

Security Certifications Compliance

- Security Certifications Compliance, on page 1
- Generate the SSH Host Key, on page 2
- Configure IPSec Secure Channel, on page 3
- Configure Static CRL for a Trustpoint, on page 9
- About the Certificate Revocation List Check, on page 9
- Configure CRL Periodic Download, on page 14
- Set the LDAP Key Ring Certificate, on page 15
- Enable Client Certificate Authentication, on page 16

Security Certifications Compliance

United States federal government agencies are sometimes required to use only equipment and software complying with security standards established by the U.S. Department of Defense and global certification organizations. The Firepower 4100/9300 chassis supports compliance with several of these security certification standards.

See the following topics for steps to enable features that support compliance with these standards:

- Enable FIPS Mode
- Enable Common Criteria Mode
- Configure IPSec Secure Channel, on page 3
- Configure Static CRL for a Trustpoint, on page 9
- About the Certificate Revocation List Check, on page 9
- Configure CRL Periodic Download, on page 14
- Setting the Date and Time Using NTP
- Set the LDAP Key Ring Certificate, on page 15
- Configure the IP Access List
- Enable Client Certificate Authentication, on page 16
- Configure Minimum Password Length Check

• Set the Maximum Number of Login Attempts

Note

Note that these topics discuss enabling certifications compliance on the Firepower 4100/9300 chassis only. Enabling certification compliance on the Firepower 4100/9300 chassis does not automatically propagate compliance to any of its attached logical devices.

Generate the SSH Host Key

Prior to FXOS release 2.0.1, the existing SSH host key created during initial setup of a device was hard-coded to 1024 bits. To comply with FIPS and Common Criteria certification, you must destroy this old host key and generate a new one. See Enable FIPS Mode or Enable Common Criteria Mode for more information.

Perform these steps to destroy the old SSH host key and generate a new certifications-compliant one.

Procedure

Step 1	From the FXOS CLI, enter services mode:
	scope system
	scope services
Step 2	Delete the SSH host key:
	delete ssh-server host-key
Step 3	Commit the configuration:
	commit-buffer
Step 4	Set the SSH host key size to 2048 bits:
	set ssh-server host-key rsa 2048
Step 5	Commit the configuration:
	commit-buffer
Step 6	Create a new SSH host key:
	create ssh-server host-key
	commit-buffer
Step 7	Confirm the new host key size:
	show ssh-server host-key
	Host Key Size: 2048

Configure IPSec Secure Channel

IPSec is a framework of open standards developed by the Internet Engineering Task Force (IETF). It creates secure, authenticated, and reliable communication over IP networks. The IPSec security service provides:

- Connectionless Integrity Assurance the received traffic has not been modified.
- Data origin authentication Assurance the traffic is sent by legitimate party.
- Confidentiality (encryption) Assurance the user's traffic is not examined by non-authorized parties.
- Access control Prevention of unauthorized use of a resource.

Note IPSec connections can only be initiated from FXOS. FXOS does not accept incoming IPSec connection requests.

IPsec tunnels are sets of SAs that FXOS establishes between peers. The SAs specify the protocols and algorithms to apply to sensitive data and also specify the keying material that the peers use. IPsec SAs control the actual transmission of user traffic. SAs are unidirectional, but are generally established in pairs (inbound and outbound).

IPSec on Chassis Manager has two modes:

Transport Mode

IP Header, IPSec Header, TCP Header, Data

Tunnel Mode

New IP Header, IPSec Header, Original IP Header, TCP Header, Data

IPSec's operation can be broken down into five main steps:

- Traffic Selection Interesting traffic which matches IPSec policy starts the IKE process. For example, traffic can be selected using src/dst host IP or subnet. Alternatively, user also can trigger IKE process through admin command.
- 2. IKE Phase 1 authenticate IPSec peers and to setup a secure channel to enable IKE exchanges
- **3.** IKE phase 2 negotiate SAs to set up the IPSec tunnel. SA stands for Security Association, it is a relationship between IPSec end-points that describe what security services are used to protect data traffic.
- 4. Data transfer Data packets are encrypted and encapsulated in IPSec header using parameters and keys stored in the SA
- 5. IPSec tunnel termination IPSec SAs terminate through deletion or by timing out.

You can configure IPSec on your Firepower 4100/9300 chassis to provide end-to-end data encryption and authentication service on data packets going through the public network. This option is one of a number offered for achieving Common Criteria certification compliance on your system. For more information, see Security Certifications Compliance, on page 1.

Note

- If you are using an IPSec secure channel in FIPS mode, the IPSec peer must support RFC 7427.
 - If you elect to configure enforcement of matching cryptographic key strength between IKE and SA connections (set sa-strength-enforcement to yes in the below procedure):

If SA enforcement is enabled	then when IKE negotiated key size is less then ESP negotiated key size, the connection fails.	
	then when IKE negotiated key size is large or equal than ESP negotiated key size, SA enforcement check passes and the connection is successful.	
If SA enforcement is disabled	then SA enforcement check passes and the connection is successful.	

Perform these steps to configure an IPSec secure channel.

Procedure

From the FXOS CLI, enter security mode:
scope security
Create the keyring:
enter keyring ssp
! create certreq subject-name subject-name ip ip
Enter the associated certificate request information:
enter certreq
Set the country:
set country country
Set the DNS:
set dns dns
Set the email:
set e-mail email
Set the IP information:
set ip <i>ip-address</i>
set ipv6 ipv6
Set the locality:
set locality locality

Step 9	Set the organization name:
	set org-name org-name
Step 10	Set the organization unit name:
	set org-unit-name org-unit-name
Step 11	Set the password:
	! set password
Step 12	Set the state:
	set state state
Step 13	Set the subject name for the certreq:
	set subject-name subject-name
Step 14	Exit:
	exit
Step 15	Set the modulus:
	set modulus modulus
Step 16	Set the regeneration for the certificate request:
	<pre>set regenerate { yes no }</pre>
Step 17	Set the trustpoint:
	set trustpoint interca
Step 18	Exit:
	exit
Step 19	Enter the newly created trustpoint:
	enter trustpoint interca
Step 20	Generate certificate signing request:
	set certchain
	Example:
	BEGIN CERTIFICATE MILF3TCC 48Wg AwlB4 glB4 DANBgkabkiG9w0B4 OsF4 DBwM0

Step 21 Show the certificate signing request:

show certreq

Example:

Firepower-chassis# /security/keyring # show certreq Certificate request subject name: SSP Certificate request ip address: 192.168.0.111 Certificate request FI A ip address: 0.0.0.0 Certificate request FI B ip address: 0.0.0.0 Certificate request e-mail name: Certificate request ipv6 address: :: Certificate request FI A ipv6 address: :: Certificate request FI B ipv6 address: :: Certificate request country name: US State, province or county (full name): CA Locality name (eg, city): SJC Organisation name (eg, company): Cisco Organisational Unit Name (eg, section): Sec DNS name (subject alternative name): Request: -----BEGIN CERTIFICATE REQUEST-----MIICwTCCAakCAQAwVTELMAkGA1UEBhMCVVMxCzAJBgNVBAgMAkNBMQwwCgYDVQQHDANTSkMxDjAMBgNVBAoMBUNpc2NvMQ0wCwYDVQQLDARTVEJVMQwwCgYDVQQDDANT U1AwggEiMA0GCSqGSIb3DQEBAQUAA4IBDwAwggEKAoIBAQDq292Rq3t0laoxPbfE p/ITKr6rxFhPqSSbtm6sXer//VZFiDTWODockDItuf4Kja215mIS0RyvEYVeRgAs wbN459wm0BASd8xCjIhsuHDV7yHu539BnvRW6Q2o+gHeSRwckqjClK/tsIxsPkV0 6OduZYXk2bnsLWs6tNk3uzOIT2Q0FcZ1ET66C8fyyKWTrmvcZjDjkMm2nDFsPlX9 39TYPItDkJE3PocqyaCqmT4uobOuvQeLJh/efkBvwhb4BF8vwzRpHWTdjjU5YnR1 qiR4q7j1RmzVFxCDY3IVP/KDBoa5NyCLEUZECP5QCQFDzIRETZwVOKtxUVG0Nljd K5TxAgMBAAGgJzAlBgkqhkiG9w0BCQ4xGDAWMBQGA1UdEQQNMAuCA1NTUIcEwKgA rjANBgkqhkiG9w0BAQsFAAOCAQEARtRBoInxXkBYNIVeEoFCqKttu3+Hc7UdyoRM 2L2pjx5OHbQICC+8NRVRMYujTnp67BWuUZZl03dGP4/lbN6bC9P3CvkZdKUsJkN0 m1Ye9dgz7MO/KEcosarmoMI9WB8LlweVdt6ycSdJzs9shOxwT6TAZPwL7gq/1ShF RJh6sq5W9p6E0SjYefK62E7MatRjDjS8DXoxj6gfn9DqK15iVpkK2QqT5rneSGj+ R+20TcUnT0h/S5K/bySEM/3U1gFxQCOzbzPuHkj28kXAVczmTxXEkJBFLVduWNo6 DT3u0xImiPR1sqW1jpMwbhC+ZGDtvgKjKHToagup9+8R9IMcBQ== -----END CERTIFICATE REQUEST-----

Step 22 Enter IPSec mode:

scope ipsec

Step 23 Set the log verbose level:

set log-level log_level

- Step 24Create and enter an IPSec connection:
enter connection connection name
- Step 25
 Set IPSec mode to tunnel or transport:

 set mode tunnel_or_transport
- Step 26
 Set the local IP address:

 set local-addr ip_address

set remote-addr ip_address Step 28 If using tunnel mode, set the remote subnet: set remote-subnet ip/mask Step 29 (Optional) Set the remote identity: set remote-ike-ident remote_identity_name Step 30 Set the keyring name: set keyring-name name Step 31 (Optional) Set the keyring password: set keyring-passwd passphrase Step 32 (Optional) Set the keyring password: set keyring-passwd passphrase Step 32 (Optional) Set the IKE-SA lifetime in minutes: set ike-rekey-time minutes The minutes value can be any integer between 60-1440, inclusive. Step 33 (Optional) Set the Child SA lifetime in minutes (30-480): set esp-rekey-time minutes The minutes value can be any integer between 30-480, inclusive. Step 34 (Optional) Set the child SA lifetime in minutes (30-480): set esp-rekey-time minutes The minutes value can be any integer between 1-5, inclusive. Step 35 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy (relaxed / strict / Step 30 Step 35 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsee: create authority trustpoint_name	Step 27	Set the remote IP address:
set remote-submet ip/mask Step 29 (Optional) Set the remote identity: set remote-ike-ident remote_identity_name Step 30 Set the keyring name: set keyring-name name Step 31 (Optional) Set the keyring password: set keyring-passwd passphrase Step 32 (Optional) Set the IKE-SA lifetime in minutes: set ike-rekey-time minutes Step 32 (Optional) Set the IKE-SA lifetime in minutes: set ike-rekey-time minutes Step 33 (Optional) Set the IKE-SA lifetime in minutes (30-480): set esp-rekey-time minutes Step 33 (Optional) Set the Child SA lifetime in minutes (30-480): set esp-rekey-time minutes The minutes value can be any integer between 30-480, inclusive. Step 34 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy (relaxed / strict / Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-coms The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name		set remote-addr ip_address
Step 29 (Optional) Set the remote identity: set remote-ike-ident remote_identity_name Step 30 Set the keyring name: set keyring-name name Step 31 (Optional) Set the keyring password: set keyring-passwd passphrase Step 32 (Optional) Set the IKE-SA lifetime in minutes: set ike-rekey-time minutes The minutes value can be any integer between 60-1440, inclusive. Step 33 (Optional) Set the Child SA lifetime in minutes (30-480): set esp-rekey-time minutes The minutes value can be any integer between 30-480, inclusive. Step 33 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy / relaxed / strict / Step 35 Reload connections: reload-coms The system stops all connections and then reloads them. All connections will try to re-establish. Step 39 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:	Step 28	If using tunnel mode, set the remote subnet:
set remote-ike-ident remote_identity_name Step 30 Set the keyring name: set keyring-name name Step 31 (Optional) Set the keyring password: set keyring-passwd passphrase Step 32 (Optional) Set the IKE-SA lifetime in minutes: set ike-rekey-time minutes The minutes value can be any integer between 60-1440, inclusive. Step 33 (Optional) Set the Child SA lifetime in minutes (30-480): set esp-rekey-time minutes The minutes value can be any integer between 30-480, inclusive. Step 33 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 34 (Optional) Enable or disable the certificate revocation list check: set revoke-policy { relaxed strict } Step 35 (Optional) Enable or disable the certificate revocation list check: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 39 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Configure the enforcem		set remote-subnet <i>ip/mask</i>
Step 30 Set the keyring name: set keyring-name name Step 31 (Optional) Set the keyring password: set keyring-passwd passphrase Step 32 (Optional) Set the IKE-SA lifetime in minutes: set ike-rekey-time minutes The minutes value can be any integer between 60-1440, inclusive. Step 33 (Optional) Set the Child SA lifetime in minutes (30-480): set esp-rekey-time minutes The minutes value can be any integer between 30-480, inclusive. Step 34 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy { relaxed / strict } Step 35 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:	Step 29	(Optional) Set the remote identity:
Step 31 (Optional) Set the keyring password: set keyring-passwd passphrase Step 32 (Optional) Set the IKE-SA lifetime in minutes: set ike-rekey-time minutes The minutes value can be any integer between 60-1440, inclusive. Step 33 (Optional) Set the Child SA lifetime in minutes (30-480): set esp-rekey-time minutes The minutes value can be any integer between 30-480, inclusive. Step 34 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy [relaxed] strict] Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:		set remote-ike-ident remote_identity_name
Step 31 (Optional) Set the keyring password: set keyring-passwd passphrase Step 32 (Optional) Set the IKE-SA lifetime in minutes: set ike-rekey-time minutes The minutes value can be any integer between 60-1440, inclusive. Step 33 (Optional) Set the Child SA lifetime in minutes (30-480): set esp-rekey-time minutes The minutes value can be any integer between 30-480, inclusive. Step 34 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy { relaxed / strict } Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:	Step 30	Set the keyring name:
set keyring-passwd passphrase Step 32 (Optional) Set the IKE-SA lifetime in minutes: set ike-rekey-time minutes The minutes value can be any integer between 60-1440, inclusive. Step 33 (Optional) Set the Child SA lifetime in minutes (30-480): set esp-rekey-time minutes The minutes value can be any integer between 30-480, inclusive. Step 34 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy { relaxed strict } Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections		set keyring-name name
Step 32 (Optional) Set the IKE-SA lifetime in minutes: set ike-rekey-time minutes The minutes value can be any integer between 60-1440, inclusive. Step 33 (Optional) Set the Child SA lifetime in minutes (30-480): set esp-rekey-time minutes The minutes value can be any integer between 30-480, inclusive. Step 33 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 34 (Optional) Enable or disable the certificate revocation list check: set revoke-policy { relaxed / strict } Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:	Step 31	(Optional) Set the keyring password:
set ike-rekey-time minutes The minutes value can be any integer between 60-1440, inclusive. Step 33 (Optional) Set the Child SA lifetime in minutes (30-480): set esp-rekey-time minutes The minutes value can be any integer between 30-480, inclusive. Step 34 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy / relaxed / strict / Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:		set keyring-passwd passphrase
Step 33 (Optional) Set the Child SA lifetime in minutes (30-480): set esp-rekey-time minutes The minutes value can be any integer between 30-480, inclusive. Step 34 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy { relaxed / strict } Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-coms The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:	Step 32	(Optional) Set the IKE-SA lifetime in minutes:
Step 33 (Optional) Set the Child SA lifetime in minutes (30-480): set esp-rekey-time minutes The minutes value can be any integer between 30-480, inclusive. Step 34 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy { relaxed / strict } Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:		set ike-rekey-time minutes
set esp-rekey-time minutes The minutes value can be any integer between 30-480, inclusive. Step 34 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy { relaxed strict } Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:		The minutes value can be any integer between 60-1440, inclusive.
Step 34 The minutes value can be any integer between 30-480, inclusive. Step 34 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy { relaxed / strict } Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:	Step 33	(Optional) Set the Child SA lifetime in minutes (30-480):
Step 34 (Optional) Set the number of retransmission sequences to perform during initial connect: set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy { relaxed / strict } Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:		set esp-rekey-time minutes
set keyringtries retry_number The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy { relaxed / strict } Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:		The minutes value can be any integer between 30-480, inclusive.
The retry_number value can be any integer between 1-5, inclusive. Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy { relaxed strict } Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:	Step 34	(Optional) Set the number of retransmission sequences to perform during initial connect:
Step 35 (Optional) Enable or disable the certificate revocation list check: set revoke-policy { relaxed strict } Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:		set keyringtries retry_number
Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:		The <i>retry_number</i> value can be any integer between 1-5, inclusive.
Step 36 Enable the connection: set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:	Step 35	(Optional) Enable or disable the certificate revocation list check:
set admin-state enable Step 37 Reload connections: reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:		<pre>set revoke-policy { relaxed strict }</pre>
Step 37Reload connections: reload-connsreload-connsThe system stops all connections and then reloads them. All connections will try to re-establish.Step 38(Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_nameStep 39Configure the enforcement of matching cryptographic key strength between IKE and SA connections:	Step 36	Enable the connection:
reload-conns The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:		set admin-state enable
Step 38 The system stops all connections and then reloads them. All connections will try to re-establish. Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:	Step 37	Reload connections:
Step 38 (Optional) Add the existing trustpoint name to IPsec: create authority trustpoint_name Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:		reload-conns
create authority <i>trustpoint_name</i>Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:		The system stops all connections and then reloads them. All connections will try to re-establish.
Step 39 Configure the enforcement of matching cryptographic key strength between IKE and SA connections:	Step 38	(Optional) Add the existing trustpoint name to IPsec:
		create authority trustpoint_name
<pre>set sa-strength-enforcement yes_or_no</pre>	Step 39	Configure the enforcement of matching cryptographic key strength between IKE and SA connections:
		set sa-strength-enforcement yes_or_no

Configure Static CRL for a Trustpoint

Revoked certifications are kept in the Certification Revocation List (CRL). Client applications use the CRL to check the authentication of a server. Server applications utilize the CRL to grant or deny access requests from client applications which are no longer trusted.

You can configure your Firepower 4100/9300 chassis to validate peer certificates using Certification Revocation List (CRL) information. This option is one of a number offered for achieving Common Criteria certification compliance on your system. For more information, see Security Certifications Compliance, on page 1.

Perform these steps to validate peer certificates using CRL information.

Procedure

Step 1	From th	ne FXOS CLI, enter security mode:
	scope s	ecurity
Step 2	Enter ti	ustpoint mode:
	scope t	rustpoint trustname
Step 3	Enter re	evoke mode:
	scope r	evoke
Step 4	Downlo	bad the CRL file(s):
	import	crl protocol://user_id@CA_or_CRL_issuer_IP/tmp/DoDCA1CRL1.crl
	Note	DER format static CRL is not supported in FXOS. You must convert the DER format CRL file to PEM format using the following command:
		openssl crl -in filename.crl -inform DER -outform PEM -out crl.pem
Step 5	(Optior	al) Show the status of the import process of CRL information:
	show in	nport-task detail
Step 6	Set the	certificate revocation method to CRL-only:
	set cert	revokemethod {crl}

About the Certificate Revocation List Check

You can configure your Certificate Revocation List (CRL) check mode to be either strict or relaxed in IPSec, HTTPS, and secure LDAP connections.

FXOS harvests dynamic (non-static) CRL information from the CDP information of an X.509 certificate, which indicates dynamic CRL information. System administration downloads static CRL information manually, which indicates local CRL information in the FXOS system. FXOS processes dynamic CRL information

against the current processing certificate in the certificate chain. The static CRL is applied to the whole peer certificate chain.

For steps to enable or disable certificate revocation checks for your secure IPSec, LDAP, and HTTPS connections, see Configure IPSec Secure Channel, Creating an LDAP Provider and Configuring HTTPS.

Note

- If the Certificate Revocation Check Mode is set to Strict, static CRL is only applicable when the peer certificate chain has a level of 1 or higher. (For example, when the peer certificate chain contains only the root CA certificate and the peer certificate signed by the root CA.)
- When configuring static CRL for IPSec, the Authority Key Identifier (authkey) field must be present in the imported CRL file. Otherwise, IPSec considers it invalid.
- Static CRL takes precedence over Dynamic CRL from the same issuer. When FXOS validates the peer certificate, if a valid (determined) static CRL of the same issuer exists, FXOS ignores the CDP in the peer certificate.
- Strict CRL checking is enabled by default in the following scenarios:
 - Newly created secure LDAP provider connections, IPSec connections, or Client Certificate entries
 - Newly deployed FXOS chassis managers (deployed with an initial starting version of FXOS 2.3.1.x or later)

The following tables describe the connection results, depending on your certificate revocation list check setting and certificate validation.

Without local static CRL	LDAP Connection	IPSec Connection	Client Certificate Authentication
Checking peer certificate chain	Full certificate chain is required	Full certificate chain is required	Full certificate chain is required
Checking CDP in peer certificate chain	Full certificate chain is required	Full certificate chain is required	Full certificate chain is required
CDP checking for Root CA certificate of the peer certificate chain	Yes	Not applicable	Yes
Any certificate validation failure in the peer certificate chain	Connection fails with syslog message	Connection fails with syslog message	Connection fails with syslog message
Any certificate revoked in the peer certificate chain	Connection fails with syslog message	Connection fails with syslog message	Connection fails with syslog message

Without local static CRL	LDAP Connection	IPSec Connection	Client Certificate Authentication
One CDP is missing in the peer certificate chain	Connection fails with syslog message	Peer certificate: connection fails with syslog message	Connection fails with syslog message
		Intermediate CAs: connection fails	
One CDP CRL is empty in the peer certificate chain with valid signature	Connection succeeds	Connection succeeds	Connection fails with syslog message
Any CDP in the peer certificate chain cannot be downloaded	Connection fails with syslog message	Peer certificate: Connection fails with syslog message Intermediate CA: connection fails	Connection fails with syslog message
Certificate has CDP, but the CDP server is down	Connection fails with syslog message	Peer certificate: Connection fails with syslog message Intermediate CA: connection fails	Connection fails with syslog message
Certifcate has CDP, server is up, and CRL is on CDP, but the CRL has an invalid signature	Connection fails with syslog message	Peer certificate: Connection fails with syslog message Intermediate CA: connection fails	Connection fails with syslog message

Table 2: Certificate Revocation Check Mode set to Strict with a local static CRL

With local static CRL	LDAP Connection	IPSec Connection	
Checking peer certificate chain	Full certificate chain is required	Full certificate chain is required	
Checking CDP in peer certificate chain	Full certificate chain is required Full certificate chain is required		
CDP checking for Root CA certificate of the peer certificate chain	Yes	Not applicable	
Any certificate validation failure in the peer certificate chain	Connection fails with syslog message	Connection fails with syslog message	
Any certificate revoked in the peer certificate chain	Connection fails with syslog message	Connection fails with syslog message	

With local static CRL	LDAP Connection	IPSec Connection
One CDP is missing in the peer certificate chain (Certificate Chain level is 1)	Connection succeeds	Connection succeeds
One CDP CRL is empty in the peer certificate chain (Certificate Chain level is 1)	Connection succeeds	Connection succeeds
Any CDP in the peer certificate chain cannot be downloaded (Certificate Chain level is 1)	Connection succeeds	Connection succeeds
Certificate has CDP, but the CDP server is down (Certificate Chain level is 1)	Connection succeeds	Connection succeeds
Certificate has CDP, server is up, and CRL is on CDP, but the CRL has an invalid signature (Certificate Chain level is 1)	Connection succeeds	Connection succeeds
Peer Certificate Chain level is higher than 1	Connection fails with syslog message	If combined with CDP, connection succeeds If there is no CDP, connection fails with syslog message

Table 3: Certificate Revocation Check Mode set to Relaxed without a local static CRL

Without local static CRL	LDAP Connection	IPSec Connection	Client Certificate Authentication
Checking peer certificate chain	Full certificate chain	Full certificate chain	Full certificate chain
Checking CDP in the peer certificate chain	Full certificate chain	Full certificate chain	Full certificate chain
CDP checking for Root CA certificate of the peer certificate chain	Yes	Not applicable	Yes
Any certificate validation failure in the peer certificate chain	Connection fails with syslog message	Connection fails with syslog message	Connection fails with syslog message
Any certificate revoked in the peer certificate chain	Connection fails with syslog message	Connection fails with syslog message	Connection fails with syslog message
One CDP is missing in the peer certificate chain	Connection succeeds	Connection succeeds	Connection fails with syslog message

Without local static CRL	LDAP Connection	IPSec Connection	Client Certificate Authentication
One CDP CRL is empty in the peer certificate chain with valid signature	Connection succeeds	Connection succeeds	Connection succeeds
Any CDP in the peer certificate chain cannot be downloaded	Connection succeeds	Connection succeeds	Connection succeeds
Certificate has CDP, but the CDP server is down	Connection succeeds	Connection succeeds	Connection succeeds
Certificate has CDP, server is up, and CRL is on CDP, but the CRL has an invalid signature	Connection succeeds	Connection succeeds	Connection succeeds

Table 4: Certificate Revocation Check Mode set to Relaxed with a local static CRL

With local static CRL	LDAP Connection	IPSec Connection
Checking peer certificate chain	Full certificate chain	Full certificate chain
Checking CDP in the peer certificate chain	Full certificate chain	Full certificate chain
CDP checking for Root CA certificate of the peer certificate chain	Yes	Not applicable
Any certificate validation failure in the peer certificate chain	Connection fails with syslog message	Connection fails with syslog message
Any certificate revoked in the peer certificate chain	Connection fails with syslog message	Connection fails with syslog message
One CDP is missing in the peer certificate chain (Certificate Chain level is 1)	Connection succeeds	Connection succeeds
One CDP CRL is empty in the peer certificate chain (Certificate Chain level is 1)	Connection succeeds	Connection succeeds
Any CDP in the peer certificate chain cannot be downloaded (Certificate Chain level is 1)	Connection succeeds	Connection succeeds
Certificate has CDP, but the CDP server is down (Certificate Chain level is 1)	Connection succeeds	Connection succeeds

With local static CRL	LDAP Connection	IPSec Connection
Certificate has CDP, server is up, and CRL is on CDP, but the CRL has an invalid signature (Certificate Chain level is 1)	Connection succeeds	Connection succeeds
Peer Certificate Chain level is higher than 1	Connection fails with syslog message	If combined with CDP, connection succeeds If there is no CDP, connection fails with syslog message

Configure CRL Periodic Download

You can configure your system to periodically download a (CRL) so that a new CRL is used every 1 to 24 hours to validate certificates.

You can use the following protocols and interfaces with this feature:

- FTP
- SCP
- SFTP
- TFTP
- USB

```
Note
```

• SCEP and OCSP are not supported.

- You can only configure one periodic download per CRL.
- One CRL is supported per trustpoint.

Note You can only configure the period in one-hour intervals.

Perform these steps to configure CRL periodic download.

Before you begin

Ensure that you have already configured your Firepower 4100/9300 chassis to validate peer certificates using (CRL) information. For more information, see Configure Static CRL for a Trustpoint, on page 9.

Procedure

Step 1	From the FXOS CLI, enter security mode:
	scope security
Step 2	Enter trustpoint mode:
	scope trustpoint
Step 3	Enter revoke mode:
	scope revoke
Step 4	Edit the revoke configuration:
	sh config
Step 5	Set your preferred configuration:
	Example:
	set certrevokemethod crl set crl-poll-filename rootCA.crl set crl-poll-path /users/myname set crl-poll-period 1 set crl-poll-port 0 set crl-poll-protocol scp ! set crl-poll-pwd set crl-poll-server 182.23.33.113 set crl-poll-user myname
Step 6	Exit the configuration file: exit
Step 7	(Optional) Test the new configuration by downloading a new CRL:
	Example:
	Firepower-chassis /security/trustpoint/revoke # sh import-task
	Import task: File Name Protocol Server Port Userid State
	rootCA.crl Scp 182.23.33.113 0 myname Downloading

Set the LDAP Key Ring Certificate

You can configure a secure LDAP client key ring certificate to support a TLS connection on your Firepower 4100/9300 chassis. This option is one of a number offered for achieving Common Criteria certification compliance on your system. For more information, see Security Certifications Compliance, on page 1.

	Note	If Common Criteria mode is enabled, you must have SSL enabled, and you must use the server DNS information to create the key ring certificate.			
		If SSL is enabled for the LDAP server entry, key ring information is referenced and checked when forming a connection.			
		DAP server information has to be DNS information in the CC mode for the secure LDAP connection (with SL enabled).			
	Perform these steps to configure a secure LDAP client key ring certificate:.				
	Pro	rocedure			
Step 1	Fro	m the FXOS CLI, enter security mode:			
	sco	pe security			
Step 2	Ent	er LDAP mode:			
	sco	pe Idap			
Step 3	Ent	er LDAP server mode:			
	ent	er server {server_ip/server_dns}			
Step 4	Set	the LDAP key ring:			
	set	keyring_name			
Step 5	Cor	nmit the configuration:			

Enable Client Certificate Authentication

You can enable your system to use a client certificate in conjunction with LDAP to authenticate a user for HTTPS access. The default authentication configuration on the Firepower 4100/9300 chassis is credential-based.

Note If certificate authentication is enabled, that is the only form of authentication permitted for HTTPS.

Certificate revocation check is not supported with the FXOS 2.1.1 release of the client certificate authentication feature.

The following requirements must be met by the Client Certificate to use this feature:

• The username must be included in the X509 attribute Subject Alternative Name - Email.

• The client certificate must be signed by a root CA that has had its certificate imported into a trustpoint on the Supervisor.

Procedure

Step 1 From the FXOS CLI, enter services mode:

scope system

scope services

Step 2 (Optional) View your options for HTTPS authentication:

set https auth-type

Example:

Firepower-chassis /system/services # set https auth-type cert-auth Client certificate based authentication cred-auth Credential based authentication

Step 3 Set your HTTPS authentication to client-based:

set https auth-type cert-auth

Step 4 Commit the configuration:

commit-buffer
