aaa-server active, fail

To reactivate a AAA server that is marked failed, use the `aaa-server active` command. To fail an active AAA server, use the `aaa-server fail` command.

```
aaa-server groupname {active | fail} host hostname
```

**Syntax Description**

| active | Sets the server to an active state. |
| fail  | Sets the server to a failed state. |
| groupname | AAA server group or realm name. |
| host hostname | FQDN or IP address of the server being acted upon. |

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.2.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Without this command, servers in a group that failed remain in a failed state until all servers in the group fail, after which all are reactivated. You can find the server group or realm name, as well as all the AAA server information in the output of the `show aaa-server` command.

**Examples**

The following example shows the state for server 192.168.125.60 in group1, and manually reactivates it:

```
> show aaa-server group1 host 192.168.125.60
Server Group: group1
Server Protocol: RADIUS
Server Address: 192.168.125.60
Server port: 1645
Server status: FAILED. Server disabled at 11:10:08 UTC Fri Aug...
>
> aaa-server group1 active host 192.168.125.60
>
> show aaa-server group1 host 192.168.125.60
Server Group: group1
Server Protocol: RADIUS
Server Address: 192.168.125.60
Server port: 1645
Server status: ACTIVE {admin initiated}. Last Transaction at 11:40:09 UTC Fri Aug...
```

</table>
**app-agent heartbeat**

To configure the heartbeat message interval for the app-agent (application agent) running on the Firepower Threat Defense device on Firepower chassis, use the `app-agent heartbeat` command.

```
app-agent heartbeat [interval milliseconds] [retry-count integer]
```

**Syntax Description**

- **interval milliseconds**
  - Specifies the time interval in milliseconds between heartbeat messages. You can adjust the interval in increments of 100 milliseconds. The default is 1000. The allowed range is 100 to 6000 for release 6.2.2 and following, but 300 to 6000 for older releases.
  - A loss of consecutive heartbeat messages up to the retry count triggers a failure notification to the rest of the system. The default of 1000 milliseconds provides an aggressive failure detection setting with the risk of false failure detections.

- **retry-count integer**
  - Specifies the number of times the app-agent should retry the heartbeat message if there is no response, or the app-agent receives an error response for the heartbeat message, from 3 to 10. The default is 3.

**Command Default**

- The default interval value is 1000 milliseconds.
- The default retry-count is 3.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>6.2.2</td>
<td>The allowed interval range was changed to 100 to 6000.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The primary responsibility of the app-agent running on the Firepower Threat Defense device is to interface and communicate between Firepower Threat Defense modules and the Firepower 2100, 4100, and 9300 FXOS chassis.

The heartbeat communication channel serves the purpose of monitoring the health of the link between the FXOS chassis and the Firepower Threat Defense application agent. The Firepower Threat Defense application sends request messages to the FXOS chassis supervisor at a certain interval, with retries at a set number of times until a proper response is received from the FXOS chassis supervisor.

The heartbeat mechanism between the Firepower Threat Defense app-agent and FXOS chassis supervisor also monitors the Hardware Bypass feature for failure. For certain interface modules on the Firepower 2100, 4100, and 9300, you can enable the Hardware Bypass feature. Hardware Bypass ensures that traffic continues to flow between an inline interface pair during a power outage. This feature can be used to maintain network connectivity in the case of software or hardware failures.

**Examples**

The following example sets the app-agent heartbeat interval to 600 milliseconds and the retry count to 6 times:
> app-agent heartbeat interval 600 retry-count 6

To enable egress optimization, use the `asp inspect-dp egress-optimization` command. To disable egress optimization, use the `no` form of this command.

Egress optimization is a performance feature targeted for selected IPS traffic. The feature is enabled by default on all FTD platforms.

We strongly recommend you leave this feature enabled. Disable it only if advised to do so by Cisco TAC.

**asp inspect-dp egress-optimization**

**no asp inspect-dp egress-optimization**

**Command Default**
Egress optimization is enabled by default.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Egress optimization is intended to be enabled at all times to improve performance. Disable egress optimization only on the advice of Cisco TAC for troubleshooting purposes.

**Examples**
The following example shows how to enable egress optimization:

```
> asp inspect-dp egress-optimization
```

asp load-balance per-packet

To change the load balancing behavior on multiple cores to be per packet, use the `asp load-balance per-packet` command. To restore the default load-balancing mechanism, use the `no` form of this command.

```
asp load-balance per-packet
no asp load-balance per-packet
```

**Command Default**

Per-packet load-balancing is disabled by default.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The job of the load balancer is to distribute packets to CPU cores and to maintain packet order. By default, a connection can only be processed by one core at a time. Due to this behavior, the cores will be under-utilized if there are a small number of interfaces/RX rings in use when compared to the number of cores. For example if there are only two Gigabit Ethernet interfaces in use on a Firepower Threat Defense device, then only two cores will be used. (A Ten Gigabit Ethernet interface has 4 RX rings and a Gigabit Ethernet interface as 1 RX ring.) You may want to optimize the load balancer by enabling per-packet load balancing so you can use more cores.

The default load-balancing behavior optimizes overall system performance when you have many interfaces in use, while the per-packet load balancer optimizes the overall system performance when you have a smaller number of interfaces that are active.

If you enable per-packet load balancing, when one core processes packets from an interface, another core can receive and process the next packet from the same interface. Therefore, it is possible for all cores to process packets from the same interface simultaneously.

Per-packet load balancing will improve performance if:

- The system drops packets
- The `show cpu` command shows CPU usage far less than 100%—The CPU usage is a good indicator of how many cores are being used. For example, on an 8-core system, if two cores are used, `show cpu` shows 25%; four cores: 50%; six cores: 75%.
- There are a small number of interfaces that are in use

**Note**

Typically if there are less than 64 concurrent flows on the Firepower Threat Defense device, then enabling per-packet load balancing will incur more overhead than its benefit.

**Examples**

The following example shows how to change the default load-balancing behavior:

```
> asp load-balance per-packet
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear asp load-balance history</td>
<td>Clears and resets the ASP load balancing per packet history statistics. OK</td>
</tr>
<tr>
<td>show asp load-balance</td>
<td>Displays a histogram of the load balancer queue sizes. OK</td>
</tr>
</tbody>
</table>
asp packet-profile

To obtain statistics on how a Firepower Threat Defense device handles network traffic, use the `asp packet-profile` command. To disable packet profiling, use the `no` form of this command.

The Accelerated Security Path or ASP process determines how many packets were fastpathed by a prefilter policy, offloaded as a large flow, fully evaluated by access control (Snort), and so on.

`asp packet-profile`  
`no asp packet-profile`

**Command Default**

Packet profiling is enabled by default.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Packet profiling is intended to be enabled at all times. If the CPU usage is high due to statistics collection and further computation, then the feature can be disabled.

**Examples**

The following example shows how to enable packet profiling:

```
> asp packet-profile
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show asp packet-profile</code></td>
<td>Displays statistics for the packets that traversed through dataplane only, the dataplane and Snort, and offloaded to hardware.</td>
</tr>
<tr>
<td><code>clear asp packet-profile</code></td>
<td>Clear statistics related to packet profiling.</td>
</tr>
</tbody>
</table>
To allocate additional memory to block diagnostics (displayed by the `show blocks` command), use the `blocks` command. To set the value back to the default, use the `no` form of this command.

```plaintext
blocks queue history enable [memory_size]
no blocks queue history enable [memory_size]
```

**Syntax Description**
- `memory_size` (Optional) Sets the memory size for block diagnostics in bytes, instead of applying the dynamic value. If this value is greater than free memory, an error message appears and the value is not accepted. If this value is greater than 50% of free memory, a warning message appears, but the value is accepted.

**Command Default**
The default memory assigned to track block diagnostics is 2136 bytes.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To view the currently allocated memory, enter the `show blocks queue history` command.

If you reload the Firepower Threat Defense device, the memory allocation returns to the default.

The amount of memory allocated will be at most 150 KB, but never more than 50% of free memory. Optionally, you can specify the memory size manually.

**Examples**

The following example increases the memory size for block diagnostics:

```
> blocks queue history enable
```

The following example increases the memory size to 3000 bytes:

```
> blocks queue history enable 3000
```

The following example attempts to increase the memory size to 3000 bytes, but the value is more than the available free memory:

```
> blocks queue history enable 3000
ERROR: memory size exceeds current free memory
```

The following example increases the memory size to 3000 bytes, but the value is more than 50% of the free memory:

```
> blocks queue history enable 3000
WARNING: memory size exceeds 50% of current free memory
```

capture

To enable packet capture capabilities for packet sniffing and network fault isolation, use the `capture` command. To disable packet capture capabilities, use the `no form` of this command.

Capture network traffic:

```
capture capture_name [type [asp-drop [all | drop-code] | raw-data | isakmp [ikev1 | ikev2] | inline-tag [tag]]] [interface [interface_name | data-plane | management-plane | cplane]] [buffer buf_size] [file-size file_size] [ethernet-type type] [headers-only] [packet-length bytes] [circular-buffer] [trace [trace-count number]] [match protocol [host source_ip | source_ip mask | any4 | any6] [operator src_port] [host dest_ip | dest_ip mask | any4 | any6] [operator dest_port]]
```

Capture cluster control-link traffic:

```
capture capture_name type lacp interface [buffer buf_size] [packet-length bytes] [circular-buffer] [real-time [dump] [detail]]
capture capture_name interface cluster [buffer buf_size] [ethernet-type type] [packet-length bytes] [circular-buffer] [trace [trace-count number]] [real-time [dump] [detail]] [match protocol [host source_ip | source_ip mask | any4 | any6] [operator src_port] [host dest_ip | dest_ip mask | any4 | any6] [operator dest_port]]
```

Capture packets cluster-wide:

```
cluster exec capture capture_name arguments
```

Stop or remove the packet capture:

```
no capture capture_name [arguments]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>any4</td>
<td>Specifies any IPv4 address instead of a single IP address and mask.</td>
</tr>
<tr>
<td>any6</td>
<td>Specifies any IPv6 address instead of a single IP address and mask.</td>
</tr>
<tr>
<td>all</td>
<td>Captures all packets dropped by the accelerated security path.</td>
</tr>
<tr>
<td>asp-drop drop-code</td>
<td>(Optional) Captures packets dropped by the accelerated security path. The drop-code specifies the type of traffic that is dropped by the accelerated security path. See the CLI help for a list of drop codes. You can enter this keyword with the <code>packet-length</code>, <code>circular-buffer</code>, and <code>buffer</code> keywords, but not with the <code>interface</code> or <code>ethernet-type</code> keyword. In a cluster, dropped forwarded data packets from one unit to another are also captured.</td>
</tr>
<tr>
<td>buffer buf_size</td>
<td>(Optional) Defines the buffer size used to store the packet in bytes. Once the byte buffer is full, packet capture stops. When used in a cluster, this is the per-unit size, not the sum of all units. The maximum buffer size supported is 32 MB. The buffer size and file size options are mutually exclusive.</td>
</tr>
</tbody>
</table>
**capture**

- **capture_name**: Specifies the name of the packet capture. Use the same name on multiple `capture` statements to capture multiple types of traffic. When you view the capture configuration using the `show capture` command, all options are combined on one line.

- **data-plane**: Specifies the captured packets on the dataplane interface.

- **management-plane**: Specifies the captured packets on the management interface.

- **circular-buffer**: (Optional) Overwrites the buffer, starting from the beginning, when the buffer is full.

- **ethernet-type type**: (Optional) Selects an Ethernet type to capture. Supported Ethernet types include 8021Q, ARP, IP, IP6, IPX, LACP, PPPOED, PPPOES, RARP, and VLAN. An exception occurs with the 802.1Q or VLAN type. The 802.1Q tag is automatically skipped and the inner Ethernet type is used for matching.

- **file-size file-size**: (Optional) `file-size` specifies capturing packets to a file on disk.

  - `file-size` specifies the size of capture file from 32 MB to 10 GB.
  - The capture file will be created in flash memory (`disk0:/`) with the name `capture_name.pcap`.
  - When the `file-size` is configured, the hard disk memory (file) is used to write the captured data in the capture buffer. The captured data gets stored in the disk based on the filename.

  - The buffer size and file size options are mutually exclusive.

- **headers-only**: (Optional) Selects Layer 2 and Layer 3/4 headers of packet to capture without data.

- **host source_ip, dest_ip**: Specifies the single IP address of the host to or from which the packet is being sent.

- **inline-tag tag**: Specifies a tag for a particular SGT value or leaves it unspecified to capture a tagged packet with any SGT value.

- **interface interface_name**: Sets the name of the interface on which to use packet capture. You must configure an interface for any packets to be captured except for `type asp-drop`. You can configure multiple interfaces using multiple `capture` commands with the same name. To capture packets on the management plane, you can use the `interface` keyword with `asa_mgmt_plane` as the interface name. You can specify `cluster` as the interface name to capture the traffic on the cluster control link interface. If the type `lacp` capture is configured, the interface name is the physical name.

- **ikev1, ikev2**: Captures only IKEv1 or IKEv2 protocol information.

- **isakmp**: (Optional) Captures ISAKMP traffic for VPN connections. The ISAKMP subsystem does not have access to the upper layer protocols. The capture is a pseudo capture, with the physical, IP, and UDP layers combined together to satisfy a PCAP parser. The peer addresses are obtained from the SA exchange and are stored in the IP layer.

- **lacp**: (Optional) Captures LACP traffic. If configured, the interface name is the physical interface name.
mask  The subnet mask for the IP address, for example, 255.255.255.0 for a Class C mask.

match protocol  Specifies the packets that match the five-tuple to allow filtering of those packets to be captured. You can use this keyword up to three times on one line.

operator src_port, dest_port  (Optional) Matches the port numbers used by the source or destination. The permitted operators are as follows:

  • lt—less than
  • gt—greater than
  • eq—equal to
  • neq—not equal to
  • range—range

packet-length bytes  (Optional) Sets the maximum number of bytes of each packet to store in the capture buffer.

raw-data  (Optional) Captures inbound and outbound packets on one or more interfaces.

trace trace_count  (Optional) Captures packet trace information, and the number of packets to capture. This option is used with an access list to insert trace packets into the data path to determine whether or not the packet has been processed as expected.

type  (Optional) Specifies the type of data captured.

Command Default  The defaults are as follows:

  • The default type is raw-data.
  • The default buffer size is 512 KB.
  • The default Ethernet type is IP packets.
  • The default packet-length is 1518 bytes.

</tbody>
</table>
Capturing packets is useful when troubleshooting connectivity problems or monitoring suspicious activity. You can create multiple captures. The `capture` command is not saved to the running configuration, and is not copied to the standby unit during high availability.

The Firepower Threat Defense device is capable of tracking all IP traffic that flows across it and of capturing all the IP traffic that is destined to it, including all the management traffic (such as SSH and Telnet traffic).

The Firepower Threat Defense architecture consists of three different sets of processors for packet processing; this architecture poses certain restrictions on the capability of the capture feature. Typically most of the packet forwarding functionality in the Firepower Threat Defense device is handled by the two front-end network processors, and packets are sent to the control-plane general-purpose processor only if they need application inspection. The packets are sent to the session management path network processor only if there is a session miss in the accelerated path processor.

Because all the packets that are forwarded or dropped by the Firepower Threat Defense device hits the two front-end network processors, the packet capture feature is implemented in these network processors. So all the packets that hit the Firepower Threat Defense device can be captured by these front end processors, if an appropriate capture is configured for those traffic interfaces. On the ingress side, the packets are captured the moment the packet hits the interfaces, and on the egress side the packets are captured just before they are sent out on the wire.

To save the captured data, packet capture automatically writes captured data to the physical storage on the fly, without having to use the `copy` command. The capture size is supported up to 10 GB. Captures larger than 100 MB are automatically compressed.

**Save the Capture**

The contents of any active capture on Firepower Threat Defense device are saved when the box crashes. When you activate captures as part of the troubleshooting process, you must note the following points:

- The size of capture buffer to use and if there is enough space on flash/disk.
- The capture buffer should be marked as circular for all the use cases, so that captured packets are the most recent before crash.

The name of the file for saving contents of an active capture is in the format of:

```
[<context_name>.]<capture_name>.pcap
```

The `context_name` indicates the name of the user context in which capture is activated in the multi-context mode. For the single context mode, the `context_name` is not applicable.

The `capture_name` indicates the name of the capture that is activated.

The capture save happens before the console or crash dump. This increases the crash downtime by about 5 seconds for a 33 MB capture buffer. The risk of a nested crash is minimal because copying the captured contents to a file is a simple process.

**View the Capture**

To view the packet capture, use the `show capture name` command. To save the capture to a file, use the `copy capture` command. Use the `https://FTP-ip-address/admin/capture/capture_name/[pcap]` command to see the packet capture information with a web browser. If you specify the `pcap` keyword, then a libpcap-format file is downloaded to the web browser and can be saved using the web browser. (A libcap file can be viewed with TCPDUMP or Ethereal.)
If you copy the buffer contents to a TFTP server in ASCII format, you will see only the headers, not the details and hexadecimal dump of the packets. To see the details and hexadecimal dump, you need to transfer the buffer in PCAP format and read it with TCPDUMP or Ethereal.

Delete the Capture

Entering no capture without any keywords deletes the capture. To preserve the capture, specify the interface keyword; the capture is detached from the specified interface, and the capture is preserved.

Clustering

You can precede the capture command with cluster exec to issue the capture command on one unit and run the command in all the other units at the same time. After you have performed cluster-wide capture, to copy the same capture file from all units in the cluster at the same time to a TFTP server, enter the cluster exec copy command on the master unit.

cluster exec capture capture_name arguments

cluster exec copy /pcap capture: cap_name tftp://location/path/filename.pcap

Multiple PCAP files, one from each unit, are copied to the TFTP server. The destination capture file name is automatically attached with the unit name, such as filename_A.pcap, filename_B.pcap, and so on. In this example, A and B are cluster unit names.

---

A different destination name is generated if you add the unit name at the end of the filename.

---

Limitations

The following are some of the limitations of the capture feature. Most of the limitations are caused by the distributed nature of the Firepower Threat Defense architecture and by the hardware accelerators that are being used in the Firepower Threat Defense device.

- For inline SGT tagged packets, captured packets contain an additional CMD header that your PCAP viewer might not understand.
- If there is no ingress interface and therefore no global interface, packets sent on the backplane are treated as control packets. These packets bypass the access list check and are always captured.
- The show capture command shows the correct reason when capturing a specific asp-drop. However, the show capture command does not show the correct reason when capturing all asp-drops.

The packet capture feature with the file-size option has the following limitations:

- Applicable only for Firepower 4000 and Firepower 9000 series.
- For existing capture, you cannot add the file size option.
- The copy command is not supported.
- Real-time, trace, linear, and circular buffer are not supported.
- If the number of captures with the file size option is increased, the performance of the system will be reduced.
- If the system load is high, it leads to packet capture data loss.

Examples
To capture a packet, enter the following command:

> capture captest interface inside
> capture captest interface outside

On a web browser, you can view the content of the `capture` command that was issued, named “captest,” at the following location:

https://171.69.38.95/admin/capture/captest

To download a libpcap file (that web browsers use) to a local machine, enter the following command:

https://171.69.38.95/capture/http/pcap

The following example shows how to capture a packet in the single-mode when the Firepower Threat Defense Device crashes:

> capture 789 interface inside

The contents of capture ‘789’ is saved as 789.pcap file.

The following example shows how to capture a packet in the multi-mode when the Firepower Threat Defense device crashes:

> capture 624 interface inside

The contents of capture ‘624’ in admin context is saved as admin.624.pcap file.

The following example shows how to capture ARP packets:

> capture arp ethernet-type arp interface outside

Capture for Clustering
To enable capture on all units in the cluster, you can add the cluster exec keywords in front of each of these commands.

The following example shows how to create an LACP capture for the clustering environment:

> capture lacp type lacp interface gigabitEthernet0/0

The following example shows how to create a capture for control path packets in the clustering link:

> capture cp interface cluster match udp any eq 49495 any
> capture cp interface cluster match udp any eq 49495
The following example shows how to capture data path traffic through the cluster:

```
> capture abc interface inside match tcp host 1.1.1.1 host 2.2.2.2 eq www
> capture abc interface inside match dup host 1.1.1.1 any
```

capture-traffic

To intercept and capture packets passing through a Firepower Threat Defense interface, use the `capture-traffic` command. You can capture traffic on a specified Firepower Threat Defense domain that matches the integer expression from the list of options presented, either the management interface (br1) or traffic interfaces.

capture-traffic

You are prompted for the domain and TCP dump options.

<table>
<thead>

<tr>
<td><strong>-A</strong></td>
<td>Prints each packet (minus its link level header) in ASCII. Handy for capturing web pages.</td>
</tr>
<tr>
<td><strong>-B</strong></td>
<td>Sets the operating system capture buffer size to buffer_size.</td>
</tr>
<tr>
<td><strong>-c</strong></td>
<td>Exits after receiving count packets.</td>
</tr>
<tr>
<td><strong>-C</strong></td>
<td>Before writing a raw packet to a savefile, checks whether the file is currently larger than file_size and, if so, close the current savefile and open a new one. Savefiles after the first savefile will have the name specified with the -w flag, with a number after it, starting at 1 and continuing upward. The units of file_size are millions of bytes (1,000,000 bytes, not 1,048,576 bytes).</td>
</tr>
<tr>
<td><strong>-d</strong></td>
<td>Dumps the compiled packet-matching code in a human readable form to standard output and stop.</td>
</tr>
<tr>
<td><strong>-dd</strong></td>
<td>Dumps packet-matching code as a C program fragment.</td>
</tr>
<tr>
<td><strong>-ddd</strong></td>
<td>Dumps packet-matching code as decimal numbers (preceded with a count).</td>
</tr>
<tr>
<td><strong>-D</strong></td>
<td>Prints the list of the network interfaces available on the system and on which tcpdump can capture packets. For each network interface, a number and an interface name, possibly followed by a text description of the interface, is printed. The interface name or the number can be supplied to the -i flag to specify an interface on which to capture. This can be useful on systems that do not have a command to list them (Windows systems, or UNIX systems lacking ifconfig -a); the number can be useful on Windows 2000 and later systems, where the interface name is a somewhat complex string. The -D flag will not be supported if tcpdump was built with an older version of libpcap that lacks the pcap_findalldevs() function.</td>
</tr>
<tr>
<td><strong>-e</strong></td>
<td>Prints the link-level header on each dump line.</td>
</tr>
<tr>
<td><strong>-E</strong></td>
<td>Uses spi@ipaddr algo:secret for decrypting IPsec ESP packets that are addressed to addr and contain Security Parameter Index value spi. This combination may be repeated with comma or newline separation.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>-f</td>
<td>Prints ‘foreign’ IPv4 addresses numerically rather than symbolically (this option is intended to get around serious brain damage in Sun's NIS server usually it hangs forever translating non-local internet numbers). The test for ‘foreign’ IPv4 addresses is done using the IPv4 address and netmask of the interface on which capture is being done. If that address or netmask are not available, available, either because the interface on which capture is being done has no address or netmask or because the capture is being done on the Linux 'any' interface, which can capture on more than one interface, this option will not work correctly.</td>
</tr>
<tr>
<td>-F</td>
<td>Uses file as input for the filter expression. An additional expression given on the command line is ignored.</td>
</tr>
<tr>
<td>-G</td>
<td>If specified, rotates the dump file specified with the -w option every rotate_seconds seconds. Savefiles will have the name specified by -w which should include a time format as defined by strftime(3). If no time format is specified, each new file will overwrite the previous. If used in conjunction with the -C option, filenames will take the form of ‘file&lt;count&gt;’.</td>
</tr>
<tr>
<td>-I</td>
<td>Puts the interface in ‘monitor mode’; this is supported only on IEEE 802.11 Wi-Fi interfaces, and supported only on some operating systems.</td>
</tr>
<tr>
<td>-K</td>
<td>Does not attempt to verify TCP checksums. This is useful for interfaces that perform the TCP checksum calculation in hardware; otherwise, all outgoing TCP checksums will be flagged as bad.</td>
</tr>
<tr>
<td>-l</td>
<td>Makes stdout line buffered. Useful if you want to see the data while capturing it. Example, “tcpdump -l</td>
</tr>
<tr>
<td>-L</td>
<td>Lists the known data link types for the interface and exit.</td>
</tr>
<tr>
<td>-m</td>
<td>Loads SMI MIB module definitions from file module. This option can be used several times to load several MIB modules into tcpdump.</td>
</tr>
<tr>
<td>-M</td>
<td>Uses secret as a shared secret for validating the digests found in TCP segments with the TCP-MD5 option (RFC 2385), if present.</td>
</tr>
<tr>
<td>-n</td>
<td>Does not convert addresses (i.e., host addresses, port numbers, etc.) to names.</td>
</tr>
<tr>
<td>-N</td>
<td>Does not print domain name qualification of host names. Example, if you give this flag then tcpdump will print “nic” instead of “nic.ddn.mil”.</td>
</tr>
<tr>
<td>-O</td>
<td>Does not run the packet-matching code optimizer. This is useful only if you suspect a bug in the optimizer.</td>
</tr>
</tbody>
</table>
| -p | Does not put the interface into promiscuous mode. Note that the interface might be in promiscuous mode for some other reason; hence, `-p’ cannot be used as an abbreviation for ‘ether host \{local-hw-addr\} or ether broadcast’.
### Options

**-q**
Quick output. Prints less protocol information so output lines are shorter.

**-R**
Assumes ESP/AH packets to be based on old specification (RFC1825 to RFC1829). If specified, tcpdump will not print replay prevention field. Because there is no protocol version field in ESP/AH specification, tcpdump cannot deduce the version of ESP/AH protocol.

**-r**
Reads packets from file (which was created with the -w option). Standard input is used if file is “-”.

**-S**
Prints absolute, rather than relative, TCP sequence numbers.

**-s**
Snarfs snaplen bytes of data from each packet rather than the default of 68 (with SunOS’s NIT, the minimum is actually 96). 68 bytes is adequate for IP, ICMP, TCP, and UDP but may truncate protocol information from name server and NFS packets (see below). Packets truncated because of a limited snapshot are indicated in the output with “[/proto]”, where proto is the name of the protocol level at which the truncation has occurred.

Note that taking larger snapshots both increases the amount of time it takes to process packets and, effectively, decreases the amount of packet buffering. This may cause packets to be lost. You should limit snaplen to the smallest number that will capture the protocol information you're interested in. Setting snaplen to 0 means use the required length to catch whole packets.

**-T**
Forces packets selected by ‘expression’ to be interpreted the specified type. Currently known types are aodv (Ad-hoc On-demand Distance Vector protocol), cnfp (Cisco NetFlow protocol), rpc (Remote Procedure Call), rtp (Real-Time Applications protocol), rtcp (Real-Time Applications control protocol), snmp (Simple Network Management Protocol), tftp (Trivial File Transfer Protocol), vat (Visual Audio Tool), and wb (distributed White Board).

**-t**
Does not print a timestamp on each dump line.

**-tt**
Prints an unformatted timestamp on each dump line.

**-ttt**
Prints a delta (micro-second resolution) between current and previous line on each dump line.

**-tttt**
Prints a timestamp in default format proceeded by date on each dump line.

**-ttttt**
Prints a delta (micro-second resolution) between current and first line on each dump line.

**-u**
Prints undecoded NFS handles.

**-U**
Makes output saved via the -w option “packet-buffered”; i.e., as each packet is saved, it will be written to the output file, rather than being written only when the output buffer fills. The -U flag will not be supported if tcpdump was built with an older version of libpcap that lacks the pcap_dump_flush() function.
When parsing and printing, produces (slightly more) verbose output. For example, the
time to live, identification, total length and options in an IP packet are printed. Also
enables additional packet integrity checks such as verifying the IP and ICMP header
checksum.

When writing to a file with the `-w` option, report, every 10 seconds, the number of
packets captured.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| `-v`  | Even more verbose output. For example, additional fields are printed from NFS reply
packets, and SMB packets are fully decoded. |
| `-vv` | Even more verbose output. For example, telnet SB... SE options are printed in full.
With `-X` Telnet options are printed in hex as well. |
| `-w`  | Write the raw packets to file rather than parsing and printing them out. They can later
be printed with the `-r` option. Standard output is used if file is “-”. |
| `-W`  | Used in conjunction with the `-C` option, this will limit the number of files created to
the specified number, and begin over writing files from the beginning, thus creating a
‘rotating’ buffer. In addition, it will name the files with enough leading 0s to support
the maximum number of files, allowing them to sort correctly. |
| `-x`  | When parsing and printing, in addition to printing the headers of each packet, prints
the data of each packet (minus its link level header) in hex. The smaller of the entire
packet or snaplen bytes will be printed. Note that this is the entire link-layer packet,
so for link layers that pad (e.g. Ethernet), the padding bytes will also be printed when
the higher layer packet is shorter than the required padding. |
| `-xx` | When parsing and printing, in addition to printing the headers of each packet, prints
the data of each packet, including its link level header, in hex. |
| `-X`  | When parsing and printing, in addition to printing the headers of each packet, print
the data of each packet (minus its link level header) in hex and ASCII.
This is very handy for analyzing new protocols. |
| `-XX` | When parsing and printing, in addition to printing the headers of each packet, prints
the data of each packet, including its link level header, in hex and ASCII. |
| `-y`  | Sets the data link type to use while capturing packets to datalinktype. |
| `-Z`  | Drops privileges (if root) and changes user ID to user and the group ID to the primary
group of user. |

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

By default the `capture-traffic` command produces one line of text per every packet it intercepts. Each line
includes: a time stamp; the protocol name; the source and destination addresses (for IP packets, these are IP
addresses; for other protocols, `capture-traffic` does not print any identifiers unless explicitly asked to do so
(see the `-e` command line description)); and information including TCP sequence numbers, flags, ARP/ICMP
commands, and so on.
The `pcap` file (output of the `capture-traffic` or `debug daq` command) displays untranslated details of the packet that was received; the `Connection Events` list (Firepower Management Center) displays translated packet details that are actually applied with the policies.

To stop the capture, type Control + C. If you use `-w outputfile` option, the packet capture will be saved with that file name in `/var/common/`. Otherwise it is written to the display.

### Examples

The following example shows how to capture traffic from the management interface:

```
> capture-traffic
Please choose domain to capture traffic from:
  0 - br1
  1 - Router
Selection? 0
Please specify tcpdump options desired.
(or enter '?' for a list of supported options)
-v
```

clear aaa-server statistics

To reset statistics for AAA servers, use the `clear aaa-server statistics` command.

```
clear aaa-server statistics [LOCAL | groupname [host hostname] | protocol protocol]
```

**Syntax Description**
- `groupname` (Optional) Clears statistics for servers in a group.
- `host hostname` (Optional) Clears statistics for a particular server in the group.
- `LOCAL` (Optional) Clears statistics for the LOCAL user database.
- `protocol protocol` (Optional) Clears statistics for servers of the specified protocol. Enter `?` to see the available protocols.

**Command Default**
Removes all AAA server statistics across all groups.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

clear access-list

To clear an access-list counter, use the clear access-list command.

```
clear access-list  id
```

### Syntax Description

| id | Name of an access list. |

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When you enter the `clear access-list` command, you must specify the `id` of an access list to clear the counters. Use the `show access-list` command for a list of ACLs.

### Examples

The following example shows how to clear a specific access list counter:

```
> clear access-list inbound
```

### Related Commands

</table>
To clear accelerated security path (ASP) statistics, use the `clear asp` command.

```
clear asp { cluster counter | dispatch | drop [flow | frame] | event dp-cp | inspect-dp egress-optimization | inspect-dp snort [counters [instance number [queue number]]] | queue-exhaustion [snapshot number] | load-balance history | overhead | table [arp | classify | filter [access-list acl_name]]}
```

### Syntax Description

- **access-list acl_name** (Optional) Clears the hit counters only for a specified access list.
- **arp** (Optional) Clears the hits counters in ASP ARP tables only.
- **classify** (Optional) Clears the hits counters in ASP classify tables only.
- **cluster counter** Clears cluster counters.
- **counters** Clears the data-path inspection Snort counters.
- **dispatch** Clears dispatch statistics.
- **event** Clears data-path to control-plane event statistics.
- **filter** (Optional) Clears the hits counters in ASP filter tables only.
- **flow** (Optional) Clears the dropped flow statistics.
- **frame** (Optional) Clears the dropped frame/packet statistics.
- **inspect-dp egress-optimization** (Optional) Clears egress optimization statistics.
- **inspect-dp snort** Clears data-path inspection Snort statistics.
- **instance number** (Optional) Clears the counters by instance ID.
- **load-balance history** Clears the history of ASP load balancing per packet and reset the number of times an automatic switch occurred.
- **overhead** Clears all ASP multiprocessor overhead statistics.
- **queue number** (Optional) Clears the counters by instance ID and queue ID.
- **queue-exhaustion** Clears the data-path inspection Snort queue snapshot.
- **snapshot number** (Optional) Clears the queue exhaustion by snapshot ID.
- **table** Clears the hit counters in ASP ARP tables and ASP classify tables.

To clear all bi-directional forwarding detection (BFD) counters, use the `clear bfd counters` command.

```
clear bfd counters [ld local_discr | interface_name | ipv4 ip_address | ipv6 ip_address]
```

### Syntax Description

- **ld local_discr** (Optional) Clears BFD counters for the specified local discriminator, 1 - 4294967295.
- **interface_name** (Optional) Clears BFD counters for the specified interface.
- **ipv4 ip_address** (Optional) Clears BFD counters for the specified neighbor IPv4 address.
- **ipv6 ip_address** (Optional) Clears BFD counters for the specified neighbor IPv6 address.

</table>
clear bgp

To reset Border Gateway Protocol (BGP) connections using hard or soft reconfiguration, use the clear bgp command.

clear bgp { [* | external ] [ ipv4 unicast | as_number | neighbor_address | table-map ] | ipv6 unicast [ as_number | neighbor_address ] [ soft | in | out ] | as_number [ soft | in | out ] | neighbor_address [ soft | in | out ] | table-map }

Syntax Description

* Specifies that all current BGP sessions will be reset.

as_number (Optional) Number of the autonomous system in which all BGP peer sessions will be reset.

external Specifies that all external BGP sessions will be reset.

in (Optional) Initiates inbound reconfiguration. If neither the in nor out keywords are specified, both inbound and outbound sessions are reset.

ipv4 unicast Resets BGP connections using hard or soft reconfiguration for IPv4 address family sessions.

ipv6 unicast Resets BGP connections using hard or soft reconfiguration for IPv6 address family sessions.

neighbor_address (Optional) Specifies that only the identified BGP neighbor will be reset. The value for this argument can be an IPv4 or IPv6 address.

out (Optional) Initiates inbound or outbound reconfiguration. If neither the in nor out keywords are specified, both inbound and outbound sessions are reset.

soft (Optional) Clears slow-peer status forcefully, and moves it to original update group.

table-map Clears table-map configuration information in BGP routing tables. This command can be used to clear traffic-index information configured with the BGP Policy Accounting feature.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The clear bgp command can be used to initiate a hard reset or soft reconfiguration. A hard reset tears down and rebuilds the specified peering sessions and rebuilds the BGP routing tables. A soft reconfiguration uses stored prefix information to reconfigure and activate BGP routing tables without tearing down existing peering sessions. Soft reconfiguration uses stored update information, at the cost of additional memory for storing the updates, to allow you to apply a new BGP policy without disrupting the network. Soft reconfiguration can be configured for inbound or outbound sessions.
Examples

In the following example, all the BGP sessions are reset:

> clear bgp *

In the following example, a soft reconfiguration is initiated for the inbound session with the neighbor 10.100.0.1, and the outbound session is unaffected:

> clear bgp 10.100.0.1 soft in

In the following example, the route refresh capability is enabled on the BGP neighbor routers, a soft reconfiguration is initiated for the inbound session with the neighbor 172.16.10.2, and the outbound session is unaffected:

> clear bgp 172.16.10.2 in

In the following example, a hard reset is initiated for sessions with all routers in the autonomous system numbered 35700:

> clear bgp 35700

In the following example, a soft reconfiguration is configured for all inbound eBGP peering sessions:

> clear bgp external soft in

In the following example, all outbound address family IPv4 multicast eBGP peering sessions are cleared:

> clear bgp external ipv4 multicast out

In the following example, a soft reconfiguration is initiated for the inbound sessions for BGP neighbors in IPv4 unicast address family sessions in autonomous system 65400, and the outbound session is unaffected:

> clear bgp ipv4 unicast 65400 soft in

In the following example, a hard reset is initiated for BGP neighbors in IPv4 unicast address family sessions in the 4-byte autonomous system numbered 65538 in asplain notation:

> clear bgp ipv4 unicast 65538

In the following example, a hard reset is initiated for BGP neighbors in IPv4 unicast address family sessions in the 4-byte autonomous system numbered 1.2 in asdot notation:

> clear bgp ipv4 unicast 1.2
The following example clears the table map for IPv4 unicast peering sessions:

```plaintext
> clear bgp ipv4 unicast table-map
```
clear blocks

To reset the packet buffer counters such as the exhaustion condition and history information, use the `clear blocks` command.

```
clear blocks  [exhaustion  [history  |  snapshot]  |  export-failed  |  queue  [history  [core-local  [number]]]]
```

### Syntax Description
- **core-local [number]** (Optional) Clears system buffers queued by application for all cores, or if you specify the core number, a specific core.
- **exhaustion** (Optional) Clears the exhaustion condition.
- **export-failed** (Optional) Clears the export failed counters.
- **history** (Optional) Clears the history.
- **queue** (Optional) Clears queued blocks.
- **snapshot** (Optional) Clears the snapshot information.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Resets the low watermark counters to the current available blocks in each pool. Additionally, this command clears the history information stored during the last buffer allocation failure.

### Examples

The following example clears the blocks:

```
> clear blocks
```

### Related Commands

</tbody>
</table>

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

When you make security policy changes to the configuration, all new connections use the new security policy. Existing connections continue to use the policy that was configured at the time of the connection establishment. To ensure that all connections use the new policy, you need to disconnect the current connections so they can reconnect using the new policy using the `clear conn` command. You can alternatively use the `clear local-host` command to clear connections per host, or the `clear xlate` command for connections that use dynamic NAT.

When the device creates a pinhole to allow secondary connections, this is shown as an incomplete connection in the `show conn` command output. To clear this incomplete connection, use the `clear conn` command.
This command does not clear connections to the Management interface; it can only clear management connections to a data interface or the Diagnostic interface.

**Examples**

The following example shows how to view all connections and then clear the management connection from 10.10.10.108:

```plaintext
> show conn all
TCP mgmt 10.10.10.108:4168 NP Identity Ifc 10.0.8.112:22, idle 0:00:00, bytes 3084, flags UOB
> clear conn address 10.10.10.108
```

**Related Commands**

</table>
clear counters

To clear the protocol stack counters, use the `clear counters` command.

```
clear counters [all | summary | top n] [detail] [protocol protocol_name [counter_name]] [threshold n]
```

**Syntax Description**

- `all` (Optional) Clears all filter details.
- `counter_name` (Optional) Specifies a counter by name. Use the `show counters protocol` command to see available counter names.
- `detail` (Optional) Clears detailed counters information.
- `protocol protocol_name` (Optional) Clears the counters for the specified protocol.
- `summary` (Optional) Clears the counter summary.
- `threshold n` (Optional) Clears the counters at or above the specified threshold. The range is 1 through 4294967295.
- `top n` (Optional) Clears the counters at or above the specified threshold. The range is 1 through 4294967295.

**Command Default**
The `clear counters summary detail` command is the default.

**Command History**

</tbody>
</table>
clear crypto ca crls

To empty the CRL cache of all CRLs associated with a specified trustpoint, all CRLs associated with the trustpool from the cache, or the CRL cache of all CRLs, use the `clear crypto ca crls` command.

`clear crypto ca crls [trustpool | trustpoint trust_point_name]`

**Syntax Description**

- `trustpoint trust_point_name`: The name of a trustpoint. If you do not specify a name, this command clears all CRLs cached on the system. If you give the trustpoint keyword without a trustpointname, the command fails.

- `trustpool`: Indicates that the action should be applied only to the CRLs that are associated with certificates in the trustpool.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>

clear crypto ikev1

To remove the IPsec IKEv1 SAs or statistics, use the `clear crypto ikev1` command.

**clear crypto ikev1 { sa [ip_address] | stats }**

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sa ip_address</td>
<td>Clears the SA. To clear all IKEv1 SAs, use this option without specifying an IP address. Otherwise, specify the IPv4 or IPv6 address of the SA to clear.</td>
</tr>
<tr>
<td>stats</td>
<td>Clears the IKEv1 statistics.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

The following example removes all of the IPsec IKEv1 statistics from the Firepower Threat Defense device:

```plaintext
> clear crypto ikev1 stats
>
```

The following example deletes SAs with a peer IP address of 10.86.1.1:

```plaintext
> clear crypto ikev1 sa 10.86.1.1
>
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ipsec sa</td>
<td>Displays information about IPSec SAs, including counters, entry, map name, peer IP address and hostname.</td>

<td>Displays the entire crypto configuration, including IPsec, crypto maps, dynamic crypto maps, and ISAKMP.</td>
</tr>
</tbody>
</table>
clear crypto protocol statistics

To clear the protocol-specific statistics in the crypto accelerator MIB, use the `clear crypto protocol statistics` command.

### Syntax Description

`protocol`  
Specifies the name of the protocol for which you want to clear statistics. Protocol choices are as follows:

- **all**—All protocols currently supported.
- **ikev1**—Internet Key Exchange (IKE) version 1.
- **ikev2**—Internet Key Exchange (IKE) version 2.
- **ipsec**—IP Security (IPsec) Phase-2 protocols.
- **other**—Reserved for new protocols.
- **srtp**—Secure RTP (SRTP) protocol
- **ssh**—Secure Shell (SSH) protocol
- **ssl**—Secure Socket Layer (SSL) protocol

</tbody>
</table>
clear crypto ssl

To clear SSL information, use the `clear crypto ssl` command.

```
clear crypto ssl { cache [all] | errors | mib | objects }
```

**Syntax Description**
- `cache`  Clears expired sessions in the SSL session cache.
- `all`  (Optional) Clears all sessions and statistics in the SSL session cache.
- `errors`  Clears SSL errors.
- `mib`  Clears SSL MIB statistics.
- `objects`  Clears SSL object statistics.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

The following example clears all SSL cache sessions and statistics:

```
> clear crypto ssl cache all
```
clear dhcpd

To clear the DHCP server bindings and statistics, use the `clear dhcpd` command.

```
clear dhcpd { binding [all | ip_address] | statistics }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>(Optional) Clears all dhcpd bindings.</td>
</tr>
<tr>
<td>binding</td>
<td>Clears all the client address bindings.</td>

</tbody>
</table>
clear dns

To clear all IP addresses associated with the specified fully qualified domain name (FQDN) host, use the clear dns command.

```
clear dns [host  fqdn_name]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host fqdn_name</td>
<td>(Optional) Specifies the fully qualified domain name whose IP addresses you want to clear. If you do not specify a host, all DNS resolutions are cleared.</td>
</tr>
</tbody>
</table>

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Examples

The following example clears the IP addresses associated with the specified FQDN host:

```
> clear dns host www.example.com
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show dns-hosts</td>
<td>Shows the DNS cache.</td>
</tr>
</tbody>
</table>
clear dns-hosts cache

To clear the DNS cache, use the `clear dns-hosts cache` command.

```plaintext
clear dns-hosts cache
```

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>

```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show dns-hosts</code></td>
<td>Shows the DNS cache.</td>
</tr>
</tbody>
</table>
clear eigrp events

To clear the EIGRP event log, use the `clear eigrp events` command.

```
clear eigrp [as_number] events
```

**Syntax Description**

- `as_number` (Optional) Specifies the autonomous system number of the EIGRP process for which you are clearing the event log. Because the device only supports one EIGRP routing process, you do not need to specify the autonomous system number (process ID).

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use the `show eigrp events` command to view the EIGRP event log.

**Examples**

The following example clears the EIGRP event log:

```
> clear eigrp events
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show eigrp events</td>
<td>Displays the EIGRP event log.</td>
</tr>
</tbody>
</table>
clear eigrp neighbors

To delete entries from the EIGRP neighbor table, use the `clear eigrp neighbors` command.

```
clear eigrp [as_number] neighbors [ip_addr | if_name] [soft]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>as_number</code></td>
<td>(Optional) Specifies the autonomous system number of the EIGRP process for which you are deleting neighbor entries. Because the device only supports one EIGRP routing process, you do not need to specify the autonomous system number (AS), which is the process ID.</td>
</tr>
<tr>
<td><code>if_name</code></td>
<td>(Optional) The name of an interface. Specifying an interface name removes all neighbor table entries that were learned through this interface.</td>
</tr>
<tr>
<td><code>ip_addr</code></td>
<td>(Optional) The IP address of the neighbor you want to remove from the neighbor table.</td>
</tr>
<tr>
<td><code>soft</code></td>
<td>Causes the device to resynchronize with the neighbor without resetting the adjacency.</td>
</tr>
</tbody>
</table>

**Command Default**

If you do not specify a neighbor IP address or an interface name, all dynamic entries are removed from the neighbor table.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `clear eigrp neighbors` command does not remove neighbors that were manually defined from the neighbor table. Only dynamically discovered neighbors are removed.

You can use the `show eigrp neighbors` command to view the EIGRP neighbor table.

**Examples**

The following example removes all entries from the EIGRP neighbor table:

```
> clear eigrp neighbors
```

The following example removes all entries learned through the interface named “outside” from the EIGRP neighbor table:

```
> clear eigrp neighbors outside
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show eigrp neighbors</td>
<td>Displays the EIGRP neighbor table.</td>
</tr>
</tbody>
</table>
clear eigrp topology

To delete entries from the EIGRP topology table, use the `clear eigrp topology` command.

```
clear eigrp [as_number] topology ip_addr [mask]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_number</td>
<td>(Optional) Specifies the autonomous system number of the EIGRP process. Because the device only supports one EIGRP routing process, you do not need to specify the autonomous system number (AS), which is the process ID.</td>
</tr>
<tr>
<td>ip_addr</td>
<td>The IP address to clear from the topology table.</td>
</tr>
<tr>
<td>mask</td>
<td>(Optional) The network mask to apply to the ip-addr argument.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command clears existing EIGRP entries from the EIGRP topology table. You can use the `show eigrp topology` command to view the topology table entries.

**Examples**

The following example removes entries in the 192.168.1.0 network from EIGRP topology table:

```
> clear eigrp topology 192.168.1.0 255.255.255.0
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show eigrp topology</td>
<td>Displays the EIGRP topology table.</td>
</tr>
</tbody>
</table>
