages are addressed to the all-systems multicast group, which has an address of 224.0.0.1, with a time-to-live value of 1.

These messages are sent periodically to refresh the membership information stored on the Firepower Threat Defense device. If the Firepower Threat Defense device discovers that there are no local members of a multicast group still attached to an interface, it stops forwarding multicast packets for that group to the attached network, and it sends a prune message back to the source of the packets.

By default, the PIM designated router on the subnet is responsible for sending the query messages. By default, they are sent once every 125 seconds.

When changing the query response time, by default, the maximum query response time advertised in IGMP queries is 10 seconds. If the Firepower Threat Defense device does not receive a response to a host query within this amount of time, it deletes the group.

---

**Stub Multicast Routing**

Stub multicast routing provides dynamic host registration and facilitates multicast routing. When configured for stub multicast routing, the Firepower Threat Defense device acts as an IGMP proxy agent. Instead of fully participating in multicast routing, the Firepower Threat Defense device forwards IGMP messages to an upstream multicast router, which sets up delivery of the multicast data. When configured for stub multicast routing, the Firepower Threat Defense device cannot be configured for PIM sparse or bidirectional mode. You must enable PIM on the interfaces participating in IGMP stub multicast routing.

The Firepower Threat Defense device supports both PIM-SM and bidirectional PIM. PIM-SM is a multicast routing protocol that uses the underlying unicast routing information base or a separate multicast-capable routing information base. It builds unidirectional shared trees rooted at a single Rendezvous Point (RP) per multicast group and optionally creates shortest-path trees per multicast source.

---

**PIM Multicast Routing**

Bidirectional PIM is a variant of PIM-SM that builds bidirectional shared trees connecting multicast sources and receivers. Bidirectional trees are built using a Designated Forwarder (DF) election process operating on each link of the multicast topology. With the assistance of the DF, multicast data is forwarded from sources to the Rendezvous Point (RP), and therefore along the shared tree to receivers, without requiring source-specific state. The DF election takes place during RP discovery and provides a default route to the RP.
If the Firepower Threat Defense device is the PIM RP, use the untranslated outside address of the Firepower Threat Defense device as the RP address.

### PIM Source Specific Multicast Support

The Firepower Threat Defense device does not support PIM Source Specific Multicast (SSM) functionality and related configuration. However, the Firepower Threat Defense device allows SSM-related packets to pass through unless it is placed as a last-hop router.

SSM is classified as a data delivery mechanism for one-to-many applications such as IPTV. The SSM model uses a concept of "channels" denoted by an (S,G) pair, where S is a source address and G is an SSM destination address. Subscribing to a channel is achieved by using a group management protocol such as IGMPv3. SSM enables a receiving client, once it has learned about a particular multicast source, to receive multicast streams directly from the source rather than receiving it from a shared Rendezvous Point (RP). Access control mechanisms are introduced within SSM providing a security enhancement not available with current sparse or sparse-dense mode implementations.

PIM-SSM differs from PIM-SM in that it does not use an RP or shared trees. Instead, information on source addresses for a multicast group is provided by the receivers through the local receivership protocol (IGMPv3) and is used to directly build source-specific trees.

### Multicast Bidirectional PIM

Multicast bidirectional PIM is useful for networks that have many sources and receivers talking to each other simultaneously and where each participant can become both the source and receiver of multicast traffic, such as in videoconferencing, Webex meetings, and group chat. When PIM bidirectional mode is used, the RP only creates the (*,G) entry for the shared tree. There is no (S,G) entry. This conserves resources on the RP because state tables for each (S,G) entry are not maintained.

In PIM sparse mode, traffic only flows down the shared tree. In PIM bidirectional mode, traffic flows up and down the shared tree.

PIM bidirectional mode also does not use the PIM register/register-stop mechanism to register sources to the RP. Each source can begin sending to the source at any time. When the multicast packets arrive at the RP, they are forwarded down the shared tree (if there are receivers) or dropped (when there are no receivers). However, there is no way for the RP to tell the source to stop sending multicast traffic.

Design-wise you must think about where to place the RP in your network because it should be somewhere in the middle between the sources and receivers in the network.

PIM bidirectional mode has no Reverse Path Forwarding (RPF) check. Instead it uses the concept of a Designated Forwarder (DF) to prevent loops. This DF is the only router on the segment that is allowed to send multicast traffic to the RP. If there is only one router per segment that forwards multicast traffic, there will be no loops. The DF is chosen using the following mechanism:

- The router with the lowest metric to the RP is the DF.
- If the metric is equal, then the router with the highest IP address becomes the DF.
PIM Bootstrap Router (BSR)

PIM Bootstrap Router (BSR) is a dynamic Rendezvous Point (RP) selection model that uses candidate routers for RP function and for relaying the RP information for a group. The RP function includes RP discovery and provides a default route to the RP. It does this by configuring a set of devices as candidate BSRs (C-BSR) which participate in a BSR election process to choose a BSR amongst themselves. Once the BSR is chosen, devices that are configured as candidate Rendezvous Points (C-RP) start sending their group mapping to the elected BSR. The BSR then distributes the group-to-RP mapping information to all the other devices down the multicast tree through BSR messages that travel from PIM router to PIM router on a per-hop basis.

This feature provides a means of dynamically learning RPs, which is very essential in large complex networks where an RP can periodically go down and come up.

PIM Bootstrap Router (BSR) Terminology

The following terms are frequently referenced in the PIM BSR configuration:

- **Bootstrap Router (BSR)** — A BSR advertises Rendezvous Point (RP) information to other routers with PIM on a hop-by-hop basis. Among multiple Candidate-BSRs, a single BSR is chosen after an election process. The primary purpose of this Bootstrap router is to collect all Candidate-RP (C-RP) announcements in to a database called the RP-set and to periodically send this out to all other routers in the network as BSR messages (every 60 seconds).

- **Bootstrap Router (BSR) messages** — BSR messages are multicast to the All-PIM-Routers group with a TTL of 1. All PIM neighbors that receive these messages retransmit them (again with a TTL of 1) out of all interfaces except the one in which the messages were received. BSR messages contain the RP-set and the IP address of the currently active BSR. This is how C-RPs know where to unicast their C-RP messages.

- **Candidate Bootstrap Router (C-BSR)** — A device that is configured as a candidate-BSR participates in the BSR election mechanism. A C-BSR with highest priority is elected as the BSR. The highest IP address of the C-BSR is used as a tiebreaker. The BSR election process is preemptive, for example if a new C-BSR with a higher priority comes up, it triggers a new election process.

- **Candidate Rendezvous Point (C-RP)** — An RP acts as a meeting place for sources and receivers of multicast data. A device that is configured as a C-RP periodically advertises the multicast group mapping information directly to the elected BSR through unicast. These messages contain the Group-range, C-RP address, and a hold time. The IP address of the current BSR is learned from the periodic BSR messages that are received by all routers in the network. In this way, the BSR learns about possible RPs that are currently up and reachable.

**Note**

The Firepower Threat Defense device does not act as a C-RP, even though the C-RP is a mandatory requirement for BSR traffic. Only routers can act as a C-RP. So, for BSR testing functionality, you must add routers to the topology.

- **BSR Election Mechanism** — Each C-BSR originates Bootstrap messages (BSMs) that contain a BSR Priority field. Routers within the domain flood the BSMs throughout the domain. A C-BSR that hears about a higher-priority C-BSR than itself suppresses its sending of further BSMs for some period of time. The single remaining C-BSR becomes the elected BSR, and its BSMs inform all the other routers in the domain that it is the elected BSR.
Multicast Group Concept

Multicast is based on the concept of a group. An arbitrary group of receivers expresses an interest in receiving a particular data stream. This group does not have any physical or geographical boundaries—the hosts can be located anywhere on the Internet. Hosts that are interested in receiving data flowing to a particular group must join the group using IGMP. Hosts must be a member of the group to receive the data stream.

Multicast Addresses

Multicast addresses specify an arbitrary group of IP hosts that have joined the group and want to receive traffic sent to this group.

Clustering

Multicast routing supports clustering. In Spanned EtherChannel clustering, the control unit sends all multicast routing packets and data packets until fast-path forwarding is established. After fast-path forwarding is established, data units may forward multicast data packets. All data flows are full flows. Stub forwarding flows are also supported. Because only one unit receives multicast packets in Spanned EtherChannel clustering, redirection to the control unit is common.

Requirements and Prerequisites for Multicast Routing

Model Support

FTD

Supported Domains

Any

User Roles

Admin

Network Admin

Guidelines for Multicast Routing

Firewall Mode

Supported only in routed firewall mode. Transparent firewall mode is not supported.

IPv6

Does not support IPv6.
Multicast Group

The range of addresses between 224.0.0.0 and 224.0.0.255 is reserved for the use of routing protocols and other topology discovery or maintenance protocols, such as gateway discovery and group membership reporting. Hence, Internet multicast routing from address range 224.0.0/24 is not supported; IGMP group is not created when enabling multicast routing for the reserved addressess.

Clustering

In clustering, for IGMP and PIM, this feature is only supported on the primary unit.

Additional Guidelines

- You must configure an access control or prefilter rule on the inbound security zone to allow traffic to the multicast host, such as 224.1.2.3. However, you cannot specify a destination security zone for the rule, or it cannot be applied to multicast connections during initial connection validation.
- You cannot disable an interface with PIM configured on it. If you have configured PIM on the interface (see Configure PIM Protocol, on page 866), disabling the multicast routing and PIM does not remove the PIM configuration. You must remove (delete) the PIM configuration to disable the interface.
- PIM/IGMP Multicast routing is not supported on interfaces in a traffic zone.

Configure IGMP Features

IP hosts use IGMP to report their group memberships to directly-connected multicast routers. IGMP is used to dynamically register individual hosts in a multicast group on a particular LAN. Hosts identify group memberships by sending IGMP messages to their local multicast router. Under IGMP, routers listen to IGMP messages and periodically send out queries to discover which groups are active or inactive on a particular subnet.

This section describes how to configure optional IGMP settings on a per-interface basis.

Enable Multicast Routing

Enabling multicast routing on the Firepower Threat Defense device, enables IGMP and PIM on all interfaces by default. IGMP is used to learn whether members of a group are present on directly attached subnets. Hosts join multicast groups by sending IGMP report messages. PIM is used to maintain forwarding tables to forward multicast datagrams.
Only the UDP transport layer is supported for multicast routing.

The following list shows the maximum number of entries for specific multicast tables. Once these limits are reached, any new entries are discarded.

- MFIB—30,000
- IGMP Groups—30,000
- PIM Routes—72,000

**Step 1** Choose **Devices > Device Management**, and edit the FTD device.

**Step 2** Choose **Routing > Multicast Routing > IGMP**.

**Step 3** Check the **Enable Multicast Routing** check box.

Checking this check box enables IP multicast routing on the Firepower Threat Defense device. Unchecking this check box disables IP multicast routing. By default, multicast is disabled. Enabling multicast routing enables multicast on all interfaces.

You can disable multicast on a per-interface basis. This is useful if you know that there are no multicast hosts on a specific interface and you want to prevent the Firepower Threat Defense device from sending host query messages on that interface.

## Configure IGMP Protocol

You can configure IGMP parameters per interface, such as the forward interface, query messages, and time intervals.

**Step 1** Choose **Devices > Device Management**, and edit the FTD device.

**Step 2** Choose **Routing > Multicast Routing > IGMP**.

**Step 3** On **Protocol**, click **Add** or **Edit**.

Use the **Add IGMP parameters** dialog box to add new IGMP parameters to the Firepower Threat Defense device. Use the **Edit IGMP parameters** dialog box to change existing parameters.

**Step 4** Configure the following options:

- **Interface**—From the drop-down list, select the interface for which you want to configure IGMP protocol.

- **Enable IGMP**—Check the check box to enable IGMP.

  **Note** Disabling IGMP on specific interfaces is useful if you know that there are no multicast hosts on a specific interface and you want to prevent the Firepower Threat Defense device from sending host query messages on that interface.

- **Forward Interface**—From the drop-down list, select the specific interface from which you want to forward IGMP messages.
This configures the Firepower Threat Defense device to act as an IGMP proxy agent and forward IGMP messages from hosts connected on one interface to an upstream multicast router on another interface.

- **Version**—Choose IGMP Version 1 or 2.
  
  By default, the Firepower Threat Defense device runs IGMP Version 2, which enables several additional features.

  **Note**  
  All multicast routers on a subnet must support the same version of IGMP. The Firepower Threat Defense device does not automatically detect Version 1 routers and switch to Version 1. However, you can have a mix of IGMP Version 1 and 2 hosts on the subnet; the Firepower Threat Defense device running IGMP Version 2 works correctly when IGMP Version 1 hosts are present.

- **Query Interval**—The interval in seconds at which the designated router sends IGMP host-query messages. The range is 1 to 3600. The default is 125.
  
  **Note**  
  If the Firepower Threat Defense device does not hear a query message on an interface for the specified timeout value, then the Firepower Threat Defense device becomes the designated router and starts sending the query messages.

- **Response Time**—The interval in seconds before the Firepower Threat Defense device deletes the group. The range is 1 to 25. The default is 10.
  
  If the Firepower Threat Defense device does not receive a response to a host query within this amount of time, it deletes the group.

- **Group Limit**—The maximum number of hosts that can join on an interface. The range is 1 to 500. The default is 500.
  
  You can limit the number of IGMP states resulting from IGMP membership reports on a per-interface basis. Membership reports exceeding the configured limits are not entered in the IGMP cache, and traffic for the excess membership reports is not forwarded.

- **Query Timeout**—The period of time in seconds before which the Firepower Threat Defense device takes over as the requester for the interface after the previous requester has stopped. The range is 60 to 300. The default is 255.

**Step 5** Click OK to save the IGMP protocol configuration.

---

### Configure IGMP Access Groups

You can control access to multicast groups by using access control lists.

**Step 1** Choose Devices > Device Management, and edit the FTD device.

**Step 2** Choose Routing > Multicast Routing > Access Group.

**Step 3** On Access Group, click Add or Edit.

Use the Add IGMP Access Group parameters dialog box to add new IGMP access groups to the Access Group table. Use the Edit IGMP Access Group parameters dialog box to change existing parameters.

**Step 4** Configure the following options:

a) From the Interface drop-down list, select the interface with which the access group is associated. You cannot change the associated interface when you are editing an existing access group.
b) Click one of the following:

- **Standard Access List** — From the **Standard Access List** drop-down list, select the standard ACL or click **Add** (⊕) to create a new standard ACL. See Configure Standard ACL Objects, on page 510 for the procedure.

- **Extended Access List** — From the **Extended Access List** drop-down list, select the extended ACL or click **Add** (⊕) to create a new extended ACL. See Configure Extended ACL Objects, on page 509 for the procedure.

**Step 5**  
Click **OK** to save the access group configuration.

---

### Configure IGMP Static Groups

Sometimes a group member cannot report its membership in the group or there may be no members of a group on the network segment, but you still want multicast traffic for that group to be sent to that network segment. You can have multicast traffic for that group sent to the segment by configuring a statically joined IGMP group. With this method, the Firepower Threat Defense device does not accept the packets itself, but only forwards them. Therefore, this method allows fast switching. The outgoing interface appears in the IGMP cache, but this interface is not a member of the multicast group.

**Step 1**  
Choose **Devices > Device Management**, and edit the FTD device.

**Step 2**  
Choose **Routing > Multicast Routing > IGMP**.

**Step 3**  
On **Static Group**, click **Add** or **Edit**.

Use the **Add IGMP Static Group parameters** dialog box to statically assign a multicast group to an interface. Use the **Edit IGMP Static Group parameters** dialog box to change existing static group assignments.

**Step 4**  
Configure the following options:

- From the **Interface** drop-down list, select the interface to which you want to statically assign a multicast group. If you are editing an existing entry, you cannot change the value.

- From the **Multicast Groups** drop-down list, select the multicast group to which you want to assign the interface, or click **Add** (⊕) to create a new multicast group. See Creating Network Objects for the procedure.

**Step 5**  
Click **OK** to save the static group configuration.

---

### Configure IGMP Join Groups

You can configure an interface to be a member of a multicast group. Configuring the Firepower Threat Defense device to join a multicast group causes upstream routers to maintain multicast routing table information for that group and keep the paths for that group active.

**Note**  
See Configure IGMP Static Groups, on page 865 if you want to forward multicast packets for a specific group to an interface without the Firepower Threat Defense device accepting those packets as part of the group.
**Configure PIM Features**

Routers use PIM to maintain forwarding tables to use for forwarding multicast diagrams. When you enable multicast routing on the Firepower Threat Defense device, PIM and IGMP are automatically enabled on all interfaces.

**Note**

PIM is not supported with PAT. The PIM protocol does not use ports, and PAT only works with protocols that use ports.

This section describes how to configure optional PIM settings.

---

**Configure PIM Protocol**, on page 866

**Configure PIM Neighbor Filters**, on page 867

**Configure PIM Bidirectional Neighbor Filters**, on page 868

**Configure PIM Rendezvous Points**, on page 869

**Configure PIM Route Trees**, on page 869

**Configure PIM Request Filters**, on page 870

**Configure Multicast Boundary Filters**, on page 872

---

**Configure PIM Protocol**

You can enable or disable PIM on a specific interface.

You can also configure the Designated Router (DR) priority. The DR is responsible for sending PIM register, join, and prune messages to the RP. When there is more than one multicast router on a network segment, choosing the DR is based on the DR priority. If multiple devices have the same DR priority, then the device...
with the highest IP address becomes the DR. By default, the Firepower Threat Defense device has a DR priority of 1.

Router query messages are used to choose the PIM DR. The PIM DR is responsible for sending router query messages. By default, router query messages are sent every 30 seconds. Additionally, every 60 seconds, the Firepower Threat Defense device sends PIM join or prune messages.

---

**Configure PIM Neighbor Filters**

You can define the routers that can become PIM neighbors. By filtering the routers that can become PIM neighbors, you can do the following:

- Prevent unauthorized routers from becoming PIM neighbors.
- Prevent attached stub routers from participating in PIM.

**Step 1**  Choose Devices > Device Management, and edit the FTD device.

**Step 2**  Choose Routing > Multicast Routing > PIM.

**Step 3**  On Neighbor Filter, click Add or Edit.

Use the Add PIM Neighbor Filter dialog box to add new PIM neighbor filters to the interface. Use the Edit PIM Neighbor Filter dialog box to change existing parameters.

**Step 4**  Configure the following options:

- From the Interface drop-down list, select the interface to which you want to add a PIM neighbor filter.
Configure PIM Bidirectional Neighbor Filters

A PIM bidirectional neighbor filter is an ACL that defines the neighbor devices that can participate in the Designated Forwarder (DF) election. If a PIM bidirectional neighbor filter is not configured for an interface, there are no restrictions. If a PIM bidirectional neighbor filter is configured, only those neighbors permitted by the ACL can participate in the DF election process.

Bidirectional PIM allows multicast routers to keep reduced state information. All of the multicast routers in a segment must be bidirectionally enabled to elect a DF.

When a PIM bidirectional neighbor filter is enabled, the routers that are permitted by the ACL are considered to be bidirectionally capable. Therefore, the following is true:

- If a permitted neighbor does not support bidirectional mode, then the DF election does not occur.
- If a denied neighbor supports bidirectional mode, then the DF election does not occur.
- If a denied neighbor does not support bidirectional mode, the DF election can occur.

Step 1
Choose Devices > Device Management, and edit the FTD device.

Step 2
Choose Multicast Routing > PIM.

Step 3
On Bidirectional Neighbor Filter, click Add or Edit.

Use the Add PIM Bidirectional Neighbor Filter dialog box to create ACL entries for the PIM bidirectional neighbor filter ACL. Use the Edit PIM Bidirectional Neighbor Filter dialog box to change existing parameters.

Step 4
Configure the following options:

- From the Interface drop-down list, select the interface to which you want to configure the PIM bidirectional neighbor filter ACL entry.

- Standard Access List—From the Standard Access List drop-down list, select a standard ACL or click Add (☞) to create a new standard ACL. See Configure Standard ACL Objects, on page 510 for the procedure.

Note Choosing Allow on the Add Standard Access List Entry dialog box lets the specified devices participate in the DR election process. Choosing Block prevents the specified devices from participating in the DR election process.

Step 5
Click OK to save the PIM bidirectional neighbor filter configuration.
Configure PIM Rendezvous Points

You can configure the Firepower Threat Defense device to serve as a RP to more than one group. The group range specified in the ACL determines the PIM RP group mapping. If an ACL is not specified, then the RP for the group is applied to the entire multicast group range (224.0.0.0/4). See Multicast Bidirectional PIM, on page 859 for more information about bidirectional PIM.

The following restrictions apply to RPs:

- You cannot use the same RP address twice.
- You cannot specify All Groups for more than one RP.

---

Step 1  Choose Devices > Device Management, and edit the FTD device.

Step 2  Choose Routing > Multicast Routing > PIM.

Step 3  On Rendezvous Points, click Add or Edit.

Step 4  Configure the following options:

- From the Rendezvous Point IP address drop-down list, select the IP address that you want to add as an RP or click Add to create a new network object. See Creating Network Objects for the procedure.

- Check the Use bi-directional forwarding check box if the specified multicast groups are to operate in bidirectional mode. In bidirectional mode, if the Firepower Threat Defense device receives a multicast packet and has no directly connected members or PIM neighbors present, it sends a prune message back to the source.

- Choose Use this RP for all Multicast Groups to use the specified RP for all multicast groups on the interface.

- Choose the Use this RP for all Multicast Groups as specified below to designate the multicast groups to use with the specified RP and then from the Standard Access List drop-down list, choose a standard ACL or click Add to create a new standard ACL. See Configure Standard ACL Objects, on page 510 for the procedure.

Step 5  Click OK to save the rendezvous point configuration.

---

Configure PIM Route Trees

By default, PIM leaf routers join the shortest-path tree immediately after the first packet arrives from a new source. This method reduces delay, but requires more memory than the shared tree. You can configure whether or not the Firepower Threat Defense device should join the shortest-path tree or use the shared tree, either for all multicast groups or only for specific multicast addresses.

The shortest-path tree is used for any group that is not specified in the Multicast Groups table. The Multicast Groups table displays the multicast groups to use with the shared tree. The table entries are processed from the top down. You can create an entry that includes a range of multicast groups, but excludes specific groups within that range by placing deny rules for the specific groups at the top of the table and the permit rule for the range of multicast groups below the deny statements.
This behavior is known as Shortest Path Switchover (SPT). We recommend that you always use the Shared Tree option.

---

**Configure PIM Request Filters**

When the Firepower Threat Defense device is acting as an RP, you can restrict specific multicast sources from registering with it to prevent unauthorized sources from registering with the RP. You can define the multicast sources from which the Firepower Threat Defense device will accept PIM register messages.

**Step 1** Choose **Devices > Device Management**, and edit the FTD device.

**Step 2** Choose **Routing > Multicast Routing > PIM**.

**Step 3** On **Request Filter**, define the multicast sources that are allowed to register with the Firepower Threat Defense device when it acts as an RP:

- From the **Filter PIM register messages using** drop-down list select **None**, **Access List**, or **Route Map**.

- If you choose **Access List** from the drop-down list, select an extended ACL or click **Add** to create a new extended ACL. See **Configure Extended ACL Objects**, on page 509 for the procedure.

  **Note** In the **Add Extended Access List Entry** dialog box, select **Allow** from the drop-down list to create a rule that allows the specified source of the specified multicast traffic to register with the Firepower Threat Defense device, or select **Block** to create a rule that prevents the specified source of the specified multicast traffic from registering with the Firepower Threat Defense device.

- If you choose **Route Map**, select a route map from the **Route Map** drop-down list, or click **Add** to create a new route map. See **Creating Network Objects** for the procedure.

**Step 4** Click **OK** to save the request filter configuration.
Configure the Firepower Threat Defense Device as a Candidate Bootstrap Router

You can configure the Firepower Threat Defense device as a candidate BSR.

**Step 1** Choose Devices > Device Management, and edit the FTD device.

**Step 2** Choose Routing > Multicast Routing > PIM.

**Step 3** On Bootstrap Router, check the Configure this FTD as a Candidate Bootstrap Router (C-BSR) check box to perform the C-BSR setup.

   a) From the Interface drop-down list, select the interface on the Firepower Threat Defense device from which the BSR address is derived to make it a candidate.

      This interface must be enabled with PIM.

   b) In the Hash mask length field, enter the length of a mask (32 bits maximum) that is to be ANDed with the group address before the hash function is called. All groups with the same seed hash (correspond) to the same RP. For example, if this value is 24, only the first 24 bits of the group addresses matter. This fact allows you to get one RP for multiple groups. The range is 0 to 32.

   c) In the Priority field, enter the priority of the candidate BSR. The BSR with the larger priority is preferred. If the priority values are the same, the router with the larger IP address is the BSR. The range is 0 to 255. The default value is 0.

**Step 4** (Optional) Click Add to select an interface on which no PIM BSR messages will be sent or received in the Configure this FTD as a Border Bootstrap Router (BSR) section.

   • From the Interface drop-down list, select the interface on which no PIM BSR messages will be sent or received.

      RP or BSR advertisements are filtered effectively isolating two domains of RP information exchange.

   • Check the Enable Border BSR check box to enable BSR.

**Step 5** Click OK to save the bootstrap router configuration.

---

Configure Multicast Routes

Configuring static multicast routes lets you separate multicast traffic from unicast traffic. For example, when a path between a source and destination does not support multicast routing, the solution is to configure two multicast devices with a GRE tunnel between them and to send the multicast packets over the tunnel.

When using PIM, the Firepower Threat Defense device expects to receive packets on the same interface where it sends unicast packets back to the source. In some cases, such as bypassing a route that does not support multicast routing, you may want unicast packets to take one path and multicast packets to take another.

Static multicast routes are not advertised or redistributed.

**Step 1** Choose Devices > Device Management, and edit the FTD device.

**Step 2** Choose Routing > Multicast Routing > Multicast Routes > Add or Edit.
Configure Multicast Boundary Filters

Address scoping defines domain boundary filters so that domains with RPs that have the same IP address do not leak into each other. Scoping is performed on the subnet boundaries within large domains and on the boundaries between the domain and the Internet.

You can set up an administratively scoped boundary filter on an interface for multicast group addresses. IANA has designated the multicast address range from 239.0.0.0 to 239.255.255.255 as the administratively scoped addresses. This range of addresses can be reused in domains administered by different organizations. The addresses would be considered local, not globally unique.

A standard ACL defines the range of affected addresses. When a boundary filter is set up, no multicast data packets are allowed to flow across the boundary from either direction. The boundary filter allows the same multicast group address to be reused in different administrative domains.

You can configure, examine, and filter Auto-RP discovery and announcement messages at the administratively scoped boundary. Any Auto-RP group range announcements from the Auto-RP packets that are denied by the boundary ACL are removed. An Auto-RP group range announcement is permitted and passed by the boundary filter only if all addresses in the Auto-RP group range are permitted by the boundary ACL. If any address is not permitted, the entire group range is filtered and removed from the Auto-RP message before the Auto-RP message is forwarded.

**Step 1** Choose Devices > Device Management, and edit the FTD device.

**Step 2** Choose Routing > Multicast Routing > Multicast Boundary Filter, and then click Add or Edit.

Use the Add Multicast Boundary Filter dialog box to add new multicast boundary filters to the Firepower Threat Defense device. Use the Edit Multicast Boundary Filter dialog box to change existing parameters.

You can configure a multicast boundary for administratively scoped multicast addresses. A multicast boundary restricts multicast data packet flows and enables reuse of the same multicast group address in different administrative domains.
When a multicast boundary is defined on an interface, only the multicast traffic permitted by the filter ACL passes through the interface.

**Step 3** From the **Interface** drop-down list, choose the interface for which you are configuring the multicast boundary filter ACL.

**Step 4** From the **Standard Access List** drop-down list, choose the standard ACL you want to use, or click **Add** (add) to create a new standard ACL. See **Configure Standard ACL Objects**, on page 510 for the procedure.

**Step 5** Check the **Remove any Auto-RP group range announcement from the Auto-RP packets that are denied by the boundary** check box to filter Auto-RP messages from sources denied by the boundary ACL. If this check box is not checked, all Auto-RP messages are passed.

**Step 6** Click **OK** to save the multicast boundary filter configuration.
PART XI

Firepower Threat Defense VPN

- VPN Overview for Firepower Threat Defense, on page 877
- Site-to-Site VPNs for Firepower Threat Defense, on page 889
- Remote Access VPNs for Firepower Threat Defense, on page 903

CHAPTER 43

VPN Overview for Firepower Threat Defense

A virtual private network (VPN) connection establishes a secure tunnel between endpoints over a public network such as the Internet.

This chapter applies to Remote Access and Site-to-site VPNs on Firepower Threat Defense devices. It describes the Internet Protocol Security (IPsec), the Internet Security Association and Key Management Protocol (ISAKMP, or IKE) and SSL standards that are used to build site-to-site and remote access VPNs.

Site-to-site VPNs on 7000 and 8000 Series devices, referred to as Gateway VPNs or Firepower VPNs in the Firepower Management Center are described in Gateway VPNs, on page 1343.

- VPN Types, on page 877
- VPN Basics, on page 878
- VPN Packet Flow, on page 880
- VPN Licensing, on page 880
- How Secure Should a VPN Connection Be?, on page 881
- VPN Topology Options, on page 885

VPN Types

The Firepower Management Center supports the following types of VPN connections:

- Remote Access VPNs on Firepower Threat Defense devices.

Remote access VPNs are secure, encrypted connections, or tunnels, between remote users and your company’s private network. The connection consists of a VPN endpoint device, which is a workstation or mobile device with VPN client capabilities, and a VPN headend device, or secure gateway, at the edge of the corporate private network.

Firepower Threat Defense devices can be configured to support Remote Access VPNs over SSL or IPsec IKEv2 by the Firepower Management Center. Functioning as secure gateways in this capacity, they authenticate remote users, authorize access, and encrypt data to provide secure connections to your network. No other types of appliances, managed by the Firepower Management Center, support Remote Access VPN connections.

Firepower Threat Defense secure gateways support the AnyConnect Secure Mobility Client full tunnel client. This client is required to provide secure SSL IPsec IKEv2 connections for remote users. This client gives remote users the benefits of a client without the need for network administrators to install and configure clients on remote computers since it can be deployed to the client platform upon connectivity. It is the only client supported on endpoint devices.
• Site-to-site VPNs on Firepower Threat Defense devices.

A site-to-site VPN connects networks in different geographic locations. You can create site-to-site IPsec connections between managed devices, and between managed devices and other Cisco or third-party peers that comply with all relevant standards. These peers can have any mix of inside and outside IPv4 and IPv6 addresses. Site-to-site tunnels are built using the Internet Protocol Security (IPsec) protocol suite and IKEv1 or IKEv2. After the VPN connection is established, the hosts behind the local gateway can connect to the hosts behind the remote gateway through the secure VPN tunnel.

• Site-to-site VPNs on 7000 and 8000 Series devices.

These site-to-site VPNs are referred to as Gateway VPNs or Firepower VPNs in the Firepower Management Center. See Gateway VPNs, on page 1343, for information on this type of VPN connection.

VPN Basics

Tunneling makes it possible to use a public TCP/IP network, such as the Internet, to create secure connections between remote users and private corporate networks. Each secure connection is called a tunnel.

IPsec-based VPN technologies use the Internet Security Association and Key Management Protocol (ISAKMP, or IKE) and IPsec tunneling standards to build and manage tunnels. ISAKMP and IPsec accomplish the following:

• Negotiate tunnel parameters.
• Establish tunnels.
• Authenticate users and data.
• Manage security keys.
• Encrypt and decrypt data.
• Manage data transfer across the tunnel.
• Manage data transfer inbound and outbound as a tunnel endpoint or router.

A device in a VPN functions as a bidirectional tunnel endpoint. It can receive plain packets from the private network, encapsulate them, create a tunnel, and send them to the other end of the tunnel where they are unencapsulated and sent to their final destination. It can also receive encapsulated packets from the public network, unencapsulate them, and send them to their final destination on the private network.

After the site-to-site VPN connection is established, the hosts behind the local gateway can connect to the hosts behind the remote gateway through the secure VPN tunnel. A connection consists of the IP addresses and hostnames of the two gateways, the subnets behind them, and the method the two gateways use to authenticate to each other.

Internet Key Exchange (IKE)

Internet Key Exchange (IKE) is a key management protocol that is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs).
The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes SAs for other applications, such as IPsec. Both phases use proposals when they negotiate a connection.

An IKE policy is a set of algorithms that two peers use to secure the IKE negotiation between them. IKE negotiation begins by each peer agreeing on a common (shared) IKE policy. This policy states which security parameters protect subsequent IKE negotiations. For IKE version 1 (IKEv1), IKE policies contain a single set of algorithms and a modulus group. Unlike IKEv1, in an IKEv2 policy, you can select multiple algorithms and modulus groups from which peers can choose during the Phase 1 negotiation. It is possible to create a single IKE policy, although you might want different policies to give higher priority to your most desired options. For site-to-site VPNs, you can create a single IKE policy.

To define an IKE policy, specify:

- A unique priority (1 to 65,543, with 1 the highest priority).
- An encryption method for the IKE negotiation, to protect the data and ensure privacy.
- A Hashed Message Authentication Codes (HMAC) method (called integrity algorithm in IKEv2) to ensure the identity of the sender, and to ensure that the message has not been modified in transit.
- For IKEv2, a separate pseudorandom function (PRF) used as the algorithm to derive keying material and hashing operations required for the IKEv2 tunnel encryption. The options are the same as those used for the hash algorithm.
- A Diffie-Hellman group to determine the strength of the encryption-key-determination algorithm. The device uses this algorithm to derive the encryption and hash keys.
- An authentication method, to ensure the identity of the peers.
- A limit to the time the device uses an encryption key before replacing it.

When IKE negotiation begins, the peer that starts the negotiation sends all of its policies to the remote peer, and the remote peer searches for a match with its own policies, in priority order. A match between IKE policies exists if they have the same encryption, hash (integrity and PRF for IKEv2), authentication, and Diffie-Hellman values, and an SA lifetime less than or equal to the lifetime in the policy sent. If the lifetimes are not identical, the shorter lifetime—from the remote peer policy—Applies. By default, the Firepower Management Center deploys an IKEv1 policy at the lowest priority for all VPN endpoints to ensure a successful negotiation.

### IPsec

IPsec is one of the most secure methods for setting up a VPN. IPsec provides data encryption at the IP packet level, offering a robust security solution that is standards-based. With IPsec, data is transmitted over a public network through tunnels. A tunnel is a secure, logical communication path between two peers. Traffic that enters an IPsec tunnel is secured by a combination of security protocols and algorithms.

An IPsec Proposal policy defines the settings required for IPsec tunnels. An IPsec proposal is a collection of one or more crypto-maps that are applied to the VPN interfaces on the devices. A crypto map combines all the components required to set up IPsec security associations, including:

- A proposal (or transform set) is a combination of security protocols and algorithms that secure traffic in an IPsec tunnel. During the IPsec security association (SA) negotiation, peers search for a proposal that is the same at both peers. When it is found, it is applied to create an SA that protects data flows in the access list for that crypto map, protecting the traffic in the VPN. There are separate IPsec proposals for
IKEv1 and IKEv2. In IKEv1 proposals (or transform sets), for each parameter, you set one value. For IKEv2 proposals, you can configure multiple encryption and integration algorithms for a single proposal.

- A crypto map, combines all components required to set up IPsec security associations (SA), including IPsec rules, proposals, remote peers, and other parameters that are necessary to define an IPsec SA. When two peers try to establish an SA, they must each have at least one compatible crypto map entry.

Dynamic crypto map policies are used in site-to-site VPNs when an unknown remote peer tries to start an IPsec security association with the local hub. The hub cannot be the initiator of the security association negotiation. Dynamic crypto-policies allow remote peers to exchange IPsec traffic with a local hub even if the hub does not know the remote peer’s identity. A dynamic crypto map policy essentially creates a crypto map entry without all the parameters configured. The missing parameters are later dynamically configured (as the result of an IPsec negotiation) to match a remote peer’s requirements.

Dynamic crypto map policies are applicable to both hub-and-spoke and point-to-point VPN topologies. To apply dynamic crypto map policies, specify a dynamic IP address for one of the peers in the topology and ensure that the dynamic crypto-map is enabled on this topology. Note that in a full mesh VPN topology, you can apply only static crypto map policies.

---

**VPN Packet Flow**

On a FTD device, by default no traffic is allowed to pass through access-control without explicit permission. VPN tunnel traffic as well, is not relayed to the endpoints until it has passed through Snort. Incoming tunnel packets are decrypted before being sent to the Snort process. Snort processes outgoing packets before encryption.

Access Control identifying the protected networks for each endpoint node of a VPN tunnel determines which traffic is allowed to pass through the FTD device and reach the endpoints. For Remote Access VPN traffic, a Group Policy filter or an Access Control rule must be configured to permit VPN traffic flow.

In addition, the system does not send tunnel traffic to the public source when the tunnel is down.

**VPN Licensing**

There is no specific licensing for enabling Firepower Threat Defense VPN, it is available by default.

The Firepower Management Center determines whether to allow or block the usage of strong crypto on a Firepower Threat Defense device based on attributes provided by the smart licensing server.

This is controlled by whether you selected the option to allow export-controlled functionality on the device when you registered with Cisco Smart License Manager. If you are using the evaluation license, or you did not enable export-controlled functionality, you cannot use strong encryption.
How Secure Should a VPN Connection Be?

Because a VPN tunnel typically traverses a public network, most likely the Internet, you need to encrypt the connection to protect the traffic. You define the encryption and other security techniques to apply using IKE policies and IPsec proposals.

If your device license allows you to apply strong encryption, there is a wide range of encryption and hash algorithms, and Diffie-Hellman groups, from which to choose. However, as a general rule, the stronger the encryption that you apply to the tunnel, the worse the system performance. Find a balance between security and performance that provides sufficient protection without compromising efficiency.

We cannot provide specific guidance on which options to choose. If you operate within a larger corporation or other organization, there might already be defined standards that you need to meet. If not, take the time to research the options.

The following topics explain the available options.

Complying with Security Certification Requirements

Many VPN settings have options that allow you to comply with various security certification standards. Review your certification requirements and the available options to plan your VPN configuration. See Security Certifications Compliance, on page 1153 for additional system information related to compliance.

Deciding Which Encryption Algorithm to Use

When deciding which encryption algorithms to use for the IKE policy or IPsec proposal, your choice is limited to algorithms supported by the devices in the VPN.

For IKEv2, you can configure multiple encryption algorithms. The system orders the settings from the most secure to the least secure and negotiates with the peer using that order. For IKEv1, you can select a single option only.

For IPsec proposals, the algorithm is used by the Encapsulating Security Protocol (ESP), which provides authentication, encryption, and anti-replay services. ESP is IP protocol type 50. In IKEv1 IPsec proposals, the algorithm name is prefixed with ESP-.

If your device license qualifies for strong encryption, you can choose from the following encryption algorithms. If you are not qualified for strong encryption, you can select DES only.

- AES-GCM—(IKEv2 only.) Advanced Encryption Standard in Galois/Counter Mode is a block cipher mode of operation providing confidentiality and data-origin authentication, and provides greater security than AES. AES-GCM offers three different key strengths: 128-, 192-, and 256-bit keys. A longer key provides higher security but a reduction in performance. GCM is a mode of AES that is required to support NSA Suite B. NSA Suite B is a set of cryptographic algorithms that devices must support to meet federal standards for cryptographic strength.

- AES-GMAC—(IKEv2 IPsec proposals only.) Advanced Encryption Standard Galois Message Authentication Code is a block cipher mode of operation providing only data-origin authentication. It is a variant of AES-GCM that allows data authentication without encrypting the data. AES-GMAC offers three different key strengths: 128-, 192-, and 256-bit keys.
• AES—Advanced Encryption Standard is a symmetric cipher algorithm that provides greater security than DES and is computationally more efficient than 3DES. AES offers three different key strengths: 128-, 192-, and 256-bit keys. A longer key provides higher security but a reduction in performance.

• 3DES—Triple DES, which encrypts three times using 56-bit keys, is more secure than DES because it processes each block of data three times with a different key. However, it uses more system resources and is slower than DES.

• DES—Data Encryption Standard, which encrypts using 56-bit keys, is a symmetric secret-key block algorithm. If your license account does not meet the requirements for export controls, this is your only option. It is faster than 3DES and uses less system resources, but it is also less secure. If you do not need strong data confidentiality, and if system resources or speed is a concern, choose DES.

• Null—A null encryption algorithm provides authentication without encryption. This is typically used for testing purposes only.

Deciding Which Hash Algorithms to Use

In IKE policies, the hash algorithm creates a message digest, which is used to ensure message integrity. In IKEv2, the hash algorithm is separated into two options, one for the integrity algorithm, and one for the pseudo-random function (PRF).

In IPsec proposals, the hash algorithm is used by the Encapsulating Security Protocol (ESP) for authentication. In IKEv2 IPsec Proposals, this is called the integrity hash. In IKEv1 IPsec proposals, the algorithm name is prefixed with ESP-, and there is also an -HMAC suffix (which stands for “hash method authentication code”).

For IKEv2, you can configure multiple hash algorithms. The system orders the settings from the most secure to the least secure and negotiates with the peer using that order. For IKEv1, you can select a single option only.

You can choose from the following hash algorithms.

• SHA (Secure Hash Algorithm)—Standard SHA (SHA1) produces a 160-bit digest. SHA is more resistant to brute-force attacks than MD5. However, it is also more resource intensive than MD5. For implementations that require the highest level of security, use the SHA hash algorithm.

  The following SHA-2 options, which are even more secure, are available for IKEv2 configurations. Choose one of these if you want to implement the NSA Suite B cryptography specification.

    • SHA256—Specifies the Secure Hash Algorithm SHA 2 with the 256-bit digest.
    • SHA384—Specifies the Secure Hash Algorithm SHA 2 with the 384-bit digest.
    • SHA512—Specifies the Secure Hash Algorithm SHA 2 with the 512-bit digest.

• MD5 (Message Digest 5)—Produces a 128-bit digest. MD5 uses less processing time for an overall faster performance than SHA, but it is considered to be weaker than SHA.

• Null or None (NULL, ESP-NONE)—(IPsec Proposals only.) A null Hash Algorithm; this is typically used for testing purposes only. However, you should choose the null integrity algorithm if you select one of the AES-GCM/GMAC options as the encryption algorithm. Even if you choose a non-null option, the integrity hash is ignored for these encryption standards.
Deciding Which Diffie-Hellman Modulus Group to Use

You can use the following Diffie-Hellman key derivation algorithms to generate IPsec security association (SA) keys. Each group has a different size modulus. A larger modulus provides higher security, but requires more processing time. You must have a matching modulus group on both peers.

If you select AES encryption, to support the large key sizes required by AES, you should use Diffie-Hellman (DH) Group 5 or higher. IKEv1 policies do not support all of the groups listed below.

To implement the NSA Suite B cryptography specification, use IKEv2 and select one of the elliptic curve Diffie-Hellman (ECDH) options: 19, 20, or 21. Elliptic curve options and groups that use 2048-bit modulus are less exposed to attacks such as Logjam.

For IKEv2, you can configure multiple groups. The system orders the settings from the most secure to the least secure and negotiates with the peer using that order. For IKEv1, you can select a single option only.

- 2—Diffie-Hellman Group 2: 1024-bit modular exponential (MODP) group. This option is no longer considered good protection.
- 5—Diffie-Hellman Group 5: 1536-bit MODP group. Formerly considered good protection for 128-bit keys, this option is no longer considered good protection.
- 19—Diffie-Hellman Group 19: National Institute of Standards and Technology (NIST) 256-bit elliptic curve modulo a prime (ECP) group.
- 24—Diffie-Hellman Group 24: 2048-bit MODP group with 256-bit prime order subgroup. This option is no longer recommended.

Deciding Which Authentication Method to Use

Preshared keys and digital certificates are the methods of authentication available for VPNs.

Site-to-site, IKEv1 and IKEv2 VPN connections can use both options.

Remote Access, which uses SSL and IPsec IKEv2 only, supports digital certificate authentication only.

Preshared keys allow for a secret key to be shared between two peers and used by IKE during the authentication phase. The same shared key must be configured at each peer or the IKE SA cannot be established.

Digital certificates use RSA key pairs to sign and encrypt IKE key management messages. Certificates provide non-repudiation of communication between two peers, meaning that it can be proved that the communication actually took place. When using this authentication method, you need a Public Key Infrastructure (PKI) defined where peers can obtain digital certificates from a Certification Authority (CA). CAs manage certificate requests and issue certificates to participating network devices providing centralized key management for all of the participating devices.

Preshared keys do not scale well, using a CA improves the manageability and scalability of your IPsec network. With a CA, you do not need to configure keys between all encrypting devices. Instead, each participating device is registered with the CA, and requests a certificate from the CA. Each device that has its own certificate and the public key of the CA can authenticate every other device within a given CA’s domain.
Pre-shared Keys

Pre-shared keys allow for a secret key to be shared between two peers. The key is used by IKE in the authentication phase. The same shared key must be configured on each peer, or the IKE SA cannot be established.

To configure the pre-shared keys, choose whether you will use a manual or automatically generated key, and then specify the key in the IKEv1/IKEv2 options. Then, when your configuration is deployed, the key is configured on all devices in the topology.

PKI Infrastructure and Digital Certificates

Public Key Infrastructure

A PKI provides centralized key management for participating network devices. It is a defined set of policies, procedures, and roles that support public key cryptography by generating, verifying, and revoking public key certificates commonly known as digital certificates.

In public key cryptography, each endpoint of a connection has a key pair consisting of both a public and a private key. The key pairs are used by the VPN endpoints to sign and encrypt messages. The keys act as complements, and anything encrypted with one of the keys can be decrypted with the other, securing the data flowing over the connection.

Generate a general purpose RSA or ECDSA key pair, used for both signing and encryption, or you generate separate key pairs for each purpose. Separate signing and encryption keys help to reduce exposure of the keys. SSL uses a key for encryption but not signing, however, IKE uses a key for signing but not encryption. By using separate keys for each, exposure of the keys is minimized.

Digital Certificates or Identify Certificates

When you use Digital Certificates as the authentication method for VPN connections, peers are configured to obtain digital certificates from a Certificate Authority (CA). CAs are trusted authorities that “sign” certificates to verify their authenticity, thereby guaranteeing the identity of the device or user.

CA servers manage public CA certificate requests and issue certificates to participating network devices as part of a Public Key Infrastructure (PKI), this activity is called Certificate Enrollment. These digital certificates, also called identity certificates contain:

- The digital identification of the owner for authentication, such as name, serial number, company, department, or IP address.
- A public key needed to send and receive encrypted data to the certificate owner.
- The secure digital signature of a CA.

Certificates also provide non-repudiation of communication between two peers, meaning that it they prove that the communication actually took place.

Certificate Enrollment

Using a PKI improves the manageability and scalability of your VPN since you do not have to configure pre-shared keys between all the encrypting devices. Instead, you individually enroll each participating device with a CA server, which is explicitly trusted to validate identities and create an identity certificate for the device. When this has been accomplished, each participating peer sends their identity certificate to the other
peer to validate their identities and establish encrypted sessions with the public keys contained in the certificates. See Certificate Enrollment Objects, on page 495 for details on enrolling FTD devices.

**Certificate Authority Certificates**

In order to validate a peer’s certificate, each participating device must retrieve the CA’s certificate from the server. A CA certificate is used to sign other certificates. It is self-signed and called a root certificate. This certificate contains the public key of the CA, used to decrypt and validate the CA’s digital signature and the contents of the received peer’s certificate. The CA certificate may be obtained by:

- Using the Simple Certificate Enrollment Protocol (SCEP) to retrieve the CA’s certificate from the CA server
- Manually copying the CA’s certificate from another participating device

**Trustpoints**

Once enrollment is complete, a trustpoint is created on the managed device. It is the object representation of a CA and associated certificates. A trustpoint includes the identity of the CA, CA-specific parameters, and an association with a single enrolled identity certificate.

**PKCS#12 File**

A PKCS#12, or PFX, file holds the server certificate, any intermediate certificates, and the private key in one encrypted file. This type of file may be imported directly into a device to create a trustpoint.

**Revocation Checking**

A CA may also revoke certificates for peers that no longer participate in your network. Revoked certificates are either managed by an Online Certificate Status Protocol (OCSP) server or are listed in a certificate revocation list (CRL) stored on an LDAP server. A peer may check these before accepting a certificate from another peer.

---

**VPN Topology Options**

When you create a new VPN topology you must, at minimum, give it a unique name, specify a topology type, and select the IKE version. You can select from three types of topologies, each containing a group of VPN tunnels:

- Point-to-point (PTP) topologies establish a VPN tunnel between two endpoints.
- Hub and Spoke topologies establish a group of VPN tunnels connecting a hub endpoint to a group of spoke endpoints.
- Full Mesh topologies establish a group of VPN tunnels among a set of endpoints.

Define a pre-shared key for VPN authentication manually or automatically, there is no default key. When choosing automatic, the Firepower Management Center generates a pre-shared key and assigns it to all the nodes in the topology.
**Point-to-Point VPN Topology**

In a point-to-point VPN topology, two endpoints communicate directly with each other. You configure the two endpoints as peer devices, and either device can start the secured connection.

The following diagram displays a typical point-to-point VPN topology.

![Point-to-Point VPN Topology Diagram](image)

**Hub and Spoke VPN Topology**

In a Hub and Spoke VPN topology, a central endpoint (hub node) connects with multiple remote endpoints (spoke nodes). Each connection between the hub node and an individual spoke endpoint is a separate VPN tunnel. The hosts behind any of the spoke nodes can communicate with each other through the hub node.

The Hub and Spoke topology commonly represent a VPN that connects an organization’s main and branch office locations using secure connections over the Internet or other third-party network. These deployments provide all employees with controlled access to the organization’s network. Typically, the hub node is located at the main office. Spoke nodes are located at branch offices and start most of the traffic.

The following diagram displays a typical Hub and Spoke VPN topology.
Full Mesh VPN Topology

In a Full Mesh VPN topology, all endpoints can communicate with every other endpoint by an individual VPN tunnel. This topology offers redundancy so that when one endpoint fails, the remaining endpoints can still communicate with each other. It commonly represents a VPN that connects a group of decentralized branch office locations. The number of VPN-enabled managed devices you deploy in this configuration depends on the level of redundancy you require.

The following diagram displays a typical Full Mesh VPN topology.
Implicit Topologies

In addition to the three main VPN topologies, other more complex topologies can be created as combinations of these topologies. They include:

- Partial mesh—A network in which some devices are organized in a full mesh topology, and other devices form either a hub-and-spoke or a point-to-point connection to some of the fully meshed devices. A partial mesh does not provide the level of redundancy of a full mesh topology, but it is less expensive to implement. Partial mesh topologies are used in peripheral networks that connect to a fully meshed backbone.

- Tiered hub-and-spoke—A network of hub-and-spoke topologies in which a device can behave as a hub in one or more topologies and a spoke in other topologies. Traffic is permitted from spoke groups to their most immediate hub.

- Joined hub-and-spoke—A combination of two topologies (hub-and-spoke, point-to-point, or full mesh) that connect to form a point-to-point tunnel. For example, a joined hub-and-spoke topology could comprise two hub-and-spoke topologies, with the hubs acting as peer devices in a point-to-point topology.
Site-to-Site VPNs for Firepower Threat Defense

- About Firepower Threat Defense Site-to-site VPNs, on page 889
- Requirements and Prerequisites for Site-to-Site VPN, on page 891
- Managing Firepower Threat Defense Site-to-site VPNs, on page 891
- Configuring Firepower Threat Defense Site-to-site VPNs, on page 892

About Firepower Threat Defense Site-to-site VPNs

Firepower Threat Defense site-to-site VPN supports the following features:

- Both IPsec IKEv1 & IKEv2 protocols are supported.
- Certificates and automatic or manual preshared keys for authentication.
- IPv4 & IPv6. All combinations of inside and outside are supported.
- IPsec IKEv2 Site-to-Site VPN topologies provide configuration settings to comply with Security Certifications.
- Static and Dynamic Interfaces.
- Support for both Firepower Management Center and FTD HA environments.
- VPN alerts when the tunnel goes down.
- Tunnel statistics available using the FTD Unified CLI.
- Support for IKEv1 back-up peer configuration for point-to-point extranet VPN.
- Support for extranet device as hub in 'Hub and Spokes' deployments.
- Support for dynamic IP address for a managed endpoint pairing with extranet device in 'Point to Point' deployments.
- Support for dynamic IP address for extranet device as an endpoint.
- Support for hub as extranet in 'Hub and Spokes' deployments.

VPN Topology

To create a new site-to-site VPN topology you must, at minimum, give it a unique name, specify a topology type, choose the IKE version that is used for IPsec IKEv1 or IKEv2, or both. Also, determine your authentication
method. Once configured, you deploy the topology to Firepower Threat Defense devices. The Firepower Management Center configures site-to-site VPNs on FTD devices only.

You can select from three types of topologies, containing one or more VPN tunnels:

- Point-to-point (PTP) deployments establish a VPN tunnel between two endpoints.
- Hub and Spoke deployments establish a group of VPN tunnels connecting a hub endpoint to a group of spoke nodes.
- Full Mesh deployments establish a group of VPN tunnels among a set of endpoints.

**IPsec and IKE**

In the Firepower Management Center, site-to-site VPNs are configured based on IKE policies and IPsec proposals that are assigned to VPN topologies. Policies and proposals are sets of parameters that define the characteristics of a site-to-site VPN, such as the security protocols and algorithms that are used to secure traffic in an IPsec tunnel. Several policy types may be required to define a full configuration image that can be assigned to a VPN topology.

**Authentication**

For authentication of VPN connections, configure a preshared key in the topology, or a trustpoint on each device. Preshared keys allow for a secret key, used during the IKE authentication phase, to be shared between two peers. A trustpoint includes the identity of the CA, CA-specific parameters, and an association with a single enrolled identity certificate.

**Extranet Devices**

Each topology type can include Extranet devices, devices that you do not manage in Firepower Management Center. These include:

- Cisco devices that Firepower Management Center supports, but for which your organization is not responsible. Such as spokes in networks managed by other organizations within your company, or a connection to a service provider or partner's network.
- Non-Cisco devices. You cannot use Firepower Management Center to create and deploy configurations to non-Cisco devices.

Add non-Cisco devices, or Cisco devices not managed by the Firepower Management Center, to a VPN topology as "Extranet" devices. Also specify the IP address of each remote device.

**Firepower Threat Defense Site-to-site VPN Guidelines and Limitations**

- A VPN connection can only be made across domains by using an extranet peer for the endpoint not in the current domain.
- A VPN topology cannot be moved between domains.
- Network objects with a 'range' option are not supported in VPN
- Firepower Threat Defense VPNs are only be backed up using the Firepower Management backup.
- The Firepower Threat Defense VPNs do not currently support PDF export and policy comparison.
• There is no per-tunnel or per-device edit option for Firepower Threat Defense VPNs, only the whole topology can be edited.

• Device interface address verification will not be performed for Transport mode when Crypto ACL is selected.

• All nodes in a topology must be configured with either Crypto ACL or Protected Network. A topology may not be configured with Crypto ACL on one node and Protected Network on another.

• There is no support for automatic mirror ACE generation. Mirror ACE generation for the peer is a manual process on either side.

• While using Crypto ACL, there is no support for tunnel health events for VPN topologies. With Crypto ACL, there is no support for Hub, Spoke, and Full Mesh topologies; only point to point VPN is supported.

• Whenever IKE ports 500/4500 are in use or when there are some PAT translations that are active, the Site-to-Site VPN cannot be configured on the same ports as it fails to start the service on those ports.

• Tunnel status is not updated in real-time, but at an interval of 5 minutes in the Firepower Management Center.

• The character " (double quote) is not supported as part of pre-shared keys. If you have used " in a pre-shared key, ensure that you change the character after you upgrade to Firepower Threat Defense 6.30.

Requirements and Prerequisites for Site-to-Site VPN

User Roles
Admin

Managing Firepower Threat Defense Site-to-site VPNs

Step 1
For certificate authentication for your VPNs, you must prepare the devices by allocating trust points as described in Firepower Threat Defense Certificate-Based Authentication, on page 531.

Step 2
Select Devices > VPN > Site To Site to manage your Firepower Threat Defense Site-to-site VPN configurations and deployments. Choose from the following:

• Add—To create a new VPN topology, click Add (Add VPN > Firepower Threat Defense Device, and continue as instructed in Configuring Firepower Threat Defense Site-to-site VPNs, on page 892:

  Note

  VPN topologies can be created only on leaf domains.
• Edit—To modify the settings of an existing VPN topology, click **Edit**. Modifying is similar to configuring, continue as instructed above.

**Note** You cannot edit the topology type after you initially save it. To change the topology type, delete the topology and create a new one.

Two users should **not** edit the same topology simultaneously; however, the web interface does not prevent simultaneous editing.

• Delete—To delete a VPN deployment, click **Delete**.

• View VPN status—This status applies to Firepower VPNs ONLY. Currently, no status is displayed for FTD VPNs. To determine the status of the FTD VPNs, see **VPN Monitoring for Firepower Threat Defense**, on page 959.

• Deploy—Click **Deploy**; see **Deploy Configuration Changes**, on page 382.

**Note** Some VPN settings are validated only during deployment. Be sure to verify that your deployment was successful.

---

## Configuring Firepower Threat Defense Site-to-site VPNs

**Step 1** Choose **Devices > VPN > Site To Site**. Then **Add VPN > Firepower Threat Defense Device**, or edit a listed VPN Topology.

**Step 2** Enter a unique **Topology Name**. We recommend naming your topology to indicate that it is a FTD VPN, and its topology type.

**Step 3** Choose the **Network Topology** for this VPN.

**Step 4** Choose the IKE versions to use during IKE negotiations. **IKEv1** or **IKEv2**. Default is IKEv2. Select either or both options as appropriate; select IKEv1 if any device in the topology does not support IKEv2.

For IKEv1, you can configure backup peer for point-to-point extranet VPN. For more information, see **FTD VPN Endpoint Options**, on page 893.

**Step 5** Required: Add Endpoints for this VPN deployment by clicking **Add** for each node in the topology.

Configure each endpoint field as described in **FTD VPN Endpoint Options**, on page 893.

• For Point to point, configure **Node A** and **Node B**.

• For Hub and Spoke, configure a **Hub Node** and **Spoke Nodes**

• For Full Mesh, configure multiple **Nodes**

**Step 6** (Optional) Specify non-default IKE options for this deployment as described in **FTD VPN IKE Options**, on page 895

**Step 7** (Optional) Specify non-default IPsec options for this deployment as described in **FTD VPN IPsec Options**, on page 897

**Step 8** (Optional) Specify non-default Advanced options for this deployment as described in **FTD Advanced Site-to-site VPN Deployment Options**, on page 899.
Step 9  
Click **Save**.
The endpoints are added to your configuration.

**What to do next**

Deploy configuration changes; see [Deploy Configuration Changes, on page 382](#).

**Note**

Some VPN settings are validated only during deployment. Be sure to verify that your deployment was successful.

If you get an alert that your VPN tunnel is inactive even when the VPN session is up, follow the VPN troubleshooting instructions to verify and ensure that your VPN is active. For information, see **VPN Monitoring for Firepower Threat Defense, on page 959** and **VPN Troubleshooting for Firepower Threat Defense, on page 963**.

---

**FTD VPN Endpoint Options**

**Navigation Path**

*Devices > VPN > Site To Site*. Then *Add VPN > Firepower Threat Defense Device*, or edit a listed VPN Topology. Open the **Endpoint** tab.

**Fields**

**Device**

Choose an endpoint node for your deployment:

- A FTD device managed by this Firepower Management Center.
- A FTD high availability container managed by this Firepower Management Center.
- An *Extranet* device, any device (Cisco or third-party) not managed by this Firepower Management Center.

**Device Name**

For Extranet devices only, provide a name for this device. We recommend naming it such that it is identifiable as an un-manaaged device.

**Interface**

If you chose a managed device as your endpoint, choose an interface on that managed device.

For 'Point to Point' deployments, you can also configure an endpoint with dynamic interface. Note that an endpoint with dynamic interface can pair only with an extranet device and cannot pair with an endpoint, which has a managed device.

You can configure device interfaces at **Devices > Device Management > Add/Edit device > Interfaces**.

**IP Address**

- If you choose an extranet device, a device **not** managed by the Firepower Management Center, specify an IP address for the endpoint.
For an extranet device, select **Static** and specify an IP address or select **Dynamic** to allow dynamic extranet devices.

If you have chosen point-to-point topology and only IKEv1, you can configure backup peer by entering the primary IP address and backup peer IP addresses separated by a comma.

- If you chose a managed device as an endpoint, choose a single IPv4 address or multiple IPv6 addresses from the drop-down list (these are the addresses already assigned to this interface on this managed device).
- All endpoints in a topology must have the same IP addressing scheme. IPv4 tunnels can carry IPv6 traffic and vice-versa. The Protected Networks define which addressing scheme the tunneled traffic will use.
- If the managed device is a high-availability container, choose from a list of interfaces.

**This IP is Private**

Check the check box if the endpoint resides behind a firewall with network address translation (NAT).

**Public IP address**

If you checked the **This IP is Private** check box, specify a public IP address for the firewall. If the endpoint is a responder, specify this value.

**Connection Type**

Specify the allowed negotiation as bidirectional, answer-only, or originate-only. Supported combinations for the connection type are:

<table>
<thead>
<tr>
<th>Remote Node</th>
<th>Central Node</th>
</tr>
</thead>
<tbody>
<tr>
<td>Originate-Only</td>
<td>Answer-Only</td>
</tr>
<tr>
<td>Bi-Directional</td>
<td>Answer-Only</td>
</tr>
<tr>
<td>Bi-Directional</td>
<td>Bi-Directional</td>
</tr>
</tbody>
</table>

**Certificate Map**

Choose a pre-configured certificate map object, or click **Add** to add a certificate map object that defines what information is necessary in the received client certificate for it to be valid for VPN connectivity. See **FTD Certificate Map Objects, on page 525** for details.

**Protected Networks**

Defines the networks that are protected by this VPN Endpoint. The networks may be marked by selecting the list of Subnet/IP Address that define the networks that are protected by this endpoint. Click **Add** to select from available Network Objects or add new Network Objects. See **Creating Network Objects, on page 444**. Access Control Lists will be generated from the choices made here.

- **Subnet/IP Address (Network)**—VPN endpoints cannot have the same IP address and protected networks in a VPN endpoint pair cannot overlap. If a list of protected networks for an endpoint contains one or more IPv4 or IPv6 entries, the other endpoint's protected network must have at least one entry of the same type (that is, IPv4 or IPv6). If it does not, then the other endpoint's IP address must be of the same type and must not overlap with the entries in the protected network. (Use /32
CIDR address blocks for IPv4 and /128 CIDR address blocks for IPv6.) If both of these checks fail, the endpoint pair is invalid.

---

**Note**  
Reverse Route Injection is enabled by default in Firepower Management Center. Subnet/IP Address (Network) remains the default selection. When you have selected Protected Networks as Any and observe default route traffic being dropped, disable the Reverse Route Injection under VPN > Site to Site > edit a VPN > IPsec > Enable Reverse Route Injection. Deploy the configuration changes; this will remove set reverse-route (Reverse Route Injection) from the crypto map configuration and remove the VPN-advertised reverse route that causes the reverse tunnel traffic to be dropped.

---

**Access List (Extended)**—An extended access lists provide the capability to control the type of traffic that will be accepted by this endpoint, like GRE or OSPF traffic. Traffic may be restricted either by address or port. Click Add (⊙) to add access control list objects.

---

**Note**  
Access Control List is supported only in the point to point topology.

---

**FTD VPN IKE Options**

For the versions of IKE you have chosen for this topology, specify the IKEv1/IKEv2 Settings.

---

**Note**  
Settings in this dialog apply to the entire topology, all tunnels, and all managed devices.

---

**Navigation Path**

Devices > VPN > Site To Site. Then Add VPN > Firepower Threat Defense Device, or edit a listed VPN Topology. Open the IKE tab.

---

**Fields**

**Policy**
Choose a predefined IKEv1 or IKEv2 policy object or create a new one to use. For details, see FTD IKE Policies, on page 514

**Authentication Type**
Site-to-site VPN supports two authentication methods, pre-shared key and certificate. For an explanation of the two methods, see Deciding Which Authentication Method to Use, on page 883.
In a VPN topology that supports IKEv1, the Authentication Method specified in the chosen IKEv1 Policy object becomes the default in the IKEv1 Authentication Type setting. These values must match, otherwise, your configuration will error.

- **Pre-shared Automatic Key**—The Management Center automatically defines the pre-shared key that is used for this VPN. Specify the Pre-shared Key Length, the number of characters in the key, 1-27.

  The character " (double quote) is not supported as part of pre-shared keys. If you have used " in a pre-shared key, ensure that you change the character after you upgrade to Firepower Threat Defense 6.30 or higher.

- **Pre-shared Manual Key**—Manually assign the pre-shared key that is used for this VPN. Specify the Key and then re-enter it in Confirm Key to confirm.

  When this option is chosen for IKEv2, the Enforce hex-based pre-shared key only check box appears, check if desired. If enforced, you must enter a valid hex value for the key, an even number of 2-256 characters, using numerals 0-9, or A-F.

- **Certificate**—When you use certificates as the authentication method for VPN connections, peers obtain digital certificates from a CA server in your PKI infrastructure, and trade them to authenticate each other.

  In the Certificate field, select a pre-configured certificate enrollment object. This enrollment object is used to generate a trustpoint with the same name on the managed device. The certificate enrollment object should be associated with and installed on the device, post which the enrollment process is complete, and then a trustpoint is created.

  A trustpoint is a representation of a CA or identity pair. A trustpoint includes the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate.

  Before you select this option, note the following:

  - Ensure you have enrolled a certificate enrollment object on all the endpoints in the topology—A certificate enrollment object contains the Certification Authority (CA) server information and enrollment parameters that are required for creating Certificate Signing Requests (CSRs) and obtaining Identity Certificates from the specified CA. Certificate Enrollment Objects are used to enroll your managed devices into your PKI infrastructure, and create trustpoints (CA objects) on devices that support VPN connections. For instructions on creating a certificate enrollment object, see Adding Certificate Enrollment Objects, on page 496, and for instructions on enrolling the object on the endpoints see one of the following as applicable:

    - Installing a Certificate Using Self-Signed Enrollment, on page 533
    - Installing a Certificate Using SCEP Enrollment, on page 534
    - Installing a Certificate Using Manual Enrollment, on page 534
    - Installing a Certificate Using a PKCS12 File, on page 535
For a site-to-site VPN topology, ensure that the same certificate enrollment object is enrolled in all the endpoints in the topology. For further details, see the table below.

- Refer the following table to understand the enrollment requirement for different scenarios. Some of the scenarios require you to override the certificate enrollment object for specific devices. See Managing Object Overrides, on page 441 to understand how to override objects.

<table>
<thead>
<tr>
<th>Certificate Enrollment Types</th>
<th>Device identity certificate for all endpoints is from the same CA</th>
<th>Device identity certificate for all endpoints is from different CAs</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Device-specific parameters are NOT specified in the certificate enrollment object</td>
<td>Device-specific parameters are specified in the certificate enrollment object</td>
</tr>
<tr>
<td>Manual</td>
<td>No override required</td>

<tr>
<td>Self-signed</td>
<td>Not applicable</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

- Understand the VPN certificate limitations mentioned in Firepower Threat Defense VPN Certificate Guidelines and Limitations, on page 532.

If you use a Windows Certificate Authority (CA), the default Application Policies extension is IP security IKE intermediate. If you are using this default setting, you must select the Ignore IPsec Key Usage option in the Advanced Settings section on the Key tab in the PKI Certificate Enrollment dialog box for the object you select. Otherwise, the endpoints cannot complete the site-to-site VPN connection.

FTD VPN IPsec Options

Settings in this dialog apply to the entire topology, all tunnels, and all managed devices.

Crypto-Map Type

A crypto map combines all the components required to set up IPsec security associations (SA). When two peers try to establish an SA, they must each have at least one compatible crypto map entry. The proposals defined in the crypto map entry are used in the IPsec security negotiation to protect the data...
flows specified by that crypto map’s IPsec rules. Choose static or dynamic for this deployment's crypto-map:

- **Static**—Use a static crypto map in a point-to-point or full mesh VPN topology.
- **Dynamic**—Dynamic crypto-maps essentially create a crypto map entry without all the parameters configured. The missing parameters are later dynamically configured (as the result of an IPsec negotiation) to match a remote peer’s requirements.

Dynamic crypto map policies are applicable to both hub-and-spoke and point-to-point VPN topologies. To apply dynamic crypto map policies, specify a dynamic IP address for one of the peers in the topology and ensure that the dynamic crypto-map is enabled on this topology. Note that in a full mesh VPN topology, you can apply only static crypto map policies.

**IKEv2 Mode**

For IPsec IKEv2 only, specify the encapsulation mode for applying ESP encryption and authentication to the tunnel. This determines what part of the original IP packet has ESP applied.

- **Tunnel mode**—(default) Encapsulation mode is set to tunnel mode. Tunnel mode applies ESP encryption and authentication to the entire original IP packet (IP header and data), hiding the ultimate source and destination addresses and becoming the payload in a new IP packet.

The major advantage of tunnel mode is that the end systems do not need to be modified to receive the benefits of IPsec. This mode allows a network device, such as a router, to act as an IPsec proxy. That is, the router performs encryption on behalf of the hosts. The source router encrypts packets and forwards them along the IPsec tunnel. The destination router decrypts the original IP datagram and forwards it onto the destination system. Tunnel mode also protects against traffic analysis; with tunnel mode, an attacker can only determine the tunnel endpoints and not the true source and destination of the tunneled packets, even if they are the same as the tunnel endpoints.

- **Transport preferred**— Encapsulation mode is set to transport mode with an option to fallback to tunnel mode if the peer does not support it. In Transport mode only the IP payload is encrypted, and the original IP headers are left intact. Therefore, the admin must select a protected network that matches the VPN interface IP address.

This mode has the advantages of adding only a few bytes to each packet and allowing devices on the public network to see the final source and destination of the packet. With transport mode, you can enable special processing (for example, QoS) on the intermediate network based on the information in the IP header. However, the Layer 4 header is encrypted, which limits examination of the packet.

- **Transport required**— Encapsulation mode is set to transport mode only, falling back to tunnel mode is not allowed. If the endpoints cannot successfully negotiate transport mode, due to one endpoint not supporting it, the VPN connection is not made.

**Proposals**
