

License Management for the ASA

Cisco Smart Software Licensing lets you purchase and manage a pool of licenses centrally. You can easily deploy or retire devices without having to manage each unit's license key. Smart Software Licensing also lets you see your license usage and needs at a glance.

Note

This section only applies to ASA logical devices on the Firepower 9300 chassis. For more information on licensing for Firepower Threat Defense logical devices, see the Firepower Management Center Configuration Guide.

About Smart Software Licensing

This section describes how Smart Software Licensing works.

Note

This section only applies to ASA logical devices on the Firepower 9300 chassis. For more information on licensing for Firepower Threat Defense logical devices, see the Firepower Management Center Configuration Guide.

Smart Software Licensing for the ASA

For the ASA application on the Firepower 9300 chassis, Smart Software Licensing configuration is split between the Firepower 9300 chassis supervisor and the application.

- Firepower 9300 chassis—Configure all Smart Software Licensing infrastructure in the supervisor, including parameters for communicating with the License Authority. The Firepower 9300 chassis itself does not require any licenses to operate.
- ASA Application—Configure all license entitlements in the application.

Smart Software Manager and Accounts

When you purchase 1 or more licenses for the device, you manage them in the Cisco Smart Software Manager:

https://software.cisco.com/#module/SmartLicensing

The Smart Software Manager lets you create a master account for your organization.

Note

If you do not yet have an account, click the link to set up a new account. The Smart Software Manager lets you create a master account for your organization.

By default, your licenses are assigned to the *Default Virtual Account* under your master account. As the account administrator, you can optionally create additional virtual accounts; for example, you can create accounts for regions, departments, or subsidiaries. Multiple virtual accounts let you more easily manage large numbers of licenses and devices.

Offline Management

If your devices do not have Internet access, and cannot register with the License Authority, you can configure offline licensing.

Satellite Server

If your devices cannot access the internet for security reasons, you can optionally install a local Smart Software Manager satellite server as a virtual machine (VM). The satellite provides a subset of Smart Software Manager functionality, and allows you to provide essential licensing services for all your local devices. Only the satellite needs to connect periodically to the main License Authority to sync your license usage. You can sync on a schedule or you can sync manually.

Once you download and deploy the satellite application, you can perform the following functions without sending data to Cisco SSM using the Internet:

- Activate or register a license
- View your company's licenses
- Transfer licenses between company entities

For more information, see the Smart Software Manager satellite installation and configuration guides on Smart Account Manager satellite.

Licenses and Devices Managed per Virtual Account

Licenses and devices are managed per virtual account: only that virtual account's devices can use the licenses assigned to the account. If you need additional licenses, you can transfer an unused license from another virtual account. You can also transfer devices between virtual accounts.

Only the Firepower 9300 chassis registers as a device, while the ASA applications in the chassis request their own licenses. For example, for a Firepower 9300 chassis with 3 security modules, the chassis counts as one device, but the modules use 3 separate licenses.

Evaluation License

The Firepower 9300 chassis supports two types of evaluation license:

- Chassis-level evaluation mode—Before the Firepower 9300 chassis registers with the Licensing Authority, it operates for 90 days (total usage) in evaluation mode. The ASA cannot request specific entitlements in this mode; only default entitlements are enabled. When this period ends, the Firepower 9300 chassis becomes out-of-compliance.
- Entitlement-based evaluation mode—After the Firepower 9300 chassis registers with the Licensing Authority, you can obtain time-based evaluation licenses that can be assigned to the ASA. In the ASA, you request entitlements as usual. When the time-based license expires, you need to either renew the time-based license or obtain a permanent license.

Note

You cannot receive an evaluation license for Strong Encryption (3DES/AES); only permanent licenses support this entitlement.

Smart Software Manager Communication

This section describes how your device communicates with the Smart Software Manager.

Device Registration and Tokens

For each virtual account, you can create a registration token. This token is valid for 30 days by default. Enter this token ID plus entitlement levels when you deploy each chassis, or when you register an existing chassis. You can create a new token if an existing token is expired.

At startup after deployment, or after you manually configure these parameters on an existing chassis, the chassis registers with the Cisco License Authority. When the chassis registers with the token, the License Authority issues an ID certificate for communication between the chassis and the License Authority. This certificate is valid for 1 year, although it will be renewed every 6 months.

Periodic Communication with the License Authority

The device communicates with the License Authority every 30 days. If you make changes in the Smart Software Manager, you can refresh the authorization on the device so the change takes place immediately. Or you can wait for the device to communicate as scheduled.

You can optionally configure an HTTP proxy.

The Firepower 9300 chassis must have internet access either directly or through an HTTP proxy at least every 90 days. Normal license communication occurs every 30 days, but with the grace period, your device will operate for up to 90 days without calling home. After the grace period, you must contact the Licensing Authority, or you will not be able to make configuration changes to features requiring special licenses; operation is otherwise unaffected.

Out-of-Compliance State

The device can become out of compliance in the following situations:

- Over-utilization—When the device uses unavailable licenses.
- License expiration—When a time-based license expires.
- Lack of communication—When the device cannot reach the Licensing Authority for re-authorization.

To verify whether your account is in, or approaching, an Out-of-Compliance state, you must compare the entitlements currently in use by your Firepower 9300 chassis against those in your Smart Account.

In an out-of-compliance state, you will not be able to make configuration changes to features requiring special licenses, but operation is otherwise unaffected. For example, existing contexts over the Standard license limit can continue to run, and you can modify their configuration, but you will not be able to add a *new* context.

Smart Call Home Infrastructure

By default, a Smart Call Home profile exists in the FXOS configuration that specifies the URL for the Licensing Authority. You cannot remove this profile. Note that the only configurable option for the License profile is the destination address URL for the License Authority. Unless directed by Cisco TAC, you should not change the License Authority URL.

Prerequisites for Smart Software Licensing

- Note that this chapter only applies to ASA logical devices on the Firepower 9300 chassis. For more
 information on licensing for Firepower Threat Defense logical devices, see the Firepower Management
 Center Configuration Guide.
- Create a master account on the Cisco Smart Software Manager:

https://software.cisco.com/#module/SmartLicensing

If you do not yet have an account, click the link to set up a new account. The Smart Software Manager lets you create a master account for your organization.

- Purchase 1 or more licenses from the Cisco Commerce Workspace. On the home page, search for your
 platform in the Find Products and Solutions search field. Some licenses are free, but you still need to
 add them to your Smart Software Licensing account.
- Ensure internet access or HTTP proxy access from the chassis, so the chassis can contact the Licensing Authority.
- Configure a DNS server so the chassis can resolve the name of the Licensing Authority.
- Set the time for the chassis.

• Configure the Smart Software Licensing infrastructure on the Firepower 9300 chassis before you configure the ASA licensing entitlements.

Guidelines for Smart Software Licensing

ASA Guidelines for Failover and Clustering

Each Firepower 9300 chassis must be registered with the License Authority or satellite server. There is no extra cost for secondary units.

Defaults for Smart Software Licensing

The Firepower 9300 chassis default configuration includes a Smart Call Home profile called "SLProf" that specifies the URL for the Licensing Authority.

Configure Regular Smart Software Licensing

To communicate with the Cisco License Authority, you can optionally configure an HTTP proxy. To register with the License Authority, you must enter the registration token ID on the Firepower 9300 chassis that you obtained from your Smart Software License account.

Procedure

- **Step 1** (Optional) Configure the HTTP Proxy, on page 5.
- **Step 2** Register the Firepower Security Appliance with the License Authority, on page 6.

(Optional) Configure the HTTP Proxy

If your network uses an HTTP proxy for Internet access, you must configure the proxy address for Smart Software Licensing. This proxy is also used for Smart Call Home in general.

Note

HTTP proxy with authentication is not supported.

Procedure

Step 1 Choose System > Licensing > Call Home.

The Call Home page provides fields for configuring the destination address URL for the License Authority and for configuring an HTTP proxy.

Note Unless directed by Cisco TAC, you should not change the License Authority URL.

- **Step 2** In the Server Enable drop-down list, select **on**.
- **Step 3** Enter the proxy IP address and port in the **Server URL** and **Server Port** fields. For example, enter port 443 for an HTTPS server.
- Step 4 Click Save.

Register the Firepower Security Appliance with the License Authority

When you register the Firepower 9300 chassis, the License Authority issues an ID certificate for communication between the Firepower 9300 chassis and the License Authority. It also assigns the Firepower 9300 chassis to the appropriate virtual account. Normally, this procedure is a one-time instance. However, you might need to later re-register the Firepower 9300 chassis if the ID certificate expires because of a communication problem, for example.

Procedure

Step 1 In the Smart Software Manager or the Smart Software Manager Satellite, request and copy a registration token for the virtual account to which you want to add this Firepower 9300 chassis.

For more information on how to request a registration token using the Smart Software Manager Satellite, see the Cisco Smart Software Manager Satellite User Guide (http://www.cisco.com/web/software/286285517/138897/Smart_Software_Manager_satellite_4.1.0_User_Guide.pdf).

- Step 2 In Firepower Chassis Manager, choose System > Licensing > Smart License.
- Step 3 Enter the registration token in the Enter Product Instance Registration Token field.
- Step 4 Click Register.

The Firepower 9300 chassis attempts to register with the License Authority.

To unregister the device, click **Unregister**.

Deregistering the Firepower 9300 chassis removes the device from your account. All license entitlements and certificates on the device are removed. You might want to deregister to free up a license for a new Firepower 9300 chassis. Alternatively, you can remove the device from the Smart Software Manager.

Configure a Smart License Satellite Server for the Firepower 9300 chassis

The following procedure shows how to configure the Firepower 9300 chassis to use a Smart License satellite server.

Before you begin

• Complete all prerequisites listed in the Prerequisites for Smart Software Licensing, on page 4.

- Download the Smart License Satellite OVA file from Cisco.com and install and configure it on a VMwareESXi server. For more information, see the Smart Software Manager satellite Install Guide.
- If you do not already have a certificate chain, use the following procedures to request one:
 - Create a key ring (Creating a Key Ring).
 - Create a certificate request for that key ring (Creating a Certificate Request for a Key Ring with Basic Options).
 - Send this certificate request to a trust anchor or Certificate Authority to obtain a certificate chain for your key ring.

For more information, see Certificates, Key Rings, and Trusted Points.

Procedure

- Step 1 Choose System > Licensing > Call Home.
- Step 2 In the Call home Configuration area, replace the default URL in the Address field with the satellite URL: https://ip address/Transportgateway/services/DeviceRequestHandler
- Step 3 Create a new trust point. You must use the FXOS CLI to create a new trust point.
 - a) Enter security mode:

scope security

b) Create and name a trusted point:

create trustpoint trustpoint name

c) Specify certificate information for the trust point. Note: the certificate must be in Base64 encoded X.509 (CER) format.

set certchain certchain

For the *certchain* variable, use the certificate chain information obtained in the certificate generation prerequisite of this procedure.

If you do not specify certificate information in the command, you are prompted to enter a certificate or a list of trust points defining a certification path to the root certificate authority (CA). On the next line following your input, type **ENDOFBUF** to finish.

d) Commit the configuration:

commit-buffer

Example:

```
firepower-chassis# scope security
firepower-chassis /security # create trustpoint tPoint10
firepower-chassis /security/trustpoint* # set certchain
Enter lines one at a time. Enter ENDOFBUF to finish. Press ^C to abort.
Trustpoint Certificate Chain:
