Initializing the Sensor

This chapter explains how to initialize the sensor using the `setup` command. It contains the following sections:

- **Overview, page 3-1**
- **System Configuration Dialog, page 3-1**
- **Initializing the Sensor, page 3-2**
- **Verifying Initialization, page 3-7**

**Overview**

After you have installed the sensor on your network, you must use the `setup` command to initialize it. With the `setup` command, you configure basic sensor settings, including the hostname, IP interfaces, Telnet server, web server port, access control lists, time settings, and assign and enable interfaces. After you have initialized the sensor, you can communicate with it over the network. You are then ready to configure intrusion prevention.

**System Configuration Dialog**

When you enter the `setup` command, an interactive dialog called the System Configuration Dialog appears on the system console screen. The System Configuration Dialog guides you through the configuration process.

The values shown in brackets next to each prompt are the current values.

You must go through the entire System Configuration Dialog until you come to the option that you want to change. To accept default settings for items that you do not want to change, press Enter.

To return to the EXEC prompt without making changes and without going through the entire System Configuration Dialog, press Ctrl-C.

The System Configuration Dialog also provides help text for each prompt. To access the help text, press the question mark (?) key at a prompt.

When you complete your changes, the System Configuration Dialog shows you the configuration that you created during the setup session. It also asks you if you want to use this configuration. If you enter yes, the configuration is saved. If you enter no, the configuration is not saved and the process begins again. There is no default for this prompt; you must enter either yes or no.
You can configure daylight savings time either in recurring mode or date mode. If you select recurring mode, the start and end days are based on week, day, month, and time. If you select date mode, the start and end days are based on month, day, year, and time. Selecting Disable turns off daylight savings time.

You can edit the default virtual sensor, vs0, through the System Configuration Dialog. You can assign promiscuous and/or inline-pairs to the virtual sensor. This also enables the assigned interfaces. After setup is complete, the virtual sensor is configured to monitor traffic.

---

**Note**

You only need to set the date and time in the System Configuration Dialog if the system is an appliance and is NOT using NTP.

---

## Initializing the Sensor

To initialize the sensor, follow these steps:

### Step 1

Log in to the sensor using an account with administrator privileges:

- Log in to the appliance by using a serial connection or with a monitor and keyboard.

  **Note**

  You cannot use a monitor and keyboard with IDS-4215, IPS-4240, IPS-4255, or IPS-4260.

- Session to IDSM-2:
  - For Catalyst software:
    
    ```
    console> enable
    console> (enable) session module_number
    ```
  - For Cisco IOS software:
    
    ```
    Router# session slot slot_number processor 1
    ```

- Session to NM-CIDS:
  
  ```
  router# service-module IDS-Sensor slot_number/port_number session
  ```

- Session to AIP-SSM:
  
  ```
  asa# session 1
  ```

  **Note**

  The default username and password are both cisco.

### Step 2

The first time you log in to the sensor you are prompted to change the default password. Passwords must be at least eight characters long and be strong, that is, not be a dictionary word.

**Caution**

If you forget your password, you may have to reimage your sensor unless there is another user with Administrator privileges (see Chapter 17, “Upgrading, Downgrading, and Installing System Images”). The other Administrator can log in and assign a new password to the user who forgot the password. Or, if you have created the service account for support purposes, you can have TAC create a password. For more information, see Creating the Service Account, page 4-13.
Chapter 3 Initializing the Sensor

After you change the password, the sensor# prompt appears.

**Step 3** Enter the `setup` command.

The System Configuration Dialog is displayed.

--- System Configuration Dialog ---

At any point you may enter a question mark '?' for help.
User `ctrl-c` to abort configuration dialog at any prompt.
Default settings are in square brackets '[]'.

Current Configuration:

```
service host
network-settings
host-ip 10.1.9.201/24,10.1.9.1
host-name sensor
telnet-option disabled
ftp-timeout 300
login-banner-text
exit
time-zone-settings
offset 0
standard-time-zone-name UTC
exit
summertime-option disabled
ntp-option disabled
exit
service web-server
port 443
exit
```

Current time: Wed May 5 10:25:35 2004

**Step 4** Press the spacebar to get to the following question:

Continue with configuration dialog?[yes]:

Press the spacebar to show one page at a time. Press **Enter** to show one line at a time.

**Step 5** Enter **yes** to continue.

**Step 6** Specify the hostname.

The hostname is a case-sensitive character string up to 64 characters. Numbers, "_" and "-" are valid, but spaces are not acceptable. The default is sensor.

**Step 7** Specify the IP interface.

The IP interface is in the form of IP Address/Netmask,Gateway: `X.X.X.X/nn,Y.Y.Y.Y`, where `X.X.X.X` specifies the sensor IP address as a 32-bit address written as 4 octets separated by periods, `nn` specifies the number of bits in the netmask, and `Y.Y.Y.Y` specifies the default gateway as a 32-bit address written as 4 octets separated by periods.
Step 8 Specify the Telnet server status.
You can disable or enable Telnet services. The default is disabled.

Step 9 Specify the web server port.
The web server port is the TCP port used by the web server (1 to 65535). The default is 443.

Note If you change the web server port, you must specify the port in the URL address of your browser when you connect to the IDM in the format https://sensor_ip_address:port (for example, https://10.1.9.201:1040).

Note The web server is configured to use TLS/SSL encryption by default. Setting the port to 80 does not disable the encryption.

Step 10 Enter yes to modify the network access list.

a. If you want to delete an entry, enter the number of the entry and press Enter, or press Enter to get to the Permit line.

b. Enter the IP address and netmask of the network you want to add to the access list.
The IP network interface is in the form of IP Address/Netmask: X.X.X.X/nn, where X.X.X.X specifies the network IP address as a 32-bit address written as 4 octets separated by periods and nn specifies the number of bits in the netmask for that network.

For example, 10.0.0.0/8 permits all IP addresses on the 10.0.0.0 network (10.0.0.0-10.255.255.255) and 10.1.1.0/24 permits only the IP addresses on the 10.1.1.0 subnet (10.1.1.0-10.1.1.255).

If you want to permit access to a single IP address than the entire network, use a 32-bit netmask. For example, 10.1.1.1/32 permits just the 10.1.1.1 address.

c. Repeat Step b until you have added all networks that you want to add to the access list.
d. Press Enter at a blank permit line to proceed to the next step.

Step 11 Enter yes to modify the system clock settings.

a. Enter yes if you want to use NTP.
You will need the NTP server IP address, the NTP key ID, and the NTP key value. If you do not have those at this time, you can configure NTP later. For the procedure, see Configuring the Sensor to Use an NTP Time Source, page 4-30.

b. Enter yes to modify summertime settings.

Note Summertime is also known as DST. If your location does not use Summertime, go to Step n.

c. Choose recurring, date, or disable to specify how you want to configure summertime settings.
The default is recurring.
d. If you chose recurring, specify the month you want to start summertime settings.
Valid entries are january, february, march, april, may, june, july, august, september, october, november, and december.
The default is april.
e. Specify the week you want to start summertime settings.
   Valid entries are first, second, third, fourth, fifth, and last.
   The default is first.

f. Specify the day you want to start summertime settings.
   Valid entries are sunday, monday, tuesday, wednesday, thursday, friday, and saturday.
   The default is sunday.

g. Specify the time you want to start summertime settings.
   The default is 02:00:00.

h. Specify the month you want summertime settings to end.
   Valid entries are january, february, march, april, may, june, july, august, september, october, 
   november, and december.
   The default is october.
i. Specify the week you want the summertime settings to end.
   Valid entries are first, second, third, fourth, fifth, and last.
   The default is last.

j. Specify the day you want the summertime settings to end.
   Valid entries are sunday, monday, tuesday, wednesday, thursday, friday, and saturday.
   The default is sunday.
k. Specify the time you want summertime settings to end.

l. Specify the DST zone.

m. Specify the summertime offset.
   Specify the summertime offset from UTC in minutes (negative numbers represent time zones west 
   of the Prime Meridian).
   The default is 0.

n. Enter yes to modify the system time zone.

o. Specify the standard time zone name.
   The zone name is a character string up to 24 characters long.

p. Specify the standard time offset.
   The default is 0.

   Specify the standard time zone offset from UTC in minutes (negative numbers represent time zones 
   west of the Prime Meridian).

Step 12 Enter yes to modify the virtual sensor configuration (vs0).
The current interface configuration appears:

```plaintext
Current interface configuration
Command control: GigabitEthernet0/1
Unused:
  GigabitEthernet0/0
  GigabitEthernet2/1
  GigabitEthernet2/0
Promiscuous:
  None
Inline:
  None
Inline VLAN Pair:
  None
```

**Step 13** Enter `yes` to add a promiscuous or monitoring interface.

**Step 14** Enter the interface you want to add, for example, `GigabitEthernet0/1`.

**Step 15** Enter `yes` to add inline interface pairs (appears only if your platform supports inline interface pairs).

  a. Enter the inline interface pair name.
  b. Enter the inline interface pair description.
     The default is `Created via setup by user <yourusername>`.
  c. Enter the name of the first interface in the inline pair, `interface1`.
  d. Enter the name of the second interface in the inline pair, `interface2`.
  e. Repeat Steps a through d to add another inline interface pair, or press `Enter` for the next option.

**Step 16** Enter `yes` to add inline VLAN pairs (appears only if your platform supports inline VLAN pairs).

A list of interfaces available for inline VLAN pairs appears:

```
Available Interfaces:
[1] GigabitEthernet0/0
[3] GigabitEthernet2/1
```

**Step 17** Enter the number of the interface you want to subdivide into inline VLAN pairs.

The current inline VLAN pair configuration for that interface appears:

```
Inline Vlan Pairs for GigabitEthernet0/0
  None
```

  a. Enter the subinterface number to add.
  b. Enter the inline VLAN pair description.
  c. Enter the first VLAN number (vlan1).
  d. Enter the second VLAN number (vlan2).
  e. Repeat Steps a through d to add another inline VLAN pair on this interface or press `Enter` for the next option.

**Step 18** Enter `yes` to subdivide another interface. Enter `no` or press `Enter` to complete the addition of the inline VLAN pairs.

Your configuration appears with the following options:

```
[0] Go to the command prompt without saving this config.
[1] Return back to the setup without saving this config.
[2] Save this configuration and exit setup.
```
Step 19 Enter 2 to save the configuration.

Enter your selection[2]: 2
Configuration Saved.

Step 20 Enter yes to modify the system date and time.

Note This option is not available on modules or when NTP has been configured. The modules get their time from the router or switch in which they are installed, or from the configured NTP server.

a. Enter the local date (yyyy-mm-dd).
b. Enter the local time (hh:mm:ss).

Step 21 Reboot the sensor:
sensor# reset
Warning: Executing this command will stop all applications and reboot the node.
Continue with reset? []:

Step 22 Enter yes to continue the reboot.

Step 23 Display the self-signed X.509 certificate (needed by TLS):
sensor# show tls fingerprint

Step 24 Write down the certificate fingerprints.
You will need these to check the authenticity of the certificate when connecting to this sensor with a web browser.

Step 25 Apply the most recent service pack and signature update.
For information on how to obtain the most recent software, see Obtaining Cisco IPS Software, page 18-1. The Readme explains how to apply the most recent software update.
You are now ready to configure your sensor for intrusion prevention.

Verifying Initialization

After you have run the setup command, you should verify that your sensor has been initialized correctly.
To verify that you initialized your sensor, follow these steps:

Step 1 Log in to the sensor.
For the procedure, see Chapter 2, “Logging In to the Sensor.”

Step 2 View your configuration:
sensor# show configuration
    generating current config:

Chapter 3      Initializing the Sensor

Verifying Initialization

Note You can also use the more current-config command to view your configuration.
Step 3  Display the self-signed X.509 certificate (needed by TLS):

```bash
sensor# show tls fingerprint
```

Step 4  Write down the certificate fingerprints.

You will need these to check the authenticity of the certificate when connecting to this sensor with a web browser.
