debug

To show debugging messages for a given feature, use the **debug** command. To disable the display of debug messages, use the **no** form of this command. Use **no debug all** to turn off all debugging commands.

debug feature [subfeature] [level] **no debug** feature [subfeature]

Syntax Description	feature	Specifies the feature for which you want to enable debugging. To see available features, use the debug ? command for CLI help.			
	subfeature	(Optional) Depending on the feature, you can enable debug messages for one or more subfeatures. Use ? to see the available subfeatures.			
	level	(Optional) Specifies the debugging level. The level might not be available for all features. Use ? to see the available levels.			
Command Default	The default deb	bugging level is 1.			
Command History	Release	Modification			
	6.1	This command was introduced.			
	7.2	This command was modified to include the debug for path monitoring.			
	 with the Cisco reclinical Assistance Center (TAC). Moreover, it is best to use debug commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased debug command processing overhead will affect system use. You can view debug output in a CLI session only. Output is directly available when connected to the Console port, or when in the diagnostic CLI (enter system support diagnostic-cli). You can also view output from the regular threat defense CLI using the show console-output command. 				
	Example				
	The following example enables DNS debugging and performs an action that generates messages in the diagnostic CLI. The debug messages start after the "ERROR: % Invalid Hostname" message. Press enter to get to the prompt. The example then shows what these debug messages would look like in the show console-output display.				
	> debug dns debug dns enabled at level 1.				
	> system supp Attaching to Type help or	port diagnostic-cli Diagnostic CLI Press 'Ctrl+a then d' to detach. '?' for a list of available commands.			

firepower# ping www.example.com

```
ERROR: % Invalid Hostname
firepower# DNS: get global group DefaultDNS handle 1fa0b047
DNS: Resolve request for 'www.example.com' group DefaultDNS
DNS: No interfaces enabled
DNS: get global group DefaultDNS handle 1fa0b047
DNS: Resolve request for 'www.example.com' group DefaultDNS
DNS: No interfaces enabled
firepower# (press Ctrl+a, then d, to return to the regular CLI.)
Console connection detached.
> show console-output
... (output redacted)...
Message #75 : DNS: get global group DefaultDNS handle 1fa0b047
Message #76 : DNS: Resolve request for 'www.cisco.com' group DefaultDNS
Message #77 : DNS: No interfaces enabled
Message #78 : DNS: get global group DefaultDNS handle 1fa0b047
Message #79 : DNS: Resolve request for 'www.cisco.com' group DefaultDNS
Message #80 : DNS: No interfaces enabled
```

	show debug	Shows the currently active debug settings.		
	undebug	Disables debugging for a feature. This command is a synonym for no debug .		

debug packet-condition

d - r

To apply the filters on the flows that must be debugged, use the **debug packet-condition** command. To remove the filters on the flows, use the **no** form of this command. Use **no debug packet-condition** to turn off all the filters on the flows.

debug packet-condition [**position** *<line>*] **match** *<proto>* {*any*|*any*4|*any*6|*host*

<ip>|<ipv4>|<ipv4_mask>|<ipv6>/<prefixlen>} [<src_operator> <ports> {any|any4|any6|host <ip>|<ipv4>|<ipv4_mask>|<ipv6>/<prefixlen>}] [<dest_operator> <ports>] [<icmp_type> | <icmp6_type>] [connection <connection-id>] [unidirectional]

Syntax Description	position <i><line></line></i>	Specifies the position at which the filter should be placed in the list of existing filters.				
		<i><line></line></i> indicates the number.				
	match <proto></proto>	Specifies the matching condition for the filter.				
	{any/any4/any6/nosi <ip>/<ipv4>/<ipv4_mask>/</ipv4_mask></ipv4></ip>	<i>sproto></i> indicates the protocol.				
	<ipv6>/<prefixlen>}</prefixlen></ipv6>	{ <i>any</i> / <i>any</i> 6/ <i>host</i> < <i>ip</i> >/< <i>ipv</i> 4>/< <i>ipv</i> 4_ <i>mask</i> >/< <i>ipv</i> 6>/< <i>prefixlen</i> >} indicate the IP address options.				
	<src_operator><port> {any/any4/any6/host <ip>/<ipv4>/<ipv4_mask>/</ipv4_mask></ipv4></ip></port></src_operator>	(Optional) Specifies the port or IP address details of the source.				
	<ipv6>/<prefixlen>}</prefixlen></ipv6>					
	<dest_operator><port> {any/any4/any6/host <ip>/<ipv4>/<ipv4_mask>/</ipv4_mask></ipv4></ip></port></dest_operator>	(Optional) Specifies the port or IP address details of the destination.				
	<ipv6>/<prefixlen>}</prefixlen></ipv6>					
	<icmp_type>/<icmp6_type></icmp6_type></icmp_type>	(Optional) Specifies the ICMP type of the connection.				
	connection <connection-id></connection-id>	(Optional) Specifies the connection ID of an ongoing connection.				
Command Default	unidirectional	(Optional) Specifies that the debugging should be performed only on packets in the specified direction. If the variable is not provided, then the default behavio is bi-directional, wherein the traffic will be matched with both the forward and the reverse flows of the connection.				
Command History	Release Modif	ication				
	6.4 This c	command was introduced.				
	6.5 The c	ommand was changed from debug packet condition to debug packet-condition .				

	Release	Modification					
	6.6	The command debug packet-condition was enhanced to provide support for ongoing connections.					
Usage Guidelines	Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use debug commands only to troubleshoot specific problems or during troubleshooting sessions with the Cisco Technical Assistance Center (TAC). Moreover, it is best to use debug commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased debug command processing overhead will affect system use.						
	You can view debug output in a CLI session only. Output is directly available when connected to the Console port, or when in the diagnostic CLI (enter system support diagnostic-cli). You can also view output from the regular threat defense CLI using the show console-output command.						
	Example						
	The following examples show how you can set filters to the flows that must be debugged.						
	> debug packet-condition position 7 match tcp 1.2.3.0 255.255.255.0 any4						
	> debug packet-condition match tcp 1.2.3.0 255.255.255.0 eq www any4 unidirectional						
	> debug packet-condition match connection 70856531						
	> no debug pac	cket-condition match tcp 1.2.3.0 255.255.255 eq www unidirectional					
Related Commands	Command	Description					
	debug packet-start Open the connection to debug logs database and start writing debug log database.						
	debug packet-stop Closes the connection to debug logs database and stops writing debug logs to database.						
		1					

debug packet-module

To set the level for each module to send debug messages, use the **debug packet-module** command. The level can be set from 0 (emergencies) to 7 (debug). After a level is set, all the messages with equal or higher severity are logged.

debug packet-module [acl | all | appid | daq | pdts | snort-engine | snort-fileprocessor | snort-firewall 1 < 0-7 >

	-				
Syntax Description	acl		Selects the access control policies in the packet processing path.		
	all daq pdts snort-engine snort-fileprocessor		Selects all the modules in the packet processing path.		
			Selects the DAQ information in the packet processing path.		
			Selects the PDTS (data plane transmit/receive queues to snort) communication in the packet processing path.		
			Selects the Snort information in the packet processing path.		
			Selects the Snort file processor information in the packet processing path.		
	snort-firewal	l	Selects the Snort firewall information in the packet processing path.		
	_				
Command History	Release	Moo	lification		
	6.4	This	s command was introduced.		
	6.5	.5 The command was changed from debug packet to debug packet-module .			
Ilsane Guidelines	Because debug	ging outp	but is assigned high priority in the CPU process, it can render the system unusable.		

aye ui

For this reason, use **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with the Cisco Technical Assistance Center (TAC). Moreover, it is best to use debug commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

You can view debug output in a CLI session only. Output is directly available when connected to the Console port, or when in the diagnostic CLI (enter system support diagnostic-cli). You can also view output from the regular threat defense CLI using the show console-output command.

Examples

The following example shows how you can set a level to the DAQ information in the packet processing path.

> debug packet daq 6

Related Commands	Command	Description		
	debug packet-start	Open the connection to debug logs database and start writing the debug logs to the database.		
	debug packet-stop	Closes the connection to debug logs database and stops writing the debug logs to the database.		

debug packet-module trace

To enable module level packet tracing, use the debug packet-module trace command.

debug packet-module trace

Command History	Release	Modification
	6.6	This command was introduced.

Usage Guidelines

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with the Cisco Technical Assistance Center (TAC). Moreover, it is best to use **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

You can view debug output in a CLI session only. Output is directly available when connected to the Console port, or when in the diagnostic CLI (enter **system support diagnostic-cli**). You can also view output from the regular threat defense CLI using the **show console-output** command.

Example

The following example shows how you can enable module level packet tracing.

> debug packet-module trace

The following is sample output from the **debug packet-module trace** command:

ID		Details								Time	(ns)
										-	
6525759 06:48:43	ا 05	TCP 0675868	74.125.24.156	:	443	-> 192	2.168.0.31	:	58280	19-02-	2020

Further, details of the packet can be derived by using the following command.

> show packet debugs module trace packet-id 6525759

Related Commands	Command	Description		
	show packet debugs module trace	Displays the list of all the debug traces collected from each module.		
	debug packet-start	Open the connection to debug logs database and start writing the debug logs to the database.		
	debug packet-stop	Closes the connection to debug logs database and stops writing the debug logs to the database.		

I

debug packet-start

To start debugging of packets and to start writing debug logs to the debug log database, use the **debug packet-start** command.

debug packet-start

Command History	Release	ise Modification			
	6.4 This command was introduced.				
	6.5	This command was changed from debug packet start to debug packet-start .			
Usage Guidelines	The debug packet-start opens the connection to the debug log database. Debug logs are not written to the database unless this command is invoked.				
	Example				
	The following example shows how to start debugging packets:				
	> debug packet-st	art			
Related Commands	Command	Description			
	debug packet-stop	Closes the connection to debug logs database and stops writing debug logs to the database.			

debug packet-stop

To stop debugging of packets and to stop writing debug logs to the debug log database, use the **debug packet-stop** command.

debug packet-stop

Command History	Release Modification				
	6.4 This command was introduced.				
	6.5	This command was changed from debug packet stop to debug packet-stop .			
Usage Guidelines	The debug packet-stop closes the connection to the debug log database.				
	Example				
	The following example shows how to stop debugging packets:				
	> debug packet-s	top			
Related Commands	Command	Description			
	debug packet-star	•t Open the connection to debug logs database and start writing debug logs to the database.			

delete

To delete a file from flash memory, use the **delete** command.

	delete /noconfir	m [/recursive] [/replicate] [disk0: diskn: flash:] [path/] filename		
Syntax Description	/noconfirm	Does not prompt for confirmation.		
	/recursive	(Optional) Deletes the specified file recursively in all subdirectories.		
	/replicate	(Optional) Deletes the specified file on the standby unit.		
	disk0:	(Optional) Specifies the internal flash memory.		
	diskn:	(Optional) Indicates optional external flash drive, where n specifies the drive number. This is typically disk1:		
	filename	Specifies the name of the file to delete.		
	flash:	(Optional) Specifies the internal flash memory. This keyword is the same as disk0 .		
	path/	(Optional) Specifies to the path to the file.		
Command Default	If you do not spe	ecify a directory, the directory is the current working directory by default.		
Command History	Release	Modification		
	6.1	This command was introduced.		
Usage Guidelines	The file is delete deleting files.	d from the current working directory if a path is not specified. Wildcards are supported when		
	Examples			
	The following example shows how to delete a file named test.cfg in the current working directory:			
	> delete /nocc	onfirm test.cfg		
Related Commands	Command	Description		
	cd	Changes the current working directory to the one specified		

cd	Changes the current working directory to the one specified.
dir	List the files in the current directory.
rmdir	Removes a file or directory.

14

dig

To look up the IP address for a fully-qualified domain name, use the dig command.

	dig hostname	2		
Syntax Description	hostname	The fully-qualified domain name of a host whose IP address you are looking up. For example, www.example.com.		
Command History	Release	Modification		
	7.1	This command was introduced. It replaced the nslookup command.		
Usage Guidelines	Some comman management in commands that IP address in th	ds that allow fully-qualified domain names cannot use the DNS servers configured for the iterface to look up the IP address for the name. If you do not have DNS servers configured for go through the data interfaces, use the dig command to determine the IP address, then use the ne command.		
	The dig command works through the management interface only, and returns information from the DNS servers configured for the management interface. If you configure different servers for the data interfaces, using an FQDN on a command that goes through a data interface might return a different IP address, or no IP address at all if those DNS servers cannot resolve the name.			
	Example			
	The following highlighted in t shows the IP ac has been saniti	example looks up the IP address of the FQDN www.example.com. The address is he ANSWER section of the output. The SERVER indication near the end of the output ddress of the DNS server that returned the resolution (the IP address in this example zed).		
	The NOERRO an error. For ex server. You car command.	R status in the header indicates the request was successful; any other value represents cample, NXDOMAIN means the domain name does not exist in the responding DNS a search the internet for more details about reading the output of the Linux dig		
	> dig www.exa	ample.com

dir

To display the directory contents, use the dir command.

dir [/**all**] [**all-filesystems**] [/recursive] [**disk0:** | **diskn:** | **flash:** | **system:**] [*path*] [*filename*]

Syntax Description	/all	(Optional) Displays all files.
	/recursive	(Optional) Displays the directory contents recursively.
	all-filesystems	(Optional) Displays the files of all filesystems.
	disk0:	(Optional) Specifies the internal Flash memory, followed by a colon.
	diskn:	(Optional) Indicates optional external flash drive, where <i>n</i> specifies the drive number. This is typically disk1:
	flash:	(Optional) Displays the directory contents of the default flash partition.
	path	(Optional) Specifies a specific path.
	filename	(Optional) Specifies the name of a file.
	system:	(Optional) Displays the directory contents of the file system.

Command Default If you do not specify a directory, the directory is the current working directory by default.

Command History

Release

6.1

This command was introduced.

Modification

Examples

The following example shows how to display the directory contents:

```
> dir
Directory of disk0:/
1   -rw- 1519   10:03:50 Jul 14 2003   my_context.cfg
2   -rw- 1516   10:04:02 Jul 14 2003   my_context.cfg
3   -rw- 1516   10:01:34 Jul 14 2003   admin.cfg
60985344 bytes total (60973056 bytes free)
```

Related Commands	Command	Description
	cd	Changes the current working directory to the one specified.

dir

I

Command	Description
mkdir	Creates a directory.
rmdir	Removes a directory.

dns update

clear dns

show dns

To start DNS lookup to resolve the designated hostnames without waiting for the expiration of the DNS poll timer, use the **dns update** command.

dns update	[host	fqdn_name]	[timeout seconds	number]
------------	--------	------------	------------------	---------

Syntax Description	host fqdn_nar	me	Specifies the fully qualified domain name of the host on which to run DNS updates.		
	timeout seconds number		Specifies the timeout for the lookup operation, in seconds, from 3-30. The default is 30.		
Command History	Release	Modifica	ition		
	6.3	This con	nmand was introduced.		
Usage Guidelines	This command expiration of the are used in acc running, the sy	l immediately s he DNS poll tin ess control rule ystem displays	starts a DNS lookup to resolve the designated hostnames without waiting for the mer. When you run DNS update without specifying a hostname, all names that es, which is known as being activated, are resolved. When the command finishes [Done] at the command prompt and generates a syslog message.		
	Examples				
	The following example performs a DNS update for all FQDNs used in access control rules.				
	> dns update INFO: update > [Done]	dns process	started		
Related Commands	Command		Description		

Removes FQDN network object DNS resolutions.

Displays FQDN network object DNS resolutions.

I

eotool commands

Only use eotool commands under the direction of the Cisco Technical Assistance Center.

exit

To exit from the CLI, use the exit command.

exit

Command History	Release	Modification
	6.1	This command was introduced.

Usage Guidelines In the regular CLI, the exit and logout commands do the same thing, closing the SSH session with the device. When you are in expert mode, exit leaves expert mode and returns you to the regular CLI.

When you are in the Diagnostic CLI (**system support diagnostic-cli**), the **exit** command also moves you from Privileged EXEC mode back to User EXEC mode.

Examples

The following example shows how to use the exit command to close the SSH connection to the CLI.

> exit

The following example shows how to use the **exit** command go from Privileged EXEC mode in the Diagnostic CLI (represented by the # sign in the prompt) back to User EXEC mode. You can ignore the Logoff message, your CLI session remains active.

```
firepower# exit
Logoff
Type help or '?' for a list of available commands.
firepower>
```

Related Commands	Command	Description
	logout	Logs off from the CLI session.

I

expert

To enter expert mode, which is required for some procedures, use the expert command.

expert

Command History		lease	Modification
	6.	1	This command was introduced.
Usage Guidelines	Use Cer	e expert mode nter tells you	e only if a documented procedure tells you to enter it, or if the Cisco Technical Assistance to use it. The use of expert mode is unsupported under any other circumstances.
-	<u>/!</u> Caution	You might h Use docume avoid unint	be able to execute commands in expert mode whose results are not reflected in device manager. ented commands only in expert mode, or commands as directed by Cisco Technical Support, to

Examples

The following example shows how to enter and exit expert mode. The expert mode prompt shows the username@hostname information.

```
> expert
admin@firepower:~$
admin@firepower:~$ exit
logout
>
```

Related Commands	Command	Description
	exit	Exit from expert mode.

failover active

To switch a standby device to the active state, use the **failover active** command. To switch an active device to standby, use the **no** form of this command.

failover active no failover active

Command History	Release	Modification
	6.1	This command was introduced.
Usage Guidelines	Use the failover active command to initiate a failover switch from the standby unit, or use the no failover active command from the active unit to initiate a failover switch. You can use this feature to return a failed unit to service, or to force an active unit offline for maintenance. If you are not using Stateful Failover, all active connections are dropped and must be reestablished by the clients after the failover occurs.	
	Examples	
	The following	example switches the standby unit to active:

> failover active

Related Commands	Command	Description
	failover reset	Moves a device from a failed state to standby.

failover exec

To execute a command on a specific unit in a failover pair, use the **failover exec** command.

	failover exec { active standby mate } cmd_string		
Syntax Description	active	Specifies that the command is executed on the active unit in the failover pair.	
	cmd_string	The command to be executed. See the CLI help for supported commands.	
	mate	Specifies that the command is executed on the failover peer.	
	standby	Specifies that the command is executed on the standby unit in the failover pair.	
Command History	Roloaso	Modification	
command motory			
	6.1	This command was introduced.	
Usage Guidelines	You can use the	failover exec command to send commands to a specific unit in a failover pair.	

Output from the commands is displayed in the current terminal session, so you can use the failover exec command to issue **show** commands on a peer unit and view the results in the current terminal.

You must have sufficient privileges to execute a command on the local unit to execute the command on the peer unit.

Limitations

- Command completion and context help are not available for the commands in the *cmd_string* argument.
- You cannot use the debug (undebug) command with the failover exec command.
- If the standby unit is in the failed state, it can still receive commands from the failover exec command if the failure is due to a service card failure; otherwise, the remote command execution will fail.
- You cannot enter recursive failover exec commands, such as the failover exec mate failover exec mate command.
- Commands that require user input or confirmation must use the /nonconfirm option.

Examples

The following example uses the **failover exec** command to display the failover configuration of the failover peer. The command is executed on the primary unit, which is the active unit, so the information displayed is from the secondary, standby unit.

```
> failover exec mate show running-config failover
failover
failover lan interface failover GigabitEthernet0/3
failover polltime unit 1 holdtime 3
failover polltime interface 3 holdtime 15
failover link failover GigabitEthernet0/3
```

failover interface ip failover 10.0.5.1 255.255.255.0 standby 10.0.5.2

The following example uses the **failover exec** command to send the **show interface** command to the standby unit:

> failover exec standby show interface Interface GigabitEthernet0/0 "outside", is up, line protocol is up Hardware is i82546GB rev03, BW 1000 Mbps Auto-Duplex(Half-duplex), Auto-Speed(100 Mbps) MAC address 000b.fcf8.c290, MTU 1500 IP address 192.168.5.111, subnet mask 255.255.255.0 216 packets input, 27030 bytes, 0 no buffer Received 2 broadcasts, 0 runts, 0 giants 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort 0 L2 decode drops 284 packets output, 32124 bytes, 0 underruns 0 output errors, 0 collisions 0 late collisions, 0 deferred input queue (curr/max blocks): hardware (0/0) software (0/0) output queue (curr/max blocks): hardware (0/1) software (0/0) Traffic Statistics for "outside": 215 packets input, 23096 bytes 284 packets output, 26976 bytes 0 packets dropped 1 minute input rate 0 pkts/sec, 21 bytes/sec 1 minute output rate 0 pkts/sec, 23 bytes/sec 1 minute drop rate, 0 pkts/sec 5 minute input rate 0 pkts/sec, 21 bytes/sec 5 minute output rate 0 pkts/sec, 24 bytes/sec 5 minute drop rate, 0 pkts/sec Interface GigabitEthernet0/1 "inside", is up, line protocol is up Hardware is i82546GB rev03, BW 1000 Mbps Auto-Duplex(Half-duplex), Auto-Speed(10 Mbps) MAC address 000b.fcf8.c291, MTU 1500 IP address 192.168.0.11, subnet mask 255.255.255.0 214 packets input, 26902 bytes, 0 no buffer Received 1 broadcasts, 0 runts, 0 giants 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort 0 L2 decode drops 215 packets output, 27028 bytes, 0 underruns 0 output errors, 0 collisions 0 late collisions, 0 deferred input queue (curr/max blocks): hardware (0/0) software (0/0) output queue (curr/max blocks): hardware (0/1) software (0/0) Traffic Statistics for "inside": 214 packets input, 23050 bytes 215 packets output, 23140 bytes 0 packets dropped 1 minute input rate 0 pkts/sec, 21 bytes/sec 1 minute output rate 0 pkts/sec, 21 bytes/sec 1 minute drop rate, 0 pkts/sec 5 minute input rate 0 pkts/sec, 21 bytes/sec 5 minute output rate 0 pkts/sec, 21 bytes/sec 5 minute drop rate, 0 pkts/sec Interface GigabitEthernet0/2 "failover", is up, line protocol is up Hardware is i82546GB rev03, BW 1000 Mbps Auto-Duplex(Full-duplex), Auto-Speed(100 Mbps) Description: LAN/STATE Failover Interface MAC address 000b.fcf8.c293, MTU 1500 IP address 10.0.5.2, subnet mask 255.255.255.0 1991 packets input, 408734 bytes, 0 no buffer Received 1 broadcasts, 0 runts, 0 giants

   0 L2 decode drops
   1835 packets output, 254114 bytes, 0 underruns
   0 output errors, 0 collisions
   0 late collisions, 0 deferred
    input queue (curr/max blocks): hardware (0/0) software (0/0)
    output queue (curr/max blocks): hardware (0/2) software (0/0)
Traffic Statistics for "failover":
   1913 packets input, 345310 bytes
   1755 packets output, 212452 bytes
   0 packets dropped
   1 minute input rate 1 pkts/sec, 319 bytes/sec
   1 minute output rate 1 pkts/sec, 194 bytes/sec
   1 minute drop rate, 0 pkts/sec
   5 minute input rate 1 pkts/sec, 318 bytes/sec
   5 minute output rate 1 pkts/sec, 192 bytes/sec
   5 minute drop rate, 0 pkts/sec
```

The following example shows the error message returned when issuing an illegal command to the peer unit:

```
> failover exec mate bad command
bad command
 ^
ERROR: % Invalid input detected at '^' marker.
```

The following example shows the error message that is returned when you use the **failover exec** command when failover is disabled:

> failover exec mate show failover

ERROR: Cannot execute command on mate because failover is disabled

Related Commands	Command	Description
	debug fover	Displays failover-related debugging messages.
	debug xml	Displays debugging messages for the XML parser used by the failover exec command.
	show failover exec	Displays the failover exec command mode.

failover reload-standby

To force the standby unit to reboot, use the failover reload-standby command.

failover reload-standby

Command History	Release	Modification
	6.1	This command was introduced.

Usage Guidelines Use this command when your failover units do not synchronize. The standby unit restarts and resynchronizes to the active unit after it finishes booting.

Examples

The following example shows how to use the **failover reload-standby** command on the active unit to force the standby unit to reboot:

> failover reload-standby

To restore a failed device to an unfailed state, use the **failover reset** command.

failover reset

Command History	Release	Modification	
	6.1	This command was introduced.	
Usage Guidelines	The failover reset command allows you to change the failed unit to an unfailed state. The failover reset command can be entered on either unit, but we recommend that you always enter the command on the active unit. Entering the failover reset command at the active unit will "unfail" the standby unit.		
	You can display the failover status of the unit with the show failover command.		
	Examples		
	The following example shows how to change a failed unit to an unfailed state:		
	> failover reset		
Related Commands	Command	Description	
	show failover	Displays information about the failover status of the unit.

I

file copy

To transfer files from the common directory to a remote host via FTP, use the file copy command.

file copy *host_name user_id path filename_1* [*filename_2* . . . *filename_n*]

Syntax Description	host_name	Specifies the name or IP address of the target remote host.
	user_id	Specifies the user on the remote host.
	path	Specifies the destination path on the remote host.
	filename_1 th filename_n	ugh Specifies the names of the files to transfer from the common directory. If multiple file names are specified, they must be separated with blanks. This argument supports wildcards.
Command Default	This command	ransfers files only from the common directory where the system writes troubleshooting files.
Command History	Release	Modification
	6.0.1	This command was introduced.
	Examples	
	This example sentinel acces	Insfers all files in the common directory to the /pub directory on the remote host d via user jdoe :

> file copy sentinel jdoe /pub *

Related Commands	Command	Description
	file list	List files in the common directory.
	file delete	Delete files from the common directory.
	file secure-copy	Transfer files in the common directory via SCP.

To erase files from the common directory, use the file delete command.

file delete *filename_1* [*filename_2* ... *filename_n*]

Syntax Description	filename_1 through filename_nSpecifies the names of the files to delete from the common directory. If m file names are specified, they must be separated with blanks. This argume supports wildcards.		
Command Default	This command operates only on files in the common directory where the system writes troubleshooting file.		
Command History	Release M	odification	

6.0.1	This command was introduced.	
-------	------------------------------	--

Examples

This example deletes a single file:

> file delete 10.83.170.31-43235986-2363-11e6-b278-aff0a43948fe-troubleshoot.tar.gz

Related Commands	Command	Description
	file list	List files in the common directory.
	file copy	Transfer files in the common directory via FTP.
	file secure-copy	Transfer files in the common directory via SCP.

I

file list

To list the files in the common directory, use the **file list** command.

file list [filename_1 . . . filename_n]

Syntax Description	filename_1 throug filename_n	gh Specifies the names of the files to list from the common directory. If multiple file names are specified, they must be separated with blanks. This argument supports wildcards.			
Command History	Release Modification				
	6.0.1	This command was introduced.			
Usage Guidelines	This command list file names are specified	ts only files in the common directory where the system writes troubleshooting files. If no cified, all files in the common directory are listed.			
	Examples				
	This example lists the contents of the common directory:				
	> file list May 26 17:46 Jun 27 20:36	137474048 /core_1464284811_rackham-sfr.cisco.com_diskmanager_11.21145 1464696832 /core_1467059810_rackham-sfr.cisco.com_lina_6.21293			

Related Commands	Command	Description
	file copy	Transfer files in the common directory via FTP.
	file delete	Delete files from the common directory.
	file secure-copy	Transfer files in the common directory via SCP.

file secure-copy

To transfer files from the common directory to a remote host via SCP, use the file secure-copy command.

file secure-copy *host_name user_id path filename_1* [*filename_2* . . . *filename_n*]

Syntax Description	host_name user_id path filename_1 through filename_n		Specifies the name or IP address of the target remote host. Specifies the user on the remote host.		
			Specifies the names of the files to transfer from the common directory. If multiple file names are specified, they must be separated with blanks. This argument supports wildcards.		
			Command Default	This command	transfers f
Command History	Release	Modi	fication		
	6.0.1 This command was introduced.				
	Examples				

Examples

This example transfers all files in the common directory to the **/tmp** directory on the remote host **101.123.31.1** accessed via user **jdoe**:

> file secure-copy 101.123.31.1 jdoe /tmp *

Related Commands	Command	Description
	file copy	Transfer files in the common directory via FTP.
	file delete	Delete files from the common directory.
	file list	List files in the common directory.

fsck

I

To perform a file system check and to repair corruptions, use the **fsck** command.

	fsck /n	fsck /noconfirm diskn:			
Syntax Description	diskn:	Specifies the flash memory drive, where <i>n</i> is the drive number.			
	/nocor	firm Specifies that the command runs without prompting. This keyword is required.			
Command History	Releas	e Modification			
	6.1	This command was introduced.			
Usage Guidelines	The fsck command checks and tries to repair corrupt file systems. Use this command before trying more permanent procedures.				
	If the FSCK utility fixes an instance of disk corruption (due to power failure or abnormal shutdown, for example), it creates recovery files named FSCKxxx.REC. These files can contain a fraction of a file or a whole file that was recovered while FSCK was running. In rare circumstances, you might need to inspect these files to recover data; generally, these files are not needed, and can be safely deleted.				
-	Note The FSCK utility runs automatically at startup, so you may see these recovery files even if you did not manual enter the fsck command.				
	Examples				
	The following example shows how to check the file system of the flash memory:				
	<pre>> fsck /noconfirm disk0:</pre>				
Related Commands	Comm	and Description			

ated Commands	Command	Description
	delete	Removes all user-visible files.
	erase	Deletes all files and formats the flash memory.
	format	Formats the file system.

help

To display help information for a specified command, use the help command.

	help {command ?}			
Syntax Description	?	Displays all commands for which help is available.		
	command	Specifies the command for which to display the CLI help.		
Command History	Release	Modification		
	6.1	This command was introduced.		

Usage Guidelines The **help** command displays help information about some commands. You can see help for an individual command by entering the **help** command followed by the command name. If you do not specify a command name and enter **?** instead, all commands for which there is help are listed.

You can also get help by entering ? after entering a partial command. This shows you the valid parameters at that location in the command string.

Examples

The following example shows how to display help for the **traceroute** command:

```
> help traceroute
USAGE:
        traceroute <destination> [source <src_address|src_intf>]
                   [numeric] [timeout <time>] [ttl <min-ttl> <max-ttl>]
                   [probe <probes>] [port <port-value>] [use-icmp]
DESCRIPTION:
traceroute
               Print the route packets take to a network host
SYNTAX:
destination
               Address or hostname of destination
src address
                Source address used in the outgoing probe packets
src intf
               Interface through which the destination is accessible
numeric
               Do not resolve addresses to hostnames
time
               The time in seconds to wait for a response to a probe
               Minimum time-to-live value used in probe packets
min-ttl
max-ttl
               Maximum time-to-live value used in probe packets
probes
               The number of probes to send for each TTL value
port-value
               Base UDP destination port used in probes
               Use ICMP probes instead of UDP probes
use-icmp
```

history

To display the command line history for the current session, use the history command.

	history limit			
Syntax Description	limit	The size of the history list in number of entries. To set the size to unlimited, that is, to see the full history, enter 0.		
Command History	Release Modification			
	6.1	This command was introduced.		
Usage Guidelines	You can also use the up arrow to scroll through past commands.			
	The history view includes sequence numbers for the order in which the commands were entered.			
	Examples			
	The following example shows the command history.			
	> history 0	environment		
	49 show network-static-routes			

- 50 show network
- 51 show running-config
- 52 show service-policy 53 show ntp
- 54 show cpu
- 55 show memory 56 history 0

>

local-base-url

(Optional) Configures the local base URL of the SAML service provider for VPN authentication. In a DNS load balancing cluster, when you configure SAML authentication on threat defenses, you can specify this URL to uniquely resolve to the device on which the configuration is applied.

To disable this feature, use the no form of this command

local base-url { url }
no local base-url

Syntax Description *url* Local base URL of the SAML service provider for VPN authentication.

Command Default None.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Parameters configuration	• Yes	• Yes	• Yes	• Yes	_

Command History	Release	Modification		
	7.4.0 This command was added.			
	7.2.4	This command was added.		
Usage Guidelines	You must use this command in conjunction with the base-url command. Versions 7.3.0 and 7.3.1 and v lower than 7.2.4 do not support this option.			
Examples	The following example sets up a local base-url:			

ciscoasa(config)# webvpn ciscoasa(config-webvpn)# saml idp https://idp.com/<app-specific> ciscoasa(config-webvpn-saml-idp)# base url https://ftd-dns-group.vpn.customer.com ciscoasa(config-webvpn-saml-idp)# local-base-url https://this-ftd.vpn.customer.com
logging savelog

To save the log buffer to flash memory, use the logging savelog command.

logging savelog [savefile]

Syntax Description		
	savefile	(Optional) The file name for the saved log. If you do not specify the file name, the system saves the log file using a default time-stamp format, as follows:
		LOG-YYYY-MM-DD-HHMMSS.TXT
		where <i>YYYY</i> is the year, <i>MM</i> is the month, <i>DD</i> is the day of the month, and <i>HHMMSS</i> is the time in hours, minutes, and seconds.
Command History	Release	Modification
	6.1	This command was introduced.
Usage Guidelines	Before you ca buffer never l than 2MB, the management	an save the log buffer to flash memory, you must enable logging to the buffer; otherwise, the log has data to be saved to flash memory. However, if the configured logging buffer size is more e internal log buffer will not be written to flash memory. Configure buffer logging using center (remote) or device manager (local).
	Note The logg	ging savelog command does not clear the buffer. To clear the buffer, use the clear logging buffer
	comman	d.

> logging savelog latest-logfile.txt
>

Related Commands	Command	Description
	clear logging buffer	Clears the log buffer of all syslog messages that it contains.
	сору	Copies a file from one location to another, including to a TFTP or FTP server.
	delete	Deletes a file from the disk partition, such as saved log files.

I

I

logout

To exit from the CLI, use the **logout** command.

logout

Command History	Release	Modification
	6.1	This command was introduced.

Usage Guidelines The **logout** command lets you log out of the device and end your CLI session. You can also use the **exit** command.

Examples

The following example shows how to log out of the device:

> logout

memory caller-address

d-r

To configure a specific range of program memory for the call tracing, or caller PC, to help isolate memory problems, use the **memory caller-address** command. The caller PC is the address of the program that called a memory allocation primitive. To remove an address range, use the no form of this command.

memory caller-address *startPC endPC* **no memory caller-address**

Syntax Description	endPC	Specifies the end address range of the memory block.
	startPC	Specifies the start address range of the memory block.
Command Default	The actual call	ler PC is recorded for memory tracing.
Command History	Release	Modification
	6.1	This command was introduced.

In certain cases the actual caller PC of the memory allocation primitive is a known library function that is used at many places in the program. To isolate individual places in the program, configure the start and end program address of the library function, thereby recording the program address of the caller of the library function.

Ì

Note The device might experience a temporary reduction in performance when caller-address tracing is enabled.

Examples

The following examples show the address ranges configured with the **memory caller-address** commands, and the resulting display of the **show memory caller-address** command:

```
> memory caller-address 0x00109d5c 0x00109e08
> memory caller-address 0x009b0ef0 0x009b0f14
> memory caller-address 0x00cf211c 0x00cf4464
> show memory caller-address
Move down stack frame for the addresses:
pc = 0x00109d5c-0x00109e08
pc = 0x009b0ef0-0x009b0f14
pc = 0x00cf211c-0x00cf4464
```

Related Commands	Command	Description
	memory profile enable	Enables the monitoring of memory usage (memory profiling).

Command	Description	
memory profile text	Configures a text range of memory to profile.	
show memory	Displays a summary of the maximum physical memory and current free memory available to the operating system.	
show memory binsize	Displays summary information about the chunks allocated for a specific bin size.	
show memory profile	Displays information about the memory usage (profiling) of the device.	
show memory caller-address	Displays the address ranges configured on the device.	

memory delayed-free-poisoner

Use the **memory delayed-free-poisoner** command to set parameters for the delayed free-memory poisoner tool. To enable the delayed free-memory poisoner tool, use the **memory delayed-free-poisoner enable** command. To disable the delayed free-memory poisoner tool, use the **no** form of this command. The delayed free-memory poisoner tool lets you monitor freed memory for changes after it has been released by an application.

memory delayed-free-poisoner {enable | desired-fragment-count *frag_count* | desired-fragment-size *frag-size* | threshold *heap_use_percent* | validate | watchdog-percent *watchdog_limit*} no memory delayed-free-poisoner enable

Syntax Description	enable	Start operation of the delayed free-memory poisoner tool.	
	desired-fragment-count frag_count	Set the number of memory fragments to keep in the poisoner's queue. Legal values range from 0 to 8192; the default is 16	
	desired-fragment-size frag-sizeSet the size in bytes of the contiguous free memory fragments to keep in the poisoner's queue. Legal values range from 0 to 268435456; the default is 102400.		
	threshold heap_use_percent	Set the percentage threshold of system memory use at which the system will release memory from the poisoner's queue, ranging from 0 to 100. The default is 100.	
	validate	Forces validation of all elements in the delayed-free-poisoner queue.	
	watchdog-percent watchdog_limit	Set the watchdog limit as a percentage of the watchdog threshold, which is 15 seconds. Values range from 10 to 100. The default is 50.	
Command Default	The memory delayed-free-poisoner enable command is disabled by default.		
	The default desired-fragment-count is 16.		
	The default desire-fragment-size is 102400.		
	The default watchdog-percent is 50.		
Command History	Release Modifica	tion	
	6.1 This con	nmand was introduced.	
Usage Guidelines	Enabling the delayed free-memory poisoner tool has a significant impact on memory usage and system performance. The command should be used only under the supervision of the Cisco Technical Assistance Center. It should not be run in a production environment during heavy system usage.		
	When you enable this tool, requests to free memory by the applications running on the device are written to a FIFO queue. As each request is written to the poisoner's queue, each associated byte of memory that is not required by lower-level memory management is "poisoned" by being written with the value 0xcc.		
	The freed memory requests remain in the queue until more memory is required by an application than is in the system free memory pool. When more memory is needed, the poisoner seeks at least		

desired-fragment-count memory buffers of **desired-fragment-size** bytes in its queue, pulls that memory from the queue, and validates it. You can tune the time it takes the poisoner to satisfy large memory requests by changing the values for **desired-fragment-size** and **desired-fragment-count**.

If the memory is unmodified, it is returned to the system free memory pool and the poisoner reissues the memory request from the application that made the initial request. The process repeats until enough memory for the requesting application is freed.

If the poisoned memory has been modified, then the system forces a crash and produces diagnostic output which can be used to determine the cause of the crash.

The delayed free poisoner includes a watchdog mechanism to prevent processes from excessive resource usage. The watchdog threshold is 15 seconds, and when a process executes continuously for that time without relinquishing the CPU, the poisoner forces a system crash.

You can tune the watchdog behavior by setting the watchdog limit, which indicates a percentage of the 15 second watchdog threshold; the default is 50%. Therefore when the delayed free poisoner is active, by default if a process executes continuously for 7.5 seconds without relinquishing the CPU, further memory allocation requests from that process fail until the process is rescheduled. You can tune this behavior by changing the value of the watchdog limit.

To guard against excessive memory fragmentation and reduce system CPU load, you can set a percentage **threshold** of free memory usage at which the poisoner automatically releases memory from its queue to the system memory pool. (By default, the poisoner does not release memory from its queue until system memory has been exhausted.)

The delayed free-memory poisoner tool periodically performs validation on all of the elements of the queue automatically. You can also start validation manually using the **memory delayed-free-poisoner validate** command. If an element contains unexpected values, then the system forces a crash and produces diagnostic output to determine the cause of the crash. If no unexpected values are encountered, the elements remain in the queue and are processed normally by the tool; the **memory delayed-free-poisoner validate** command does not cause the memory in the queue to be returned to the system memory pool.

The **no** form of the command causes all of the memory referenced by the requests in the queue to be returned to the free memory pool without validation and any statistical counters to be cleared.

Examples

The following example enables the delayed free-memory poisoner tool:

> memory delayed-free-poisoner enable

The following is sample output when the delayed free-memory poisoner tool detects illegal memory reuse:

42

d - r

The following table describes the significant portion of the output.

Table 1: Illegal Memory Usage Output Description

d - r

Field	Description
heap region	The address region and size of the region of memory available for use by the requesting application. This is not the same as the requested size, which may be smaller given the manner in which the system may parcel out memory at the time the memory request was made.
memory address	The location in memory where the fault was detected.
byte offset	The byte offset is relative to the beginning of the heap region and can be used to find the field that was modified if the result was used to hold a data structure starting at this address. A value of 0 or that is larger than the heap region byte count may indicate that the problem is an unexpected value in the lower level heap package.
allocated by/freed by	Instruction addresses where the last malloc/calloc/realloc and free calls where made involving this particular region of memory.
Dumping	A dump of one or two regions of memory, depending upon how close the detected fault was to the beginning of the region of heap memory. The next eight bytes after any system heap header is the memory used by this tool to hold a hash of various system header values plus the queue linkage. All other bytes in the region until any system heap trailer is encountered should be set to 0xcc.

Related Commands	Command	Description
	clear memory delayed-free-poisoner	Clears the delayed free-memory poisoner tool queue and statistics.
	show memory delayed-free-poisoner	Displays a summary of the delayed free-memory poisoner tool queue usage.

I

memory logging

To enable memory logging, use the **memory logging** command. To disable memory logging, use the **no** form of this command.

memory logging 1024-4194304 [wrap [size [1-2147483647] | process process-name] no memory logging

Syntax Description	1024-4194304	Specifies the number of logging entries in the memory logging buffer. This is the only required argument to specify.	
	process process-name	Specifies the process to monitor.	
		Note The Checkheaps process is completely ignored as a process because it uses the memory allocator in a non-standard way.	
	size 1-2147483647	Specifies the size and number of entries to monitor.	
	wrap	Save the buffer when it wraps. It can only be saved once. If it wraps multiple times, it can be overwritten. When the buffer wraps, a trigger is sent to the event manager to enable saving of the data.	
Command History	Release Mod	ification	
	6.1 This command was introduced.		
Usage Guidelines	To change memory loggi command to view the log	ng parameters, you must disable it, then reenable it. Use the show memory logging g.	
	Examples		
	The following example e	enables memory logging:	
	> memory logging 202980		

Related Commands	Command	Description
	show memory logging	Displays memory logging results.

memory profile enable

d - r

To enable the monitoring of memory usage (memory profiling), use the **memory profile enable** command. To disable memory profiling, use the **no** form of this command.

memory profile enable [peak peak_value]
no memory profile enable [peak peak_value]

Syntax Description	nonk naak walu	Specifies the memory usage threshold at which a spenchot of the memory usage
oynax besonption	peak peak_valu	is saved to the peak usage buffer. The contents of this buffer could be analyzed at a later time to determine the peak memory needs of the system.
Command Default	Memory profilin	g is disabled by default.
Command History	Release	Modification
	6.1	This command was introduced.
Usage Guidelines	Before enabling profile text com Some memory is output of the sho	memory profiling, you must first configure a memory text range to profile with the memory mand. The held by the profiling system until you enter the clear memory profile command. See the by memory profile status command
	Note The device	might experience a temporary reduction in performance when memory profiling is enabled.
	Examples The following ex	cample enables memory profiling:

> memory profile enable

Related Commands	Command	Description
	memory profile text	Configures a text range of memory to profile.
	show memory profile	Displays information about the memory usage (profiling) of the device.

memory profile text

To configure a program text range of memory to profile, use the **memory profile text** command. To disable, use the no form of this command.

d-r

memory profile text {*startPC endPC* | **all**} *resolution* **no memory profile text** {*startPC endPC* | **all**} *resolution*

Syntax Description	all	Specifies the entire text range of the memory block.
	endPC	Specifies the end text range of the memory block.
	resolution	You must set the resolution of tracing for the source text region, from 1-44582263.
	startPC	Specifies the start text range of the memory block.
Command History	Release	Modification
	6.1	This command was introduced.
Usage Guidelines For a small text range, a reso coarse resolution is probably regions in the next pass.		range, a resolution of "4" normally traces the call to an instruction. For a larger text range, a n is probably enough for the first pass and the range could be narrowed down to a set of smaller ext pass.
	After entering t memory profil	he text range with the memory profile text command, you must then enter the e enable command to begin memory profiling. Memory profiling is disabled by default.

```
Note
```

The device might experience a temporary reduction in performance when memory profiling is enabled.

Examples

The following example shows how to configure a text range of memory to profile, with a resolution of 100.

> memory profile text all 100

The following example displays the configuration of the text range and the status of memory profiling (OFF):

```
> show memory profile status
InUse profiling: OFF
Peak profiling: OFF
Memory used by profile buffers: 0 bytes
Profile:
0x00007efc3e0227a8-0x00007efc40aa1f8e(00000100)
```

I

Note To begin memory profiling, you must enter the **memory profile enable** command. Memory profiling is disabled by default.

Related Commands	Command	Description
	clear memory profile	Clears the buffers held by the memory profiling function.
	memory profile enable	Enables the monitoring of memory usage (memory profiling).
	show memory profile	Displays information about the memory usage (profiling) of the device.

memory tracking

To enable the tracking of heap memory request, use the **memory tracking** command. To disable memory tracking, use the **no** form of this command.

memory tracking {enable | allocates-by-threshold min_allocates | bytes-threshold min_bytes | filter-from-address-pool address} no memory tracking enable

Syntax Description	enable	Enable memory tracking.
	allocates-by-threshold min_allocates	Address pool entries for callers must make at least this many allocation calls to be included, from 0-4294967295.
	bytes-threshold <i>min_bytes</i>	Address pool entries for callers must consume at least this many bytes of memory to be included, from 0-4294967295.
	filter-from-address-pool address	Exclude address pool entries at this address. To determine an address, first enable tracking, then use show memory tracking address. Look for the "allocated by" address in the "memory tracking address pool" listing. For example, if you see the following:
		allocated by 0x00007efc3f80e508
		You can exclude it using:
		filter-from-address-pool 0x00007efc3f80e508

Command History	Release	Modification
	6.1	This command was introduced.

Examples

The following example enables tracking heap memory requests:

> memory tracking enable

Related Commands	Command	Description
	clear memory tracking	Clears all currently gathered information.
	show memory tracking	Shows memory tracking results.

more

To display the contents of a file, use the **more** command.

more [/ascii | /binary | /ebcdic | disk0: | disk1: | flash: | ftp: | http: | https: | tftp:]filename

Syntax Description	/ascii	(Optional) Displays a binary file in binary mode and an ASCII file in binary mode.
	/binary	(Optional) Displays any file in binary mode.
	/ebcdic	(Optional) Displays binary files in EBCDIC.
	disk0:	(Optional) Displays a file on the internal Flash memory.
	disk1:	(Optional) Displays a file on the external Flash memory card.
	filename	Specifies the name of the file to display.
	flash:	(Optional) Specifies the internal Flash memory, followed by a colon. In the ASA 5500 series adaptive security appliance, the flash keyword is aliased to disk0 .
	ftp:	(Optional) Displays a file on an FTP server.
	http:	(Optional) Displays a file on a website.
	https:	(Optional) Displays a file on a secure website.
	tftp:	(Optional) Displays a file on a TFTP server.
Command Default	ASCII mode.	
Command History	Release	Modification
Usage Guidelines	6.1	This command was introduced.
	The system support view-files command is a better option for finding and viewing log files.	
	Examples	
	The following e	xample shows how to display the contents of a local file named "test.cfg":

```
> more test.cfg

	system support view-files	Find and view the contents of log files.	

nslookup (deprecated)

To look up the IP address for a fully-qualified domain name, or the reverse, use the **nslookup** command.

nslookup { hos	stname ip_address }	
hostname	The fully-qualified domain name of a host whose IP address you are looking up. For example, www.example.com.	
ip_address	The IP address of a host whose fully-qualified domain name you are looking up.	
Release	Modification	
6.1	This command was introduced.	
6.6	This command no longer works and is deprecated.	
7.1	This command was removed and replaced by dig .	
	nslookup {ho. hostname ip_address Release 6.1 6.6 7.1	

Usage Guidelines

Some commands that allow fully-qualified domain names cannot use the DNS servers configured for the management interface to look up the IP address for the name. If you do not have DNS servers configured for commands that go through the data interfaces, use the **nslookup** command to determine the IP address, then use the IP address in the command.

The **nslookup** command is also useful in determining the fully-qualified domain name for a given IP address.

Examples

The following example looks up the IP address for www.cisco.com. The initial Server and Address information shows the DNS server (which could be a fully-qualified domain name), IP address, and port. (The addresses in this example are faked.) The following information shows the canonical (real) host name and IP address for the name you entered.

```
> nslookup www.cisco.com
Server: 10.102.6.247
Address: 10.102.6.247#53
www.cisco.com canonical name = origin-www.cisco.com.
Name: origin-www.cisco.com
Address: 173.37.145.84
```

The following example shows how to do a reverse lookup and determine a hostname for an IP address. The initial information is for the DNS server used. The mapped hostname is indicated by the **name** = field.

packet-tracer

To enable packet-tracing capabilities for troubleshooting by specifying the 5-tuple to test firewall rules, use the **packet-tracer** command. (For clarity, the syntax is shown separately for ICMP, TCP/UDP, and IP packet modeling. You can replay multiple packets and trace a complete workflow using the **pcap** keyword.)

packet-tracer input ifc_name icmp { sip | user username } type code [ident] { dip |
fqdn fqdn-string } [detailed] [xml]
packet-tracer input ifc_name { tcp | udp } { sip | user username } sport { dip |
fqdn fqdn-string } dport [detailed] [xml]
packet-tracer input ifc_name rawip { sip | user username } protocol { dip | fqdn
fqdn-string } [detailed] [xml]
packet-tracer input ifc_name pcap pcap_filename [bypass-checks | decrypted | detailed | persist |
transmit | xml | json | force]

Syntax Description	bypass-checks	(Optional) Bypasses the security checks for simulated packets.
	decrypted	(Optional) Considers simulated packet as IPsec/SSL VPN decrypted.
	code	The ICMP code for an ICMP packet trace.
	detailed	(Optional) Provides detailed trace results information.
	dip	The destination IPv4 or IPv6 address for the packet trace.
	dport	The destination port for a TCP/UDP/SCTP packet trace.
	fqdn fqdn-string	The fully qualified domain name of the host. Supports the FQDN for IPv4 only.
	force	Removes existing pcap trace and executes a new pcap file.
	icmp	Specifies the protocol to use is ICMP.
	ident	(Optional.) The ICMP identifier for an ICMP packet trace.
	inline-tag tag	The security group tag value being embedded in the Layer 2 CMD header. Valid values range from 0 - 65533.
	input <i>ifc_name</i>	The name of the source interface on which to trace the packets.
	json	(Optional) Displays the trace results in JSON format.
	рсар	Specifies pcap as input.
	pcap_filename	The pcap filename that contain the packet for tracing.
	protocol	The protocol number for raw IP packet tracing, 0-255.
	persist	(Optional) Enables tracing for a long term and also tracing in cluster.
	rawip	Specifies the protocol to use is raw IP.
	sip	The source IPv4 or IPv6 address for the packet trace.

	sport	The source port for a TCP/UDP/SCTP packet trace.	
	tcp	Specifies the protocol to use is TCP.	
	transmit	(Optional) Allows simulated packet to transmit from device.	
	type	The ICMP type for an ICMP packet trace.	
	udp	Specifies the protocol to use is UDP.	
	user username	The user identity in the format of domain/user if you want to specify the user as the source IP address. The most recently mapped address for the user (if any) is used in the trace.	
	xml	(Optional) Displays the trace results in XML format.	
Command History	Release	Modification	
	6.1 This command was introduced.		
	6.6 The output was enhanced to provide specific reasons for packet allow and drop while routing the packets.		
	7.1	The packet-tracer command is enhanced to allow a PCAP file as input for tracing.	
Usage Guidelines	In addition to capturing packets, it is possible to trace the lifespan of a packet through the threat defense device to see if it is behaving as expected. The packet-tracer command enables you to do the following:		
	Debug all packet drops in production network.		
	• Verify the configuration is working as intended.		
	• Show all rules applicable to a packet along with the CLI lines that caused the rule addition.		
	• Show a time line of packet changes in a data path.		
	• Inject tracer packets into the data path.		
	The packet-trace the threat defense packet-tracer con a packet was dropp due to bad ip head	The packet-tracer command provides detailed information about the packets and how they are processed by the threat defense device. If a command from the configuration did not cause the packet to drop, the packet-tracer command provides information about the cause in an easily readable format. For example if a packet was dropped because of an invalid header validation, the following message appears: "packet dropped due to bad ip header (reason)."	
	While the packet-tracer injects and traces a single packet, the pcap keyword enables the packet-tracer to replay multiple packets (maximum of 100 packets) and to trace an entire flow. You can provide the pcap file as input and obtain the results in XML or JSON format for further analysis. To clear the trace output, use the pcap trace sub command of clear packet-tracer . You cannot use the trace output while the trace is in progress.		

Examples

I

The following example shows how to run packet-tracer with a pcap file as input:

```
> packet-tracer input inside pcap http_get.pcap detailed xml
```

d-r

The following example shows how to run packet-tracer by clearing existing pcap trace buffer and giving a pcap file as input:

> packet-tracer input inside pcap http_get.pcap force

The following example traces a ICMP packet from the inside interface. The result indicates that the packet will be dropped for the reverse-path verification failure (RPF). The reason for the failure could be that the traffic entered the outside interface from an address that is known to the routing table, but is associated with the inside interface, then the device drops the packet. Similarly, if traffic enters the inside interface from an unknown source address, the device drops the packet because the matching route (the default route) indicates the outside interface.

```
> packet-tracer input inside icmp 10.15.200.2 8 0$
```

```

Related Commands	Command	Description
	capture	Captures packet information, including trace packets.
	show capture	Displays the capture configuration when no options are specified.
	show packet-tracer	Displays the trace buffer output of the most recently run packet-tracer on a PCAP file.

perfmon

To display performance information at the console, use the **perfmon** command.

perfmon { verbose interval seconds settings }			
verbose	Displays performance monitor information at the console. The default is to not display information, which is shown as "quiet" in the perfmon settings.		
	You must be in the Diagnostic CLI to turn off perfmon verbose .		
interval seco	<i>nds</i> Specifies the number of seconds before the performance display is refreshed on the console.		
settings	Displays the interval and whether perfmon is quiet or verbose.		
The default in	terval is 120 seconds.		
Release	Modification		
6.1	This command was introduced.		
The perfmon command allows you to monitor the performance of the device. Use the show perfmon command to display the information immediately.			
Use the perfmon verbose command to display the information on the console each interval.			
The information appears automatically only if you are actually connected to the CLI on the Console port, or if you are in the Diagnostic CLI (system support diagnostic-cli). If you are in the CLI on a different port, including the management interface, use the show console-output command to see the automatically-generated information. Alternatively, do not use this command, and simply use the show perfmon command directly.			
We recommend you use this command in the Diagnostic CLI only.			
Note You cann in the Dia	ot turn off verbose from the regular CLI. Instead, you must turn it off from Privileged EXEC mode agnostic CLI. See the examples section.		
	perfmon { ver verbose interval seco settings The default in Release 6.1 The perfmon of to display the Use the perfmon of to display the Use the perfmon of the information of the information. A We recomment Note You canne in the Dia		

Examples

This example shows how to display the performance monitor statistics every 120 seconds on the console. In the output, the "Fixup" statistics refer to the related protocol inspection engine.

```
> perfmon verbose
> perfmon settings
interval: 120 (seconds)
verbose
> show console-output
...

quiet
firepower# <Press Ctrl+a, d>
Console connection detached.
> perfmon settings
interval: 120 (seconds)

```
quiet
```

Related Commands	Command	Description
	show perfmon	Displays performance information.

pigtail commands

Only use **pigtail** commands under the direction of the Cisco Technical Assistance Center.

If you want to view logs as they are written, use the tail-logs command instead of pigtail.

Caution

Do not leave the pigtail process running as it can cause high disk usage. This process may also interfere with policy deployment if it is running during deployment. For information on how to stop the pigtail process, contact the Cisco Technical Assistance Center.

ping

To test connectivity from a specified interface to an IP address, use the **ping** command. The parameters available differ for regular ICMP-based ping, TCP ping, and a "system" ping. Also, system pings are from the management interface, whereas the other types of ping go through the data interfaces. Be sure to use the correct type of ping for your tests.

ping [interface if_name | vrf name] host [repeat count] [timeout seconds] [data pattern]
[size bytes] [validate]
ping tcp [interface if_name | vrf name] host port [repeat count] [timeout seconds] [source
host port]
ping system host

Syntax Description	data pattern	(Optional, ICMP only.) Specifies the 16-bit data pattern in hexadecimal format, from 0 to FFFF. The default is 0xabcd.
	host	Specifies the IPv4 address or name of the host to ping. For ICMP pings, you can also specify an IPv6 address. IPv6 is not supported for TCP or system pings.
		Whether a ping can use a fully-qualified domain name, such as www.example.com, depends on the availability of a DNS server to resolve the name. The system pings use the DNS servers for the management interface, but other types of ping do not use the management DNS servers. You must configure DNS for the data interfaces for non-system hostname pings to work.
		If ping cannot resolve a hostname, use nslookup to determine the IP address associated with the name, and then ping the IP address.
	interface if_name	(Optional) For ICMP, this is the name of the interface through which the host is accessible. If not supplied, then the host is resolved to an IP address and the routing table is consulted to determine the destination interface. For TCP, this is the input interface through which the source sends SYN packets.
		If you specify the interface keyword when virtual routing and forwarding (VRF) is enabled, the ping uses the virtual routing table for the specified interface.
	port	(TCP only.) Specifies the TCP port number for the host you are pinging, 1-65535.
	repeat count	(Optional) Specifies the number of times to repeat the ping request. The default is 5.
	size bytes	(Optional, ICMP only.) Specifies the datagram size in bytes. The default is 100.
	source host port	(Optional, TCP only.) Specifies a certain IP address and port to send the ping from (Use port = 0 for a random port).
	system	Ping the host through the management interface. Unlike pings through the data interfaces, there is no default count for system pings. The ping continues until you stop it using Ctrl+c.

Release	Modification
	If you specify the interface keyword when virtual routing and forwarding (VRF) is enabled, the ping uses the virtual routing table for the specified interface.
vrf name	(Optional.) If you enable virtual routing and forwarding (VRF), also known as virtual routers, you can choose which virtual routing table to use by specifying the name of the virtual router. This keyword is exclusive with the interface keyword.
validate	(Optional, ICMP only.) Validates reply data.
timeout seconds	(Optional) Specifies the number of seconds of the timeout interval. The default is 2 seconds.
tcp	(Optional) Tests a connection over TCP (the default is ICMP). A TCP ping sends SYN packets and considers the ping successful if the destination sends a SYN-ACK packet. You can also have at most 2 concurrent TCP pings running at a time.

Command History	Release	Modification
	6.1	This command was introduced.
	6.6	The vrf keyword was added.

Usage Guidelines The **ping** command allows you to determine if the device has connectivity or if a host is available on the network.

When using regular ICMP-based ping, ensure that you do not have ICMP rules that prohibit these packets (if you do not use ICMP rules, all ICMP traffic is allowed).

When using TCP ping, you must ensure that access policies allow TCP traffic on the ports you specify.

This configuration is required to allow the device to respond and accept messages generated from the **ping** command. The **ping** command output shows if the response was received. If a host is not responding after you enter the **ping** command, a message similar to the following appears:

```
> ping 10.1.1.1
Sending 5, 100-byte ICMP Echos to 10.1.1.1, timeout is 2 seconds:
?????
Success rate is 0 percent (0/5)
```

Use the **show interface** command to ensure that the device is connected to the network and is passing traffic. The address of the specified interface name is used as the source address of the ping.

Examples

The following example shows how to determine if an IP address is accessible through a data interface. Because no interface is specified, the routing table is used to determine how to get to the address.

```
> ping 171.69.38.1
Sending 5, 100-byte ICMP Echos to 171.69.38.1, timeout is 2 seconds:
!!!!!
```

d - r

Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/10 ms

The following examples use TCP ping to determine if a host is accessible through a data interface.

```
> ping tcp 10.0.0.1 21
Type escape sequence to abort.
No source specified. Pinging from identity interface.
Sending 5 TCP SYN requests to 10.0.0.1 port 21
from 10.0.0.10, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms
> ping tcp 10.0.0.1 21 source 192.168.1.1 2002 repeat 10
Type escape sequence to abort.
Sending 10 TCP SYN requests to 10.0.0.1 port 21
from 192.168.1.1 starting port 2002, timeout is 2 seconds:
!!!!!!
Success rate is 100 percent (10/10), round-trip min/avg/max = 1/2/2 ms
```

The following example does a system ping to determine if www.cisco.com is accessible through the management interface. You must use Ctrl+c to stop the ping (indicated by ^C in the output).

```
> ping system www.cisco.com
```

```
PING origin-www.cisco.COM (72.163.4.161) 56(84) bytes of data.
64 bytes from wwwl.cisco.com (72.163.4.161): icmp_seq=1 ttl=242 time=10.6 ms
64 bytes from wwwl.cisco.com (72.163.4.161): icmp_seq=2 ttl=242 time=8.13 ms
64 bytes from wwwl.cisco.com (72.163.4.161): icmp_seq=3 ttl=242 time=8.51 ms
64 bytes from wwwl.cisco.com (72.163.4.161): icmp_seq=4 ttl=242 time=8.40 ms
^c
---- origin-www.cisco.COM ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 3003ms
rtt min/avg/max/mdev = 8.139/8.927/10.650/1.003 ms
>
```

The following example pings an address using the routing table of the virtual router named red.

```
> ping vrf red 2002::2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 2002::2, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/4/20 ms
```

Related Commands	Command	Description
	nslookup	Perform a DNS lookup for a hostname or IP address.

redundant-interface

To set which member interface of a redundant interface is active, use the redundant-interface command.

redundant-interface redundant number active-member physical_interface

Syntax Description	active-member physical_interface	Sets the active member. Use the show interface command to see available physical interface names, such as GigabitEthernet0/0. Both member interfaces must be the same physical type.		
	redundant number	Specifies the redundant interface ID, such as redundant 1 . Numbers are 1-8.		
Command Default	By default, the active	e interface is the first member interface listed in the configuration, if it is available.		
Command History Release Modification		Modification		
	6.1	This command was introduced.		
Usage Guidelines	Create redundant interfaces in the device manager. When you create the redundant interface, you specify which is primary. Use this command to change which interface is active during run time.			
	To view which interface is active, enter the following command:			
	show interface redundant number detail grep Member			
	For example:			
	<pre>> show interface redundant1 detail grep Member Members GigabitEthernet0/3(Active), GigabitEthernet0/2</pre>			
	Examples			
	The following example changes the active interface for the redundant1 interface.			
	> show interface redundant1 detail grep Member Members GigabitEthernet0/3(Active), GigabitEthernet0/2			
	> redundant-interface redundant 1 active-member gigabitethernet0/2			

Related Commands	Command	Description
	clear interface	Clears counters for the show interface command.
	show interface	Displays the runtime status and statistics of interfaces.

restore

To restore configuration backed up locally from a Secure Firewall Threat Defense device being managed by a Secure Firewall Management Center, use the **restore** command. To restore a backup saved to a remote location, specify additional parameters for location of the backup file and username.

restore remote-manager-backup [backup tar-file | **location** [scp-hostname username filepath backup tar-file]]

Syntax Description	remote-manager-backup backup tar-file remote-manager-backup location scp-hostname username filepath backup tar-file		 <i>e</i> Restore a local backup created by the Secure Firewall Management Center. The local backup file is saved on the Secure Firewall Threat Defense device. Restore a remote backup created by the Secure Firewall Management Center. The remote backup is saved at a user-configured location, accessible by an SCP server and identified by the hostname, username and file path. 			
Command History	Release	Modification				
	6.3	This command was in	troduced.			
Usage Guidelines	The restore command restores the Secure Firewall Threat Defense system files, Snort DB tables and the LINA running configuration on the new/ replacement Secure Firewall Threat Defense. The restore command also ensures that the existing LINA running configuration on the Secure Firewall Threat Defense device is deleted before the actual restore operation proceeds. This ensures that the Secure Firewall Threat Defense device carries only the configurations present at the time the backup was taken. All device configurations except the serial number of the replacement device, will be replaced after a successful restore operation.					
	The restore operation ensures that the connection between the replacement /new Secure Firewall Threat Defense device and the original Secure Firewall Management Center is re-established using the universally unique identifier (UUID), assigned to the original device. After successful restore, the Secure Firewall Management Center marks all the policies of the device as out-of-date so that any configuration changes on the Secure Firewall Management Center that may affect the replacement Secure Firewall Threat Defense are deployed to it, when the device replacement procedure is complete. This ensures that the new Secure Firewall Threat Defense and Secure Firewall Management Centerconfigurations are in sync.					
	Examples					
	The following example shows a restore operation from a local backup file:					
	<pre>> restore remote-manager-backup 10.10.1.168_PRIMARY_20180614055906.tar</pre>					
	The following example shows a restore operation from a remote backup file:					
	>restore rem 10.10.1.168_	ote-manager-backup loca PRIMARY_20180614055906.1	cion 10.106.140.100 admin /Volume/home/admin tar			

restore
