pxGrid Persona 6
Cisco ISE Certificate Authority 7
Support for Active Directory Multidomain Forests 7
Support for SAnet Devices 7
Support for Installation on Multiple Hardware and VMware Platforms 7

CHAPTER 2

Navigate the Admin portal 9

Admin Portal 9
Cisco ISE Dashboard 11

Setup Assistant 12
Cisco ISE Licensing Impact on Setup Assistant 12
Run the Setup Assistant 13
Setup Assistant Overwrites Previous Configurations 13
Identify Policy Requirements Page in Setup Assistant 13
Configure Network Access Service Page in Setup Assistant 14
Select Network Device Types Page in Setup Assistant 16
Review and Confirm Your Choices Page in Setup Assistant 16

Filter Data on Listing Pages 17
Data Filters in Listing Pages 17
Customize the Displayed Field Attributes 17
Filter Data by Field Attributes Using the Quick Filter 17
Filter Data by Conditions Using the Advanced Filter 18
Create Custom Filters 18

Cisco ISE Internationalization and Localization 19
Supported Languages 19
Support for UTF-8 Character Data Entry 19
UTF-8 Credential Authentication 20
UTF-8 Policies and Posture Assessment 20
Cisco NAC and MAC Agent UTF-8 Support 20
UTF-8 Support for Messages Sent to Supplicant 20
Reports and Alerts UTF-8 Support 21
UTF-8 Character Support in the Portals 21
UTF-8 Support Outside the User Interface 24
Support for Importing and Exporting UTF-8 Values 24
Configure an Inline Posture Node  66
Create Inline Posture Downloadable Access Control Lists  68
Create Inline Posture Node Profiles  69
Create an Inline Posture Authorization Policy  70
Configure a High-Availability Pair  71
Synchronize an Inline Posture Node  72
Configure Inline Posture Node as RADIUS Client in Administration Node  73
Remove an Inline Posture Node from Deployment  74
Health of an Inline Posture Node  74
Remote Access VPN Use Case  75
Configure an Inline Posture Node with a VPN Device  76
Collection of Inline Posture Node Logs  76
K click process in Inline Posture Node  77

PART III

Setup Cisco ISE Management Access  79

CHAPTER 5

Administer Cisco ISE  81
Administrator Access to Cisco ISE  81
  Administrator Login Browser Support  82
    Administrator Lockout Following Failed Login Attempts  82
Specify Proxy Settings in Cisco ISE  83
Ports Used by the Admin Portal  83
Enable External RESTful Services APIs  83
External RESTful Services SDK  84
Specify System Time and NTP Server Settings  85
Changing the System Time Zone  85
Configure SMTP Server to Support Notifications  86
Cisco Software Patches  87
  Software Patch Installation Guidelines  87
Install a Software Patch  88
Roll Back Software Patches  88
  Software Patch Rollback Guidelines  89
View Patch Install and Rollback Changes  89
FIPS Mode Support  90
Secure SSH Key Exchange Using Diffie-Hellman Algorithm 90
Configure Cisco ISE to Send Secure Syslog 90
Configure Secure Syslog Remote Logging Target 91
Enable Logging Categories to Send Auditable Events to the Secure Syslog Target 91
Disable the TCP Syslog and UDP Syslog Collectors 92
Offline Maintenance 92

CHAPTER 6

Manage Administrators and Admin Access Policies 93
Role-Based Access Control 93
Cisco ISE Administrators 93
Privileges of a CLI Administrator Versus a Web-Based Administrator 94
Create a New Cisco ISE Administrator 94
Cisco ISE Administrator Groups 95
Create Admin Groups 101
Administrative Access to Cisco ISE 102
Role-Based Access Control in Cisco ISE 102
Role-Based Permissions 102
RBAC Policies 102
Default Menu Access Permissions 103
Configure Menu Access Permissions 104
Default Data Access Permissions 104
Configure Data Access Permissions 105
Configure Admin Access Policies 105
Administrator Access Settings 106
Configure the Maximum Number of Concurrent Administrative Sessions and Login Banners 106
Allow Administrative Access to Cisco ISE from Select IP Addresses 107
Configure a Password Policy for Administrator Accounts 107
Configure Session Timeout for Administrators 108
Terminate an Active Administrative Session 109
Change Administrator Name 109
Administrative Access to Cisco ISE Using an External Identity Store 109
External Authentication and Authorization 110
External Authentication Process Flow 110
Configure a Password-Based Authentication Using an External Identity Store 111
Create an External Administrator Group 111
Configure Menu Access and Data Access Permissions for the External Administrator Group 112
Create an RBAC Policy for External Administrator Authentication 112
Configure Admin Access Using an External Identity Store for Authentication with Internal Authorization 113

CHAPTER 7 Cisco ISE Licenses 115
Cisco ISE Licenses 115
License Consumption 117
View License Consumption 117
Unregistered License Consumption 118
Manage License Files 119
Register Licenses 119
Re-Host Licenses 120
Renew Licenses 120
Migrate and Upgrade Licenses 120
Remove Licenses 121

CHAPTER 8 Manage Certificates 123
Certificate Management in Cisco ISE 123
Certificates Enable Cisco ISE to Provide Secure Access 123
Certificate Usage 124
Certificate Matching in Cisco ISE 125
Validity of X.509 Certificates 126
Enable PKI in Cisco ISE 126
Wildcard Certificates 127
Wildcard Certificate Support in Cisco ISE 128
Wildcard Certificates for HTTPS and EAP Communication 128
Fully Qualified Domain Name in URL Redirection 129
Advantages of Using Wildcard Certificates 130
Disadvantages of Using Wildcard Certificates 130
Wildcard Certificate Compatibility 131
System Certificates 131
View System Certificates 132
Contents

Import a System Certificate 133
Generate a Self-Signed Certificate 133
Edit a System Certificate 134
Export a System Certificate 135

Trusted Certificates Store 136
Certificates in Trusted Certificates Store 137
Trusted Certificate Naming Constraint 137
View Trusted Store Certificates 138
Change the Status of a Certificate in Trusted Certificates Store 138
Add a Certificate to Trusted Certificates Store 138
Edit a Trusted Certificate 139
Export a Certificate from the Trusted Certificates Store 139
Import the Root Certificates to the Trusted Certificate Store 140
Certificate Chain Import 140
Certificate Signing Requests 141
Create a Certificate Signing Request and Submit the CSR to a Certificate Authority 141
Bind the CA-Signed Certificate to the CSR 141
Export a Certificate Signing Request 142
Install Trusted Certificates for Cisco ISE Inter-node Communication 143
Set Up Certificates for Portal Use 143
Associate the Portal Certificate Tag Before You Register a Node 144

User and Endpoint Certificate Renewal 145
Dictionary Attributes Used in Policy Conditions for Certificate Renewal 145
Authorization Policy Condition for Certificate Renewal 146
CWA Redirect to Renew Certificates 146
Configure Cisco ISE to Allow Users to Renew Certificates 146
Update the Allowed Protocol Configuration 146
Create an Authorization Policy Profile for CWA Redirection 147
Create an Authorization Policy Rule to Renew Certificates 148
Enable BYOD Settings in the Guest Portal 148
Certificate Renewal Fails for Apple iOS Devices 148

Cisco ISE CA Service 149
Certificates Provisioned on Primary Policy Administration Node and Policy Service Nodes 149
Simple Certificate Enrollment Protocol Profiles 150
Contents

Endpoint Certificates 150
Backup and Restore of Cisco ISE CA Certificates and Keys 150
   Export Cisco ISE CA Certificates and Keys 151
   Import Cisco ISE CA Certificates and Keys 152
Generate Root CA and Subordinate CAs on the Primary PAN and PSN 152
Configure Cisco ISE Root CA as Subordinate CA of an External PKI 153
Configure Cisco ISE to Use Certificates for Authenticating Personal Devices 154
   Add Users to the Employee User Group 154
   Create a Certificate Authentication Profile for TLS-Based Authentication 155
   Create an Identity Source Sequence for TLS-Based Authentication 155
   Configure Certificate Authority Settings 156
Create a CA Template 157
Create a Native Supplicant Profile to be Used in Client Provisioning Policy 158
Download Agent Resources from Cisco Site for Windows and MAC OS X Operating Systems 158
Create Client Provisioning Policy Rules for Apple iOS, Android, and MACOSX Devices 159
Configure the Dot1X Authentication Policy Rule for TLS-Based Authentication 159
Create Authorization Profiles for Central Web Authentication and Supplicant Provisioning Flows 160
   Create Authorization Policy Rules 161
   CA Service Policy Reference 161
Client Provisioning Policy Rules for Certificate Services 161
   Authorization Profiles for Certificate Services 162
   Authorization Policy Rules for Certificate Services 163
Revoke an Endpoint Certificate 164
OCSP Services 164
   Cisco ISE CA Service Online Certificate Status Protocol Responder 165
   OCSP Certificate Status Values 165
   OCSP High Availability 165
   OCSP Failures 166
   Add OCSP Client Profiles 166
   OCSP Statistics Counters 167

CHAPTER 9

Manage Network Devices 169
CHAPTER 11  
Logging Mechanism  197
Cisco Logging Mechanism  197
    Configure Local Log Purge Settings  197
Cisco ISE System Logs  198
    Local Store Syslog Message Format  198
    Remote Syslog Message Format  200
    Configure Remote Syslog Collection Locations  202
Cisco ISE Message Codes  203
    Set Severity Levels for Message Codes  203
Cisco ISE Message Catalogs  204
Debug Logs  204
    View Logging Components for a Node  204
    Configure Debug Log Severity Level  205
Endpoint Debug Log Collector  205
    Download Debug Logs for a Specific Endpoint  205
Collection Filters  206
    Configure Collection Filters  206
    Event Suppression Bypass Filter  207

CHAPTER 12  
Backup and Restore Operations  209
Backup Data Type  209
Backup and Restore Repositories  209
    Create Repositories  210
On-Demand and Scheduled Backups  211
    Perform an On-Demand Backup  211
    Schedule a Backup  213
PART IV

Manage Users and End-User Portals 237

CHAPTER 14

Manage Users and External Identity Sources 239

Cisco ISE Users 239
  User Identity 239
  User Groups 239
  User Identity Groups 240
  User Role 240

User Account Custom Attributes and Password Policies 240

Add Users 242

Export Cisco ISE User Data 242

Import Cisco ISE Internal Users 243

Create a User Identity Group 243

Export User Identity Groups 244

Import User Identity Groups 244

Internal and External Identity Sources 244

Create an External Identity Source 246

Certificate Authentication Profiles 246

Add a Certificate Authentication Profile 246

Active Directory as an External Identity Source 247

Active Directory Supported Authentication Protocols and Features 248

Active Directory Attribute and Group Retrieval for Use in Authorization Policies 248

Active Directory Certificate Retrieval for Certificate-Based Authentication 249

Active Directory User Authentication Process Flow 249

Support for Active Directory Multidomain Forests 250

Prerequisites for Integrating Active Directory and Cisco 250

Active Directory Account Permissions Required for Performing Various Operations 251

Network Ports That Must Be Open for Communication 251

DNS Server 252

Configure Active Directory as an External Identity Source 252

Add an Active Directory Join Point and Join Cisco ISE Node to the Join Point 253
<table>
<thead>

Contents

LDAP User Authentication 272
LDAP Group and Attribute Retrieval for Use in Authorization Policies 272
  LDAP Group Membership Information Retrieval 272
  LDAP Attributes Retrieval 273
  LDAP Certificate Retrieval 273
Errors Returned by the LDAP Server 273
LDAP User Lookup 274
LDAP MAC Address Lookup 274
Add LDAP Identity Sources 275
  Configure Primary and Secondary LDAP Servers 275
  Enable Cisco ISE to Obtain Attributes from the LDAP Server 276
  Retrieve Group Membership Details from the LDAP Server 276
  Retrieve User Attributes From the LDAP Server 277
Enable Secure Authentication with LDAP Identity Source 277
RADIUS Token Identity Sources 278
  RADIUS Token Server Supported Authentication Protocols 278
  Ports Used By the RADIUS Token Servers for Communication 279
  RADIUS Shared Secret 279
  Failover in RADIUS Token Servers 279
  Configurable Password Prompt in RADIUS Token Servers 279
  RADIUS Token Server User Authentication 279
  User Attribute Cache in RADIUS Token Servers 279
  RADIUS Identity Source in Identity Sequence 280
  RADIUS Server Returns the Same Message for All Errors 280
  Safeword Server Supports Special Username Format 280
  Authentication Request and Response in RADIUS Token Servers 281
  Add a RADIUS Token Server 281
  Delete a RADIUS Token Server 282
RSA Identity Sources 283
  Cisco ISE and RSA SecurID Server Integration 283
    RSA Configuration in Cisco ISE 283
    RSA Agent Authentication Against the RSA SecurID Server 284
    RSA Identity Sources in a Distributed Cisco ISE Environment 284
    RSA Server Updates in a Cisco ISE Deployment 284
Override Automatic RSA Routing 284
RSA Node Secret Reset 284
RSA Automatic Availability Reset 285
Add RSA Identity Sources 285
Import the RSA Configuration File 285
Configure the Options File for a Cisco ISE Server and Resetting SecurID and sdstatus.12 Files 286
Configure Authentication Control Options for RSA Identity Source 287
Configure RSA Prompts 287
Configure RSA Messages 287
Identity Source Sequences 288
Create Identity Source Sequences 288
Delete Identity Source Sequences 289
Identity Source Details in Reports 290
Authentications Dashlet 290
Identity Source Reports 290

CHAPTER 15
Configure Guest Access 291
Cisco ISE Guest Services 291
End-User Guest and Sponsor Portals in Distributed Environment 291
Guest and Sponsor Accounts 292
Guest Types and User Identity Groups 292
Create or Edit a Guest Type 293
Disable a Guest Type 295
Changing Guest Account Attributes 296
Schedule When to Purge Expired Guest Accounts 296
Add Custom Fields for Guest Account Creation 297
Specify Email Addresses and SMTP Servers for Email Notifications 297
Assign Guest Locations and SSIDs 298
Rules for Guest Password Policies 299
Set the Guest Password Policy and Expiration 300
Rules for Guest Username Policies 301
Set the Guest Username Policy 301
SMS Providers and Services 302
Create External Identity Sources 345
Create Identity Source Sequences 345
Create Endpoint Identity Groups 346
Edit the Blacklist Portal 346
Create a BYOD Portal 348
Create a Client Provisioning Portal 350
Create an MDM Portal 351
Create a My Devices Portal 352
Create Authorization Profiles 353
Create Authorization Profiles 353
Create Authorization Policy Rules 354
Customize Device Portals 355
Manage Personal Devices Added by Employees 355
Display Devices Added by an Employee 355
Errors When Adding Devices to My Devices Portal 355
Devices Deleted from My Devices Portal Remain in Endpoints Database 356
Limit the Number of Personal Devices Registered by Employees 356
Monitor My Devices Portals and Endpoints Activity 356
My Devices Login and Audit Report 357
Registered Endpoints Report 357

CHAPTER 17

Customize End-User Web Portals 359

End-User Portals 359
Customization of End-User Web Portals 359
Portal Content Types 362
Basic Customization of Portals 363
Modify the Portal Theme Colors 363
Change the Portal Display Language 364
Change the Portal Icons, Images, and Logos 365
Update the Portal Banner and Footer Elements 365
Change the Titles, Instructions, Buttons, and Label Text 366
Format and Style Text Box Content 366
Variables for Portal Pages Customization 367
View Your Customization 370
## Contents

**Advanced Customization of Portals** 370
  - Configure Portal Customization 371
  - Portal Theme and Structure CSS Files 371
  - About Changing Theme Colors with jQuery Mobile 372
    - Change Theme Colors with jQuery Mobile 373
  - Location Based Customization 374
  - User Device Type Based Customization 375
  - Export a Portal’s Default Theme CSS File 375
  - Create a Custom Portal Theme CSS File 376
  - Embed Links in Portal Content 376
  - Insert Variables for Dynamic Text Updates 377
  - Use Source Code to Format Text and Include Links 378
  - Add an Image as an Advertisement 379
  - Set Up Carousel Advertising 380
  - Customize Greetings Based on Guest Location 382
  - Customize Greetings Based on User Device Type 383
  - Modify the Portal Page Layout 384
  - Import the Custom Portal Theme CSS File 386
  - Delete a Custom Portal Theme 387
  - View Your Customization 387

**Portal Language Customization** 388
  - Export the Language File 389
  - Add or Delete Languages from the Language File 390
  - Import the Updated Language File 391

**Customization of Guest Notifications, Approvals, and Error Messages** 391
  - Customize Email Notifications 392
  - Customize SMS Text Message Notifications 392
  - Customize Print Notifications 393
  - Customize Approval Request Email Notifications 394
  - Edit Error Messages 394

Purpose

This preface introduces the Cisco Identity Services Engine Administrator Guide, Release 1.3.

Audience

This guide is written for network security administrators who are responsible for setting up and maintaining network and application security. This guide assumes that you have a working knowledge of networking principles and applications, and have experience as a network system administrator.

### Reader Alert Conventions

This document uses the following conventions for reader alerts:

| Note | Means reader take note. Notes contain helpful suggestions or references to material not covered in the manual. |
Tip
Means the following information will help you solve a problem, or could be some useful information.

Caution
Means reader be careful. In this situation, you might do something that could result in equipment damage or loss of data.

Timesaver
Means the described action saves time. You can save time by performing the action described in the paragraph.

Warning
Means reader be warned. In this situation, you might perform an action that could result in bodily injury.

Documentation Updates

The following table lists the documentation updates for this Cisco Identity Services Engine product release.

Cisco ISE Overview

Cisco ISE is a security policy management platform that provides secure access to network resources. Cisco ISE functions as a policy decision point and enables enterprises to ensure compliance, enhance infrastructure security, and streamline service operations. Cisco ISE allows enterprises to gather real-time contextual information from networks, users, and devices. The administrator can then use that information to make governance decisions by tying identity to various network elements, including access switches, wireless LAN controllers (WLCs), Virtual Private Network (VPN) gateways, and data center switches. Cisco ISE acts as the policy manager in the Cisco TrustSec solution and supports TrustSec software-defined segmentation.
Key Functions

Cisco ISE is a consolidated policy-based access control system that incorporates a superset of features available in existing Cisco policy platforms. Cisco ISE performs the following functions:

- Combines authentication, authorization, accounting (AAA), posture, and profiler into one appliance
- Provides for comprehensive guest access management for Cisco ISE administrators, sanctioned sponsor administrators, or both
- Enforces endpoint compliance by providing comprehensive client provisioning measures and assessing the device posture for all endpoints that access the network, including 802.1X environments
- Provides support for discovery, profiling, policy-based placement, and monitoring of endpoint devices on the network
- Enables consistent policy in centralized and distributed deployments that allows services to be delivered where they are needed
- Employs advanced enforcement capabilities including Trustsec through the use of Security Group Tags (SGTs) and Security Group Access Control Lists (SGACLs)
- Supports scalability to support a number of deployment scenarios from small office to large enterprise environments

Identity-Based Network Access

The Cisco ISE solution provides context-aware identity management in the following areas:

- Cisco ISE determines whether users are accessing the network on an authorized, policy-compliant device.
- Cisco ISE establishes user identity, location, and access history, which can be used for compliance and reporting.
- Cisco ISE assigns services based on the assigned user role, group, and associated policy (job role, location, device type, and so on).
- Cisco ISE grants authenticated users with access to specific segments of the network, or specific applications and services, or both, based on authentication results.

Support for Multiple Deployment Scenarios

Cisco ISE can be deployed across an enterprise infrastructure, supporting 802.1X wired, wireless, and Virtual Private Networks (VPNs).

The Cisco ISE architecture supports both standalone and distributed (also known as “high-availability” or “redundant”) deployments where one machine assumes the primary role and another “backup” machine assumes the secondary role. Cisco ISE features distinct configurable personas, services, and roles, which allow you to create and apply Cisco ISE services where they are needed in the network. The result is a comprehensive Cisco ISE deployment that operates as a fully functional and integrated system.
Cisco ISE nodes can be deployed with one or more of the Administration, Monitoring, and Policy Service personas—each one performing a different vital part in your overall network policy management topology. Installing Cisco ISE with an Administration persona allows you to configure and manage your network from a centralized portal to promote efficiency and ease of use.

Cisco ISE platform can also be deployed as an Inline Posture node to perform policy enforcement and execute Change of Authorization (CoA) requests where users are accessing the network via WLCs and/or VPN concentrators that do not support the necessary functionality to facilitate Cisco ISE policy management.

**Support for UCS Hardware**

In addition to Cisco ISE 3300 Series appliance, Cisco ISE 1.3 supports the UCS C220 M3 hardware and is available on the following platforms:

- SNS-3415 (small)
- SNS-3495 (large)

Refer to Table 3 in the Cisco Identity Services Engine Data Sheet for the hardware specifications.

**Basic User Authentication and Authorization**

User authentication policies in Cisco ISE enable you to provide authentication for a number of user login session types using a variety of standard authentication protocols including, but not limited to, Password Authentication Protocol (PAP), Challenge-Handshake Authentication Protocol (CHAP), Protected Extensible Authentication Protocol (PEAP), and Extensible Authentication Protocol (EAP). Cisco ISE specifies the allowable protocol(s) that are available to the network devices on which the user tries to authenticate and specifies the identity sources from which user authentication is validated.

Cisco ISE allows for a wide range of variables within authorization policies to ensure that only authorized users can access the appropriate resources when they access the network. The initial release of Cisco ISE supports only RADIUS-governed access to the internal network and its resources.

At the most fundamental level, Cisco ISE supports 802.1X, MAC authentication bypass (MAB), and browser-based Web authentication login for basic user authentication and access via both wired and wireless networks. Upon receiving an authentication request, the “outer part” of the authentication policy is used to select the set of protocols that are allowed when processing the request. Then, the “inner part” of the authentication policy is used to select the identity source that is used to authenticate the request. The identity source may consist of a specific identity store or an identity store sequence that lists a set of accessible identities until the user received a definitive authorization response.

Once authentication succeeds, the session flow proceeds to the authorization policy. (There are also options available that allow Cisco ISE to process the authorization policy even when the authentication did not succeed.) Cisco ISE enables you to configure behavior for “authentication failed,” “user not found,” and “process failed” cases, and also to decide whether to reject the request, drop the request (no response is issued), or continue to the authorization policy. In cases where Cisco ISE continues to perform authorization, you can use the “AuthenticationStatus” attribute in the “NetworkAccess” dictionary to incorporate the authentication result as part of the authorization policy.

The authorization policy result is Cisco ISE assigning an authorization profile that might also involve a downloadable ACL specifying traffic management on the network policy enforcement device. The downloadable
ACL specifies the RADIUS attributes that are returned during authentication and that define the user access privileges granted once authenticated by Cisco ISE.

---

**Note**
Cisco ISE processes the attributes in the following order while identifying the Authentication session for the incoming accounting packet:

- For Cisco devices:
  1. Class/State
  2. audit-session-id

- For third party devices:
  1. Class/State
  2. Calling-Station-ID
  3. If the authentication session cannot be identified, Cisco ISE creates a new session ID based on the Calling-Station-ID, NAS-Port, and NAS-IP-Address.

---

**Policy Sets**

Cisco ISE supports policy sets, which let you group sets of authentication and authorization policies. As opposed to the basic authentication and authorization policy model, which is a flat list of authentication and authorization rules, policy sets let you logically define the organization’s IT business use cases into policy groups or services, such as VPN and 802.1x, such that it is easier for configuration, deployment, and troubleshooting.

You must enable Policy Sets on **Administration > System > Settings > Policy Settings** to make them available on the **Policy** menu.

---

**Support for Common Access Card Functions**

Cisco ISE supports U.S. government users who authenticate themselves using Common Access Card (CAC) authentication devices. A CAC is an identification badge with an electronic chip containing a set of X.509 client certificates that identify a particular employee of, for example, the U.S. Department of Defense (DoD). Access via the CAC requires a card reader into which the user inserts the card and enters a PIN. The certificates from the card are then transferred into the Windows certificate store, where they are available to applications such as the local browser running Cisco ISE.

Benefits of using a CAC card to authenticate include these:

- Common Access Card X.509 certificates are the identity source for 802.1X EAP-TLS authentication.
- Common Access Card X.509 certificates are also the identity source for authentication and authorization to Cisco ISE administration.
Cisco ISE only supports login to the Admin portal. It does not support CAC authentication for the following access methods:

- You cannot use CAC authentication login to manage the Cisco ISE Command Line Interface.
- External REST API (Monitoring and Troubleshooting) and Endpoint Protection Services APIs are outside the scope of the CAC authentication.
- Guest Services and Guest Sponsor Administration access does not support the CAC authentication method in Cisco ISE.

**Client Posture Assessment**

To ensure that the imposed network security measures remain relevant and effective, Cisco ISE enables you to validate and maintain security capabilities on any client machine that accesses the protected network. By employing posture policies that are designed to ensure that the most up-to-date security settings or applications are available on client machines, the Cisco ISE administrator can ensure that any client machine that accesses the network meets, and continues to meet, the defined security standards for enterprise network access. Posture compliance reports provide Cisco ISE with a snapshot of the compliance level of the client machine at the time of user login, as well as any time a periodic reassessment occurs.

Posture assessment and compliance occurs using one of the following agent types available in Cisco ISE:

- Cisco NAC Web Agent—A temporal agent that the users install on their system at the time of login and that is no longer visible on the client machine once the login session terminates.
- Cisco NAC Agent—A persistent agent that, once installed, remains on a Windows or Mac OS X client machine to perform all security compliance functions.
- AnyConnect ISE Agent—A persistent agent that can be installed on Windows or Mac OS X client to perform posture compliance functions.

**Network Access for Guests**

Cisco ISE administrators and employees who are granted appropriate access to the Cisco ISE guest registration portal as guest sponsors can create temporary guest login accounts and specify available network resources to allow guests, visitors, contractors, consultants, and customers to get restricted access to the specified network resources and Internet. Guest access sessions have expiration timers associated with them, so they are effective in controlling guest access to a specific day, time period, and so forth.

All aspects of a guest user session (including account creation and termination) are tracked and recorded in Cisco ISE so that you can provide audit information and troubleshoot session access, as necessary.

**Support for Personal Devices**

Cisco ISE allows employees to connect their personal devices, such as laptop computers, mobile phones, tablets, printers, and other network devices on the enterprise network.

Supporting these devices presents difficulties in protecting network services and enterprise data, so you must ensure that both the employees and their devices are authenticated and authorized for network access. With
a Plus license, Cisco ISE provides you with the tools you need to allow employees to securely use their personal devices on your corporate network.

**Mobile Device Manager Interoperability with Cisco ISE**

Mobile Device Management (MDM) servers secure, monitor, manage, and support mobile devices deployed across mobile operators, service providers, and enterprises. MDM enforces policy on endpoints, but it cannot force users to register their device or force remediation. ISE retrieves policies from the MDM server, and enforces those policies when users register their devices. If the ISE device policy requires MDM, and the device is not compliant with MDM, then ISE redirects the user to the MDM on-boarding portal, and prompts the user to update the device for network access. ISE can also allow internet-only access to users who decline MDM compliance.

**Wireless and VPN Traffic with Inline Posture Nodes**

Inline Posture nodes are gatekeeping nodes that enforce Cisco ISE access policies and handle Change of Authorization (CoA) requests. After initial authentication (using EAP/802.1X and RADIUS), client machines must still go through posture assessment. The posture assessment process determines whether the client should be restricted, denied, or allowed full access to the network. When a client accesses the network through a WLC or VPN device, the Inline Posture node has the responsibility for the policy enforcement and CoA that the other network devices are unable to accommodate. Consequently, a Cisco ISE can be deployed as an Inline Posture node behind other network access devices on your network, such as WLCs and VPN concentrators.

**Profiled Endpoints on the Network**

The Profiler service assists in identifying, locating, and determining the capabilities of all endpoints on your network (known as identities in Cisco ISE), regardless of their device types, to ensure and maintain appropriate access to your enterprise network. The Cisco ISE Profiler function uses a number of probes to collect attributes for all endpoints on your network, and pass them to the Profiler analyzer, where the known endpoints are classified according to their associated policies and identity groups.

The Profiler Feed service allows administrators to retrieve new and updated endpoint profiling policies and the updated OUI database as a feed from a designated Cisco feed server through a subscription into to Cisco ISE.

**pxGrid Persona**

Cisco pxGrid is used to enable the sharing of contextual-based information from Cisco ISE session directory to other policy network systems such as Cisco Adaptive Security Appliance (ASA). The pxGrid framework can also be used to exchange policy and configuration data between nodes like sharing tags and policy objects between ISE and third party vendors, and for non-ISE related information exchanges such as threat information.
Cisco ISE Certificate Authority

Cisco ISE provides a native Certificate Authority (CA) that issues and manages digital certificates for endpoints from a centralized console to allow employees to connect to the company’s network using their personal devices. Cisco ISE CA supports standalone and subordinate deployments.

Support for Active Directory Multidomain Forests

Cisco ISE supports Active Directory with multidomain forests. Cisco ISE connects to a single domain, but can access resources from the other domains in the Active Directory forest if trust relationships are established between the domain to which Cisco ISE is connected and the other domains.

Support for SAnet Devices

Cisco ISE provides limited support for Session Aware Networking (SAnet), a session management framework on the switches that provides more consistent and flexible management of access-sessions, including visibility, authentication, and authorization. SAnet defines the notion of a service template which is an authorization object accepted both by ISE as well as by the device. This is in contradistinction to Cisco ISE authorization profiles which are containers of RADIUS authorization attributes that are merged and flattened into a list of attributes before they are sent to the device. Similarly, SAnet service templates are also containers of RADIUS authorization attributes but they are not flattened into a list before sending to the device. Instead, Cisco ISE sends the name of the service template and the device downloads the content (RADIUS attributes) if it does not already have a cached or statically defined version of it. In addition, Cisco ISE sends CoA notifications to the device if the definition of a service template has changed, that is, if a RADIUS attribute was added, removed or changed.

Cisco ISE implements service templates as authorization profiles that contain a special flag that marks them as “Service Template” compatible. This way the service template, which is also an authorization profile, can be used in a single policy statement that will support sessions connecting from SAnet capable devices as well as legacy devices.

Support for Installation on Multiple Hardware and VMware Platforms

Cisco ISE comes preinstalled on a range of physical appliances with various performance characteristics. The Cisco Application Deployment Engine (ADE) and Cisco ISE software run either on a dedicated SNS-3400 Series appliance or on a virtual machine (Cisco ISE VM). The Cisco ISE software image does not support the installation of any other packages or applications on this dedicated platform. The inherent scalability of Cisco ISE allows you to add appliances to a deployment and increase performance and resiliency, as needed.
CHAPTER 2

Navigate the Admin portal

- Admin Portal, on page 9
- Setup Assistant, on page 12
- Filter Data on Listing Pages, on page 17
- Cisco ISE Internationalization and Localization, on page 19
- MAC Address Normalization, on page 24
- Admin Features Limited by Role-Based Access Control Policies, on page 25

Admin Portal

The Admin portal is an administration console from which you can manage various identity services. The following figure shows the main elements of this portal.

*Figure 1: Admin portal*
|   | Menu Bar | Access tools for viewing, monitoring, and managing different Cisco ISE options:  
|   |   | - **Home**: Access the dashboard, which is a real-time view of all the services running in the Cisco ISE network.  
|   |   | - **Operations**: Access tools for monitoring real-time alarms and live authentications, querying historical data through reports, and troubleshooting network services.  
|   |   | - **Policy**: Access tools for managing network security in the areas of authentication, authorization, profiling, posture, and client provisioning.  
|   |   | - **Administration**: Access tools for managing Cisco ISE nodes, licenses, certificates, network devices, users, endpoints, and guest services.  
| 2 | Top Right Panel | View the connected Cisco ISE node. Click the appropriate options to edit account information, log out, and provide feedback to Cisco.  
| 3 | Search | Search for endpoints and display their distribution by profiles, failures, identity stores, location, device type, and so on.  
| 4 | Setup Assistant | Access wizard to create a basic configuration to demonstrate Cisco ISE feature functionality in your network.  
| 5 | Context-Sensitive Help | Access help for the currently displayed page.  
| 6 | Help | Access the complete Cisco ISE online Help system. |
Cisco ISE Dashboard

The Cisco ISE Dashboard displays live consolidated and correlated statistical data that is essential for effective monitoring and troubleshooting. Dashboard elements show activity over 24 hours, unless otherwise noted. The following figure shows some of the information available on the Cisco ISE Dashboard.

**Figure 2: Cisco ISE User Dashboard**

1. **Dashlets**
   - Dashboard element that displays statistical summaries about the devices and user accessing the network. In some dashlets, colored icons are displayed prior to the device names to convey the system health:
     - Green = Healthy
     - Yellow = Warning
     - Red = Critical
     - Gray = No information

2. **Sparklines**
   - Depict trends over time.
Display the distribution of parameters using color as the dividing element, so you can see where one parameter ends and another begins. Display is limited to the top 10 distributions. In general, stacked bar charts use color to mark the boundary points between one data measurement and another.

Summarize the most important statistics regarding the devices that are accessing the network. Metric meters provide an at-a-glance view of network health and performance. You can click the number displayed above the metrics meter to view more information about the devices.

**Setup Assistant**

The Setup Assistant guides you through a series of questions in a wizard-like interface retaining your responses and using them to configure Cisco ISE directly. It enables you to set up a basic working Cisco ISE configuration as a proof-of-concept for your network. Your answers to the questions impact these Cisco ISE features: authentication, authorization, profiling, posture, client provisioning, guest services, and support for personal devices.

**Cisco ISE Licensing Impact on Setup Assistant**

Setup Assistant functionality depends on the Cisco ISE license that you have applied to your configuration.

<table>
<thead>
<tr>
<th>Cisco ISE License</th>
<th>Identify Policy Requirements</th>
<th>Configure Network Access Services</th>
<th>Select Network Device Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic</td>
<td>—</td>
<td>The posture, endpoint profiling, and personal devices options are not available.</td>
<td>—</td>
</tr>
<tr>
<td>Advanced</td>
<td>If you choose wired + monitor, the guest and posture choices are disabled on the next page. If you choose wireless and wired + monitor, the guest and posture choices on the next page impact wireless only.</td>
<td>The guest and posture choices are not available if you select wired + monitor on the previous page.</td>
<td>If you choose wired only on the first page, the wireless LAN controller (WLC) information does not appear. If you choose wireless only on the first page, switch information does not appear.</td>
</tr>
</tbody>
</table>
### Run the Setup Assistant

When you start Cisco ISE for the first time, you are prompted to run the Setup Assistant. If you choose not to run it then, you can run it again later.

#### Before you begin

To perform this task, you must be a Super Admin. You can only run the Setup Assistant on the standalone or Primary Administration Node (PAN).

#### Procedure

1. Click **Setup Assistant** in the upper-right corner of the Admin portal.
2. Follow the on-screen instructions to complete the configuration.

### Setup Assistant Overwrites Previous Configurations

Each time you run the Setup Assistant, Cisco ISE overwrites previous settings, which can critically impact your configuration in the following ways:

- All authentication, authorization, client provisioning, and posture policies are deleted and replaced, including any that you added without using the Setup Assistant.

- Other settings, such as policy elements and web portal customizations, are overwritten with any newly specified values. If you do not enter anything for the optional settings, the Setup Assistant resets them to their default values.

### Identify Policy Requirements Page in Setup Assistant

#### Wired or Wireless

You must indicate whether you want to support wired or wireless connections, or both. If you are using a Cisco ISE Wireless License, the wired option is unavailable.

These choices impact the policies that Cisco ISE creates, and also dictate other required responses. For example, if you choose wired, you can also indicate whether your network supports IP phones.

You must also indicate whether or not the wired connections are monitored or if network access must be enforced based on compliance:

- Monitor generates non-compliance logs and reports, but does not require that users or devices comply with the defined policies.

---

<table>
<thead>
<tr>
<th>Cisco ISE License</th>
<th>Identify Policy Requirements</th>
<th>Configure Network Access Services</th>
<th>Select Network Device Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wireless</td>
<td>The wired option is not available.</td>
<td>—</td>
<td>Switch information does not appear.</td>
</tr>
</tbody>
</table>

---

**Cisco Identity Services Engine Administrator Guide, Release 1.3**

---
In monitoring mode, posture and guest policies are ignored. If you support wired connections in monitoring mode, the Setup Assistant disables the guest and posture choices on the next page to prevent unauthorized computer and guest access.

If you support wired and wireless connections, you can enable the guest and posture features, but they will apply only to the wireless connections. The wireless connections always run in enforcement mode.

- Enforce requires compliance with the defined policies.

**Protected Subnets**

You must indicate which subnets should are inaccessible by guests or noncompliant endpoints. This information is used when creating the downloadable ACLs.

**Configure Network Access Service Page in Setup Assistant**

**User Authentication**

Users belonging to these groups will be granted network access as employees and be allowed to create guest accounts using the Sponsor portal.

- Internal users—If you choose to create an internal user, Cisco ISE creates a single user using the name you enter and assigns the user to the default Employee and ALL_ACCOUNTS user identity groups. You can verify this in the Administration > Identity Management > Identities > Users page after setup completes.

  Because the Setup Assistant provides only the basic Cisco ISE configuration to demonstrate its functionality in your network, you cannot use it to import additional users into the internal user database. You can add additional internal users using the Admin portal after you complete the Setup Assistant.

- Active Directory—If you choose to join the Active Directory domain, Cisco ISE adds the indicated AD domain and joins to it. After joining the domain, you must choose an Active Directory group. All users belonging to this group will be able to authenticate using Dot1x and create guests using the Sponsor portal. You can verify this from the Administration > Identity Management > External Identity Sources > Active Directory page after setup completes.

**Posture Compliance**

When you enable posture using the Setup Assistant, Cisco ISE checks for antispyware and antivirus definitions and installations on connected endpoints.

You must indicate whether you want to assess or assess and enforce posture compliance for employees and guests:

- Assess generates reports about noncompliant users, but allows them to be authenticated.

- Enforce prevents authentication.

If you want to force Cisco ISE to redirect noncompliant endpoints to a remediation server before granting network access, enter the proxy server IP address.

If you enable posture compliance, Cisco ISE will:

- Download the Cisco NAC agents and update the Policy > Policy Elements > Results > Client Provisioning > Resources page.
• Create the downloadable ACLs on the Policy > Policy Elements > Results > Authorization > Downloadable ACLs page. All DACLS created by the Setup Assistant include the prefix AutoGen, such as: AutoGen_DACL_PrePostureWired.

• Create authorization profiles on the Policy > Policy Elements > Results > Authorization > Authorization Profiles page. Authorization profiles created by the Setup Assistant include the prefix AutoGen, such as: AutoGen_profile_Byod_CWA.

• Create authorization conditions on the Policy > Policy Elements > Conditions > Authorization > Simple Conditions and Policy > Policy Elements > Conditions > Authorization > Compound Conditions pages. Authorization conditions created by the Setup Assistant include the prefix AutoGen, such as: AutoGen_condition_Android_Devices or AutoGen_condition_GuestWired.

• Create client provisioning policies on the Policy > Client Provisioning page. Client provisioning policies created by the Setup Assistant include the prefix AutoGen, such as: AutoGen_Provisioning.

• Download posture updates from the Administration > System > Settings > Posture > Updates page.

• Create posture policies on the Policy > Posture page. Posture policies created by the Setup Assistant include the prefix AutoGen, such as: AutoGen_Policy_Check_For_AS_Definition_Mac_Employee.

• Create authorization policies on the Policy > Authorization page. Authorization policies created by the Setup Assistant include the prefix AutoGen, such as: AutoGen_policy_Registered_Wireless_Devices.

• Create authentication policies on the Policy > Authentication page. Authorization policies created by the Setup Assistant include the prefix AutoGen, such as: AutoGen_AuthNPolicy_MAB.

Endpoint Profiling

Endpoint profiling discovers, identifies, and determines the capabilities of all attached endpoints on your network. If you enable endpoint profiling, Cisco ISE will:

• Enable these endpoint profiling features on the Administration > System > Deployment > Edit Node > Profiling Configuration page.
  • DHCP
  • RADIUS
  • Network Scan (NMAP)
  • SNMP Query Probes

• Configure SNMP on the Administration > Network Resources > Network Devices page.

Proxy Settings

Cisco ISE uses the proxy server to download Cisco-defined posture checks and client provisioning resources required for assessing posture of endpoints and allowing personal devices on the network. If you configure these proxy settings, Cisco ISE will update the settings on the Administration > System > Settings > Proxy page.

Guest User Support

To support guest users, you must create a sponsor user. Cisco ISE creates a single user using the name you enter and assigns the user to the default ALL_ACCOUNTS user identity group, which defines the user as a
sponsor user. You can verify this from the Administration > Identity Management > Identities > Users page after setup completes.

If you add a simplified URL, Cisco ISE updates the Portal Name settings at the top of the Guest Access > Configure > Sponsor Portals > Edit page.

Support for Personal Devices

You can add a simplified URL for employees to use to access the My Devices portal, and Cisco ISE updates the Portal Names settings at the top of the Administration > Device Portal Management > My Devices > Edit page.

Web Portal Customizations

You can upload an image to use as a custom logo for the Sponsor, Guest, and My Devices portals. Cisco ISE also will upload the image to the appropriate page:

- Guest portals: Guest Access > Configure > Guest Portals > Edit > Portal Page Customization.
- Sponsor portals: Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization
- Administration > Device Portal Management > My Devices > Edit > Portal Page Customization

Select Network Device Types Page in Setup Assistant

Switches and Wireless Controllers

Cisco ISE adds the switches and wireless controllers to the Administration > Network Resources > Network Devices page, updates the SNMP settings, and adds the RADIUS shared secret to the Authentication Settings option.

Depending on the choices you made previously, you must configure the switches and wireless controllers. Click the Wired or Wireless Network Diagram links to display sample network topologies that illustrate the required configuration details.

Review and Confirm Your Choices Page in Setup Assistant

Review Your Selection

You can verify your responses to each of the questions.

Network Device Configuration

Configuration details for each configured switch and WLC display separately. Cisco ISE does not automatically update these configurations on the devices. If you want to completely replace the current device configuration, copy and paste the entire configuration. Alternatively, you can just copy the specific sections with the configuration changes you need. You can access the most current copy of the settings after exiting the Setup Assistant by choosing Setup Assistant > View network device configuration.
ISE Configuration

The ISE Configuration tab displays details about each setting, policy, profile, DACL, and network device added to Cisco ISE.

Filter Data on Listing Pages

Listing pages include tools that enable you to filter and customize the displayed information.

Data Filters in Listing Pages

You can customize and filter the information that displays in the listing pages using the settings and filter icons.

![Settings Icon](image1.png)

**Figure 3: Data Filters Example**

Customize the Displayed Field Attributes

You can customize the field attributes displayed in the listing pages. The available and default options vary based on the specific listing page.

**Procedure**

1. **Step 1** Click the Settings icon and choose Columns.
2. **Step 2** Select the items to add or remove. A checkmark displays next to the selected items.
3. **Step 3** Click Close.

**Related Topics**

- Data Filters in Listing Pages, on page 17

Filter Data by Field Attributes Using the Quick Filter

The Quick Filter allows you to enter a value for any of the field attributes displayed in the listing page, refreshes the page, and lists only those records that match your filter criteria.
**Filter Data by Conditions Using the Advanced Filter**

The Advanced Filter allows you to filter information based on specified conditions, such as, First Name = Mike and User Group = Employee. You can specify more than one condition.

**Procedure**

**Step 1**  
Click the **Show** drop-down list and choose **Advanced Filter**.

**Step 2**  
Specify the search attributes, such as fields, operators, and values from the Filter menus.

**Step 3**  
Click + to add additional conditions.

**Step 4**  
Click **Go** to display the entries that match the specified attributes.

**Related Topics**
- **Data Filters in Listing Pages**, on page 17

**Create Custom Filters**

You can create and save custom filters and modify the filter criteria in preset filters. Custom filters are not saved in the Cisco ISE database. You can only access them using the same computer and browser used to create them.

**Procedure**

**Step 1**  
Click the **Show** drop-down list and choose **Advanced Filter**.

**Step 2**  
Specify the search attributes, such as fields, operators, and values from the Filter menus.

**Step 3**  
Click + to add additional conditions.

**Step 4**  
Click **Go** to display the entries that match the specified attributes.

**Step 5**  
Click the **Save** icon to save the filter.

**Step 6**  
Enter a name and click **Save**. The filter now appears in the Show drop-down list.

**Related Topics**
- **Filter Data by Conditions Using the Advanced Filter**, on page 18
- **Data Filters in Listing Pages**, on page 17
Cisco ISE Internationalization and Localization

Cisco ISE internationalization adapts the user interface for supported languages. Localization of the user interface incorporates locale-specific components and translated text.

In Cisco ISE, internalization and localization support focuses on support for non-English text in UTF-8 encoding to the end-user facing portals and on selective fields in the Admin portal.

Supported Languages

Cisco ISE, provides localization and internalization support for the following languages and browser locales:

<table>
<thead>
<tr>
<th>Language</th>
<th>Browser Locale</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chinese traditional</td>
<td>zh-tw</td>
</tr>
<tr>
<td>Chinese simplified</td>
<td>zh-cn</td>
</tr>

<td>Czech</td>
<td>cs-cz</td>
</tr>
<tr>
<td>Dutch</td>
<td>nl-nl</td>
</tr>
<tr>
<td>English</td>
<td>en</td>
</tr>
<tr>
<td>French</td>
<td>fr-fr</td>
</tr>
<tr>
<td>German</td>
<td>de-de</td>
</tr>
<tr>
<td>Hungarian</td>
<td>hu-hu</td>
</tr>
<tr>
<td>Italian</td>
<td>it-it</td>
</tr>
<tr>
<td>Japanese</td>
<td>ja-jp</td>
</tr>
<tr>
<td>Korean</td>
<td>ko-kr</td>
</tr>
<tr>
<td>Polish</td>
<td>pl-pl</td>
</tr>
<tr>
<td>Portuguese (Brazil)</td>
<td>pt-br</td>
</tr>
<tr>
<td>Russian</td>
<td>ru-ru</td>
</tr>
<tr>
<td>Spanish</td>
<td>es-es</td>
</tr>
</tbody>
</table>

Support for UTF-8 Character Data Entry

Cisco ISE fields that are exposed to the end user (through the Cisco NAC agent, or supplicants, or through the Sponsor, Guest, My Devices, and Client Provisioning portals) support UTF-8 character sets for all languages. UTF-8 is a multibyte-character encoding for the unicode character set, which includes many different language character sets, such as Hebrew, Sanskrit, and Arabic.
Character values are stored in UTF-8 in the administration configuration database, and the UTF-8 characters display correctly in reports and user interface components.

**UTF-8 Credential Authentication**

Network access authentication supports UTF-8 username and password credentials. This includes RADIUS, EAP, RADIUS proxy, RADIUS token, and web authentication from the Guest and Administrative portal login authentications. UTF-8 support for user name and password applies to authentication against the local identity store as well as external identity stores.

UTF-8 authentication depends on the client supplicant that is used for network login. Some Windows native supplicants do not support UTF-8 credentials.

---

### Note

RSA does not support UTF-8 users, hence UTF-8 authentication with RSA is not supported. Likewise, RSA servers, which are compatible with Cisco ISE, do not support UTF-8.

---

**UTF-8 Policies and Posture Assessment**

Policy rules in Cisco ISE that are conditioned on attribute values may include UTF-8 text. Rule evaluation supports UTF-8 attribute values. In addition, you can configure conditions with UTF-8 values through the Administrative portal.

Posture requirements can be modified as File, Application, and Service conditions based on a UTF-8 character set. This includes sending UTF-8 requirement values to the NAC agent. The NAC agent then assesses the endpoint accordingly, and reports UTF-8 values, when applicable.

**Cisco NAC and MAC Agent UTF-8 Support**

The Cisco NAC agent supports internationalization of text, messages, and any UTF-8 data that is exchanged with Cisco ISE. This includes requirement messages, requirement names, and file and process names that are used in conditions.

The following limitations apply:

- UTF-8 support applies to Windows-based NAC agents only.
- Cisco NAC and MAC agent interfaces currently do not support localization.
- WebAgent does not support UTF-8 based rules and requirements.
- If an acceptable use policy (AUP) is configured, the policy pages are provided on the client side, based on the browser locale and the set of languages that are specified in the configuration. You are responsible for providing a localized AUP bundle or site URL.

---

**UTF-8 Support for Messages Sent to Supplicant**

RSA prompts and messages are forwarded to the supplicant using a RADIUS attribute REPLY-MESSAGE, or within EAP data. If the text contains UTF-8 data, it is displayed by the supplicant, based on the client’s local operating system language support. Some Windows-native supplicants do not support UTF-8 credentials.

Cisco ISE prompts and messages may not be in sync with the locale of the client operating system on which the supplicant is running. You must align the end-user supplicant locale with the languages that are supported by Cisco ISE.
Reports and Alerts UTF-8 Support

Monitoring and troubleshooting reports and alerts support UTF-8 values for relevant attributes, for Cisco ISE supported languages, in the following ways:

- Viewing live authentications
- Viewing detailed pages of report records
- Exporting and saving reports
- Viewing the Cisco ISE dashboard
- Viewing alert information
- Viewing tcpdump data

UTF-8 Character Support in the Portals

Many more character sets are supported in Cisco ISE fields (UTF-8) than are currently supported for localizations in portals and end-user messages. For example, Cisco ISE does not support right-to-left languages, such as Hebrew or Arabic, even though the character sets themselves are supported.

The following table lists the fields in the Admin and end-user portals that support UTF-8 characters for data entry and viewing, with the following limitations:

- Cisco ISE does not support guest usernames and passwords with UTF-8 characters.
- Cisco ISE does not support UTF-8 characters in certificates.

**Table 2: Admin Portal UTF-8 Character Fields**

<table>
<thead>
<tr>

UTF-8 Support Outside the User Interface

This section contains the areas outside the Cisco ISE user interface that provide UTF-8 support.

Debug Log and CLI-Related UTF-8 Support

Attribute values and posture condition details appear in some debug logs; therefore, all debug logs accept UTF-8 values. You can download debug logs containing raw UTF-8 data that can be viewed with a UTF-8 supported viewer.

ACS Migration UTF-8 Support

Cisco ISE, allows for the migration of ACS UTF-8 configuration objects and values. Migration of some UTF-8 objects may not be supported by Cisco ISE UTF-8 languages, which might render some of the UTF-8 data that is provided during migration as unreadable using Administrative portal or report methods. You must convert unreadable UTF-8 values (that are migrated from ACS) into ASCII text. For more information about migrating from ACS to ISE, see the Cisco Secure ACS to Cisco ISE Migration Tool for your version of ISE.

Support for Importing and Exporting UTF-8 Values

The Admin and Sponsor portals support plain text and .csv files with UTF-8 values to be used when importing user account details. Exported files are provided as csv files.

UTF-8 Support on REST

UTF-8 values are supported on external REST communication. This applies to configurable items that have UTF-8 support in the Cisco ISE user interface, with the exception of admin authentication. Admin authentication on REST requires ASCII text credentials for login.

UTF-8 Support for Identity Stores Authorization Data

Cisco ISE allows Active Directory and LDAP to use UTF-8 data in authorization policies for policy processing.

MAC Address Normalization

ISE supports normalization of MAC address entered by you in any of the following formats:

- 00-11-22-33-44-55
- 0011.2233.4455
- 00:11:22:33:44:55
- 001122334455
- 001122-334455

For the following ISE windows, you can provide full or partial MAC address:

- Policy > Authorization
- Policy > Policy Elements > Conditions > Authorization
- Authentications > Filters (Endpoint and Identity columns)
• Global Search
• Operations > Reports > Reports Filters
• Operations > Diagnostic Tools > General Tools > Endpoint Debug

For the following ISE windows, you should provide full MAC address (six octets separated by ‘:’ or ‘-’ or ‘.’):

• Operations > Endpoint Protection Services
• Operations > Troubleshooting > Diagnostic Tools > General Tools > RADIUS Authentication Troubleshooting
• Operations > Troubleshooting > Diagnostic Tools > General Tools > Posture Troubleshooting
• Administration > Identities > Endpoints
• Administration > System > Deployment
• Administration > Logging > Collection Filter

REST APIs also support normalization of full MAC address.

Valid octet can contain only 0-9, a-f or A-F.

Admin Features Limited by Role-Based Access Control Policies

Cisco ISE provides role-based access control (RBAC) policies that ensure security by restricting administrative privileges. RBAC policies are associated with default admin groups to define roles and permissions. A standard set of permissions (for menu as well as data access) is paired with each of the predefined admin groups, and is thereby aligned with the associated role and job function.

Some features in the user interface require certain permissions for their use. If a feature is unavailable, or you are not allowed to perform a specific task, your admin group may not have the necessary permissions to perform the task that utilizes the feature.

Regardless of the level of access, any administrator account can modify or delete objects for which it has permission, on any page that it can access. Read-only functionality is unavailable for any administrative access.
Admin Features Limited by Role-Based Access Control Policies

Cisco ISE Deployment Terminology

The following terms are commonly used when discussing Cisco ISE deployment scenarios:

- **Service**—A service is a specific feature that a persona provides such as network access, profiler, posture, security group access, monitoring and troubleshooting, and so on.

- **Node**—A node is an individual instance that runs the Cisco ISE software. Cisco ISE is available as an appliance and also as a software that can be run on VMware. Each instance, appliance or VMware that runs the Cisco ISE software is called a node.

- **Persona**—The persona or personas of a node determine the services provided by a node. A Cisco ISE node can assume any of the following personas: Administration, Policy Service, Monitoring, pxGrid, and Inline Posture. The Inline Posture persona requires a dedicated Cisco ISE node. The menu options
that are available through the Admin portal are dependent on the role and personas that an Cisco ISE node assumes.

• Deployment Model—Determines if your deployment is distributed, standalone, or high availability in standalone, which is a basic two-node deployment.

Personas in Distributed Cisco ISE Deployments

A Cisco ISE node can assume the Administration, Policy Service, Monitoring, or Inline Posture personas.

A Cisco ISE node can provide various services based on the persona that it assumes. Each node in a deployment, with the exception of the Inline Posture node, can assume the Administration, Policy Service, and Monitoring personas. In a distributed deployment, you can have the following combination of nodes on your network:

• Primary and secondary Administration nodes for high availability
• A single or a pair of non-administration nodes for health check of Administration nodes for automatic failover
• A pair of health check nodes or a single health check node for PAN automatic failover
• One or more Policy Service nodes for session failover
• A pair of Inline Posture nodes for high availability

Cisco ISE Distributed Deployment

A deployment that has more than one Cisco ISE node is called a distributed deployment. To support failover and to improve performance, you can set up your deployment with multiple Cisco ISE nodes in a distributed fashion. In Cisco ISE distributed deployment, administration and monitoring activities are centralized, and processing is distributed across the Policy Service nodes. Depending on your performance needs, you can scale your deployment. Each Cisco ISE node in a deployment can assume any of the following personas: Administration, Policy Service, and Monitoring. The Inline Posture node cannot assume any other persona, due to its specialized nature. The Inline Posture node must be a dedicated node.

Cisco ISE Deployment Setup

After you install Cisco ISE on all your nodes, as described in the Cisco Identity Services Engine Hardware Installation Guide, the nodes come up in a standalone state. You must then define one node as your Primary PAN. While defining your Primary PAN, you must enable the Administration and Monitoring personas on that node. You can optionally enable the Policy Service persona on the Primary PAN. After you complete the task of defining personas on the Primary PAN, you can then register other secondary nodes to the Primary PAN and define personas for the secondary nodes.

All Cisco ISE system and functionality-related configurations should be done only on the Primary PAN. The configuration changes that you perform on the Primary PAN are replicated to all the secondary nodes in your deployment.

There must be at least one Monitoring node in a distributed deployment. At the time of configuring your Primary PAN, you must enable the Monitoring persona. After you register a Monitoring node in your deployment, you can edit the Primary PAN and disable the Monitoring persona, if required.
Data Replication from Primary to Secondary ISE Nodes

When you register an Cisco ISE node as a secondary node, Cisco ISE immediately creates a data replication channel from the primary to the secondary node and begins the process of replication. Replication is the process of sharing Cisco ISE configuration data from the primary to the secondary nodes. Replication ensures consistency among the configuration data present in all Cisco ISE nodes that are part of your deployment.

A full replication typically occurs when you first register an ISE node as a secondary node. Incremental replication occurs after a full replication and ensures that any new changes such as additions, modifications, or deletions to the configuration data in the PAN are reflected in the secondary nodes. The process of replication ensures that all Cisco ISE nodes in a deployment are in sync. You can view the status of replication in the Node Status column from the deployment pages of the Cisco ISE Admin portal. When you register a Cisco ISE node as a secondary node or perform a manual synchronization with the PAN, the node status shows an orange icon indicating that the requested action is in progress. Once it is complete, the node status turns green indicating that the secondary node is synchronized with the PAN. After the node status turns green, it takes about five minutes for the Cisco ISE application server to restart and run to complete the secondary ISE node configuration.

Cisco ISE Node Deregistration

To remove a node from a deployment, you must deregister it. When you deregister a secondary node from the Primary PAN, the status of the deregistered node changes to standalone and the connection between the primary and the secondary node will be lost. Replication updates are no longer sent to the deregistered standalone node.

Note

You cannot deregister a Primary PAN.

Guidelines for Setting Up a Distributed Deployment

Read the following statements carefully before you set up Cisco ISE in a distributed environment.

• Choose a node type, ISE node or Inline Posture node. For Administration, Policy Service, and Monitoring capabilities, you must choose an ISE node. For Inline Posture service, you must choose the Inline Posture node.

• Choose the same Network Time Protocol (NTP) server for all the nodes. To avoid timezone issues among the nodes, you must provide the same NTP server name during the setup of each node. This setting ensures that the reports and logs from the various nodes in your deployment are always synchronized with timestamps.

• Configure the Cisco ISE Admin password when you install Cisco ISE. The previous Cisco ISE Admin default login credentials (admin/cisco) are no longer valid. Use the username and password that was created during the initial setup or the current password if it was changed later.

• Configure the Domain Name System (DNS) server. Enter the IP addresses and fully qualified domain names (FQDNs) of all the Cisco ISE nodes that are part of your distributed deployment in the DNS server. Otherwise, node registration will fail.

• Configure the forward and reverse DNS lookup for all Cisco ISE nodes in your distributed deployment in the DNS server. Otherwise, you may run into deployment related issues when registering and restarting
Cisco ISE nodes. Performance might be degraded if reverse DNS lookup is not configured for all the nodes.

• (Optional) Deregister a secondary Cisco ISE node from the Primary PAN to uninstall Cisco ISE from it.

• Back up the primary Monitoring node, and restore the data to the new secondary Monitoring node. This ensures that the history of the primary Monitoring node is in sync with the new secondary node as new changes are replicated.

• Ensure that the Primary PAN and the standalone node that you are about to register as a secondary node are running the same version of Cisco ISE.

• Ensure that the database passwords of the primary and secondary nodes are the same. If these passwords are set differently during node installation, you can modify them using the following commands:

  • application reset-passwd ise internal-database-admin
  • application reset-passwd ise internal-database-user

### Menu Options Available on Primary and Secondary Nodes

The menu options available in Cisco ISE nodes that are part of a distributed deployment depend on the personas that are enabled on them. You must perform all administration and monitoring activities through the Primary PAN. For other tasks, you must use the secondary nodes. Therefore, the user interface of the secondary nodes provides limited menu options based on the persona that are enabled on them.

If a node assumes more than one persona, for example, the Policy Service persona, and a Monitoring persona with an Active role, then the menu options listed for Policy Service nodes and Active Monitoring node will be available on that node.

The following table lists the menu options that are available on Cisco ISE nodes that assume different persona.

<table>
<thead>
<tr>
<th>Cisco ISE Node</th>
<th>Available Menu Options</th>
</tr>
</thead>
</table>
| All Nodes      | • View and configure system time and NTP server settings.  
|                | • Install server certificate, manage certificate signing request.  
<p>|                | <strong>Note</strong> The server certificate operations must be performed directly on each individual node. The private keys are not stored in the local database and are not copied from the relevant node; the private keys are stored in the local file system. |
| Primary PAN    | All menus and sub-menus. |</p>
<table>
<thead>
<tr>
<th>Cisco ISE Node</th>
<th>Available Menu Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Monitoring Node</td>
<td>• Provides access to monitoring data (on both Primary and Active Monitoring nodes).</td>
</tr>
<tr>
<td>Policy Service Nodes</td>
<td>Option to join, leave, and test Active Directory connection. Each Policy Service node must be separately joined to the Active Directory domain. You must first define the domain information and join the PAN to the Active Directory domain. Then, join the other Policy Service nodes to the Active Directory domain individually.</td>
</tr>
<tr>
<td>Secondary PAN</td>
<td>Option to promote the Secondary PAN to become the Primary PAN.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> After you have registered the secondary nodes to the Primary PAN, while logging in to the Admin portal of any of the secondary nodes, you must use the login credentials of the Primary PAN.</td>
</tr>
</tbody>
</table>

Configure a Cisco ISE Node

After you install a Cisco ISE node, all the default services provided by the Administration, Policy Service, and Monitoring personas run on it. This node will be in a standalone state. You must log in to the Admin portal of the Cisco ISE node to configure it. You cannot edit the personas or services of a standalone Cisco ISE node. You can, however, edit the personas and services of the primary and secondary Cisco ISE nodes. You must first configure a primary ISE node and then register secondary ISE nodes to the primary ISE node.

If you are logging in to the node for the first time, you must change the default administrator password and install a valid license.

It is recommended not to change the host name and the domain name on Cisco ISE that have been configured or in production. If it is required, then reimage the appliance, make changes, and configure the details during the initial deployment.

**Before you begin**

You should have a basic understanding of how distributed deployments are set up in Cisco ISE. Read the guidelines for setting up a distributed deployment.

**Procedure**

1. Choose **Administration > System > Deployment**.
2. Check the check box next to the Cisco ISE node that you want to configure, and click **Edit**.
3. Enter the values as required and click **Save**.
Configure a Primary PAN

To set up a distributed deployment, you must first configure a Cisco ISE node as your Primary PAN.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Administration &gt; System &gt; Deployment. The Register button will be disabled initially. To enable this button, you must configure a Primary PAN.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Check the check box next to the current node, and click Edit.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click Make Primary to configure your Primary PAN.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Enter data on the General Settings tab.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Click Save to save the node configuration.</td>
</tr>
</tbody>
</table>

What to do next

1. Add secondary nodes to your deployment.
2. Enable the profiler service and configure the probes, if required.

Register a Secondary Cisco ISE Node

After you register the secondary node, the configuration of the secondary node is added to the database of the primary node and the application server on the secondary node is restarted. After the restart is complete, the secondary node will be running the personas and services that you have enabled on it. You can view all the configuration changes that you make from the Deployment page of the Primary PAN. However, expect a delay of 5 minutes for your changes to take effect and appear on the Deployment page.

Before you begin

Ensure that the primary node’s trusted certificate store has the appropriate certificate authority (CA) certificates to validate the HTTPS certificate of the secondary node that you are going to register. When you import the secondary node’s certificate into the trusted certificate store, check the Trust for authentication within ISE check box for the Primary PAN to validate the secondary node’s certificate.

After you register the secondary node to the primary node, if you change the HTTPS certificate on the secondary node, you must import the appropriate CA certificates into the trusted certificate store of the primary node.

The certificates that you import into the trusted certificate store of the Primary PAN are replicated to the secondary nodes.

We recommend that you decide on the type of node (Cisco ISE or Inline Posture) at the time of registration. If you want to change the node type later, you have to deregister the node from the deployment, restart Cisco ISE on the standalone node, and then reregister it.

If you plan to deploy two Administration nodes for high availability, register the Secondary PAN before you register the other secondary nodes. If you register the nodes in this sequence, you do not have to restart the secondary ISE nodes after you promote the Secondary PAN as your primary.
If you plan to deploy multiple Policy Service nodes running Session services with mutual failover among these nodes, place the Policy Service nodes in a node group. You must create the node group before you register the nodes.

**Procedure**

**Step 1** Log in to the Primary PAN.

**Step 2** Choose Administration > System > Deployment.

**Step 3** Choose Register > Register an Cisco ISE Node to register a secondary node.

**Step 4** Enter a DNS-resolvable hostname or IP address of the secondary node.

If you are using the hostname while registering the Cisco ISE node, the fully qualified domain name (FQDN) of the standalone node that you are going to register, for example, abc.xyz.com, must be DNS-resolvable from the Primary PAN. Otherwise, node registration fails. You must have previously defined the IP address and the FQDN of the secondary node in the DNS server.

**Step 5** Enter a UI-based administrator credential for the secondary node in the Username and Password fields.

**Step 6** Click Next.

Cisco ISE contacts the secondary node, obtains some basic information such as the hostname, default gateway, and so on, and displays it.

If you have chosen to register a secondary node, you can edit the configuration of the secondary node.

If you have chosen to register a secondary Inline Posture node, no additional configuration needs to be performed at this point.

**Step 7** Click Save.

After a secondary node is registered successfully, you will receive an alarm on your Primary PAN that confirms a successful node registration. If the secondary node fails to register with the Primary PAN, the alarm is not generated. When a node is registered, the application server on that node is restarted. After successful registration and database synchronization, enter the credentials of the Primary PAN to log in to the user interface of the secondary node.

**Note**

In addition to the existing Primary node in the deployment, when you successfully register a new node, no alarm corresponding to the newly registered node is displayed. The Configuration Changed alarms reflect information corresponding to the newly registered nodes. You can use this information to ascertain the successful registration of the new node.

**What to do next**

- For time-sensitive tasks such as guest user access and authorization, logging, and so on, ensure that the system time on your nodes is synchronized.

- If you registered a Secondary PAN, and will be using the internal Cisco ISE CA service, you must back up the Cisco ISE CA certificates and keys from the Primary PAN and restore them on the Secondary PAN.
Administration Node

A Cisco ISE node with the Administration persona allows you to perform all administrative operations on Cisco ISE. It handles all system-related configurations that are related to functionality such as authentication, authorization, auditing, and so on. In a distributed environment, you can have a maximum of two nodes running the administration persona. The administration persona can take on any one of the following roles: Standalone, Primary, or Secondary.

High Availability for the Administrative Node

In a high-availability configuration, the Primary PAN is in the active state, which means that all configuration changes are made there. The Secondary PAN (backup PAN) is in the standby state, which means it receives all configuration updates from the Primary PAN. The secondary PAN is continuously synchronized with the Primary PAN.

If the Primary PAN goes down, you must log in to the user interface of the Secondary PAN and manually promote the Secondary PAN. There is no automatic failover for the Administration persona.

When the Primary PAN is down, sponsors cannot create new guest accounts. During this time, guest and sponsor portals will provide read-only access to already created guests and sponsors, respectively. Also, a sponsor who has never logged in to the sponsor portal before the Primary PAN goes offline, will not be able to log in to the sponsor portal until a Secondary PAN is promoted or the Primary PAN becomes available.

At least one node in your distributed setup must assume the Administration persona.

The following table lists a set of features and specifies whether they are available or not when the Primary PAN goes down.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Available When the Primary PAN Goes Down (Yes/No)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Existing internal user RADIUS authentication</td>
<td>Yes</td>
</tr>
<tr>
<td>Existing or New AD user RADIUS authentication</td>
<td>Yes</td>
</tr>
<tr>
<td>Existing endpoint with no profile change</td>
<td>Yes</td>
</tr>
<tr>
<td>Existing endpoint with profile change</td>
<td>Yes</td>
</tr>
<tr>
<td>New endpoint learned through profiling</td>
<td>Yes</td>
</tr>
<tr>
<td>Existing guest – LWA</td>
<td>Yes</td>
</tr>
<tr>
<td>Existing guest – CWA</td>
<td>Yes</td>
</tr>
<tr>
<td>Guest change password</td>
<td>No (Guest must log in with old password)</td>
</tr>
<tr>
<td>Guest – AUP</td>
<td>Yes</td>
</tr>
<tr>
<td>Guest – Max Failed Login Enforcement</td>
<td>No</td>
</tr>
<tr>
<td>New Guest (Sponsored or Self-registered)</td>
<td>No</td>
</tr>
<tr>
<td>Posture</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Manually Promote Secondary PAN To Primary

If the Primary PAN fails and you have not configured PAN auto-failover, you must manually promote the Secondary PAN to become the new Primary PAN.

Before you begin

Ensure that you have a second Cisco ISE node configured with the Administration persona to promote as your Primary PAN.

Procedure

Step 1 Log in to the user interface of the Secondary PAN.

Step 2 Choose Administration > System > Deployment.

Step 3 In the Edit Node page, click Promote to Primary.

You can only promote a Secondary PAN to become the Primary PAN. Cisco ISE nodes that assume only the Policy Service or Monitoring persona, or both, cannot be promoted to become the Primary PAN.

Step 4 Click Save.

What to do next

If the node that was originally the Primary PAN comes back up, it will be demoted automatically and become the Secondary PAN. You must perform a manual synchronization on this node (that was originally the Primary PAN) to bring it back into the deployment.

In the Edit Node page of a secondary node, you cannot modify the personas or services because the options are disabled. You have to log in to the Admin portal to make changes.

Policy Service Node

A Cisco ISE node with the Policy Service persona provides network access, posture, guest access, client provisioning, and profiling services. This persona evaluates the policies and makes all the decisions. You can have more than one node assume this persona. Typically, there would be more than one Policy Service node in a distributed deployment. All Policy Service nodes that reside in the same high-speed Local Area Network (LAN) or behind a load balancer can be grouped together to form a node group. If one of the nodes in a node group fails, the other nodes detect the failure and reset any URL-redirected sessions.

### Table: Available When the Primary PAN Goes Down

<table>
<thead>
<tr>
<th>Feature</th>
<th>Available When the Primary PAN Goes Down (Yes/No)</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Device Registration</td>
<td>No</td>
</tr>
<tr>
<td>Existing Registered Devices</td>
<td>Yes</td>
</tr>
<tr>
<td>pxGrid</td>
<td>No</td>
</tr>
</tbody>
</table>
At least one node in your distributed setup should assume the Policy Service persona.

**High Availability in Policy Service Nodes**

To detect node failure and to reset all URL-redirected sessions on the failed node, two or more Policy Service nodes can be placed in the same node group. When a node that belongs to a node group fails, another node in the same node group issues a Change of Authorization (CoA) for all URL-redirected sessions on the failed node.

All the nodes within the same node group should be configured on the network access device (NAD) as RADIUS clients and authorized for CoA, because any one of them can issue a CoA request for the sessions that are established through any node in the node group. If you are not using a load balancer, the nodes in a node group should be the same as, or a subset of, the RADIUS servers and clients configured on the NAD. These nodes would also be configured as RADIUS servers.

While a single NAD can be configured with many ISE nodes as RADIUS servers and dynamic-authorization clients, it is not necessary for all the nodes to be in the same node group.

The members of a node group should be connected to each other using high-speed LAN connection such as Gigabit Ethernet. The node group members need not be L2 adjacent, but L2 adjacency is highly recommended to ensure sufficient bandwidth and reachability. See Create a Policy Service Node Group, on page 47 section for more details.

**Load Balancer To Distribute Requests Evenly Among PSNs**

When you have multiple Policy Service nodes in the deployment, you can use a load balancer to distribute the requests evenly. The load balancer distributes the requests to the functional nodes behind it. Refer to the Cisco and F5 Deployment Guide: ISE Load Balancing using BIG-IP for information on and best practices about deploying PSNs behind a load balancer.

**Session Failover in Policy Service Nodes**

When a Policy Service node that has active URL-redirected sessions fails, the endpoints are stuck in an intermediate state. Even if the redirect endpoint detects that the Policy Service node that it has been communicating with has failed, it cannot re-initiate authorization.

If the Policy Service nodes are part of a node group, the nodes within a node group exchange heartbeat messages to detect node failures. If a node fails, one of its peers from the node group learns about the active URL-redirected sessions on the failed node and issues a CoA to disconnect those sessions.

As a result, the sessions are handled by another Policy Service node that is available in the same node group. The session failover does not automatically move the sessions over from a Policy Service node that has gone down to one that is available, but issues a CoA to achieve that.

The Policy Service nodes in a distributed deployment do not share their Machine Access Restriction (MAR) cache with each other. If you have enabled the MAR feature in Cisco ISE and the client machine is authenticated by a Policy Service node that fails, then another Policy Service node in the deployment handles the user authentication. However, the user authentication fails because the second Policy Service node does not have the host authentication information in its MAR cache.
Number of Nodes in a Policy Service Node Group

The number of nodes that you can have in a node group depends on your deployment requirements. Node groups ensure that node failures are detected and that a peer issues a CoA for sessions that are authorized, but not yet postured. The size of the node group does not have to be very large.

If the size of the node group increases, the number of messages and heartbeats that are exchanged between nodes increases significantly. As a result, traffic also increases. Having fewer nodes in a node group helps reduce the traffic and at the same time provides sufficient redundancy to detect Policy Service node failures.

There is no hard limit on the number of Policy Service nodes that you can have in a node group cluster.

Monitoring Node

A Cisco ISE node with the Monitoring persona functions as the log collector and stores log messages from all the administration and Policy Service nodes in your network. This persona provides advanced monitoring and troubleshooting tools that you can use to effectively manage your network and resources. A node with this persona aggregates and correlates the data that it collects to provide you with meaningful information in the form of reports.

Cisco ISE allows you to have a maximum of two nodes with this persona that can take on primary or secondary roles for high availability. Both the primary and secondary Monitoring nodes collect log messages. In case the primary Monitoring node goes down, the secondary Monitoring node automatically becomes the primary Monitoring node.

At least one node in your distributed setup should assume the Monitoring persona. We recommend that you not have the Monitoring and Policy Service personas enabled on the same Cisco ISE node. We recommend that the node be dedicated solely to monitoring for optimum performance.

You can access the Monitoring menu from the PAN and the Primary Monitoring Node in your deployment.

Automatic Failover in Monitoring Nodes

The term automatic failover is used because high availability is not supported on Monitoring nodes in the true sense. For Monitoring nodes, operation audit data is duplicated by the Policy Service node(s), which then sends copies to both the primary and secondary Monitoring nodes.

Note

Monitoring is served from the primary (active) Monitoring node. Monitoring data is only served from the secondary (standby) Monitoring node when the active node is down. The secondary monitoring node is read-only.

Automatic Failover Process

When a primary Monitoring node goes down, the secondary Monitoring node takes over all monitoring and troubleshooting information. The secondary node provides read-only capabilities.

To convert the existing secondary node to an active primary node, the administrator must first manually promote the secondary node to a primary role. If the primary node comes back up after the secondary node has been promoted, it assumes the secondary role. If the secondary node was not promoted, the primary Monitoring node will resume its role after it comes back up.
Caution
When the primary node comes back up after a failover, obtain a backup and restore the data to update the primary node.

Guidelines for Setting Up an Active-Standby Pair of Monitoring Nodes

You can specify two Monitoring nodes on an ISE network and create an active-standby pair. When you register a secondary Monitoring node, we recommend that you back up the primary Monitoring node and then restore the data to the new secondary Monitoring node. This ensures that the history of the primary Monitoring node is in sync with the new secondary node as new changes are replicated. Once the active-standby pair is defined, the following rules apply:

• All changes must be made on the primary Monitoring node. The secondary node is read-only.
• Changes made to the primary node are automatically replicated on the secondary node.
• Both the primary and secondary nodes are listed as log collectors to which all other nodes send logs.
• The Cisco ISE dashboard is the main entry point for monitoring and troubleshooting. Monitoring information is displayed on the dashboard from the primary Monitoring node. If the primary node goes down, the information is served from the secondary node.
• Backing up and purging monitoring data is not part of a standard Cisco ISE node backup process. You must configure repositories for backup and data purging on both the primary and secondary Monitoring nodes, and use the same repositories for each.

Monitoring Node Failover Scenarios
The following scenarios apply to the active-standby or single node configurations corresponding to the monitoring nodes:

• In an active-standby configuration of the monitoring nodes, the Primary Administration Node (PAN) always points to the active monitoring node to collect the monitoring data. After the active monitoring node fails, the PAN points to the standby monitoring node. The failover from the active monitoring node to the standby monitoring node happens after it is down for more than 5 minutes.

However, after the active node fails, the standby node does not become the active node. In case the active node comes up, the Administration node starts collecting the monitoring data again from the resumed active node.

• During the time that the active monitoring node is down, if you want to promote the standby monitoring node to active status, you must de-register the existing active monitoring node. When you de-register the existing active monitoring node, the standby node becomes the active monitoring node and the PAN automatically starts pointing to the newly promoted active node.

• In an active-standby pair, if you choose to de-register the standby monitoring node from the deployment or if the standby monitoring node goes down, the existing active monitoring node still retains the active node status. The PAN points to the existing active node for data collection.

• If there is only one monitoring node in the ISE deployment, then that node acts as the active monitoring node that provides monitoring data to the PAN. However, when you register a new monitoring node and make it the active node in the deployment, the existing active monitoring node automatically becomes the standby node. The PAN begins to point to the newly registered active monitoring node for collecting monitoring data.
**pxGrid Node**

You can use Cisco pxGrid to share the context-sensitive information from Cisco ISE session directory with other network systems such as ISE Eco system partner systems and other Cisco platforms. The pxGrid framework can also be used to exchange policy and configuration data between nodes like sharing tags and policy objects between Cisco ISE and third party vendors, and for other information exchanges. pxGrid also allows 3rd party systems to invoke adaptive network control actions (EPS) to quarantine users/devices in response to a network or security event. The TrustSec information like tag definition, value, and description can be passed from Cisco ISE via TrustSec topic to other networks. The endpoint profiles with Fully Qualified Names (FQNs) can be passed from Cisco ISE to other networks through a endpoint profile meta topic. Cisco pxGrid also supports bulk download of tags and endpoint profiles.

In a high-availability configuration, Cisco pxGrid servers replicate information between the nodes through the PAN. When the PAN goes down, pxGrid server stops handling the client registration and subscription. You need to manually promote the PAN for the pxGrid server to become active.

For XMPP (Extensible Messaging and Presence Protocol) clients, pxGrid nodes work in Active/Standby high availability mode which means that the pxGrid Service is in "running" state on the active node and in "disabled" state on the standby node.

After the automatic failover to the secondary pxGrid node is initiated, if the original primary pxGrid node is brought back into the network, the original primary pxGrid node will continue to have the secondary role and will not be promoted back to the primary role unless the current primary node goes down.

---

**Note**

At times, the original primary pxGrid node might be automatically promoted back to the primary role.

---

In a high availability deployment, when the primary pxGrid node goes down, it might take around 3 to 5 minutes to switchover to the secondary pxGrid node. It is recommended that the client waits for the switchover to complete, before clearing the cache data in case of primary pxGrid node failure.

The following logs are available for pxGrid node:

- `pxgrid.log`—State change notifications.
- `pxgrid-cm.log`—Updates on publisher/subscriber and data exchange activity between client and server.
- `pxgrid-controller.log`—Displays the details of client capabilities, groups, and client authorization.
- `pxgrid-jabberd.log`—All logs related to system state and authentication.
- `pxgrid-pubsub.log`—Information related to publisher and subscriber events.

**pxGrid Client and Capability Management**

Clients connected to Cisco ISE need to register to use the pxGrid services. pxGrid clients should adopt the pxGrid Client Library available from Cisco through the pxGrid SDK to become the clients. Cisco pxGrid clients need an approved account to participate in pxGrid services. Cisco ISE supports both auto and manual approvals. A client can log in to pxGrid using a unique name and certificate-based mutual authentication. Similar to the AAA setting on a switch, clients can connect to either a configured pxGrid server host-name or an IP Address.
Capabilities are information topics or channels created on pxGrid for clients to publish and subscribe. In Cisco ISE, only capabilities such as Identity, adaptive network control, and SGA are supported. You can enable or disable capabilities. If disabled, the client is unsubscribed. Capability information is available from the publisher through publish, directed query, or bulk download query.

**Related Topics**
- Generate pxGrid Certificate

## Enable pxGrid Clients

### Before you begin
- Enable the pxGrid persona on at least one node to view the requests from the Cisco pxGrid clients.
- Enable Identity Mapping. For more information, see Configure Identity Mapping, on page 43.

### Procedure

1. **Step 1** Choose Administration > pxGrid Services.
2. **Step 2** Check the checkbox next to the client and click Approve.
3. **Step 3** To view the capabilities, click View by Capabilities at the top-right.
4. **Step 4** Click Refresh to view the latest status.

## Cisco pxGrid Live Logs

The Live Logs page displays all the pxGrid management events. Event info includes the client and capability names along with the event type and timestamp.

Navigate to Administration > pxGrid Services > Live Log to view the list of events. You can also clear the logs and resynchronize or refresh the list.

## ISE pxGrid Identity Mapping

Identity Mapping enables you to monitor users that are authenticated by a Domain Controller (DC) and not by Cisco ISE. In networks where Cisco ISE does not actively authenticate users for network access, it is possible to use Identity Mapping to collect user authentication information from the active directory (AD) Domain Controller. The Identity Mapping connects to Windows system using the MS WMI interface and queries logs from the Windows event messaging. Once a user logs into the network and is authenticated with an Active Directory, the Domain Controller generates an event log that includes the user name and IP address allocated for the user.

Identity mapping can also be activated even if Cisco ISE plays an active role for authentication. In such cases, the same session may be identified twice. The operational data has a session attribute that indicates the source. You can go to Operations > Authentications and click Show Live Sessions to check the Session Source.

The Identity Mapping component retrieves the user logins from the Domain Controller and imports them into the Cisco ISE session directory. So users authenticated with Active Directory (AD) are shown in the Cisco
ISE live sessions view, and can be queried from the session directory using Cisco pxGrid interface by third-party applications. The known information is the user name, IP address, and the AD DC host name and the AD DC NetBIos name.

The Cisco ISE plays only a passive role and does not perform the authentication. When Identity Mapping is active, Cisco ISE collects the login information from the AD and includes the data into the session directory.

**Key Features**

- Identity Mapping is configured from the Cisco ISE administration console. The configuration includes the following settings:
  - Definition of all the DCs from which Identity Mapping is to collect user authentication information. This also includes import and export of the DC list using *.csv files
  - DC connection characteristics such as authentication security protocol (NTLMv1 or NTLMv2) and user session aging time
  - Connection testing, to verify the DC is set correctly to initialize valid connection with Identity Mapping
- Identity Mapping report. This report provides information about the Identity Mapping component for troubleshooting
- Identity Mapping debug logs
- Cisco ISE session directory maintains the collected user information, so that customers can view it from the Live Sessions and query it from the pxGrid interface
- Using the CLI command **show application status** provides the health status of nodes that use Identity Mapping
- Supports High Availability

**Configuring Identity Mapping**

ID Mapping requires configuration in ISE, and the Active Directory Domain Server must have the right patches and configuration.

**Configure Identity Mapping**

ISE must be able to establish a connection with an AD Domain Controller (DC).

**Before you begin**

Enable pxGrid services to configure Identity Mapping. Choose **Administration > System > Deployment** to enable pxGrid services.

To add a new Domain Controller (DC) for Identity Mapping, you need the login credentials of that DC. Make sure the Domain Controller is properly configured for ISE Identity Mapping.
**Procedure**

**Step 1** Choose Administration > pxGrid Identity Mapping > AD Domain Controller.

**Step 2** Click General Settings.

**Step 3** The Active Directory General Settings pop-up is displayed. Set the required values and click Save.

- **History interval** is the time during which Identity Mapping reads user login information that already occurred. This is required upon startup or restart of Identity Mapping to catch up with events generated while it was unavailable.

- **User session aging time** is the amount of time the user can be logged in. Identity Mapping identifies new user login events from the DC, however the DC does not report when the user logs off. The aging time enables Cisco ISE to determine the time interval for which the user is logged in.

- You can select either NTLMv1 or NTLMv2 as the communications protocol between the ISE and the DC.

**Step 4** Click Add.

**Step 5** In the General Settings section, enter the Display Name, Domain FQDN, and Host FQDN of the DC.

**Step 6** In the Credentials section, enter the Username and Password of the DC.

**Step 7** (Optional) Test the connection to the specified domain by clicking Verify DC Connection Settings. This test ensures that the connection to the DC is healthy. However it does not check whether Cisco ISE can fetch the user information upon login.

**Step 8** Click Submit. An updated table is displayed with the newly-defined DC included in the list of DCs. The status column indicates the different states of DC.

You can also Import or Export the DC list.

**Note** While importing, you need to provide the password in the template. As the file contains password, the import template should be treated as sensitive. The Export option does not export the password.

---

**Filter Identity Mapping**

You can filter certain users, based on their name or IP address. You can add as many filters as needed. The “OR” logic operator applies between filters. If both the fields are specified in a single filter, the “AND” logic operator applies between these fields. The Monitoring live session shows Identity Mapping components that are not filtered out by the Mapping Filters.

**Procedure**

**Step 1** Choose Administration > pxGrid Identity Mapping > Mapping Filters.

**Step 2** Click Add, enter the Username and or IP address of the user you want to filter and click Submit.

**Step 3** To view the non-filtered users that are currently logged into the Monitoring session directory, choose Operations > Authentications.
Inline Posture Node

An Inline Posture node is a gatekeeping node that is positioned behind network access devices such as Wireless LAN Controllers (WLC) and VPN concentrators on the network. The Inline Posture node enforces access policies after a user has been authenticated and granted access, and handles change of authorization (CoA) requests that a WLC or VPN are unable to accommodate. Cisco ISE allows you to have two Inline Posture nodes that can take on primary or secondary roles for high availability.

The Inline Posture node must be a dedicated node. It must be dedicated solely for inline posture service, and cannot operate concurrently with other Cisco ISE services. Likewise, due to the specialized nature of its service, an Inline Posture node cannot assume any persona. For example, it cannot act as an Administration node that offers administration service, or a Policy Service node that offers network access, posture, profile, and guest services, or a Monitoring node that offers monitoring and troubleshooting services for a Cisco ISE network.

The Inline Posture persona is not supported on the Cisco ISE 3495 platform. Ensure that you install the Inline Posture persona on any one of the following supported platforms: Cisco ISE 3315, Cisco ISE 3355, Cisco ISE 3395, or Cisco ISE 3415.

You cannot access the web-based user interface of the Inline Posture nodes. You can configure them only from the PAN.

Inline Posture Node Installation

You must download the Inline Posture ISO (IPN ISO) image from Cisco.com and install it on any of the supported platforms. You must then configure certificates through the Command Line Interface (CLI). You can then register this node from the Admin portal.

There is no separate Inline Posture ISO image for Release 1.3. Use the 1.2 IPN ISO image to install and set up an inline posture node.

After you install and set up the Inline Posture application, you must configure certificates before you can register the Inline Posture nodes. See the Cisco Identity Services Engine Hardware Installation Guide for more information.

Register an Inline Posture Node

We recommend that you decide on the type of node (Cisco ISE or Inline Posture) at the time of registration. If you want to change the node type later, you have to deregister the node from the deployment, restart Cisco ISE on the standalone node, and then reregister it.

Before you begin

- Ensure that the primary node’s Certificate Trust List (CTL) has the appropriate certificate authority (CA) certificates to validate the HTTPS certificate of the secondary node that you are going to register.
- After you register the secondary node to the primary node, if you change the HTTPS certificate on the secondary node, you must import the appropriate CA certificates into the CTL of the primary node.
Procedure

Step 1 Log in to the PAN.
Step 2 Choose Administration > System > Deployment.
Step 3 Click Deployment from the navigation pane on the left.
Step 4 Choose Register > Register an Inline Posture Node to register a secondary Inline Posture node.

View Nodes in a Deployment

In the Deployment Nodes page, you can view all the Cisco ISE nodes, primary and secondary, that are part of your deployment.

Procedure

Step 1 Log in to the primary Cisco ISE Admin portal.
Step 2 Choose Administration > System > Deployment.
Step 3 Click Deployment from the navigation pane on the left.

All the Cisco ISE nodes that are part of your deployment are listed.

Synchronize Primary and Secondary Cisco ISE Nodes

You can make configuration changes to Cisco ISE only through the Primary PAN. The configuration changes get replicated to all the secondary nodes. If, for some reason, this replication does not occur properly, you can manually synchronize the Secondary PAN with the Primary PAN.

Before you begin

You must click the Syncup button to force a full replication if the Sync Status is set to Out of Sync or if the Replication Status is Failed or Disabled.

Procedure

Step 1 Log in to the Primary PAN.
Step 2 Choose Administration > System > Deployment.
Step 3 Check the check box next to the node that you want to synchronize with the Primary PAN, and click Syncup to force a full database replication.
Change Node Personas and Services

You can edit the Cisco ISE node configuration to change the personas and services that run on the node.

**Before you begin**

- When you enable or disable any of the services that run on a Policy Service node or make any changes to a Policy Service node, you will be restarting the application server processes on which these services run. Expect a delay while these services restart.

**Procedure**

1. Log in to the Primary PAN.
2. Choose Administration > System > Deployment.
3. Check the check box next to the node whose personas or services you want to change, and then click Edit.
4. Choose the personas and services that you want.
5. Click Save.
6. Verify receipt of an alarm on your Primary PAN to confirm the persona or service change. If the persona or service change is not saved successfully, an alarm is not generated.

**Effects of Modifying Nodes in Cisco ISE**

When you make any of the following changes to a node in a Cisco ISEISE, that node restarts, which causes a delay:

- Register a node (Standalone to Secondary)
- Deregister a node (Secondary to Standalone)
- Change a primary node to Standalone (if no other nodes are registered with it; Primary to Standalone)
- Promote an Administration node (Secondary to Primary)
- Change the personas (when you assign or remove the Policy Service or Monitoring persona from a node)
- Modify the services in the Policy Service node (enable or disable the session and profiler services)
- Restore a backup on the primary and a sync up operation is triggered to replicate data from primary to secondary nodes

**Create a Policy Service Node Group**

When two or more Policy Service nodes (PSNs) are connected to the same high-speed Local Area Network (LAN), we recommend that you place them in the same node group. This design optimizes the replication of endpoint profiling data by retaining less significant attributes local to the group and reducing the information
that is replicated to the remote nodes in the network. Node group members also check on the availability of peer group members. If the group detects that a member has failed, it attempts to reset and recover all URL-redirected sessions on the failed node.

Note

We recommend that you make all PSNs in the same local network part of the same node group. PSNs need not be part of a load-balanced cluster to join the same node group. However, each local PSN in a load-balanced cluster should typically be part of the same node group.

Before you can add PSNs as members to a node group, you must create the node group first. You can create, edit, and delete Policy Service node groups from the Deployment pages of the Admin portal.

Before you begin

Node group members can communicate over TCP/7800.

Procedure

Step 1 Choose Administration > System > Deployment.
Step 2 Click the action icon, and then click Create Node Group.
Step 3 Enter a unique name for your node group.
Step 4 (Optional) Enter a description for your node group.
Step 5 Click Submit to save the node group.

After you save the node group, it should appear in the navigation pane on the left. If you do not see the node group in the left pane, it may be hidden. Click the Expand button on the navigation pane to view the hidden objects.

What to do next

Add a node to a node group. Edit the node by choosing the node group from the Member of Node Group drop-down list.

Deploy pxGrid Node

You can enable Cisco pxGrid persona both on a standalone node and distributed deployment node.

Before you begin

- You need a Plus license to enable the Cisco pxGrid persona.
- Cisco pxGrid services running on a Cisco ISE SNS 3415/3495 Appliance or in VMWare.
- All nodes are configured to use the CA certificate for pxGrid usage. If default certificate is used for pxGrid before upgrade, it will be replaced by the internal CA certificate after upgrade.
- If you are using a distributed deployment or upgrading from Cisco ISE 1.2, then you need to enable the pxGrid Usage option for the certificates. To enable the pxGrid Usage option, go to Administration >
Certificates > System Certificates. Choose the certificate being used in the deployment and click Edit. Check the pxGrid: use certificate for the pxGrid Controller checkbox.

Procedure

Step 1
Choose Administration > System > Deployment.

Step 2
In the Deployment Nodes page, check the check box next to the node to which you want to enable the pxGrid services, and click Edit.

Step 3
Click the General Settings tab and check the pxGrid checkbox.

Step 4
Click Save.

When you upgrade from the previous version, the Save option might be disabled. This happens when the browser cache refers to the old files from the previous version of Cisco ISE. Clear the browser cache to enable the Save option.

Configure Monitoring Nodes for Automatic Failover

If you have two Monitoring nodes in a deployment, you can configure a primary-secondary pair for automatic failover to avoid downtime in the Cisco ISE Monitoring service. A primary-secondary pair ensures that a secondary Monitoring node automatically provides monitoring should the primary node fail.

Before you begin

• Before you can configure Monitoring nodes for automatic failover, they must be registered as Cisco ISE nodes.

• Configure monitoring roles and services on both nodes and name them for their primary and secondary roles, as appropriate.

• Configure repositories for backup and data purging on both the primary and secondary Monitoring nodes. For the backup and purging features to work properly, use the same repositories for both the nodes. Purging takes place on both the primary and secondary nodes of a redundant pair. For example, if the primary Monitoring node uses two repositories for backup and purging, you must specify the same repositories for the secondary node.

Configure a data repository for a Monitoring node using the repository command in the system CLI.

Caution

For scheduled backup and purge to work properly on the nodes of a Monitoring redundant pair, configure the same repository, or repositories, on both the primary and secondary nodes using the CLI. The repositories are not automatically synced between the two nodes.

From the Cisco ISE dashboard, verify that the Monitoring nodes are ready. The System Summary dashlet shows the Monitoring nodes with a green check mark to the left when their services are ready.
Procedure

Step 1 Choose Administration > System > Deployment.
Step 2 In the Deployment Nodes page, check the check box next to the Monitoring node that you want to specify as active, and click Edit.
Step 3 Click the General Settings tab and choose Primary from the Role drop-down list.
   When you choose a Monitoring node as primary, the other Monitoring node automatically becomes secondary.
   In the case of a standalone deployment, primary and secondary role configuration is disabled.
Step 4 Click Save. The active and standby nodes restart.

Remove a Node from Deployment

To remove a node from a deployment, you must deregister it. The deregistered node becomes a standalone Cisco ISE node.

It retains the last configuration that it received from the Primary PAN and assumes the default personas of a standalone node that are Administration, Policy Service, and Monitoring. If you deregister a Monitoring node, this node will no longer be a syslog target.

You can view these changes from the Deployment page of the Primary PAN. However, expect a delay of 5 minutes for the changes to take effect and appear on the Deployment page.

Before you begin
Before you remove any secondary node from a deployment, perform a backup of Cisco ISE configuration, which you can then restore later on, if needed.

Procedure

Step 1 Choose Administration > System > Deployment.
Step 2 Check the check box next to the secondary node that you want to remove, and then click Deregister.
Step 3 Click OK.
Step 4 Verify receipt of an alarm on your Primary PAN to confirm that the secondary node is deregistered successfully. If the secondary node fails to deregister from the Primary PAN, the alarm is not generated.

Change the Hostname or IP Address of a Standalone Cisco ISE Node

You can change the hostname, IP address, or domain name of standalone Cisco ISE nodes. You cannot use "localhost" as the hostname for a node.
Before you begin

If the Cisco ISE node is part of a distributed deployment, you must first remove it from the deployment and ensure that it is a standalone node.

Procedure

Step 1  Change the hostname or IP address of the Cisco ISE node using the `hostname`, `ip address`, or `ip domain-name` command from the Cisco ISE CLI.

Step 2  Reset the Cisco ISE application configuration using the `application stop ise` command from the Cisco ISE CLI to restart all the services.

Step 3  Register the Cisco ISE node to the Primary PAN if it is part of a distributed deployment.

Note  If you are using the hostname while registering the Cisco ISE node, the fully qualified domain name (FQDN) of the standalone node that you are going to register, for example, `abc.xyz.com` must be DNS-resolvable from the Primary PAN. Otherwise, node registration fails. You must enter the IP addresses and FQDNs of the Cisco ISE nodes that are part of your distributed deployment in the DNS server.

After you register the Cisco ISE node as a secondary node, the Primary PAN replicates the change in the IP address, hostname, or domain name to the other Cisco ISE nodes in your deployment.

Replace the Cisco ISE Appliance Hardware

You should replace the Cisco ISE appliance hardware only if there is an issue with the hardware. For any software issues, you can reimage the appliance and reinstall the Cisco ISE software.

Procedure

Step 1  Re-image or re-install the Cisco ISE software on the new nodes.

Step 2  Obtain a license with the UDI for the Primary and Secondary PANs and install it on the Primary PAN.

Step 3  Restore the backup on the replaced Primary PAN.

The restore script will try to sync the data on the Secondary PAN, but the Secondary PAN is now a standalone node and the sync will fail. Data is set to the time the backup was taken on the Primary PAN.

Step 4  Register the new node as a secondary server with the Primary PAN.
Replace the Cisco ISE Appliance Hardware
Set Up Inline Posture

- Role of Inline Posture Node in a Cisco ISE Deployment, on page 53

Role of Inline Posture Node in a Cisco ISE Deployment

An Inline Posture node is a gatekeeper that enforces access policies and handles change of authorization (CoA) requests. An Inline Posture node is positioned behind the network access devices on your network that are unable to accommodate CoA requests, such as wireless LAN controllers (WLCs) and VPN devices.

After the initial authentication of a client using the EAP/802.1x and RADIUS protocols, the client must go through posture assessment. The posture assessment process determines whether the client should be restricted, denied, or allowed full access to the network. When a client accesses the network through a WLC or VPN device, an Inline Posture node is responsible for the policy enforcement and CoA that these devices are unable to accommodate.

Note

Starting from Release 1.3, Cisco ISE does not include a separate ISO image for Inline Posture. You can continue to use the existing Release 1.2 Inline Posture nodes in the deployment.

Inline Posture Policy Enforcement

Inline Posture uses RADIUS proxy and URL redirect capabilities in the control plane to manage data plane traffic for endpoints. As a RADIUS proxy, Inline Posture is able to tap into RADIUS sessions between network...
access devices (NADs) and RADIUS servers. NADs can open full gate to client traffic. However, Inline Posture opens only enough to allow limited traffic from clients. The restricted bandwidth allows clients the ability to have an agent provisioned, posture assessed, and remediation completed. This restriction is accomplished by downloading and installing Downloadable Access Control Lists (DACLs) that are tailored for specific client flows.

When the client is compliant, a CoA is sent to the Inline Posture node by the Policy Service node, and full gate is opened by the Inline Posture node for the compliant client endpoint. The RADIUS proxy downloads the full-access DACL, installs it, and associates the client IP address to it. The installed DACL can be common for a number of user groups, and therefore duplicate downloads are not necessary as long as the DACL content does not change in the Cisco ISE servers.

**Inline Posture Policy Enforcement Flow**

The following figure illustrates the Inline Posture policy enforcement process and shows the flow for WLC enforcement for traffic to the Policy Service node. The access steps are similar for an inline deployment with VPN gateways.

*Figure 4: Inline Posture Policy Enforcement Flow*

1. The endpoint initiates a .1X connection to the wireless network.
2. The WLC, which is a NAD, sends a RADIUS Access-Request message to the RADIUS server, which is usually the Policy Service node (in this illustration, the RADIUS Access-Request message is sent to the Inline Posture node).
3. The Inline Posture node, acting as a RADIUS proxy, relays the Access-Request message to the RADIUS server.
4. After authenticating the user, the RADIUS server sends a RADIUS Access-Accept message back to the Inline Posture node.
There can be a number of RADIUS transactions between the Endpoint, WLC, Inline Posture node, and the Cisco ISE RADIUS server before the Access-Accept message is sent. The process described in this example has been simplified for the sake of brevity.

5. The Inline Posture node passes the Access-Accept message to the WLC, which in turn authorizes the endpoint access, in accordance with the profile that accompanied the message.

6. The proxied Access-Accept message triggers the Inline Posture node to send an Authorization-Only request to the Policy Service node to retrieve the profile for the session.

7. The Policy Service node returns an Access-Accept message, along with the necessary Inline Posture node profile.

8. If the access control list (ACL) that is defined in the profile is not already available on the Inline Posture node, the Inline Posture node downloads it from the Policy Service node using a RADIUS request (to the Cisco ISE RADIUS server).

9. The Cisco ISE RADIUS server sends the complete ACL in response. It is then installed in the Inline Posture data plane so that endpoint traffic passes through it.

   There may be a number of transactions before the complete ACL is downloaded, especially if the ACL is too large for one transaction.

10. As the endpoint traffic arrives at the WLC, the WLC sends out a RADIUS Accounting-Start message for the session to the Inline Posture node.

    The actual data traffic from the endpoint may arrive at the Inline Posture node untrusted side before the Accounting-Start message is received by the Inline Posture node. Upon receiving the RADIUS Accounting-Start message, the Inline Posture node learns the IP address of the endpoint involved in the session and associates the endpoint with the ACL, which is downloaded and installed earlier in the session. The initial profile for this client endpoint could be restrictive, to posture the client before being given full access.

11. Assuming the restrictive ACL allows access only to Cisco ISE servers, the endpoint is only allowed actions such as agent downloading and posture assessment over the data plane.

12. If the client endpoint is posture compliant (as part of the restricted communication with Cisco ISE services earlier), the Policy Service node initiates a RADIUS (CoA) with the new profile. Therefore, a new ACL is applied at the Inline Posture node for the session. The new ACL is installed immediately and applied to the endpoint traffic.

13. The endpoint is then capable of full access to the enterprise network, as a result of the new profile that was applied to the Inline Posture node.

    A RADIUS stop message for a given session that is issued from the WLC resets the corresponding endpoint access at the Inline Posture node.

In a deployment, such as outlined in the example, when more endpoints connect to the wireless network, they are likely to fall into one of the identity groups that already have authenticated and authorized users connected to the network.

For example, there may be an employee, executive, and guest user that have been granted access through the outlined steps. This situation means that the respective restrictive or full-access profiles for those ID groups have already been installed on the Inline Posture node. The subsequent endpoint authentication and authorization uses the existing installed profiles on the Inline Posture node, unless the original profiles have been modified during the Cisco ISE policy configuration. In the latter case, the modified profile with ACL is downloaded and installed on the Inline Posture node, replacing the previous version.
Trusted and Untrusted Interfaces

The following terminology plays a significant role in Inline Posture deployment:

• Trusted—The interface that talks to the Policy Service node and other trusted devices inside the Cisco ISE network. The trusted interface is always designated to Eth0 interface.

• Untrusted—The interface that talks to the WLC, VPN, and other devices outside the Cisco ISE network. The untrusted interface is always designated to Eth1 interface.

Dedicated Nodes Required for Inline Posture

Unlike other personas, Inline Posture is unable to share a node with other services. This inability to share a node means that Inline Posture must be a dedicated node that is registered to the PAN on your network.

Cisco ISE allows you to have up to two Inline Posture nodes configured as an active-standby pair for high availability.

Standalone Inline Posture Node in a Cisco ISE Deployment

A standalone Inline Posture node is simply a single Inline Posture node that provides services and works independently of all other nodes. You might choose to deploy a single standalone Inline Posture node for a network that serves a small facility, where redundancy is not a major concern.

Inline Posture High Availability

An Inline Posture high-availability deployment consists of two Inline Posture nodes that are configured as an active-standby pair. The active node acts as the RADIUS proxy and forwards all network packets until it fails and then the standby node takes over. As long as the active node is functioning properly, the standby node remains passive. However, should the active node falter, the standby node takes over to perform Inline Posture functionality.

The terms primary and secondary have different meanings with regard to Inline Posture high availability than they do in relation to Cisco ISE nodes. For Inline Posture high availability, primary and secondary denote the device that takes over the active state and the device that takes the standby role in case there is a contention, such as when both nodes boot up at the same time. The terms active and standby are representative of high-availability states. A primary or secondary Inline Posture node can be in either an active or standby state. The secondary Inline Posture node is read-only, and cannot be used for configuration of any kind, even high availability.

When you configure an Inline Posture high-availability pair, the primary node has more options available for editing. That is because you make all configuration changes on the primary node. Configuration changes made to the primary node are automatically populated onto the secondary node. For this reason, the secondary node is read-only.

An Inline Posture high-availability pair consists of two physical Inline Posture nodes configured as a cluster that have heartbeat links on the eth2 and eth3 interfaces, and are connected by dedicated cables.

The eth2 and eth3 interfaces of both nodes communicate with heartbeat protocol exchanges to determine the health of the nodes. Each Inline Posture node has its own physical IP addresses on the trusted and untrusted Ethernet interfaces, but a separate service IP address must be assigned to the cluster as a whole.
The service IP address, also called a virtual IP address, is required for RADIUS authentication purposes. You assign the service IP address to both the trusted and untrusted interfaces for both nodes of the active-standby pair, thus making the service IP address the address of the cluster, representing it as a single entity to the rest of the network.

**Note**

Automatic Failover in Inline Posture Nodes

Inline Posture stateless high-availability deployment has an active-standby pair node configuration, where the standby node acts as a backup unit and does not forward any packets between the interfaces. Stateless means that sessions that have been authenticated and authorized by an active node are automatically authorized again after a failover occurs.

The standby node monitors the active node using the heartbeat protocol (using eth2 and eth3 interfaces), which requires that messages are sent at regular intervals between the two nodes. If the heartbeat stops or does not receive a response back in the allotted time, failover occurs and recovery action takes place.

A heartbeat is a message that is sent from one node to the other node at regular intervals. If a heartbeat is not received for an extended period of time, usually several heartbeat intervals, the node that should have sent the heartbeat is assumed to have failed. If it is the primary Inline Posture node that fails, the secondary node takes over so there is no disruption in service.

If the heartbeats simultaneously go down for both Inline Posture high-availability nodes, a partitioning state may ensue. A partitioning state is a condition where both nodes assume that the other has totally failed, and both try to take over active control.

In addition to the heartbeat monitor, an optional (but highly recommended) link-detect mechanism is available. With the use of this mechanism, Inline Posture trusted and untrusted interfaces ping an external IP address from their respective interfaces. If both nodes are unable to ping the external IP address, then failover does not occur. However, if either of the nodes becomes unreachable, the node that is functional automatically becomes the active node.

When failover occurs:

1. The standby Inline Posture node takes over the service IP address.
2. The administrator corrects the failed node and reverts to an earlier configuration, as needed.
   - When a failed node is brought back online, a manual sync operation to update the node with the most current information is required.
3. Active sessions are automatically reauthenticated and authorized.

**Related Topics**

- Synchronize an Inline Posture Node, on page 72

**Inline Posture Operating Modes**

The Inline Posture operating mode that you choose depends largely on the architecture of your existing network. Cisco ISE supports the following operating modes:

**Related Topics**

- Inline Posture Routed Mode, on page 58
Inline Posture Routed Mode

The Inline Posture routed mode acts as a Layer 3 “hop” in the wire, selectively forwarding packets to specified addresses. This mode provides the ability to segregate network traffic, allowing you to specify users who have access to selected destination addresses.

In routed mode, the Inline Posture node operates as a Layer 3 router, and becomes the default gateway for the untrusted network with its managed clients. All traffic between the untrusted and trusted networks passes through the Inline Posture node, which applies the IP filtering rules, access policies, and other traffic-handling mechanisms that you decide to configure.

When you configure Inline Posture in routed mode, you must specify the IP addresses of its two interfaces:

- Trusted (Eth0)
- Untrusted (Eth1)

The trusted and untrusted addresses should be on different subnets. Inline Posture can manage one or more subnets, with the untrusted interface acting as a gateway for the managed subnets.

The following figure illustrates an Inline Posture routed mode configuration. In this example, Inline Posture is a hop for the client traffic from the VPN gateway (GW) en route to the Policy Service node. Inline Posture requires that static routes be configured for subnets 10.20.80.0/24 and 10.20.90.0/24 toward the VPN gateway, just like any other router. The enterprise router on the trusted side of the network also requires that the static routes are configured for the same subnets toward the Inline Posture node.

*Figure 5: Inline Posture Routed Mode Configuration*
**Inline Posture Bridged Mode**

The Inline Posture bridged mode acts as a Layer 2 “bump” in the wire, forwarding packets without regard to the destination address.

In bridged mode, the Inline Posture node operates as a standard Ethernet bridge. This configuration is typically used when the untrusted network already has a gateway, and you do not want to change the existing configuration.

The following figure shows the Inline Posture node acting as a bridge for the Layer 2 client traffic from the WLC to the Cisco ISE network, managed by the Policy Service node. In this configuration, Inline Posture requires subnet entries for the 10.20.80.0/24 and 10.20.90.0/24 subnets to be able to respond to and send Address Resolution Protocol (ARP) broadcasts to the correct VLANs.

*Figure 6: Inline Posture Bridged Mode Configuration*

When the Inline Posture node is in bridged mode, the following conditions apply:

- Inline Posture eth0 and eth1 interfaces can have the same IP address.
- All end devices in the bridged subnet must be on the untrusted network.

**Inline Posture Maintenance Mode**

The Inline Posture maintenance mode takes the node offline so that you can perform administrative procedures. This mode is also the default mode of a node when it first comes onto the network, and before you perform other configurations.
Inline Posture High Availability in Routed and Bridged Modes

The following figure shows an example of an Inline Posture high-availability routed mode configuration. Note the dedicated cables that connect the eth2 and eth3 interfaces between the two nodes to facilitate the heartbeat communication that checks for failure in the active node.

In this example, the untrusted IP address for Inline Posture 1 can be 10.20.70.101, and the untrusted IP address for Inline Posture 2 can be 10.20.70.102. However, the service IP address for both nodes on the untrusted side of the network would be 10.20.70.100. The active Inline Posture node in the pair, at any point of time, assumes the service IP address on the untrusted side of the network. The same holds true for the trusted side of the network.

**Figure 7: Inline Posture High-Availability Routed Mode Configuration**

In a bridged mode, Inline Posture eth0 and eth1 interfaces should have IP addresses in the same subnet. Having the same IP address is recommended. Any devices on the trusted side of the network that have IP addresses in the subnets that are managed by an Inline Posture in bridged mode, must have an explicit static route configured at the Inline Posture node. This configuration is necessary because by default, Inline Posture assumes that the subnet that it manages (as configured on the Managed Subnets user interface page) lies entirely on the untrusted side of the network.

Best Practices for Inline Posture Deployment

You can follow the best practices listed here to manage your Inline Posture deployment efficiently.

**Use Filters to Define Access Privileges**

Consider the following when configuring filters for Inline Posture:
• In a typical implementation, Inline Posture enforces authentication requirements on endpoints that attempt to access the network. Device and subnet filters are used to validate or deny WLC and VPN devices.

• For certain devices, you may want to bypass authentication, posture assessment, role assignment, or any combination thereof. Common examples of bypassed device types include printers, IP phones, servers, nonclient machines, and network devices.

Inline Posture matches the MAC, MAC and IP, or subnet address to determine whether the bypass function is enabled for a device. You can choose to bypass policy enforcement or to forcibly block access.

⚠️ Caution

Do not configure the MAC address in a MAC filter for a directly connected ASA VPN device without also entering the IP address. Without the addition of the optional IP address, VPN clients are allowed to bypass policy enforcement. This bypass happens because the VPN is a Layer 3 hop for clients, and the device uses its own MAC address as the source address to send packets along the network toward the Inline Posture node.

Configure Managed Subnets and Static Routes

Consider the following when configuring managed subnets for Inline Posture:

• Configure a managed subnet for Inline Posture. A managed subnet configuration ensures that the Inline Posture node can send Address Resolution Protocol (ARP) queries with the appropriate VLAN IDs for the client devices on the untrusted interface. Configure the untrusted (authentication) VLAN in the VLAN ID field for the managed subnet.

• Configure managed subnets for endpoints in Layer 2 proximity of the Inline Posture node, such as, a WLC that delivers packets directly to the untrusted interface of the Inline Posture node.

• Configure an IP address and not a subnet address. This configuration ensures that the ARP requests that Inline Posture sends have a valid source IP address.

• Ensure that subnets on the trusted side of the Inline Posture node are different from the subnets on the untrusted side.

• Ensure that an Administration node, Policy Service node, and Monitoring node are not on the same subnet as the Inline Posture node, unless you have defined a static route.

Consider the following when configuring static routes for Inline Posture:

• Configure static routes for endpoints that are more than one hop away (Layer 3) from the Inline Posture node.

• Configure static routes for all downstream host networks that are typical of VPN address pools.

Configure High-Availability Pair

Consider the following when configuring Inline Posture for high availability:

• Assign a service IP address (also known as a virtual IP) for each side of the Inline Posture interfaces, trusted (eth0) and untrusted (eth1).
• Specify link-detect IP addresses for the trusted (eth0) and untrusted (eth1) interfaces. Link-detect appears as an optional setting in the user interface, but is highly recommended.

Inline Posture Node Guidelines

Before you configure an Inline Posture node in a distributed deployment, read and understand the following statements:

1. The Inline Posture node is supported only on Cisco ISE-3300 series and SNS-3415 appliances. It is not currently supported on Cisco SNS-3495 appliance or as a virtual appliance.

2. Inline Posture is unable to run concurrently with Administration, Policy Service, or Monitoring personas and, therefore, is a dedicated node.

3. An Inline Posture node must be registered to the PAN on your network.

4. For each deployment instance of an Inline Posture node, you can deploy a standalone node, or an active-standby pair.

5. At any network entry point, like VPN headend using ASA or group of ASAs in an HA cluster, a maximum of 2 Inline Posture nodes can be deployed as active-standby pair for high-availability. You can have several HA pairs in a deployment.

6. Inline Posture nodes are similar to network access devices (NAD) in function from the perspective of Cisco ISE node. Inline Posture nodes can serve as multiple NADs like switches, Wireless Lan Controllers, and VPN devices. Based on the deployment needs, you can deploy multiple instances of Inline Posture nodes. To determine the maximum number of deployment instances, treat the Inline Posture nodes as access devices.

7. For an Inline Posture high-availability, two nodes are configured as an active-standby pair. One node is designated as the primary node and the other as the secondary node. The primary node becomes the active node when both nodes come up at the same time.

8. For an Inline Posture active-standby pair configuration, all configuration must be applied from the ISE administrative user interface. The standby node configuration displays only basic tables when viewed from the ISE administrative user interface.

9. You can synchronize an Inline Posture active node configuration to its peer standby node from the Failover tab of the active node. For more information, see Synchronize an Inline Posture Node, on page 72.

Note

If you have a WLC authentication, authorization, and accounting (AAA) server (Cisco 2100 or 4400 Series Wireless LAN controllers) on your network, the RADIUS authentication server timeout value needs to be set to a minimum of 30 seconds. This minimum value ensures that RADIUS failover will work in conjunction with Inline Posture. See the WLC server hardware documentation for more information.

10. Registering an Inline Posture node results in system restart. High-availability changes and changes to infrastructure configurations such as the eth1 IP address or Inline Posture node require a system restart. The restart is automatic. However, to manually restart the node from the CLI, use the application stop ise and application start ise commands.
11. After you register an Inline Posture node to the Administration node, you are not allowed to change the eth0 (Trusted) IP address through the Admin portal. The reason for this is that, if you change the eth0 IP address of a registered Inline Posture node, it cannot communicate with the Administration node. Any attempted communication between the Inline Posture node and Administration node then fails, leading to a potential exception.

**Note**

It is highly recommended that you not change the IP address of an Inline Posture node from the CLI after it has been registered on the Cisco ISE network.

**Caution**

The Inline Posture node’s untrusted interface should be disconnected when the Inline Posture node is being configured. If the Inline Posture node’s trusted and untrusted interfaces are connected to the same VLAN during initial configuration and the Inline Posture node initially starts after changing its persona, multicast packet traffic gets flooded out of the untrusted interface. This multicast storm can potentially bring down devices that are connected to the same subnet or VLAN. The Inline Posture node at this time is in Maintenance mode.

**Inline Posture Node Authorization**

The following images illustrate the client authorization flow and session recovery using Lazy Fetch mechanism for Inline Posture node.
Figure 8: Inline Posture Node Client Authorization Flow

- **VPN client**
  - VPN Connect
  - Radius Accept triggers IPEP Radius proxy to initiate getting an IPEP profile to apply for this session at the IPEP itself

- **ASA VPN**
  - RADIUS Access Request
  - Protocol Negotiation & auth handshake
  - RADIUS Access Accept
  - Access Req {Authz Only}
  - Access Accept {Profile}
  - Access Req {dACL name}
  - Access Accept {dACL context}
  - Learn endpoint IP
  - URL redirect of http to
  - CoA {Profile}
  - Access Req {dACL name}
  - Access Accept {dACL content}

- **IPN**
  - Profile can have url-redirect and dACL name
  - dACL download, if dACL not already downloaded
  - Install dACL locally
  - Accounting Start (IP addr)
  - Client traffic starts coming: http://hrapp.wsj.com
  - Profile has dACL name
  - dACL download, if dACL not already downloaded
  - Install dACL locally and associate to the client IP
Inline Posture Node Session Removal due to Client Disconnect

When a wireless client is wandering off from the WLC control, the WLC is required to send a RADIUS Accounting Stop similar to the VPN gateway to ensure that the Inline Posture node cleans up the session corresponding to the client.

Deploy an Inline Posture Node

The initial process for deploying an Inline Posture node is the same, whether it is intended to be a standalone node or part of an active-standby pair.

Procedure

Step 1
Configure an Inline Posture node.

Step 2
Create Inline Posture Downloadable Access Control Lists.

Step 3
Create Inline Posture node profiles.

Step 4
Create an Inline Posture authorization policy.

Related Topics

Configure an Inline Posture Node, on page 66
Create Inline Posture Downloadable Access Control Lists, on page 68
Create Inline Posture Node Profiles, on page 69
Configure an Inline Posture Node

Inline Posture is a dedicated node registered to the Administration node. You configure Inline Posture from the administration console, and that configuration is then replicated to the Inline Posture node. A copy of the configuration is stored locally in the administration database. After an Inline Posture node is registered, it is rebooted.

To introduce an Inline Posture node in your Cisco ISE network, you must first register the Inline Posture node with the PAN, configure the Inline Posture settings, and then create authorization profiles and policies that establish the Inline Posture gatekeeping policies.

The Inline Posture node is a RADIUS proxy that interfaces with NADs as their RADIUS server, making the NADs (VPN gateway, WLC) RADIUS clients. As a proxy, Inline Posture interfaces with the Policy Service node as a client making the Policy Service node its RADIUS server.

---

**Note**

After completing the following procedure, a NAD entry is automatically created for the Inline Posture node. For a standalone node, the IP address for that node is used. For a high-availability pair, the service IP address for the active node is used.

---

**Before you begin**

To perform the following task, you must be a Super Admin or System Admin.

Inline Posture is not supported on the Cisco ISE 3495 platform. Ensure that you install Inline Posture on any one of the following supported platforms: ISE 3315, ISE 3355, ISE 3395, or ISE 3415.

Follow and apply the guidelines for configuring certificates for Inline Posture. Refer to *Cisco Identity Services Engine Hardware Installation Guide, Release 1.2* for details.

Register the Inline Posture node with the PAN. All nodes must be registered with the PAN to function as a member of the Cisco ISE distributed system.

RADIUS configuration is mandatory. At least one client and one server configuration is necessary. You need the corresponding shared secret information for both sides to complete this procedure.

Have all necessary configuration information for your installation on hand. For example, you might need the trusted and untrusted IP addresses, service IP address, IP addresses for other Cisco ISE nodes, shared secret information for the RADIUS configuration, management VLAN ID, WLC, or VPN IP address, and so on. Check with your system architect for a complete list of the information you will need.

---

**Caution**

Do not configure the MAC address in a MAC Filter for a directly connected ASA VPN device without also entering the IP address. Without the addition of the optional IP address, VPN clients are allowed to bypass policy enforcement. This access happens because the VPN is a Layer 3 hop for clients, and the device uses its own MAC address as the source address to send packets along the network toward the Inline Posture node.
Procedure

Step 1
Choose **Administration > System > Deployment**.

Step 2
Check the **Inline Posture node** check box in the Deployment Nodes page and click **Edit**.

Step 3
Check the **Inline PEP** check box on the General Settings tab. The Administration, Monitoring, and Policy Service check boxes are automatically unchecked.

The tabs change to General Settings, Basic Information, Deployment Modes, Filters, Radius Config, Managed Subnets, Static Routes, Logging, and Failover.

**Note**
A newly registered Inline Posture node comes up with a default IP address of 192.168.1.100, a subnet mask of 255.255.255.0, and a default gateway of 192.168.1.1. Change these values to fit your deployment in Step 3.

Step 4
Click the following tabs and enter the appropriate information for the fields in the tabs.

- **Basic Information**

- **Deployment Modes**—A newly registered Inline Posture node comes up in maintenance mode. For production purposes, you must choose the Routed or Bridged mode.

- **Filters**—Enter the subnet address and subnet mask for the client device, or the MAC address and IP address of the device on which to filter. You can use MAC and subnet filters to bypass Inline Posture enforcement to certain endpoints or devices on the untrusted side of the network. For example, if VPN or WLC management traffic is required to pass through Inline Posture, you would not want to subject those particular NADs to Cisco ISE policy enforcement. By providing the MAC address and IP address for these NADs on a filter, you can then access the user interface or configuration terminal by way of Inline Posture without restrictions.

- **Radius Config**—RADIUS configuration is mandatory. At least one client and one server configuration is necessary for Inline Posture.

- **Managed Subnets**—For subnets of endpoints that are in Layer 2 proximity to the Inline Posture node (such as a WLC), you must configure managed subnets. This configuration requires an unused IP address in the same subnet as the managed subnet, along with the VLAN (if any) of the subnet. You can have multiple managed subnet entries. You must enter the following values: IP Address, Subnet Mask, VLAN ID, and Description.

- **Static Routes**—Enter the subnet address, subnet mask, and choose **Trusted** or **Untrusted** from the Interface Type drop-down list. Repeat this step as needed for your configuration.

  When the subnets of the endpoints under Cisco ISE control are Layer 3 away from the Inline Posture node, a static route entry is needed. For example, if a VPN gateway device (that sends managed subnet traffic to the Inline Posture untrusted interface) is two hops away, its client subnet needs to have a static route defined for Inline Posture. The network on the trusted side should know to send traffic to the Inline Posture trusted interface.

- **Logging**—Click the **Logging** tab and enter the IP address and port number for the logging server, which is typically the Monitoring node.

  An IP address and port (default 20514) for logging Inline Posture events are mandatory. This requirement ensures that the viable status of the Inline Posture node is displayed in the Cisco ISE dashboard in the System Summary dashlet, and that other log information regarding the nodes is available.
• Failover—This tab is for Inline Posture High Availability configuration.

Step 5 Click Save. The Inline Posture node restarts automatically.

Step 6 To verify the automatically generated Inline Posture NAD listing, go to Administration > Network Resources > Default Device.

For a standalone node, the IP address for that node is used. For a high-availability pair, the service IP address for the active node is used.

What to do next

To complete the deployment of the Inline Posture node, you must create DACLs, authorization profiles, and authorization policy rules: unknown, compliant, and noncompliant.

Note

It is important to associate the appropriate downloadable access control list (DACL) with the corresponding profile. For example, the unknown DACL should be associated with the unknown authorization profile.

Related Topics

- Configure a High-Availability Pair, on page 71
- Create Inline Posture Downloadable Access Control Lists, on page 68
- Create Inline Posture Node Profiles, on page 69
- Create an Inline Posture Authorization Policy, on page 70

Create Inline Posture Downloadable Access Control Lists

Downloadable access control lists (DACLs) are building blocks for authorization profiles, and they provide the rules for the profiles to follow. Access control lists (ACLs) prevent unwanted traffic from entering the network by filtering source and destination IP addresses, transport protocols, and other variables, using the RADIUS protocol.

After you create DACLs as named permission objects, add them to authorization profiles, which you then specify as the result of an authorization policy.

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1 Choose Policy > Policy Elements > Results > Authorization > Downloadable ACLs.

Step 2 Click Add.

Step 3 Enter the name of the DACL and its description.

Step 4 Create the following DACLs:

- ipn-compliant (Permit All): Use the following syntax: permit ip any any
• ipn-noncompliant (Deny All): Use the following syntax: deny ip any any

• ipn-unknown (Pre-Posture): Use at least one ACL to allow supplicants and the Policy Service node to have access to each other for posture evaluation. This DACL can be used to block or quarantine users until they pass authentication. Here is an example syntax:
  
deny tcp any any eq 80
  deny tcp any any eq 443
  permit ip any 10.1.2.4 0.0.0.0
  permit udp any any eq 53
  deny ip any any

**Step 5** Save the DACLS.

---

**What to do next**

Create Inline Posture node profiles.

**Related Topics**

Create Inline Posture Node Profiles, on page 69

---

**Create Inline Posture Node Profiles**

You must create three Inline Posture authorization profiles, as well as an authorization profile for a NAD. All Inline Posture inbound profiles are automatically set to cisco-av-pair=iipep-authz=true so that the Inline Posture node applies these rules instead of proxying them on to the NADs. The URL redirect is essential for client provisioning, as well as agent discovery redirection.

**Before you begin**

To perform the following task, you must be a Super Admin, System Admin, or Policy Admin.

**Procedure**

**Step 1** Choose Policy > Policy Elements > Results > Authorization > Inline Posture Node Profiles.

**Step 2** Click Add.

**Step 3** Enter a name and description for the authorization profile. Supported characters for the name field are: space, ! # $ % & ' ( ) * + , - . / ; = ? @ _ { }.

**Note** You can configure a RADIUS Reply Message = NAD Profile, to see NAD Profile in the RADIUS log messages for Inline Posture. This configuration can be helpful for troubleshooting at a later time.

**Step 4** Create the following authorization profiles for Inline Posture that correspond to the DACLs you created. Specify the appropriate DACL for each of the following authorization profiles:
Create an Inline Posture Authorization Policy

Authorization policies provide the means for controlling access to the network and its resources. Cisco ISE lets you define a number of rules when creating authorization policies.

The elements that define the authorization policy are referenced when you create policy rules. Your choice of conditions and attributes defines the authorization profile.

**Before you begin**

To perform the following task, you must be a Super Admin or System Admin.

**Procedure**

1. **Step 1** Choose Policy > Authorization.
2. **Step 2** Leave the default rules as is.
3. **Step 3** Create the following Unknown Posture Status Rule:
   - Identity Group: Any
   - Condition: Session:PostureStatus EQUALS = Unknown
   - Permissions: IPN-Unknown-Compliant + nad-authorization-profile
4. **Step 4** Create the following Compliant Posture Rule:
   - Identity Group: Any
   - Condition: Session:PostureStatus EQUALS = Compliant
   - Permissions: IPN-Compliant + nad-authorization-profile

---

Create an Inline Posture Authorization Policy

What to do next

Create an Inline Posture authorization policy.

Related Topics

Create an Inline Posture Authorization Policy, on page 70
Step 5  Create the following Noncompliant Posture Rule:

- Identity Group: Any
- Condition: Session:PostureStatus EQUALS = Noncompliant
- Permissions: IPN-Noncompliant + nad-authorization-profile

Step 6  Save the policy. The Inline Posture node deployment is now complete.

What to do next
Configure Inline Posture node as RADIUS client in Administration node.

Related Topics
Configure Inline Posture Node as RADIUS Client in Administration Node, on page 73

Configure a High-Availability Pair

When you configure two Inline Posture nodes for high availability, you specify one node as the primary unit in the pair and it becomes the active node by default. The other becomes the secondary node, which is a standby unit in case of default.

A high-availability node failover prompts the standby node to take over the service IP address. After this process occurs, an administrator must correct the failed Inline Posture node and revert it to the earlier configuration as needed. Because high-availability failover is stateless, all active sessions are automatically reauthorized after a failover occurs.

In the example that is presented, the service IP address used for the bridged mode high availability pair is different from the physical IP addresses of the Inline Posture nodes, effectively creating a cluster. The WLC interacts with the cluster as a single unit, using the service IP address. For this reason, the service IP is defined for the trusted and untrusted networks.

Note  Both nodes in a high availability pair must use the same mode, either bridged or router. Mixed modes are not supported on Inline Posture high availability pairs.

Before you begin

- To perform the following task, you must be a Super Admin or System Admin.
- You should have successfully configured two (2) Inline Posture nodes, and registered them on the Cisco ISE network.
- The eth2 and eth3 interfaces of both nodes in an Inline Posture high availability pair (primary and secondary) communicate with heartbeat protocol exchanges to determine the health of the nodes. For the heartbeat to work, you must connect the eth2 interface of the primary Inline Posture node to the eth2 interface of the secondary node using an Ethernet cable. Likewise, the eth3 interface of the primary Inline Posture node must be connected to the eth3 interface of the secondary node with an Ethernet cable.
• For RADIUS purposes, you need a service IP address that you will assign to both the trusted and untrusted interfaces of the Inline Posture active-standby cluster during the course of this procedure.

• Have all necessary network configuration information for your installation on hand. Check with your system architect for a complete list of information you will need.

**Procedure**

**Step 1** Choose Administration > System > Deployment.

**Step 2** Check the check box next to the Inline Posture node that you want to designate as the primary node, and click Edit.

**Step 3** On the General Settings tab, verify the node name, that the Inline PEP check box is selected, then choose Active as the HA Role from the drop-down list.

**Step 4** Click the Failover tab, and check the **HA Enabled** check box.

**Step 5** Enter the appropriate information in the fields.

**Step 6** Click Save. Both Inline Posture nodes restart. When the nodes come back up, they are configured as primary and secondary, according to the settings you specified.

**Step 7** Verify the node status by checking the check box next to it, and then clicking the **Failover** tab. Ensure that your primary and secondary Inline Posture nodes are configured correctly.

**What to do next**

Configure Inline Posture node as RADIUS Client in administration node.

**Related Topics**

- Configure Inline Posture Node as RADIUS Client in Administration Node, on page 73
- Configure an Inline Posture Node, on page 66
- Synchronize an Inline Posture Node, on page 72

**Synchronize an Inline Posture Node**

When a node in a high-availability pair is down and configuration changes are made to the single active node, there is no mechanism that automatically populates the failed node with the new configuration when it comes back up. The Sync-up Peer Node button that appears in the Inline Posture high-availability user interface on the active node, allows you to manually synchronize the standby node with the latest Inline Posture database from the active node.

**Before you begin**

- You must be a Super Admin or System Admin.
- You must configure two Inline Posture nodes.
- You must establish a relationship between the two nodes.
**Procedure**

**Step 1** Choose Administration > System > Deployment.

**Step 2** Check the check box next to the Inline Posture node that you want to sync with the other node (usually the active node), and click the Edit icon.

**Step 3** Click the Failover tab.

**Step 4** Click Sync Peer Node. Data from the selected node is automatically transferred to its peer node.

**Related Topics**

- Configure an Inline Posture Node, on page 66
- Configure a High-Availability Pair, on page 71

### Configure Inline Posture Node as RADIUS Client in Administration Node

For an Inline Posture node to act as a RADIUS proxy, you must add it as a RADIUS client in the Administration node.

**Before you begin**

- You must be a Super Admin or System Admin.
- You must deploy Inline Posture in your Cisco ISE deployment.

**Procedure**

**Step 1** Choose Administration > Network Resources > Network Devices.

**Step 2** In the Network Devices navigation panel, click Network Devices.

**Step 3** Enter a Name and an optional Description for the device.

**Step 4** Enter the IP address of the Inline Posture node.

- For a standalone Inline Posture node, enter the IP address for the trusted interface.
- For a high availability pair, enter the service IP address for the trusted interface.

**Step 5** Enter a Model Name and Software Version, as necessary.

**Step 6** For the Network Device Group, specify a Location and Device Type, as necessary.

**Step 7** Check the Authentication Settings check box, and enter the RADIUS shared secret information.

**Step 8** Click Save.
Remove an Inline Posture Node from Deployment

To remove an Inline Posture node from a deployment, you must first change its deployment to maintenance mode and then deregister it. Maintenance mode is a neutral state that allows the node to smoothly transition to the network or from a deployment.

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1  Choose Administration > System > Deployment.
Step 2  Check the check box next to the Inline Posture node that you want to remove from the deployment, and click Edit.
Step 3  Click the Deployment Modes tab.
Step 4  Click the Maintenance Mode radio button, and then click Save.
Step 5  Click Deployment on the left pane, and then check the check box next to the Inline Posture node that you want to remove from the deployment.
Step 6  Click Deregister.
Step 7  Click OK.

Health of an Inline Posture Node

You can monitor the health of a deployed Inline Posture node from the Cisco ISE dashboard that is running on the Administration node. The Inline Posture node appears on the System Summary dashlet. A green icon with a check mark means that the system is healthy. A yellow icon indicates a warning, and a red icon indicates a critical system failure. Sparklines indicate the utilization of CPU, memory, and latency over time. You can choose to display data for the past 24 hours or the last 60 minutes.

When you hover your mouse cursor over the health icon, a quick view dialog appears showing detailed information on system health.

Figure 10: System Summary Quick View Status
Remote Access VPN Use Case

This section describes how to use an Inline Posture node with a VPN device such as ASA in a Cisco ISE network. The following figure shows a Cisco ISE deployment that uses an Inline Posture node for remote VPN access. The term iPEP in this illustration refers to the Inline Posture node and PDP refers to the Policy Service node. All the traffic from the VPN gateway must go through the Inline Posture node to ensure that Cisco ISE can apply policies and secure a network.

Figure 11: Cisco ISE Deployment with Inline Posture Node

Process Flow
1. Remote user authenticates to VPN gateway (ASA) using the RADIUS protocol.
2. As a RADIUS client, the ASA sends an authentication request to the AAA server (Inline Posture node).
3. As a RADIUS proxy, the Inline Posture node relays the RADIUS authentication request to the Cisco ISE node that acts as the RADIUS Server (Policy Service node).
4. The Cisco ISE Policy Service node authenticates the remote user using the configured identity store and returns the RADIUS response to the Inline Posture node which in turn relays it to the ASA (the network access device (NAD)).
5. Based on the authorization policy that is applicable for the user, the Policy Service node returns the appropriate attributes to the Inline Posture node and, optionally, to the ASA.
6. Each authorization policy rule entry can reference separate authorization profiles for both the Inline Posture node profile and the NAD (standard authorization profile).
   Inline Posture node profile: Specifies RADIUS attributes to be applied to the Inline Posture node such as a URL for redirection to the Client Provisioning service and downloadable access control lists (DACLs) for policy enforcement by the Inline Posture node.
   Standard authorization profile: Specifies any RADIUS attributes intended for the NAD, which is ASA in this example.
7. If the authorization policy determines that the endpoint is NonCompliant with the posture policy, or if the posture status is Unknown, then the Policy Service node returns a URL redirect attribute value to the Inline Posture node along with a DACL to specify the traffic to be allowed. All HTTP/HTTPS traffic denied by the DACL is redirected to the specified URL.
8. When the posture becomes Compliant, a reauthorization occurs and the Policy Service node sends a new DACL to the Inline Posture node, which provides the user privileged access to the internal network.

Related Topics
   Configure an Inline Posture Node with a VPN Device, on page 76
Configure an Inline Posture Node with a VPN Device

Before you begin

Ensure that your network infrastructure is configured correctly to route or switch traffic to and from the Inline Posture node and its downstream networks.

Procedure

Step 1  Configure a standalone Cisco ISE node.
Step 2  Register the standalone Cisco ISE node as an Inline Posture node to an existing PAN, and configure the Inline Posture node from the PAN.
Step 3  Optionally, you can configure a second Inline Posture node and configure an Active/Standby pair.
Step 4  Set up a Policy Service node to be the RADIUS server for the Inline Posture node. Configure the Policy Service node with the same RADIUS shared secret that is configured on the Inline Posture node.
Step 5  Configure authorization profiles (Inline Posture node profiles) for use by the Inline Posture node.
Step 6  (Optional) You can configure standard authorization profiles for the NAD’s use.
Step 7  Configure an authorization policy to apply the Inline Posture node profiles to remote VPN users based on identity and posture status.
Step 8  Add the VPN gateway’s inside IP address as a RADIUS client in the Inline Posture node’s RADIUS configuration along with the NAD’s (ASA in this example) RADIUS shared secret.
Step 9  Configure the VPN gateway (ASA) for RADIUS authentication and accounting with the Inline Posture node configured as the RADIUS server. To do this:
  a) Choose Policy > Authentication.
  b) Ensure that the Default Rule is configured to authenticate users against the identity source that contains the user records.
  c) Click Save.

Collection of Inline Posture Node Logs

From the Inline Posture node CLI, all the logs can be archived and collected using the backup-logs command.

```
PEP/admin# config terminal
PEP/admin# repository remoteloc
PEP/admin# url ftp://myremoteserver/store
PEP/admin# user <myremoteuser> password plain <myremotepasswd>
PEP/admin# end
PEP/admin# backup-logs myipeplogs repository remoteloc
```
Collecting Inline Posture node logs remotely from the Primary Administration UI is not supported.

Kclick process in Inline Posture Node

Click kernel module process, called as kclick owns CPU scheduling in Inline Posture node. Kclick provides the CPU cycles for other processes that request it. Due to this the 'top' output at an Inline Posture Node displays the kclick using all the CPU cycles in the system including idle cycles.

Administrator Access to Cisco ISE

You can connect to ISE servers in several ways. The PAN runs the Administrators portal, which requires the admin password to log in. Other ISE persona servers can be accessed by SSH or the console, where you run the CLI. This section describes the process and password options available for each connection type.

- **Admin password**: The ISE Admin user that you created during installation is configured to time out in 45 days by default. You can prevent that by turning off password time on Administration > System > Admin Settings. Chose the Password Policy tab, and uncheck Administrative passwords expire under Password Lifetime.

  If you don’t do this, and the password expires, you can reset the Admin password in the CLI. The CLI command is application reset-passwd. You can either connect to the console to access the CLI, or reboot the ISE image file to access the boot options menu, to reset the Admin menu.

- **CLI password**: The CLI password is specified during installation. If you have a problem logging in with to the CLI because of an invalid password, you can reset the CLI password by connecting to console and running the password CLI command. See the ISE CLI Reference for more information.
- **SSH access to the CLI**: You either enable SSH access during installation, or after, using the CLI command `service sshd`. You can also force SSH connections to use a key. Note that when you do that, SSH connections to all network devices will also use that key, see **SSH Key Validation**, on page 601. You can force the SSH key to use the Diffie-Hellman Algorithm **Securing SSH Key Exchange Using Diffie-Hellman Algorithm**, on page 90. ECDSA keys are not supported for SSH keys.

The following steps describe how to log into the Administrative portal.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Enter the Cisco URL in the address bar of your browser (for example, https://&lt;ise hostname or ip address&gt;/admin/).</td>
</tr>
<tr>
<td>Step 2</td>
<td>Enter the username and case-sensitive password, that was specified and configured during the initial Cisco ISE setup.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click <strong>Login</strong> or press <strong>Enter</strong>.</td>
</tr>
</tbody>
</table>

If your login is unsuccessful, click the **Problem logging in?** link in the Login page and follow the instructions.

**Related Topics**

**Administrator Login Browser Support**, on page 82

**Administrator Login Browser Support**

The Cisco ISE Admin portal supports the following HTTPS-enabled browsers:

- Mozilla Firefox versions 31.x ESR, 32.x, and 33.x
- Microsoft Internet Explorer 10.x and 11.x

Adobe Flash Player 11.2.0.0 or above must be installed on the system running your client browser.

The minimum required screen resolution to view the Admin portal and for a better user experience is 1280*800 pixels.

**Administrator Lockout Following Failed Login Attempts**

If you enter an incorrect password for your specified administrator user ID enough times, the Admin portal “locks you out” of the system, adds a log entry in the Server Administrator Logins report, and suspends the credentials for that administrator ID until you have an opportunity to reset the password that is associated with that administrator ID, as described in the “Performing Post-Installation Tasks” chapter of the *Cisco Identity Services Engine Hardware Installation Guide*. The number of failed attempts that is required to disable the administrator account is configurable according to the guidelines that are described in 'User Account Custom Attributes and Password Policies’ section. After an administrator user account gets locked out, an e-mail is sent to the associated administrator user.

Disabled System administrators’ status can be enabled by any Super Admin, including Active Directory users.
Specify Proxy Settings in Cisco ISE

If your existing network topology requires you to use a proxy for Cisco ISE, to access external resources (such as the remote download site where you can find client provisioning and posture-related resources), you can use the Admin portal to specify proxy properties.

The proxy settings impact the following Cisco ISE functions:

- Partner Mobile Management
- Endpoint Profiler Feed Service Update
- Endpoint Posture Update
- Endpoint Posture Agent Resources Download
- CRL (Certificate Revocation List) Download

The Cisco ISE proxy configuration supports basic authentication for proxy servers. NT LAN Manager (NTLM) authentication is not supported.

Procedure

Step 1 Choose Administration > System > Settings > Proxy.
Step 2 Enter the proxy IP address or DNS-resolvable host name and specify the port through which proxy traffic travels to and from Cisco ISE in Proxy host server : port.
Step 3 Check Password required check box, if required.
Step 4 Enter the user name and password used to authenticate to the proxy servers in the User Name and Password fields.
Step 5 Enter the IP address or address range of hosts or domains to be bypassed in Bypass proxy for these hosts and domain.
Step 6 Click Save.

Ports Used by the Admin Portal

The Admin portal is set to use HTTP port 80 and HTTPS port 443, and you cannot change these settings. Cisco ISE also prevents you from assigning any of the end-user portals to use the same ports, which reduces the risk to the Admin portal.

Enable External RESTful Services APIs

The External RESTful Services APIs are based on HTTPS protocol and REST methodology and uses port 9060.

The External RESTful Services APIs support basic authentication. The authentication credentials are encrypted and are part of the request header.

You can use any REST client like JAVA, curl linux command, python or any other client to invoke External RESTful Services API calls.
The ISE administrator must assign special privileges to a user to perform operations using the External RESTful Services APIs. To perform operations using the External RESTful Services APIs (except for the Guest API), the users must be assigned to one of the following Admin Groups and must be authenticated against the credentials stored in the Cisco ISE internal database (internal admin users):

- External RESTful Services Admin—Full access to all ERS APIs (GET, POST, DELETE, PUT). This user can Create, Read, Update, and Delete ERS API requests.
- External RESTful Services Operator—Read Only access (GET request only).

The External RESTful Services APIs are not enabled by default. If you try to evoke the External RESTful Services API calls before enabling them, you will receive an error response. You must enable the Cisco ISE REST API in order for applications developed for a Cisco ISE REST API to be able to access Cisco ISE. The Cisco REST APIs uses HTTPS port 9060, which is closed by default. If the Cisco ISE REST APIs are not enabled on the Cisco ISE admin server, the client application will receive a time-out error from the server for any Guest REST API request.

**Procedure**

**Step 1** Choose Administration > Settings > ERS Settings.

**Step 2** Choose Enable ERS for Read/Write for the Primary Administration Node.

**Step 3** Choose Enable ERS for Read for All Other Nodes if there are any secondary nodes.

External RESTful Service requests of all types are valid only for the primary ISE node. Secondary nodes have read-access (GET requests).

**Step 4** Click Submit.

All REST operations are audited and the logs are logged in the system logs. External RESTful Services APIs have a debug logging category, which you can enable from the debug logging page of the Cisco ISE GUI.

**Related Topics**

External RESTful Services SDK, on page 84

---

**External RESTful Services SDK**

You can use the External RESTful Services SDK to start building your own tools. You can access the External RESTful Services SDK from the following URL: https://<ISE-ADMIN-NODE>:9060/ers/sdk. External RESTful Services SDK can be accessed by the External RESTful Services Admin users only.

The SDK consists the following components:

- Quick reference API documentation
- Complete list of all available API operations
- Schema files available for download
- Sample application in Java available for download
- Use cases in curl script format
Specify System Time and NTP Server Settings

Cisco ISE allows you to configure up to three Network Time Protocol (NTP) servers. You can use the NTP servers to maintain accurate time and synchronize time across different time zones. You can also specify whether or not Cisco ISE should use only authenticated NTP servers, and you can enter one or more authentication keys for that purpose.

Cisco recommends that you set all Cisco ISE nodes to the Coordinated Universal Time (UTC) timezone—especially if your Cisco ISE nodes are installed in a distributed deployment. This procedure ensures that the reports and logs from the various nodes in your deployment are always in sync with regard to the timestamps.

Before you begin
You must have either the Super Admin or System Admin administrator role assigned.
If you have both a primary and a secondary Cisco ISE node, you must log in to the user interface of the secondary node and configure the system time and NTP server settings on each Cisco ISE node in your deployment individually.

Procedure

**Step 1** Choose Administration > System > Settings > System Time.
**Step 2** Enter unique IP addresses (IPv4/IPv6/FQDN) for your NTP servers.
**Step 3** Check the Only allow authenticated NTP servers check box if you want to restrict Cisco ISE to use only authenticated NTP servers to keep system and network time.
**Step 4** (Optional) If you want to authenticate the NTP server using private keys, click the NTP Authentication Keys tab and specify one or more authentication keys if any of the servers that you specify requires authentication via an authentication key, as follows:
   a) Click Add.
   b) Enter the necessary Key ID and Key Value, specify whether the key in question is trusted by activating or deactivating the Trusted Key option, and click OK. The Key ID field supports numeric values between 1 to 65535 and the Key Value field supports up to 15 alphanumeric characters.
   c) Return to the NTP Server Configuration tab when you are finished entering the NTP Server Authentication Keys.
**Step 5** Click Save.

Changing the System Time Zone
Once set, you cannot edit the time zone from the Admin portal. To change the time zone setting, you must enter the following command in the Cisco ISE CLI:
Configure SMTP Server to Support Notifications

You must set up a Simple Mail Transfer Protocol (SMTP) server to send e-mail notifications for alarms, to enable sponsors to send email notification to guests with their login credentials and password reset instructions, and to enable guests to automatically receive their login credentials after they successfully register themselves and with actions to take before their guest accounts expire.

Procedure

Step 1  Choose Administration > System > Settings > SMTP Server.
Step 2  Choose Settings > SMTP Server.
Step 3  Enter the host name of the outbound SMTP server in the SMTP server field. This SMTP host server must be accessible from the Cisco server. The maximum length for this field is 60 characters.
Step 4  Choose one of these options:
   - Use email address from Sponsor to send guest notification e-mail from the e-mail address of the sponsor and choose Enable Notifications.
   - Use Default email address to specify a specific e-mail address from which to send all guest notifications and enter it in the Default email address field.
Step 5  Click Save.

The recipient of alarm notifications can be any internal admin users with “Include system alarms in emails” option enabled. The sender’s email address for sending alarm notifications is hardcoded as ise@<hostname>.

clock timezone timezone

Note
Cisco uses POSIX-style signs in the time zone names and the output abbreviations. Therefore, zones west of Greenwich have a positive sign and zones east of Greenwich have a negative sign. For example, TZ='Etc/GMT+4' corresponds to 4 hours behind Universal Time (UT).

Caution
Changing the time zone on a Cisco appliance after installation requires services to be restarted on that particular node. Hence we recommend that you perform such changes within a maintenance window. Also, it is important to have all the nodes in a single deployment configured to the same time zone. If you have nodes located in different geographical locations or time zones, you should use a global time zone such as UTC on all the nodes.

For more information on the clock timezone command, refer to the Cisco Identity Services Engine CLI Reference Guide.
Cisco Software Patches

Cisco software patches are usually cumulative. Cisco allows you to perform patch installation and rollback from CLI or GUI.

You can install patches on Cisco servers in your deployment from the Primary PAN. To install a patch from the Primary PAN, you must download the patch from Cisco.com to the system that runs your client browser.

If you want to validate the patch on some of the nodes before upgrading the entire deployment, you can use the CLI to install the patch on selected nodes. Use the following CLI command to install the patch:

```
patch install <patch_bundle> <repository_that_stores_patch_file>
```

For more information, see the Cisco Identity Services Engine CLI Reference Guide.

You can install the required patch version directly. For example, if you are currently using Cisco ISE 2.x and would like to install Cisco ISE 2.x patch 5, you can directly install Cisco ISE 2.x patch 5, without installing the previous patches (in this example, Cisco ISE 2.x patches 1 – 4).

- Software Patch Installation Guidelines, on page 87
- Software Patch Rollback Guidelines, on page 89
- Install a Software Patch, on page 88
- Roll Back Software Patches, on page 88

Software Patch Installation Guidelines

When you install a patch on an ISE node, the node is rebooted after the installation is complete. You might have to wait for a few minutes before you can log in again. You can schedule patch installations during a maintenance window to avoid temporary outage.

Ensure that you install patches that are applicable for the Cisco version that is deployed in your network. Cisco reports any mismatch in versions as well as any errors in the patch file.

You cannot install a patch with a version that is lower than the patch that is currently installed on Cisco. Similarly, you cannot roll back changes of a lower-version patch if a higher version is currently installed on Cisco. For example, if patch 3 is installed on your Cisco servers, you cannot install or roll back patch 1 or 2.

When you install a patch from the Primary PAN that is part of a distributed deployment, Cisco ISE installs the patch on the primary node and then all the secondary nodes in the deployment. If the patch installation is successful on the Primary PAN, Cisco ISE then continues patch installation on the secondary nodes. If it fails on the Primary PAN, the installation does not proceed to the secondary nodes. However, if the installation fails on any of the secondary nodes for any reason, it still continues with the next secondary node in your deployment.

When you install a patch from the Primary PAN that is part of a two-node deployment, Cisco installs the patch on the primary node and then on the secondary node. If the patch installation is successful on the Primary PAN, Cisco then continues patch installation on the secondary node. If it fails on the Primary PAN, the installation does not proceed to the secondary node.
Install a Software Patch

Note
Cisco ISE allows you to install a patch on an Inline Posture node only through the CLI.

Before you begin
• You must have the Super Admin or System Admin administrator role assigned.

Procedure

| Step 1 | Choose Administration > System > Maintenance > Patch Management > Install. |
| Step 2 | Click Browse and choose the patch that you downloaded from Cisco.com. |
| Step 3 | Click Install to install the patch. After the patch is installed on the PAN, Cisco logs you out and you have to wait for a few minutes before you can log in again. |
| Note | When patch installation is in progress, Show Node Status is the only function that is accessible on the Patch Management page. |
| Step 4 | Choose Administration > System > Maintenance > Patch Management to return to the Patch Installation page. |
| Step 5 | Click the radio button next to the patch that you have installed on any secondary node and click Show Node Status to verify whether installation is complete. |

What to do next
If you need to install the patch on one or more secondary nodes, ensure that the nodes are up and repeat the process to install the patch on the remaining nodes.

Roll Back Software Patches

When you roll back a patch from the PAN that is part of a deployment with multiple nodes, Cisco rolls back the patch on the primary node and then all the secondary nodes in the deployment.

Before you begin
• You must have either the Super Admin or System Admin administrator role assigned.

Procedure

| Step 1 | Choose Administration > System > Maintenance > Patch Management. |
Step 2  Click the radio button for the patch version whose changes you want to roll back and click **Rollback**.

**Note** When a patch rollback is in progress, **Show Node Status** is the only function that is accessible on the Patch Management page.

After the patch is rolled back from the PAN, Cisco ISE logs you out and you have to wait a few minutes before you can log in again.

Step 3  After you log in, click the **Alarms** link at the bottom of the page to view the status of the rollback operation.

Step 4  Choose **Administration** > **System** > **Maintenance** > **Patch Management**.

Step 5  To view the progress of the patch rollback, choose the patch in the Patch Management page and click **Show Node Status**.

Step 6  Click the radio button for the patch and click **Show Node Status** on a secondary node to ensure that the patch is rolled back from all the nodes in your deployment.

If the patch is not rolled back from any of the secondary nodes, ensure that the node is up and repeat the process to roll back the changes from the remaining nodes. Cisco only rolls back the patch from the nodes that still have this version of the patch installed.

**Related Topics**

- Software Patch Rollback Guidelines, on page 89
- View Patch Install and Rollback Changes, on page 89

---

### Software Patch Rollback Guidelines

To roll back a patch from Cisco ISE nodes in a deployment, you must first roll back the change from the PAN. If this is successful, the patch is then rolled back from the secondary nodes. If the rollback process fails on the PAN, the patches are not rolled back from the secondary nodes. However, if the patch rollback fails on any secondary node, it still continues to roll back the patch from the next secondary node in your deployment.

While Cisco ISE rolls back the patch from the secondary nodes, you can continue to perform other tasks from the PAN GUI. The secondary nodes will be restarted after the rollback.

### View Patch Install and Rollback Changes

The monitoring and troubleshooting component of Cisco ISE provides information on the patch installation and rollback operations that are performed on your Cisco ISE nodes according to a time period that you specify.

**Before you begin**

You must have either the Super Admin or System Admin administrator role assigned.

**Procedure**

Step 1  Choose **Operations** > **Reports** > **Catalog** > **Server Instance**.

Step 2  Click the **Server Operations Audit** radio button, click **Run**, and choose the time period for which you want to generate the report.
Step 3  
Click the Launch Interactive Viewer link in the upper right corner of the page to view, sort, and filter the data in this report.

FIPS Mode Support

Cisco ISE Release 1.3 does not support FIPS mode.

Securing SSH Key Exchange Using Diffie-Hellman Algorithm

You can configure Cisco to only allow Diffie-Hellman-Group14-SHA1 SSH key exchanges. To do this, you must enter the following commands from the Cisco Command-Line Interface (CLI) Configuration Mode:

```
service sshd key-exchange-algorithm diffie-hellman-group14-sha1
```

Here’s an example:

```
ise/admin#conf t
ise/admin (config)#service sshd key-exchange-algorithm diffie-hellman-group14-sha1
```

Configure Cisco ISE to Send Secure Syslog

To configure Cisco ISE to send only TLS-protected secure syslog between the Cisco ISE nodes and to the Monitoring nodes, you must perform the following tasks:

**Before you begin**

- Ensure that all the Cisco ISE nodes in your deployment are configured with appropriate server certificates.
- Ensure that the default network access authentication policy does not allow any version of the SSL protocol.
- Ensure that all the nodes in your deployment are registered with the Primary PAN. Also, ensure that at least one node in your deployment has the Monitoring persona enabled to function as the secure syslog receiver (TLS server).

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Configure secure syslog remote logging target.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Enable Logging Categories to send auditable events to the secure syslog remote logging target.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Disable TCP Syslog and UDP syslog collectors. Only TLS-protected syslog collectors should be enabled.</td>
</tr>
</tbody>
</table>

**Related Topics**

- Configure Secure Syslog Remote Logging Target, on page 91
- Enable Logging Categories to Send Auditable Events to the Secure Syslog Target, on page 91
Configure Secure Syslog Remote Logging Target

Cisco ISE system logs are collected and stored by log collectors for various purposes. You must choose the Cisco ISE Monitoring node as your log collector for configuring a secure syslog target.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Log in to the Admin portal.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Choose Administration &gt; System &gt; Logging &gt; Remote Logging Targets.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Click Add.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Enter a name for the secure syslog server.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Choose Secure Syslog from the Target Type drop-down list.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Choose Enabled from the Status drop-down list.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Enter the IP address of the Cisco ISE Monitoring node in your deployment.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Enter 6514 as the port number. The secure syslog receiver listens on TCP port 6514.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Choose the syslog facility code. The default is LOCAL6.</td>
</tr>
</tbody>
</table>
| **Step 10** | Check the Buffer Messages When Server is Down check box. If this option is checked, Cisco ISE stores the logs if the secure syslog receiver is unreachable, periodically checks the secure syslog receiver, and forwards them when the secure syslog receiver comes up.  
  a) Enter the buffer size.  
  b) Enter the Reconnect Timeout in seconds for Cisco ISE to periodically check the secure syslog receiver. |
| **Step 11** | Select a CA certificate that you want Cisco ISE to present to the secure syslog server. |
| **Step 12** | Uncheck the Ignore Server Certificate validation check box. You must not check this option. |
| **Step 13** | Click Submit. |

Enable Logging Categories to Send Auditable Events to the Secure Syslog Target

You must enable logging categories for Cisco ISE to send auditable events to the secure syslog target.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Log in to the Admin portal.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Click the radio button next to the AAA Audit logging category, then click Edit.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Choose WARN from the Log Severity Level drop-down list.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Move the secure syslog remote logging target that you created earlier to the Selected box.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Click Save.</td>
</tr>
</tbody>
</table>
Step 7

Repeat this procedure to enable the following logging categories:

- Administrative and Operational Audit
- Posture and Client Provisioning Audit

---

Disable the TCP Syslog and UDP Syslog Collectors

For Cisco ISE to send only secure syslog between the ISE nodes, you must disable the TCP and UDP syslog collectors, and enable only the secure syslog collector.

**Procedure**

**Step 1**
Log in to the Admin portal.

**Step 2**
Choose **Administration** > **System** > **Logging** > **Remote Logging Targets**.

**Step 3**
Click the radio button next to the TCP or UDP syslog collector.

**Step 4**
Click **Edit**.

**Step 5**
Choose Disabled from the Status drop-down list.

**Step 6**
Click **Save**.

**Step 7**
Repeat this process until you disable all the TCP or UDP syslog collectors.

---

**Offline Maintenance**

If the maintenance time period is less than an hour, take the ISE node offline and perform the maintenance task. When you bring the node back online, PAN will automatically synchronize all the changes that happened during maintenance time period. If the changes are not synchronized automatically, you can manually synchronize it with the PAN.

If the maintenance time period is more than an hour, de-register the node at the time of maintenance and re-register the node when you add the node back to deployment.

We recommend that you schedule the maintenance at a time period during which the activity is low.

---

**Note**

1. Data replication issue may occur if the queue contains more than 1,000,000 messages or if the ISE node is offline for more than 6 hours.
2. If you are planning to perform maintenance on primary MnT node, we recommend that you take operational backup of the MnT node before performing maintenance activities.
Manage Administrators and Admin Access Policies

- Role-Based Access Control, on page 93
- Cisco ISE Administrators, on page 93
- Cisco ISE Administrator Groups, on page 95
- Administrative Access to Cisco ISE, on page 102

Role-Based Access Control

Cisco ISE allows you to define role-based access control (RBAC) policies that allow or deny certain system-operation permissions to an administrator. These RBAC policies are defined based on the identity of individual administrators or the admin group to which they belong.

To further enhance security and control who has access to the Admin portal, you can:

- Configure administrative access settings based on the IP address of remote clients.
- Define strong password policies for administrative accounts.
- Configure session timeouts for administrative GUI sessions.

Cisco ISE Administrators

Cisco ISE administrators use the Admin portal to:

- Manage deployments, help desk operations, network devices and node monitoring and troubleshooting.
- Manage Cisco ISE services, policies, administrator accounts, and system configuration and operations.
- Change administrator and user passwords.

Administrators can access Cisco ISE through the command-line interface (CLI) or web-based interface. The username and password that you configure during Cisco ISE setup is intended only for administrative access to the CLI. This role is considered to be the CLI-admin user, also known as CLI administrator. By default, the username for the CLI-admin user is admin and the password is defined during setup. There is no default password. This CLI-admin user is known as the default admin user. This default admin user account cannot...
be deleted, but can be edited by other administrators (which includes options to enable, disable, or change password for this account).

You can create an administrator or you can promote an existing user to an administrator role. Administrators can also be demoted to simple network user status by disabling the corresponding administrative privileges. Administrators can be considered as users who have local privileges to configure and operate the Cisco ISE system.

Administrators are assigned to one or more admin groups. These admin groups are pre-defined in the system for your convenience, as described in the following section.

**Related Topics**
- Cisco ISE Administrator Groups, on page 95

### Privileges of a CLI Administrator Versus a Web-Based Administrator

A CLI administrator can start and stop the Cisco ISE application, apply software patches and upgrades, reload or shut down the Cisco ISE appliance, and view all system and application logs. Because of the special privileges granted to a CLI administrator, we recommend that you protect the CLI administrator credentials and create web-based administrators for configuring and managing Cisco ISE deployments.

### Create a New Cisco ISE Administrator

Cisco ISE administrators need accounts with specific roles assigned to it to perform specific administrative tasks. You can create administrator accounts and assign one or more roles to it based on the administrative tasks that an administrator has to perform.

You can use the Admin Users page to view, create, modify, delete, change the status, duplicate, or search for attributes of Cisco ISE administrators.

**Procedure**

**Step 1** Choose Administration > System > Admin Access > Administrators > Admin Users > Add.

**Step 2** Choose one of the following:
- Create New User
  - If you choose Create New User, a blank Admin User page appears that you must configure.
  - Select from Network Access Users
  - If you choose Select from Network Access Users, a list of current users appears from which you can click to choose a user, and the corresponding Admin User page appears.

**Step 3** Enter values for the Administrator fields. Supported characters for the name field are # $ ’ ( ) * + - . / @ _.

**Step 4** Click Submit to create the new administrator in the Cisco ISE internal database.

**Related Topics**
- The Read-Only Admin Policy
- Create an Internal Read-Only Admin
Customize Menu Access for the Read-Only Administrator
Map External Groups to the Read-Only Admin Group

Cisco ISE Administrator Groups

Administrator groups, also called as role-based access control (RBAC) groups in Cisco ISE, contain a number of administrators who belong to the same administrative group. All administrators who belong to the same group share a common identity and have the same privileges. An administrator’s identity as a member of a specific administrative group can be used as a condition in authorization policies. An administrator can belong to more than one administrator group.

Read-only functionality is unavailable for any administrative access in Cisco ISE. Regardless of the level of access, any administrator account can modify or delete objects for which it has permission, on any page that the administrator can access.

The Cisco ISE security model limits administrators to creating administrative groups that contain the same set of privileges that the administrator has, which is based on the administrative role of the user as defined in the Cisco ISE database. In this way, administrative groups form the basis for defining privileges for accessing the Cisco ISE systems.

The following table lists the admin groups that are predefined in Cisco ISE and the tasks that members from these groups can perform.

Table 4: Cisco ISE Admin Groups, Access Levels, Permissions, and Restrictions

<table>
<thead>

Cisco ISE Administrators, on page 93

Create Admin Groups

The Admin Groups page allows you to view, create, modify, delete, duplicate, or filter Cisco ISE network admin groups.

Before you begin

To configure an external administrator group type, you must have already specified one or more external identity stores.

Procedure

**Step 1** Choose **Administration > System > Admin Access > Administrators > Admin Groups**.

**Step 2** Click **Add**, and enter a Name and Description. Supported special characters for the name field are: space, # $ & ' ( ) * + - . / @ _ .

**Step 3** Specify the Type of administrator group you are configuring:

- Internal—Administrators assigned to this group type will authenticate against the credentials that are stored in the Cisco ISE internal database.

- External—Administrators that you assign to this group will authenticate against the credentials that are contained in the external identity store that you specify in the attribute selector. After choosing External, specify the identity store from which Cisco ISE should import the external group information.

**Step 4** Click **Add** to add users to the Admin Group Users table. From the Users list, select the users to be added to the admin group.

**Step 5** To delete users from the Admin Group Users table, check the check box corresponding to the user that you want to delete, and click **Remove**.

**Step 6** Click **Submit** to save any changes made to the admin group that you created in the Cisco ISE database.

Note

If an internal user is configured with an external identity store for authentication, while logging into the ISE Admin portal, the internal user must select the external identity store as the Identity Source. Authentication will fail if Internal Identity Source is selected.
Administrative Access to Cisco ISE

Cisco ISE administrators can perform various administrative tasks based on the administrative group to which they belong. These administrative tasks are critical and you must ensure that administrative access is restricted to users who are authorized to administer Cisco ISE in your network.

Cisco ISE allows you to control administrative access to its web interface through the following options:

Role-Based Access Control in Cisco ISE

Role-based access control policies (known as admin access) are access control policies that you define to provide limited access to the Cisco ISE administrative interface. These access policies allow you to customize the amount and type of access on a per-administrator or per-admin group basis using specified role-based access permission settings that apply to an individual admin user or an admin group.

Role-based access determines what each entity can access, which is controlled with an access control policy. Role-based access also determines the administrative role that is in use, the admin group to which the entity belongs, and the corresponding permissions and settings that are applied based upon the role of the entity.

Role-Based Permissions

Cisco ISE allows you to configure permissions at the menu and data levels, called the menu access and data access permissions.

The menu access permissions allow you to show or hide the menu items of the Cisco ISE administrative interface. This feature lets you create permissions so that you can restrict or enable access at the menu level.

The data access permissions allow you to grant read/write, or no access to the following data in the Cisco ISE interface: Admin Groups, User Identity Groups, Endpoint Identity Groups, Locations, and Device Types.

RBAC Policies

RBAC policies determine if an administrator can be granted a specific type of access to a menu item or other identity group data elements. You can grant or deny access to a menu item or identity group data element to an administrator based on the admin group by using RBAC policies. When administrators log in to the Admin portal, they can access menus and data that are based on the policies and permissions defined for the admin groups with which they are associated.

RBAC policies map admin groups to menu access and data access permissions. For example, you can prevent a network administrator from viewing the Admin Access operations menu and the policy data elements. This can be achieved by creating a custom RBAC policy for the admin group with which the network administrator is associated.

If you are using customized RBAC policies for admin access, ensure that you provide all relevant menu access for a given data access. For example, to add or delete endpoints with data access of Identity or Policy Admin, you must provide menu access to Work Center > Network Access and Administration > Identity Management.
Default Menu Access Permissions

Cisco ISE provides an out of the box set of permissions that are associated with a set of predefined admin groups. Having predefined admin group permissions allow you to set permissions so that a member of any admin group can have full or limited access to the menu items within the administrative interface (known as menu access) and to delegate an admin group to use the data access elements of other admin groups (known as data access). These permissions are reusable entities that can be further used to formulate RBAC policies for various admin groups. Cisco ISE provides a set of system defined menu access permissions that are already used in the default RBAC policies. The following table lists the default menu access permissions. Apart from the predefined menu access permissions, Cisco ISE also allows you to create custom menu access permissions that you can use in RBAC policies.

Table 5: Default Menu Access Permissions

<table>
<thead>
<tr>

<td>MnT Admin</td>
<td>Operations &gt; All menu items</td>
</tr>
</tbody>
</table>
Configure Menu Access Permissions

Cisco ISE allows you to create custom menu access permissions that you can map to an RBAC policy. Depending on the role of the administrators, you can allow them to access only specific menu options.

Procedure

Step 1
Choose Administration > System > Admin Access > Authorization > Permissions > Menu Access.

Step 2
Click Add, and enter values for the Name and Description fields.

a) Click to expand the menu item up to the desired level, and click the menu item(s) on which you want to create permissions.

b) In the Permissions for Menu Access area, click Show.

Step 3
Click Submit.

Default Data Access Permissions

Cisco ISE comes with a set of predefined data access permissions. The data access permissions enable multiple administrators to have the data access permissions within the same user population. You can enable or restrict the use of data access permissions to one or more admin groups. This process allows autonomous delegated control to administrators of one admin group to reuse data access permissions of the chosen admin groups through selective association. Data access permissions range from full access to no access for viewing selected admin groups or the network device groups. The following table lists the default data access permissions. RBAC policies are defined based on the administrator (RBAC) group, menu access, and data access permissions. You first create menu access and data access permissions and then create an RBAC policy that associates an admin group with the corresponding menu access and data access permissions. The RBAC policy takes the form: If admin_group=Super Admin then assign SuperAdmin Menu Access permission + SuperAdmin Data Access permission. Apart from the predefined data access permissions, Cisco ISE also allows you to create custom data access permissions that you can associate with an RBAC policy.

<table>
<thead>
<tr>
<th>Data Access Name</th>
<th>RBAC Group</th>
<th>Permissible Admin Groups</th>
<th>Permissible Network Device Groups</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super Admin Data Access</td>
<td>Super Admin</td>
<td>Admin Groups, User Identity Groups, Endpoint Identity Groups</td>
<td>All Locations, All Device Types</td>
</tr>
<tr>
<td>Policy Admin Data Access</td>
<td>Policy Admin</td>
<td>User Identity Groups, Endpoint Identity Groups</td>
<td>None</td>
</tr>
</tbody>
</table>

Table 6: Default Data Access Permissions
Configure Data Access Permissions

Cisco ISE allows you to create custom data access permissions that you can map to an RBAC policy. Based on the role of the administrator, you can choose to provide them access only to select data.

**Procedure**

**Step 1** Choose Administration > System > Admin Access > Authorization > Permissions.

**Step 2** Choose Permissions > Data Access.

**Step 3** Click Add, and enter values for the Name and Description fields.

a) Click to expand the admin group and select the desired admin group.

b) Click Full Access.

**Step 4** Click Save.

Configure Admin Access Policies

An Admin Access (RBAC) policy is represented in an if-then format, where if is the RBAC Admin Group value and then is the RBAC Permissions value.

The RBAC policies page (Administration > System > Admin Access > Authorization > Policy) contains a list of default policies. You cannot edit or delete these default policies. The RBAC policies page also allows you to create custom RBAC policies for an admin group specifically for your workplace, and apply to personalized admin groups.

When you assign limited menu access, make sure that the data access permissions allow the administrator to access the data that is required to use the specified menus. For example, if you give menu access to the MyDevices portal, but don't allow data access to Endpoint Identity Groups, then that administrator cannot modify the portal.

**Before you begin**

- Ensure that you have created all admin groups for which you want to define the RBAC policies.
- Ensure that these admin groups are mapped to the individual admin users.
- Ensure that you have configured the RBAC permissions, such as menu access and data access permissions.

**Procedure**

**Step 1** Choose Administration > System > Admin Access > Authorization > Policy.

The RBAC Policies page contains a set of ready-to-use predefined policies for default admin groups. You cannot edit or delete these default policies.

**Step 2** Click Actions next to any of the default RBAC policy rule.

Here, you can insert new RBAC policies, duplicate an existing RBAC policy, and delete an existing RBAC policy.

**Step 3** Click Insert new policy.

**Step 4** Enter values for the Rule Name, RBAC Group(s), and Permissions fields.

You cannot select multiple menu access and data access permissions when creating an RBAC policy.

**Step 5** Click Save.

---

**Administrator Access Settings**

Cisco ISE allows you to define some rules for administrator accounts to enhance security. You can restrict access to the management interfaces, force administrators to use strong passwords, regularly change their passwords, and so on. The password policy that you define under the Administrator Account Settings in Cisco ISE applies to all administrator accounts.

Cisco ISE does not support administrator passwords with UTF-8 characters.

**Configure the Maximum Number of Concurrent Administrative Sessions and Login Banners**

You can configure the maximum number of concurrent administrative GUI or CLI (SSH) sessions and login banners that help and guide administrators who access your administrative web or CLI interface. You can configure login banners that appear before and after an administrator logs in. By default, these login banners are disabled.

**Before you begin**

To perform the following task, you must be a Super Admin or System Admin.

**Procedure**

**Step 1** Choose Administration > System > Admin Access > Settings > Access > Session.

**Step 2** Enter the maximum number of concurrent administrative sessions that you want to allow through the GUI and CLI interfaces. The valid range for concurrent administrative GUI sessions is from 1 to 20. The valid range for concurrent administrative CLI sessions is 1 to 10.
If you want Cisco ISE to display a message before an administrator logs in, check the Pre-login banner check box and enter your message in the text box.

If you want Cisco ISE to display a message after an administrator logs in, check the Post-login banner check box and enter your message in the text box.

Click Save.

Related Topics

Allow Administrative Access to Cisco ISE from Select IP Addresses, on page 107

Allow Administrative Access to Cisco ISE from Select IP Addresses

Cisco ISE allows you to configure a list of IP addresses from which administrators can access the Cisco ISE management interfaces.

The administrator access control settings are only applicable for Cisco ISE nodes that assume the Administration, Policy Service, or Monitoring personas. These restrictions are replicated from the primary to the secondary nodes. These restrictions are not applicable for the Inline Posture nodes.

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

Select Allow only listed IP addresses to connect.

From the Configure IP List for Access Restriction area, click Add.

Enter IP addresses in the classless interdomain routing (CIDR) format in the IP address field.

Enter the subnet mask in the Netmask in CIDR format field.

Click OK. Repeat the process to add more IP address ranges to this list.

Click Save to save the changes.

Click Reset to refresh the IP Access page.

Configure a Password Policy for Administrator Accounts

Cisco ISE also allows you to create a password policy for administrator accounts to enhance security. You can define whether you want a password based or client certificate based administrator authentication. The password policy that you define here is applied to all administrator accounts in Cisco ISE.

Cisco ISE does not support administrator passwords with UTF-8 characters.
Before you begin

• To perform the following task, you must be a Super Admin or System Admin.

Procedure

**Step 1**  
Choose Administration > System > Admin Access > Authentication.

**Step 2**  
Select either of these authentication methods:

  • Password Based—If you want to use the standard user ID and password credentials for an administrator login, choose the Password Based option and specify either the “Internal” or “External” authentication type.

    **Note**  
    If you have configured an external identity source such as LDAP and want to use that as your authentication source to grant access to the admin user, you must select that particular identity source from the Identity Source list box.

  • Client Certificate Based—If you want to specify a certificate-based policy, choose the Client Certificate Based option, and select an existing Certificate Authentication Profile.

**Step 3**  
Click the Password Policy tab and enter the values.

**Step 4**  
Click Save to save the administrator password policy.

**Note**  
If you are using an external identity store to authenticate administrators at login, remember that even if this setting is configured for the password policy applied to the administrator profile, the external identity store will still validate the administrator’s username and password.

Configure Session Timeout for Administrators

Cisco ISE allows you to determine the length of time an administration GUI session can be inactive and still remain connected. You can specify a time in minutes after which Cisco ISE logs out the administrator. After a session timeout, the administrator must log in again to access the Cisco ISE Admin portal.

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

**Step 1**  
Choose Administration > System > Admin Access > Settings > Session > Session Timeout.

**Step 2**  
Enter the time in minutes that you want Cisco ISE to wait before it logs out the administrator if there is no activity. The default value is 60 minutes. The valid range is from 6 to 100 minutes.
Step 3 Click Save.

Terminate an Active Administrative Session

Cisco displays all active administrative sessions from which you can select any session and terminate at any point of time, if a need to do so arises. The maximum number of concurrent administrative GUI sessions is 20. If the maximum number of GUI sessions is reached, an administrator who belongs to the super admin group can log in and terminate some of the sessions.

Before you begin

To perform the following task, you must be a Super Admin.

Procedure

Step 1 Choose Administration > System > Admin Access > Settings > Session > Session Info.
Step 2 Check the check box next to the session ID that you want to terminate and click Invalidate.

Change Administrator Name

Cisco ISE allows you to change your username from the GUI.

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1 Log in to the Admin portal.
Step 2 Click your username that appears as a link at the upper right corner of the Cisco ISE UI.
Step 3 Enter the new username in the Admin User page that appears.
Step 4 Edit any other details about your account that you want to change.
Step 5 Click Save.

Administrative Access to Cisco ISE Using an External Identity Store

In Cisco ISE, you can authenticate administrators via an external identity store such as Active Directory, LDAP, or RSA SecureID. There are two models you can use to provide authentication via an external identity store:

- External Authentication and Authorization—There are no credentials that are specified in the local Cisco ISE database for the administrator, and authorization is based on external identity store group membership only. This model is used for Active Directory and LDAP authentication.
• External Authentication and Internal Authorization—The administrator’s authentication credentials come from the external identity source, and authorization and administrator role assignment take place using the local Cisco ISE database. This model is used for RSA SecurID authentication. This method requires you to configure the same username in both the external identity store and the local Cisco ISE database.

During the authentication process, Cisco ISE is designed to “fall back” and attempt to perform authentication from the internal identity database, if communication with the external identity store has not been established or if it fails. In addition, whenever an administrator for whom you have set up external authentication launches a browser and initiates a login session, the administrator still has the option to request authentication via the Cisco ISE local database by choosing “Internal” from the **Identity Store** drop-down selector in the login dialog.

**Note**

You can configure this method of providing external administrator authentication only via the Admin portal. The Cisco ISE Command Line Interface (CLI) does not feature these functions.

If your network does not already have one or more existing external identity stores, ensure that you have installed the necessary external identity stores and configured Cisco ISE to access those identity stores.

### External Authentication and Authorization

By default, Cisco ISE provides internal administrator authentication. To set up external authentication, you must create a password policy for the external administrator accounts that you define in the external identity stores. You can then apply this policy to the external administrator groups that eventually become a part of the external administrator RBAC policy.

In addition to providing authentication via an external identity store, your network may also require you to use a Common Access Card (CAC) authentication device.

To configure external authentication, you must:

• Configure password-based authentication using an external identity store.

• Create an external administrator group.

• Configure menu access and data access permissions for the external administrator group.

• Create an RBAC policy for external administrator authentication.

### External Authentication Process Flow

When the administrator logs in, the login session passes through the following steps in the process:

1. The administrator sends an RSA SecurID challenge.

2. RSA SecurID returns a challenge response.

3. The administrator enters a user name and the RSA SecurID challenge response in the Cisco ISE login dialog, as if entering the user ID and password.

4. The administrator ensures that the specified Identity Store is the external RSA SecurID resource.

5. The administrator clicks **Login**.
Upon logging in, the administrator sees only the menu and data access items that are specified in the RBAC policy.

**Configure a Password-Based Authentication Using an External Identity Store**

You must first configure password-based authentication for administrators who authenticate using an external identity store such as Active Directory or LDAP.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose <strong>Administration &gt; System &gt; Admin Access &gt; Authentication</strong>.</td>
</tr>
<tr>
<td>Step 2</td>
<td>On the Authentication Method tab, select <strong>Password Based</strong> and choose one of the external identity sources you should have already configured. For example, the Active Directory instance that you have created.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Configure any other specific password policy settings that you want for administrators who authenticate using an external identity store.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click <strong>Save</strong>.</td>
</tr>
</tbody>
</table>

**Create an External Administrator Group**

You will need to create an external Active Directory or LDAP administrator group. This ensures that Cisco ISE uses the username that is defined in the external Active Directory or LDAP identity store to validate the administrator username and password that you entered upon login.

Cisco ISE imports the Active Directory or LDAP group information from the external resource and stores it as a dictionary attribute. You can then specify that attribute as one of the policy elements when it is time to configure the RBAC policy for this external administrator authentication method.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose <strong>Administration &gt; System &gt; Admin Access &gt; Administrators &gt; Admin Groups</strong>.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click <strong>Add</strong>.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter a name and optional description.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Choose the External radio button.</td>
</tr>
<tr>
<td></td>
<td>If you have connected and joined to an Active Directory domain, your Active Directory instance name appears in the Name field.</td>
</tr>
<tr>
<td>Step 5</td>
<td>From the External Groups drop-down list box, choose the Active Directory group that you want to map for this external administrator group.</td>
</tr>
<tr>
<td></td>
<td>Click the “+” sign to map additional Active Directory groups to this external administrator group.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Click <strong>Save</strong>.</td>
</tr>
</tbody>
</table>
Configure Menu Access and Data Access Permissions for the External Administrator Group

You must configure menu access and data access permissions that can be assigned to the external administrator group.

Procedure

Step 1
Choose Administration > System > Admin Access > Permissions.

Step 2
Click one of the following:

- **Menu Access**—All administrators who belong to the external administrator group can be granted permission at the menu or submenu level. The menu access permission determines the menus or submenus that they can access.

- **Data Access**—All administrators who belong to the external administrator group can be granted permission at the data level. The data access permission determines the data that they can access.

Step 3
Specify menu access or data access permissions for the external administrator group.

Step 4
Click Save.

Create an RBAC Policy for External Administrator Authentication

In order to configure Cisco ISE to authenticate the administrator using an external identity store and to specify custom menu and data access permissions at the same time, you must configure a new RBAC policy. This policy must have the external administrator group for authentication and the Cisco ISE menu and data access permissions to manage the external authentication and authorization.

**Note**
You cannot modify an existing (system-preset) RBAC policy to specify these new external attributes. If you have an existing policy that you would like to use as a “template,” be sure to duplicate that policy, rename it, and then assign the new attributes.

Procedure

Step 1
Choose Administration > System > Admin Access > Authorization > Policy.

Step 2
Specify the rule name, external administrator group, and permissions.

Remember that the appropriate external administrator group must be assigned to the correct administrator user IDs. Ensure that the administrator in question is associated with the correct external administrator group.

Step 3
Click Save.

If you log in as an administrator, and the Cisco ISE RBAC policy is not able to authenticate your administrator identity, Cisco ISE displays an “unauthenticated” message, and you cannot access the Admin portal.
Configure Admin Access Using an External Identity Store for Authentication with Internal Authorization

This method requires you to configure the same username in both the external identity store and the local Cisco ISE database. When you configure Cisco ISE to provide administrator authentication using an external RSA SecurID identity store, administrator credential authentication is performed by the RSA identity store. However, authorization (policy application) is still done according to the Cisco ISE internal database. In addition, there are two important factors to remember that are different from external authentication and authorization:

- You do not need to specify any particular external administrator groups for the administrator.
- You must configure the same username in both the external identity store and the local Cisco ISE database.

Procedure

**Step 1**
Choose Administration > System > Admin Access > Administrators > Admin Users.

**Step 2**
Ensure that the administrator username in the external RSA identity store is also present in Cisco ISE. Ensure that you click the **External** option under Password.

**Note**
You do not need to specify a password for this external administrator user ID, nor are you required to apply any specially configured external administrator group to the associated RBAC policy.

**Step 3**
Click Save.
Configure Admin Access Using an External Identity Store for Authentication with Internal Authorization
This chapter describes the licensing mechanism and schemes that are available for Cisco ISE and how to add and upgrade licenses.

- Cisco ISE Licenses, on page 115
- License Consumption, on page 117
- Manage License Files, on page 119

Cisco ISE Licenses

Cisco ISE licensing provides the ability to manage the application features and access, such as the number of concurrent endpoints that can use Cisco ISE network resources.

To maximize economy for customers, licensing in Cisco ISE is supplied in different packages as Base, Plus, Apex, and Mobility Upgrade.

All Cisco ISE appliances are supplied with a 90-day Evaluation license. To continue to use Cisco ISE services after the 90-day Evaluation license expires, and to support more than 100 concurrent endpoints on the network, you must obtain and register Base licenses for the number of concurrent users on your system. If you require additional functionality, you will need Plus and/or Apex licenses to enable that functionality.

Licenses are uploaded to the Primary PAN and propagated to the other Cisco ISE nodes in the cluster. Licenses are centrally managed by the PAN. If you have two PANs deployed in a high-availability pair, obtain a license based on the hardware IDs (UIDs) of both the Primary and Secondary PANs. After you obtain the license, add it only to the Primary PAN. The license gets replicated to the Secondary PAN.

After you install the Cisco ISE software and initially configure the appliance as the Primary PAN, you must obtain a license for Cisco ISE and then register that license. You register all licenses to the Cisco ISE Primary PAN via the Primary and Secondary PAN hardware UID. The Primary PAN then centrally manages all the licenses that are registered for your deployment.

Cisco recommends installing both Base and Plus or Apex licenses at the same time.

- Using a Plus or Apex license requires also using a Base license. However, you do not need a Plus license in order to have an Apex license or vice versa, since there is no overlap in their functionality.
- When you install a Base or Mobility Upgrade license, Cisco ISE continues to use the default Evaluation license as a separate license for the remainder of its duration.
- You cannot upgrade the Evaluation license to an Plus and/or Apex license without first installing the Base license.
• Cisco ISE allows you to use more Plus and/or Apex licenses on the system than Base licenses. For example, you can have 100 Base licenses and Plus licenses.

• When you install a Mobility Upgrade license, Cisco ISE enables all Wired, Wireless, and VPN services.

Table 7: Cisco ISE License Packages

<table>
<thead>
<tr>
<th>ISE License Packages</th>
<th>Perpetual/Subscription (Terms Available)</th>
<th>ISE Functionality Covered</th>
<th>Notes</th>
</tr>
</thead>
</table>
| Base                 | Perpetual                               | • Basic network access: AAA, IEEE-802.1X  
• Guest management  
• Link encryption (MACSec)  
• TrustSec  
• ISE Application Programming Interfaces | Does not include Base services; a Base license is required to install the Plus license.                                              |
| Plus                 | Subscription (1, 3, or 5 years)          | • Bring Your Own Device (BYOD).  
• Profiling and Feed Services  
• Endpoint Protection Service (EPS)  
• Cisco pxGrid  
• MSE integration for location services | Does not include Base services; a Base license is required to install the Apex license.                                                                 |
| Apex                 | Subscription (1, 3, or 5 years)          | • Third Party Mobile Device Management (MDM)  
• Posture Compliance | Does not include Base services; a Base license is required to install the Apex license.                                                                 |
| Mobility             | Subscription (1, 3, or 5 years)          | Combination of Base, Plus, and Apex for wireless and VPN endpoints | Cannot coexist on a Cisco PAN with Base, Plus, or Apex Licenses.                                                                       |
| Mobility Upgrade     | Subscription (1, 3, or 5 years)          | Provides wired support to Mobility license | You can only install a Mobility Upgrade License on top of an existing Mobility license.                                                      |
| Evaluation           | Temporary (90 days)                      | Full Cisco ISE functionality is provided for 100 endpoints. | All Cisco ISE appliances are supplied with an Evaluation license.                                                                     |
License Consumption

You purchase licenses for the number of concurrent users on the system. A Cisco ISE user consumes a license during an active session (always a Base; and a Plus and an Apex license, if you use the functionality covered by these licenses). Once the session ends, the license is released for reuse by other users.

Cisco ISE license architecture consumption logic relies on authorization policy constructs. Cisco ISE uses the dictionaries and attributes within authorization rules to determine the license to use.

The Cisco ISE license is counted as follows:

- A Base license is consumed for every active session. The same endpoint also consumes Plus and Apex licenses depending on the features that it is using.
- The endpoint consumes the Base license before it consumes a Plus and Apex license.
- The endpoint consumes the Plus license before it consumes an Apex license.
- One Plus license is consumed per endpoint for any assortment of the license's features. Likewise, one Apex license is consumed per endpoint for any assortment of its features.
- Licenses are counted against concurrent, active sessions.
- Licenses are released for all features when the endpoint's session ends.
- pxGrid is used to share context collected by ISE with other products. A Plus license is required to enable pxGrid functionality. There is no session count decrement when context for session is shared. However, to use pxGrid, the number of Plus sessions licensed must be equal to the number of Base sessions licensed. For more information, see Cisco ISE Licenses and Services section in Cisco Identity Services Engine Ordering Guide.
- One AnyConnect Apex user license is consumed by each user who uses AnyConnect regardless of the number of devices that the user owns and whether or not the user has an active connection to the network.

To avoid service disruption, Cisco ISE continues to provide services to endpoints that exceed license entitlement. Cisco ISE instead relies on RADIUS accounting functions to track concurrent endpoints on the network and generates an alarm when the endpoint count of the previous day exceeded the amount of licenses.

View License Consumption

You can view your system's current license consumption from the Licensing dashboard at: Administration > System > Licensing. Consumption is portrayed as in the following image:
The License Consumption graph, in the License Usage area, is updated every 30 minutes. This window also displays the type of licenses purchased, the total number of concurrent users permitted on the system, and the expiry date of subscription services.

If you want to see your system's license consumption over multiple weeks, click Usage Over Time. Each bar in the graph shows the maximum number of licenses used during a period of one week.

### Unregistered License Consumption

#### Problem

License consumption relies on the attributes used in the authorization policy with which the endpoint is matched.

Consider you only have a Base license registered on your system (you deleted the 90-day Evaluation license). You will be able to see and configure the corresponding Base menu items and features.

If you configure (mis-configure) an authorization policy to use a feature (for example: Session:PostureStatus) that requires an Apex license, and if an endpoint matches this authorization policy then:

- The endpoint will consume an Apex license, despite the fact that an Apex license has not been registered on the system.
- Notifications to this effect will appear whenever you log in.
- Cisco ISE will give notifications and alarms “Exceeded license usage than allowed” (technically, this is to be expected as there are no registered Apex licenses on the system, but an endpoint is never-the-less consuming one).

#### Possible Causes

Due to authorization policy mis-configuration, the Licensing dashboard can show that Cisco ISE is consuming a license you have not purchased and registered. Before you purchase Plus and Apex licenses, the ISE user interface does not display the functionality covered by those licenses. However, once you have purchased these licenses, the user interface continues to display their functionality even after the license has expired or exceeded its endpoint consumption. Thus, you are able to configure them even if you do not have a valid license for them.
Solution

Choose Policy > Authorization, identify the authorization rule that is using the feature(s) for which you do not have a registered license, and reconfigure that rule.

Manage License Files

This section explains how to register, re-host, renew, migrate, upgrade, and remove ISE licenses:

- Register Licenses, on page 119
- Re-Host Licenses, on page 120
- Renew Licenses, on page 120
- Migrate and Upgrade Licenses, on page 120
- Remove Licenses, on page 121

Register Licenses

Before you begin

Consult your Cisco partner/account team about the types of licenses and number of concurrent users you require for your installation, together with the various packages you can purchase to maximize economy.

Procedure

Step 1
From the ordering system (Cisco Commerce Workspace - CCW) on Cisco's website www.cisco.com, order the required licenses.

After about an hour, an email confirmation containing the Product Authorization Key (PAK) is sent.

Step 2
From the Cisco ISE Administration portal, choose Administration > System > Licensing. Make a note of the node information in the Licensing Details section: Product Identifier (PID), Version Identifier (VID), and Serial Number (SN).

Step 3
Go to www.cisco.com/go/licensing, and where prompted, enter the PAK of the license you received, the node information, and some details about your company.

After one day, Cisco sends you the license file.

Step 4
Save this license file to a known location on your system.

Step 5
From the Cisco ISE Administration portal, choose Administration > System > Licensing. In the License Files section, click the Import License button.

Step 6
Click Choose File and select the license file you previously stored on your system.

Step 7
Click Import.

The new license is now installed on your system.
Re-Host Licenses

Re-hosting means moving a license from one Cisco ISE node to another. From the licensing portal, you select the PAK of the license you want to move and follow the instructions for re-hosting. After one day, you are sent an email with a new PAK. You then register this new PAK for the new node, and remove the old license from the original Cisco ISE node.

Renew Licenses

Subscription licenses, such as Plus and Apex licenses, are issued for 1, 3 or 5 years. Cisco ISE sends an alarm when licenses are near their expiration date and again when the licenses expire.

Licenses must be renewed after they expire. This process is carried out by your Cisco partner or account team only.

Migrate and Upgrade Licenses

Cisco licensing policy supports migration from previous Cisco ISE versions, upgrading from wireless and VPN only to include wired deployments, and adding concurrent users and functionality. Existing Wireless/Wireless Upgrade deployment will be migrated to Mobility/Mobility Upgrade package during upgrade from Cisco ISE version 1.2 to 1.3. You can also purchase bundles of licenses to minimize your ongoing expenses. These scenarios are all covered in the licensing site, or for more information contact your Cisco partner/account team.

---

**Note**

If you have migrated from Cisco ISE version 1.2, your Advanced license covers all the features in both Plus and Apex licenses.

**Note**

After upgrading from Cisco ISE version 1.2, the system will show the default Evaluation license only if it existed on the system prior to upgrade.

**Note**

Mobility/Mobility Upgrade license is always displayed as Base/Plus/Apex in the user interface with its corresponding number of end points.

If your Cisco ISE node needs to support:

- A larger number of concurrent users than the number for which you have licenses
- Wired (LAN) access, and your system has only the Mobility license
You will need to upgrade your license(s) for that node. This process is carried out by your Cisco partner or account team only.

**Remove Licenses**

**Before you begin**

Keep the following in mind before attempting to remove a license:

- If you have installed a Mobility Upgrade license after a Mobility license, you must remove the Mobility Upgrade license before you can remove the underlying Mobility license.

- If you install a combined license, all related installations in the Base, Plus, and Apex packages are also removed.

**Procedure**

CHAPTER 8

Manage Certificates

- Certificate Management in Cisco ISE, on page 123
- Cisco ISE CA Service, on page 149
- OCSP Services, on page 164

Certificate Management in Cisco ISE

A certificate is an electronic document that identifies an individual, a server, a company, or other entity and associates that entity with a public key. A self-signed certificate is signed by its own creator. Certificates can be self-signed or digitally signed by an external Certificate Authority (CA). A CA-signed digital certificate is considered industry standard and more secure.

Certificates are used in a network to provide secure access. Cisco ISE uses certificates for internode communication, and for communicating with external servers such as the syslog server, feed server, and all the end-user portals (guest, sponsor, and personal devices portals). Certificates identify a Cisco ISE node to an endpoint and secures the communication between that endpoint and the Cisco ISE node.

You can use the Admin portal to manage certificates for all the nodes in your deployment.

Certificates Enable Cisco ISE to Provide Secure Access

The Cisco Identity Services Engine (ISE) relies on public key infrastructure (PKI) to provide secure communication with both endpoints and administrators, as well as between Cisco ISE nodes in a multinode deployment. PKI relies on X.509 digital certificates to transfer public keys for encryption and decryption of messages, and to verify the authenticity of other certificates representing users and devices. Cisco ISE provides the Admin Portal to manage the following two categories of X.509 certificates:

- System certificates—These are server certificates that identify a Cisco ISE node to client applications. Every Cisco ISE node has its own system certificates, each of which are stored on the node along with the corresponding private key.

- Trusted certificates—These are certificate authority (CA) certificates used to establish trust for the public keys received from users and devices. The Trusted Certificates Store also contains certificates that are distributed by the Simple Certificate Enrollment Protocol (SCEP), which enables registration of mobile devices into the enterprise network. Certificates in the Trusted Certificates Store are managed on the Primary Administration Node (PAN), and are automatically replicated to all other nodes in an Cisco ISE deployment.
In a distributed deployment, you must import the certificate only in to the certificate trust list (CTL) of the PAN. The certificate gets replicated to the secondary nodes.

In general, to ensure certificate authentication in Cisco ISE is not impacted by minor differences in certificate-driven verification functions, use lower case hostnames for all Cisco ISE nodes deployed in a network.

**Certificate Usage**

When you add or import a certificate in to Cisco ISE, you should specify the purpose for which the certificate is to be used:

- **Admin**: For internode communication and authenticating the Admin portal
- **EAP**: For TLS-based EAP authentication
- **Portal**: For communicating with all Cisco ISE end-user portals
- **xGrid**: For communicating with the pxGrid controller

You can associate different certificates from each node for communicating with the Admin portal (Admin), the pxGrid controller (xGrid), and for TLS-based EAP authentication (EAP). However, you can associate only one certificate from each node for each of these purposes.

With multiple Policy Service nodes (PSNs) in a deployment that can service a web portal request, Cisco ISE needs a unique identifier to identify the certificate that has to be used for portal communication. When you add or import certificates that are designated for portal use, you must define a certificate group tag and associate it with the corresponding certificate on each node in your deployment. You must associate this certificate group tag to the corresponding end-user portals (guest, sponsor, and personal devices portals). This certificate group tag is the unique identifier that helps Cisco ISE identify the certificate that has to be used when communicating with each of these portals. You can designate one certificate from each node for each of the portals.
EAP-TLS client certificate should have KeyUsage=Key Agreement and ExtendedKeyUsage=Client Authentication for the following ciphers:

- ECDHE-ECDSA-AES128-GCM-SHA256
- ECDHE-ECDSA-AES256-GCM-SHA384
- ECDHE-ECDSA-AES128-SHA256
- ECDHE-ECDSA-AES256-SHA384

EAP-TLS client certificate should have KeyUsage=Key Encipherment and ExtendedKeyUsage=Client Authentication for the following ciphers:

- AES256-SHA256
- AES128-SHA256
- AES256-SHA
- AES128-SHA
- DHE-RSA-AES128-SHA
- DHE-RSA-AES256-SHA
- DHE-RSA-AES128-SHA256
- DHE-RSA-AES256-SHA256
- ECDHE-RSA-AES256-GCM-SHA384
- ECDHE-RSA-AES128-GCM-SHA256
- ECDHE-RSA-AES256-SHA384
- ECDHE-RSA-AES128-SHA256
- ECDHE-RSA-AES256-SHA
- EDH-RSA-DES-CBC3-SHA
- DES-CBC3-SHA
- RC4-SHA
- RC4-MD5

**Certificate Matching in Cisco ISE**

When you set up Cisco ISE nodes in a deployment, those two nodes communicate with each other. The system checks the FQDN of each ISE node to ensure they match (for example ise1.cisco.com and ise2.cisco.com or if you use wildcard certificates then *.cisco.com). In addition, when an external machine presents a certificate
to an ISE server, the external certificate that is presented for authentication is checked (or matched) against the certificate in the ISE server. If the two certificates match, the authentication succeeds.

For matching, is performed between the nodes (if there are two) and between the and pxGrid.

Cisco ISE checks for a matching subject name as follows:

1. Cisco ISE looks at the subject alternative name (SAN) extension of the certificate. If the SAN contains one or more DNS names, then one of the DNS names must match the FQDN of the Cisco ISE node. If a wildcard certificate is used, then the wildcard domain name must match the domain in the Cisco ISE node’s FQDN.

2. If there are no DNS names in the SAN, or if the SAN is missing entirely, then the Common Name (CN) in the Subject field of the certificate or the wildcard domain in the Subject field of the certificate must match the FQDN of the node.

3. If no match is found, the certificate is rejected.

---

**Validity of X.509 Certificates**

X.509 certificates are only valid until a specific date. When a system certificate expires, the Cisco ISE functionality that depends on the certificate is impacted. Cisco ISE notifies you about the pending expiration of a system certificate when the expiration date is within 90 days. This notification appears in several ways:

- Colored expiration status icons appear in the System Certificates page.
- Expiration messages appear in the Cisco ISE System Diagnostic report.
- Expiration alarms are generated at 90 days, 60 days, and every day in the final 30 days before expiration.

If the expiring certificate is a self-signed certificate, you can extend its expiration date by editing the certificate. For a CA-signed certificate, you must allow sufficient time to acquire replacement certificate from your CA.

**Enable PKI in Cisco ISE**

Public Key Infrastructure (PKI) is a cryptographic technique that enables secure communication and verifies the identity of a user using digital signatures.

**Procedure**

**Step 1** Establish system certificates on each deployment node for TLS-enabled authentication protocols such as EAP-TLS, for authenticating the Admin portal, for browser and REST clients to access the Cisco ISE web portals, and for the pxGrid controller.
By default, a Cisco ISE node is preinstalled with a self-signed certificate that is used for EAP authentication, Admin portal, portals, and pxGrid controller. In a typical enterprise environment, this certificate is replaced with server certificates that are signed by a trusted CA.

**Step 2**

Populate the Trusted Certificates Store with the CA certificates that are necessary to establish trust with the user as well as device certificates that will be presented to Cisco ISE.

If a certificate chain consists of a root CA certificate plus one or more intermediate CA certificates, to validate the authenticity of a user or device certificate, you must import the entire chain into the Trusted Certificates Store.

For inter-node communication, you must populate the Trusted Certificates Store with the trust certificate(s) needed to validate the Admin system certificate belonging to each node in the Cisco ISE deployment. If you want to use the default self-signed certificate for internode communication, then you must export this certificate from the System Certificates page of each Cisco ISE node and import it into the Trusted Certificates Store. If you replace the self-signed certificates with CA-signed certificates, it is only necessary to populate the Trusted Certificates Store with the appropriate root CA and intermediate CA certificates. Be aware that you cannot register a node in a Cisco ISE deployment until you complete this step.

**Note** After you obtain a backup from a standalone Cisco ISE node or the PAN, if you change the certificate configuration on one or more nodes in your deployment, you must obtain another backup to restore data. Otherwise, if you try to restore data using the older backup, communication between the nodes might fail.

---

**Wildcard Certificates**

A wildcard certificate uses a wildcard notation (an asterisk and period before the domain name) and allows the certificate to be shared across multiple hosts in an organization. For example, the CN value for the Certificate Subject would be some generic hostname such as aaa.ise.local and the SAN field would include the same generic hostname and the wildcard notation such as DNS.1=aaa.ise.local and DNS.2=*.ise.local.

If you configure a wildcard certificate to use *.ise.local, you can use the same certificate to secure any other host whose DNS name ends with "*.ise.local," such as:

- aaa.ise.local
- psn.ise.local
- mydevices.ise.local
- sponsor.ise.local

Wildcard certificates secure communication in the same way as a regular certificate, and requests are processed using the same validation methods.

The following figure shows an example of a wildcard certificate that is used to secure a web site.
Cisco ISE supports wildcard certificates. In earlier releases, Cisco ISE verified any certificate enabled for HTTPS to ensure the CN field matches the Fully Qualified Domain Name (FQDN) of the host exactly. If the fields did not match, the certificate could not be used for HTTPS communication.

In earlier releases, Cisco ISE used that CN value to replace the variable in the url-redirect A-V pair string. For all Centralized Web Authentication (CWA), onboarding, posture redirection, and so on, the CN value was used.

Cisco ISE uses the hostname of the ISE node as the CN.

**Wildcard Certificates for HTTPS and EAP Communication**

You can use wildcard server certificates in Cisco ISE for Admin (web-based service) and EAP protocols that use SSL/TLS tunneling. With the use of wildcard certificates, you no longer have to generate a unique certificate for each Cisco ISE node. Also, you no longer have to populate the SAN field with multiple FQDN values to prevent certificate warnings. Using an asterisk (*) in the SAN field allows you to share a single certificate across multiple nodes in a deployment and helps prevent certificate name mismatch warnings. However, use of wildcard certificates is considered less secure than assigning a unique server certificate for each Cisco ISE node.

When assigning public wildcard certificates to the guest portal and importing sub-CA with root-CA certificates, the certificate chain is not sent until the ISE services are restarted.
If you use wildcard certificates, we strongly recommend that you partition your domain space for greater security. For example, instead of *.example.com, you can partition it as *.amer.example.com. If you do not partition your domain, it can lead to serious security issues.

Wildcard certificate uses an asterisk (*) and a period before the domain name. For example, the CN value for a certificate’s Subject Name would be a generic host name such as aaa.ise.local and the SAN field would have the wildcard character such as *.ise.local. Cisco ISE supports wildcard certifications in which the wildcard character (*) is the left most character in the presented identifier. For example, *.example.com or *.ind.example.com. Cisco ISE does not support certificates in which the presented identifier contains additional characters along with the wildcard character. For example, abc*.example.com or a*b.example.com or *abc.example.com.

**Fully Qualified Domain Name in URL Redirection**

When Cisco ISE builds an authorization profile redirect (for central web authentication, device registration web authentication, native supplicant provisioning, mobile device management, and client provisioning and posture services), the resulting cisco-av-pair includes a string similar to the following:

```
url-redirect=https://ip:port/guestportal/gateway?sessionId=SessionIdValue&action=cwa
```

When processing this request, Cisco ISE substitutes actual values for some keywords in this string. For example, SessionIdValue is replaced with the actual session ID of the request. For eth0 interface, Cisco ISE replaces the IP in the URL with the FQDN of the Cisco ISE node. For non-eth0 interfaces, Cisco ISE uses the IP address in the URL. You can assign a host alias(name) for interfaces eth1 through eth3, which Cisco ISE can then substitute in place of IP address during URL redirection.

To do this, you can use the `ip host` command in the configuration mode from the Cisco ISE CLI ISE /admin(config)# prompt:

```
ip host IP_address host-alias FQDN-string
```

where IP_address is the IP address of the network interface (eth1 or eth2 or eth3) and host-alias is the name that you assign to the network interface. FQDN-string is the fully qualified domain name of the network interface. Using this command, you can assign a host-alias or an FQDN-string or both to a network interface.

Here is an example using the `ip host` command: `ip host a.b.c.d sales.sales.amerxyz.com`

After you assign a host alias to the non-eth0 interface, you must restart the application services on Cisco ISE using the `application start ise` command.

Use the no form of this command to remove the association of the host alias with the network interface.

```
no ip host IP_address host-alias FQDN-string
```

Use the `show running-config` command to view the host alias definitions.

If you provide the FQDN-string, Cisco ISE replaces the IP address in the URL with the FQDN. If you provide only the host alias, Cisco ISE combines the host alias with the configured IP domain name to form a complete FQDN, and replaces the IP address in the URL with the FQDN. If you do not map a network interface to a host alias, then Cisco ISE uses the IP address of the network interface in the URL.

When you make use of non-eth0 interfaces for client provisioning or native supplicant or guest flows, you have to make sure that the IP address or host alias for non-eth0 interfaces should be configured appropriately in the Policy Service node certificate's SAN fields.
Advantages of Using Wildcard Certificates

- Cost savings. Certificates signed by a third party Certificate Authority is expensive, especially as the number of servers increase. Wildcard certificates may be used on multiple nodes in the Cisco ISE deployment.

- Operational efficiency. Wildcard certificates allow all Policy Service Node (PSN) EAP and web services to share the same certificate. In addition to significant cost savings, certificate administration is also simplified by creating the certificate once and applying it on all the PSNs.

- Reduced authentication errors. Wildcard certificates address issues seen with Apple iOS devices where the client stores trusted certificates within the profile, and does not follow the iOS keychain where the signing root is trusted. When an iOS client first communicates with a PSN, it does not explicitly trust the PSN certificate, even though a trusted Certificate Authority has signed the certificate. Using a wildcard certificate, the certificate will be the same across all PSNs, so the user only has to accept the certificate once and successive authentications to different PSNs proceed without error or prompting.

- Simplified supplicant configuration. For example, Microsoft Windows supplicant with PEAP-MSCHAPv2 and server certificate trust enabled requires that you specify each of the server certificate to trust, or the user may be prompted to trust each PSN certificate when the client connects using a different PSN. With wildcard certificates, a single server certificate can be trusted rather than individual certificates from each PSN.

- Wildcard certificates result in an improved user experience with less prompting and more seamless connectivity.

Disadvantages of Using Wildcard Certificates

The following are some of the security considerations related to wildcard certificates:

- Loss of auditability and nonrepudiation
- Increased exposure of the private key
- Not common or understood by administrators

Wildcard certificates are considered less secure than a unique server certificate per ISE node. But, cost and other operational factors outweigh the security risk.

Security devices such as ASA also support wildcard certificates.

You must be careful when deploying wildcard certificates. For example, if you create a certificate with *.company.local and an attacker is able to recover the private key, that attacker can spoof any server in the company.local domain. Therefore, it is considered a best practice to partition the domain space to avoid this type of compromise.

To address this possible issue and to limit the scope of use, wildcard certificates may also be used to secure a specific subdomain of your organization. Add an asterisk (*) in the subdomain area of the common name where you want to specify the wildcard.

For example, if you configure a wildcard certificate for *.ise.company.local, that certificate may be used to secure any host whose DNS name ends in “.ise.company.local”, such as:

- psn.ise.company.local
- mydevices.ise.company.local
Wildcard Certificate Compatibility

Wildcard certificates are usually created with the wildcard listed as the Common Name (CN) of the Certificate Subject. Cisco ISE supports this type of construction. However, not all endpoint supplicants support the wildcard character in the Certificate Subject.

All Microsoft native supplicants tested (including Windows Mobile) do not support wildcard character in the Certificate Subject.

You can use another supplicant, such as Cisco AnyConnect Network Access Manager (NAM) that might allow the use of wildcard character in the Subject field.

You can also use special wildcard certificates such as DigiCert's Wildcard Plus that is designed to work with incompatible devices by including specific subdomains in the Subject Alternative Name of the certificate.

Although the Microsoft supplicant limitation appears to be a deterrent to using wildcard certificates, there are alternative ways to create the wildcard certificate that allow it to work with all devices tested for secure access, including the Microsoft native supplicants.

To do this, instead of using the wildcard character in the Subject, you must use the wildcard character in the Subject Alternative Name (SAN) field instead. The SAN field maintains an extension designed for checking the domain name (DNS name). See RFCs 6125 and 2128 for more information.

System Certificates

Cisco ISE system certificates are server certificates that identify a Cisco ISE node to other nodes in the deployment and to client applications. System certificates are:

- Used for inter-node communication in a Cisco ISE deployment. Choose the Admin option in the Usage field for these certificates.
- Used by browser and REST clients who connect to Cisco ISE web portals. Choose the Portal option in the Usage field for these certificates.
- Used to form the outer TLS tunnel with PEAP and EAP-FAST. Choose the EAP option in the Usage field for mutual authentication with EAP-TLS, PEAP, and EAP-FAST.
- Used to communicate with the pxGrid controller. Choose the pxGrid option in the Usage field for these certificates.

You must install valid system certificates on each node in your Cisco ISE deployment. By default, a self-signed certificate is created on a Cisco ISE node during installation time, and this certificate is designated for EAP, Admin, Portal, and pxGrid use (it has a key length of 1024 and is valid for one year).

Note

When you export a wildcard system certificate to be imported in to the other nodes (for inter-node communication), ensure that you export the certificate and private key, and specify an encryption password. During import, you will need the certificate, private key, and encryption password.

Cisco recommends that you replace the self-signed certificate with a CA-signed certificates for greater security. To obtain a CA-signed certificate, you must:
1. Create a certificate signing request (CSR)
2. Submit it to a Certificate Authority (CA)
3. Obtain the signed certificate
4. Import the relevant root and intermediate CA certificates into the Trusted Certificates Store
5. Bind the signed certificate with the CSR

View System Certificates

The System Certificate page lists all the system certificates added to Cisco ISE.

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1
Choose **Administration > System > Certificates > System Certificates**.

The System Certificates page appears and provides the following information for the local certificates:

- **Friendly Name**—Name of the certificate.
- **Used By**—Service for which this certificate is used.
- **Portal group tag**—Applicable only for certificates that are designated for portal use. Specifies which certificate has to be used for the portals.
- **Issued To**—Common Name of the certificate subject.
- **Issued By**—Common Name of the certificate issuer.
- **Valid From**—Date on which the certificate was created, also known as the Not Before certificate attribute.
- **Expiration Date**—Expiration date of the certificate, also known as the Not After certificate attribute. Indicates when the certificate expires. There are five categories along with an associated icon that appear here:
  - Expiring in more than 90 days (green icon)
  - Expiring in 90 days or less (blue icon)
  - Expiring in 60 days or less (yellow icon)
  - Expiring in 30 days or less (orange icon)
  - Expired (red icon)

Step 2
Select a certificate and choose **View** to display the certificate details.
Import a System Certificate

You can import a system certificate for any Cisco ISE node from the Admin portal.

Before you begin

- Ensure that you have the system certificate and the private key file on the system that is running the client browser.
- If the system certificate that you import is signed by an external CA, import the relevant root CA and intermediate CA certificates in to the Trusted Certificates Store (Administration > System > Certificates > Trusted Certificates).
- Cisco ISE does not support certificates that are signed with a hash algorithm greater than SHA-256. Hence, you must not import a server certificate that is signed with a hash algorithm greater than SHA-256.
- If the system certificate that you import contains the basic constraints extension with the CA flag set to true, ensure that the key usage extension is present, and the keyEncipherment bit or the keyAgreement bit or both are set.
- To perform the following task, you must be a Super Admin or System Admin.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Administration &gt; System &gt; Certificates &gt; System Certificates.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Import. The Import Server Certificate screen opens.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter the values for the certificate that you are going to import.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click Submit.</td>
</tr>
</tbody>
</table>

Generate a Self-Signed Certificate

You can add a new local certificate by generating a self-signed certificate. Cisco recommends that you only employ self-signed certificates for your internal testing and evaluation needs. If you are planning to deploy Cisco ISE in a production environment, be sure to use CA-signed certificates whenever possible to ensure more uniform acceptance around a production network.

Note

If you are using a self-signed certificate and you must change the hostname of your Cisco ISE node, you must log in to the Admin portal of the Cisco ISE node, delete the self-signed certificate that has the old hostname, and generate a new self-signed certificate. Otherwise, Cisco ISE will continue to use the self-signed certificate with the old hostname.

Before you begin

To perform the following task, you must be a Super Admin or System Admin.
Procedure

Step 1  Choose Administration > System > Certificates > System Certificates.
To generate a self-signed certificate from a secondary node, choose Administration > System > Server Certificate.

Step 2  Click Generate Self Signed Certificate and enter the details in the Generate Self Signed Certificate page.

Step 3  Check the checkboxes in the Usage area based on the service for which you want to use this certificate.

Step 4  Click Submit to generate the certificate.
To restart the secondary nodes, from the CLI, enter the following commands in the given order:

a) application stop ise
b) application start ise

Edit a System Certificate

You can use this page to edit a system certificate and to renew a self-signed certificate.

Before you begin
To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1  Choose Administration > System > Certificates > System Certificates.

Step 2  Check the check box next to the certificate that you want to edit, and click Edit.

Step 3  To renew a self-signed certificate, check the Renew Self Signed Certificate check box and enter the Expiration TTL (Time to Live) in days, weeks, months, or years.

Step 4  Click Save to save your changes.
If the Admin check box is checked, then the application server on the Cisco ISE node will be restarted. In addition, if the Cisco ISE node is the PAN in a deployment, then the application server on all other nodes in the deployment will also be restarted. The system restarts one node at a time, after the Primary Administration Node (PAN) restart has completed.
Using Chrome 65 and above to launch ISE can cause BYOD portal or Guest portal to fail to launch in the browser even though URL is redirected successfully. This is because of a new security feature introduced by Google that requires all certificates to have a Subject Alternative Name field. All ISE releases until ISE 2.4 don’t fill the Subject Alternative Name field.

To launch with Chrome 65 and above, follow the steps below:

1. Generate a new self-signed certificate from ISE GUI by filling the Subject Alternative Name field. Both DNS and IP Address must be filled.
2. ISE services will now restart.
3. Redirect the portal in Chrome browser.
4. From browser View Certificate>Details>Copy the certificate by selecting base-64 encoded.
5. Install the certificate in Trusted path.
6. Close the Chrome browser and try to redirect the portal.

Export a System Certificate

You can export a selected system certificate or a certificate and its associated private key. If you export a certificate and its private key for backup purposes, you can reimport them later if needed.

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

| Step 1 | Choose Administration > System > Certificates > System Certificates. |
| Step 2 | Check the checkbox next to the certificate that you want to export and then click Export. |
| Step 3 | Choose whether to export only the certificate, or the certificate and its associated private key. |
| Tip | We do not recommend exporting the private key associated with a certificate because its value may be exposed. If you must export a private key (for example, when you export a wild card system certificate to be imported in to the other nodes for inter-node communication), specify an encryption password for the private key. You will need to specify this password while importing this certificate in to another Cisco ISE node to decrypt the private key. |
| Step 4 | Enter the password if you have chosen to export the private key. The password should be at least 8 characters long. |
| Step 5 | Click Export to save the certificate to the file system that is running your client browser. |

If you export only the certificate, the certificate is stored in the privacy-enhanced mail format. If you export both the certificate and private key, the certificate is exported as a .zip file that contains the certificate in the privacy-enhanced mail format and the encrypted private key file.
Trusted Certificates Store

The Trusted Certificates Store contains X.509 certificates that are used for trust and for Simple Certificate Enrollment Protocol (SCEP).

The certificates in the Trusted Certificate Store are managed on the PAN, and are replicated to every node in the Cisco ISE deployment. Cisco ISE supports wildcard certificates.

Cisco ISE uses the trusted certificates for the following purposes:

- To verify client certificates used for authentication by endpoints, and by Cisco ISE administrators accessing ISE-PIC the Admin Portal using certificate-based administrator authentication.

- To enable secure communication between Cisco ISE nodes in a deployment. The Trusted Certificates Store must contain the chain of CA certificates needed to establish trust with the system certificate on each node in a deployment.
  - If a self-signed certificate is used for the system certificate, the self-signed certificate from each node must be placed in the Trusted Certificates Store of the PAN.
  - If a CA-signed certificate is used for the system certificate, the CA root certificate, as well as any intermediate certificates in the trust chain, must be placed in the Trusted Certificates Store of the PAN.

- To enable secure LDAP authentication, a certificate from the Certificate Store must be selected when defining an LDAP identity source that will be accessed over SSL.

- To distribute to personal devices preparing to register in the network using the personal devices portals. Cisco ISE implements the SCEP on Policy Service Nodes (PSN) to support personal device registration. A registering device uses the SCEP protocol to request a client certificate from a PSN. The PSN contains a registration authority (RA) that acts as an intermediary; it receives and validates the request from the registering device, and then forwards the request to an external CA or the internal Cisco ISE CA, which issues the client certificate. The CA sends the certificate back to the RA, which returns it to the device.

  Each SCEP CA used by Cisco ISE is defined by a SCEP RA Profile. When a SCEP RA Profile is created, two certificates are automatically added to the Trusted Certificates Store:
  - A CA certificate (a self-signed certificate)
  - An RA certificate (a Certificate Request Agent certificate), which is signed by the CA.

  The SCEP protocol requires that these two certificates be provided by the RA to a registering device. By placing these two certificates in the Trusted Certificates Store, they are replicated to all PSN nodes for use by the RA on those nodes.

**Note**

- X.509 certificates imported to Cisco ISE must be in Privacy-Enhanced Mail (PEM) or Distinguished Encoding Rule (DER) format. Files containing a certificate chain, that is, a system certificate along with the sequence of trust certificates that sign it, can be imported, subject to certain restrictions.
Certificates in Trusted Certificates Store

The Trusted Certificate Store is prepopulated with trusted certificates: Manufacturing certificate, Root certificate, Endpoint CA, Endpoint RA, and other trusted certificates. The Root certificate (Cisco Root CA) signs the Manufacturing (Cisco CA Manufacturing) certificate. These certificates are disabled by default. If you have Cisco IP phones as endpoints in your deployment, you should enable these two certificates so the Cisco-signed client certificates for the phones can be authenticated.

Trusted Certificate Naming Constraint

A trusted certificate in CTL may contain a name constraint extension. This extension defines a namespace for values of all subject name and subject alternative name fields of subsequent certificates in a certificate chain. Cisco ISE does not check constraints specified in a root certificate.

The following name constraints are supported:

- **Directory name**
  
The Directory name constraint should be a prefix of the directory name in subject/SAN. For example,
  
  - Correct subject prefix:
    
    CA certificate name constraint: Permitted: O=Cisco
    
    Client certificate subject: O=Cisco,CN=Salomon
  
  - Incorrect subject prefix:
    
    CA certificate name constraint: Permitted: O=Cisco
    
    Client certificate subject: CN=Salomon,O=Cisco

- **DNS**
- **E-mail**
- **URI** (The URI constraint must start with a URI prefix such as http://, https://, ftp://, or ldap://).

The following name constraints are not supported:

- **IP address**
- **Othername**

When a trusted certificate contains a constraint that is not supported and certificate that is being verified does not contain the appropriate field, it is rejected because Cisco ISE cannot verify unsupported constraints.

The following is an example of the name constraints definition within the trusted certificate:

```
X509v3 Name Constraints: critical
   Permitted:
      othername:<unsupported>
      email:abcde.at
      email:abcde.be
      email:abcde.bg
      email:abcde.by
      DNS: dir
      DirName: DC = dir, DC = emea
      DirName: C = AT, ST = EMEA, L = AT, O = ABCDE Group, OU = Domestic
      DirName: C = BG, ST = EMEA, L = BG, O = ABCDE Group, OU = Domestic
```
An acceptable client certificate subject that matches the above definition is as follows:

Subject: DC=dir, DC=emea, OU=DE, OU=OU-Administration, OU=Users, OU=X1, CN=cwinwell

View Trusted Store Certificates

The Trusted Certificates page lists all the trusted certificates that have been added to Cisco ISE. To view the trusted certificates, you must be a Super Admin or System Admin.

To view all the certificates, choose Choose Administration > System > Certificates > Trusted Certificates. The Trusted Certificates page appears, listing all the trusted certificates.

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Change the Status of a Certificate in Trusted Certificates Store

The status of a certificate must be enabled so that Cisco ISE can use the certificate for establishing trust. When a certificate is imported into the Trusted Certificates Store, it is automatically enabled.

Procedure

1. Choose Administration > System > Certificates > Trusted Certificates.
2. Check the checkbox next to the certificate you want to enable or disable, and click Edit.
3. Change the status.
4. Click Save.

Add a Certificate to Trusted Certificates Store

The Certificate Store page allows you to add CA certificates to Cisco ISE.

Before you begin

• To perform the following task, you must be a Super Admin or System Admin.

• Ensure that the certificate store certificate resides on the file system of the computer where your browser is running. The certificate must be in PEM or DER format.

• If you plan to use the certificate for Admin or EAP authentication, ensure that the basic constraints are defined in the certificate and the CA flag is set to true.
Procedure

Step 1 Choose Administration > System > Certificates > Trusted Certificates.
Step 2 Click Import.
Step 3 Configure the field values as necessary.

If you plan to use any sub-CA certificate in the certificate chain for EAP authentication, ensure that you check the Trust for client authentication and Syslog checkbox while importing all the certificates in the certificate chain up until the Root CA.

When you change the authentication type from password-based authentication to certificate-based authentication, Cisco ISE restarts the application server on each node in your deployment, starting with the application server on the PAN and followed, one-by-one, by each additional node.

Edit a Trusted Certificate

After you add a certificate to the Trusted Certificates Store, you can further edit it by using the edit settings.

Before you begin
To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1 Choose Administration > System > Certificates > Trusted Certificates.
Step 2 Check the check box next to the certificate that you want to edit, and click Edit.
Step 3 Modify the editable fields as required.
Step 4 Click Save to save the changes you have made to the certificate store.

Export a Certificate from the Trusted Certificates Store

Before you begin
To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1 Choose Administration > System > Certificates > Trusted Certificates.
Step 2 Check the check box next to the certificate that you want to export, and click Export. You can export only one certificate at a time.
Step 3 Save the privacy-enhanced mail file to the file system that is running your client browser.
Import the Root Certificates to the Trusted Certificate Store

While importing the root CA and intermediate CA certificates, you can specify the service(s) for which the Trusted CA certificates are to be used.

Before you begin

You must have the root certificate and other intermediate certificates from the Certificate Authority that signed your CSRs and returned the digitally signed CA certificates.

Procedure

Step 1  Choose Administration > System > Certificates > Trusted Certificates.

Step 2  Click Import.

Step 3  Click Browse to select the root CA certificate.

Step 4  Enter a Friendly Name.

If you do not enter a Friendly Name, Cisco ISE autopopulates this field with a Friendly Name of the format common-name#issuer#nnnnn, where nnnnn is a unique number. You can edit the certificate again to change the Friendly Name.

Step 5  Choose the root certificate returned by your CA.

Step 6  Check the check boxes next to the services for which you want to use this trusted certificate for.

Step 7  Enter a description.

Step 8  Click Submit.

What to do next

Import the intermediate CA certificates into the Trusted Certificates store (if applicable).

Certificate Chain Import

You can import multiple certificates from a single file that contains a certificate chain received from a Certificate store. All certificates in the file must be in Privacy-Enhanced Mail (PEM) format, and the certificates must be arranged in the following order:

- The last certificate in the file must be the client or server certificate being issued by the CA.
- All preceding certificates must be the root CA certificate plus any intermediate CA certificates in the signing chain for the issued certificate.

Importing a certificate chain is a two-step process:

1. Import the certificate chain file into the Trusted Certificate Store in the Admin portal. This operation imports all certificates from the file except the last one into the Trusted Certificates Store.

2. Import the certificate chain file using the Bind a CA-Signed Certificate operation. This operation imports the last certificate from the file as a local certificate.
Certificate Signing Requests

For a certificate authority (CA) to issue a signed certificate, you must create a certificate signing request (CSR) and submit it to the CA.

The list of Certificate Signing Requests (CSRs) that you have created is available in the Certificate Signing Requests page. To obtain signatures from a Certificate Authority (CA), you must export the CSRs and then send the certificates to the CA. The CA signs and returns your certificates.

You can manage the certificates centrally from the Admin portal. You can create CSRs for all nodes in the deployment and export them. Then you should submit the CSRs to a CA, obtain the CA-signed certificates from the CA, import the root and intermediary CA certificates returned by the CA in to the Trusted Certificates Store, and bind the CA-signed certificates to the CSRs.

Create a Certificate Signing Request and Submit the CSR to a Certificate Authority

You can generate a certificate signing request (CSR) to obtain a CA-signed certificate for the nodes in your deployment. You can generate the CSR for select nodes in the deployment or for all the nodes in your deployment.

Procedure

Step 1 Choose Administration > System > Certificates > Certificate Signing Requests

Step 2 Enter the values for generating a CSR. See Certificate-Signing Request Settings, on page 684 for information on each of the fields.

Step 3 Click Generate to generate the CSR.

The CSR is generated.

Step 4 Click Export to open the CSR in a Notepad.

Step 5 Copy all the text from “-----BEGIN CERTIFICATE REQUEST-----” through “-----END CERTIFICATE REQUEST-----.”

Step 6 Paste the contents of the CSR in to the certificate request of a chosen CA.

Step 7 Download the signed certificate.

Some CAs might email the signed certificate to you. The signed certificate is in the form of a zip file that contains the newly issued certificate and the public signing certificates of the CA that you must add to the Cisco ISE trusted certificates store. The digitally-signed CA certificate, root CA certificate, and other intermediate CA certificate (if applicable) are downloaded to the local system running your client browser.

Bind the CA-Signed Certificate to the CSR

After you have the digitally signed certificate returned by the CA, you must bind it to the certificate signing request (CSR). You can perform the bind operation for all the nodes in your deployment from the Admin portal.
Before you begin

- You must have the digitally signed certificate, and the relevant root intermediate CA certificates returned by the CA.
- Import the relevant root and intermediate CA certificates into the Trusted Certificates Store (Administration > System > Certificates > Trusted Certificates).

Procedure

Step 1  Choose Administration > System > Certificates > Certificate Signing Requests
Check the check box next to the node for which you are binding the CSR with the CA-signed certificate.

Step 2  Click Bind.

Step 3  Click Browse to choose the CA-signed certificate.

Step 4  Specify a Friendly Name for the certificate.

Step 5  Check the Validate Certificate Extensions check box if you want Cisco ISE to validate certificate extensions.

If you enable the Validate Certificate Extensions option, and the certificate that you are importing contains a basic constraints extension with the CA flag set to true, ensure that the key usage extension is present, and that the keyEncipherment bit or the keyAgreement bit, or both, are also set.

Note  ISE requires EAP-TLS client certificates to have digital signature key usage extension.

Step 6  Check the service for which this certificate will be used in the Usage area.
This information is autopopulated, if you have enabled the Usage option while generating the CSR.

Step 7  Click Submit to bind the CA-signed certificate.

If you have chosen to use this certificate for Cisco ISE internode communication, the application server on the Cisco ISE node is restarted.
Repeat this process to bind the CSR with the CA-signed certificate on the other nodes.

What to do next

Import the Root Certificates to the Trusted Certificate Store, on page 140

Export a Certificate Signing Request

You can use this page to export certificate signing requests.

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1  Choose Administration > System > Certificates > Certificate Signing Requests
Step 2 Check the check box next to the certificates that you want to export, and click Export.

Step 3 Click OK to save the file to the file system that is running the client browser.

Install Trusted Certificates for Cisco ISE Inter-node Communication

When you set up the deployment, before you register a secondary node, you must populate the PAN's Certificate Trust List (CTL) with appropriate CA certificates that are used to validate the Admin certificate of the secondary node. The procedure to populate the CTL of the PAN is different for different scenarios:

- If the secondary node is using a CA-signed certificate to communicate with the Admin portal, you must import the CA-signed certificate of the secondary node, the relevant intermediate certificates (if any), and the root CA certificate (of the CA that signed the secondary node's certificate) into the CTL of the PAN.

- If the secondary node is using a self-signed certificate to communicate with the Admin portal, you can import the self-signed certificate of the secondary node in to the CTL of the PAN.

Note

- If you change the Admin certificate on a registered secondary node, you must obtain appropriate CA certificates that can be used to validate the secondary node’s Admin certificate and import it in to the CTL of the PAN.

- If you use self-signed certificates to secure communication between a client and PSN in a deployment, when BYOD users move from one location to another, EAP-TLS user authentication fails. For such authentication requests that have to be serviced between a few PSNs, you must secure communication between the client and PSN with an externally-signed CA certificate or use wildcard certificates signed by an external CA.

Ensure that the certificate issued by the external CA has basic constraints defined and the CA flag set to true. To install CA-signed certificates for inter-node communication:

Procedure

Step 1 Create a Certificate Signing Request and Submit the CSR to a Certificate Authority, on page 141
Step 2 Import the Root Certificates to the Trusted Certificate Store, on page 140
Step 3 Bind the CA-Signed Certificate to the CSR, on page 141

Set Up Certificates for Portal Use

With multiple Policy Service nodes (PSNs) in a deployment that can service a web portal request, Cisco ISE needs a unique identifier to identify the certificate that has to be used for portal communication. When you add or import certificates that are designated for portal use, you must define a certificate group tag and associate it with the corresponding certificate on each node in your deployment. You must associate this certificate
group tag to the corresponding end-user portals (guest, sponsor, and personal devices portals). This certificate group tag is the unique identifier that helps Cisco ISE identify the certificate that has to be used when communicating with each of these portals. You can designate one certificate from each node for each of the portals.

**Note**
Cisco ISE presents the Portal certificate on TCP port 8443 (or the port that you have configured for portal use).

**Procedure**

**Step 1**
Create a Certificate Signing Request and Submit the CSR to a Certificate Authority, on page 141.

You must choose a Certificate Group Tag that you have already defined or create a new one for the portal. For example, mydevicesportal.

**Step 2**
Import the Root Certificates to the Trusted Certificate Store, on page 140.

**Step 3**
Bind the CA-Signed Certificate to the CSR, on page 141.

**Associate the Portal Certificate Tag Before You Register a Node**

If you use the "Default Portal Certificate Group" tag for all the portals in your deployment, before you register a new ISE node, ensure that you import the relevant CA-signed certificate, choose "Portal" as a service, and associate the "Default Portal Certificate Group" tag with this certificate.

When you add a new node to a deployment, the default self-signed certificate is associated with the "Default Portal Certificate Group" tag and the portals are configured to use this tag.

After you register a new node, you cannot change the Certificate Group tag association. Therefore, before you register the node to the deployment, you must do the following:

**Procedure**

**Step 1**
Create a self-signed certificate, choose "Portal" as a service, and assign a different certificate group tag (for example, tempportaltag).

**Step 2**
Change the portal configuration to use the newly created certificate group tag (tempportaltag).

**Step 3**
Edit the default self-signed certificate and remove the Portal role.

This option removes the Default Portal Certificate Group tag association with the default self-signed certificate.

**Step 4**
Do one of the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate a CSR</td>
<td>When you generate the CSR:</td>
</tr>
<tr>
<td></td>
<td>1. Choose &quot;Portal&quot; as a service for which you will use this certificate and</td>
</tr>
<tr>
<td></td>
<td>associate the &quot;Default Portal Certificate Group&quot; tag.</td>
</tr>
<tr>
<td></td>
<td>2. Send the CSR to a CA and obtain the signed certificate.</td>
</tr>
</tbody>
</table>
### User and Endpoint Certificate Renewal

By default, Cisco ISE rejects a request that comes from a device whose certificate has expired. However, you can change this default behavior and configure ISE to process such requests and prompt the user to renew the certificate.

If you choose to allow the user to renew the certificate, Cisco recommends that you configure an authorization policy rule which checks if the certificate has been renewed before processing the request any further. Processing a request from a device whose certificate has expired may pose a potential security threat. Hence, you must configure appropriate authorization profiles and rules to ensure that your organization’s security is not compromised.

Some devices allow you to renew the certificates before and after their expiry. But on Windows devices, you can renew the certificates only before it expires. Apple iOS, Mac OSX, and Android devices allow you to renew the certificates before or after their expiry.

### Dictionary Attributes Used in Policy Conditions for Certificate Renewal

Cisco ISE certificate dictionary contains the following attributes that are used in policy conditions to allow a user to renew the certificate:

- Days to Expiry: This attribute provides the number of days for which the certificate is valid. You can use this attribute to create a condition that can be used in authorization policy. This attribute can take a value from 0 to 15. A value of 0 indicates that the certificate has already expired. A value of 1 indicates that the certificate has less than 1 day before it expires.

---

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3. Import the root and any other intermediate</td>
<td>3. Import the root and any other intermediate certificates of the CA that signed your</td>
</tr>
<tr>
<td>certificates of the CA that signed your certificate</td>
<td>certificate into the Trusted Certificates store.</td>
</tr>
<tr>
<td>4. Bind the CA-signed certificate with the CSR.</td>
<td>4. Bind the CA-signed certificate with the CSR.</td>
</tr>
</tbody>
</table>

*Step 5*  
Register the ISE node to the deployment.  
The portal configuration in the deployment is configured to the "Default Portal Certificate Group" tag and the portals are configured to use the CA-signed certificate associated with the "Default Portal Certificate Group" tag on the new node.

---

### User and Endpoint Certificate Renewal

By default, Cisco ISE rejects a request that comes from a device whose certificate has expired. However, you can change this default behavior and configure ISE to process such requests and prompt the user to renew the certificate.

If you choose to allow the user to renew the certificate, Cisco recommends that you configure an authorization policy rule which checks if the certificate has been renewed before processing the request any further. Processing a request from a device whose certificate has expired may pose a potential security threat. Hence, you must configure appropriate authorization profiles and rules to ensure that your organization’s security is not compromised.

Some devices allow you to renew the certificates before and after their expiry. But on Windows devices, you can renew the certificates only before it expires. Apple iOS, Mac OSX, and Android devices allow you to renew the certificates before or after their expiry.

### Dictionary Attributes Used in Policy Conditions for Certificate Renewal

Cisco ISE certificate dictionary contains the following attributes that are used in policy conditions to allow a user to renew the certificate:

- Days to Expiry: This attribute provides the number of days for which the certificate is valid. You can use this attribute to create a condition that can be used in authorization policy. This attribute can take a value from 0 to 15. A value of 0 indicates that the certificate has already expired. A value of 1 indicates that the certificate has less than 1 day before it expires.
• Is Expired: This Boolean attribute indicates whether a certificate has expired or not. If you want to allow certificate renewal only when the certificate is near expiry and not after it has expired, use this attribute in authorization policy condition.

Authorization Policy Condition for Certificate Renewal

You can use the CertRenewalRequired simple condition (available by default) in authorization policy to ensure that a certificate (expired or about to expire) is renewed before Cisco ISE processes the request further.

CWA Redirect to Renew Certificates

If a user certificate is revoked before its expiry, Cisco ISE checks the CRL published by the CA and rejects the authentication request. In case, if a revoked certificate has expired, the CA may not publish this certificate in its CRL. In this scenario, it is possible for Cisco ISE to renew a certificate that has been revoked. To avoid this, before you renew a certificate, ensure that the request gets redirected to Central Web Authentication (CWA) for a full authentication. You must create an authorization profile to redirect the user for CWA.

Configure Cisco ISE to Allow Users to Renew Certificates

You must complete the tasks listed in this procedure to configure Cisco ISE to allow users to renew certificates.

Before you begin

Configure a limited access ACL on the WLC to redirect a CWA request.

Procedure

Step 1 Update the Allowed Protocol Configuration, on page 146
Step 2 Create an Authorization Policy Profile for CWA Redirection, on page 147
Step 3 Create an Authorization Policy Rule to Renew Certificates, on page 148
Step 4 Enable BYOD Settings in the Guest Portal, on page 148

Update the Allowed Protocol Configuration

Procedure

Step 1 Choose Policy > Policy Elements > Results > Authentication > Allowed Protocols > Default Network Access.
Step 2 Check the Allow Authentication of expired certificates to allow certificate renewal in Authorization Policy check box under the EAP-TLS protocol and EAP-TLS inner methods for PEAP and EAP-FAST protocols.

Requests that use the EAP-TLS protocol will go through the NSP flow.

For PEAP and EAP-FAST protocols, you must manually configure Cisco AnyConnect for Cisco ISE to process the request.
Step 3
Click Submit.

What to do next
Create an Authorization Policy Profile for CWA Redirection, on page 147

Create an Authorization Policy Profile for CWA Redirection

Before you begin
Ensure that you have configured a limited access ACL on the WLC.

Procedure

Step 1

Step 2
Click Add.

Step 3
Enter a name for the authorization profile. For example, CertRenewal_CWA.

Step 4
Check the Web Redirection (CWA, DRW, MDM, NSP, CPP) check box in the Common Tasks area.

Step 5
Choose Centralized Web Auth from the drop-down list and the limited access ACL.

Step 6
Check the Display Certificates Renewal Message check box.
The URL-redirect attribute value changes and includes the number of days for which the certificate is valid.

Step 7
Click Submit.

Note
If you have configured the following Device Registration WebAuth (DRW) policies for wireless devices in Cisco ISE 1.2:

• DRW-Redirect policy with Condition = (Wireless_MAB AND Network Access:UseCase EQUALS HostLookup) and Profile = Wireless-drw-redirect

• DRW-Allow policy with Condition = (Wireless_MAB AND Network Access:UseCase EQUALS HostLookup) and Profile = Wireless-Permit

After upgrading to ISE 1.3 or above version, you must update the DRW-Allow policy condition as follows:

• Condition = (Wireless_MAB AND Network Access:UseCase EQUALS Guest Flow) and Profile = Wireless-Permit

What to do next
Create an Authorization Policy Rule to Renew Certificates, on page 148
Create an Authorization Policy Rule to Renew Certificates

**Before you begin**
Ensure that you have created an authorization profile for central web authentication redirection.
Enable Policy Sets on Administration > System > Settings > Policy Settings.

**Procedure**

1. **Step 1** Choose Policy > Policy Sets.
2. **Step 2** Click Create Above.
3. **Step 3** Enter a name for the new rule.
4. **Step 4** Choose the following simple condition and result:
   - If CertRenewalRequired EQUALS True, then choose the authorization profile that you created earlier (CertRenewal_CWA) for the permission.
5. **Step 5** Click Save.

**What to do next**
When you access the corporate network with a device whose certificate has expired, click **Renew** to reconfigure your device.

Enable BYOD Settings in the Guest Portal
For a user to be able to renew a personal device certificate, you must enable the BYOD settings in the chosen guest portal.

**Procedure**

1. **Step 1** Choose Work Centers > Guest Access > Configure > Guest Portals.
   - a) Select the chosen CWA portal and click **Edit**.
2. **Step 2** From BYOD Settings, check the **Allow employees to use personal devices on the network** check box.
3. **Step 3** Click **Save**.

**Certificate Renewal Fails for Apple iOS Devices**
When you use ISE to renew the endpoint certificates on Apple iOS devices, you might see a “Profiled Failed to Install” error message. This error message appears if the expiring or expired network profiles were signed by a different Admin HTTPS certificate than the one that is used in processing the renewal, either on the same Policy Service Node (PSN) or on another PSN.

As a workaround, use a multi-domain SSL certificate, which is commonly referred to as Unified Communications Certificate (UCC), or a wildcard certificate for Admin HTTPS on all PSNs in the deployment.
Cisco ISE CA Service

Certificates can be self-signed or digitally signed by an external Certificate Authority (CA). The Cisco ISE Internal Certificate Authority (ISE CA) issues and manages digital certificates for endpoints from a centralized console to allow employees to use their personal devices on the company's network. A CA-signed digital certificate is considered industry standard and more secure. The ISE CA offers the following functionalities:

- Certificate Issuance: Validates and signs Certificate Signing Requests (CSRs) for endpoints that connect to your network.
- Key Management: Generates and securely stores keys and certificates on both PAN and PSN nodes.
- Certificate Storage: Stores certificates issued to users and devices.

Certificates Provisioned on Primary Policy Administration Node and Policy Service Nodes

After installation, a Cisco ISE node is provisioned with self-signed CA and subordinate CA (sub CA) certificates for the Cisco ISE node to issue and manage certificates for endpoints. Any PSN that you register with your Primary PAN is provisioned with a sub CA certificate that is signed by the Primary PAN. When you use the Cisco ISE internal CA service and endpoints access your network, then the sub CA on the PSN node issues certificates to endpoints.

Figure 14: Certificates Provisioned At Node Registration - PSNs get an Endpoint CA and an OCSP certificates from the Primary PAN
Simple Certificate Enrollment Protocol Profiles

To help enable certificate provisioning functions for the variety of mobile devices that users can register on the network, Cisco ISE enables you to configure one or more Simple Certificate Enrollment Protocol (SCEP) Certificate Authority (CA) profiles (called as Cisco ISE External CA Settings) to point Cisco ISE to multiple CA locations. The benefit of allowing for multiple profiles is to help ensure high availability and perform load balancing across the CA locations that you specify. If a request to a particular SCEP CA goes unanswered three consecutive times, Cisco ISE declares that particular server unavailable and automatically moves to the CA with the next lowest known load and response times, then it begins periodic polling until the server comes back online.

Endpoint Certificates

The Admin portal lists all the certificates issued by the internal ISE CA to endpoints (Administration > System > Certificates > Endpoint Certificates). The Endpoint Certificates page provides you an at-a-glance view of the certificate status. You can mouse over the Status column to find out the reason for revocation if a certificate has been revoked. You can mouse over the Certificate Template column to view additional details such as , Subject, Subject Alternative Name (SAN), and Validity of the certificate. You can click on the endpoint certificate to view the certificate.

For example, if you want to view the certificates issued to user7, enter user7 in the text box that appears below the Friendly Name field. All the certificates issued by Cisco ISE to this user appear. Remove the search term from the text box to cancel the filter. You can also use the Advanced Filter option to view records based on various search criteria.

This Endpoint Certificates page also provides you the option to revoke an endpoint certificate, if necessary.

The Certificate Management Overview page displays the total number of endpoint certificates issued by each PSN node in your deployment. You can also view the total number of revoked certificates per node and the total number of certificates that have failed. You can filter the data on this page based on any of the attributes.

Note pxGrid certificates are not listed in the Endpoint Certificates page.

Backup and Restore of Cisco ISE CA Certificates and Keys

You must back up the Cisco ISE CA certificates and keys securely to be able to restore them back on a Secondary Administration Node in case of a PAN failure and you want to promote the Secondary Administration Node to function as the root CA or intermediate CA of an external PKI. The Cisco ISE configuration backup does not include the CA certificates and keys. Instead, you should use the Command Line Interface (CLI) to export the CA certificates and keys to a repository and to import them. The application configure ise command now includes export and import options to backup and restore CA certificates and keys.

The following certificates from the Trusted Certificates Store are restored on the Secondary Administration Node:

• Cisco ISE Root CA certificate
You must back up and restore Cisco ISE CA certificates and keys when you:

- Have a Secondary Administration Node in the deployment
- Replace the entire Cisco ISE CA root chain
- Configure Cisco ISE root CA to act as a subordinate CA of an external PKI
- Upgrade from Release 1.2 to a later release
- Restore data from a configuration backup. In this case, you must first regenerate the Cisco ISE CA root chain and then back up and restore the ISE CA certificates and keys.

### Export Cisco ISE CA Certificates and Keys

You must export the CA certificates and keys from the PAN to import them on the Secondary Administration Node. This option enables the Secondary Administration Node to issue and manage certificates for endpoints when the PAN is down and you promote the Secondary Administration Node to be the PAN.

**Before you begin**

Ensure that you have created a repository to store the CA certificates and keys.

**Procedure**

1. Enter `application configure ise` command from the Cisco ISE CLI.
2. Enter 7 to export the certificates and keys.
3. Enter the repository name.
4. Enter an encryption key.

A success message appears with the list of certificates that were exported, along with the subject, issuer, and serial number.

**Example:**

The following 4 CA key pairs were exported to repository 'sftp' at 'ise_ca_key_pairs_of_ise-vm1':

Subject:CN=Cisco ISE Self-Signed CA of ise-vm1
Issuer:CN=Cisco ISE Self-Signed CA of ise-vm1
Serial #:0x621867df-568341cd-944cc77f-c9820765

Subject:CN=Cisco ISE Endpoint RA of ise-vm1
Issuer:CN=Cisco ISE Endpoint CA of ise-vm1
Serial #:0x1a65ec14-4f284da7-9532f0a0-8ae0e5c2

Subject:CN=Cisco ISE OCSP Responder Certificate of ise-vm1
Issuer:CN=Cisco ISE Self-Signed CA of ise-vm1

---

Cisco Identity Services Engine Administrator Guide, Release 1.3
Import Cisco ISE CA Certificates and Keys

After you register the Secondary Administration Node, you must export the CA certificates and keys from the PAN and import them in to the Secondary Administration Node.

Procedure

Step 1  Enter `application configure ise` command from the Cisco ISE CLI.
Step 2  Enter 8 to import the CA certificates and keys.
Step 3  Enter the repository name.
Step 4  Enter the name of the file that you want to import.
Step 5  Enter the encryption key to decrypt the file.

A success message appears.

Example:
The following 4 CA key pairs were imported:
Subject:CN=Cisco ISE Self-Signed CA of ise-vml
Issuer:CN=Cisco ISE Self-Signed CA of ise-vml
Serial#:0x21ce1000-8008472c-a6bc4fd9-272c8da4

Subject:CN=Cisco ISE Endpoint CA of ise-vml
Issuer:CN=Cisco ISE Self-Signed CA of ise-vml
Serial#:0x05fa86d0-092542b4-8ff68ed4-f1964a56

Subject:CN=Cisco ISE Endpoint RA of ise-vml
Issuer:CN=Cisco ISE Endpoint CA of ise-vml
Serial#:0x77932e02-e8c8b3d-b27e2f1c-e9f246ca

Subject:CN=Cisco ISE OCSP Responder Certificate of ise-vml
Issuer:CN=Cisco ISE Self-Signed CA of ise-vml
Serial#:0x5082017f-330e412f-8d63305d-e13fd2a5

Stopping ISE Certificate Authority Service...
Starting ISE Certificate Authority Service...
ISE CA keys import completed successfully

Generate Root CA and Subordinate CAs on the Primary PAN and PSN

When you set up the deployment, Cisco ISE generates a root CA on the Primary PAN and subordinate CA certificates on the Policy Service Nodes (PSNs) for the Cisco ISE CA service. However, when you change the domain name or the hostname of the Primary PAN or PSN, you must regenerate root CA on the Primary PAN and sub CAs on the PSNs respectively.
If you want to change the hostname on a PSN, instead of regenerating the root CA and subordinates CAs on the Primary PAN and PSNs respectively, you can deregister the PSN before changing the hostname, and register it back. A new subordinate certificate gets provisioned automatically on the PSN.

**Procedure**

**Step 1**  
Administration > System > Certificates > Certificate Signing Requests

**Step 2**  
Click Generate Certificate Signing Requests (CSR).

**Step 3**  
Choose ISE Root CA from the Certificate(s) will be used for drop-down list.

**Step 4**  
Click Replace ISE Root CA Certificate chain.

The root CA and subordinate CA certificates get generated for all the nodes in your deployment.

**What to do next**

If you have a Secondary PAN in the deployment, obtain a backup of the Cisco ISE CA certificates and keys from the Primary PAN and restore it on the Secondary PAN. This ensures that the Secondary PAN can function as the root CA in case of a Primary PAN failure and you promote the Secondary PAN to be the Primary PAN.

### Configure Cisco ISE Root CA as Subordinate CA of an External PKI

If you want the root CA on the Primary PAN to act as a subordinate CA of an external PKI, generate an ISE intermediate CA certificate signing request, send it to the external CA, obtain the root and CA-signed certificates, import the root CA certificate in to the Trusted Certificates Store, and bind the CA-signed certificate to the CSR. In this case, the external CA is the root CA, the Primary PAN is a subordinate CA of the external CA, and the PSNs are subordinate CAs of the Primary PAN.

**Procedure**

**Step 1**  
Choose Administration > System > Certificates > Certificate Signing Requests.

**Step 2**  
Click Generate Certificate Signing Requests (CSR).

**Step 3**  
Choose ISE Intermediate CA from the Certificate(s) will be used for drop-down list.

**Step 4**  
Click Generate.

**Step 5**  
Export the CSR, send it to the external CA, and obtain the CA-signed certificate.

**Step 6**  
Import the root CA certificate from the external CA in to the Trusted Certificates store.

**Step 7**  
Bind the CA-signed certificate with the CSR.

**What to do next**

If you have a Secondary PAN in the deployment, obtain a backup of the Cisco ISE CA certificates and keys from the Primary PAN and restore it on the Secondary PAN. This ensures that the Secondary PAN can function as subordinate CA of the external PKI in case of a Primary PAN failure and you promote the Secondary PAN to be the Primary PAN.
Configure Cisco ISE to Use Certificates for Authenticating Personal Devices

You can configure Cisco ISE to issue and manage certificates for endpoints (personal devices) that connect to your network. You can use the internal Cisco ISE Certificate Authority (CA) service to sign the certificate signing request (CSR) from endpoints or forward the CSR to an external CA.

Before you begin

- Obtain a backup of the Cisco ISE CA certificates and keys from the Primary PAN and store them in a secure location for disaster recovery purposes.
- If you have a Secondary PAN in the deployment, back up the Cisco ISE CA certificates and keys from the Primary PAN and restore them on the Secondary PAN.

Procedure

- **Step 1** Add Users to the Employee User Group, on page 154
  You can add users to the internal identity store or to an external identity store such as Active Directory.

- **Step 2** Create a Certificate Authentication Profile for TLS-Based Authentication, on page 155

- **Step 3** Create an Identity Source Sequence for TLS-Based Authentication, on page 155

- **Step 4** Creating a client provisioning policy.
  a) Configure Certificate Authority Settings, on page 156
  b) Create a CA Template, on page 157
  c) Create a Native Supplicant Profile to be Used in Client Provisioning Policy, on page 158
  d) Download Agent Resources from Cisco Site for Windows and MAC OS X Operating Systems, on page 158
  e) Create Client Provisioning Policy Rules for Apple iOS, Android, and MACOSX Devices, on page 159

- **Step 5** Configure the Dot1X Authentication Policy Rule for TLS-Based Authentication, on page 159

- **Step 6** Configure authorization policy rules for TLS-based authentications.
  a) Create Authorization Profiles for Central Web Authentication and Supplicant Provisioning Flows, on page 160
  b) Create Authorization Policy Rules, on page 161

Add Users to the Employee User Group

The following procedure describes how to add users to the Employee user group in the Cisco ISE identity store. If you are using an external identity store, make sure that you have an Employee user group to which you can add users.

Procedure

- **Step 1** Choose Administration > Identity Management > Identities > Users.
- **Step 2** Click Add.
Step 3   Enter the user details.
Step 4   Select Employee from the User Group drop-down list.
          All users who belong to the Employee user group share the same set of privileges.
Step 5   Click Submit.

What to do next
Create a Certificate Authentication Profile for TLS-Based Authentication, on page 155

Create a Certificate Authentication Profile for TLS-Based Authentication
To use certificates for authenticating endpoints that connect to your network, you must define a certificate authentication profile in Cisco ISE or edit the default Preloaded_Certificate_Profile. The certificate authentication profile includes the certificate field that should be used as the principal username. For example, if the username is in the Common Name field, then you can define a certificate authentication profile with the Principal Username being the Subject - Common Name, which can be verified against the identity store.

Procedure

Step 1   Choose Administration > Identity Management > External Identity Sources > Certificate Authentication Profile.
Step 2   Enter a name for your certificate authentication profile. For example, CAP.
Step 3   Choose Subject - Common Name as the Principal Username X509 Attribute.
Step 4   Click Save.

What to do next
Create an Identity Source Sequence for TLS-Based Authentication, on page 155

Create an Identity Source Sequence for TLS-Based Authentication
After you create a certificate authentication profile, you must add it to the identity source sequence so that Cisco ISE can obtain the attribute from the certificate and match it against the identity sources that you have defined in the identity source sequence.

Before you begin
Ensure that you have completed the following tasks:

• Add users to the Employee user group.
• Create a certificate authentication profile for certificate-based authentication.
Procedure

**Step 1** Choose Administration > Identity Management > Identity Source Sequences.

**Step 2** Click Add.

**Step 3** Enter a name for the identity source sequence. For example, Dot1X.

**Step 4** Check the Select Certificate Authentication Profile check box and select the certificate authentication profile that you created earlier, namely CAP.

**Step 5** Move the identity source that contains your user information to the Selected list box in the Authentication Search List area.

You can add additional identity sources and Cisco ISE searches these data stores sequentially until a match is found.

**Step 6** Click the Treat as if the user was not found and proceed to the next store in the sequence radio button.

**Step 7** Click Submit.

What to do next

Configure Certificate Authority Settings, on page 156

**Configure Certificate Authority Settings**

You must configure the external CA settings if you are going to use an external CA for signing the CSRs. The external CA settings was known as the SCEP RA profile in previous releases of Cisco ISE. If you are using the Cisco ISE CA, then you do not have to explicitly configure the CA settings. You can review the Internal CA settings at Administration > System > Certificates > Internal CA Settings.

Once users’ devices receive their validated certificate, they reside on the device as described in the following table.

**Table 8: Device Certificate Location**

<table>
<thead>
<tr>
<th>Device</th>
<th>Certificate Storage Location</th>
<th>Access Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>iPhone/iPad</td>
<td>Standard certificate store</td>
<td>Settings &gt; General &gt; Profile</td>
</tr>
<tr>
<td>Android</td>
<td>Encrypted certificate store</td>
<td>Invisible to end users.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> Certificates can be removed using Settings &gt; Location &amp; Security &gt; Clear Storage.</td>
</tr>
<tr>
<td>Windows</td>
<td>Standard certificate store</td>
<td>Launch mmc.exe from the \cmd prompt or view in the certificate snap-in.</td>
</tr>
<tr>
<td>Mac</td>
<td>Standard certificate store</td>
<td>Application &gt; Utilities &gt; Keychain Access</td>
</tr>
</tbody>
</table>
Before you begin

If you are going to use an external Certificate Authority (CA) for signing the certificate signing request (CSR), then you must have the URL of the external CA.

Procedure

Step 1
Choose Administration > System > Certificates > External CA Settings.

Step 2
Click Add.

Step 3
Enter a name for the external CA setting. For example, EXTERNAL_SCEP.

Step 4
Enter the external CA server URL in the URL text box. Click Test Connection to check if the external CA is reachable. Click the + button to enter additional CA server URLs.

Step 5
Click Submit.

What to do next

Create a CATemplate, on page 157

Create a CA Template

The certificate template defines the SCEP RA profile that must be used (for the internal or external CA), Subject, Subject Alternative Name (SAN), validity period of the certificate, and the Extended Key Usage. This example assumes that you are going to use the internal Cisco ISE CA. For an external CA template, the validity period is determined by the external CA and you cannot specify it.

You can create a new CA template or edit the default certificate template, EAP_Authentication_Certificate_Template.

Before you begin

Ensure that you have configured the CA settings.

Procedure

Step 1
Choose Administration > System > CA Service > Internal CA Certificate Template.

Step 2
Enter a name for the internal CA template. For example, Internal_CA_Template.

Step 3
(Optional) Enter values for the Organizational Unit, Organization, City, State, and Country fields.

We do not support UTF-8 characters in the certificate template fields (Organizational Unit, Organization, City, State, and Country). Certificate provisioning fails if UTF-8 characters are used in the certificate template.

The username of the internal user generating the certificate is used as the Common Name of the certificate. Cisco ISE Internal CA does not support "+" or "*" characters in the Common Name field. Ensure that your username does not include "+" or "*" special characters.

Step 4
Specify the Subject Alternative Name (SAN) and the validity period of the certificate.

Step 5
Specify a key size. You must choose 1024 or a higher key size.
Step 6 Specify the Extended Key Usage. Check the **Client Authentication** check box if you want the certificate to be used for client authentication. Check the **Server Authentication** check box if you want the certificate to be used for server authentication.

Step 7 Click **Submit**.

---

The internal CA certificate template is created and will be used by the client provisioning policy.

**What to do next**

Create a Native Supplicant Profile to be Used in Client Provisioning Policy, on page 158

---

**Create a Native Supplicant Profile to be Used in Client Provisioning Policy**

You can create native supplicant profiles to enable users to bring personal devices to your Corporate network. Cisco ISE uses different policy rules for different operating systems. Each client provisioning policy rule contains a native supplicant profile, which specifies which provisioning wizard is to be used for which operating system.

**Before you begin**

- Configure the CA certificate template in Cisco ISE.
- Open up TCP port 8905 and UDP port 8905 to enable Cisco NAC Agent, Cisco NAC Web Agent, and supplicant provisioning wizard installation. For more information on port usage, see the "Cisco ISE Appliance Ports Reference" appendix in the *Cisco Identity Services Engine Hardware Installation Guide*.

**Procedure**

---

**Step 1** Choose **Policy** > **Policy Elements** > **Results** > **Client Provisioning** > **Resources**.

**Step 2** Choose **Add** > **Native Supplicant Profile**.

**Step 3** Enter a name for the native supplicant profile. For example, EAP_TLS_INTERNAL.

**Step 4** Choose **ALL** from the **Operating System** drop-down list.

**Step 5** Check the **Wired** or **Wireless** check box.

**Step 6** Choose **TLS** from the **Allowed Protocol** drop-down list.

**Step 7** Choose the CA certificate template that you created earlier.

**Step 8** Click **Submit**.

---

**What to do next**

Download Agent Resources from Cisco Site for Windows and MAC OS X Operating Systems, on page 158

---

**Download Agent Resources from Cisco Site for Windows and MAC OS X Operating Systems**

For Windows and MAC OS X operating systems, you must download the remote resources from the Cisco site.
Before you begin

Ensure that you are able to access the appropriate remote location to download client provisioning resources to Cisco ISE, by verifying that the proxy settings for your network are correctly configured.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Choose Policy &gt; Policy Elements &gt; Resources &gt; Client Provisioning &gt; Resources.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Choose Add &gt; Agent resources from Cisco site.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Check the check boxes next to the Windows and MAC OS X packages. Be sure to include the latest versions.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Click Save.</td>
</tr>
</tbody>
</table>

What to do next

Create Client Provisioning Policy Rules for Apple iOS, Android, and MACOSX Devices, on page 159

Create Client Provisioning Policy Rules for Apple iOS, Android, and MACOSX Devices

Client provisioning resource policies determine which users receive which version (or versions) of resources (agents, agent compliance modules, and agent customization packages/profiles) from Cisco ISE upon login and user session initiation.

When you download the agent compliance module, it always overwrites the existing one, if any, available in the system.

To enable employees to bring iOS, Android, MACOSX devices, you must create policy rules for each of these devices on the Client Provisioning Policy page.

Before you begin

You must have configured the required native supplicant profiles and downloaded the required agents from the Client Provisioning Policy pages.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Choose Policy &gt; Client Provisioning.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Create client provisioning policy rules for Apple iOS, Android, and MACOSX devices.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Click Save.</td>
</tr>
</tbody>
</table>

What to do next

Configure the Dot1X Authentication Policy Rule for TLS-Based Authentication, on page 159

Configure the Dot1X Authentication Policy Rule for TLS-Based Authentication

You must update the Dot1X authentication policy rule for TLS-based authentications.
Before you begin

Ensure that you have the certificate authentication profile created for TLS-based authentication.

Procedure

Step 1
Choose Policy > Authentication.

Step 2
Click the Rule-Based radio button.
The default rule-based authentication policy includes a rule for Dot1X authentication.

Step 3
Edit the Dot1X authentication policy rule.

Step 4
Choose Actions > Insert new row above from the Dot1X policy rule.

Step 5
Enter a name for the rule. For example, eap-tls.

Step 6
Use the Expression Builder to create the following policy condition: If Network Access:EapAuthentication Equals EAP-TLS, then use the certificate authentication profile that you created earlier.

Step 7
Leave the default rule as is.

Step 8
Click Save.

What to do next

Create Authorization Profiles for Central Web Authentication and Supplicant Provisioning Flows, on page 160

Create Authorization Profiles for Central Web Authentication and Supplicant Provisioning Flows

You must define authorization profiles to determine the access that must be granted to the user after the certificate-based authentication is successful.

Before you begin

Ensure that you have configured the required access control lists (ACLs) on the wireless LAN controller (WLC). Refer to the TrustSec How-To Guide: Using Certificates for Differentiated Access for information on how to create the ACLs on the WLC.

This example assumes that you have created the following ACLs on the WLC.

- NSP-ACL - For native supplicant provisioning
- BLACKHOLE - For restricting access to blacklisted devices
- NSP-ACL-Google - For provisioning Android devices

Procedure

Step 1

Step 2
Click Add to create a new authorization profile.

Step 3
Enter a name for the authorization profile.

Step 4
From the Access Type drop-down list, choose ACCESS_ACCEPT.
Step 5  Click Add to add the authorization profiles for central web authentication, central web authentication for Google Play, native supplicant provisioning, and native supplicant provisioning for Google.

Step 6  Click Save.

What to do next
Create Authorization Policy Rules, on page 161

Create Authorization Policy Rules

Cisco ISE evaluates the authorization policy rules and grants the user access to the network resources based on the authorization profile specified in the policy rule.

Before you begin
Ensure that you have created the required authorization profiles.

Procedure

Step 1  Choose Policy > Authorization.
Step 2  Insert additional policy rules above the default rule.
Step 3  Click Save.

CA Service Policy Reference

This section provides reference information for the authorization and client provisioning policy rules that you must create before you can enable the Cisco ISE CA service.

Client Provisioning Policy Rules for Certificate Services

This section lists the client provisioning policy rules that you must create while using the Cisco ISE certificate services. The following table provides the details.

<table>
<thead>
<tr>
<th>Rule Name</th>
<th>Identity Groups</th>
<th>Operating Systems</th>
<th>Other Conditions</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>iOS</td>
<td>Any</td>
<td>Apple iOS All</td>
<td>Condition(s)</td>
<td>EAP_TLS_INTERNAL (the native supplicant profile that you created earlier). If you are using an external CA, select the native supplicant profile that you have created for the external CA.</td>
</tr>
<tr>
<td>Rule Name</td>
<td>Identity Groups</td>
<td>Operating Systems</td>
<td>Other Conditions</td>
<td>Results</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------</td>
<td>-------------------</td>
<td>-----------------</td>
<td>---------</td>
</tr>
<tr>
<td>Android</td>
<td>Any</td>
<td>Android</td>
<td>Condition(s)</td>
<td>EAP_TLS_INTERNAL (the native supplicant profile that you created earlier). If you are using an external CA, select the native supplicant profile that you have created for the external CA.</td>
</tr>
<tr>
<td>MACOSX</td>
<td>Any</td>
<td>MACOSX</td>
<td>Condition(s)</td>
<td>Under the Native Supplicant Configuration, specify the following:</td>
</tr>
</tbody>
</table>

1. Config Wizard: Select the MACOSX supplicant wizard that you downloaded from the Cisco site.
2. Wizard Profile: Choose the EAP_TLS_INTERNAL native supplicant profile that you created earlier. If you are using an external CA, select the native supplicant profile that you have created for the external CA.

### Authorization Profiles for Certificate Services

This section lists the authorization profiles that you must create for enabling certificate-based authentication in Cisco ISE. You must have already created the ACLs (NSP-ACL and NSP-ACL-Google) on the wireless LAN controller (WLC).

- **CWA** - This profile is for devices that go through the central web authentication flow. Check the Web Authentication check box, choose Centralized from the drop-down list, and enter NSP-ACL in the ACL text box.
• CWA_GooglePlay - This profile is for Android devices that go through the central web authentication flow. This profile enables Android devices to access Google Play Store and download the Cisco Network Setup Assistant. Check the **Web Authentication** check box, choose Centralized from the drop-down list, and enter NSP-ACL-Google in the ACL text box.

• NSP - This profile is for non-Android devices that go through the supplicant provisioning flow. Check the **Web Authentication** check box, choose Supplicant Provisioning from the drop-down list, and enter NSP-ACL in the ACL text box.

• NSP-Google - This profile is for Android devices that go through the supplicant provisioning flow. Check the **Web Authentication** check box, choose Supplicant Provisioning from the drop-down list, and enter NSP-ACL-Google in the ACL text box.

Review the default Blackhole_Wireless_Access authorization profile. The Advanced Attributes Settings should be:

- Cisco:cisco-av-pair = url-redirect-acl=BLACKHOLE

**Authorization Policy Rules for Certificate Services**

This section lists the authorization policy rules that you must create while enabling the Cisco ISE CA service.

- Corporate Assets-This rule is for corporate devices that connect to the corporate wireless SSID using 802.1X and MSCHAPV2 protocol.
- Android_SingleSSID-This rule is for Android devices that access the Google Play Store to download the Cisco Network Setup Assistant for provisioning. This rule is specific to single SSID setup.
- Android_DualSSID-This rule is for Android devices that access the Google Play Store to download the Cisco Network Setup Assistant for provisioning. This rule is specific to dual SSID setup.
- CWA-This rule is for devices that go through the central web authentication flow.
- NSP-This rule is for devices that go through the native supplicant provisioning flow using a certificate for EAP-TLS authentication.
- EAP-TLS-This rule is for devices that have completed the supplicant provisioning flow and are provisioned with a certificate. They will be given access to the network.

The following table lists the attributes and values that you must choose while configuring authorization policy rules for the Cisco ISE CA service. This example assumes that you have the corresponding authorization profiles configured in Cisco ISE as well.

<table>
<thead>
<tr>
<th>Rule Name</th>
<th>Conditions</th>
<th>Permissions (authorization profiles to be applied)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Corporate Assets</td>
<td>Corp_Agents AND (Wireless 802.1X AND Network Access:AuthenticationMethod EQUALS MSCHAPV2)</td>
<td>PermitAccess</td>
</tr>
</tbody>
</table>
Revoke an Endpoint Certificate

If you need to revoke a certificate issued to an employee's personal device, you can revoke it from the Endpoint Certificates page. For example, if an employee's device has been stolen or lost, you can log in to the Cisco ISE Admin portal and revoke the certificate issued to that device from the Endpoint Certificates page. You can filter the data on this page based on the Friendly Name, Device Unique Id, or Serial Number. If a PSN (sub CA) is compromised, you can revoke all certificates issued by that PSN by filtering on the Issued By field from the Endpoint Certificates page.

Procedure

Step 1 Choose Administration > System > CA Service > Endpoint Certificates.
Step 2 Check the box next to the endpoint certificate that you want to revoke and click Revoke. You can search for the certificate based on the Friendly Name and Device Type.
Step 3 Enter the reason for revoking the certificate.
Step 4 Click Yes.

OCSP Services

The Online Certificate Status Protocol (OCSP) is a protocol that is used for checking the status of x.509 digital certificates. This protocol is an alternative to the Certificate Revocation List (CRL) and addresses issues that result in handling CRLs.

Cisco ISE has the capability to communicate with OCSP servers over HTTP to validate the status of certificates in authentications. The OCSP configuration is configured in a reusable configuration object that can be referenced from any certificate authority (CA) certificate that is configured in Cisco ISE.

You can configure CRL and/or OCSP verification per CA. If both are selected, then Cisco ISE first performs verification over OCSP. If a communication problem is detected with both the primary and secondary OCSP servers, or if an unknown status is returned for a given certificate, Cisco ISE switches to checking the CRL.
Cisco ISE CA Service Online Certificate Status Protocol Responder

The Cisco ISE CA OCSP responder is a server that communicates with OCSP clients. The OCSP clients for the Cisco ISE CA include the internal Cisco ISE OCSP client and OCSP clients on the Adaptive Security Appliance (ASA). The OCSP clients should communicate with the OCSP responder using the OCSP request/response structure defined in RFC 2560, 5019.

The Cisco ISE CA issues a certificate to the OCSP responder. The OCSP responder listens on port 2560 for any incoming requests. This port is configured to allow only OCSP traffic.

The OCSP responder accepts a request that follows the structure defined in RFC 2560, 5019. Nonce extension is supported in the OCSP request. The OCSP responder obtains the status of the certificate and creates an OCSP response and signs it. The OCSP response is not cached on the OCSP responder, although you can cache the OCSP response on the client for a maximum period of 24 hours. The OCSP client should validate the signature in the OCSP response.

The self-signed CA certificate (or the intermediate CA certificate if ISE acts as an intermediate CA of an external CA) on the PAN issues the OCSP responder certificate. This CA certificate on the PAN issues the OCSP certificates on the PAN and PSNs. This self-signed CA certificate is also the root certificate for the entire deployment. All the OCSP certificates across the deployment are placed in the Trusted Certificates Store for ISE to validate any response signed using these certificates.

OCSP Certificate Status Values

OCSP services return the following values for a given certificate request:

- **Good**—Indicates a positive response to the status inquiry. It means that the certificate is not revoked, and the state is good only until the next time interval (time to live) value.

- **Revoked**—The certificate was revoked.

- **Unknown**—The certificate status is unknown. OCSP service returns this value if the certificate was not issued by the CA of this OCSP responder.

- **Error**—No response was received for the OCSP request.

OCSP High Availability

Cisco ISE has the capability to configure up to two OCSP servers per CA, and they are called primary and secondary OCSP servers. Each OCSP server configuration contains the following parameters:

- **URL**—The OCSP server URL.

- **Nonce**—A random number that is sent in the request. This option ensures that old communications cannot be reused in replay attacks.

- **Validate response**—Cisco ISE validates the response signature that is received from the OCSP server.

In case of timeout (which is 5 seconds), when Cisco ISE communicates with the primary OCSP server, it switches to the secondary OCSP server.

Cisco ISE uses the secondary OCSP server for a configurable amount of time before attempting to use the primary server again.
OCSP Failures

The three general OCSP failure scenarios are as follows:

• Failed OCSP cache or OCSP client side (Cisco ISE) failures.

• Failed OCSP responder scenarios, for example:

  The first primary OCSP responder not responding, and the secondary OCSP responder responding to the Cisco ISE OCSP request.

  Errors or responses not received from Cisco ISE OCSP requests.

  An OCSP responder may not provide a response to the Cisco ISE OCSP request or it may return an OCSP Response Status as not successful. OCSP Response Status values can be as follows:

    • tryLater
    • signRequired
    • unauthorized
    • internalError
    • malformedRequest

  There are many date-time checks, signature validity checks and so on, in the OCSP request. For more details, refer to RFC 2560 X.509 Internet Public Key Infrastructure Online Certificate Status Protocol - OCSP which describes all the possible states, including the error states.

• Failed OCSP reports

Add OCSP Client Profiles

You can use the OCSP Client Profile page to add new OCSP client profiles to Cisco ISE.

Before you begin

If the Certificate Authority (CA) is running the OCSP service on a nonstandard port (other than 80 or 443), you must configure ACLs on the switch to allow for communication between Cisco ISE and the CA on that port. For example:

\[
\text{permit tcp } <\text{source ip}> <\text{destination ip}> \text{ eq } <\text{OCSP port number}>
\]

Procedure

Step 1  Choose Administration > System > Certificates > Certificate Management > OCSP Client Profile.

Step 2  Enter the values to add an OCSP Client Profile.

Step 3  Click Submit.
OCSP Statistics Counters

Cisco ISE uses OCSP counters to log and monitor the data and health of the OCSP servers. Logging occurs every five minutes. Cisco ISE sends a syslog message to the Monitoring node and it is preserved in the local store. The local store contains data from the previous five minutes. After Cisco ISE sends the syslog message, the counters are recalculated for the next interval. This means, after five minutes, a new five-minute window interval starts again.

The following table lists the OCSP syslog messages and their descriptions.

Table 9: OCSP Syslog Messages

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OCSPPrimaryNotResponsiveCount</td>
<td>The number of nonresponsive primary requests</td>
</tr>
<tr>
<td>OCSPSecondaryNotResponsiveCount</td>
<td>The number of nonresponsive secondary requests</td>
</tr>
<tr>
<td>OCSPPrimaryCertsGoodCount</td>
<td>The number of ‘good’ certificates that are returned for a given CA using the primary OCSP server</td>
</tr>
<tr>
<td>OCSPSecondaryCertsGoodCount</td>
<td>The number of ‘good’ statuses that are returned for a given CA using the primary OCSP server</td>

Network Devices Definitions in Cisco ISE

A network device such as a switch or a router is an authentication, authorization, and accounting (AAA) client through which AAA service requests are sent to Cisco ISE. You must define network devices for Cisco ISE to interact with the network devices. You can configure network devices for RADIUS AAA, Simple Network Management Protocol (SNMP) for the Profiling service to collect Cisco Discovery Protocol and Link Layer Discovery Protocol attributes for profiling endpoints, and Trustsec attributes for Trustsec devices. A network device that is not defined in Cisco ISE cannot receive AAA services from Cisco ISE.

In the network device definition:

- You can configure the RADIUS protocol for RADIUS authentications. When Cisco ISE receives a RADIUS request from a network device, it looks for the corresponding device definition to retrieve the shared secret that is configured. If it finds the device definition, it obtains the shared secret that is configured on the device and matches it against the shared secret in the request to authenticate access. If the shared secrets match, the RADIUS server will process the request further based upon the policy and configuration. If they do not match, a reject response is sent to the network device. A failed authentication report is generated, which provides the failure reason.

- You can configure the Simple Network Management Protocol (SNMP) in the network device definition for the Profiling service to communicate with the network devices and profile endpoints that are connected to the network devices.
You must define Trustsec-enabled devices in Cisco ISE to process requests from Trustsec-enabled devices that can be part of the Cisco Trustsec solution. Any switch that supports the Trustsec solution is an Trustsec-enabled device.

Trustsec devices do not use the IP address. Instead, you must define other settings so that Trustsec devices can communicate with Cisco ISE.

Trustsec-enabled devices use the Trustsec attributes to communicate with Cisco ISE. Trustsec-enabled devices, such as the Nexus 7000 series switches, Catalyst 6000 series switches, Catalyst 4000 series switches, and Catalyst 3000 series switches are authenticated using the Trustsec attributes that you define while adding Trustsec devices.

Default Network Device Definition in Cisco ISE

Cisco ISE supports the default device definition for RADIUS authentications. You can define a default network device that Cisco ISE can use if it does not find a device definition for a particular IP address. This feature enables you to define a default RADIUS shared secret and the level of access for newly provisioned devices.

Note: We recommend that you add the default device definition only for basic RADIUS authentications. For advanced flows, you must add separate device definition for each network device.

Cisco ISE looks for the corresponding device definition to retrieve the shared secret that is configured in the network device definition when it receives a RADIUS request from a network device.

Cisco ISE performs the following procedure when a RADIUS request is received:

1. Looks for a specific IP address that matches the one in the request.
2. Looks up the ranges to see if the IP address in the request falls within the range that is specified.
3. If both step 1 and 2 fail, it uses the default device definition (if defined) to process the request.

Create a Network Device Definition in Cisco ISE

You can create a network device definition in Cisco ISE and use the default network device definition when there is no network device definition in Cisco ISE.

Procedure

1. Choose Administration > Network Resources > Network Devices.
2. Click Add.
3. Complete all mandatory fields.
**Import Network Devices into Cisco ISE**

You can import a list of device definitions into a Cisco ISE node using a comma-separated value (CSV) file. You must first update the imported template before you can import network devices into Cisco ISE. You cannot run an import of the same resource type at the same time. For example, you cannot concurrently import network devices from two different import files.

You can download the CSV template from the Admin portal, enter your device definition details in the template, and save it as a CSV file, which you can then import back into Cisco ISE.

While importing devices, you can create new records or update existing records. Cisco ISE displays the summary of the number of devices that are imported and also reports any errors that were found during the import process. When you import devices, you can also define whether you want Cisco ISE to overwrite the existing device definitions with the new definitions or stop the import process when Cisco ISE encounters the first error.

You cannot import network devices that are exported in previous releases of Cisco ISE, as the import template for these releases are different.

**Procedure**

**Step 1** Choose Administration > Network Resources > Network Devices.

**Step 2** Click Import.

**Step 3** Click Browse to choose the CSV file from the system that is running the client browser.

**Step 4** Check the Overwrite Existing Data with New Data check box.

**Step 5** Check the Stop Import on First Error check box.

**Step 6** Click Import.

---

**Export Network Devices from Cisco ISE**

You can export network devices configured in Cisco ISE in the form of a CSV file that you can use to import these network devices into another Cisco ISE node.

**Procedure**

**Step 1** Choose Administration > Network Resources > Network Devices.
Step 2  Click Export.
Step 3  To export network devices, you can do one of the following:

- Check the check boxes next to the devices that you want to export, and choose Export > Export Selected.
- Choose Export > Export All to export all the network devices that are defined.

Step 4  Save the export.csv file to your local hard disk.

Network Device Groups

Cisco ISE allows you to create hierarchical Network Device Groups (NDGs). NDGs can be used to logically group network devices based on various criteria, such as geographic location, device type, or the relative place in the network (Access Layer, Data Center, and so on). For example, to organize your network devices based on geographic location, you can group them by continent, region, or country:

- Africa -> Southern -> Namibia
- Africa -> Southern -> South Africa
- Africa -> Southern -> Botswana

You can also group the network devices based on the device type:

- Africa -> Southern -> Botswana -> Firewalls
- Africa -> Southern -> Botswana -> Routers
- Africa -> Southern -> Botswana -> Switches

Network devices can be assigned to one or more hierarchical NDGs. Thus, when Cisco ISE processes the ordered list of configured NDGs to determine the appropriate group to assign to a particular device, it may find that the same device profile applies to multiple Device Groups, and will apply the first Device Group matched.

There is no limit on the maximum number of NDGs that can be created. There is also no restriction on the maximum number of hierarchy levels.

Root Network Device Groups

Cisco ISE includes two predefined root NDGs: All Device Types and All Locations. You cannot edit, duplicate, or delete these predefined NDGs, but you can add new device groups under them.

You can create a root Network Device Group (NDG), and then create child NDGs under the root group in the Network Device Groups page. When you create a new root NDG, you must provide the name and type of the NDG. This information is not required when you create a child under the root NDG.

Network Device Attributes Used By Cisco ISE in Policy Evaluation

When you create a new network device group, a new network device attribute is added to the Device dictionary defined in the system, which you can use in policy definitions. Cisco ISE allows you to configure authentication...
and authorization policies based on Device dictionary attributes, such as device type, location, model name, and software version that is running on the network device.

**Import Network Device Groups in to Cisco ISE**

You can import network device groups into a Cisco ISE node using a comma-separated value (CSV) file. You cannot run import of the same resource type at the same time. For example, you cannot concurrently import network device groups from two different import files.

You can download the CSV template from the Admin portal, enter your device group details in the template, and save the template as a CSV file, which you can then import back into Cisco ISE.

While importing device groups, you can create new records or update existing records. When you import device groups, you can also define whether you want Cisco ISE to overwrite the existing device groups with the new groups or stop the import process when Cisco ISE encounters the first error.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Administration &gt; Network Resources &gt; Network Device Groups &gt; Groups.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Click Import.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click Browse to choose the CSV file from the system that is running the client browser.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Check the Overwrite Existing Data with New Data check box.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Check the Stop Import on First Error check box.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Click Import or click the Network Device Groups List link to return to the Network Device Groups list page.</td>
</tr>
</tbody>
</table>

**Export Network Device Groups from Cisco ISE**

You can export network device groups configured in Cisco ISE in the form of a CSV file that you can use to import these network device groups into another Cisco ISE node.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Administration &gt; Network Resources &gt; Network Device Groups &gt; Groups.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>To export the network device groups, you can do one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Check the check boxes next to the device groups that you want to export, and choose mExport &gt; Export Selected.</td>
</tr>
<tr>
<td></td>
<td>• Choose Export &gt; Export All to export all the network device groups that are defined.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Save the export.csv file to your local hard disk.</td>
</tr>
</tbody>
</table>
Cisco ISE allows you to import a large number of network devices and network device groups using comma-separated value (CSV) files. The template contains a header row that defines the format of the fields. The header row should not be edited, and should be used as is.

By default, you can use the Generate a Template link to download a CSV file in the Microsoft Office Excel application and save the file format locally on your system. When you click the Generate a Template link, the Cisco ISE server displays the Opening template.csv dialog. This dialog allows you to open the template.csv file and save the template.csv file locally on your system with an appropriate name for network devices and network device groups. If you choose to open the template.csv file from the dialog, the file opens in the Microsoft Office Excel application by default.

### Network Devices Import Template Format

The following table lists the fields in the template header and provides a description of the fields in the Network Device CSV file.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name:String(32):</td>
<td>(Required) This field is the network device name. It is an alphanumeric string, with a maximum of 32 characters in length.</td>
</tr>
<tr>
<td>Description: String(256)</td>
<td>This field is an optional description for the network device. A string, with a maximum of 256 characters in length.</td>
</tr>
<tr>
<td>IP Address: Subnets(a.b.c.d/m</td>
<td>...)</td>
</tr>
<tr>
<td>Model Name:String(32):</td>
<td>(Required) This field is the network device model name. It is a string, with a maximum of 32 characters in length.</td>
</tr>
<tr>
<td>Software Version:String(32):</td>
<td>(Required) This field is the network device software version. It is a string, with a maximum of 32 characters in length.</td>
</tr>
<tr>
<td>Network Device Groups:String(100):</td>
<td>(Required) This field should be an existing network device group. It can be a subgroup, but must include both the parent and subgroup separated by a space. It is a string, with a maximum of 100 characters, for example, Location#All Location#US</td>
</tr>
<tr>
<td><strong>Field</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------</td>
</tr>
<tr>
<td>Authentication:Protocol:String(6)</td>
<td>This is an optional field. It is the protocol that you want to use for authentication. The only valid value is RADIUS (not case sensitive).</td>
</tr>
<tr>
<td>Authentication:Shared Secret:String(128)</td>
<td>(Required, if you enter a value for the Authentication Protocol field) This field is a string, with a maximum of 128 characters in length.</td>
</tr>
<tr>
<td>EnableKeyWrap:Boolean(true</td>
<td>false)</td>
</tr>
<tr>
<td>EncryptionKey:String(ascii:16</td>
<td>hexa:32)</td>
</tr>
<tr>
<td>AuthenticationKey:String(ascii:20</td>
<td>hexa:40)</td>
</tr>
<tr>
<td>InputFormat:String(32)</td>
<td>Indicates encryption and authentication keys input format. Valid value is ASCII or Hexadecimal.</td>
</tr>
<tr>
<td>SNMP:Version:Enumeration ([2c]3)</td>
<td>This is an optional field, used by the Profiler service. It is the version of the SNMP protocol. Valid value is 1, 2c, or 3.</td>
</tr>
<tr>
<td>SNMP:RO Community:String(32)</td>
<td>(Required, if you enter a value for the SNMP Version field) SNMP Read Only community. It is a string, with a maximum of 32 characters in length.</td>
</tr>
<tr>
<td>SNMP:RW Community:String(32)</td>
<td>(Required, if you enter a value for the SNMP Version field) SNMP Read Write community. It is a string, with a maximum of 32 characters in length.</td>
</tr>
<tr>
<td>SNMP:Username:String(32)</td>
<td>This is an optional field. It is a string, with a maximum of 32 characters in length.</td>
</tr>
<tr>
<td>SNMP:Security Level:Enumeration(Auth</td>
<td>No Auth</td>
</tr>
<tr>
<td>SNMP:Authentication Protocol:Enumeration(MD5</td>
<td>SHA)</td>
</tr>
<tr>
<td>SNMP:Authentication Password:String(32)</td>
<td>(Required if you have entered Auth for the SNMP security level) It is a string, with a maximum of 32 characters in length.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>SNMP:Privacy Protocol:Enumeration(DES</td>
<td>AES128</td>
</tr>
<tr>
<td>SNMP:Privacy Password:String(32)</td>
<td>(Required if you have entered Priv for the SNMP security level) It is a string, with a maximum of 32 characters in length.</td>
</tr>
<tr>
<td>SNMP:Polling Interval:Integer:600-86400 seconds</td>
<td>This is an optional field to set the SNMP polling interval. Valid value is an integer between 600 and 86400.</td>
</tr>
<tr>
<td>SNMP:Is Link Trap Query:Boolean(true/false)</td>
<td>This is an optional field to enable or disable the SNMP link trap. Valid value is true or false.</td>
</tr>
<tr>
<td>SNMP:Is MAC Trap Query:Boolean(true/false)</td>
<td>This is an optional field to enable or disable the SNMP MAC trap. Valid value is true or false.</td>
</tr>
<tr>
<td>SNMP:Originating Policy Services Node:String(32)</td>
<td>This is an optional field. Indicates which ISE server to be used to poll for SNMP data. By default, it is automatic, but you can overwrite the setting by assigning different values.</td>
</tr>
<tr>
<td>Trustsec:Device Id:String(32)</td>
<td>This is an optional field. It is the Trustsec device ID, and is a string, with a maximum of 32 characters in length.</td>
</tr>
<tr>
<td>Trustsec:Device Password:String(256)</td>
<td>(Required if you have entered Trustsec device ID) This is the Trustsec device password and is a string, with a maximum of 256 characters in length.</td>
</tr>
<tr>
<td>Trustsec:Environment Data Download Interval:Integer:1-2147040000 seconds</td>
<td>This is an optional field. It is the Trustsec environment data download interval. Valid value is an integer between 1 and 2147040000.</td>
</tr>
<tr>
<td>Trustsec:Peer Authorization Policy Download Interval:Integer:1-2147040000 seconds</td>
<td>This is an optional field. It is the Trustsec peer authorization policy download interval. Valid value is an integer between 1 and 2147040000.</td>
</tr>
<tr>
<td>Trustsec:Reauthentication Interval:Integer:1-2147040000 seconds</td>
<td>This is an optional field. It is the Trustsec reauthentication interval. Valid value is an integer between 1 and 2147040000.</td>
</tr>
<tr>
<td>Trustsec:SGACL List Download Interval:Integer:1-2147040000 seconds</td>
<td>This is an optional field. It is the Trustsec SGACL list download interval. Valid value is an integer between 1 and 2147040000.</td>
</tr>
<tr>
<td>Trustsec:Is Other Trustsec Devices Trusted:Boolean(true/false)</td>
<td>This is an optional field. Indicates whether Trustsec is trusted. Valid value is true or false.</td>
</tr>
</tbody>
</table>
### Network Device Groups Import Template Format

The following table lists the fields in the template header and provides a description of the fields in the Network Device Group CSV file.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trustsec:Notify this device about Trustsec configuration changes:String(ENABLE_ALL</td>
<td>DISABLE_ALL)</td>
</tr>
<tr>
<td>Trustsec:Include this device when deploying Security Group Tag Mapping Updates:Boolean(true</td>
<td>false)</td>
</tr>
<tr>
<td>Deployment:Execution Mode Username:String(32)</td>
<td>This is an optional field. It is the username that has privileges to edit the device configuration. It is a string, with a maximum of 32 characters in length.</td>
</tr>
<tr>
<td>Deployment:Execution Mode Password:String(32)</td>
<td>This is an optional field. It is the device password and is a string, with a maximum of 32 characters in length.</td>
</tr>
<tr>
<td>Deployment:Enable Mode Password:String(32)</td>
<td>This is an optional field. It is the enable password of the device that would allow you to edit its configuration and is a string, with a maximum of 32 characters in length.</td>
</tr>
<tr>
<td>Trustsec:PAC issue date:Date</td>
<td>This is the field that displays the issuing date of the last Trustsec PAC that has been generated by Cisco ISE for the Trustsec device.</td>
</tr>
<tr>
<td>Trustsec:PAC expiration date:Date</td>
<td>This is the field that displays the expiration date of the last Trustsec PAC that has been generated by Cisco ISE for the Trustsec device.</td>
</tr>
<tr>
<td>Trustsec:PAC issued by:String</td>
<td>This is a field that displays the name of the issuer (a Trustsec administrator) of the last Trustsec PAC that has been generated by Cisco ISE for the Trustsec device. It is a string.</td>
</tr>
</tbody>
</table>
Table 11: CSV Template Fields and Description for Network Device Groups

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name: String(100):</td>
<td>(Required) This field is the network device group name. It is a string with a maximum of 100 characters in length. The full name of an NDG can have a maximum of 100 characters in length. For example, if you are creating a subgroup India under the parent groups Global &gt; Asia, then the full name of the NDG that you are creating would be Global#Asia#India and this full name cannot exceed 100 characters in length. If the full name of the NDG exceeds 100 characters in length, the NDG creation fails.</td>
</tr>
<tr>
<td>Description: String(1024)</td>
<td>This is an optional network device group description. It is a string, with a maximum of 1024 characters in length.</td>
</tr>
<tr>
<td>Type: String(64):</td>
<td>(Required) This field is the network device group type. It is a string, with a maximum of 64 characters in length.</td>
</tr>
<tr>
<td>Is Root: Boolean(true</td>
<td>false):</td>
</tr>
</tbody>
</table>

**Mobile Device Manager Interoperability with Cisco ISE**

Mobile Device Management (MDM) servers secure, monitor, manage, and support mobile devices deployed across mobile operators, service providers, and enterprises. MDM servers act as a policy server that controls the use of some applications on a mobile device (for example, an e-mail application) in the deployed environment. However, the network is the only entity that can provide granular access to endpoints based on ACLs. Cisco ISE queries the MDM servers for the necessary device attributes to create ACLs that provide network access control for those devices.

In this illustration, Cisco ISE is the enforcement point and the MDM policy server is the policy information point. Cisco ISE obtains data from the MDM server to provide a complete solution.
The following table lists the components that are used in the MDM setup.

You can configure Cisco ISE to interoperate with an external Mobile Device Manager (MDM) server. By setting up this type of third-party connection, you can leverage the detailed information available in the MDM database. Cisco ISE uses REST API calls over HTTPS to pull the various pieces of information from the external MDM server. Cisco ISE applies appropriate access control policies to switches, access routers, wireless access points, and other network access points to achieve greater control of remote device access to your Cisco ISE network.

The supported MDM vendors are listed here: Supported MDM Servers, on page 180.

**Supported MDM Use Cases**

The functions Cisco ISE performs with the external MDM server are as follows:

- Managing device registration—Unregistered endpoints accessing the network are redirected to a registration page, which is hosted on the MDM server. Device registration includes user role, device type, and so on.
- Handling device remediation—Endpoints are granted only restricted access during remediation.
- Augmenting endpoint data—Update the endpoint database with information from the MDM server that you cannot gather using the Cisco ISE Profiler. Cisco ISE uses six device attributes you can view using the Administration > Identity Management > Identities > Endpoints page if an endpoint is an MDM monitored device. For example:
  - MDMImei: 99 000100 160803 3
  - MDMManufacturer: Apple
• MDMModel: iPhone
• MDMOSVersion: iOS 6.0.0
• MDMPhoneNumber: 9783148806
• MDMSerialNumber: DNPGQZGUDTF9

• Cisco ISE polls the MDM server once every 4 hours for device compliance data. This is configurable by the administrator.

• Issuing device instructions through the MDM server—Issues remote actions for users’ devices through the MDM server. Administrators initiate remote actions from the ISE console.

**Vendor MDM Attributes**

When you configure an MDM server in ISE, that vendor's attributes are added to a new entry in the ISE system dictionary, named `mdm`. The following attributes are used for registration status, and are commonly supported by MDM vendors.

• DeviceRegisterStatus
• DeviceCompliantStatus
• DiskEncryptionStatus
• PinLockStatus
• JailBrokenStatus
• Manufacturer
• IMEI
• SerialNumber
• OsVersion
• PhoneNumber

Vendor's unique attributes are not supported, but you may be able to use ERS APIs to exchange vendor-specific attributes, if the vendor supports that.

The new MDM dictionary attributes are available to use in authorization policies.

When you are using these MDM dictionary attributes in policies, you cannot delete the MDM server configuration from Cisco ISE. To remove the MDM server configuration, you must first remove the MDM dictionary attributes from policies, and then remove the MDM server from Cisco ISE.

**Supported MDM Servers**

Supported MDM servers include products from the following vendors:

• Airwatch, Inc.
• Good Technology
• MobileIron, Inc.
Ports Used by the MDM Server

The following table lists the ports that must be open between the Cisco ISE and the MDM server to enable them to communicate with each other. Refer to the MDM Server Documentation for a list of ports that must be open on the MDM agent and server.

Table 12: Ports Used by the MDM Server

</table>

MDM Integration Process Flow

This section describes the MDM integration process:

1. The user associates a device to SSID.
2. Cisco ISE makes an API call to the MDM server.
3. This API call returns a list of devices for this user and the posture status for the devices.

Note

The input parameter is the MAC address of the endpoint device. For off-premise Apple iOS devices, this is the UDID.

4. Cisco ISE uses MDM to provision the device and presents an appropriate page for the user to register the device.
5. The user registers the device in the MDM server, and the MDM server redirects the request to Cisco ISE (through automatic redirection or manual browser refresh).

6. Cisco ISE queries the MDM server again for the posture status.

7. If the user’s device is not compliant to the posture (compliance) policies configured on the MDM server, the user is notified that the device is out of compliance and must be compliant.

8. After the user’s device becomes compliant, the MDM server updates the device state in its internal tables.

9. If the user refreshes the browser now, the control is transferred back to Cisco ISE.

10. Cisco ISE polls the MDM server once every four hours to get compliance information and issues Change of Authorization (CoA) appropriately. This can be configured by the administrator. Cisco ISE also checks the MDM server every 5 minutes to make sure that it is available.

The following figure illustrates the MDM process flow.

---

**Set Up MDM Servers with Cisco ISE**

To set up MDM servers with Cisco ISE, you must perform the following high-level tasks:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Import MDM server certificate into Cisco ISE.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Create mobile device manager definitions.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Configure ACLs on the Wireless LAN Controllers.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Configure an authorization profile that redirects non-registered devices to the MDM server.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Configure authorization policy rules for the MDM use cases.</td>
</tr>
</tbody>
</table>
Import MDM Server Certificate into Cisco ISE

For Cisco ISE to connect with the MDM server, you must import the MDM server certificate into the Cisco ISE Certificate Store. If your MDM server has a CA-signed certificate, you must import the root CA into the Cisco ISE Certificate Store.

Procedure

| Step 1 | Export the MDM server certificate from your MDM server and save it on your local machine. |
| Step 2 | Choose Administration > Certificates > Certificate Store > Import. |
| Step 3 | Click Browse to select the MDM server certificate that you obtained from the MDM server. |
| Step 4 | Add a friendly name. |
| Step 5 | Click Submit. |
| Step 6 | Verify that the Certificate Store list page lists the MDM server certificate. |

Create Mobile Device Manager Definitions

You can create one or more Mobile Device Manager (MDM) definitions for external MDM servers to help ensure Cisco ISE is able to obtain the most up-to-date device connection status from logged-in user devices as possible on demand. (Although you can configure multiple MDM server definitions, you can activate only one MDM server with which Cisco ISE interoperates at a time.)

Before you begin

Ensure that you have imported the MDM server certificate into Cisco ISE.

Procedure

| Step 1 | Choose Administration > Network Resources > MDM. |
| Step 2 | Click Add. |
| Step 3 | Enter the name and description of the MDM server that you want to add. |
| Step 4 | Check (or uncheck) the Status check box to indicate which MDM server should be Active. Cisco ISE can communicate with only one MDM server at a time. |
| Step 5 | Enter the MDM server IP address or hostname (FQDN) in the MDM server host field. |
| Step 6 | Specify the network/proxy port through which Cisco ISE must communicate with the MDM server. |
| Step 7 | Specify a server instance name for the MDM server you are adding. (This depends on the vendor.) |
| Step 8 | Specify the MDM server administrator username and password so that Cisco ISE can log in to and interoperate with the MDM server database. |
| Step 9 | Enter the polling interval in minutes for Cisco ISE to poll the MDM server for compliance check information. This value should be the same as the polling interval on your MDM server. The default value is 240 minutes. We recommend that you set the polling interval below 60 minutes only for testing a few active clients on your network. If you set this value below 60 minutes for a production environment with many active clients, the system’s load increases significantly and might negatively impact performance. |
If you set the polling interval to 0, ISE disables communication with the MDM server.

**Step 10** Specify the time interval in minutes for Cisco ISE to poll the MDM server for device re-authentication for compliant devices in the **Time Interval For Compliance Device ReAuth Query** field. The valid range is from 1 to 1440 minutes. The default value is 1 minute. If the device is non-compliant, Cisco ISE queries the MDM server every one minute for device re-authentication.

**Step 11** Check the **Enable** check box to activate the MDM server connection with Cisco ISE.

**Step 12** Click **Test Connection** to test Cisco ISE’s connection to the MDM server.

If Cisco ISE displays a connection error, the issue may be with the certificate, the username/password, or the server not being reachable. If you are using a proxy for the internet connection and MDM server is part of internal network then you have to put the MDM server name or its IP address in the Proxy-Bypass list. Choose **Administration > Settings > Proxy Settings** to perform this action.

**Step 13** Click **Submit** to save the MDM server definition. Only after you successfully connect Cisco ISE with the MDM server, the MDM dictionary gets populated in Cisco ISE.

---

**What to do next**

Configure an Authorization Profile for Redirecting Nonregistered Devices

### Set Permissions When AD User in the Domain Admin Group

For Windows 2008 R2, Windows 2012, and Windows 2012 R2, the Domain Admin group does not have full control on certain registry keys in the Windows operating system by default. The Active Directory admin must give the Active Directory user Full Control permissions on the following registry keys:

- **HKEY_CLASSES_ROOT\CLSID\{76A64158-CB41-11D1-8B02-00600806D9B6}**
- **HKLM\Software\Classes\Wow6432Node\CLSID\{76A64158-CB41-11D1-8B02-00600806D9B6}**

No registry changes are required for the following Active Directory versions:

- Windows 2003
- Windows 2003R2
- Windows 2008

To grant full control, the Active Directory admin must first take ownership of the key, as shown below.

**Procedure**

**Step 1** Go to the Owner tab by right clicking the key.

**Step 2** Click **Permissions**.

**Step 3** Click **Advanced**.
Required Permissions when AD User not in Domain Admin Group

For Windows 2012 R2, give the Active Directory user **Full Control** permissions on the following registry keys:

- HKEY_CLASSES_ROOT\CLSID\{76A64158-CB41-11D1-8B02-00600806D9B6}
- HKLM\Software\Classes\Wow6432Node\CLSID\{76A64158-CB41-11D1-8B02-00600806D9B6}

The following permissions also are required when an Active Directory user is not in the Domain Admin group, but is in the Domain Users group:

- Add Registry Keys to Allow ISE to Connect to the Domain Controller (see below)
- Permissions to Use DCOM on the Domain Controller, on page 186
- Set Permissions for Access to WMI Root/CIMv2 Name Space, on page 187

These permissions are only required for the following Active Directory versions:

- Windows 2003
- Windows 2003R2
- Windows 2008
- Windows 2008 R2
- Windows 2012
- Windows 2012 R2

Add Registry Keys to Allow ISE to Connect to the Domain Controller

You must manually add some registry keys to the domain controller to allow ISE to connect as a Domain User, and retrieve login authentication events. An agent is not required on the domain controllers or on any machine in the domain.

The following registry script shows the keys to add. You can copy and paste this into a text file, save the file with a .reg extension, and double click the file to make the registry changes. To add registry keys, the user must be an owner of the root key.

Windows Registry Editor Version 5.00

```
[HKEY_CLASSES_ROOT\CLSID\{76A64158-CB41-11D1-8B02-00600806D9B6}]
"AppID"="{76A64158-CB41-11D1-8B02-00600806D9B6}"

[HKEY_CLASSES_ROOT\AppID\{76A64158-CB41-11D1-8B02-00600806D9B6}]
"DllSurrogate"=" "

[HKEY_CLASSES_ROOT\Wow6432Node\AppID\{76A64158-CB41-11D1-8B02-00600806D9B6}]
"DllSurrogate"=" "
```

Make sure that you include two spaces in the value of the key **DllSurrogate**.

Keep the empty lines as shown in the script above, including an empty line at the end of the file.
Permissions to Use DCOM on the Domain Controller

The Active Directory user used for ISE identity Mapping services must have permissions to use DCOM (remote COM) on the Domain Controller. You can configure permissions with the `dcomcnfg` command line tool.

**Procedure**

**Step 1** Run the `dcomcnfg` tool from the command line.

**Step 2** Expand **Component Services**.

**Step 3** Expand **Computers > My Computer**.

**Step 4** Select Action from the menu bar, click **properties**, and click **COM Security**.

**Step 5** Make sure that the account that ISE will use for both Access and Launch has Allow permissions. That Active Directory user should be added to all the four options (Edit Limits and Edit Default for both Access Permissions and Launch and Activation Permissions).

**Step 6** Allow all Local and Remote access for both Access Permissions and Launch and Activation Permissions.

*Figure 16: Local and Remote Access for Access Permissions*
Set Permissions for Access to WMI Root/CIMv2 Name Space

By default, Active Directory users do not have permissions for the Execute Methods and Remote Enable. You can grant access using the wmiimgmt.msc MMC console.

Procedure

Step 1  Click Start > Run and type wmiimgmt.msc.
Step 2  Right-click WMI Control and click Properties.
Step 3  Under the Security tab, expand Root and choose CIMV2.
Step 4  Click Security.
Step 5  Add the Active Directory user, and configure the required permissions as shown below.
Figure 18: Required Permissions for WMI Root\CIMv2 Name Space

Open Firewall Ports for WMI Access

The firewall software on the Active Directory Domain Controller may block access to WMI. You can either turn the firewall off, or allow access on a specific IP (ISE IP address) to the following ports:

- TCP 135: General RPC Port. When doing asynchronous RPC calls, the service listening on this port tells the client which port the component servicing this request is using.
- UDP 138: Netbios Datagram Service
- TCP 139: Netbios Session Service
- TCP 445: SMB

Note

Cisco ISE 1.3 and above support SMB 2.0.
Higher ports are assigned dynamically or you can configure them manually. We recommend that you add %SystemRoot%/System32/dllhost.exe as a target. This program manages ports dynamically.
All firewall rules can be assigned to specific IP (ISE IP).

**Configure an Authorization Profile for Redirecting Nonregistered Devices**

You must configure an authorization profile in Cisco ISE to redirect nonregistered devices.

**Before you begin**
- Ensure that you have created an MDM server definition in Cisco ISE. Only after you successfully integrate ISE with the MDM server does the MDM dictionary get populated and you can create authorization policy using the MDM dictionary attributes.
- Configure ACLs on the Wireless LAN Controller for redirecting unregistered and noncompliant devices.

**Procedure**

Step 2 Create an authorization profile for redirecting nonregistered devices that are not compliant or registered.
Step 3 Enter a name for the authorization profile that matches the MDM server name.
Step 4 Choose ACCESS_ACCEPT as the Access Type.
Step 5 Check the **Web Redirection** check box and choose MDM Redirect from the drop-down list.
Step 6 Enter the name of the ACL that you configured on the wireless LAN controller in the ACL field.
Step 7 Click **Submit**.

**What to do next**

Configure Authorization Policy Rules for the MDM Use Cases.

**Configure Authorization Policy Rules for the MDM Use Cases**

You must configure authorization policy rules in Cisco ISE to complete the MDM configuration.

**Before you begin**
- Add the MDM server certificate to the Cisco ISE certificate store.
- Ensure that you have created the MDM server definition in Cisco ISE. Only after you successfully integrate ISE with the MDM server, the MDM dictionary gets populated and you can create authorization policy using the MDM dictionary attributes.
- Configure ACLs on the Wireless LAN Controller for redirecting unregistered or noncompliant devices.
Procedure

**Step 1** Choose **Policy > Authorization > Insert New Rule Below.**

**Step 2** Choose **Policy > Policy Sets, and expand the policy set to view the authorization policy rules.**

**Step 3** Add the following rules:

- **MDM_Un_REGISTERED_NON_Compliant**—For devices that are not yet registered with an MDM server or compliant with MDM policies. Once a request matches this rule, the ISE MDM page appears with information on registering the device with MDM.

- **PERMIT**—If the device is registered with Cisco ISE, registered with MDM, and is compliant with Cisco ISE and MDM policies, it will be granted access to the network based on the access control policies configured in Cisco ISE.

The following illustration shows an example of this configuration.

*Figure 19: Authorization Policy Rules for the MDM Use Cases*

**Step 4** Click **Save.**

---

**Wipe or Lock a Device**

Cisco ISE allows you to wipe or turn on pin lock for a device that is lost. You can do this from the Endpoints page.

**Procedure**

**Step 1** Choose **Administration > Identity Management > Identities > Endpoints.**

**Step 2** Check the check box next to the device that you want to wipe or lock.

**Step 3** From the MDM Access drop-down list, choose any one of the following options:

- **Full Wipe**—Depending on the MDM vendor, this option either removes the corporate apps or resets the device to the factory settings.

- **Corporate Wipe**—Removes applications that you have configured in the MDM server policies

- **PIN Lock**—Locks the device

**Step 4** Click **Yes** to wipe or lock the device.
View Mobile Device Manager Reports

Cisco ISE records all additions, updates, and deletions of MDM server definitions. You can view these events in the “Change Configuration Audit” report, which provides all the configuration changes from any system administrator for a selected time period.

Choose Operations > Reports > Change Configuration Audit > MDM, and specify the period of time to display in the resulting report.

View Mobile Device Manager Logs

You can use the Message Catalog page to view Mobile Device Manager log messages. Choose Administration > System > Logging > Message Catalog. The default reporting level for MDM log entries is "INFO." You can change the reporting level to "DEBUG" or "TRACE."
View Mobile Device Manager Logs
CHAPTER 10

Manage Resources

- Dictionaries and Dictionary Attributes, on page 193
- RADIUS-Vendor Dictionaries, on page 195

Dictionaries and Dictionary Attributes

Dictionaries are domain-specific catalogs of attributes and allowed values that can be used to define access policies for a domain. An individual dictionary is a homogeneous collection of attribute type. Attributes that are defined in a dictionary have the same attribute type and the type indicates the source or context of a given attribute.

Attribute types can be one of the following:

- MSG_ATTR
- ENTITY_ATTR
- PIP_ATTR

In addition to attributes and allowed values, a dictionary contains information about the attributes such as the name and description, data type, and the default values. An attribute can have one of the following data types: BOOLEAN, FLOAT, INTEGER, IPv4, OCTET_STRING, STRING, UNIT32, and UNIT64.

Cisco ISE creates system dictionaries during installation and allows you to create user dictionaries.

System Defined Dictionaries and Dictionary Attributes

Cisco ISE creates system dictionaries during installation that you can find in the System Dictionaries page. System-defined dictionary attributes are read-only attributes. Because of their nature, you can only view existing system-defined dictionaries. You cannot create, edit, or delete system-defined values or any attributes in a system dictionary.

A system-defined dictionary attribute is displayed with the descriptive name of the attribute, an internal name as understood by the domain, and allowed values.

Cisco ISE also creates dictionary defaults for the IETF RADIUS set of attributes that are also a part of the system-defined dictionaries, which are defined by the Internet Engineering Task Force (IETF). You can edit all free IETF RADIUS attribute fields except the ID.
Display System Dictionaries and Dictionary Attributes

You cannot create, edit, or delete any system-defined attribute in a system dictionary. You can only view system-defined attributes. You can perform a quick search that is based on a dictionary name and description or an advanced search that is based on a search rule that you define.

Procedure

Step 1 Choose Policy > Policy Elements > Dictionaries > System.
Step 2 Choose a system dictionary in the System Dictionaries page, and click View.
Step 3 Click Dictionary Attributes.
Step 4 Choose a system dictionary attribute from the list, and click View.
Step 5 Click the Dictionaries link to return to the System Dictionaries page.

User-Defined Dictionaries and Dictionary Attributes

Cisco ISE displays the user-defined dictionaries that you create in the User Dictionaries page. You cannot modify the values for Dictionary Name or Dictionary Type for an existing user dictionary once created and saved in the system.

You can do the following in the User Dictionaries page:

• Edit and delete user dictionaries.
• Search user dictionaries based on name and description.
• Add, edit, and delete user-defined dictionary attributes in the user dictionaries.
• Add or remove allowed values for dictionary attributes.

Related Topics

Create User-Defined Dictionaries

You can create, edit, or delete user-defined dictionaries.

Procedure

Step 1 Choose Policy > Policy Elements > Dictionaries > User.
Step 2 Click Add.
Step 3 Enter the name for the user dictionary, an optional description, and a version for the user dictionary.

Step 4 Choose the attribute type from the Dictionary Attribute Type drop-down list.

Step 5 Click Submit.

---

**Related Topics**

Create User-Defined Dictionary Attributes, on page 195

---

**Create User-Defined Dictionary Attributes**

You can add, edit, and delete user-defined dictionary attributes in user dictionaries as well as add or remove allowed values for the dictionary attributes.

**Procedure**

2. Choose a user dictionary from the User Dictionaries page, and click Edit.
3. Click Dictionary Attributes.
4. Click Add.
5. Enter the name for an attribute name, an optional description, and an internal name for the dictionary attribute.
6. Choose a data type from the Data Type drop-down list.
7. Click Add to configure the name, allowed value, and set the default status in the Allowed Values table.
8. Click Submit.

---

**RADIUS-Vendor Dictionaries**

Cisco ISE allows you to define a set of RADIUS-vendor dictionaries, and define a set of attributes for each one. Each vendor definition in the list contains the vendor name, the vendor ID, and a brief description.

Cisco ISE provides you the following RADIUS-vendor dictionaries by default:

- Airespace
- Cisco
- Cisco-BBSM
- Cisco-VPN3000
- Microsoft

The RADIUS protocol supports these vendor dictionaries, and the vendor-specific attributes that can be used in authorization profiles and in policy conditions.

**Related Topics**

Create RADIUS-Vendor Dictionaries, on page 196
Create RADIUS-Vendor Dictionary Attributes, on page 196
Create RADIUS-Vendor Dictionaries

You can also create, edit, delete, export, and import RADIUS-vendor dictionaries.

Procedure

**Step 1** Choose Policy > Policy Elements > Dictionaries > System > Radius > Radius Vendors.

**Step 2** Click Add.

**Step 3** Enter a name for the RADIUS-vendor dictionary, an optional description, and the vendor ID as approved by the Internet Assigned Numbers Authority (IANA) for the RADIUS vendor.

**Step 4** Choose the number of bytes taken from the attribute value to specify the attribute type from the Vendor Attribute Type Field Length drop-down list. Valid values are 1, 2, and 4. The default value is 1.

**Step 5** Choose the number of bytes taken from the attribute value to specify the attribute length from the Vendor Attribute Size Field Length drop-down list. Valid values are 0 and 1. The default value is 1.

**Step 6** Click Submit.

Related Topics

Create RADIUS-Vendor Dictionary Attributes, on page 196

Create RADIUS-Vendor Dictionary Attributes

You can create, edit, and delete RADIUS vendor attributes that Cisco ISE supports. Each RADIUS-vendor attribute has a name, data type, description, and direction, which specifies whether it is relevant to requests only, responses only, or both.

Procedure

**Step 1** Choose Policy > Policy Elements > Dictionaries > System > Radius > Radius Vendors.

**Step 2** Choose a RADIUS-vendor dictionary from the RADIUS vendor dictionaries list, and click Edit.

**Step 3** Click Dictionary Attributes, and then click Add.

**Step 4** Enter the attribute name for the RADIUS vendor attribute and an optional description.

**Step 5** Choose the data type from the Data Type drop-down list.

**Step 6** Check the Enable MAC option check box.

**Step 7** Choose the direction that applies to RADIUS requests only, RADIUS responses only, or both from the Direction drop-down list.

**Step 8** Enter the vendor attribute ID in the ID field.

**Step 9** Check the Allow Tagging check box.

**Step 10** Check the Allow multiple instances of this attribute in a profile check box.

**Step 11** Click Add to add the allowed value for the vendor attribute in the Allowed Values table.

**Step 12** Click Submit.
Logging Mechanism

Cisco provides a logging mechanism that is used for auditing, fault management, and troubleshooting. The logging mechanism helps you to identify fault conditions in deployed services and troubleshoot issues efficiently. It also produces logging output from the monitoring and troubleshooting primary node in a consistent fashion.

You can configure a Cisco ISE node to collect the logs in the local systems using a virtual loopback address. To collect logs externally, you configure external syslog servers, which are called targets. Logs are classified into various predefined categories. You can customize logging output by editing the categories with respect to their targets, severity level, and so on.

Configuring network devices to send syslogs into the ISE MnT node is not a best practice as this could result in the loss of some NAD syslogs. Only ISE should be sending updates to the MnT node.

Note

If the Monitoring node is configured as the syslog server for a network device, ensure that the logging source sends the correct network access server (NAS) IP address in the following format:

\(<message\_number>\_sequence\_number: NAS\_IP\_address: timestamp: syslog\_type: <message\_text>\)

Otherwise, this might impact functionalities that depend on the NAS IP address.

Configure Local Log Purge Settings

Use this process to set local log-storage periods and to delete local logs after a certain period of time.
Procedure

Step 1  Choose Administration > System > Logging > Local Log Settings.
Step 2  In the Local Log Storage Period field, enter the maximum number of days to keep the log entries in the configuration source.
Step 3  Click Delete Logs Now to delete the existing log files at any time before the expiration of the storage period.
Step 4  Click Save.

Cisco ISE System Logs

In Cisco ISE, system logs are collected at locations called logging targets. Targets refer to the IP addresses of the servers that collect and store logs. You can generate and store logs locally, or you can use the FTP facility to transfer them to an external server. Cisco ISE has the following default targets, which are dynamically configured in the loopback addresses of the local system:

- LogCollector—Default syslog target for the Log Collector.
- ProfilerRadiusProbe—Default syslog target for the Profiler Radius Probe.

By default, AAA Diagnostics subcategories and System Diagnostics subcategories logging targets are disabled during a fresh Cisco ISE installation or an upgrade to reduce the disk space. You can configure logging targets manually for these subcategories but local logging for these subcategories are always enabled.

You can use the default logging targets that are configured locally at the end of the Cisco ISE installation or you can create external targets to store the logs.

Related Topics

Cisco ISE Message Codes, on page 203

Local Store Syslog Message Format

Log messages are sent to the local store with this syslog message format:

```
timestamp sequence_num msg_ode msg_sev msg_class msg_text attr =value
```
**Field** | Description
---|---
*timestamp* | Date of the message generation, according to the local clock of the originating the Cisco ISE node, in the following format:

```
YYYY-MM-DD hh:mm:ss:xxx +/-zh:zm
```
Possible values are:
- **YYYY** = Numeric representation of the year.
- **MM** = Numeric representation of the month. For single-digit months (1 to 9) a zero precedes the number.
- **DD** = Numeric representation of the day of the month. For single-digit days (1 to 9), a zero precedes the number.
- **hh** = The hour of the day—00 to 23.
- **mm** = The minute of the hour—00 to 59.
- **ss** = The second of the minute—00 to 59.
- **xxx** = The millisecond of the second—000 to 999.
- **+/−zh:zm** = The time zone offset from the Cisco ISE server’s time zone, where zh is the number of offset hours and zm is the number of minutes of the offset hour, all of which is preceded by a minus or plus sign to indicate the direction of the offset. For example, +02:00 indicates that the message occurred at the time indicated by the timestamp, and on a Cisco ISE node that is two hours ahead of the Cisco ISE server’s time zone.

*sequence_num* | Global counter of each message. If one message is sent to the local store and the next to the syslog server target, the counter increments by 2. Possible values are 0000000001 to 9999999999.

*msg_ode* | Message code as defined in the logging categories.

*msg_sev* | Message severity level of a log message. See [Administration > System > Logging > Logging Categories](#).

*msg_class* | Message class, which identifies groups of messages with the same context.

*msg_text* | English language descriptive text message.
Remote Syslog Message Format

You can use the web interface to configure logging category messages so that they are sent to remote syslog server targets. Log messages are sent to the remote syslog server targets in accordance with the syslog protocol standard (see RFC-3164). The syslog protocol is an unsecure UDP.

A message is generated when an event occurs. An event may be one that displays a status, such as a message displayed when exiting a program, or an alarm. There are different types of event messages generated from different facilities such as the kernel, mail, user level, and so on. An event message is associated with a severity level, which allows an administrator to filter the messages and prioritize it. Numerical codes are assigned to the facility and the severity level. A Syslog server is an event message collector and collects event messages from these facilities. The administrator can select the event message collector to which messages will be forwarded based upon their severity level. Refer to the Logging Category Settings section for the severity levels in Cisco ISE.

Log messages are sent to the remote syslog server with this syslog message header format, which precedes the local store syslog message format:

```
pri_num Mmm DD hh:mm:ss xx:xx:xx/host_name cat_name msg_id total_seg seg_num
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attr=value</td>
<td>Set of attribute-value pairs that provides details about the logged event. A comma (,) separates each pair. Attribute names are as defined in the Cisco ISE dictionaries. Values of the Response direction AttributesSet are bundled to one attribute called Response and are enclosed in curly brackets {}. In addition, the attribute-value pairs within the Response are separated by semicolons. For example, Response={RadiusPacketType=AccessAccept; AuthenticationResult=UnknownUser; cisco-av-pair=sga:security-group-tag=0000-00;}</td>
</tr>
</tbody>
</table>
**Field** | **Description**
--- | ---
**pri_num** | Priority value of the message; a combination of the facility value and the severity value of the message. Priority value = (facility value * 8) + severity value. See Set Severity Levels for Message Codes for security levels.

The facility code valid options are:

- LOCAL0 (Code = 16)
- LOCAL1 (Code = 17)
- LOCAL2 (Code = 18)
- LOCAL3 (Code = 19)
- LOCAL4 (Code = 20)
- LOCAL5 (Code = 21)
- LOCAL6 (Code = 22; default)
- LOCAL7 (Code = 23)

**time** | Date of the message generation, according to the local clock of the originating Cisco ISE server, in the format Mmm DD hh:mm:ss.

Possible values are:

- DD = Numeric representation of the day of the month. For single-digit days (1 to 9), a space precedes the number.
- hh = The hour of the day—00 to 23.
- mm = The minute of the hour—00 to 59.
- ss = The second of the minute—00 to 59.

Some devices send messages that specify a time zone in the format +/-hhmm, where - and + identifies the directional offset from the Cisco ISE server’s time zone, hh is the number of offset hours, and mm is the number of minutes of the offset hour. For example, +02:00 indicates that the message occurred at the time indicated by the time stamp, and on a Cisco ISE node that is two hours ahead of the Cisco ISE server’s time zone.
### Configure Remote Syslog Collection Locations

You can create external locations to store the syslogs.

The UDP SysLog (Log Collector) is the default remote logging target. When you disable this logging target, it no longer functions as a log collector and is removed from the Logging Categories page. When you enable this logging target, it becomes a log collector in the Logging Categories page.

**Procedure**

1. Choose **Administration > System > Logging > Remote Logging Targets**.
2. Click **Add**.
3. Enter the required details.
4. Click **Save**.
5. Go to the Remote Logging Targets page and verify the creation of the new target.

The logging targets can then be mapped to each of the logging categories below. The PSN nodes send the relevant logs to the remote logging targets depending on the services that are enabled on those nodes.

- AAA Audit
- AAA Diagnostics

### Table of Fields and Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$xx:xx:xx:xx/host_name</td>
<td>IP address of the originating Cisco ISE node, or the hostname.</td>
</tr>
<tr>
<td>cat_name</td>
<td>Logging category name preceded by the CSCOxxx string.</td>
</tr>
<tr>
<td>msg_id</td>
<td>Unique message ID; 1 to 4294967295. The message ID increases by 1 with each new message. Message IDs restart at 1 each time the application is restarted.</td>
</tr>
<tr>
<td>total_seg</td>
<td>Total number of segments in a log message. Long messages are divided into more than one segment. <strong>Note</strong> The <code>total_seg</code> depends on the Maximum Length setting in the remote logging targets page. See <em>Remote Logging Target Settings</em>.</td>
</tr>
<tr>
<td>seg_num</td>
<td>Segment sequence number within a message. Use this number to determine what segment of the message you are viewing.</td>
</tr>
</tbody>
</table>

The syslog message data or payload is the same as the [Local Store Syslog Message Format](#). The remote syslog server targets are identified by the facility code names LOCAL0 to LOCAL7 (LOCAL6 is the default logging location.) Log messages that you assign to the remote syslog server are sent to the default location for Linux syslog (/var/log/messages), however; you can configure a different location on the server.
• Accounting
• External MDM
• Passive ID
• Posture and Client Provisioning Audit
• Posture and Client Provisioning Diagnostics
• Profiler

Logs of the following categories are sent by all nodes in the deployment to the logging targets:
• Administrative and Operational Audit
• System Diagnostics
• System Statistics

Cisco ISE Message Codes

A logging category is a bundle of message codes that describe a function, a flow, or a use case. In Cisco ISE, each log is associated with a message code that is bundled with the logging categories according to the log message content. Logging categories help describe the content of the messages that they contain.

Logging categories promote logging configuration. Each category has a name, target, and severity level that you can set, as per your application requirement.

Cisco ISE provides predefined logging categories for services, such as Posture, Profiler, Guest, AAA (authentication, authorization, and accounting), and so on, to which you can assign log targets.

Related Topics
Set Severity Levels for Message Codes, on page 203

Set Severity Levels for Message Codes

You can set the log severity level and choose logging targets where the logs of selected categories will be stored.

Procedure

Step 1 Choose Administration > System > Logging > Logging Categories.
Step 2 Click the radio button next to the category that you want to edit, and click Edit.
Step 3 Modify the required field values.
Step 4 Click Save.
Step 5  Go to the Logging Categories page and verify the configuration changes that were made to the specific category.

---

### Cisco ISE Message Catalogs

You can use the Message Catalog page to view all possible log messages and the descriptions. Choose **Administration > System > Logging > Message Catalog**.

The Log Message Catalog page appears, from which you can view all possible log messages that can appear in your log files. The data available in this page are for display only.

### Debug Logs

Debug logs capture bootstrap, application configuration, runtime, deployment, monitoring, reporting, and public key infrastructure (PKI) information. Critical and warning alarms for the past 30 days and info alarms for the past 7 days are included in the debug logs.

You can configure the debug log severity level for individual components.

You can store the debug logs in the local server.

---

**Note**

Debug log configuration is not saved when a system is restored from a backup or upgraded.

---

**Related Topics**

Configure Debug Log Severity Level, on page 205

---

### View Logging Components for a Node

**Procedure**

**Step 1**  Choose **Administration > System > Logging > Debug Log Configuration**.

**Step 2**  Select the node for which you want to view the logging components, and then click **Edit**.

The Debug Level Configuration page appears. You can view the following details:

- List of logging components based on the services that are running on the selected node
- Description for each component
- Current log level that is set for the individual components
Configure Debug Log Severity Level

You can configure the severity levels for the debug logs.

Procedure

Step 1
Choose Administration > System > Logging > Debug Log Configuration.

Step 2
Select the node, and then click Edit.

The Debug Log Configuration page displays a list of components based on the services that are running in the selected node and the current log level that is set for the individual components.

Step 3
Select the component for which you want to configure the log severity level, and then click Edit. Choose the desired log severity level from the Log Level drop-down list, and click Save.

Note
Changing the log severity level of the runtime-AAA component changes the log level of its subcomponent prrt-JNI as well. A change in subcomponent log level does not affect its parent component.

Endpoint Debug Log Collector

To troubleshoot issues with a specific endpoint, you can download debug logs for that particular endpoint based on its IP address or MAC address. The logs from the various nodes in your deployment specific to that particular endpoint get collected in a single file thus helping you troubleshoot your issue quickly and efficiently. You can run this troubleshooting tool only for one endpoint at a time. The log files are listed in the GUI. You can download the logs for an endpoint from a single node or from all the nodes in your deployment.

Download Debug Logs for a Specific Endpoint

To troubleshoot issues related to a specific endpoint in your network, you can use the Debug Endpoint tool from the Admin portal. Alternatively, you can run this tool from the Authentications page. Right-click the Endpoint ID from the Authentications page and click Endpoint Debug. This tool provides all debug information for all services related to the specific endpoint in a single file.

Before you begin
You need the IP address or MAC address of the endpoint whose debug logs you want to collect.

Procedure

Step 1
Choose Operations > Troubleshoot > Diagnostic Tools > General Tools > Endpoint Debug.

Step 2
Click the MAC Address or IP radio button and enter the MAC or IP address of the endpoint.
Step 3  Check the **Automatic disable after n Minutes** check box if you want to stop log collection after a specified amount of time. If you check this check box, you must enter a time between 1 and 60 minutes.

The following message appears: "Endpoint Debug degrades the deployment performance. Would you like to continue?"

Step 4  Click **Continue** to collect the logs.

Step 5  Click **Stop** when you want to manually stop the log collection.

---

**Related Topics**

[Endpoint Debug Log Collector](#), on page 205

---

**Collection Filters**

You can configure the Collection Filters to suppress the syslog messages being sent to the monitoring and external servers. The suppression can be performed at the Policy Services Node levels based on different attribute types. You can define multiple filters with specific attribute type and a corresponding value.

Before sending the syslog messages to monitoring node or external server, Cisco ISE compares these values with fields in syslog messages to be sent. If any match is found, then the corresponding message is not sent.

**Configure Collection Filters**

You can configure multiple collection filters based on various attribute types. It is recommended to limit the number of filters to 20. You can add, edit, or delete a collection filter.

**Procedure**

Step 1  Choose **Administration** > **System** > **Logging** > **Collection Filters**.

Step 2  Click **Add**.

Step 3  Choose the **Filter Type** from the following list:

- User Name
- MAC Address
- Policy Set Name
- NAS IP Address
- Device IP Address

Step 4  Enter the corresponding **Value** for the filter type you have selected.

Step 5  Choose the **Result** from the drop-down list. The result can be All, Passed, or Failed.

Step 6  Click **Submit**.

---

**Related Topics**

[Collection Filters](#), on page 206
Cisco ISE allows you to set filters to suppress some syslog messages from being sent to the Monitoring node and other external servers using the Collection Filters. At times, you need access to these suppressed log messages. Cisco ISE now provides you an option to bypass the event suppression based on a particular attribute such as username for a configurable amount of time. The default is 50 minutes, but you can configure the duration from 5 minutes to 480 minutes (8 hours). After you configure the event suppression bypass, it takes effect immediately. If the duration that you have set elapses, then the bypass suppression filter expires.

You can configure a suppression bypass filter from the Collection Filters page in the Cisco ISE user interface. Using this feature, you can now view all the logs for a particular identity (user) and troubleshoot issues for that identity in real time.

You can enable or disable a filter. If the duration that you have configured in a bypass event filter elapses, the filter is disabled automatically until you enable it again.

Cisco ISE captures these configuration changes in the Change Configuration Audit Report. This report provides information on who configured an event suppression or a bypass suppression and the duration of time for which the event was suppressed or the suppression bypassed.
Backup and Restore Operations

- Backup Data Type, on page 209
- Backup and Restore Repositories, on page 209
- On-Demand and Scheduled Backups, on page 211
- Cisco ISE Restore Operation, on page 216
- Export Authentication and Authorization Policy Configuration, on page 222
- Synchronize Primary and Secondary Nodes in a Distributed Environment, on page 223
- Recovery of Lost Nodes in Standalone and Distributed Deployments, on page 223

Backup Data Type

Cisco ISE allows you to back up data from the Primary PAN and from the Monitoring node. Back up can be done from the CLI or user interface.

Cisco ISE allows you to back up the following type of data:

- Configuration data—Contains both application-specific and Cisco ADE operating system configuration data. Back up can be done via the Primary PAN using the GUI or CLI.
- Operational Data—Contains monitoring and troubleshooting data. Back up can be done via the Primary PAN GUI or using the CLI for the Monitoring node.

Restore operation, can be performed with the backup files of previous versions of Cisco ISE and restored on a later version. For example, if you have a backup from an ISE node from Cisco ISE, Release 1.2, you can restore it on Cisco ISE, Release 1.3.

Backup and Restore Repositories

Cisco allows you to create and delete repositories through the Admin portal. You can create the following types of repositories:

- DISK
- FTP
- SFTP
- NFS
Repositories are local to each device.

We recommend that you have a repository size of 10 GB for small deployments (100 endpoints or less), 100 GB for medium deployments, and 200 GB for large deployments.

Related Topics
  Create Repositories, on page 210
  On-Demand and Scheduled Backups, on page 211

Create Repositories

You can use the CLI and GUI to create repositories. We recommend that you use the GUI due to the following reasons:

- Repositories that are created through the CLI are saved locally and do not get replicated to the other deployment nodes. These repositories do not get listed in the GUI’s repository page.
- Repositories that are created on the Primary PAN get replicated to the other deployment nodes.

Before you begin

- To perform the following task, you must be a Super Admin or System Admin.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Administration &gt; System &gt; Maintenance &gt; Repository.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Click Add to add a new repository.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter the values as required to set up new repository. See Repository Settings, on page 700 for a description of the fields.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click Submit to create the repository.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Verify that the repository is created successfully by clicking Repository in the Operations navigation pane on the left or click the Repository List link at the top of this page to go to the repository listing page.</td>
</tr>
</tbody>
</table>

What to do next

- Ensure that the repository that you have created is valid. You can do so from the Repository listing page. Select the repository and click Validate. Alternatively, you can execute the following command from the Cisco ISE command-line interface:

  show repository repository_name
where repository_name is the name of the repository that you have created.

---

**Note**  If the path that you provided while creating the repository does not exist, then you will get the following error: %Invalid Directory.

- Run an on-demand backup or schedule a backup.

**Related Topics**

---

**On-Demand and Scheduled Backups**

Cisco provides on-demand backups of the Primary PAN and the primary monitoring node. Perform an on-demand backup when you want to backup data immediately.

Cisco also allows you to schedule system-level backups that can be scheduled to run once, daily, weekly, or monthly. Because backup operations can be lengthy, you can schedule them so they are not a disruption. You can schedule a backup from the Cisco Admin portal.

---

**Note**  If you upgrade to Cisco ISE, Release 1.2, the scheduled backup jobs need to be recreated.

**Related Topics**

---

**Perform an On-Demand Backup**

You can perform an On-demand backup to instantly backup the configuration or monitoring (operational) data. The restore operation restores Cisco to the configuration state that existed at the time of obtaining the backup.
Important

When performing a backup and restore, the restore overwrites the list of trusted certificates on the target system with the list of certificates from the source system. It is critically important to note that backup and restore functions do not include private keys associated with the Internal Certificate Authority (CA) certificates.

If you are performing a backup and restore from one system to another, you will have to choose from one of these options to avoid errors:

• **Option 1:**
  
  Export the CA certificates from the source node through the CLI and import them in to the target system through the CLI.

  **Pros:** Any certificates issued to endpoints from the source system will continue to be trusted. Any new certificates issued by the target system will be signed by the same keys.

  **Cons:** Any certificates that have been issued by the target system prior to the restore function will not be trusted and will need to be re-issued.

• **Option 2:**
  
  After the restore process, generate all new certificates for the internal CA.

  **Pros:** This option is the recommended and clean method, where neither the original source certificates or the original target certificates will be used. Certificates issued by the original source system will continue to be trusted.

  **Cons:** Any certificates that have been issued by the target system prior to the restore function will not be trusted and will need to be re-issued.

---

**Before you begin**

• Before you perform this task, you should have a basic understanding of the backup data types in Cisco.

• Ensure that you have created repositories for storing the backup file.

• Do not back up using a local repository. You cannot back up the monitoring data in the local repository of a remote Monitoring node.

• Ensure that you perform all certificate-related changes before you obtain the backup.

• To perform the following task, you must be a Super Admin or System Admin.

---

**Note**

For backup and restore operations, the following repository types are not supported: CD-ROM, HTTP, HTTPS, or TFTP. This is because, either these repository types are read-only or the protocol does not support file listing. To restore a backup, choose the repository and click **Restore**.
Procedure

Step 1 Choose Administration > System > Backup and Restore.
Step 2 Click Backup Now.
Step 3 Enter the values as required to perform a backup.
Step 4 Click OK.
Step 5 Verify that the backup completed successfully.

Cisco appends the backup filename with a timestamp and stores the file in the specified repository. In addition to the timestamp, Cisco adds a CFG tag for configuration backups and OPS tag for operational backups. Ensure that the backup file exists in the specified repository.

In a distributed deployment, do not change the role of a node or promote a node when the backup is running. Changing node roles will shut down all the processes and might cause some inconsistency in data if a backup is running concurrently. Wait for the backup to complete before you make any node role changes.

Do not promote a node when the backup is running. This will shut down all the processes and might cause some inconsistency in data if a backup is running concurrently. Wait for the backup to complete before you make any node changes.

Note High CPU usage might be observed and High Load Average alarm might be seen when the backup is running. CPU usage will be back to normal when the backup is complete.

  **Pros:** Any certificates issued to endpoints from the source system will continue to be trusted. Any new certificates issued by the target system will be signed by the same keys.

  **Cons:** Any certificates that have been issued by the target system prior to the restore function will not be trusted and will need to be re-issued.

• **Option 2:**
  
  After the restore process, generate all new certificates for the internal CA.

  **Pros:** This option is the recommended and clean method, where neither the original source certificates or the original target certificates will be used. Certificates issued by the original source system will continue to be trusted.

  **Cons:** Any certificates that have been issued by the target system prior to the restore function will not be trusted and will need to be re-issued.

### Before you begin

- Before you perform this task, you should have a basic understanding of the backup data types in Cisco.

- Ensure that you have configured repositories.

- Do not back up using a local repository. You cannot back up the monitoring data in the local repository of a remote Monitoring node.

- To perform the following task, you must be a Super Admin or System Admin.

- If you have upgraded to Cisco ISE 1.2 from Cisco ISE 1.1 or earlier releases, you should reconfigure your scheduled backups. See the Known Upgrade Issues section in the *Cisco Identity Services Engine Upgrade Guide, Release 1.2*.

### Note

For backup and restore operations, the following repository types are not supported: CD-ROM, HTTP, HTTPS, or TFTP. This is because, either these repository types are read-only or the protocol does not support file listing.
Procedure

Step 1  Choose Administration > System > Backup and Restore.
Step 2  Click Create to schedule a Configuration or an Operational backup.
Step 3  Enter the values as required to schedule a backup.
Step 4  Click Save to schedule the backup.
Step 5  Click the Refresh link at the top of this page to see the scheduled backup list.

You can create only one schedule at a time for a Configuration or Operational backup. You can enable or disable a scheduled backup, but you cannot delete it.

Backup Using the CLI

Although you can schedule backups both from the CLI as well as the GUI, it is recommended to use GUI for better options. But, you can perform Operational backup on the secondary monitoring node only from the CLI.

Backup History

Backup history provides basic information about scheduled and on-demand backups. It lists the name of the backup, backup file size, repository where the backup is stored, and time stamp that indicates when the backup was obtained. This information is available in the Operations Audit report and on the Backup and Restore page in the History table.

For failed backups, Cisco triggers an alarm. The backup history page provides the failure reason. The failure reason is also cited in the Operations Audit report. If the failure reason is missing or is not clear, you can run the backup-logs command from the Cisco ISE CLI and look at the ADE.log for more information.

While the backup operation is in progress, you can use the show backup status CLI command to check the progress of the backup operation.

Backup history is stored along with the Cisco ADE operating system configuration data. It remains there even after an application upgrade and are only removed when you reimage the PAN.

Backup Failures

If backup fails, check the following:

- Make sure that no other backup is running at the same time.
• Check the available disk space for the configured repository.
  • Monitoring (operational) backup fails if the monitoring data takes up more than 75% of the allocated monitoring database size. For example, if your Monitoring node is allocated 600 GB, and the monitoring data takes up more than 450 GB of storage, then monitoring backup fails.
  • If the database disk usage is greater than 90%, a purge occurs to bring the database size to less than or equal to 75% of its allocated size.

• Verify if a purge is in progress. Backup and restore operations will not work while a purge is in progress.
• Verify if the repository is configured correctly.

Cisco ISE Restore Operation

You can restore configuration data on a primary or standalone administration node. After you restore data on the Primary PAN, you must manually synchronize the secondary nodes with the Primary PAN.

The process for restoring the operational data is different depending on the type of deployment.

Note
The new backup/restore user interface in Cisco makes use of meta-data in the backup filename. Therefore, after a backup completes, you should not modify the backup filename manually. If you manually modify the backup filename, the Cisco backup/restore user interface will not be able to recognize the backup file. If you have to modify the backup filename, you should use the Cisco ISE CLI to restore the backup.

Related Topics
  Restoration of Configuration or Monitoring (Operational) Backup from the CLI, on page 217
  Restore Configuration Backups from the GUI, on page 219
  Restoration of Monitoring Database, on page 220
  Synchronize Primary and Secondary Nodes in a Distributed Environment, on page 223

Guidelines for Data Restoration

Following are guidelines to follow when you restore Cisco backup data.

• Cisco ISE allows you to obtain a backup from an ISE node (A) and restore it on another ISE node (B), both having the same host names (but different IP addresses). However, after you restore the backup on node B, do not change the hostname of node B because it might cause issues with certificates and portal group tags.

• If you obtain a backup from the Primary PAN in one timezone and try to restore it on another Cisco node in another timezone, the restore process might fail. This failure happens if the timestamp in the backup file is later than the system time on the Cisco node on which the backup is restored. If you restore the same backup a day after it was obtained, then the timestamp in the backup file is in the past and the restore process succeeds.

• When you restore a backup on the Primary PAN with a different hostname than the one from which the backup was obtained, the Primary PAN becomes a standalone node. The deployment is broken and the secondary nodes become nonfunctional. You must make the standalone node the primary node, reset the
configuration on the secondary nodes, and reregister them with the primary node. To reset the configuration on Cisco nodes, enter the following command from the Cisco ISE CLI:

- `application reset-config ise`

- We recommend that you do not change the system timezone after the initial Cisco installation and setup.

- If you changed the certificate configuration on one or more nodes in your deployment, you must obtain another backup to restore the data from the standalone Cisco node or Primary PAN. Otherwise, if you try to restore data using an older backup, the communication between the nodes might fail.

- After you restore the configuration backup on the Primary PAN, you can import the Cisco ISE CA certificates and keys that you exported earlier.

Note If you did not export the Cisco ISE CA certificates and keys, then after you restore the configuration backup on the Primary PAN, generate the root CA and subordinate CAs on the Primary PAN and Policy Service Nodes (PSNs).

- You need a data repository, which is the location where Cisco saves your backup file. You must create a repository before you can run an on-demand or scheduled backup.

- If you have a standalone administration node that fails, you must run the configuration backup to restore it. If the Primary PAN fails, you can use the distributed setup to promote your Secondary Administration Node to become the primary. You can then restore data on the Primary PAN after it comes up.

Note Cisco also provides the `backup-logs` CLI command that you can use to collect log and configuration files for troubleshooting purposes.

## Restoration of Configuration or Monitoring (Operational) Backup from the CLI

To restore configuration data through the Cisco ISE CLI, use the `restore` command in the EXEC mode. Use the following command to restore data from a configuration or operational backup:

```
restore filename repository repository-name encryption-key hash/plain encryption-key name include-adeos
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>restore</code></td>
<td>Type this command to restore data from a configuration or operational backup.</td>
</tr>
<tr>
<td><code>filename</code></td>
<td>Name of the backed-up file that resides in the repository. Supports up to 120 alphanumeric characters.</td>
</tr>
<tr>
<td><code>repository</code></td>
<td>Specifies the repository that contains the backup.</td>
</tr>
</tbody>
</table>

Note You must add the `.tar.gpg` extension after the `filename` (for example, `myfile.tar.gpg`).
<table>
<thead>
<tr>
<th><strong>repository-name</strong></th>
<th>Name of the repository you want to restore the backup from.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>encryption-key</strong></td>
<td>(Optional) Specifies user-defined encryption key to restore backup.</td>
</tr>
<tr>
<td><strong>hash</strong></td>
<td>Hashed encryption key for restoring backup. Specifies an encrypted (hashed) encryption key that follows. Supports up to 40 characters.</td>
</tr>
<tr>
<td><strong>plain</strong></td>
<td>Plaintext encryption key for restoring backup. Specifies an unencrypted plaintext encryption key that follows. Supports up to 15 characters.</td>
</tr>
<tr>
<td><strong>encryption-key name</strong></td>
<td>Enter the encryption key.</td>
</tr>
<tr>
<td><strong>include-adeos</strong></td>
<td>(Optional, applicable only for configuration backup) Enter this command operator parameter if you want to restore ADE-OS configuration from a configuration backup. When you restore a configuration backup, if you do not include this parameter, Cisco ISE restores only the Cisco ISE application configuration data.</td>
</tr>
</tbody>
</table>

**Defaults**

No default behavior or values.

**Command Modes**

EXEC

**Usage Guidelines**

When you use restore commands in Cisco, the Cisco server restarts automatically.

The encryption key is optional while restoring data. To support restoring earlier backups where you have not provided encryption keys, you can use the `restore` command without the encryption key.

**Examples**

```
ise/admin# restore mybackup-100818-1502.tar.gpg repository myrepository encryption-key plain Lab12345
Restore may require a restart of application services. Continue? (yes/no) [yes] ? yes
Initiating restore. Please wait...
ISE application restore is in progress.
This process could take several minutes. Please wait...
Stopping ISE Application Server...
Stopping ISE Monitoring & Troubleshooting Log Processor...
Stopping ISE Monitoring & Troubleshooting Log Collector...
Stopping ISE Monitoring & Troubleshooting Alert Process...
Stopping ISE Monitoring & Troubleshooting Session Database...
Stopping ISE Database processes...
Starting ISE Database processes...
Starting ISE Monitoring & Troubleshooting Session Database...
Starting ISE Application Server...
```
Starting ISE Monitoring & Troubleshooting Alert Process...
Starting ISE Monitoring & Troubleshooting Log Collector...
Starting ISE Monitoring & Troubleshooting Log Processor...
Note: ISE Processes are initializing. Use 'show application status ise' CLI to verify all processes are in running state.

ise/admin#

<table>
<thead>
<tr>
<th>Related Commands</th>

## Restore Configuration Backups from the GUI

You can restore a configuration backup from the Admin portal. The GUI lists only the backups that are taken from the current release. To restore backups that are prior to this release, use the restore command from the CLI.

**Procedure**

1. Choose **Administration > System > Backup and Restore**.
2. Select the name of the backup from the list of Configurational backup and click **Restore**.
3. Enter the Encryption Key used during the backup.
4. Click **Restore**.
What to do next

If you are using the Cisco ISE CA service, you must:

1. Regenerate the entire Cisco ISE CA root chain.
2. Obtain a backup of the Cisco ISE CA certificates and keys from the Primary PAN and restore it on the Secondary PAN. This ensures that the Secondary PAN can function as the root CA or subordinate CA of an external PKI in case of a Primary PAN failure and you promote the Secondary PAN to be the Primary PAN.

Restoration of Configuration or Monitoring (Operational) Backup from the CLI, on page 217

Restoration of Monitoring Database

The process for restoring the Monitoring database is different depending on the type of deployment. The following sections explain how to restore the Monitoring database in standalone and distributed deployments.

You must use the CLI to restore an on-demand Monitoring database backup from previous releases of Cisco ISE. Restoring a scheduled backup across Cisco ISE releases is not supported.

Note

If you attempt to restore data to a node other than the one from which the data was taken, you must configure the logging target settings to point to the new node. This ensures that the monitoring syslogs are sent to the correct node.

Restore a Monitoring Backup with a Monitoring Persona, on page 221

Restore a Monitoring (Operational) Backup in a Standalone Environment

The GUI lists only the backups that are taken from the current release. To restore backups that obtained from earlier releases, use the restore command from the CLI.

Before you begin

- Purge the old monitoring data.
- Schedule a backup or perform an on-demand backup.

Procedure

Step 1 Choose Administration > System > Backup and Restore.
Step 2 Select the name of the backup from the list of Operational backup and click Restore.
Step 3 Enter the Encryption Key used during the backup.
Step 4  Click Restore.

**Related Topics**

- Restore a Monitoring (Operational) Backup in a Standalone Environment, on page 220
- Restore a Monitoring Backup with a Monitoring Persona, on page 221

**Restore a Monitoring Backup with Administration and Monitor Personas**

You can restore a Monitoring backup in a distributed environment with Administration and Monitor personas.

**Before you begin**
- Purge the old monitoring data.
- Schedule a backup or perform an on-demand backup.

**Procedure**

**Step 1**  If you are using a primary and secondary PAN, synchronize the PANs.
When you synchronize the PANs, you must choose a PAN as the active primary.

**Step 2**  Before you deregister the Monitoring node, assign the Monitoring persona to another node in the deployment.
Every deployment must have at least one functioning Monitoring node.

**Step 3**  Deregister the Monitoring node to be backed up.

**Step 4**  Restore the Monitoring backup to the newly deregistered node.

**Step 5**  Register the newly restored node with the current Administration node.

**Step 6**  Promote the newly restored and registered node as the active Monitoring node.

**Related Topics**
- Schedule a Backup, on page 213
- Perform an On-Demand Backup, on page 211
- Synchronize Primary and Secondary Nodes in a Distributed Environment, on page 223
- Restore a Monitoring (Operational) Backup in a Standalone Environment, on page 220
- Restore a Monitoring Backup with a Monitoring Persona, on page 221

**Restore a Monitoring Backup with a Monitoring Persona**

You can restore a Monitoring backup in a distributed environment with only Monitoring persona.

**Before you begin**
- Purge the old monitoring data.
• Schedule a backup or perform an on-demand backup.

**Procedure**

**Step 1** Prepare to deregister the node to be restored by assigning the Monitoring persona to another node in the deployment.

A deployment must have at least one functioning Monitoring node.

**Step 2** Deregister the node to be restored.

*Note*  
Wait until the deregistration is complete before proceeding with the restore. The node must be in a standalone state before you can continue with the restore.

**Step 3** Restore the Monitoring backup to the newly deregistered node.

**Step 4** Register the newly restored node with the current Administration node.

**Step 5** Promote the newly restored and registered node as the PAN.

**Related Topics**

## Restore History

You can obtain information about all restore operations, log events, and statuses from the Operations Audit report.

*Note*  
However, the Operations Audit report does not provide information about the start times corresponding to the previous restore operations.

For troubleshooting information, you have to run the `backup-logs` command from the Cisco ISE CLI and look at the ADE.log file.

While the restore operation is in progress, all Cisco services are stopped. You can use the `show restore status` CLI command to check the progress of the restore operation.

## Export Authentication and Authorization Policy Configuration

You can export authentication and authorization policy configuration in the form of an XML file that you can read offline to identify any configuration errors and use for troubleshooting purposes. This XML file includes authentication and authorization policy rules, simple and compound policy conditions, dACLs, and authorization profiles. You can choose to email the XML file or save it to your local system.
Procedure

Step 1 Choose Administration > System > Backup & Restore.
Step 2 Click Policy Export.
Step 3 Enter the values as needed.
Step 4 Click Export.

Use a text editor such as WordPad to view the contents of the XML file.

Synchronize Primary and Secondary Nodes in a Distributed Environment

In a distributed environment, sometimes the Cisco database in the primary and secondary nodes are not synchronized automatically after restoring a backup file on the PAN. If this happens, you can manually force a full replication from the PAN to the secondary nodes. You can force a synchronization only from the PAN to the secondary nodes. During the sync-up operation, you cannot make any configuration changes. Cisco allows you to navigate to other Cisco Admin portal pages and make any configuration changes only after the synchronization is complete.

Before you begin
To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1 Choose Administration > System > Deployment.
Step 2 Check the check boxes next to the secondary ISE nodes with an Out of Sync replication status.
Step 3 Click Syncup and wait until the nodes are synchronized with the PAN. You will have to wait until this process is complete before you can access the Cisco Admin portal again.

Recovery of Lost Nodes in Standalone and Distributed Deployments

This section provides troubleshooting information that you can use to recover lost nodes in standalone and distributed deployments. Some of the following use cases use the backup and restore functionality and others use the replication feature to recover lost data.
Recovery of Lost Nodes Using Existing IP Addresses and Hostnames in a Distributed Deployment

**Scenario**

In a distributed deployment, a natural disaster leads to a loss of all the nodes. After recovery, you want to use the existing IP addresses and hostnames.

For example, you have two nodes: N1 (Primary Policy Administration Node or Primary PAN) and N2 (Secondary Policy Administration Node or Secondary PAN.) A backup of the N1 node, which was taken at time T1, is available. Later, both N1 and N2 nodes fail because of a natural disaster.

**Assumption**

All Cisco nodes in the deployment were destroyed. The new hardware was imaged using the same hostnames and IP addresses.

**Resolution Steps**

1. You have to replace both the N1 and N2 nodes. N1 and N2 nodes will now have a standalone configuration.
2. Obtain a license with the UDI of the N1 and N2 nodes and install it on the N1 node.
3. You must then restore the backup on the replaced N1 node. The restore script will try to sync the data on N2, but N2 is now a standalone node and the synchronization fails. Data on N1 will be reset to time T1.
4. You must log in to the N1 Admin portal to delete and reregister the N2 node. Both the N1 and N2 nodes will have data reset to time T1.

**Related Topics**

Restoration of Configuration or Monitoring (Operational) Backup from the CLI, on page 217

Recovery of Lost Nodes Using New IP Addresses and Hostnames in a Distributed Deployment

**Scenario**

In a distributed deployment, a natural disaster leads to loss of all the nodes. The new hardware is reimaged at a new location and requires new IP addresses and hostnames.

For example, you have two nodes: N1 (Primary Policy Administration Node or Primary PAN) and N2 (Secondary Policy Service Node.) A backup of the N1 node which was taken at time T1, is available. Later, both N1 and N2 nodes fail because of a natural disaster. The Cisco nodes are replaced at a new location and the new hostnames are N1A (Primary PAN) and N2A (Secondary Policy Service Node). N1A and N2A are standalone nodes at this point in time.

**Assumptions**

All Cisco nodes in the deployment were destroyed. The new hardware was imaged at a different location using different hostnames and IP addresses.
Resolution Steps

1. Obtain the N1 backup and restore it on N1A. The restore script will identify the hostname change and domain name change, and will update the hostname and domain name in the deployment configuration based on the current hostname.

2. You must generate a new self-signed certificate.

3. You must log in to the Cisco Admin portal on N1A, choose Administration > System > Deployment, and do the following:
   - Delete the old N2 node.
   - Register the new N2A node as a secondary node. Data from the N1A node will be replicated to the N2A node.

Related Topics

Restoration of Configuration or Monitoring (Operational) Backup from the CLI, on page 217

Recovery of a Node Using Existing IP Address and Hostname in a Standalone Deployment

Scenario

A standalone administration node is down.

For example, you have a standalone administration node, N1. A backup of the N1 database was taken at time T1. The N1 node goes down because of a physical failure and must be reimaged or a new hardware is required. The N1 node must be brought back up with the same IP address and hostname.

Assumptions

This deployment is a standalone deployment and the new or reimaged hardware has the same IP address and hostname.

Resolution Steps

Once the N1 node is up after a reimage or you have introduced a new Cisco node with the same IP address and hostname, you must restore the backup taken from the old N1 node. You do not have to make any role changes.

Related Topics

Restoration of Configuration or Monitoring (Operational) Backup from the CLI, on page 217

Recovery of a Node Using New IP Address and Hostname in a Standalone Deployment

Scenario

A standalone administration node is down.
For example, you have a standalone administration node, N1. A backup of the N1 database taken at time T1 is available. The N1 node is down because of a physical failure and will be replaced by a new hardware at a different location with a different IP address and hostname.

Assumptions
This is a standalone deployment and the replaced hardware has a different IP address and hostname.

Resolution Steps
1. Replace the N1 node with a new hardware. This node will be in a standalone state and the hostname is N1B.
2. You can restore the backup on the N1B node. No role changes are required.

Related Topics
Restoration of Configuration or Monitoring (Operational) Backup from the CLI, on page 217

Configuration Rollback

Problem
There may be instances where you inadvertently make configuration changes that you later determine were incorrect. For example, you may delete several NADs or modify some RADIUS attributes incorrectly and realize this issue several hours later. In this case, you can revert back to the original configuration by restoring a backup that was taken before you made the changes.

Possible Causes
There are two nodes: N1 (Primary Policy Administration Node or Primary PAN) and N2 (Secondary Policy Administration Node or Secondary PAN) and a backup of the N1 node is available. You made some incorrect configuration changes on N1 and want to remove the changes.

Solution
Obtain a backup of the N1 node that was taken before the incorrect configuration changes were made. Restore this backup on the N1 node. The restore script will synchronize the data from N1 to N2.

Related Topics
Restoration of Configuration or Monitoring (Operational) Backup from the CLI, on page 217

Recovery of Primary Node in Case of Failure in a Distributed Deployment

Scenario
In a multinode deployment, the PAN fails.

For example, you have two Cisco nodes, N1 (PAN) and N2 (Secondary Administration Node). N1 fails because of hardware issues.
Assumptions

Only the primary node in a distributed deployment has failed.

Resolution Steps

1. Log in to the N2 Admin portal. Choose Administration > System > Deployment and configure N2 as your primary node.
   
   The N1 node is replaced with a new hardware, reimaged, and is in the standalone state.

2. From the N2 Admin portal, register the new N1 node as a secondary node.
   
   Now, the N2 node becomes your primary node and the N1 node becomes your secondary node.

If you wish to make the N1 node the primary node again, log in to the N1 Admin portal and make it the primary node. N2 automatically becomes a secondary server. There is no data loss.

Recovery of Secondary Node in Case of Failure in a Distributed Deployment

Scenario

In a multinode deployment, a single secondary node has failed. No restore is required.

For example, you have multiple nodes: N1 (Primary PAN), N2 (Secondary PAN), N3 (Secondary Policy Service Node), N4 (Secondary Policy Service Node). One of the secondary nodes, N3, fails.

Resolution Steps

1. Reimage the new N3A node to the default standalone state.

2. Log in to the N1 Admin portal and delete the N3 node.

3. Reregister the N3A node.

   Data is replicated from N1 to N3A. No restore is required.
Recovery of Secondary Node in Case of Failure in a Distributed Deployment
Setup Endpoint Protection Service

- Enable Endpoint Protection Service in Cisco ISE, on page 229
- Configure Network Access Settings, on page 229
- Endpoint Protection Service, on page 231
- EPS Quarantine and Unquarantine Flow, on page 233
- EPS NAS Port Shutdown Flow, on page 234
- Endpoints Purge Settings, on page 235

Enable Endpoint Protection Service in Cisco ISE

Endpoint Protection Service (EPS) is disabled by default. You must enable EPS manually, and it remains enabled until you manually disable the service in the Admin portal.

You must have Super Admin and Policy Admin role privileges to enable EPS in Cisco ISE.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Administration &gt; System &gt; Settings &gt; Endpoint Protection Service.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Click the Service Status drop-down list, and choose Enabled.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click Save.</td>
</tr>
</tbody>
</table>

Configure Network Access Settings, on page 229

Configure Network Access Settings

Endpoint Protection Service (EPS) allows you to reset the network access status of an endpoint to quarantine, unquarantine, or shutdown a port, which defines authorization to the network depending on the network access status.

You can quarantine or unquarantine endpoints, or shut down the network access server (NAS) ports to which endpoints are connected, by using their endpoint IP addresses or MAC addresses. You can perform quarantine and unquarantine operations on the same endpoint multiple times, provided they are not performed
simultaneously. If you discover a hostile endpoint on your network, you can shut down the endpoint’s access, using EPS to close the NAS port.

**Before you begin**

- You must enable EPS.
- You must create authorization profiles and Exception type authorization policies for EPS.

**Procedure**

**Step 1** Choose **Operations > Endpoint Protection Service**.

**Step 2** Under **Endpoint Operation**, enter the IP Address or MAC Address of an endpoint.

**Step 3** Click the Operations drop-down list to choose one of the following actions:

- **Quarantine**—Isolates the endpoint, restricting access on the network
- **Unquarantine**—Reverses the quarantine process, allowing full access to the network
- **Shutdown**—Closes the NAS port to which the endpoint is connected

**Step 4** Click **Submit**.

**Related Topics**

[Quarantined Endpoints Do Not Renew Authentication Following Policy Change](#), on page 230

**Quarantined Endpoints Do Not Renew Authentication Following Policy Change**

**Problem**

Authentication has failed following a change in policy or additional identity and no reauthentication is taking place. Authentication fails or the endpoint in question remains unable to connect to the network. This issue often occurs on client machines that are failing posture assessment per the posture policy that is assigned to the user role.

**Possible Causes**

The authentication timer setting is not correctly set on the client machine, or the authentication interval is not correctly set on the switch.

**Solution**

There are several possible resolutions for this issue:

1. Check the Session Status Summary report in Cisco ISE for the specified NAD or switch, and ensure that the interface has the appropriate authentication interval configured.

2. Enter “show running configuration” on the NAD/switch and ensure that the interface is configured with an appropriate “authentication timer restart” setting. (For example, “authentication timer restart 15,” and “authentication timer reauthenticate 15.”)
3. Try entering “interface shutdown” and “no shutdown” to bounce the port on the NAD/switch and force reauthentication following a potential configuration change in Cisco ISE.

---

**Note**

Because CoA requires a MAC address or session ID, we recommend that you do not bounce the port that is shown in the Network Device SNMP report.

---

**Endpoint Protection Service**

Endpoint Protection Service (EPS) is a service that runs on the Administration node that can be used for monitoring and controlling network access of endpoints. EPS is also known as Adaptive Network Control (ANC). EPS can be invoked by the ISE administrator on the admin GUI and also through pxGrid from third party systems. EPS supports wired and wireless deployments and requires a Plus License.

You can use EPS to change the authorization state without having to modify the overall authorization policy of the system. EPS allows you to set the authorization state when you quarantine an endpoint as a result of established authorization policies where authorization policies are defined to check for EPSStatus to limit or deny network access. You can unquarantine an endpoint for full network access. You can also shut down the port on the network attached system (NAS) that disconnects the endpoint from the network.

There are no limits to the number of users that can be quarantined at one time, and there are no time constraints on the length of the quarantine period.

You can perform the following operations to monitor and control network access through EPS:

- **Quarantine**—Allows you to use Exception policies (authorization policies) to limit or deny an endpoint access to the network. You must create Exception policies to assign different authorization profiles (permissions) depending on the EPSStatus. Setting to the Quarantine state essentially moves an endpoint from its default VLAN to a specified Quarantine VLAN. You must define the Quarantine VLAN previously that is supported on the same NAS as the endpoint.

- **Unquarantine**—Allows you to reverse the quarantine status that permits full access to the network for an endpoint returning the endpoint to its original VLAN.

- **Shutdown**—Allows you to deactivate a port on the NAS and disconnect the endpoint from the network. Once the port is shutdown on the NAS to which an endpoint is connected, you must manually reset the port on the NAS again to allow an endpoint to connect to the network, which is not available for wireless deployments.

Quarantine and unquarantine operations can be triggered from the session directory reports for active endpoints.

---

**Note**

If a quarantined session is unquarantined, the initiation method for a newly unquarantined session depends on the authentication method that is specified by the switch configuration.

---

**Related Topics**

- Create Authorization Profiles for Network Access through EPS, on page 232
- EPS Operations Fail when IP Address or MAC Address is not Found, on page 233
- Externally Authenticated Administrators Cannot Perform EPS Operations, on page 233
Create Authorization Profiles for Network Access through EPS

You must create an authorization profile for use with EPS and the authorization profile appears in the list of Standard Authorization Profiles. An endpoint can be authenticated and authorized in the network, but restricted to access network.

Procedure

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Click Add.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter a unique name and description for the authorization profile, and leave the Access Type as ACCESS_ACCEPT.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Check the DACL Name check box, and choose DENY_ALL_TRAFFIC from the drop-down list.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Click Submit.</td>
</tr>
</tbody>
</table>

Create Exception Policies for Network Access through EPS

For EPS authorization, you must create a quarantine exception policy that is processed before all standard authorization policies. Exception authorization polices are intended for authorizing limited access to meet special conditions or permissions or an immediate requirement. Standard authorization policies are intended to be stable and apply to a large groups of users, devices, and groups that share a common set of privileges.

Before you begin

You should have successfully created standard authorization profiles for use with EPS.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Policy &gt; Authorization, and expand Exceptions.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Choose Enabled or Disabled or Monitor Only option.</td>

<td>Click Create a New Rule.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Enter the exception rule name.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Click the plus [+] sign to choose an identity group.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Click the plus [+] sign to choose Create New Condition (Advanced Option).</td>
</tr>
<tr>
<td>Step 7</td>
<td>Click the down arrow icon in the first field to display the dictionaries list and choose Session &gt; EPSStatus.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Choose Equals from the drop-down list in the second field.</td>
</tr>
<tr>
<td>Step 9</td>
<td>Choose Quarantine from the drop-down list in the third field.</td>
</tr>
<tr>
<td>Step 10</td>
<td>Click Save.</td>
</tr>
</tbody>
</table>
EPS Operations Fail when IP Address or MAC Address is not Found

An EPS operation that you perform on an endpoint fails when an active session for that endpoint does not contain information about the IP address. This also applies to the MAC address and session ID for that endpoint.

**Note**

When you want to change the authorization state of an endpoint through EPS, you must provide the IP address or the MAC address for the endpoint. If the IP address or the MAC address is not found in the active session for the endpoint, then you will see the following error message: No active session found for this MAC address, IP Address or Session ID.

Externally Authenticated Administrators Cannot Perform EPS Operations

If an externally authenticated administrator tries to issue CoA-Quarantine from a live session, Cisco ISE returns the following error message:

CoA Action of Quarantine for xx:xx:xx:xx:xx:xx cannot be initiated. (Cause:User not found internally. Possible use of unsupported externally authenticated user

If an externally authenticated administrator performs an EPS operation from Operations > Endpoint Protection Service in the Cisco ISE Admin portal using the IP address or MAC address of the endpoint, Cisco ISE returns the following error message:

Server failure: User not found internally. Possible use of unsupported externally authenticated user

EPS Quarantine and Unquarantine Flow

You can quarantine selected endpoints with EPS, to limit their access to the network. You can quarantine endpoints and establish exception authorization policies that assign different authorization profiles, depending on the status. An authorization profile acts as a container for permissions that you define in the authorization policies that allow access to specified network services. When the authorization is complete, the permissions are granted for a network access request. If the endpoint is then validated, you can unquarantine the endpoint to allow it full access to the network.

This figure illustrates the quarantine flow, which assumes that authorization rules have been configured and the EPS session has been established.
1. A client device logs onto the network through a wireless device (WLC), and a quarantine REST API call is issued from the Administration node (PAP) to the Monitoring node (MnT).

2. The Monitoring node then calls PrRT through the Policy Services ISE node (PDP) to invoke a CoA.

3. The client device is disconnected.

4. The client device then reauthenticates and reconnects.

5. A RADIUS request for the client device is sent back to the Monitoring node.

6. The client device is quarantined while the check is made.

7. The Q-Profile authorization policy is applied, and the client device is validated.

8. The client device is unquarantined, and allowed full access to the network.

**EPS NAS Port Shutdown Flow**

You can shut down the NAS port to which an endpoint is connected by using the endpoint IP address or MAC address.

Shutdown allows you to close a NAS port based on a specified IP address for a MAC address, and you have to manually reinstate the port to bring the endpoint back into the network, which is effective only for endpoints that are connected through wired media.

Shutdown may not be supported on all devices. Most switches should support the shut down command, however. You can use the getResult() command to verify that the shutdown executed successfully.

This figure illustrates the EPS shutdown flow. For the client device in the illustration, the shutdown operation is performed on the NAS that the client device uses to access the network.
Endpoints Purge Settings

You can define the Endpoint Purge Policy by configuration rules based on identity groups and other conditions using Administration > Identity Management > Settings > Endpoint Purge. You can choose not to purge specified endpoints and to purge endpoints based on selected profiling conditions.

You can schedule an endpoint purge job. This endpoint purge schedule is enabled by default. Cisco ISE, by default, deletes endpoints and registered devices that are older than 30 days. The purge job runs at 1 AM every day based on the time zone configured in the Primary PAN.

The following are some of the conditions with examples you can use for purging the endpoints:

- **InactivityDays**— Number of days since last profiling activity or update on endpoint.
  - This condition purges stale devices that have accumulated over time, commonly transient guest or personal devices, or retired devices. These endpoints tend to represent noise in most deployments as they are no longer active on network or likely to be seen in near future. If they do happen to connect again, then they will be rediscovered, profiled, registered, etc as needed.
  - When there are updates from endpoint, InactivityDays will be reset to 0 only if profiling is enabled.

- **ElapsedDays**—Numbers days since object is created.
  - This condition can be used for endpoints that have been granted unauthenticated or conditional access for a set time period, such as a guest or contractor endpoint, or employees leveraging webauth for network access. After the allowed connect grace period, they must be fully reauthenticated and registered.

- **PurgeDate**—Date to purge the endpoint.
  - This option can be used for special events or groups where access is granted for a specific time, regardless of creation or start time. This allows all endpoints to be purged at same time. For example, a trade show, a conference, or a weekly training class with new members each week, where access is granted for specific week or month rather than absolute days/weeks/months.

Cisco ISE Users

In this chapter, the term user refers to employees and contractors who access the network regularly as well as sponsor and guest users. A sponsor user is an employee or contractor of the organization who creates and manages guest-user accounts through the sponsor portal. A guest user is an external visitor who needs access to the organization’s network resources for a limited period of time.

You must create an account for any user to gain access to resources and services on the Cisco ISE network. Employees, contractors, and sponsor users are created from the Admin portal.

User Identity

User identity is like a container that holds information about a user and forms their network access credentials. Each user’s identity is defined by data and includes: a username, e-mail address, password, account description, associated administrative group, user group, and role.

User Groups

User groups are a collection of individual users who share a common set of privileges that allow them to access a specific set of Cisco ISE services and functions.
User Identity Groups

A user’s group identity is composed of elements that identify and describe a specific group of users that belong to the same group. A group name is a description of the functional role that the members of this group have. A group is a listing of the users that belong to this group.

Default User Identity Groups

Cisco ISE comes with the following predefined user identity groups:

- **Employee**—Employees of your organization belong to this group.
- **SponsorAllAccount**—Sponsor users who can suspend or reinstate all guest accounts in the Cisco ISE network.
- **SponsorGroupAccounts**—Sponsor users who can suspend guest accounts created by sponsor users from the same sponsor user group.
- **SponsorOwnAccounts**—Sponsor users who can only suspend the guest accounts that they have created.
- **Guest**—A visitor who needs temporary access to resources in the network.
- **ActivatedGuest**—A guest user whose account is enabled and active.

User Role

A user role is a set of permissions that determine what tasks a user can perform and what services they can access on the Cisco ISE network. A user role is associated with a user group. For example, a network access user.

User Account Custom Attributes and Password Policies

Cisco ISE allows you to restrict a user’s network access based on user attributes. Cisco ISE comes with a set of predefined user attributes and also allows you to create custom attributes. Both types of attributes can be used in conditions that define the authentication policy. You can also define a password policy for user accounts so that passwords meet specified criteria.

Custom User Attributes

On the User Custom Attributes Setting page, you can use the Custom Attributes pane to define additional user-account attributes. Cisco ISE provides a list of predefined attributes that are not configurable. However, you can define custom attributes by configuring the following:

- Attribute name
- Data type

User Password Policy Settings

You can define the criteria that user-account passwords must meet in the User Password Policy page. Choose Administration > Identity Management > Settings > User Password Policy.

The following table describes the fields in the User Password Policy page.
### Table 13: User Password Policy Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum length</td>
<td>Sets the minimum length of the password (in characters)</td>

Add Users

Cisco ISE allows you to view, create, modify, duplicate, delete, change the status, import, export, or search for attributes of Cisco ISE users.

If you are using a Cisco ISE internal database, you must create an account for any new user who needs access to resources or services on a Cisco ISE network.

**Procedure**

**Step 1** Choose Administration > Identity Management > Identities > Users.

**Step 2** Click Add (+) to create a new user.

**Step 3** Enter values for the fields.

Do not include space, +, and * characters in the username. If you use the Cisco ISE Internal Certificate Authority (CA) for BYOD, the username that you provide here is used as the Common Name for the endpoint certificate. Cisco ISE Internal CA does not support "+" or "*" characters in the Common Name field.

**Step 4** Click Submit to create a new user in the Cisco ISE internal database.

**Related Topics**

- Cisco ISE Users, on page 239

- Custom User Attributes
- User Password Policy Settings
- Import Cisco ISE Internal Users, on page 243

Export Cisco ISE User Data

You might have to export user data from the Cisco ISE internal database. Cisco ISE allows you to export user data in the form of a password-protected csv file.

**Procedure**

**Step 1** Choose Administration > Identity Management > Identities > Users.

**Step 2** Check the check box that corresponds to the user(s) whose data you want to export.

**Step 3** Click Export Selected.

**Step 4** Enter a key for encrypting the password in the Key field.

**Step 5** Click Start Export to create a users.csv file.
Import Cisco ISE Internal Users

You can import new user data into ISE with a csv file to create new internal accounts. A template csv file is available for download on the pages where you can import user accounts. You can import users on Administration > Identity Management > Identities > Users.

Procedure

Step 1
Choose Administration > Identity Management > Identities > Users.

Step 2
Click Import to import users from a comma-delimited text file.

If you do not have a comma-delimited text file, click Generate a Template to create a csv file with the heading rows filled in.

Step 3
In the File textbox, enter the filename containing the users to import, or click Browse and navigate to the location where the file resides.

Step 4
Check the Create new user(s) and update existing user(s) with new data check boxes if you want to both create new users and update existing users.

Step 5
Click Save to save your changes to the Cisco ISE internal database.

Note
We recommend that you do not delete all the network access users at a time, because this may lead to CPU spike and the services to crash, especially if you are using a very large database.

Create a User Identity Group

You must create a user identity group before you can assign a user to it.

Procedure

Step 1
Choose Administration > Identity Management > Groups > Identity Groups > Add.

Step 2
Enter values in the Name and Description fields. Supported characters for the Name field are space # $ & ' ( ) * + . / @ _ .

Step 3
Click Submit.

Related Topics
User Groups, on page 239
User Identity Groups, on page 240
Default User Identity Groups
Export User Identity Groups

Cisco ISE allows you to export locally configured user identity groups in the form of a csv file.

Procedure

2. Check the check box that corresponds to the user identity group that you want to export, and click Export.
3. Click OK.

Import User Identity Groups

Cisco ISE allows you to import user identity groups in the form of a csv file.

Procedure

2. Click Generate a Template to get a template to use for the import file.
3. Click Import to import network access users from a comma-delimited text file.
4. Check the Overwrite existing data with new data check box if you want to both add a new user identity group and update existing user identity groups.
5. Click Import.
6. Click Save to save your changes to the Cisco ISE database.

Internal and External Identity Sources

Identity sources contain user information that Cisco ISE uses to validate credentials during user authentication, and to retrieve group information and other attributes that are associated with the user for use in authorization policies. They are databases that store user information in the form of records. You can add, edit, and delete user information from identity sources.

Cisco ISE supports internal and external identity sources. Both sources can be used as an authentication source for sponsor-user and guest-user authentication.

Internal Identity Sources

Cisco ISE has an internal user database that you can use to store user information. Users in the internal user database are called internal users. Cisco ISE also has an internal endpoint database that stores information about all the devices and endpoints that connect to it.
External Identity Sources

Cisco ISE allows you to configure the external identity source that contains user information. Cisco ISE connects to an external identity source to obtain user information for authentication. External identity sources also include certificate information for the Cisco ISE server and certificate authentication profiles. Cisco ISE uses authentication protocols to communicate with external identity sources. The following table lists authentication protocols and the external identity sources that they support.

**Table 14: Authentication Protocols and Supported External Identity Sources**

<table>
<thead>
<tr>
<th>Protocol (Authentication Type)</th>
<th>Internal Database</th>
<th>Active Directory</th>
<th>LDAP</th>
<th>RADIUS Token Server or RSA</th>
</tr>
</thead>
<tbody>
<tr>
<td>EAP-GTC, PAP (plain text password)</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>MS-CHAP password hash: MSCHAPv1/v2</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>EAP-MSCHAPv2 (as inner method of PEAP or EAP-FAST)</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>LEAP</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>EAP-MD5 CHAP</td>

<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>EAP-TLS PEAP-TLS (certificate retrieval)</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Note**
For TLS authentications (EAP-TLS and PEAP-TLS), identity sources are not required but can optionally be added for authorization policy conditions.
Create an External Identity Source

Cisco ISE can connect with external identity sources such as Active Directory, LDAP, RADIUS Token, and RSA SecurID servers to obtain user information for authentication and authorization. External identity sources also include certificate authentication profiles that you need for certificate-based authentications.

Procedure

Step 1  Choose Administration > Identity Management > External Identity Sources.

Step 2  Choose one of these options:

- **Certificate Authentication Profile** for certificate-based authentications.
- **Active Directory** to connect to an Active Directory as an external identity source See Active Directory as an External Identity Source, on page 247 for more details.
- **LDAP** to add an LDAP identity source. See LDAP, on page 270 for more details.
- **RADIUS Token** to add a RADIUS Token server. See RADIUS Token Identity Sources, on page 278 for more details.
- **RSA SecurID** to add an RSA SecurID server. See RSA Identity Sources, on page 283 for more details.

Certificate Authentication Profiles

For each profile, you must specify the certificate field that should be used as the principal username and whether you want a binary comparison of the certificates.

Add a Certificate Authentication Profile

You must create a certificate authentication profile if you want to use the Extensible Authentication Protocol-Transport Layer Security (EAP-TLS) certificate-based authentication method. Instead of authenticating
via the traditional username and password method, Cisco ISE compares a certificate received from a client with one in the server to verify the authenticity of a user.

**Before you begin**

You must be a Super Admin or System Admin.

**Procedure**

**Step 1**  
Choose Administration > Identity Management > External Identity Sources > Certificate Authentication Profile > Add.

**Step 2**  
Enter the name and an optional description for the certificate authentication profile.

**Step 3**  
Select an identity store from the drop-down list.

Basic certificate checking does not require an identity source. If you want binary comparison checking for the certificates, you must select an identity source. If you select Active Directory as an identity source, subject and common name and subject alternative name (all values) can be used to look up a user.

**Step 4**  
Select the use of identity from Certificate Attribute or Any Subject or Alternative Name Attributes in the Certificate. This will be used in logs and for lookups.

If you choose Any Subject or Alternative Name Attributes in the Certificate, Active Directory UPN will be used as the username for logs and all subject names and alternative names in a certificate will be tried to look up a user. This option is available only if you choose Active Directory as the identity source.

**Step 5**  
Choose when you want to Match Client Certificate Against Certificate In Identity Store. For this you must select an identity source (LDAP or Active Directory.) If you select Active Directory, you can choose to match certificates only to resolve identity ambiguity.

- Never—This option never performs a binary comparison.
- Only to resolve identity ambiguity—This option performs the binary comparison of client certificate to certificate on account in Active Directory only if ambiguity is encountered. For example, several Active Directory accounts matching to identity names from certificate are found.
- Always perform binary comparison—This option always performs the binary comparison of client certificate to certificate on account in identity store (Active Directory or LDAP).

**Step 6**  
Click Submit to add the certificate authentication profile or save the changes.

**Active Directory as an External Identity Source**

Cisco ISE uses Microsoft Active Directory as an external identity source to access resources such as users, machines, groups, and attributes. User and machine authentication in Active Directory allows network access only to users and devices that are listed in Active Directory.
Active Directory Supported Authentication Protocols and Features

Active Directory supports features such as user and machine authentications, changing Active Directory user passwords with some protocols. The following table lists the authentication protocols and the respective features that are supported by Active Directory.

<table>
<thead>
<tr>
<th>Authentication Protocols</th>
<th>Features</th>
</tr>
</thead>
<tbody>
<tr>
<td>EAP-FAST and password based Protected Extensible Authentication Protocol (PEAP)</td>

| Protected Extensible Authentication Protocol-Transport Layer Security (PEAP-TLS) | • User and machine authentication  
• Groups and attributes retrieval  
• Binary certificate comparison |
| Lightweight Extensible Authentication Protocol (LEAP) | User authentication |

Active Directory Attribute and Group Retrieval for Use in Authorization Policies

Cisco ISE retrieves user or machine attributes and groups from Active Directory for use in authorization policy rules. These attributes can be used in Cisco ISE policies and determine the authorization level for a user or machine. Cisco ISE retrieves user and machine Active Directory attributes after successful authentication and can also retrieve attributes for an authorization that is independent of authentication.
Cisco ISE may use groups in external identity stores to assign permissions to users or computers; for example, to map users to sponsor groups. You should note the following restrictions on group memberships in Active Directory:

- Policy rule conditions may reference any of the following: a user’s or computer’s primary group, the groups of which a user or computer is a direct member, or indirect (nested) groups.
- Domain local groups outside a user’s or computer’s account domain are not supported.

Attributes and groups are retrieved and managed per join point. They are used in authorization policy (by selecting first the join point and then the attribute). You cannot define attributes or groups per scope for authorization, but you can use scopes for authentication policy. When you use a scope in authentication policy, it is possible that a user is authenticated via one join point, but attributes and/or groups are retrieved via another join point that has a trust path to the user's account domain. You can use authentication domains to ensure that no two join points in one scope have any overlap in authentication domains.

---

**Note**

An authorization policy fails if the rule contains an Active Directory group name with special characters such as /, !, @, \, #, $, %, ^, &, *, (, ), _, +, or ~.

**Use Explicit UPN**

To reduce ambiguity when matching user information against Active Directory's User-Principal-Name (UPN) attributes, you must configure Active Directory to use Explicit UPN. Using Implicit UPN can produce ambiguous results if two users have the same value for `sAMAccountName`.

To set Explicit UPN in Active Directory, open the Advanced Tuning page, and set the attribute `REGISTRY\Services\lsass\Parameters\Providers\ActiveDirectory\UseExplicitUPN` to 1.

---

**Active Directory Certificate Retrieval for Certificate-Based Authentication**

Cisco ISE supports certificate retrieval for user and machine authentication that uses the EAP-TLS protocol. The user or machine record on Active Directory includes a certificate attribute of the binary data type. This certificate attribute can contain one or more certificates. Cisco ISE identifies this attribute as `userCertificate` and does not allow you to configure any other name for this attribute. Cisco ISE retrieves this certificate and uses it to perform binary comparison.

The certificate authentication profile determines the field where the username is taken from in order to lookup the user in Active Directory to be used for retrieving certificates, for example, Subject Alternative Name (SAN) or Common Name. After Cisco ISE retrieves the certificate, it performs a binary comparison of this certificate with the client certificate. When multiple certificates are received, Cisco ISE compares the certificates to check for one that matches. When a match is found, the user or machine authentication is passed.

---

**Active Directory User Authentication Process Flow**

When authenticating or querying a user, Cisco ISE checks the following:

- MS-CHAP and PAP authentications check if the user is disabled, locked out, expired or out of logon hours and the authentication fails if some of these conditions are true.
• EAP-TLS authentications checks if the user is disabled or locked out and the authentication fails if some of these conditions is met.

**Support for Active Directory Multidomain Forests**

Cisco ISE supports Active Directory with multidomain forests. Within each forest, Cisco ISE connects to a single domain, but can access resources from the other domains in the Active Directory forest if trust relationships are established between the domain to which Cisco ISE is connected and the other domains.

Refer to Release Notes for Cisco Identity Services Engine for a list of Windows Server Operating Systems that support Active Directory services.

---

**Note**

Cisco ISE does not support Microsoft Active Directory servers that reside behind a network address translator and have a Network Address Translation (NAT) address.

---

**Prerequisites for Integrating Active Directory and Cisco**

This section describes the manual steps necessary in order to configure Active Directory for integration with Cisco. However, in most cases, you can enable Cisco to automatically configure Active Directory. The following are the prerequisites to integrate Active Directory with Cisco.

- Ensure you have Active Directory Domain Admin credentials, required in order to make changes to any of the AD domain configurations.

- Ensure you have the privileges of a Super Admin or System Admin in ISE.

- Use the Network Time Protocol (NTP) server settings to synchronize the time between the Cisco server and Active Directory. You can configure NTP settings from Cisco CLI.

- Cisco ISE can connect with multiple Active Directory domains that do not have a two-way trust or have zero trust between them. If you want to query other domains from a specific join point, ensure that trust relationships exist between the join point and the other domains that have user and machine information to which you need access. If trust relationships does not exist, you must create another join point to the untrusted domain. For more information on establishing trust relationships, refer to Microsoft Active Directory documentation.

- You must have at least one global catalog server operational and accessible by Cisco, in the domain to which you are joining Cisco.
Active Directory Account Permissions Required for Performing Various Operations

<table>
<thead>
<tr>
<th>Join Operations</th>
<th>Leave Operations</th>
<th>Cisco Machine Accounts</th>
</tr>
</thead>
<tbody>
<tr>
<td>For the account that is used to perform the join operation, the following permissions are required:</td>
<td>For the account that is used to perform the leave operation, the following permissions are required:</td>
<td>For the newly created Cisco machine account that is used to communicate to the Active Directory connection, the following permissions are required:</td>
</tr>
<tr>
<td>• Search Active Directory (to see if a Cisco machine account already exists)</td>
<td>• Search Active Directory (to see if a Cisco machine account already exists)</td>
<td>• Ability to change own password</td>
</tr>
<tr>
<td>• Create Cisco machine account to domain (if the machine account does not already exist)</td>
<td>• Remove Cisco machine account from domain</td>
<td>• Read the user/machine objects corresponding to users/machines</td>
</tr>
<tr>
<td>• Set attributes on the new machine account (for example, Cisco machine account password, SPN, dnsHostname)</td>
<td>If you perform a force leave (leave without the password), it will not remove the machine account from the domain.</td>
<td>• Query some parts of the Active Directory to learn about required information (for example, trusted domains, alternative UPN suffixes and so on.)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Ability to read tokenGroups attribute</td>
</tr>
</tbody>
</table>

You can precreate the machine account in Active Directory, and if the SAM name matches the Cisco appliance hostname, it should be located during the join operation and re-used.

If multiple join operations are performed, multiple machine accounts are maintained inside Cisco, one for each join.

Note: The credentials used for the join or leave operation are not stored in Cisco. Only the newly created Cisco machine account credentials are stored, and this is in order to enable the Endpoint probe to run as well.

Network Ports That Must Be Open for Communication

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port (remote-local)</th>
<th>Target</th>
<th>Authenticated</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS (TCP/UDP)</td>
<td>Random number greater than or equal to 49152</td>
<td>DNS Servers/AD Domain Controllers</td>
<td>No</td>
<td>—</td>
</tr>
<tr>
<td>MSRPC</td>
<td>445</td>
<td>Domain Controllers</td>
<td>Yes</td>
<td>—</td>
</tr>
</tbody>
</table>
DNS Server

While configuring your DNS server, make sure that you take care of the following:

- The DNS servers that you configure in Cisco ISE must be able to resolve all forward and reverse DNS queries for the domains that you want to use.
- The Authoritative DNS server is recommended to resolve Active Directory records, as DNS recursion can cause delays and have significant negative impact on performance.
- All DNS servers must be able to answer SRV queries for DCs, GCs, and KDCs with or without additional Site information.
- Cisco recommends that you add the server IP addresses to SRV responses to improve performance.
- Avoid using DNS servers that query the public Internet. They can leak information about your network when an unknown name has to be resolved.

Configure Active Directory as an External Identity Source

Before you configure Active Directory as an External Identity Source, make sure that:

- Cisco ISE hostnames are 15 characters or less in length. Active Directory does not allow hostnames larger than 15 characters.
- The Microsoft Active Directory server does not reside behind a network address translator and does not have a Network Address Translation (NAT) address.
- The Microsoft Active Directory account intended for the join operation is valid and is not configured with the Change Password on Next Login.
- You have the privileges of a Super Admin or System Admin in ISE.

**Note**

If you see operational issues when Cisco ISE is connected to Active Directory, see the AD Connector Operations Report under Operations > Reports.
You must perform the following tasks to configure Active Directory as an external identity source.

1. **Add an Active Directory Join Point and Join Cisco ISE Node to the Join Point, on page 253**
2. **Configure Authentication Domains, on page 256**
3. **Configure Active Directory User Groups, on page 256**
4. **Configure Active Directory User and Machine Attributes, on page 257**
5. **(Optional) Modify Password Changes, Machine Authentications, and Machine Access Restriction Settings, on page 258**

## Add an Active Directory Join Point and Join Cisco ISE Node to the Join Point

### Before you begin
Make sure that the Cisco ISE node can communicate with the networks where the NTP servers, DNS servers, domain controllers, and global catalog servers are located. You can check these parameters by running the Domain Diagnostic tool.

Join points must be created in order to work with Active Directory as well as with the Agent, Syslog, SPAN and Endpoint probes of the Passive ID Work Center.

### Procedure

**Step 1** Choose **Administration > Identity Management > External Identity Sources > Active Directory.**

**Step 2** Click **Add** and enter the domain name and identity store name from the Active Directory Join Point Name settings.

**Step 3** Click **Submit**.

A pop-up appears asking if you want to join the newly created join point to the domain. Click **Yes** if you want to join immediately.
If you clicked No, then saving the configuration saves the Active Directory domain configuration globally (in the primary and secondary policy service nodes), but none of the Cisco ISE nodes are joined to the domain yet.

**Step 4** Check the checkbox next to the new Active Directory join point that you created and click **Edit**, or click on the new Active Directory join point from the navigation pane on the left. The deployment join/leave table is displayed with all the Cisco ISE nodes, the node roles, and their status.

**Step 5** Check the checkbox next to the relevant Cisco ISE nodes and click **Join** to join the Cisco ISE node to the Active Directory domain.

You must do this explicitly even though you saved the configuration. To join multiple Cisco ISE nodes to a domain in a single operation, the username and password of the account to be used must be the same for all join operations. If different username and passwords are required to join each Cisco ISE node, the join operation should be performed individually for each Cisco ISE node.

**Step 6** Enter the Active Directory username and password from the **Join Domain** dialog box that opens.

It is strongly recommended that you choose **Store credentials**, in which case your administrator’s user name and password will be saved in order to be used for all Domain Controllers (DC) that are configured for monitoring.

The user used for the join operation should exist in the domain itself. If it exists in a different domain or subdomain, the username should be noted in a UPN notation, such as jdoe@acme.com.

**Step 7** *(Optional)* Check the **Specify Organizational Unit** checkbox.

You should check this checkbox in case the Cisco ISE node machine account is to be located in a specific Organizational Unit other than CN=Computers,DC=someDomain,DC=someTLD. Cisco ISE creates the machine account under the specified organizational unit or moves it to this location if the machine account already exists. If the organizational unit is not specified, Cisco ISE uses the default location. The value should be specified in full distinguished name (DN) format. The syntax must conform to the Microsoft guidelines. Special reserved characters, such as /+;<=<> line feed, space, and carriage return must be escaped by a backslash (\). For example, OU=Cisco ISE\,US,OU=IT Servers,OU=Servers\,and Workstations,DC=someDomain,DC=someTLD. If the machine account is already created, you need not check this checkbox. You can also change the location of the machine account after you join to the Active Directory domain.

**Step 8** Click **OK**.

You can select more than one node to join to the Active Directory domain.

If the join operation is not successful, a failure message appears. Click the failure message for each node to view detailed logs for that node.

**Note** When the join is complete, Cisco ISE updates its AD groups and corresponding SIDS. Cisco ISE automatically starts the SID update process. You must ensure that this process is allowed to complete.
You might not be able to join Cisco ISE with an Active Directory domain if the DNS SRV records are missing (the domain controllers do not advertise their SRV records for the domain that you are trying to join to). Refer to the following Microsoft Active Directory documentation for troubleshooting information:

- http://support.microsoft.com/kb/816587

**What to do next**

Configure Active Directory User Groups, on page 256

Configure authentication domains.

**Leave the Active Directory Domain**

If you no longer need to authenticate users or machines from this Active Directory domain or from this join point, you can leave the Active Directory domain.

When you reset the Cisco ISE application configuration from the command-line interface or restore configuration after a backup or upgrade, it performs a leave operation, disconnecting the Cisco ISE node from the Active Directory domain, if it is already joined. However, the Cisco ISE node account is not removed from the Active Directory domain. We recommend that you perform a leave operation from the Admin portal with the Active Directory credentials because it also removes the node account from the Active Directory domain. This is also recommended when you change the Cisco ISE hostname.

**Before you begin**

If you leave the Active Directory domain, but still use Active Directory as an identity source for authentication (either directly or as part of an identity source sequence), authentications may fail.

**Procedure**

| Step 1 | Choose Administration > Identity Management > External Identity Sources > Active Directory. |
| Step 2 | Check the checkbox next to the Active Directory join point that you created and click Edit. The deployment join/leave table is displayed with all the Cisco ISE nodes, the node roles, and their statuses. |
| Step 3 | Check the checkbox next to the Cisco ISE node and click Leave. |
| Step 4 | Enter the Active Directory username and password, and click OK to leave the domain and remove the machine account from the Cisco ISE database. If you enter the Active Directory credentials, the Cisco ISE node leaves the Active Directory domain and deletes the Cisco ISE machine account from the Active Directory database. |
| Note | To delete the Cisco ISE machine account from the Active Directory database, the Active Directory credentials that you provide here must have the permission to remove machine account from domain. |
| Step 5 | If you do not have the Active Directory credentials, check the No Credentials Available checkbox, and click OK. |
If you check the **Leave domain without credentials** checkbox, the primary Cisco ISE node leaves the Active Directory domain. The Active Directory administrator must manually remove the machine account that was created in Active Directory during the time of the join.

---

### Configure Authentication Domains

The domain to which Cisco ISE is joined to has visibility to other domains with which it has a trust relationship. By default, Cisco ISE is set to permit authentication against all those trusted domains. You can restrict interaction with the Active Directory deployment to a subset of authentication domains. Configuring authentication domains enables you to select specific domains for each join point so that the authentications are performed against the selected domains only. Authentication domains improve security because they instruct Cisco ISE to authenticate users only from selected domains and not from all domains trusted from join point. Authentication domains also improve performance and latency of authentication request processing because authentication domains limit the search area (that is, where accounts matching to incoming username or identity will be searched). It is especially important when incoming username or identity does not contain domain markup (prefix or suffix). Due to these reasons, configuring authentication domains is a best practice, and we highly recommended it.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose <strong>Administration &gt; Identity Management &gt; External Identity Sources &gt; Active Directory</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Click the <strong>Authentication Domains</strong> tab. A table appears with a list of your trusted domains. By default, Cisco ISE permits authentication against all trusted domains.</td>
</tr>
<tr>
<td>Step 3</td>
<td>To allow only specified domains, uncheck <strong>Use all Active Directory domains for authentication</strong> check box.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Check the check box next to the domains for which you want to allow authentication, and click <strong>Enable Selected</strong>. In the <strong>Authenticate</strong> column, the status of this domain changes to Yes. You can also disable selected domains.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Click <strong>Show Unusable Domains</strong> to view a list of domains that cannot be used. Unusable domains are domains that Cisco ISE cannot use for authentication due to reasons such as one-way trust, selective authentication and so on.</td>
</tr>
</tbody>
</table>

**What to do next**

Configure Active Directory user groups.

---

### Configure Active Directory User Groups

You must configure Active Directory user groups for them to be available for use in authorization policies. Internally, Cisco ISE uses security identifiers (SIDs) to help resolve group name ambiguity issues and to enhance group mappings. SID provides accurate group assignment matching.
Procedure

Step 1  Choose Administration > Identity Management > External Identity Sources > Active Directory.
Step 2  Click the Groups tab.
Step 3  Do one of the following:
   a) Choose Add > Select Groups From Directory to choose an existing group.
   b) Choose Add > Add Group to manually add a group. You can either provide both group name and SID
       or provide only the group name and press Fetch SID.
       Do not use double quotes (") in the group name for the user interface login.
Step 4  If you are manually selecting a group, you can search for them using a filter. For example, enter admin* as
       the filter criteria and click Retrieve Groups to view user groups that begin with admin. You can also enter
       the asterisk (*) wildcard character to filter the results. You can retrieve only 500 groups at a time.
Step 5  Check the check boxes next to the groups that you want to be available for use in authorization policies and
       click OK.
Step 6  If you choose to manually add a group, enter a name and SID for the new group.
Step 7  Click OK.
Step 8  Click Save.

Note  If you delete a group and create a new group with the same name as original, you must click Update SID Values to assign new SID to the newly created group. After an upgrade, the SIDs are automatically updated after the first join.

What to do next
Configure Active Directory user attributes.

Configure Active Directory User and Machine Attributes

You must configure Active Directory user and machine attributes to be able to use them in conditions in authorization policies.

Procedure

Step 1  Choose Administration > Identity Management > External Identity Sources > Active Directory.
Step 2  Click the Attributes tab.
Step 3  Choose Add > Add Attribute to manually add a attribute, or choose Add > Select Attributes From
       Directory to choose a list of attributes from the directory.
Step 4  If you choose to add attributes from the directory, enter the name of a user in the Sample User or Machine
       Account field, and click Retrieve Attributes to obtain a list of attributes for users. For example, enter
       administrator to obtain a list of administrator attributes. You can also enter the asterisk (*) wildcard character
       to filter the results.
Modify Password Changes, Machine Authentications, and Machine Access Restriction Settings

**Before you begin**

You must join Cisco ISE to the Active Directory domain. For more information, see Add an Active Directory Join Point and Join Cisco ISE Node to the Join Point, on page 253.

**Procedure**

1. Choose Administration > Identity Management > External Identity Sources > Active Directory.
2. Check the check box next to the relevant Cisco ISE node and click **Edit**.
3. Click the **Advanced Settings** tab.
4. Modify as required, the Password Change, Machine Authentication, and Machine Access Restrictions (MARs) settings. These options are enabled by default.
5. Check the **Use Kerberos for Plain Text Authentications** check box if you want to use Kerberos for plain-text authentications. The default and recommended option is MS-RPC. Kerberos is used in ISE 1.2.

**Support for Active Directory Multi-Join Configuration**

Cisco ISE supports multiple joins to Active Directory domains. Cisco ISE supports up to 50 Active Directory joins. Cisco ISE can connect with multiple Active Directory domains that do not have a two-way trust or have zero trust between them. Active Directory multi-domain join comprises a set of distinct Active Directory domains with their own groups, attributes, and authorization policies for each join.

You can join the same forest more than once, that is, you can join more than one domain in the same forest, if necessary.

Cisco ISE now allows to join domains with one-way trust. This option helps bypass the permission issues caused by a one-way trust. You can join either of the trusted domains and hence be able to see both domains.

- **Join Point**—In Cisco ISE, each independent join to an Active Directory domain is called a join point. The Active Directory join point is an Cisco ISE identity store and can be used in authentication policy. It has an associated dictionary for attributes and groups, which can be used in authorization conditions.
• Scope—A subset of Active Directory join points grouped together is called a scope. You can use scopes in authentication policy in place of a single join point and as authentication results. Scopes are used to authenticate users against multiple join points. Instead of having multiple rules for each join point, if you use a scope, you can create the same policy with a single rule and save the time that Cisco ISE takes to process a request and help improve performance. A join point can be present in multiple scopes. A scope can be included in an identity source sequence. You cannot use scopes in an authorization policy condition because scopes do not have any associated dictionaries.

When you perform a fresh Cisco ISE install, by default no scopes exist. This is called the no scope mode. When you add a scope, Cisco ISE enters multi-scope mode. If you want, you can return to no scope mode. All the join points will be moved to the Active Directory folder.

• Initial_Scope is an implicit scope that is used to store the Active Directory join points that were added in no scope mode. When multi-scope mode is enabled, all the Active Directory join points move into the automatically created Initial_Scope. You can rename the Initial_Scope.

• All_AD_Instances is a built-in pseudo scope that is not shown in the Active Directory configuration. It is only visible as an authentication result in policy and identity sequences. You can select this scope if you want to select all Active Directory join points configured in Cisco ISE.

Create a New Scope to Add Active Directory Join Points

Procedure

Step 1  Choose Administration > Identity Management > External Identity Sources > Active Directory.
Step 2  Click Scope Mode.
        A default scope called Initial_Scope is created, and all the current join points are placed under this scope.
Step 3  To create more scopes, click Add.
Step 4  Enter a name and a description for the new scope.
Step 5  Click Submit.

Identity Rewrite

Identity rewrite is an advanced feature that directs Cisco ISE to manipulate the identity before it is passed to the external Active Directory system. You can create rules to change the identity to a desired format that includes or excludes a domain prefix and/or suffix or other additional markup of your choice.

Identity rewrite rules are applied on the username or hostname received from the client, before being passed to Active Directory, for operations such as subject searches, authentication, and authorization queries. Cisco ISE will match the condition tokens and when the first one matches, Cisco ISE stops processing the policy and rewrites the identity string according to the result.

During the rewrite, everything enclosed in square bracket [ ] (such as [IDENTITY]) is a variable that is not evaluated on the evaluation side but instead added with the string that matches that location in the string. Everything without the brackets is evaluated as a fixed string on both the evaluation side and the rewrite side of the rule.
The following are some examples of identity rewrite, considering that the identity entered by the user is ACME\jdoe:

- If identity matches ACME\[IDENTITY], rewrite as [IDENTITY].
  The result would be jdoe. This rule instructs Cisco ISE to strip all usernames with the ACME prefix.

- If the identity matches ACME\[IDENTITY], rewrite as [IDENTITY]@ACME.com.
  The result would be jdoe@ACME.com. This rule instructs Cisco ISE to change the format from prefix for suffix notation or from NetBIOS format to UPN formats.

- If the identity matches ACME\[IDENTITY], rewrite as ACME2\[IDENTITY].
  The result would be ACME2\jdoe. This rule instructs Cisco ISE to change all usernames with a certain prefix to an alternate prefix.

- If the identity matches [ACME]\jdoe.USA, rewrite as [IDENTITY]@[ACME].com.
  The result would be jdoe\ACME.com. This rule instructs Cisco ISE to strip the realm after the dot, in this case the country and replace it with the correct domain.

- If the identity matches E=[IDENTITY], rewrite as [IDENTITY].
  The result would be jdoe. This is an example rule that can be created when an identity is from a certificate, the field is an email address, and Active Directory is configured to search by Subject. This rule instructs Cisco ISE to remove ‘E=’.

- If the identity matches E=[EMAIL],\[DN], rewrite as [DN].
  This rule will convert certificate subject from E=jdoe@acme.com, CN=jdoe, DC=acme, DC=com to pure DN, CN=jdoe, DC=acme, DC=com. This is an example rule that can be created when identity is taken from a certificate subject and Active Directory is configured to search user by DN. This rule instructs Cisco ISE to strip email prefix and generate DN.

The following are some common mistakes while writing the identity rewrite rules:

- If the identity matches [DOMAIN]\[IDENTITY], rewrite as [IDENTITY]@DOMAIN.com.
  The result would be jdoe@DOMAIN.com. This rule does not have [DOMAIN] in square brackets [ ] on the rewrite side of the rule.

- If the identity matches DOMAIN\[IDENTITY], rewrite as [IDENTITY]@[DOMAIN].com.
  Here again, the result would be jdoe@DOMAIN.com. This rule does not have [DOMAIN] in square brackets [ ] on the evaluation side of the rule.

Identity rewrite rules are always applied within the context of an Active Directory join point. Even if a scope is selected as the result of an authentication policy, the rewrite rules are applied for each Active Directory join point. These rewrite rules also applies for identities taken from certificates if EAP-TLS is being used.

**Enable Identity Rewrite**

---

**Note**
This configuration task is optional. You can perform it to reduce authentication failures that can arise because of various reasons such as ambiguous identity errors.
Before you begin

You must join Cisco ISE to the Active Directory domain.

Procedure

Step 1
Choose Administration > Identity Management > External Identity Sources > Active Directory.

Step 2
Click the Advanced Settings tab.

Step 3
Under the Identity Rewrite section, choose whether you want to apply the rewrite rules to modify usernames.

Step 4
Enter the match conditions and the rewrite results. You can remove the default rule that appears and enter the rule according to your requirement. Cisco ISE processes the policy in order, and the first condition that matches the request username is applied. You can use the matching tokens (text contained in square brackets) to transfer elements of the original username to the result. If none of the rules match, the identity name remains unchanged. You can click the Launch Test button to preview the rewrite processing.

Identity Resolution Settings

Some type of identities include a domain markup, such as a prefix or a suffix. For example, in a NetBIOS identity such as ACME\jdoe, “ACME” is the domain markup prefix, similarly in a UPN identity such as jdoe@acme.com, “acme.com” is the domain markup suffix. Domain prefix should match to the NetBIOS (NTLM) name of the Active Directory domain in your organization and domain suffix should match to the DNS name of Active Directory domain or to the alternative UPN suffix in your organization. For example jdoe@gmail.com is treated as without domain markup because gmail.com is not a DNS name of Active Directory domain.

The identity resolution settings allows you to configure important settings to tune the security and performance balance to match your Active Directory deployment. You can use these settings to tune authentications for usernames and hostnames without domain markup. In cases when Cisco ISE is not aware of the user's domain, it can be configured to search the user in all the authentication domains. Even if the user is found in one domain, Cisco ISE will wait for all responses in order to ensure that there is no identity ambiguity. This might be a lengthy process, subject to the number of domains, latency in the network, load, and so on.

Avoid Identity Resolution Issues

It is highly recommended to use fully qualified names (that is, names with domain markup) for users and hosts during authentication. For example, UPNs and NetBIOS names for users and FQDN SPNs for hosts. This is especially important if you hit ambiguity errors frequently, such as, several Active Directory accounts match to the incoming username; for example, jdoe matches to jdoe@emea.acme.com and jdoe@amer.acme.com. In some cases, using fully qualified names is the only way to resolve issue. In others, it may be sufficient to guarantee that the users have unique passwords. So, it is more efficient and leads to less password lockout issues if unique identities are used initially.

Configure Identity Resolution Settings

Note
This configuration task is optional. You can perform it to reduce authentication failures that can arise because of various reasons such as ambiguous identity errors.
Before you begin

You must join Cisco ISE to the Active Directory domain.

Procedure

Step 1 Choose Administration > Identity Management > External Identity Sources > Active Directory.

Step 2 Click the Advanced Settings tab.

Step 3 Define the following settings for identity resolution for usernames or machine names under the Identity Resolution section. This setting provides you advanced control for user search and authentication.

The first setting is for the identities without a markup. In such cases, you can select any of the following options:

- **Reject the request**—This option will fail the authentication for users who do not have any domain markups, such as a SAM name. This is useful in case of multi join domains where Cisco ISE will have to look up for the identity in all the joined global catalogs, which might not be very secure. This option forces the users to use names with domain markups.

- **Only search in the “Authentication Domains” from the joined forest**—This option will search for the identity only in the domains in the forest of the join point which are specified in the authentication domains section. This is the default option and identical to Cisco ISE 1.2 behavior for SAM account names.

- **Search in all the “Authentication Domains” sections**—This option will search for the identity in all authentication domains in all the trusted forests. This might increase latency and impact performance.

The selection is made based on how the authentication domains are configured in Cisco ISE. If only specific authentication domains are selected, only those domains will be searched (for both “joined forest” or “all forests” selections).

The second setting is used if Cisco ISE cannot communicate with all Global Catalogs (GCs) that it needs to in order to comply with the configuration specified in the “Authentication Domains” section. In such cases, you can select any of the following options:

- **Proceed with available domains**—This option will proceed with the authentication if it finds a match in any of the available domains.

- **Drop the request**—This option will drop the authentication request if the identity resolution encounters some unreachable or unavailable domain.

Test Users for Active Directory Authentication

The Test User tool can be used to verify user authentication from Active Directory. You can also fetch groups and attributes and examine them. You can run the test for a single join point or for scopes.

Procedure

Step 1 Choose Administration > Identity Management > External Identity Sources > Active Directory.

Step 2 Choose one of the following options:
• To run the test on all join points, choose Advanced Tools > Test User for All Join Points.
• To run the test for a specific join point, select the join point and click Edit. Select the Cisco ISE node and click Test User.

Step 3
Enter the username and password of the user (or host) in Active Directory.

Step 4
Choose the authentication type. Password entry in Step 3 is not required if you choose the Lookup option.

Step 5
Select the Cisco ISE node on which you want to run this test, if you are running this test for all join points.

Step 6
Check the Retrieve Groups and Attributes checkboxes if you want to retrieve the groups and attributes from Active Directory.

Step 7
Click Test.
The result and steps of the test operation are displayed. The steps can help to identify the failure reason and troubleshoot.

Delete Active Directory Configurations

You should delete Active Directory configurations if you are not going to use Active Directory as an external identity source. Do not delete the configuration if you want to join another Active Directory domain. You can leave the domain to which you are currently joined and join a new domain.

Before you begin

Ensure that you have left the Active Directory domain.

Procedure

Step 1
Choose Administration > Identity Management > External Identity Sources > Active Directory.

Step 2
Check the checkbox next to the configured Active Directory.

Step 3
Check and ensure that the Local Node status is listed as Not Joined.

Step 4
Click Delete.

You have removed the configuration from the Active Directory database. If you want to use Active Directory at a later point in time, you can resubmit a valid Active Directory configuration.

View Active Directory Joins for a Node

You can use the Node View button on the Active Directory page to view the status of all Active Directory join points for a given Cisco ISE node or a list of all join points on all Cisco ISE nodes.

Procedure

Step 1
Choose Administration > Identity Management > External Identity Sources > Active Directory.

Step 2
Click Node View.

Step 3
Select a node from the ISE Node drop-down list.
Diagnose Active Directory Problems

The Diagnostic Tool is a service that runs on every Cisco ISE node. It allows you to automatically test and diagnose the Active Directory deployment and execute a set of tests to detect issues that may cause functionality or performance failures when Cisco ISE uses Active Directory.

There are multiple reasons for which Cisco ISE might be unable to join or authenticate against Active Directory. This tool helps ensure that the prerequisites for connecting Cisco ISE to Active Directory are configured correctly. It helps detect problems with networking, firewall configurations, clock sync, user authentication, and so on. This tool works as a step-by-step guide and helps you fix problems with every layer in the middle, if needed.

Procedure

Step 1 Choose Administration > Identity Management > External Identity Sources > Active Directory.
Step 2 Click the Advanced Tools drop-down and choose Diagnostic Tools.
Step 3 Select a Cisco ISE node to run the diagnosis on.
   If you do not select a Cisco ISE node then the test is run on all the nodes.
Step 4 Select a specific Active Directory join point.
   If you do not select an Active Directory join point then the test is run on all the join points.
Step 5 Click Run All Tests on Node to start the test.
Step 6 Click View Test Details to view the details for tests with Warning or Failed status.
   This table allows you to rerun specific tests, stop running tests, and view a report of specific tests.

Enable Active Directory Debug Logs

Active Directory debug logs are not logged by default. You must enable this option on the Cisco ISE node that has assumed the Policy Service persona in your deployment. Enabling Active Directory debug logs may affect ISE performance.

Procedure

Step 1 Choose Administration > System > Logging > Debug Log Configuration.
Step 2 Click the radio button next to the Cisco ISE Policy Service node from which you want to obtain Active Directory debug information, and click Edit.
Obtain the Active Directory Log File for Troubleshooting

Download and view the Active Directory debug logs to troubleshoot issues you may have.

Before you begin
Active Directory debug logging must be enabled.

Procedure

1. Choose Operations > Troubleshoot > Download Logs.
2. Click the node from which you want to obtain the Active Directory debug log file.
3. Click the Debug Logs tab.
4. Scroll down this page to locate the ad_agent.log file. Click this file to download it.

Active Directory Alarms and Reports

Cisco ISE provides various alarms and reports to monitor and troubleshoot Active Directory related activities.

Alarms
The following alarms are triggered for Active Directory errors and issues:

- Configured nameserver not available
- Joined domain is unavailable
- Authentication domain is unavailable
- Active Directory forest is unavailable
- AD Connector had to be restarted
- AD: ISE account password update failed
- AD: Machine TGT refresh failed

Reports
You can monitor Active Directory related activities through the following two reports:
• RADIUSAuthentications Report—This report shows detailed steps of the Active Directory authentication and authorization. You can find this report here: Operations > Reports > Auth Services Status > RADIUS Authentications.

• AD Connector Operations Report—The AD Connector Operations report provides a log of background operations performed by AD connector, such as Cisco ISE server password refresh, Kerberos ticket management, DNS queries, DC discovery, LDAP, and RPC connections management. If you encounter any Active Directory failures, you can review the details in this report to identify the possible causes. You can find this report here: Operations > Reports > Auth Services Status > AD Connector Operations.

Active Directory Advanced Tuning

The advanced tuning feature provides node-specific settings used for support action under the supervision of Cisco support personnel, to adjust the parameters deeper in the system. These settings are not intended for normal administration flow, and should be used only under guidance.

Supplemental Information for Setting Up Cisco ISE with Active Directory

For configuring Cisco ISE with Active Directory, you must configure group policies, and configure a supplicant for machine authentication.

Configure Group Policies in Active Directory

For more information about how to access the Group Policy management editor, refer to the Microsoft Active Directory documentation.

Procedure

Step 1  Open the Group Policy management editor as shown in the following illustration.

Group Policy Objects selection

Step 2  Create a new policy and enter a descriptive name for it or add to an existing domain policy.

Example:

In example below, we used Wired Autoconfiguration for the policy name.

Step 3  Check the Define this policy setting check box, and click the Automatic radio button for the service startup mode as shown in the following illustration.
Policy Properties

Step 4
Apply the policy at the desired organizational unit or domain Active Directory level.
The computers will receive the policy when they reboot and this service will be turned on.

Configure Odyssey 5.X Supplicant for EAP-TLS Machine Authentications Against Active Directory

If you are using the Odyssey 5.x supplicant for EAP-TLS machine authentications against Active Directory, you must configure the following in the supplicant.

Procedure

Step 1
Start Odyssey Access Client.

Step 2
Choose Odyssey Access Client Administrator from the Tools menu.

Step 3
Double-click the Machine Account icon.

Step 4
From the Machine Account page, you must configure a profile for EAP-TLS authentications:

a) Choose Configuration > Profiles.
b) Enter a name for the EAP-TLS profile.
c) On the Authentication tab, choose EAP-TLS as the authentication method.
d) On the Certificate tab, check the Permit login using my certificate check box, and choose a certificate for the supplicant machine.
e) On the User Info tab, check the Use machine credentials check box.
If this option is enabled, the Odyssey supplicant sends the machine name in the format `host<machine_name>` and Active Directory identifies the request as coming from a machine and will look up computer objects to perform authentication. If this option is disabled, the Odyssey supplicant sends the machine name without the host prefix and Active Directory will look up user objects and the authentication fails.

### AnyConnect Agent for Machine Authentication

When you configure AnyConnect Agent for machine authentication, you can do one of the following:

- Use the default machine hostname, which includes the prefix “host/.”
- Configure a new profile, in which case you must include the prefix “host/” and then the machine name.

### ISE pxGrid Identity Mapping

Identity Mapping enables you to monitor users that are authenticated by a Domain Controller (DC) and not by Cisco ISE. In networks where Cisco ISE does not actively authenticate users for network access, it is possible to use Identity Mapping to collect user authentication information from the active directory (AD) Domain Controller. The Identity Mapping connects to Windows system using the MS WMI interface and queries logs from the Windows event messaging. Once a user logs into the network and is authenticated with an Active Directory, the Domain Controller generates an event log that includes the user name and IP address allocated for the user.

Identity mapping can also be activated even if Cisco ISE plays an active role for authentication. In such cases, the same session may be identified twice. The operational data has a session attribute that indicates the source. You can go to Operations > Authentications and click **Show Live Sessions** to check the Session Source.

The Identity Mapping component retrieves the user logins from the Domain Controller and imports them into the Cisco ISE session directory. So users authenticated with Active Directory (AD) are shown in the Cisco ISE live sessions view, and can be queried from the session directory using Cisco pxGrid interface by third-party applications. The known information is the user name, IP address, and the AD DC host name and the AD DC NetBios name.

The Cisco ISE plays only a passive role and does not perform the authentication. When Identity Mapping is active, Cisco ISE collects the login information from the AD and includes the data into the session directory.

### Key Features

- Identity Mapping is configured from the Cisco ISE administration console. The configuration includes the following settings:
  - Definition of all the DCs from which Identity Mapping is to collect user authentication information. This also includes import and export of the DC list using *.csv files
  - DC connection characteristics such as authentication security protocol (NTLMv1 or NTLMv2) and user session aging time
  - Connection testing, to verify the DC is set correctly to initialize valid connection with Identity Mapping
• Identity Mapping report. This report provides information about the Identity Mapping component for troubleshooting
• Identity Mapping debug logs
• Cisco ISE session directory maintains the collected user information, so that customers can view it from the Live Sessions and query it from the pxGrid interface
• Using the CLI command **show application status** provides the health status of nodes that use Identity Mapping
• Supports High Availability

**Configuring Identity Mapping**
ID Mapping requires configuration in ISE, and the Active Directory Domain Server must have the right patches and configuration.

**Configure Identity Mapping**
ISE must be able to establish a connection with an AD Domain Controller (DC).

**Before you begin**
Enable pxGrid services to configure Identity Mapping. Choose **Administration > System > Deployment** to enable pxGrid services.
To add a new Domain Controller (DC) for Identity Mapping, you need the login credentials of that DC.
Make sure the Domain Controller is properly configured for ISE Identity Mapping.

**Procedure**

**Step 1** Choose **Administration > pxGrid Identity Mapping > AD Domain Controller**.
**Step 2** Click **General Settings**.
**Step 3** The Active Directory General Settings pop-up is displayed. Set the required values and click **Save**.

- **History interval** is the time during which Identity Mapping reads user login information that already occurred. This is required upon startup or restart of Identity Mapping to catch up with events generated while it was unavailable.

- **User session aging time** is the amount of time the user can be logged in. Identity Mapping identifies new user login events from the DC, however the DC does not report when the user logs off. The aging time enables Cisco ISE to determine the time interval for which the user is logged in.

- You can select either **NTLMv1** or **NTLMv2** as the communications protocol between the ISE and the DC.

**Step 4** Click **Add**.
**Step 5** In the **General Settings** section, enter the **Display Name, Domain FQDN, and Host FQDN** of the DC.
**Step 6** In the **Credentials** section, enter the Username and Password of the DC.
**Step 7** (Optional) Test the connection to the specified domain by clicking **Verify DC Connection Settings**.
This test ensures that the connection to the DC is healthy. However it does not check whether Cisco ISE can fetch the user information upon login.

**Step 8**

Click **Submit.** An updated table is displayed with the newly-defined DC included in the list of DCs. The status column indicates the different states of DC.

You can also Import or Export the DC list.

**Note**
While importing, you need to provide the password in the template. As the file contains password, the import template should be treated as sensitive. The Export option does not export the password.

### Filter Identity Mapping

You can filter certain users, based on their name or IP address. You can add as many filters as needed. The “OR” logic operator applies between filters. If both the fields are specified in a single filter, the “AND” logic operator applies between these fields. The Monitoring live session shows Identity Mapping components that are not filtered out by the Mapping Filters.

**Procedure**

**Step 1** Choose **Administration > pxGrid Identity Mapping > Mapping Filters.**

**Step 2** Click **Add,** enter the Username and or IP address of the user you want to filter and click **Submit.**

**Step 3** To view the non-filtered users that are currently logged into the Monitoring session directory, choose **Operations > Authentications.**

### LDAP

Lightweight Directory Access Protocol (LDAP) is a networking protocol defined by RFC 2251 for querying and modifying directory services that run on TCP/IP. LDAP is a lightweight mechanism for accessing an X.500-based directory server.

Cisco ISE integrates with an LDAP external database, which is also called an identity source, by using the LDAP protocol.

### LDAP Directory Service

LDAP directory service is based on a client-server model. A client starts an LDAP session by connecting to an LDAP server and sending operation requests to the server. The server then sends its responses. One or more LDAP servers contain data from the LDAP directory tree or the LDAP backend database.

The directory service manages a directory, which is a database that holds information. Directory services use a distributed model for storing information, and that information is usually replicated between directory servers.

An LDAP directory is organized in a simple tree hierarchy and can be distributed among many servers. Each server can have a replicated version of the total directory, which is synchronized periodically.
An entry in the tree contains a set of attributes, where each attribute has a name (an attribute type or attribute description) and one or more values. The attributes are defined in a schema.

Each entry has a unique identifier: its distinguished name (DN). This name contains the relative distinguished name (RDN), which is constructed from attributes in the entry, followed by the DN of the parent entry. You can think of the DN as a full filename, and the RDN as a relative filename in a folder.

Multiple LDAP Instances

By creating more than one LDAP instance with different IP addresses or port settings, you can configure Cisco ISE to authenticate using different LDAP servers or different databases on the same LDAP server. Each primary server IP address and port configuration, along with the secondary server IP address and port configuration, forms an LDAP instance that corresponds to one Cisco ISE LDAP identity source instance.

Cisco ISE does not require that each LDAP instance correspond to a unique LDAP database. You can have more than one LDAP instance set to access the same database. This method is useful when your LDAP database contains more than one subtree for users or groups. Because each LDAP instance supports only one subtree directory for users and one subtree directory for groups, you must configure separate LDAP instances for each user directory and group directory subtree combination for which Cisco ISE submits authentication requests.

LDAP Failover

Cisco ISE supports failover between a primary LDAP server and a secondary LDAP server. A failover occurs when an authentication request fails because Cisco ISE could not connect to an LDAP server because it is down or is otherwise unreachable.

If you establish failover settings and the first LDAP server that Cisco ISE attempts to contact cannot be reached, Cisco ISE always attempts to contact a second LDAP server. If you want Cisco ISE to use the first LDAP server again, you must enter a value in the Failback Retry Delay text box.

Note

Cisco ISE always uses the primary LDAP server to obtain groups and attributes for use in authorization policies from the Admin portal, so the primary LDAP server must be accessible when you configure these items. Cisco ISE uses the secondary LDAP server only for authentications and authorizations at run time, according to the failover configuration.

LDAP Connection Management

Cisco ISE supports multiple concurrent LDAP connections. Connections are opened on demand at the time of the first LDAP authentication. The maximum number of connections is configured for each LDAP server. Opening connections in advance shortens the authentication time. You can set the maximum number of connections to use for concurrent binding connections. The number of open connections can be different for each LDAP server (primary or secondary) and is determined based on the maximum number of administration connections configured for each server.

Cisco ISE retains a list of open LDAP connections (including the binding information) for each LDAP server that is configured in Cisco ISE. During the authentication process, the connection manager attempts to find an open connection from the pool. If an open connection does not exist, a new one is opened.
If the LDAP server closed the connection, the connection manager reports an error during the first call to search the directory, and tries to renew the connection. After the authentication process is complete, the connection manager releases the connection.

**LDAP User Authentication**

LDAP can be used as an external database for Cisco ISE user authentication. Cisco ISE supports plain password authentication. User authentication includes:

- Searching the LDAP server for an entry that matches the username in the request
- Checking the user password with the one that is found in the LDAP server
- Retrieving a group’s membership information for use in policies
- Retrieving values for specified attributes for use in policies and authorization profiles

To authenticate a user, Cisco ISE sends a bind request to the LDAP server. The bind request contains the DN and password of the user in clear text. A user is authenticated when the DN and password of the user match the username and password in the LDAP directory.

We recommend that you protect the connection to the LDAP server using Secure Sockets Layer (SSL).

**LDAP Group and Attribute Retrieval for Use in Authorization Policies**

Cisco ISE can authenticate a subject (user or host) against an LDAP identity source by performing a bind operation on the directory server to find and authenticate the subject. After successful authentication, Cisco ISE can retrieve groups and attributes that belong to the subject whenever they are required. You can configure the attributes to be retrieved in the Cisco ISE Admin portal by choosing Administration > Identity Management > External Identity Sources > LDAP. These groups and attributes can be used by Cisco ISE to authorize the subject.

To authenticate a user or query the LDAP identity source, Cisco ISE connects to the LDAP server and maintains a connection pool.

You should note the following restrictions on group memberships when Active Directory is configured as an LDAP store:

- Users or computers must be direct members of the group defined in the policy conditions to match the policy rule.
- The defined group may not be a user’s or computer’s primary group. This restriction is applicable only when Active Directory is configured as an LDAP store.

**LDAP Group Membership Information Retrieval**

For user authentication, user lookup, and MAC address lookup, Cisco ISE must retrieve group membership information from LDAP databases. LDAP servers represent the association between a subject (a user or a host) and a group in one of the following ways:

- Groups Refer to Subjects—The group objects contain an attribute that specifies the subject. Identifiers for subjects can be sourced in the group as the following:
  - Distinguished names
• Plain usernames

• Subjects Refer to Groups—The subject objects contain an attribute that specifies the group to which they belong.

LDAP identity sources contain the following parameters for group membership information retrieval:

• Reference direction—This parameter specifies the method to use when determining group membership (either groups to subjects or subjects to groups).
• Group map attribute—This parameter indicates the attribute that contains group membership information.
• Group object class—This parameter determines that certain objects are recognized as groups.
• Group search subtree—This parameter indicates the search base for group searches.
• Member type option—This parameter specifies how members are stored in the group member attribute (either as DNs or plain usernames).

**LDAP Attributes Retrieval**

For user authentication, user lookup, and MAC address lookup, Cisco ISE must retrieve the subject attributes from LDAP databases. For each instance of an LDAP identity source, an identity source dictionary is created. These dictionaries support attributes of the following data types:

• String
• Unsigned integer 32
• IPv4 address

For unsigned integers and IPv4 attributes, Cisco ISE converts the strings that it has retrieved to the corresponding data types. If conversion fails or if no values are retrieved for the attributes, Cisco ISE logs a debug message, but the authentication or lookup process does not fail.

You can optionally configure default values for the attributes that Cisco ISE can use when the conversion fails or when Cisco ISE does not retrieve any values for the attributes.

**LDAP Certificate Retrieval**

If you have configured certificate retrieval as part of user lookup, then Cisco ISE must retrieve the value of the certificate attribute from LDAP. To retrieve the value of the certificate attribute from LDAP, you must have previously configured the certificate attribute in the list of attributes to be accessed while configuring an LDAP identity source.

**Errors Returned by the LDAP Server**

The following errors can occur during the authentication process:

• Authentication Errors—Cisco ISE logs authentication errors in the Cisco ISE log files.

Possible reasons for an LDAP server to return binding (authentication) errors include the following:

• Parameter errors—Invalid parameters were entered
• User account is restricted (disabled, locked out, expired, password expired, and so on)
• Initialization Errors—Use the LDAP server timeout settings to configure the number of seconds that Cisco ISE should wait for a response from an LDAP server before determining that the connection or authentication on that server has failed.

Possible reasons for an LDAP server to return an initialization error are:

• LDAP is not supported.
• The server is down.
• The server is out of memory.
• The user has no privileges.
• Administrator credentials are configured incorrectly.

The following errors are logged as external resource errors, indicating a possible problem with the LDAP server:

• A connection error occurred
• The timeout expired
• The server is down
• The server is out of memory

The following error is logged as an Unknown User error:

• A user does not exist in the database

The following error is logged as an Invalid Password error, where the user exists, but the password sent is invalid:

• An invalid password was entered

**LDAP User Lookup**

Cisco ISE supports the user lookup feature with an LDAP server. This feature allows you to search for a user in the LDAP database and retrieve information without authentication. The user lookup process includes the following actions:

• Searching the LDAP server for an entry that matches the username in the request
• Retrieving a user’s group membership information for use in policies
• Retrieving values for specified attributes for use in policies and authorization profiles

**LDAP MAC Address Lookup**

Cisco ISE supports the MAC address lookup feature. This feature allows you to search for a MAC address in the LDAP database and retrieve information without authentication. The MAC address lookup process includes the following actions:

• Searching the LDAP server for an entry that matches the MAC address of the device
• Retrieving a MAC Address group information for the device for use in policies
• Retrieving values for specified attributes for use in policies

Add LDAP Identity Sources

Before you begin

• To perform the following task, you must be a Super Admin or System Admin.
• Cisco ISE always uses the primary LDAP server to obtain groups and attributes for use in authorization policies. Therefore, your primary LDAP server must be reachable when you configure these items.

Procedure

Step 1  Choose Administration > Identity Management > External Identity Sources > LDAP > Add.
Step 2  Enter the values.
Step 3  Click Submit to create an LDAP instance.

Retrieve User Attributes From the LDAP Server, on page 277
Enable Secure Authentication with LDAP Identity Source, on page 277

Configure Primary and Secondary LDAP Servers

After you create an LDAP instance, you must configure the connection settings for the primary LDAP server. Configuring a secondary LDAP server is optional.
Enable Cisco ISE to Obtain Attributes from the LDAP Server

For Cisco ISE to obtain user and group data from an LDAP server, you must configure LDAP directory details in Cisco ISE. For LDAP identity source, the following three searches are applicable:

- Search for all groups in group subtree for administration
- Search for user in subject subtree to locate user
- Search for groups in which the user is a member

Retrieve Group Membership Details from the LDAP Server

You can add new groups or select groups from the LDAP directory.

Procedure

Step 1 Choose Administration > Identity Management > External Identity Sources > LDAP.
Step 2 Check the check box next to the LDAP instance that you want to edit and click Edit.
Step 3 Click the Directory Organization tab.
Step 4 Choose Add > Add Group to add a new group or choose Add > Select Groups From Directory to select the groups from the LDAP directory.
   a) If you choose to add a group, enter a name for the new group.
   b) If you are selecting from the directory, enter the filter criteria, and click Retrieve Groups. Your search criteria can contain the asterisk (*) wildcard character.
Step 5 Check the check boxes next to the groups that you want to select and click OK.
The groups that you have selected will appear in the Groups page.

**Step 6**

Click **Submit** to save the group selection.

---

**Note**

Active Directory built-in groups are not supported when Active Directory is configured as LDAP Identity Store in Cisco ISE.

### Retrieve User Attributes From the LDAP Server

You can obtain user attributes from the LDAP server for use in authorization policies.

**Procedure**

1. **Step 1** Choose **Administration** > **Identity Management** > **External Identity Sources** > **LDAP**.
2. **Step 2** Check the check box next to the LDAP instance that you want to edit and click **Edit**.
3. **Step 3** Click the **Attributes** tab.
4. **Step 4** Choose **Add** > **Add Attribute** to add a new attribute or choose **Add** > **Select Attributes From Directory** to select attributes from the LDAP server.
   a) If you choose to add an attribute, enter a name for the new attribute.
   b) If you are selecting from the directory, enter an example user and click **Retrieve Attributes** to retrieve the user’s attributes. You can use the asterisk (*) wildcard character.
5. **Step 5** Check the check boxes next to the attributes that you want to select, then click **OK**.
6. **Step 6** Click **Submit** to save the attribute selections.

### Enable Secure Authentication with LDAP Identity Source

When you choose the Secure Authentication option in the LDAP configuration page, Cisco ISE uses SSL to secure communication with the LDAP identity source. Secure connection to LDAP identity source is established using:

- **SSL tunnel**—Using SSL v3 or TLS v1 (the strongest version supported by the LDAP server)
- **Server authentication** (authentication of LDAP server)—Certificate based
- **Client authentication** (authentication of Cisco ISE)—None (Administrator bind is used inside the SSL tunnel)
- **Cipher suites**—All cipher suites supported by Cisco ISE

We recommend that you use TLS v1 with the strongest encryption and ciphers that Cisco ISE supports. To enable Cisco ISE to communicate securely with the LDAP identity source:
Before you begin

- Cisco ISE must be connected to an LDAP server
- TCP port 636 should be open

Procedure

Step 1
Import the full Certificate Authority (CA) chain of the CA that issued the server certificate to the LDAP server into Cisco ISE (Administration > System > Certificates > Trusted Certificates). The full CA chain refers to the root CA and intermediate CA certificates; not the LDAP server certificate.

Step 2
Configure Cisco ISE to use secure authentication when communicating with the LDAP identity source (Administration > Identity Management > External Identity Sources > LDAP; be sure to check the Secure Authentication check box in the Connection Settings tab).

Step 3
Select the root CA certificate in the LDAP identity store.

RADIUS Token Identity Sources

A server that supports the RADIUS protocol and provides authentication, authorization, and accounting (AAA) services to users and devices is called a RADIUS server. A RADIUS identity source is simply an external identity source that contains a collection of subjects and their credentials and uses the RADIUS protocol for communication. For example, the Safeword token server is an identity source that can contain several users and their credentials as one-time passwords that provides an interface that you can query using the RADIUS protocol.

Cisco ISE supports any RADIUS RFC 2865-compliant server as an external identity source. Cisco ISE supports multiple RADIUS token server identities, for example the RSA SecurID server and the SafeWord server. RADIUS identity sources can work with any RADIUS token server that is used to authenticate a user. RADIUS identity sources use the User Datagram Protocol (UDP) port for authentication sessions. The same UDP port is used for all RADIUS communication.

Note
The Process Host Lookup option must be enabled for MAB authentication. We recommend that you don’t configure the RADIUS token server that is used as the external identity source, for MAB authentication, because the devices that are using MAB authentication cannot generate an OTP or a RADIUS token (which is required for RADIUS token server authentication). Hence, the authentication will fail. You can use the external RADIUS server option to process the MAB requests.

RADIUS Token Server Supported Authentication Protocols

Cisco ISE supports the following authentication protocols for RADIUS identity sources:

- RADIUS PAP
Ports Used By the RADIUS Token Servers for Communication

RADIUS token servers use the UDP port for authentication sessions. This port is used for all RADIUS communication. For Cisco ISE to send RADIUS one-time password (OTP) messages to a RADIUS-enabled token server, you must ensure that the gateway devices between Cisco ISE and the RADIUS-enabled token server allow communication over the UDP port. You can configure the UDP port through the Admin portal.

RADIUS Shared Secret

You must provide a shared secret while configuring RADIUS identity sources in Cisco ISE. This shared secret should be the same as the shared secret that is configured on the RADIUS token server.

Failover in RADIUS Token Servers

Cisco ISE allows you to configure multiple RADIUS identity sources. Each RADIUS identity source can have primary and secondary RADIUS servers. When Cisco ISE is unable to connect to the primary server, it uses the secondary server.

Configurable Password Prompt in RADIUS Token Servers

RADIUS identity sources allow you to configure the password prompt. You can configure the password prompt through the Admin portal.

RADIUS Token Server User Authentication

Cisco ISE obtains the user credentials (username and passcode) and passes them to the RADIUS token server. Cisco ISE also relays the results of the RADIUS token server authentication processing to the user.

User Attribute Cache in RADIUS Token Servers

RADIUS token servers, by default, do not support user lookups. However, the user lookup functionality is essential for the following Cisco ISE features:

- PEAP session resume—This feature allows the PEAP session to resume after successful authentication during EAP session establishment.
- EAP/FAST fast reconnect—This feature allows fast reconnection after successful authentication during EAP session establishment.

Cisco ISE caches the results of successful authentications to process user lookup requests for these features. For every successful authentication, the name of the authenticated user and the retrieved attributes are cached. Failed authentications are not written to the cache.
The cache is available in the memory at runtime and is not replicated between Cisco ISE nodes in a distributed deployment. You can configure the Time to Live (TTL) limit for the cache through the Admin portal. You must enable the identity caching option and set the aging time in minutes. The cache is available in the memory for the specified amount of time.

**RADIUS Identity Source in Identity Sequence**

You can add the RADIUS identity source for authentication sequence in an identity source sequence. However, you cannot add the RADIUS identity source for attribute retrieval sequence because you cannot query the RADIUS identity source without authentication. Cisco ISE cannot distinguish among different errors while authenticating with a RADIUS server. RADIUS servers return an Access-Reject message for all errors. For example, when a user is not found in the RADIUS server, instead of returning a User Unknown status, the RADIUS server returns an Access-Reject message.

**RADIUS Server Returns the Same Message for All Errors**

When a user is not found in the RADIUS server, the RADIUS server returns an Access-Reject message. Cisco ISE provides an option to configure this message through the Admin portal as either an Authentication Failed or a User Not Found message. However, this option returns a User Not Found message not only for cases where the user is not known, but for all failure cases.

The following table lists the different failure cases that are possible with RADIUS identity servers.

<table>
<thead>
<tr>
<th>Failure Cases</th>
<th>Reasons for Failure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication Failed</td>
<td>• User is unknown.</td>
</tr>
<tr>
<td></td>
<td>• User attempts to log in with an incorrect passcode.</td>
</tr>
<tr>
<td></td>
<td>• User login hours expired.</td>
</tr>
<tr>
<td>Process Failed</td>
<td>• RADIUS server is configured incorrectly in Cisco ISE.</td>
</tr>
<tr>
<td></td>
<td>• RADIUS server is unavailable.</td>
</tr>
<tr>
<td></td>
<td>• RADIUS packet is detected as malformed.</td>
</tr>
<tr>
<td></td>
<td>• Problem during sending or receiving a packet from the RADIUS server.</td>
</tr>
<tr>
<td></td>
<td>• Timeout.</td>
</tr>
<tr>
<td>Unknown User</td>
<td>Authentication failed and the Fail on Reject option is set to false.</td>
</tr>
</tbody>
</table>

**Safeword Server Supports Special Username Format**

The Safeword token server supports authentication with the following username format:
Username—Username, OTP

As soon as Cisco ISE receives the authentication request, it parses the username and converts it to the following username:

Username—Username

The SafeWord token servers support both of these formats. Cisco ISE works with various token servers. While configuring a SafeWord server, you must check the SafeWord Server check box in the Admin portal for Cisco ISE to parse the username and convert it to the specified format. This conversion is done in the RADIUS token server identity source before the request is sent to the RADIUS token server.

**Authentication Request and Response in RADIUS Token Servers**

When Cisco ISE forwards an authentication request to a RADIUS-enabled token server, the RADIUS authentication request contains the following attributes:

- User-Name (RADIUS attribute 1)
- User-Password (RADIUS attribute 2)
- NAS-IP-Address (RADIUS attribute 4)

Cisco ISE expects to receive any one of the following responses:

- Access-Accept—No attributes are required, however, the response can contain a variety of attributes based on the RADIUS token server configuration.
- Access-Reject—No attributes are required.
- Access-Challenge—The attributes that are required per RADIUS RFC are the following:
  - State (RADIUS attribute 24)
  - Reply-Message (RADIUS attribute 18)
  - One or more of the following attributes: Vendor-Specific, Idle-Timeout (RADIUS attribute 28), Session-Timeout (RADIUS attribute 27), Proxy-State (RADIUS attribute 33)

No other attributes are allowed in Access-Challenge.

**Add a RADIUS Token Server**

**Before you begin**

To perform the following task, you must be a Super Admin or System Admin.

**Procedure**

**Step 1** Choose Administration > Identity Management > External Identity Sources > RADIUS Token > Add.

**Step 2** Enter the values in the General and Connection tabs.

**Step 3** Click the Authentication tab.
This tab allows you to control the responses to an Access-Reject message from the RADIUS token server. This response could either mean that the credentials are invalid or that the user is not known. Cisco ISE accepts one of the following responses: Failed authentication or User not found. This tab also allows you to enable identity caching and to set the aging time for the cache. You can also configure a prompt to request the password.

a) Click the **Treat Rejects as ‘authentication failed’** radio button if you want the Access-Reject response from the RADIUS token server to be treated as a failed authentication.

b) Click the **Treat Rejects as ‘user not found’** radio button if you want the Access-Reject response from the RADIUS token server to be treated as an unknown user failure.

**Step 4** Click the **Authorization** tab.

This tab allows you to configure a name that will appear for the attribute that is returned by the RADIUS token server while sending an Access-Accept response to Cisco ISE. This attribute can be used in authorization policy conditions. The default value is CiscoSecure-Group-Id.

**Step 5** Click **Submit**.

---

### Delete a RADIUS Token Server

**Before you begin**

- To perform the following task, you must be a Super Admin or System Admin.
- Ensure that you do not select the RADIUS token servers that are part of an identity source sequence. If you select a RADIUS token server that is part of an identity source sequence for deletion, the delete operation fails.

**Procedure**

**Step 1** Choose **Administration > Identity Management > External Identity Sources > RADIUS Token.**

**Step 2** Check the check box next to the RADIUS token server or servers that you want to delete, then click **Delete**.

**Step 3** Click **OK** to delete the RADIUS token server or servers that you have selected.
If you select multiple RADIUS token servers for deleting, and one of them is used in an identity source sequence, the delete operation fails and none of the RADIUS token servers are deleted.

## RSA Identity Sources

Cisco ISE supports the RSA SecurID server as an external database. RSA SecurID two-factor authentication consists of the PIN of the user and an individually registered RSA SecurID token that generates single-use token codes based on a time code algorithm. A different token code is generated at fixed intervals (usually each at 30 or 60 seconds). The RSA SecurID server validates this dynamic authentication code. Each RSA SecurID token is unique, and it is not possible to predict the value of a future token based on past tokens. Thus, when a correct token code is supplied together with a PIN, there is a high degree of certainty that the person is a valid user. Therefore, RSA SecurID servers provide a more reliable authentication mechanism than conventional reusable passwords.

Cisco ISE supports the following RSA identity sources:

- RSA ACE/Server 6.x series
- RSA Authentication Manager 7.x and 8.0 series

You can integrate with RSA SecurID authentication technology in any one of the following ways:

- Using the RSA SecurID agent—Users are authenticated with their username and passcode through the RSA native protocol.
- Using the RADIUS protocol—Users are authenticated with their username and passcode through the RADIUS protocol.

The RSA SecurID token server in Cisco ISE connects with the RSA SecurID authentication technology by using the RSA SecurID Agent.

Cisco ISE supports only one RSA realm.

## Cisco ISE and RSA SecurID Server Integration

These are the two administrative roles involved in connecting Cisco ISE with an RSA SecurID server:

- RSA Server Administrator—Configures and maintains RSA systems and integration
- Cisco ISE Administrator—Configures Cisco ISE to connect to the RSA SecurID server and maintains the configuration

This section describes the processes that are involved in connecting Cisco ISE with the RSA SecurID server as an external identity source. For more information on RSA servers, please refer to the RSA documentation.

## RSA Configuration in Cisco ISE

The RSA administrative system generates an sdconf.rec file, which the RSA system administrator will provide to you. This file allows you to add Cisco ISE servers as RSA SecurID agents in the realm. You have to browse and add this file to Cisco ISE. By the process of replication, the primary Cisco ISE server distributes this file to all the secondary servers.
RSA Agent Authentication Against the RSA SecurID Server

After the sdconf.rec file is installed on all Cisco ISE servers, the RSA agent module initializes, and authentication with RSA-generated credentials proceeds on each of the Cisco ISE servers. After the agent on each of the Cisco ISE servers in a deployment has successfully authenticated, the RSA server and the agent module together download the securid file. This file resides in the Cisco ISE file system and is in a well-known place defined by the RSA agent.

RSA Identity Sources in a Distributed Cisco ISE Environment

Managing RSA identity sources in a distributed Cisco ISE environment involves the following:

- Distributing the sdconf.rec and sdopts.rec files from the primary server to the secondary servers.
- Deleting the securid and sdstatus.12 files.

RSA Server Updates in a Cisco ISE Deployment

After you have added the sdconf.rec file in Cisco ISE, the RSA SecurID administrator might update the sdconf.rec file in case of decommissioning an RSA server or adding a new RSA secondary server. The RSA SecurID administrator will provide you with an updated file. You can then reconfigure Cisco ISE with the updated file. The replication process in Cisco ISE distributes the updated file to the secondary Cisco ISE servers in the deployment. Cisco ISE first updates the file in the file system and coordinates with the RSA agent module to phase the restart process appropriately. When the sdconf.rec file is updated, the sdstatus.12 and securid files are reset (deleted).

Override Automatic RSA Routing

You can have more than one RSA server in a realm. The sdopts.rec file performs the role of a load balancer. Cisco ISE servers and RSA SecurID servers operate through the agent module. The agent module that resides on Cisco ISE maintains a cost-based routing table to make the best use of the RSA servers in the realm. You can, however, choose to override this routing with a manual configuration for each Cisco ISE server for the realm using a text file called sdopts.rec through the Admin portal. Refer to the RSA documentation for information on how to create this file.

RSA Node Secret Reset

The securid file is a secret node key file. When RSA is initially set up, it uses a secret to validate the agents. When the RSA agent that resides in Cisco ISE successfully authenticates against the RSA server for the first time, it creates a file on the client machine called securid and uses it to ensure that the data exchanged between the machines is valid. At times, you may have to delete the securid file from a specific Cisco ISE server or a group of servers in your deployment (for example, after a key reset on the RSA server). You can use the Cisco ISE Admin portal to delete this file from a Cisco ISE server for the realm. When the RSA agent in Cisco ISE authenticates successfully the next time, it creates a new securid file.

Note

If authentications fail after upgrading to a latest release of Cisco ISE, reset the RSA secret.
RSA Automatic Availability Reset

The sdstatus.12 file provides information about the availability of RSA servers in the realm. For example, it provides information on which servers are active and which are down. The agent module works with the RSA servers in the realm to maintain this availability status. This information is serially listed in the sdstatus.12 file, which is sourced in a well-known location in the Cisco ISE file system. Sometimes this file becomes old and the current status is not reflected in this file. You must remove this file so that the current status can be recreated. You can use the Admin portal to delete the file from a specific Cisco ISE server for a specific realm. Cisco ISE coordinates with the RSA agent and ensures correct restart phasing.

The availability file sdstatus.12 is deleted whenever the secudid file is reset, or the sdconf.rec or sdopts.rec files are updated.

Add RSA Identity Sources

To create an RSA identity source, you must import the RSA configuration file (sdconf.rec). You must obtain the sdconf.rec file from your RSA administrator. To perform this task, you must be a Super Admin or System Admin.

Adding an RSA identity source involves the following tasks:

**Related Topics**

- RSA Identity Sources, on page 283

- Import the RSA Configuration File, on page 285
- Configure the Options File for a Cisco ISE Server and Resetting SecurID and sdstatus.12 Files, on page 286
- Configure Authentication Control Options for RSA Identity Source, on page 287
- Configure RSA Prompts, on page 287
- Configure RSA Messages, on page 287

Import the RSA Configuration File

You must import the RSA configuration file to add an RSA identity source in Cisco ISE.

**Procedure**

1. **Step 1** Choose Administration > Identity Management > External Identity Sources > RSA SecurID > Add.
2. **Step 2** Click Browse to choose the new or updated sdconf.rec file from the system that is running your client browser.

When you create the RSA identity source for the first time, the Import new sdconf.rec file field will be a mandatory field. From then on, you can replace the existing sdconf.rec file with an updated one, but replacing the existing file is optional.
Configure the Options File for a Cisco ISE Server and Resetting SecurID and sdstatus.12 Files

Procedure

**Step 1** Log into the Cisco ISE server.

**Step 2** Choose Administration > Identity Management > External Identity Sources > RSA SecurID > Add.

**Step 3** Click the RSA Instance Files tab.

This page lists the sdopts.rec files for all the Cisco ISE servers in your deployment.

**Step 4** Click the radio button next to the sdopts.rec file for a particular Cisco ISE server, and click Update Options File.

The existing file is displayed in the Current File region.

**Step 5** Choose one of the following:

- Use the Automatic Load Balancing status maintained by the RSA agent—Choose this option if you want the RSA agent to automatically manage load balancing.

- Override the Automatic Load Balancing status with the sdopts.rec file selected below—Choose this option if you want to manually configure load balancing based on your specific needs. If you choose this option, you must click Browse and choose the new sdopts.rec file from the system that is running your client browser.

**Step 6** Click OK.

**Step 7** Click the row that corresponds to the Cisco ISE server to reset the securid and sdstatus.12 files for that server:

a) Click the drop-down arrow and choose Remove on Submit in the Reset securid File and Reset sdstatus.12 File columns.

**Note** The Reset sdstatus.12 File field is hidden from your view. Using the vertical and horizontal scroll bars in the innermost frame, scroll down and then to your right to view this field.

b) Click Save in this row to save the changes.

**Step 8** Click Save.
Configure Authentication Control Options for RSA Identity Source

You can specify how Cisco ISE defines authentication failures and enable identity caching. The RSA identity source does not differentiate between “Authentication failed” and “User not found” errors and sends an Access-Reject response.

You can define how Cisco ISE should handle such failures while processing requests and reporting failures. Identity caching enables Cisco ISE to process requests that fail to authenticate against the Cisco ISE server the second time. The results and the attributes retrieved from the previous authentication are available in the cache.

Procedure

Step 1 Choose Administration > Identity Management > External Identity Sources > RSA SecurID > Add.
Step 2 Click the Authentication Control tab.
Step 3 Choose one of the following:
  • Treat Rejects as “authentication failed”—Choose this option if you want the rejected requests to be treated as failed authentications.
  • Treat Rejects as “user not found”—Choose this option if you want the rejected requests to be treated as user not found errors.
Step 4 Click Save to save the configuration.

Configure RSA Prompts

Cisco ISE allows you to configure RSA prompts that are presented to the user while processing requests sent to the RSA SecurID server.

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1 Choose Administration > Identity Management > External Identity Sources > RSA SecurID.
Step 2 Click Prompts.
Step 3 Enter the values as described in RSA SecurID Identity Source Settings.
Step 4 Click Submit.

Configure RSA Messages

Cisco ISE allows you to configure messages that are presented to the user while processing requests sent to the RSA SecurID server.
Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1
Choose Administration > Identity Management > External Identity Sources > RSA SecurID.

Step 2
Click Prompts.

Step 3
Click the Messages tab.

Step 4
Enter the values as described in RSA SecurID Identity Source Settings.

Step 5
Click Submit.

Identity Source Sequences

Identity source sequences define the order in which Cisco ISE looks for user credentials in the different databases. Cisco ISE supports the following identity sources:

- Internal Users
- Guest Users
- Active Directory
- LDAP
- RSA
- RADIUS Token Servers
- Certificate Authentication Profiles

If you have user information in more than one of the databases that are connected to Cisco ISE, you can define the order in which you want Cisco ISE to look for information in these identity sources. Once a match is found, Cisco ISE does not look any further, but evaluates the credentials, and returns the result to the user. This policy is the first match policy.

Create Identity Source Sequences

Before you begin

Ensure that you have configured your external identity sources in Cisco ISE.

To perform the following task, you must be a Super Admin or System Admin.

For allowing guest users to authenticate through Local WebAuth, you must configure both the Guest Portal authentication source and the identity source sequence to contain the same identity stores.
## Manage Users and End-User Portals

### Delete Identity Source Sequences

You can delete identity source sequences that you no longer use in policies.

**Before you begin**

- Ensure that the identity source sequence that you are about to delete is not used in any authentication policy.
- To perform the following task, you must be a Super Admin or System Admin.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Administration &gt; Identity Management &gt; Identity Source Sequences.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Check the check box next to the identity source sequence or sequences that you want to delete, then click Delete.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click OK to delete the identity source sequence or sequences.</td>
</tr>
</tbody>
</table>
Identity Source Details in Reports

Cisco ISE provides information about the identity sources through the Authentications dashlet and Identity Source reports.

Authentications Dashlet

From the Authentications dashlet, you can drill down to find more information including failure reasons. Choose Operations > Authentications to view real-time authentication summary. For more information, see Recent RADIUS Authentications, on page 859.

Identity Source Reports

Cisco ISE provides various reports that include information about identity sources. See the Available Reports section for a description of these reports Available Reports, on page 656.
CHAPTER 15

Configure Guest Access

• Cisco ISE Guest Services, on page 291
• Guest and Sponsor Accounts, on page 292
• Guest Portals, on page 303
• Sponsor Portals, on page 315
• Monitor Guest and Sponsor Activity, on page 325
• Guest Access Web Authentication Options, on page 327

Cisco ISE Guest Services

Cisco Identity Services Engine (ISE) guest services enable you to provide secure network access to guests such as visitors, contractors, consultants, and customers. You can support guests with base Cisco ISE licenses, and you can choose from several deployment options depending on your company’s infrastructure and feature requirements.

Cisco ISE provides web-based and mobile portals to provide on-boarding for guests and employees to your company’s network and internal resources and services.

From the Admin portal, you can create and edit guest and sponsor portals, configure guest access privileges by defining their guest type, and assign sponsor privileges for creating and managing guest accounts.

• Guest Portals, on page 303
• Guest Types and User Identity Groups, on page 292
• Sponsor Portals, on page 315
• Sponsor Groups, on page 317

End-User Guest and Sponsor Portals in Distributed Environment

Cisco ISE end-user web portals depend on the Administration, Policy Services, and Monitoring personas to provide configuration, session support, and reporting.

• Administration Node—Configuration changes that you make to users, devices, and end-user portals are written to the Administration node.

• Policy Services Node—The end-user portals run on a Policy Services Node, which handles all session traffic, including: network access, client provisioning, guest services, posture, and profiling. If a Policy
Service Node is part of a node group, and one node fails, the other nodes detect the failure and reset any pending sessions.

- **Monitoring Node**—The Monitoring node collects, aggregates, and reports data about the end-user and device activity on the My Devices, Sponsor, and Guest portals. If the primary Monitoring node fails, the secondary Monitoring node automatically becomes the primary Monitoring node.

## Guest and Sponsor Accounts

- **Guest Accounts**—Guests typically represent authorized visitors, contractors, customers, or other users who require temporary access to your network. You can also use guest accounts for employees if you prefer to use one of the guest deployment scenarios to allow employees to access the network. You can access the Sponsor portal to view guest accounts created by a sponsor and by self-registering guests.

- **Sponsor Accounts**—Use the Sponsor portal to create temporary accounts for authorized visitors to securely access your corporate network or the Internet. After creating the guest accounts, you also can use the Sponsor portal to manage these accounts and provide account details to the guests.

Guest accounts can be created by:

- **Sponsors**—On the Admin portal, you can define the access privileges and feature support for sponsors, who can access the Sponsor portal to create and manage guest accounts.

- **Guests**—Guests can also create their own accounts by registering themselves on the Self-Registered Guest portal. Based on the portal configuration, these self-registering guests may need sponsor approval before they receive their login credentials.

Guests can also choose to access the network using the Hotspot Guest portal, which does not require the creation of guest accounts and login credentials, such as username and password.

- **Employees**—Employees who are included in identity stores (such as Active Directory, LDAP, Internal Users) can also gain access through the credentialed Guest portals (Sponsored-Guest and Self-Registered Guest portals), if configured.

After their guest accounts are created, guests can use the Sponsored-Guest portal to log in and gain access to the network.

## Guest Types and User Identity Groups

Each guest account must be associated with a guest type. Guest types allow a sponsor to assign different levels of access and different network connection times to a guest account. These guest types are associated with particular network access policies. Cisco ISE includes these default guest types:

- **Contractor**—Users who need access to the network for an extended amount of time, up to a year.
- **Daily**—Guests who need access to the resources on the network for just 1 to 5 days.
- **Weekly**—Users who need access to the network for a couple of weeks.

When creating guest accounts, certain sponsor groups can be restricted to using specific guest types. Members of such a group can create guests with only the features specified for their guest type. For instance, the sponsor group, ALL_ACCOUNTS, can be set up to use only the Contractor guest type, and the sponsor groups,
OWN_ACCOUNTS and GROUP_ACCOUNTS, can be set up to use Daily and Weekly guest types. Also, since self-registering guests using the Self-Registered Guest portal typically need access for just a day, you can assign them the Daily guest type.

The guest type defines the user identity group for a guest.

For more information, see:

- User Identity Groups, on page 240
- Create a User Identity Group, on page 243

Create or Edit a Guest Type

Besides creating new guest types, you can edit the default Guest Types' default access privileges and settings. The changes that you make will be applied to the existing Guest accounts that were created using this Guest Type. Guest users who are logged in will not see these changes until they log out and log in again. You can also duplicate a Guest Type to create additional Guest Types with the same access privileges.

Each Guest Type has a name, description, and a list of sponsor groups that can create guest accounts with this guest type. You can designate some guest types as follows: use just for self-registering guests, or do not use to create Guest accounts (by any sponsor group).

Procedure

Fill in the following fields.

- **Guest type name**—Provide a name (from 1 to 256 characters) that distinguishes this Guest Type from the other Guest Types.

- **Description**—Provide additional information (maximum of 2000 characters) about the recommended use of this Guest Type, for example, Use for self-registering Guests. Do not use for Guest account creation, and so forth.

- **Language File**—This field allows you to export and import the language file, which contains content for email subject, email message, and SMS messages in all supported languages. These languages and content are used in notifications about an expired account, and are sent to guests who are assigned to this guest type. If you are creating a new guest type, this feature is disabled until after you save the guest type. For more information about editing the language file, see Portal Language Customization, on page 388.

- **Collect Additional Data**—Click the **Custom Fields**... button to select which custom fields to use to collect additional data from guests using this Guest Type.

To manage custom fields, choose **Work Centers > Guest Access > Settings > Custom Fields**.

- **Maximum Access Time**

  - **Maximum account duration**—Enter the number of days, hours, or minutes that guests assigned to this guest type can log on.

  **Note** The account purge policy checks for expired guest accounts, and sends expiration notification. This policy runs every 20 minutes, so if you set the account duration to less than 20 mins, it is possible that expiration notices may not be sent out before the account is purged.
You can specify the duration time and the days of the week when access is provided to the guests of this Guest Type by using the **Allow access only on these days and times** option.

- The days of the week that you select limits access to the dates that are selectable in the Sponsor's calendar.
- Maximum account duration is enforced in the sponsor portal, when the Sponsor picks duration and dates.

The settings you make here for access time affect the time settings that are available on the sponsor portal when creating a guest account.

**Logon Options**

- **Maximum simultaneous logins**—Enter the maximum number of user sessions that users assigned to this Guest Type can have running concurrently.
- **When guest exceeds limit**—When you select **Maximum simultaneous logins**, you must also select the action to take when a user connects after the maximum number of log ins is reached.
  - **Disconnect the oldest connection**
  - **Disconnect the newest connection**—Optionally select **Redirect user to a portal page showing an error message**: An error message is displayed for a configurable amount of time, then the session is disconnected, and the user is redirected to the Guest portal. The error page's content is configured on the Portal Page Customization dialog, on the **Messages > Error Messages** page.

- **Maximum devices guests can register**—Enter the maximum number of devices that can be registered to each Guest. You can set the limit to a number lower than what is already registered for the Guests of this Guest Type. This only affects newly created Guest accounts. When a new device is added, and the maximum is reached, the oldest device is disconnected.

- **Endpoint identity group for guest device registration**—Choose an endpoint identity group to assign to guest devices. Cisco ISE provides the **GuestEndpoints** endpoint identity group to use as a default. You can also create more endpoint identity groups if you choose to not use the default.

- **Allow guest to bypass the Guest portal**—Allows users to bypass the credentialed guest-type captive portal (web authentication page), and access the network by providing credentials to wired and wireless (dot1x) supplicants or VPN clients. Guest accounts change to the **Active** state, bypassing the **Awaiting Initial Login** state and the AUP page, even if the AUP is required.

If you do not enable this setting, users must first log in through the credentialed Guest captive portal before they are able to access other parts of the network.

**Account Expiration Notification**

- **Send account expiration notification ___ days before account expires**—Send a notification to Guests before their account expires and specify how many days, hours, or minutes before the expiration.
- **View messages in**—Specify the language to use when displaying email or SMS notifications as you set them up.
- **Email**—Send account expiration notices by email.
• **Use customization from**—Apply the same customizations that you configured for the selected portal to this Guest Type's account expiration emails.

• **Copy text from**—Reuse email text that you created for another Guest Type's account expiration email.

• **Send test email to me at**

• **SMS**—Send account expiration notices by SMS.
  The settings that follow for SMS are the same as for email notifications, except that you choose an SMS gateway for **Send test SMS to me**.

• **Sponsor Groups**—Specify the sponsor groups whose members can create a guest account using this guest type. Delete the sponsor groups that you do not want to have access to this guest type.

---

**What to do next**

• Create or modify sponsor groups to use this guest type. For more information, see **Sponsor Groups**, on page 317.

• If appropriate, assign this guest type to self-registering guests in the Self-Registered Guest portal. For more information, see **Create a Self-Registered Guest Portal**, on page 312.

---

**Disable a Guest Type**

You cannot delete the last remaining guest type or guest types that are being used by guest accounts. If you want to delete a guest type that is in use, first ensure that it is no longer available for use. Disabling a guest type does not affect guest accounts that were created with that guest type.

The following steps explain how to prepare for and disable a target guest type.

**Procedure**

---

**Step 1**
Identify the sponsor groups that allow the sponsor to create guests using the target guest type. Choose **Guest Access** > **Configure** > **Sponsor Groups**, and open each sponsor group and examine the **This sponsor group can create accounts using these guest types** list.

**Step 2**
Identify the Self-Registered portals that assign the target guest type. Choose **Guest Access** > **Configure** > **Guest Portals**. Open each Self-Registered Guest portal. If the portal is using the specific guest type, expand **Portal Settings**, and change the assigned guest type in the field **Employees using this portal as guests inherit login options from**:

**Step 3**
Open the guest type you wish to delete, and delete all sponsor groups that you identified in the previous steps. This action effectively prevents all sponsors from using creating a new guest account with this guest type. Choose **Guest Access** > **Configure** > **Guest Type**.

That's it. You can't actually delete the guest type. Make sure you don't use in any portals in the future.
Changing Guest Account Attributes

When a guest account is created, attributes are configured for that account by the Guest Type.

If you edit an existing Guest Type to change the time period or other attributes, the new attributes will not be applied to existing guest accounts.

To change the attributes of an existing Guest account, create a new Guest type with new attributes, and apply that Guest Type to an existing account. That account will take on all the attributes of the new Guest Type, including default access times, dates and duration. In addition, the custom fields from the original Guest Type are copied to the new Guest account, even if the custom field is blank.

A Sponsor can also extend the account duration before the time period has expired.

Schedule When to Purge Expired Guest Accounts

When an active or suspended guest account reaches the end of its account duration (as defined by the sponsor when creating the account), the account expires. When guest accounts expire, the affected guests cannot access the network. Sponsors can extend expired accounts before they are purged. However, after an account is purged, sponsors must create new accounts.

When expired guest accounts are purged, the associated endpoints and reporting and logging information are retained.

Cisco ISE automatically purges expired guest accounts every 15 days, by default. The Date of next purge indicates when the next purge will occur. You can also:

- Schedule a purge to occur every X days. The first purge will occur in X days at Time of Purge, then purges occur every X days.
- Schedule a purge on a given day of the week every X weeks. The first purge occurs on the next Day of Week at Time of Purge, then purges occur every configured number of weeks on that day and time. For example, on Monday you set purges to occur on Thursday every 5 weeks. The next purge will be the Thursday of this week, not the Thursday 5 weeks from now.
- Force a purge to happen immediately by clicking Purge Now.

If the Cisco ISE server is down when the purge is scheduled to run, the purge is not executed. The purge process will run again at the next scheduled purge time, assuming the server is operational at that time.

Procedure

**Step 1** Choose Guest Access > Settings > Guest Account Purge Policy.

**Step 2** Choose one of these options:

- Click Purge Now to immediately purge the expired guest account records.
- Check Schedule purge of expired guest accounts to schedule a purge.

**Note** After each purge is completed, the Date of next purge is reset to the next scheduled purge.

**Step 3** Specify after how many days of inactivity to purge user-specific portal records maintained in the Cisco ISE database for LDAP and Active Directory users.
Step 4   Click Save. If you do not want to save any updates you made to the settings, click Reset to revert to the last saved values.

---

Add Custom Fields for Guest Account Creation

When providing guest access, you may want to collect information from your guests beyond just their names, email addresses, and phone numbers. Cisco ISE provides custom fields that you can use to collect additional information about guests that is specific to your company’s needs. You can associate the custom fields with guest types and with the Self-Registered Guest and Sponsor portals. Cisco ISE does not provide any default custom fields.

Procedure

Step 1   To add, edit, or delete custom fields for all Guest and Sponsor portals, choose Guest Access > Settings > Custom Fields.

Step 2   Enter the Custom Field Name, pick a Data Type from the drop-down list, and enter Tip Text to help provide additional information about the custom field. For instance, if you enter Date of Birth, pick Date-MDY, and enter a tip for the date format as MM/DD/YYYY.

Step 3   Click Add.

The custom field appears in the list in alphabetical order or in the context of the sorted order.

Step 4   Click Save. If you do not want to save any updates you made to the settings, click Reset to revert to the last saved values.

Note   If you delete a custom field, it will no longer be available for selection in the Custom Fields list for guest types and in the Self-Registered Guest and Sponsor portals settings. If the field is being used, Delete will be disabled.

What to do next

You can include the desired custom fields:

- When defining a guest type so that accounts created with that guest type will include this information. See Create or Edit a Guest Type, on page 293.

- When configuring the Sponsor portal for sponsors to use when creating guest accounts. See #unique_531.

- When requesting information from self-registering guests using a Self-Registered Guest portal. See Create a Self-Registered Guest Portal, on page 312.

Specify Email Addresses and SMTP Servers for Email Notifications

Cisco ISE allows you to send emails to sponsors and guests, notifying them of information and instructions. You can configure SMTP servers to deliver these email notifications. You can also specify the email address from which the notifications will be sent to guests.
Assign Guest Locations and SSIDs

A Guest Location defines a name for a time zone, and is used by ISE to enforce time-related settings of logged on Guests. Guest Locations are assigned to Guest accounts by Sponsors creating a Guest account, and by self-registering Guests. The default Guest Location is San Jose. If no other Guest Locations are added, all accounts are assigned this Guest Location. You can't delete the San Jose Guest Location unless you create one or more new Locations. Unless all your Guests will be in the same time-zone as San Jose, create at least one Guest Location with the required time-zone.

---

Procedure

Step 1 To specify email settings and configure SMTP servers for all Guest and Sponsor portals, choose Guest Access > Settings > Guest Email Settings.

Step 2 Enable email notification to guests is checked by default. If you disable this setting, guests will not receive email notifications regardless of any other settings you may have enabled while configuring Guest and Sponsor portals.

Step 3 Enter the Default “From” email address that is designated for sending email notifications to guests. For example, donotreply@yourcompany.com.

Step 4 Do one of the following:

- Check Send notifications from sponsor's email address (if sponsored) if you want guests to receive notifications from the sponsor who created their accounts. Self-registering guests will receive notifications from the default email address.
- Check Always send notifications from the default email address if you want guests to receive notifications, regardless of whether they are sponsored and self-registering.

Step 5 Click Save. If you do not want to save any updates you made to the settings, click Reset to revert to the last saved values.

Note

Guest access times are based on the Guest Location's time zone. A Guest user may not be able to login if the Guest Location's time zone doesn't match the system time zone. In this case, the Guest user may get an "Authentication Failed" error. You might see the "Guest active time period not yet started" error message in the debug report. As a workaround, you can adjust the Guest access start time to match the local time zone of the Guest user by using the Manage Accounts option.

The SSIDs you add here are available to Sponsor Portals, so Sponsors can tell the Guest which SSID to connect to.

You can't delete a Guest Location or a SSID if it is configured in a Sponsor portal or assigned to a Guest account.

Procedure

Step 1 To add, edit or delete Guest Locations and SSIDs for Guest and Sponsor portals, choose Guest Access > Settings > Guest Locations and SSIDs.
Step 2 For Guest Locations:

a) For each time-zone that you need to support, enter a Location name and pick a Time zone from the drop-down list.
b) Click Add.

Note In a Guest Location, the name of the place, the name of the time zone, and the GMT offset are static; you cannot change them. The GMT offset does not change with daylight savings time changes. The GMT offsets are the opposite of what is shown in the list. For example, Etc/GMT+3 is actually GMT-3.

Step 3 For Guest SSIDs:

a) Enter the SSID names of the networks that will be available for guests to use at the Guest Locations.
b) Click Add.

Step 4 Click Save. To revert to the last saved values, click Reset.

What to do next

If you added a new Guest Location or SSID, you can:

• Provide the SSIDs for Sponsors to use when creating Guest accounts. See Portal Settings for Sponsor Portals, on page 783.

• Add the Guest Locations to Sponsor Groups, so Sponsors assigned to that group can use them when creating guest accounts. See Configure Sponsor Groups, on page 318.

• Assign the Guest Locations available to self-registering guests using a Self-Registered Guest portal. See Create a Self-Registered Guest Portal, on page 312.

• For existing guest accounts, edit them manually to add SSIDs or Locations.

Rules for Guest Password Policies

Cisco ISE has the following built-in rules for guest passwords:

• The Guest password policy applies to sponsor portals, self registered portals, accounts uploaded in a CSV file, passwords created using the ERS API, and user created passwords.

• Changes to the guest password policy do not affect existing accounts, until the guests passwords have expired and need to be changed.

• Passwords are case sensitive.

• The special characters <, >, /, and % cannot be used.

• Minimum length and minimum required characters apply to all passwords.

• Passwords cannot match usernames.

• New passwords cannot match current passwords.

• Guests do not receive notifications prior to password expiration, unlike guest account expiration. When guest passwords expire, either sponsors can reset the password to a random password or guests can log in using their current login credentials and then change their password.
The guest default username is four alpabetic and password is four numeric characters. Short, easy to remember usernames and passwords are adequate for short-term guests. You can change the username and password length in ISE, if you desire.

Set the Guest Password Policy and Expiration

You can define a password policy for all Guest portals. A Guest password policy determines how the password is generated for all guest accounts. A password can be a mixture of alphabetic, numeric, or special characters. You can also set the number of days after which guest passwords will expire, requiring guests to reset their passwords.

The Guest password policy applies to sponsor portals, self registered portals, accounts uploaded in a CSV file, passwords created using the ERS API, and user created passwords.

**Procedure**

**Step 1** Choose **Guest Access > Settings > Guest Password Policy**.

**Step 2** Enter the **Minimum password length** (in characters) for the guest passwords.

**Step 3** Specify the characters from each character set that can be used by guests to create passwords. Choose one of the following options under **Allowed Characters and Minimums** to specify the password policy for guests:

- Use all the characters from each character set.
- To prevent the use of certain characters, choose **Custom** from the drop-down menu, and delete these characters from the predefined and complete sets.

**Step 4** Enter the minimum number of characters to use from each set. The total number of required characters across the four character sets should not exceed the overall **Minimum password length**.

**Step 5** Choose one of the following options under **Password Expiration**:

- Specify the frequency (in days) when guests have to change their passwords after they first log in. If the guests do not reset their passwords before they expire, the next time they log in to the network using their original login credentials, they are prompted to change their passwords.
- Set the passwords to never expire.

**Step 6** Click **Save**. If you do not want to save any updates you made to the settings, click **Reset** to revert to the last saved values.

**What to do next**

You should customize the error messages that are related to the password policy to provide the password requirements.

1. Choose **Guest Access > Configure > Sponsored-Guest Portals or Self-Registered Guest Portals > Edit > Portal Page Customization > Error Messages**.
2. Search for the keyword “policy.”

Rules for Guest Username Policies

Cisco ISE has the following built-in rules for guest username policies:

• Changes to the guest username policy do not affect existing accounts, until the guest accounts have expired and need to be changed.

• The special characters <, >, /, and % cannot be used.

• Minimum length and minimum required characters apply to all system-generated usernames, including usernames based on email addresses.

• Passwords cannot match usernames.

Set the Guest Username Policy

You can configure rules for how guest usernames are created. A generated username can be created based on the email address, or based on the first name and last name of the guest. The Sponsor can also create a random number of guest accounts to save time when creating multiple guests, or when guest names and email addresses are not available. Randomly generated guest usernames consist of a mixture of alphabetic, numeric, and special characters. These settings affect all guests.

Procedure

Step 1  To define the guest username policies for all Guest and Sponsor portals, choose Guest Access > Settings > Guest Username Policy.

Step 2  Enter the Minimum username length (in characters) for the guest usernames.

Step 3  Choose one of the options under Username Criteria for Known Guests to specify the policy for creating usernames for known guests.

Step 4  Choose one of the following options under Characters Allowed in Randomly-Generated Usernames to specify the policy for creating random usernames for guests:

• Use all characters from each character set.

• To prevent the use of certain characters, choose Custom from the drop-down menu, and delete these characters from the predefined and complete sets.

Step 5  Enter the minimum number of characters to use from each set.

The total number of characters from the three character sets should not exceed the number specified in Minimum username length.

Step 6  Click Save. If you do not want to save any updates you made to the settings, click Reset to revert to the last saved values.
What to do next

You should customize the error messages that are related to the username policy to provide the username requirements.

2. Search for the keyword “policy.”

SMS Providers and Services

SMS services are required when you and sponsors want to send SMS notifications to guests that are using credentialed Guest portals. Whenever possible, configure and provide free SMS service providers to lower your company's expenses.

Cisco ISE supports a variety of cellular service providers that provide free SMS services to their own subscribers. You can use these providers without a service contract and without configuring their account credentials in Cisco ISE. These include ATT, Orange, Sprint, TMobile, and Verizon.

You can also add other cellular service providers that offer free SMS services or a global SMS service provider, such as a Click-A-Tell. The default global SMS service provider requires a service contract and you must configure their account credentials in Cisco ISE.

- If self-registering guests pick their free SMS service provider on the Self-Registration form, SMS notifications with their login credentials are sent to them free of cost. If they do not pick their SMS service provider, then the default global SMS service provider contracted by your company is used to send the SMS notifications.

- If you plan to allow sponsors to send SMS notifications to guests whose accounts they have created, you should customize the sponsor portal and select all the appropriate SMS service providers that can be used by these sponsors. If you do not select any SMS service providers for the Sponsor portal, the default global SMS service provider contracted by your company will provide the SMS services.

SMS providers are configured as SMS Gateways in ISE. Email from ISE is converted to SMS by the SMS gateway.

Related Topics
- Configure SMS Gateways to Send SMS Notifications to Guests, on page 302
- SMS Gateway Settings, on page 716

Configure SMS Gateways to Send SMS Notifications to Guests

You must set up SMS gateways in Cisco ISE to enable:

- Sponsors to manually send SMS notifications to guests with their login credentials and password reset instructions.

- Guests to automatically receive SMS notifications with their login credentials after they successfully register themselves.

- Guests to automatically receive SMS notifications with actions to take before their guest accounts expire.

When entering information in the fields, you should update all text within [ ], such as [USERNAME], [PASSWORD], [PROVIDER_ID], etc., with information specific to your SMS provider's account.
Before you begin

Configure a default SMTP server to use for the SMS Email Gateway option.

Procedure

Step 1  Choose Administration > System > Settings > SMS Gateway.

Step 2  Click Add.

Step 3  Enter an SMS Gateway Provider Name.

Step 4  Select a Provider Interface Type and enter the required information:

- SMS Email Gateway to send SMS via an email server.
- SMS HTTP API to send SMS via an HTTP API (GET or POST method).

For information about configuring an SMS Email Gateway and an SMS HTTP API gateway, see SMS Gateway Settings, on page 716.

Step 5  Check Break up long message into multiple parts to enable Cisco ISE to divide messages that exceed 140 bytes into multiple messages.

Most SMS providers divide long SMS messages into multiple parts automatically. MMS messages can be longer than SMS messages.

Step 6  Click Submit.

What to do next

If you configured a new SMS gateway, you can:

- Select the SMS service provider to use when sending SMS notifications about expiring accounts to guests. See Create or Edit a Guest Type, on page 293.

- Specify which of the configured SMS providers should display on the Self-Registration form for self-registering guests to pick from. See Create a Self-Registered Guest Portal, on page 312.

Guest Portals

When people visiting your company wish to use your company’s network to access the internet, or resources and services on your network, you can provide them network access through a Guest portal. Employees can use these Guest portals to access your company’s network, if configured.

There are three default Guest portals:

- Hotspot Guest portal—Network access is granted without requiring any credentials. Usually, an Acceptance of User Policy (AUP) must be accepted before network access is granted.

- Sponsored-Guest portal—Network access is granted by a sponsor who creates accounts for guests, and provides the Guest with login credentials.

- Self-Registered Guest portal—Guests can create their own accounts credentials, and may need sponsor approval before they are granted network access.
Cisco ISE can host multiple Guest portals, including a predefined set of default portals.

The default portal themes have standard Cisco branding that you can customize through the Admin portal.

Wireless setup has its own default theme (CSS) and you are able to modify some basic settings such as logo, banner, background image, coloring and fonts. In ISE, you can also choose to further customize your portal by changing more settings and go into advanced customizations.

## Credentials for Guest Portals

Cisco ISE provides secured network access by requiring guests to log in using various types of credentials. You can require that guests log in using one or a combination of these credentials.

- **Username**—Required. Applies to all guests using end-user portals (except Hotspot Guest portals) and is derived from the username policy. The username policy applies only to system-generated usernames and not to usernames specified using the Guest API programming interface or the self-registering process. You can configure the policy settings that apply to usernames at Guest Access > Settings > Guest Username Policy. Guests can be notified of their username in an email, SMS, or in printed form.

- **Password**—Required. Applies to all guests using end-user portals (except Hotspot Guest portals) and is derived from the password policy. You can configure the policy settings that apply to passwords at Guest Access > Settings > Guest Password Policy. Guests can be notified of their password in an email, SMS, or in printed form.

- **Access code**—Optional. Applies to guests using the Hotspot Guest and Credentialed Guest portals. An access code is primarily a locally known code that is given to physically present guests (either visually via a whiteboard or verbally by a lobby ambassador). It would not be known and used by someone outside the premises to gain access to the network. If the Access code setting is enabled:
  - Sponsored guests are prompted to enter it on the Login page (along with a username and password).
  - Guests using the Hotspot Guest portal are prompted to enter it on the Acceptable Use Policy (AUP) page.

- **Registration code**—Optional. Applies to self-registering guests and is similar to an access code in how it is provided to the self-registering guests. If the Registration code setting is enabled, self-registering guests are prompted to enter it on the Self-Registration form.

The username and password can be provided by a sponsor at your company (for sponsored guests), or a Credentialed Guest portal can be configured to allow guests to register themselves to obtain these credentials.

## Guest Access with Hotspot Guest Portals

Cisco ISE provides network access functionality that includes “hotspots,” which are access points that guests can use to access the Internet without requiring credentials to log in. When guests connect to the hotspot network with a computer or any device with a web browser and attempt to connect to a website, they are automatically redirected to a Hotspot Guest portal. Both wired and wireless (Wi-Fi) connections are supported with this functionality.
The Hotspot Guest portal is an alternative Guest portal that allows you to provide network access without requiring guests to have usernames and passwords and alleviates the need to manage guest accounts. Instead, Cisco ISE works together with the network access device (NAD) and Device Registration Web Authentication (Device Registration WebAuth) to grant network access directly to the guest devices. Sometimes, guests may be required to log in with an access code. Typically, this is a code that is locally provided to guests who are physically present on a company’s premises.

If you support the Hotspot Guest portal:

- Based on the Hotspot Guest portal configuration and settings, guests are granted access to the network if the guest access conditions are met.
- Cisco ISE provides you with a default guest identity group, GuestEndpoints, which enables you to cohesively track guest devices.

**Guest Access with Credentialed Guest Portals**

You can use a credentialed Guest portal to identify and authorize temporary access for external users to internal networks and services, as well as to the Internet. Sponsors can create temporary usernames and passwords for authorized visitors who can access the network by entering these credentials in the portal’s Login page.

You can set up a credentialed Guest portal so that guests can log in using a username and password that is obtained:

- From a sponsor. In this guest flow, guests are greeted by a sponsor, such as a lobby ambassador, when they enter company premises and are set up with individual guest accounts.
- After they register themselves, using an optional registration code or access code. In this guest flow, guests are able to access the Internet without any human interaction and Cisco ISE ensures that these guests have unique identifiers that can be used for compliance.
- After they register themselves, using an optional registration code or access code, but only after the request for a guest account is approved by a sponsor. In this guest flow, guests are provided access to the network, but only after an additional level of screening is done.

You can also force the user to enter a new password when logging in.

Cisco ISE enables you to create multiple credentialed Guest portals, which you can use to allow guest access based on different criteria. For example, you might have a portal for monthly contractors that is separate from the portal used for daily visitors.

**Employee Access with Credentialed Guest Portals**

Employees can also access the network using Credentialed Guest Portals by signing in using their employee credentials, as long as their credentials can be accessed by the identity source sequence configured for that portal.

**Guest Device Compliance**

When guests and non-guests access the network through credentialed Guest portals, you can check their devices for compliance before they are allowed to gain access. You can route them to a Client Provisioning page and require them to first download the posture agent that checks their posture profile and verifies if their
device is compliant. You can do this by enabling the option in the Guest Device Compliance Settings in a credentialed Guest portal, which displays the Client Provisioning page as part of the guest flow.

The Client Provisioning service provides posture assessments and remediations for guests. The Client Provisioning portal is available only with a Central Web Authorization (CWA) guest deployment. The guest login flow performs a CWA, and the credentialed Guest portal is redirected to the Client Provisioning portal after performing acceptable-use-policy and change-password checks. The posture subsystem performs a Change of Authorization (CoA) on the network access device to reauthenticate the client connection once the posture has been assessed.

Guest Portals Configuration Tasks

You can use a default portal and its default settings such as certificates, endpoint identity group, identity source sequence, portal themes, images, and other details provided by Cisco ISE. If you do not want to use the default settings, you should create a new portal or edit an existing one to meet your needs. You can duplicate a portal if you want to create multiple portals with the same settings.

After creating a new portal or editing a default one, you must authorize the portal for use. Once you authorize a portal for use, any subsequent configuration changes you make are effective immediately.

If you choose to delete a portal, you must first delete any authorization policy rules and authorization profiles associated with it or modify them to use another portal.

Use this table for the tasks related to configuring the different Guest portals.

Enable Policy Services

To support the Cisco ISE end-user web portals, you must enable portal-policy services on the node on which you want to host them.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Administration &gt; System &gt; Deployment</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click the node and click Edit.</td>
</tr>
<tr>
<td>Step 3</td>
<td>On the General Settings tab, check Policy Service.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Check the Enable Session Services option.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Click Save.</td>
</tr>
</tbody>
</table>

Add Certificates for Guest Portals

If you do not want to use the default certificates, you can add a valid certificate and assign it to a certificate group tag. The default certificate group tag used for all end-user web portals is Default Portal Certificate Group.

Procedure

| Step 1 | Choose Administration > System > Certificates > System Certificates. |
| Step 2 | Add a system certificate and assign it to a certificate group tag that you want to use for the portal. |
| Step 3 | Choose Guest Access > Configure > Guest Portals > Create or Edit > Portal Settings. |
| Step 4 | Select the specific certificate group tag from the Certificate group tag drop-down list that is associated with the newly added certificate. |

Create External Identity Sources

Cisco ISE can connect with external identity sources such as Active Directory, LDAP, RADIUS Token, and RSA SecurID servers to obtain user information for authentication and authorization. External identity sources also include certificate authentication profiles that you need for certificate-based authentications.
Procedure

Step 1
Choose Administration > Identity Management > External Identity Sources.

Step 2
Choose one of these options:

• Certificate Authentication Profile for certificate-based authentications.
• Active Directory to connect to an Active Directory as an external identity source. See Active Directory as an External Identity Source, on page 247 for more details.
• LDAP to add an LDAP identity source. See LDAP, on page 270 for more details.
• RADIUS Token to add a RADIUS Token server. See RADIUS Token Identity Sources, on page 278 for more details.
• RSA SecurID to add an RSA SecurID server. See RSA Identity Sources, on page 283 for more details.

Create Identity Source Sequences

Before you begin

Ensure that you have configured your external identity sources in Cisco ISE.

To perform the following task, you must be a Super Admin or System Admin.

For allowing guest users to authenticate through Local WebAuth, you must configure both the Guest Portal authentication source and the identity source sequence to contain the same identity stores.

Procedure

Step 1
Choose Administration > Identity Management > Identity Source Sequences > Add.

Step 2
Enter a name for the identity source sequence. You can also enter an optional description.

Step 3
Check the Select Certificate Authentication Profile check box and choose a certificate authentication profile for certificate-based authentication.

Step 4
Choose the database or databases that you want to include in the identity source sequence in the Selected List box.

Step 5
Rearrange the databases in the Selected list in the order in which you want Cisco ISE to search the databases.

Step 6
Choose one of the following options in the Advanced Search List area:

• Do not access other stores in the sequence and set the AuthenticationStatus attribute to ProcessError —If you want Cisco ISE to discontinue the search, if the user is not found in the first selected identity source.

• Treat as if the user was not found and proceed to the next store in the sequence —If you want Cisco ISE to continue searching the other selected identity sources in sequence, if the user is not found in the first selected identity source.

While processing a request, Cisco ISE searches these identity sources in sequence. Ensure that you have the identity sources in the Selected list box listed in the order in which you want Cisco ISE to search them.
Create Endpoint Identity Groups

 Cisco ISE groups endpoints that it discovers into the corresponding endpoint identity groups. Cisco ISE comes with several system-defined endpoint identity groups. You can also create additional endpoint identity groups from the Endpoint Identity Groups page. You can edit or delete the endpoint identity groups that you have created. You can only edit the description of the system-defined endpoint identity groups; you cannot edit the name of these groups or delete them.

Procedure

Step 1 Choose Administration > Identity Management > Groups > Endpoint Identity Groups.
Step 2 Click Add.
Step 3 Enter the name for the endpoint identity group that you want to create (do not include spaces in the name of the endpoint identity group).
Step 4 Enter the description for the endpoint identity group that you want to create.
Step 5 Click the Parent Group drop-down list to choose an endpoint identity group to which you want to associate the newly created endpoint identity group.
Step 6 Click Submit.

Create a Hotspot Guest Portal

You can provide a Hotspot Guest portal to enable guests to connect to your network without requiring a username and password to log in. An access code can be required to log in.

You can create a new Hotspot Guest portal, or you can edit or duplicate an existing one. You can delete any Hotspot Guest portal, including the default portal provided by Cisco ISE.

Any changes that you make to the Page Settings on the Portal Behavior and Flow Settings tab are reflected in the graphical flow in the Guest Flow diagram. If you enable a page, such as the AUP page, it appears in the flow and the guest will experience it in the portal. If you disable it, it is removed from the flow and the next enabled page displays for the guest.

All the Page Settings, except the Authentication Success Settings, are optional.

Before you begin

- Ensure that you have the required certificates and endpoint identity groups configured for use with this portal.
- Ensure that the WLC that guests connect to for the Hotspot portal is supported by ISE. See the Identity Services Engine Network Component Compatibility guide for your version of ISE.
Procedure

Step 1  Choose Guest Access > Configure > Guest Portals > Create, Edit or Duplicate.
Step 2  If creating a new portal, in the Create Guest Portal dialog box, select Hotspot Guest Portal as the portal type and click Continue.
Step 3  Provide a unique Portal Name and a Description for the portal.
        Ensure that the portal name that you use here is not used for any other end-user portals.
Step 4  Use the Language File drop-down menu to export and import language files to use with the portal.
Step 5  Update the default values for ports, Ethernet interfaces, certificate group tags, endpoint identity groups, and so on in Portal Settings, and define behavior that applies to the overall portal.
Step 6  Update the following settings, which apply to each of the specific pages:
        • Acceptable Use Policy (AUP) Page Settings—Require guests to accept an acceptable use policy.
        • Post-Access Banner Page Settings—Inform guests of their access status and any other additional actions, if required.
        • VLAN DHCP Release Page Settings—Release the guest device IP address from the guest VLAN and renew it to access another VLAN on the network.
        • Authentication Success Settings—Specify what guests should see once they are authenticated.
        • Support Information Page Settings—Help guests provide information that the Help Desk can use to troubleshoot network access issues.
Step 7  Click Save. A system-generated URL displays as the Portal test URL, which you can use to access the portal and test it.

What to do next

You must authorize the portal in order to use it. You can also customize your portal either before or after you authorize it for use.

Create a Sponsored-Guest Portal

You can provide a Sponsored-Guest portal to enable designated sponsors to grant access to guests.

You can create a new Sponsored-Guest portal, or you can edit or duplicate an existing one. You can delete any Sponsored-Guest portal, including the default portal provided by Cisco ISE.

Any changes that you make to the Page Settings on the Portal Behavior and Flow Settings tab are reflected in the graphical flow in the Guest Flow diagram. If you enable a page, such as the AUP page, it appears in the flow and the guest will experience it in the portal. If you disable it, it is removed from the flow and the next enabled page displays for the guest.

All these page settings enable you to display an Acceptable Use Policy (AUP) for a guest and require its acceptance:
        • Login Page Settings
        • Acceptable Use Policy (AUP) Page Settings
        • BYOD Settings
Before you begin

Ensure that you have the required certificates, external identity sources, and identity source sequences configured for use with this portal.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Guest Access &gt; Configure &gt; Guest Portals &gt; Create, Edit or Duplicate.</td>
</tr>
<tr>
<td>Step 2</td>
<td>If creating a new portal, in the Create Guest Portal dialog box, select Sponsored-Guest Portal as the portal type and click Continue.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Provide a unique Portal Name and a Description for the portal. Ensure that the portal name that you use here is not used for any other end-user portals.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Use the Language File drop-down menu to export and import language files to use with the portal.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Update the default values for ports, Ethernet interfaces, certificate group tags, identity source sequences, and so on in Portal Settings, and define behavior that applies to the overall portal.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Update the following settings, which apply to each of the specific pages:</td>
</tr>
<tr>
<td></td>
<td>• Login Page Settings—Specify guest credential and login guidelines. If you select the Allow guests to create their accounts option, users will be able to create their own guest accounts. If this option is not selected, sponsors will be required to create guest accounts.</td>
</tr>
<tr>
<td></td>
<td>• Acceptable Use Policy (AUP) Page Settings—Add a separate AUP page and define the acceptable use policy behavior for guests, including employees who use the credentialed Guest portals.</td>
</tr>
<tr>
<td></td>
<td>• Employee Change Password Settings—Require guests to change their password after the first time they log in.</td>
</tr>
<tr>
<td></td>
<td>• Guest Device Registration Settings—Select whether Cisco ISE automatically registers guest devices or displays a page where guests can manually register their devices.</td>
</tr>
<tr>
<td></td>
<td>• BYOD Settings—Let employees use their personal devices to access the network.</td>
</tr>
<tr>
<td></td>
<td>• Post-Login Banner Page Settings—Notify guests of additional information before they are granted network access.</td>
</tr>
<tr>
<td></td>
<td>• Guest Device Compliance Settings—Route guests to the Client Provisioning page and require them to first download the posture agent.</td>
</tr>
<tr>
<td></td>
<td>• VLAN DHCP Release Page Settings—Release the guest device IP address from the guest VLAN and renew it to access another VLAN on the network.</td>
</tr>
<tr>
<td></td>
<td>• Authentication Success Settings—Specify what guests should see once they are authenticated.</td>
</tr>
<tr>
<td></td>
<td>• Support Information Page Settings—Help guests provide information that the Help Desk can use to troubleshoot network access issues.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Click Save. A system-generated URL displays as the Portal test URL, which you can use to access the portal and test it.</td>
</tr>
</tbody>
</table>

What to do next

Note

The test portal does not support RADIUS sessions, so you won't see the entire portal flow for all portals. BYOD and Client Provisioning are examples of portals that depend on RADIUS sessions. For example, a redirect to an external URL will not work.
You must authorize the portal in order to use it. You can also customize your portal either before or after you authorize it for use.

Create a Self-Registered Guest Portal

You can provide a Self-Registered Guest portal to enable guests to register themselves and create their own accounts so they can access the network. You can still require that these accounts be approved by a sponsor before access is granted.

You can create a new Self-Registered Guest portal, or you can edit or duplicate an existing one. You can delete any Self-Registered Guest portal, including the default portal provided by Cisco ISE.

Any changes that you make to the Page Settings on the Portal Behavior and Flow Settings tab are reflected in the graphical flow in the Guest Flow diagram. If you enable a page, such as the AUP page, it appears in the flow and the guest will experience it in the portal. If you disable it, it is removed from the flow and the next enabled page displays for the guest.

All these page settings enable you to display an Acceptable Use Policy (AUP) for a guest and require its acceptance:

- Login Page Settings
- Self-Registration Page Settings
- Self-Registration Success Page Settings
- Acceptable Use Policy (AUP) Page Settings
- BYOD Settings

Before you begin

Ensure that you have configured the required certificates, external identity sources, and identity source sequences for this portal.

Procedure

1. Choose Guest Access > Configure > Guest Portals > Create, Edit or Duplicate.
2. If creating a new portal, in the Create Guest Portal dialog box, select Self-Registered Guest Portal as the portal type and click Continue.
3. Provide a unique Portal Name and a Description for the portal. Ensure that the portal name that you use here is not used for any other end-user portals.
4. Use the Language File drop-down menu to export and import language files to use with the portal.
5. In Portal Settings, update the default values for ports, Ethernet interfaces, certificate group tags, identity source sequences, and other settings that define behavior of this portal. For more information about Portal Settings fields, see Portal Settings for Credentialed Guest Portals, on page 768.
6. Update the following settings, which apply to each of the specific pages:
   - Login Page Settings—Specify guest credential and login guidelines. For more information, see Login Page Settings for Credentialed Guest Portals, on page 770.
• **Self-Registration Page Settings**—Specify the information self-registering guests will read and should enter on the Self-Registration form, in addition to the guest experience after they have submitted the form.

• **Acceptable Use Policy (AUP) Page Settings**—Add a separate AUP page and define the acceptable use policy behavior for guests, including employees who use the credentialed Guest portals. For more information, see Acceptable Use Policy (AUP) Page Settings for Credentialed Guest Portals, on page 776.

• **Employee Change Password Settings**—Require guests to change their password after the first time they log in.

• **Guest Device Registration Settings**—Select whether Cisco ISE automatically registers guest devices or displays a page where guests can manually register their devices.

• **BYOD Settings**—Let employees use their personal devices to access the network. For more information, see BYOD Settings for Credentialed Guest Portals, on page 777. For more information, see BYOD Settings for Credentialed Guest Portals, on page 777.

• **Post-Login Banner Page Settings**—Display additional information after the user successfully logs in, and before they are granted network access.

• **Guest Device Compliance Settings**—Redirects guests to the Client Provisioning page for posture assessment. For more information, see Guest Device Compliance Settings for Credentialed Guest Portals, on page 779.

• **VLAN DHCP Release Page Settings**—Release the guest device IP address from the guest VLAN and renew it to access another VLAN on the network. For more information, see BYOD Settings for Credentialed Guest Portals, on page 777.

• **Authentication Success Settings**—Specify where to direct guests after they are authenticated. If you redirect a Guest to an external URL after authentication, there may be a delay while the URL address is resolved and the session is redirected. For more information, see Authentication Success Settings for Guest Portals, on page 780.

• **Support Information Page Settings**—Help guests provide information that the Help Desk can use to troubleshoot network access issues.

**Step 7**

Click **Save**. A system-generated URL displays as the **Portal test URL**, which you can use to access the portal and test it.

---

### What to do next

**Note**

The test portal does not support RADIUS sessions, so you won't see the entire portal flow for all portals. BYOD and Client Provisioning are examples of portals that depend on RADIUS sessions. For example, a redirect to an external URL will not work.

You must authorize the portal in order to use it. You can also customize your portal either before or after you authorize it for use.

### Authorize Portals

When you authorize a portal, you are setting up the network authorization profiles and rules for network access.
Before you begin
You must create a portal before you can authorize it.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Step 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set up a special authorization profile for the portal.</td>
<td>Create an authorization policy rule for the profile.</td>
</tr>
</tbody>
</table>

Create Authorization Profiles

Each portal requires that you set up a special authorization profile for it.

Before you begin
If you do not plan to use a default portal, you must first create the portal so you can associate the portal name with the authorization profile.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Step 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choose Policy &gt; Policy Elements &gt; Results &gt; Authorization &gt; Authorization Profiles.</td>
<td>Create an authorization profile using the name of the portal that you want to authorize for use.</td>
</tr>
</tbody>
</table>

What to do next
You should create a portal authorization policy rule that uses the newly created authorization profile.

Create Authorization Policy Rules for Hotspot and MDM Portals

To configure the redirection URL for a portal to use when responding to the users' (guests, sponsors, employees) access requests, define an authorization policy rule for that portal.

The url-redirect takes the following form based on the portal type, where:

ip:port = the IP address and port number
PortalID = the unique portal name

For a Hotspot Guest portal:
https://ip:port/guestportal/gateway?sessionID=SessionIdValue&portal=PortalID&action=cwa&type=drw

For a Mobile Device Management (MDM) portal:
https://ip:port/mdmportal/gateway?sessionID=SessionIdValue&portal=PortalID&action=mdm

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Choose Policy &gt; Authorization to create a new authorization policy rule under Standard policies.</td>
<td></td>
</tr>
</tbody>
</table>
If you enabled Policy Sets, choose Policy > Policy Set, pick the Policy Set you plan to use for this portal, expand Authorization Policy, and add a new rule.

**Step 2**

For **Conditions**, select an endpoint identity group that you want to use for the portal validation. For example, for the Hotspot Guest portal, select the default GuestEndpoints endpoint identity group and, for the MDM portal, select the default RegisteredDevices endpoint identity group.

**Note**

Because the Hotspot Guest portal only issues a Termination CoA, do not use Network Access:UseCase EQUALS Guest Flow as one of the validation conditions in the Guest authorization policy. Instead, match the Identity Group that the endpoint belongs to for validation. For example,

- If "GuestEndpoint" + Wireless MAB then Permit Access
- If Wireless MAB then HotSpot Redirect

**Step 3**

For **Permissions**, select the portal authorization profile that you created.

---

### Customize Guest Portals

You can customize the portal appearance and user (guests, sponsors, or employees as applicable) experience by customizing the portal themes, changing UI elements on the portal pages, and editing error messages and notifications that display to the users. For more information about customizing portals, see **Customization of End-User Web Portals**, on page 359.

### Sponsor Portals

The Sponsor portal is one of the primary components of Cisco ISE guest services. Using the Sponsor portal, sponsors can create and manage temporary accounts for authorized visitors to securely access the corporate network or the Internet. After creating a guest account, sponsors also can use the Sponsor portal to provide account details to the guest by printing, emailing, or texting. Before providing self-registering guests access to the company network, sponsors may be requested via email to approve their guests’ accounts.

### Managing Guest Accounts on the Sponsor Portal

#### Sponsor Portal Log On Flow

A sponsor group specifies a set of permissions that can be assigned to a sponsor user. When a sponsor logs in to a sponsor portal:

1. ISE verifies the sponsor’s credentials.

2. If the sponsor authenticates successfully, the next step is to search all the available sponsor groups to find the ones that match that sponsor user, that is, the sponsor groups that the sponsor belongs to. A sponsor matches or belongs to a sponsor group if both:
   - The sponsor is a member of one of the configured Member Groups.
   - If you are using Other Conditions, all the conditions evaluate to true for that sponsor.
3. If the sponsor belongs to a sponsor group, then that sponsor gets the permissions from that group. A sponsor can belong to more than one sponsor group, in which case the permissions from those groups are combined. If the sponsor does not belong to any sponsor group, then the login to the sponsor portal fails.

Sponsor groups and their permissions are independent of the sponsor portals. The same algorithm for matching sponsor groups is applied regardless of which sponsor portal the sponsor logs in to.

**Using a Sponsor Portal**

Use a Sponsor portal to create temporary guest accounts for authorized visitors to securely access your corporate network or the Internet. After creating guest accounts, you can also use a Sponsor portal to manage these accounts and to provide account details to the guests.

On a Sponsor portal, the sponsor can create new guest accounts individually, or import a group of users from a file.

### Note

An ISE administrator that was authorized from an external identity store, such as Active Directory, can be part of a Sponsor group. However, internal administrator accounts, for example, the default "admin" account, cannot be part of a Sponsor group.

There are several ways to open a Sponsor portal:

- In the Administrators console, using the Manage Accounts link. On the Administrators console, click **Guest Access**, then click **Manage Accounts**. When you click **Manage Accounts**, you are assigned to the default sponsor group with access to **ALL_ACCOUNTS**. You can create new guest accounts, but those guests cannot be notified, since there is no email address available to receive the account activation request from the guest. A Sponsor with the same privileges who logs onto the sponsor portal, and searches for those accounts, can send notification.

  This step requires that the FQDN that you configured on the sponsor portal's **Portal Behavior and Flow Settings** page is in your DNS server.

- In the Administrator console, on the Sponsor Portal configuration page. Click **Guest Access > Configure > Sponsor Portals**, open a sponsor portal, and click the **Portal Test URL** link to the right of the **Description** field.

- In a browser, by opening the URL (FQDN) configured in the sponsor portal's **Portal Settings** page, which must be defined in your DNS server.

### What to do next

**Managing Sponsor Accounts**

A sponsor user is an employee or contractor of your organization who creates and manages guest-user accounts through the sponsor portal. Cisco ISE authenticates sponsors through a local database, or through external Lightweight Directory Access Protocol (LDAP), Microsoft Active Directory, or SAML identity stores. If you are not using an external source, you must create internal user accounts for sponsors.
Sponsor Groups

Sponsor groups control the permissions given to a sponsor when using any Sponsor portal. If a sponsor is a member of a sponsor group, then the sponsor receives the permissions defined in the group.

A sponsor is considered to be a member of a sponsor group if the sponsor belongs to at least one of the Member Groups defined in the sponsor group. A Member Group can be a User Identity Group, or a group selected from an external identity source, such as Active Directory.

A sponsor can be a member of more than one sponsor group. If so, the sponsor receives the combined permissions from all of those groups, as follows:

• An individual permission such as "Delete guests' accounts" is granted if it is enabled in any of the groups.
• The sponsor can create guests using the Guest Types in any of the groups.
• The sponsor can create guests at the locations in any of the groups.
• For a numeric value such as a batch size limit, the largest value from the groups is used.

If a sponsor is not a member of any sponsor group, then the sponsor is not permitted to log in to any sponsor portal.

• ALL_ACCOUNTS—Sponsors can manage all guest accounts.
• GROUP_ACCOUNTS—Sponsors can manage the guest accounts created by sponsors from the same Sponsor Group.
• OWN_ACCOUNTS—Sponsors can manage only the Guest accounts that they created.

You can customize the features available to particular sponsor groups to limit or expand the functionality of the Sponsor portal. For example:

Related Topics

Sponsor Portals, on page 315

Create Sponsor Accounts and Assign to Sponsor Groups

To create internal sponsor user accounts and specify the sponsors who can use the Sponsor portals:

Procedure

Step 1 Choose Administration > Identity Management > Identities > Users. Assign the internal sponsor user account to the appropriate user identity group.

Note The default Sponsor Groups have the default Identity Group Guest_Portal_Sequence assigned to them.

Step 2 Choose Guest Access > Configure > Sponsor Groups > Create, Edit or Duplicate and click Members. Map the sponsor user identity groups to sponsor groups.
**What to do next**

You can also create additional user identity groups specific to your organization to use with sponsors. Choose Administration > Identity Management > Groups > User Identity Groups.

**Configure Sponsor Groups**

Cisco provides default sponsor groups. If you do not want to use the default options, you can either create new sponsor groups or edit the default sponsor groups and change the settings. You can also duplicate a sponsor group to create more sponsor groups with the same settings and privileges.

You can disable a sponsor group, which prevents the members of the sponsor group from logging in to the Sponsor portal. You can delete any of the sponsor groups, except the default sponsor groups provided by Cisco ISE.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Guest Access &gt; Configure &gt; Sponsor Groups &gt; Create, Edit or Duplicate.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Enter the Sponsor group name and Description.</td>
</tr>
<tr>
<td>Step 3</td>
<td><strong>Member Groups</strong>—Click Members to select one or more user (identity) groups and groups from external identity sources, and add those groups. In order for a user to be a member of this sponsor group, they must belong to at least one of the configured groups.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click Members to select user (identity) groups and add them as group members of this sponsor group.</td>
</tr>
<tr>
<td>Step 5</td>
<td>To specify which guest types that sponsors based on this sponsor group can create, click inside the box under This sponsor group can create accounts using these guest types, and select one or more guest types. You can create more guest types to assign to this sponsor group by clicking the link under Create Guest Types at. After you create a new guest type, save, close, and reopen the sponsor group before you can select that new guest type.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Use Select the locations that guests will be visiting to specify the locations (used to set the guest time zones) that sponsors in this sponsor group can choose from when creating guest accounts. You can add more locations to choose from by clicking the link under Configure guest locations at and adding guest locations. After you create a new guest location, save, close, and reopen the sponsor group before you can select that new guest location. This does not restrict guests from logging in from other locations.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Under Sponsor Can Create, configure options that sponsors in this group have for creating guest accounts.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Multiple guest accounts assigned to specific guests (Import)</strong>—Enable the sponsor to create multiple guest accounts by importing guest details such as first name and last name from a file. If this option is enabled, the Import button displays on the Create Accounts page of the Sponsor portal. The Import option is only available on desktop browsers (not mobile), such as Internet Explorer, Firefox, Safari, and so forth</td>
</tr>
<tr>
<td></td>
<td>• <strong>Limit to batch of</strong>—If this sponsor group is allowed to create multiple accounts simultaneously, specify the number of guest accounts that can be created in a single import operation. Although a sponsor can create a maximum of 10,000 accounts, we recommend that you limit the number of accounts you create, due to potential performance issues.</td>
</tr>
</tbody>
</table>
• **Multiple guest accounts to be assigned to any guests (Random)**—Enable the sponsor to create multiple random guest accounts as placeholders for guests who are not known as yet, or to create many accounts quickly.

If this option is enabled, the **Random** button displays on the **Create Accounts** page of the Sponsor portal.

• **Default username prefix**—Specify a username prefix that sponsors can use when creating multiple random guest accounts. If specified, this prefix appears in the Sponsor Portal when creating random guest accounts. In addition, if **Allow sponsor to specify a username prefix** is:

  • **Enabled**—The sponsor can edit the default prefix in the Sponsor portal.
  
  • **Not enabled**—The sponsor cannot edit the default prefix in the Sponsor portal.

If you do not specify a username prefix or allow the sponsor to specify one, then the sponsor will not be able to assign username prefixes in the Sponsor portal.

• **Allow sponsor to specify a username prefix**—If this sponsor group is allowed to create multiple accounts simultaneously, specify the number of guest accounts that can be created in a single import operation.

Although a sponsor can create a maximum of 10,000 accounts, we recommend that you limit the number of accounts you create, due to potential performance issues.

**Step 8** Under **Sponsor Can Manage**, you can restrict which guests accounts the members of this sponsor group can view and manage.

• **Only accounts sponsor has created**—Sponsors in this group can view and manage only the guest accounts that they have created, which is based on the Sponsor’s email account.

• **Accounts created by members of this sponsor group**—Sponsors in this group can view and manage the guest accounts created by any sponsor in this sponsor group.

• **All guest accounts**—Sponsors view and manage all pending guest accounts.

**Step 9** Under **Sponsor Can**, you can provide more privileges related to guest passwords and accounts to the members of this sponsor group.

• **View guests’ passwords**—For guest accounts that they can manage, allow the sponsor to view the passwords.

  If the guest has changed the password, the sponsor can no longer view it; unless it was reset by the sponsor to a random password generated by Cisco ISE.

  **Note** If this option is disabled for a sponsor group, the members of that group cannot send email and SMS notifications regarding the login credentials (guest password) for the guest accounts that they manage.

• **Reset guest account passwords**—For guest accounts that they can manage, allow the sponsor to reset passwords for guests to a random password generated by Cisco ISE.

• **Extend guests’ accounts**—For guest accounts that they can manage, allow the sponsor to extend them beyond their expiration date. The sponsor is automatically copied on email notifications sent to guests regarding their account expiration.

• **Delete guests’ accounts**—For guest accounts that they can manage, allow the sponsor to delete the accounts, and prevent guests from accessing your company's network.
• **Suspend guests’ accounts**—For guest accounts that they can manage, allow the sponsor to suspend their accounts to prevent guests from logging in temporarily. This action also issues a Change of Authorization (CoA) Terminate to remove the suspended guests from the network.

  • **Require sponsor to provide a reason**—Require the sponsor to provide an explanation for suspending the guest accounts.

• **Approve and view requests from self-registering guests**—Sponsors who are included in this Sponsor Group can either view all pending account requests from self-registering guests (that require approval), or only the requests where the user entered the Sponsor's email address as the person being visited. This feature requires that the portal used by the Self-registering guest has **Require self-registered guests to be approved** checked, and the Sponsor's email is listed as the person to contact.

  • Any pending accounts—A sponsor belonging to this group an approve and review accounts that were created by any sponsor.

  • Only pending accounts assigned to this sponsor—A sponsor belonging to this group can only view and approve accounts that they created.

• **Access Cisco ISE guest accounts using the programmatic interface (Guest REST API)**—For guest accounts that they can manage, allow the sponsor to access guest accounts using the Guest REST API programming interface.

  **Step 10** Click **Save** and then **Close**.

---

### Configure Account Content for Sponsor Account Creation

You can configure the type of user data that your guests and sponsors must provide to create a new guest account. Some fields are required to identify an ISE account, but you can eliminate other fields, and add your own custom fields.

To configure fields for account creation by Sponsors:

1. In ISE, choose **Work Centers > Guest Access > Portals & Components > Sponsor Portals**, and edit your sponsor portal

2. Select the **Portal Page Customization** tab.

3. Scroll down and select **Create Account for Known Guests**.

4. On the Preview display on the right, select **Settings**.

These settings determine which fields display and are required for guest accounts when they are created on the sponsor portal. This configuration applies to Known, Random, and Imported guest types. The template that the sponsor downloads to import new users is created dynamically, so that only the fields set in Known Guests are included.

---

### Configure a Sponsor Portal Flow

You can use a default portal and its default settings such as certificates, endpoint identity group, identity source sequence, portal themes, images, and other details provided by Cisco ISE. If you do not want to use
the default settings, you should create a new portal or edit an existing one to meet your needs. You can duplicate a portal if you want to create multiple portals with the same settings.

You may want to create multiple sponsor portals if your company has different branding for your corporate office and its retail locations, or if your company has different product brands, or if a city’s offices want different themed portals for the fire, police, and other departments.

These are the tasks related to configuring a Sponsor portal.

**Before you begin**

Configure or edit existing sponsor groups for your site, as described in Configure Sponsor Groups, on page 318.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Enable Policy Services, on page 321.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Add Certificates for Guest Services, on page 321.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Create External Identity Sources, on page 322.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Create Identity Source Sequences, on page 322.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Create a Sponsor Portal, on page 323.</td>
</tr>
<tr>
<td>Step 6</td>
<td>(Optional) Customize Sponsor Portals, on page 324.</td>
</tr>
</tbody>
</table>

**Enable Policy Services**

To support the Cisco ISE end-user web portals, you must enable portal-policy services on the node on which you want to host them.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Administration &gt; System &gt; Deployment</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click the node and click Edit.</td>
</tr>
<tr>
<td>Step 3</td>
<td>On the General Settings tab, check Policy Service.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Check the Enable Session Services option.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Click Save.</td>
</tr>
</tbody>
</table>

**Add Certificates for Guest Services**

If you do not want to use the default certificates, you can add a valid certificate and assign it to a certificate group tag. The default certificate group tag used for all end-user web portals is Default Portal Certificate Group.
Create External Identity Sources

Cisco ISE can connect with external identity sources such as Active Directory, LDAP, RADIUS Token, and RSA SecurID servers to obtain user information for authentication and authorization. External identity sources also include certificate authentication profiles that you need for certificate-based authentications.

Procedure

Step 1 Choose Administration > Identity Management > External Identity Sources.
Step 2 Choose one of these options:
- Certificate Authentication Profile for certificate-based authentications.
- Active Directory to connect to an Active Directory as an external identity source See Active Directory as an External Identity Source, on page 247 for more details.
- LDAP to add an LDAP identity source. See LDAP, on page 270 for more details.
- RADIUS Token to add a RADIUS Token server. See RADIUS Token Identity Sources, on page 278 for more details.
- RSA SecurID to add an RSA SecurID server. See RSA Identity Sources, on page 283 for more details.

Create Identity Source Sequences

Before you begin

Ensure that you have configured your external identity sources in Cisco ISE.
To perform the following task, you must be a Super Admin or System Admin.
For allowing guest users to authenticate through Local WebAuth, you must configure both the Guest Portal authentication source and the identity source sequence to contain the same identity stores.

Procedure

Step 1 Choose Administration > Identity Management > Identity Source Sequences > Add.
Step 2 Enter a name for the identity source sequence. You can also enter an optional description.
Step 3  Check the Select Certificate Authentication Profile check box and choose a certificate authentication profile for certificate-based authentication.

Step 4  Choose the database or databases that you want to include in the identity source sequence in the Selected List box.

Step 5  Rearrange the databases in the Selected list in the order in which you want Cisco ISE to search the databases.

Step 6  Choose one of the following options in the Advanced Search List area:

- Do not access other stores in the sequence and set the AuthenticationStatus attribute to ProcessError — If you want Cisco ISE to discontinue the search, if the user is not found in the first selected identity source.

- Treat as if the user was not found and proceed to the next store in the sequence — If you want Cisco ISE to continue searching the other selected identity sources in sequence, if the user is not found in the first selected identity source.

While processing a request, Cisco ISE searches these identity sources in sequence. Ensure that you have the identity sources in the Selected list box listed in the order in which you want Cisco ISE to search them.

Step 7  Click Submit to create the identity source sequence that you can then use in policies.

Create a Sponsor Portal

You can provide a Sponsor portal to enable sponsors to create, manage, and approve accounts for guests who want to connect to your network to access the internet and internal resources and services.

Cisco ISE provides you with a default Sponsor portal that you can use without having to create another one. However, you can create a new Sponsor portal, or you can edit or duplicate an existing one. You can delete any of these portals, except the default Sponsor portal.

Any changes that you make to the Page Settings on the Portal Behavior and Flow Settings tab are reflected in the graphical flow in the Sponsor Flow diagram. If you enable a page, such as the AUP page, it appears in the flow and the sponsor will experience it in the portal. If you disable it, it is removed from the flow and the next enabled page displays for the sponsor.

Before you begin

Ensure that you have the required certificates, external identity sources, and identity source sequences configured for use with this portal.

Procedure

Step 1  Configure the Portal Settings page, as described in Portal Settings for Sponsor Portals, on page 783. Ensure that the portal name that you use here is not used for any other end-user portals.

Step 2  Configure the Login Settings page, as described in Login Settings for Sponsor Portals, on page 785.

Step 3  Configure the Acceptable Use Policy (AUP) Page Settings page, as described in Acceptable Use Policy (AUP) Settings for Sponsor Portals, on page 786.

Step 4  Configure the Sponsor Change Password Settings page, as described in Set the Guest Password Policy and Expiration, on page 300 and in Rules for Guest Password Policies, on page 299.
Step 5  Configure the Post-Login Banner Page Settings page, as described in Post-Login Banner Settings for Sponsor Portals, on page 786.

Step 6  Sponsor Portal Application Settings refers you to the Portal Customization tab if you wish to customize the portal.

Step 7  Click Save.

Customize Sponsor Portals

You can customize the portal appearance and user experience by customizing the portal themes, changing UI elements on the portal pages, and editing error messages and notifications that display to the users. For more information about customizing portals, see Customization of End-User Web Portals, on page 359.

Configuring Account Content for Sponsor Account Creation

You can configure the type of user data that your guests and sponsors must provide to create a new guest account. Some fields are required to identify an ISE account, but you can eliminate other fields, and add your own custom fields.

To configure fields for account creation by Sponsors:

1. In ISE, choose Work Centers > Guest Access > Portals & Components > Sponsor Portals, and edit your sponsor portal.

2. Select the Portal Page Customization tab.

3. Scroll down and select Create Account for Known Guests.

   • On the Preview display on the right, select Settings.

These settings determine which fields display and are required for guest accounts when they are created on the sponsor portal.

This configuration applies to Known, Random, and Imported guest types. The template that the sponsor downloads to import new users is created dynamically, so that only the fields set in Known Guests are included.

Sponsors Cannot Log In to the Sponsor Portal

Problem

The following error message appears when a sponsor tries to log in to the Sponsor portal:

“Invalid username or password. Please try again.”

Causes

• The sponsor has entered invalid credentials.

• The sponsor is not valid because the user record is not present in the database (Internal Users or Active Directory).

• The sponsor group to which the sponsor belongs is disabled.
Monitor Guest and Sponsor Activity

Cisco ISE provides various reports and logs that allow you to view endpoint and user management information and guest and sponsor activity. Some of the Cisco ISE 1.2 reports have been deprecated, but the information can be viewed in other reports.

You can run these reports either on demand or on a scheduled basis.

Procedure

Step 1
Choose Operations > Reports.

Step 2
Under the Report Selector, expand the Guest Access Reports and Endpoints and Users selections to view the various guest, sponsor, and endpoint related reports.

Step 3
Select the report and choose the data with which you want to search using the Filters drop-down list.
You can use filters on username, portal name, device name, endpoint identity group and other such data.

Step 4
Select the Time Range during which you want to view the data.

Step 5
Click Run.

Metrics Dashboard

Cisco ISE provides an at-a-glance view of Authenticated Guests and Active Endpoints in the network in a metrics dashboard that appears on the Cisco ISE Home page.

AUP Acceptance Status Report

The AUP Acceptance Status report displays the acceptance status of the Acceptable Use Policy (AUP) by guests from all the Guest portals. This report is available at: Operations > Reports > Guest Access Reports > AUP Acceptance Status.

You can use the report to track all the accepted and denied AUP connections for a given period of time.
Guest Accounting Report

The Guest Accounting report displays the guest login history for an indicated time period. This report is available at: Operations > Reports > Guest Access Reports > Guest Accounting.

Master Guest Report

The Master Guest report combines data from various reports into a single view enabling you to export data from different reporting sources. You can add more data columns and remove the ones you do not want to view or export. This report is available at Operations > Reports > Guest Access Reports > Master Guest. It now includes information that used to be in the deprecated Guest Activity Report.

This report collects all guest activity and provides details about the websites that guest users visit. You can use this report for security auditing purposes to see when guest users accessed the network and what they did on it. To view the guests’ Internet activity, such as the URLs of the websites that they visited, you must first:

- Enable the passed authentications logging category. Choose Administration > System > Logging > Logging Categories and select Passed authentications.
- Enable these options on the firewall used for guest traffic:
  - Inspect HTTP traffic and send data to Cisco ISE Monitoring node. Cisco ISE requires only the IP address and accessed URL for the Guest Activity report; so, limit the data to include just this information, if possible.
  - Send syslogs to Cisco ISE Monitoring node.

Sponsor Login and Audit Report

The Sponsor Login and Audit report is a combined report that tracks:

- Login activity by the sponsors at the Sponsor portal.
- Guest-related operations performed by the sponsors in the Sponsor portal.

This report is available at Operations > Reports > Guest Access Reports > Sponsor Login and Audit.

Audit Logging for Guest and Sponsor Portals

During specific actions within the Guest and Sponsor portals, audit log messages are sent to the underlying audit system. By default, these messages appear in the /opt/CSCOcpm/logs/localStore/iseLocalStore.log file.

You can configure these messages to be sent by syslog to the monitoring and troubleshooting system and log collector. The monitoring subsystem presents this information in the appropriate sponsor and device audit logs and guest activity logs.

Guest login flow is logged in the audit logs regardless of whether the guest login has passed or failed.
Guest Access Web Authentication Options

Cisco ISE supports several deployment options to enable secure guest access through Cisco ISE Guest and Web Authentication Services. You can provide wired or wireless guest connectivity using Local or Central Web Authentication and Device Registration Web Authentication.

- **Central Web Authentication (Central WebAuth)**—Applies to all Guest portals. Web authentication is done by a central Cisco ISE RADIUS server for both wired and wireless connection requests. Authentication of the guest device is done after an optional access code is entered by the guest at the Hotspot Guest portals and a username and password are entered by the guest at the Credentialed Guest portals.

- **Local Web Authentication (Local WebAuth)**—Applies to the Credentialed Guest portals. Serving of the web pages to the guest is done locally either on a network access device (NAD) such as a switch for a wired connection or by the wireless LAN controller (WLC) for a wireless connection. Authentication of the guest device is done after a username and password are entered by the guest at the Credentialed Guest portals.

- **Device Registration Web Authentication (Device Registration WebAuth)**—Applies only to the Hotspot Guest portal. Web authentication is done after the guest device is registered and authorized for use by Cisco ISE. Guests are directed to the Hotspot Guest portal where they can gain access to the network through either a wired or wireless connection (without entering a username or password).

NAD with Central WebAuth Process

In this scenario, the network access device (NAD) makes a new authorization request to the Cisco ISE RADIUS server from an unknown endpoint connection. The endpoint then receives a url-redirect to Cisco ISE.

**Note**

webauth-vrf-aware command is supported only in IOS XE 3.7E, IOS 15.2(4)E or later versions. Other switches do not support WebAuth URL redirect in virtual routing and forwarding (VRF) environment. In such cases, as a workaround, you can add a route in the global routing table to leak the traffic back into the VRF.

If the guest device is connected to a NAD, the guest service interaction takes the form of a MAC Authentication Bypass (MAB) request that leads to a Guest portal Central WebAuth login. The following is an outline of the subsequent Central Web Authentication (Central WebAuth) process, which applies to both wireless and wired network access devices.

1. The guest device connects to the NAD through a hard-wired connection. There is no 802.1X supplicant on the guest device.

2. An authentication policy with a service type for MAB allows a MAB failure to continue and return a restricted network profile containing a url-redirect for the Central WebAuth user interface.

3. The NAD is configured to authenticate MAB requests to the Cisco ISE RADIUS server.

4. The Cisco ISE RADIUS server processes the MAB request and does not find an endpoint for the guest device.

   This MAB failure resolves to the restricted network profile and returns the url-redirect value in the profile to the NAD in an access-accept. To support this function, ensure that an authorization policy
exists and features the appropriate wired or wireless MAB (under compound conditions) and, optionally, “Session:Posture Status=Unknown” conditions. The NAD uses this value to redirect all guest HTTPS traffic on the default port 8443 to the url-redirect value.

The standard URL value in this case is:

5. The guest device initiates an HTTP request to redirect URL via a web browser.
6. The NAD redirects the request to the url-redirect value returned from the initial access-accept.
7. The gateway URL value with action CWA redirects to the Guest portal login page.
8. The guest enters their login credentials and submits the login form.
9. The guest server authenticates the login credentials.
10. Depending on the type of flow, the following occurs:

   • If it is a non-posture flow (authentication without further validation), where the Guest portal is not configured to perform client provisioning, the guest server sends a CoA to the NAD. This CoA causes the NAD to reauthenticate the guest device using the Cisco ISE RADIUS server. A new access-accept is returned to the NAD with the configured network access. If client provisioning is not configured and the VLAN needs to be changed, the Guest portal performs VLAN IP renew. The guest does not have to re-enter login credentials. The username and password entered for the initial login are used automatically.

   • If it is a posture flow, where the Guest portal is configured to perform client provisioning, the guest device web browser displays the Client Provisioning page for posture agent installation and compliance. (You can also optionally configure the client provisioning resource policy to feature a “NetworkAccess:UseCase=GuestFlow” condition.)

Because there is no client provisioning or posture agent for Linux, the Guest portal redirects to the Client Provisioning portal, which in turn redirects back to a guest authentication servlet to perform optional IP release/renew and then CoA.

With redirection to the Client Provisioning portal, the Client Provisioning service downloads a non-persistent web agent to the guest device and performs a posture check of the device. (You can optionally configure the posture policy with a “NetworkAccess:UseCase=GuestFlow” condition.)

If the guest device is non-compliant, ensure that you have configured an authorization policy that features “NetworkAccess:UseCase=GuestFlow” and “Session:Posture Status=NonCompliant” conditions.

When the guest device is compliant, ensure that you have an authorization policy configured with the conditions “NetworkAccess:UseCase=GuestFlow” and “Session:Posture Status=Compliant.” From here, the Client Provisioning service issues a CoA to the NAD. This CoA causes the NAD to reauthenticate the guest using the Cisco ISE RADIUS server. A new access-accept is returned to the NAD with the configured network access.

---

**Note**

“NetworkAccess:UseCase=GuestFlow” can also apply for Active Directory (AD) and LDAP users who log in as guests.
Wireless LAN Controller with Local WebAuth Process

In this scenario, the guest logs in and is directed to the wireless LAN controller (WLC). The WLC then redirects the guest to a Guest portal, where they are prompted to enter their login credentials, accept an optional Acceptable Use Policy (AUP), and perform an optional password change. When this is complete, the guest device’s browser is redirected back to the WLC to provide login credentials via a POST.

The WLC can now log the guest in via the Cisco ISE RADIUS server. When this is complete, the WLC redirects the guest device's browser to the original URL destination. The Wireless LAN Controller (WLC) and the network access devices (NAD) requirements to support the original URL redirect for guest portals are WLC 5760 and Cisco Catalyst 3850, 3650, 2000, 3000, and 4000 Series Access Switches running releases IOS-XE 3.6.0.E and 15.2(2)E.

Figure 22: WLC with Local WebAuth Non-Posture Flow

Wired NAD with Local WebAuth Process

In this scenario, the Guest portal redirects the guest login request to the switch (wired NAD). The login request is in the form of an HTTPS URL posted to the switch and contains the login credentials. The switch receives the guest login request and authenticates the guest using the configured Cisco ISE RADIUS server.

1. Cisco ISE requires a login.html file with the HTML redirect to be uploaded to the NAD. This login.html file is returned to the browser of the guest device for any HTTPS request made.

2. The browser of the guest device is redirected to the Guest portal where the guest’s login credentials are entered.
3. After the Acceptable Use Policy (AUP) and change password are processed, both of which are optional, the Guest portal redirects the browser of the guest device to post the login credentials on the NAD.

4. The NAD makes a RADIUS request to the Cisco ISE RADIUS server to authenticate and authorize the guest.

**IP Address and Port Values Required for the Login.html Page**

The IP address and port values must be changed in the following HTML code for the login.html page to those values being used by the Cisco ISE Policy Services nodes. The default port is 8443, but you can change this value, so ensure that the value you assign to the switch matches the setting in Cisco ISE.

```html
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.0 Transitional//EN">
<html>
<head>
<title>ISE Guest Portal</title>
<meta Http-Equiv="Cache-Control" Content="no-cache">
<meta Http-Equiv="Pragma" Content="no-cache">
<meta Http-Equiv="Expires" Content="0">
<meta http-equiv="content-type" content="text/html; charset=ISO-8859-1">
<meta http-equiv="REFRESH" content="0;url=https://ip:port/portal/PortalSetup.action?switch_url=wired">

</head>
<body>
<center>
Redirecting ... Login
</center>
</body>
</html>
```

Because the custom login page is a public web form, consider these guidelines:

- The login form must accept user entries for the username and password and must show them as `uname` and `pwd`.

- The custom login page should follow best practices for a web form, such as page timeout, hidden password, and prevention of redundant submissions.

**HTTPS Server Enabled on the NAD**

To use web-based authentication, you must enable the HTTPS server within the switch using the `ip http secure-server` command.

**Support for Customized Authentication Proxy Web Pages on the NAD**

You can upload custom pages for success, expiry, and failure to the NAD. Cisco ISE does not require any specific customization, so you can create these pages using the standard configuration instructions included with the NAD.
Configure Web Authentication on the NAD

You need to complete the web authentication on the NAD by replacing the default HTML pages with your custom files.

Before you begin

During web-based authentication, create four substitute HTML pages to use instead of the switch default HTML pages.

Procedure

Step 1
To specify the use of your custom authentication proxy web pages, first store your custom HTML files on the switch flash memory. To copy your HTML files to the switch flash memory, run the following command on the switch:

copy tftp/ftp flash

Step 2
After copying your HTML files to the switch, perform the following commands in global configuration mode:

| a. | ip admission proxy http login page file device:login-filename | Specifies the location in the switch memory file system of the custom HTML file to use in place of the default login page. The device: is flash memory. |
| b. | ip admission proxy http success page file device:success-filename | Specifies the location of the custom HTML file to use in place of the default login success page. |
| c. | ip admission proxy http failure page file device:fail-filename | Specifies the location of the custom HTML file to use in place of the default login failure page. |
| d. | ip admission proxy http login expired page file device:expired-filename | Specifies the location of the custom HTML file to use in place of the default login expired page. |

Step 3
Configure the customized authentication proxy web pages following the guidelines provided by the switch.

Step 4
Verify the configuration of a custom authentication proxy web page, as shown in the following example:

Switch# show ip admission configuration
Authentication proxy webpage
Login page : flash:login.htm
Success page : flash:success.htm
Fail Page : flash:fail.htm
Login expired Page : flash:expired.htm

Authentication global cache time is 60 minutes
Authentication global absolute time is 0 minutes
Authentication global init state time is 2 minutes
Authentication Proxy Session ratelimit is 100
Authentication Proxy Watch-list is disabled
Device Registration WebAuth Process

Using Device Registration Web Authentication (Device Registration WebAuth) and the Hotspot Guest portal, you can allow guest devices to connect to a private network without requiring usernames and passwords.

In this scenario, the guest connects to the network with a wireless connection. See Figure 23: Wireless Device Registration Web Authentication Flow for an example of the Device Registration WebAuth process flow. The following is an outline of the subsequent Device Registration WebAuth process, which is similar for both wireless and wired connections:

1. The network access device (NAD) sends a redirect to the Hotspot Guest portal.

2. If the MAC address of the guest device is not in any endpoint identity group or is not marked with an Acceptable Use Policy (AUP) accepted attribute set to true, Cisco ISE responds with a URL redirection specified in an authorization profile.

3. The URL redirection presents the guest with an AUP page (if enabled) when the guest attempts to access any URL.
   - If the guest accepts the AUP, the endpoint associated with their device MAC address is assigned to the configured endpoint identity group. This endpoint is now marked with an AUP accepted attribute set to true, to track the guest acceptance of the AUP.
   - If the guest does not accept the AUP or if an error occurs, for instance, while creating or updating the endpoint, an error message displays.

4. Based on the Hotspot Guest portal configuration, a post-access banner page (if enabled) with additional information may appear.

5. After the endpoint is created or updated, a Change of Authorization (CoA) termination is sent to the NAD.

6. After the CoA, the NAD re-authenticates the guest connection with a new MAC Auth Bypass (MAB) request. The new authentication finds the endpoint with its associated endpoint identity group, and returns the configured access to the NAD.

7. Based on the Hotspot Guest portal configuration, the guest is directed to the URL to which they requested access, or to a custom URL specified by the administrator, or to an Authentication Success Page.

The CoA type for both wired and wireless is Termination CoA. You can configure the Hotspot Guest portal to perform VLAN DHCP Release (and renew), thereby re-authorizing the CoA type for both wired and wireless to Change of Auth.

VLAN DHCP Release support is available for Mac OS and Windows on desktop devices only. It is not available for mobile devices. If the device being registered is mobile and the VLAN DHCP Release option is enabled, the guest is requested to manually renew their IP address. For mobile device users, we recommend using Access Control Lists (ACLs) on the WLC, rather than using VLANs.
Figure 23: Wireless Device Registration Web Authentication Flow
Support Device Access

- Personal Devices on a Corporate Network (BYOD), on page 335
- Personal Device Portals, on page 336
- Support Device Registration Using Native Supplicants, on page 341
- Device Portals Configuration Tasks, on page 343
- Manage Personal Devices Added by Employees, on page 355
- Monitor My Devices Portals and Endpoints Activity, on page 356

Personal Devices on a Corporate Network (BYOD)

When supporting personal devices on a corporate network, you must protect network services and enterprise data by authenticating and authorizing users (employees, contractors, and guests) and their devices. Cisco ISE provides the tools you need to allow employees to securely use personal devices on a corporate network.

Guests can automatically register their devices when logging in to Guest portals. Guests can register additional devices up to the maximum limit that you define in their guest type. These devices are registered into endpoint identity groups based on the portal configuration.

Guests can add their personal devices to the network by running the native supplicant provisioning (Network Setup Assistant), or by adding their devices to the My Devices portal. You can create native supplicant profiles, which determine the proper native supplicant provisioning wizard to use, based on the operating system.

Because native supplicant profiles are not available for all devices, users can use the My Devices portal to add these devices manually; or you can configure BYOD rules to register these devices.

End-User Device Portals in a Distributed Environment

Cisco ISE end-user web portals depend on the Administration, Policy Services, and Monitoring personas to provide configuration, session support, and reporting.

- **Administration Node**—Configuration changes that you make to users, devices, and end-user portals are written to the Administration node.

- **Policy Services Node**—The end-user portals run on a Policy Services Node, which handles all session traffic, including: network access, client provisioning, guest services, posture, and profiling. If a Policy Service Node is part of a node group, and one node fails, the other nodes detect the failure and reset any pending sessions.
Monitoring Node—The Monitoring node collects, aggregates, and reports data about the end-user and device activity on the My Devices, Sponsor, and Guest portals. If the primary Monitoring node fails, the secondary Monitoring node automatically becomes the primary Monitoring node.

Global Settings for Device Portals

Choose Work Centers > BYOD > Settings > Employee Registered Devices or Administration > Device Portal Management > Settings.

You can configure the following general settings for the BYOD and My Devices portals:

• **Employee Registered Devices**—Enter the maximum number of devices that an employee can register in Restrict employees to. By default, this value is set to 5 devices.

• **Retry URL**—Enter a URL that can be used to redirect the device back to Cisco ISE in Retry URL for onboarding.

Once you configure these general settings, they apply to all BYOD and My Devices portals that you set up for your company.

Related Topics
- Limit the Number of Personal Devices Registered by Employees, on page 341
- Provide a URL to Reconnect with BYOD Registration, on page 342
- End-User Device Portals in a Distributed Environment, on page 335

Personal Device Portals

Cisco ISE provides several web-based portals to support employee-owned personal devices. These Device portals do not participate in the guest or sponsor portal flows.

Use these portals to:

• **Blacklist Portal**—Provide information about personal devices that are “blacklisted” and cannot be used to gain access to the network.

• **BYOD Portals**—Enable employees to register their personal devices using native supplicant provisioning functionality.

• **Client Provisioning Portals**—Force employees to download a posture agent on their devices that checks for compliance.

• **MDM Portals**—Enable employees to enroll their mobile devices with an external Mobile Device Management (MDM) system.

• **My Devices Portals**—Enable employees to add and register personal devices, including those that do not support native supplicant provisioning, and then manage them.

Cisco ISE provides you with the ability to host multiple device portals on the Cisco ISE server, including a predefined set of default portals. The default portal themes have standard Cisco branding that you can customize through the Admin portal. You can also choose to further customize a portal by uploading images, logos, and cascading style sheets (CSS) files that are specific to your organization.
Access Device Portals

Procedure

Step 1
To access any of the Device portals, you can either:

• Click Administration > Device Portal Management. The Configure and Customize Device Portals page displays the list of supported Device portals.

• Choose Administration > Device Portal Management. The supported Device portals display in the drop-down menu.

Step 2
Select the specific device portal that you want to configure.

Blacklist Portal

Employees do not access this portal directly, but are redirected to it.

If employees lose their personal device or it is stolen, they can update its status in the My Devices portal, which adds it to the Blacklist endpoint identity group. This prevents others from using the device to obtain unauthorized network access. If anyone attempts to connect to the network using one of these devices, they are redirected to the Blacklist portal which informs them that the device is denied access to the network. If the device is found, employees can reinstate it (in the My Devices portal) and regain network access without having to register the device again. Depending on whether the device was lost or stolen, additional provisioning may be required before the device can be connected to the network.

You can configure the port settings (default is port 8444) for the Blacklist portal. If you change the port number, make sure it is not being used by another end-user portal.

For information about configuring a Blacklist portal, see Edit the Blacklist Portal, on page 346.

Bring Your Own Device Portal

Employees do not access this portal directly.

Employees are redirected to the Bring Your Own Device (BYOD) portal when registering personal devices using native supplicants. The first time employees attempt to access the network using a personal device, they may be prompted to manually download and launch the Network Setup Assistant (NSA) wizard and be guided through registering and installing the native supplicant. After they have registered a device, they can use the My Devices portal to manage it.

Note
BYOD flow is not supported when a device is connected to a network using AnyConnect Network Access Manager (NAM).

Related Topics
Create a BYOD Portal, on page 348
Personal Devices on a Corporate Network (BYOD), on page 335
Client Provisioning Portal

Employees do not access this portal directly, but are redirected to it.

The Client Provisioning system provides posture assessments and remediations for devices that are attempting to gain access to your corporate network. When employees request network access using their devices, you can route them to a Client Provisioning portal and require them to first download the posture agent. The posture agent scans the device for compliance, such as verifying that virus protection software is installed on it and that its operating system is supported.

Related Topics
- Create a Client Provisioning Portal, on page 350

Mobile Device Management Portal

Employees do not access this portal directly, but are redirected to it.

Many companies use a Mobile Device Management (MDM) system to manage employees’ mobile devices. Cisco ISE allows integration with external MDM systems that employees can use to enroll their mobile device and gain access to your corporate network. Cisco provides an external MDM interface that employees can enroll in to register their devices and then connect to the network.

The MDM portal enables employees to enroll in an external MDM system.

Employees can then use the My Devices portal to manage their mobile devices, such as lock their devices with a pin code, reset their device to its default factory settings, or remove applications and settings that were installed when registering the device.

For information about configuring MDM servers to work with ISE, see Create an MDM Portal, on page 351.

My Devices Portal

Employees can access the My Devices portal directly.

Some network devices that need network access are not supported by native supplicant provisioning and cannot be registered using the BYOD portal. However, employees can add and register personal devices, whose operating systems are not supported or do not have web browsers (such as printers, Internet radios, and other devices), using the My Devices portal.

Employees can add and manage new devices by entering the MAC address for the device. When employees add devices using the My Devices portal, Cisco ISE adds the devices to the Endpoints page as members of the RegisteredDevices endpoint identity group (unless already statically assigned to a different endpoint identity group). The devices are profiled like any other endpoint in Cisco ISE and go through a registration process for network access.

When two MAC addresses from one device are entered into the My Devices Portal by a user, profiling determines that they have the same hostname, and they are merged together as a single entry in ISE. For example, a user registers a laptop with wired and wireless addresses. Any operations on that device, such as delete, acts on both addresses.

When a registered device is deleted from the portal, the Device Registration Status and BYOD Registration Status attributes change to NotRegistered and No, respectively. However, these attributes remain unchanged when a guest (who is not an employee) registers a device using the Guest Device Registration page in the credentialed Guest portals, because these are BYOD attributes used only during employee device registration.
Regardless of whether employees register their devices using the BYOD or the My Devices portals, they can use the My Devices portal to manage them.

**BYOD Deployment Options and Status Flow**

The BYOD deployment flows that support personal devices vary slightly based on these factors:

- **Single or dual SSID**—With single SSID, the same WLAN is used for certificate enrollment, provisioning, and network access. In a dual SSID deployment, there are two SSIDs: one provides enrollment and provisioning, and the other provides secure network access.

- **Windows, MacOS, iOS, or Android device**—The native supplicant flow starts similarly, regardless of the device type, by redirecting employees using a supported personal device to the BYOD portal to confirm their device information. The process diverges based on device type.

---

**Employee Connects to Network**

1. **Employee Credentials Are Authenticated**—Cisco ISE authenticates the employee against the corporate Active Directory or other corporate identity stores and provides an authorization policy.

2. **Device Is Redirected to the BYOD Portal**—The device is redirected to the BYOD portal. The device’s MAC address field is automatically preconfigured, and the user can add a device name and description.

3. **Native Supplicant Is Configured (MacOS, Windows, iOS, Android)**—The native supplicant is configured; but the process varies by device:

   - MacOS and Windows devices—Employee clicks **Register** in the BYOD portal to download and install the supplicant provisioning wizard (Network Setup Assistant), which configures the supplicant and provides the certificate (if necessary) used for EAP-TLS certificate-based authentication. The issued certificate is embedded with the device's MAC address and employee's username.

   **Note**

   Network Setup Assistant cannot be downloaded to a Windows device, unless the user of that device has administrative privileges. If you cannot grant end users administrative privileges, then use your GPO to push the certificate to the user's device, instead of using the BYOD flow.

   - iOS devices—The Cisco ISE policy server sends a new profile using Apple’s iOS over the air to the IOS device, which includes:
     - The issued certificate (if configured) is embedded with the IOS device's MAC address and employee's username.
     - A Wi-Fi supplicant profile that enforces the use of EAP-TLS for 802.1X authentication.

   - Android devices—Cisco ISE prompts and routes employee to download the Cisco Network Setup Assistant (NSA) from the Google Play store. After installing the app, the employee can open NSA and start the setup wizard, which generates the supplicant configuration and issued certificate used to configure the device.
4. **Change of Authorization Issued**—After the user goes through the on boarding flow, Cisco ISE initiates a Change of Authorization (CoA). This causes the MacOS X, Windows, and Android devices to reconnect to the secure 802.1X network. For single SSID, iOS devices also connect automatically, but for dual SSID, the wizard prompts iOS users to manually connect to the new network.

---

**Note**
You can configure a BYOD flow that does not use supplicants. See the Cisco ISE Community document https://supportforums.cisco.com/blog/12705471/ise-byod-registration-only-without-native-suppliant-or-certificate-provisioning.

---

**Note**
Check the **Enable if Target Network is Hidden** check box only when the actual Wi-Fi network is hidden. Otherwise, Wi-Fi network configuration may not be provisioned properly for certain iOS devices, especially in the single SSID flow (where the same Wi-Fi network/SSID is used for both onboarding and connectivity).

---

**BYOD Session Endpoint Attribute**
The state of the endpoint attribute `BYODRegistration` changes during the BYOD flow to the following states.

- **Unknown**—The device has not been through a BYOD flow.
- **Yes**—The device has been through BYOD flow, and is registered.
- **No**—The device has been through BYOD flow, but is not registered. This means that the device was deleted.

**Device Registration Status Endpoint Attribute**
The state of the endpoint attribute `DeviceRegistrationStatus` changes during device registration to the following states.

- **Registered**—The device has been through BYOD flow, and it is registered. There is a 20-minute delay before the attribute changes from pending to registered.
- **Pending**—The device has been through BYOD flow, and it is registered. But, ISE has not seen it on the network.
- **Not Registered**—The device has not been through BYOD flow. This is the default state of this attribute.
- **Stolen**—The user logs onto the **MyDevices** portal, and marks a currently onboarded device as Stolen. When this happens:
  - If the device was onboarded by provisioning a certificate and a profile, ISE revokes the certificate that was provisioned to the device, and assigns the device’s mac address to the **Blacklist** identity group. That device no longer has network access.
  - If the device was onboarded by provisioning a profile (no certificate), ISE assigns the device to the **Blacklist** endpoint identity group. The device will still have network access, unless you create an authorization policy for this situation. For example, `IF Endpoint Identity Group is Blacklist AND BYOD_is_Registered THEN DenyAccess`. 

---
An Administrator performs an action that disables network access for several devices, such as deleting or revoking a certificate.

If a user reinstates a stolen device, the status reverts to not registered. The user must delete that device, and add that it back. That starts the onboarding process.

• Lost—The user logs on to the MyDevices portal, and marks a currently onboarded device as Lost. That causes the following actions:
  • That device is assigned to Blacklist identity group.
  • Certificates provisioned to the device are not revoked.
  • The device status is updated to Lost.
  • “BYODRegistration” is updated to No.

A lost device still has network access unless you create an authorization policy to block lost devices. You can use the Blacklist identity group or the endpoint:BYODRegistration attribute in your rule. For example, IF Endpoint Identity Group is Blacklist AND EndPoints:BYODRegistrations Equals No THEN BYOD. For more granular access, you can also add NetworkAccess:EAPAuthenticationMethod Equals PEAP or EAP-TLS or EAP-FAST", InternalUser:IdentityGroup Equals "<<group>>" to the IF part of the rule.

**Limit the Number of Personal Devices Registered by Employees**

You can allow employees to register between 1 and 100 personal devices. Regardless of the portal that employees used to register their personal devices, this setting defines the maximum number of devices registered across all portals.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Administration &gt; Device Portal Management &gt; Settings &gt; Employee Registered Devices.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Enter the maximum number of devices that an employee can register in Restrict employees to. By default, this value is set to 5 devices.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click Save. If you do not want to save any updates you made to the settings, click Reset to revert to the last saved values.</td>
</tr>
</tbody>
</table>

**Support Device Registration Using Native Supplicants**

You can create native supplicant profiles to support personal devices on the Cisco ISE network. Based on the profile that you associate with a user’s authorization requirements, Cisco ISE provides the necessary supplicant provisioning wizard to set up the user’s personal device to access the network.

The first time employees attempt to access the network using a personal device, they are guided automatically through registration and supplicant configuration. After they have registered the device, they can use the My Devices portal to manage their devices.
Operating Systems Supported by Native Supplicants

Native supplicants are supported for these operating systems:

- Android (excluding Amazon Kindle, B&N Nook)
- Mac OS X (for Apple Mac computers)
- Apple iOS devices (Apple iPod, iPhone, and iPad)
- Microsoft Windows 7, 8 (excluding RT), Vista, and 10

Allow Employees to Register Personal Devices Using Credentialed Guest Portals

Employees using credentialed Guest portals can register their personal devices. The self-provisioning flow supplied by the BYOD portal enables employees to connect devices to the network directly using native supplicants, which are available for Windows, MacOS, iOS, and Android devices.

Before you begin

You must create the native supplicant profiles.

Procedure

Step 1 Choose Guest Access > Configure > Guest Portals.

Step 2 Choose the credentialed Guest portal that you want to allow employees to use to register their devices using native supplicants and click Edit.

Step 3 On the Portal Behavior and Flow Settings tab and in BYOD Settings, check Allow employees to use personal devices on the network.

Step 4 Click Save and then Close.

Provide a URL to Reconnect with BYOD Registration

You can provide information that enables employees, who encounter a problem while registering their personal devices using the BYOD portal to reconnect with the registration process.

Procedure

Step 1 Choose Administration > Device Portal Management > Settings > Retry URL.

Step 2 Change the IP address or enter a URL that can be used to redirect the device back to Cisco ISE in Retry URL for onboarding.

When the employee’s device encounters a problem during the registration process, it tries to reconnect to the Internet automatically. At this point, the IP address or domain name that you enter here redirects the device to Cisco ISE, which reinitiates the onboarding process. The default value is 1.1.1.1.
Step 3  Click **Save**. If you do not want to save any updates you made to the settings, click **Reset** to revert to the last saved values.

---

## Device Portals Configuration Tasks

You can use a default portal and its default settings such as certificates, endpoint identity group, identity source sequence, portal themes, images, and other details provided by Cisco ISE. If you do not want to use the default settings, you should create a new portal or edit an existing one to meet your needs. You can duplicate a portal if you want to create multiple portals with the same settings.

After creating a new portal or editing a default one, you must authorize the portal for use. Once you authorize a portal for use, any subsequent configuration changes you make are effective immediately.

You do not need to authorize the My Devices portal for use.

If you choose to delete a portal, you must first delete any authorization policy rules and authorization profiles associated with it or modify them to use another portal.

Use this table for the tasks related to configuring the different Device portals.

### Enable Policy Services

To support the Cisco ISE end-user web portals, you must enable portal-policy services on the node on which you want to host them.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Administration &gt; System &gt; Deployment.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click the node and click Edit.</td>
</tr>
<tr>
<td>Step 3</td>
<td>On the General Settings tab, check Policy Service.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Check the Enable Session Services option.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Click Save.</td>
</tr>
</tbody>
</table>

### Add Certificates

If you do not want to use the default certificates, you can add a valid certificate and assign it to a certificate group tag. The default certificate group tag used for all end-user web portals is Default Portal Certificate Group.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Chose Administration &gt; System &gt; Certificates &gt; System Certificates.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Add a system certificate and assign it to a certificate group tag that you want to use for the portal. This certificate group tag will be available to select during portal creation or editing.</td>
</tr>
</tbody>
</table>
Create External Identity Sources

Cisco ISE can connect with external identity sources such as Active Directory, LDAP, RADIUS Token, and RSA SecurID servers to obtain user information for authentication and authorization. External identity sources also include certificate authentication profiles that you need for certificate-based authentications.

Procedure

Step 1 Choose Administration > Identity Management > External Identity Sources.
Step 2 Choose one of these options:

- Certificate Authentication Profile for certificate-based authentications.
- Active Directory to connect to an Active Directory as an external identity source See Active Directory as an External Identity Source, on page 247 for more details.
- LDAP to add an LDAP identity source. See LDAP, on page 270 for more details.
- RADIUS Token to add a RADIUS Token server. See RADIUS Token Identity Sources, on page 278 for more details.
- RSA SecurID to add an RSA SecurID server. See RSA Identity Sources, on page 283 for more details.

Create Identity Source Sequences

Before you begin

Ensure that you have configured your external identity sources in Cisco ISE.

To perform the following task, you must be a Super Admin or System Admin.

For allowing guest users to authenticate through Local WebAuth, you must configure both the Guest Portal authentication source and the identity source sequence to contain the same identity stores.

Procedure

Step 1 Choose Administration > Identity Management > Identity Source Sequences > Add.
Step 2 Enter a name for the identity source sequence. You can also enter an optional description.
Step 3 Check the Select Certificate Authentication Profile check box and choose a certificate authentication profile for certificate-based authentication.
Step 4 Choose the database or databases that you want to include in the identity source sequence in the Selected List box.
Step 5 Rearrange the databases in the Selected list in the order in which you want Cisco ISE to search the databases.
Step 6 Choose one of the following options in the Advanced Search List area:

- **Do not access other stores in the sequence and set the AuthenticationStatus attribute to ProcessError** — If you want Cisco ISE to discontinue the search, if the user is not found in the first selected identity source.

- **Treat as if the user was not found and proceed to the next store in the sequence** — If you want Cisco ISE to continue searching the other selected identity sources in sequence, if the user is not found in the first selected identity source.

While processing a request, Cisco ISE searches these identity sources in sequence. Ensure that you have the identity sources in the Selected list box listed in the order in which you want Cisco ISE to search them.

Step 7 Click **Submit** to create the identity source sequence that you can then use in policies.

---

**Create Endpoint Identity Groups**

Cisco ISE groups endpoints that it discovers in to the corresponding endpoint identity groups. Cisco ISE comes with several system-defined endpoint identity groups. You can also create additional endpoint identity groups from the Endpoint Identity Groups page. You can edit or delete the endpoint identity groups that you have created. You can only edit the description of the system-defined endpoint identity groups; you cannot edit the name of these groups or delete them.

**Procedure**

Step 1 Choose **Administration > Identity Management > Groups > Endpoint Identity Groups**.

Step 2 Click **Add**.

Step 3 Enter the name for the endpoint identity group that you want to create (do not include spaces in the name of the endpoint identity group).

Step 4 Enter the description for the endpoint identity group that you want to create.

Step 5 Click the **Parent Group** drop-down list to choose an endpoint identity group to which you want to associate the newly created endpoint identity group.

Step 6 Click **Submit**.

---

**Edit the Blacklist Portal**

Cisco ISE provides a single Blacklist portal that displays information when a lost or stolen device that is blacklisted in Cisco ISE is attempting to access your corporate network.

You can only edit the default portal settings and customize the default message that displays for the portal. You cannot create a new Blacklist portal, or duplicate or delete the default portal.

**Before you begin**

Ensure that you have the required certificates configured for use with this portal.
Procedure

Step 1 Choose Administration > Device Portal Management > Blacklist Portal > Edit.

Step 2 Provide a unique Portal Name and a Description for the portal. Ensure that the portal name that you use here is not used for any other end-user portals.

Step 3 Use the Languages menu to export and import language files to use with the portal.

Step 4 Update the default values for certificate group tags, languages and so on in Portal Settings, and define behavior that applies to the overall portal.

• HTTPS port—Enter a port value between 8000 to 8999; the default value is 8443 for all the default portals, except the Blacklist Portal, which is 8444. If you upgraded with port values outside this range, they are honored until you modify this page. If you modify this page, update the port setting to comply with this restriction.

If you assign Ports used by a non-guest (such as My Devices) portal to a guest portal, an error message displays.

For posture assessments and remediation only, the Client Provisioning portal also uses Ports 8905 and 8909. Otherwise, it uses the same Ports assigned to the Guest portal.

Portals assigned to the same HTTPS port can use the same Gigabit Ethernet interface or another interface. If they use the same port and interface combination, they must use the same certificate group tag. For example:

• Valid combinations include, using the Sponsor portal as an example:
  • Sponsor portal: Port 8443, Interface 0, Certificate tag A and My Devices portal: Port 8443, Interface 0, Certificate group A.
  • Sponsor portal: Port 8443, Interface 0, Certificate group A and My Devices portal: Port 8445, Interface 0, Certificate group B.
  • Sponsor portal: Port 8444, Interface 1, Certificate group A and Blacklist portal: Port 8444, Interface 0, Certificate group B.

• Invalid combinations include:
  • Sponsor portal: Port 8443, Interface 0, Certificate group A and My Devices portal: 8443, Interface 0, Certificate group B.
  • Sponsor portal: Port 8444, Interface 0, Certificate tag A and Blacklist portal: Port 8444, Interface 0, Certificate group A.

• Allowed interfaces — Select the PSN interfaces which a PAN can use to run a portal. When a request to open a portal is made on the PAN, the PAN looks for an available allowed Port on the PSN. You must configure the Ethernet interfaces using IP addresses on different subnets.

These interfaces must be available on all the PSNs, including VM-based ones, that have Policy Services turned on. This is a requirement because any of these PSNs can be used for the redirect at the start of the guest session.

• The Ethernet interfaces must use IP addresses on different subnets.
• The interfaces you enable here must be available on all your PSNs, including VM-based ones when Policy Services turned on. This is required because any of these PSNs can be used for a redirect at the start of the guest session.

• The portal certificate Subject Name / Alternate Subject Name must resolve to the interface IP.

• Configure ip host x.x.x.x yyy.domain.com in ISE CLI to map secondary interface IP to FQDN, which is used to match Certificate Subject Name / Alternate Subject Name.

• Certificate group tag—Pick a certificate group tag that specifies the certificate to use for the portal’s HTTPS traffic.

• Display Language
  • Use browser locale—Use the language specified in the client browser's locale setting as the display language of the portal. If browser locale’s language is not supported by ISE, then the Fallback Language is used as the language portal.
  
  • Fallback language—Choose the language to use when language cannot be obtained from the browser locale, or if the browser locale language is not supported by ISE.
  
  • Always use—Choose the display language to use for the portal. This setting overrides the User browser locale option.

SSIDs available to sponsors—Enter the names or the SSIDs (Session Service Identifiers) of the networks that a sponsor can notify guests as the correct networks to connect to for their visit.

Step 5  On the Portal Page Customization tab, customize the page title and message text that appears in the portal when an unauthorized device is attempting to gain access to the network.

Step 6  Click Save and then Close.

Create a BYOD Portal

You can provide a Bring Your Own Device (BYOD) portal to enable employees to register their personal devices, so that registration and supplicant configuration can be done before allowing access to the network.

You can create a new BYOD portal, or you can edit or duplicate an existing one. You can delete any BYOD portal, including the default portal provided by Cisco ISE.

Any changes that you make to the Page Settings on the Portal Behavior and Flow Settings tab are reflected in the graphical flow in the device portal flow diagram. If you enable a page, such as the Support Information page, it appears in the flow and the employee will experience it in the portal. If you disable it, it is removed from the flow.

Before you begin

Ensure that you have the required certificates and endpoint identity groups configured for use with this portal.
**Procedure**

**Step 1** Choose **Administration > Device Portal Management > BYOD Portals > Create, Edit or Duplicate.**

**Step 2** Provide a unique **Portal Name** and a **Description** for the portal.
Ensure that the portal name that you use here is not used for any other end-user portals.

**Step 3** Use the **Language File** drop-down menu to export and import language files to use with the portal.

**Step 4** Update the default values for ports, certificate group tags, endpoint identity groups and so on in **Portal Settings**, and define behavior that applies to the overall portal.

**Step 5** Update the **Support Information Page Settings** to help employees provide information that the Help Desk can use to troubleshoot network access issues.

**Step 6** On the **Portal Page Customization** tab, customize the **Content Area** message text that appears on the following pages during the provisioning process:

- **BYOD Welcome page**:
  - Device Configuration Required—When the device is redirected to the BYOD portal for the first time and requires certificate provisioning.
  - Certificate Needs Renewal—When the previous certificate needs to be renewed.

- **BYOD Device Information page**:
  - Maximum Devices Reached—When the maximum limit of devices that an employee can register is reached.
  - Required Device Information—When requesting device information that is required to enable an employee to register the device.

- **BYOD Installation page**:
  - Desktop Installation—When providing installation information for a desktop device.
  - iOS Installation—When providing installation instructions for an iOS mobile device.
  - Android Installation—When providing installation instructions for an Android mobile device

- **BYOD Success page**:
  - Success—When the device is configured and automatically connected to the network.
  - Success: Manual Instructions—When the device is successfully configured and an employee must manually connect to the network.
  - Success: Unsupported Device—When an unsupported device is allowed to connect to the network.

**Step 7** Click **Save** and then **Close**.

**What to do next**
You must authorize the portal in order to use it. You can also customize your portal either before or after you authorize it for use.
Create a Client Provisioning Portal

You can provide a Client Provisioning portal to enable employees to download either the Cisco AnyConnect posture component or the Cisco NAC agent, which verifies the posture compliance of the device before allowing access to the network.

You can create a new Client Provisioning portal, or you can edit or duplicate an existing one. You can delete any Client Provisioning portal, including the default portal provided by Cisco ISE.

Any changes that you make to the Page Settings on the Portal Behavior and Flow Settings tab are reflected in the graphical flow in the device portal flow diagram. If you enable a page, such as the Support Information page, it appears in the flow and the employee will experience it in the portal. If you disable it, it is removed from the flow.

**Before you begin**

Ensure that you have the required certificates and client provisioning policies configured for use with this portal.

**Procedure**

**Step 1** Choose Administration > Device Portal Management > Client Provisioning Portals > Create, Edit or Duplicate.

**Step 2** Provide a unique Portal Name and a Description for the portal. Ensure that the portal name that you use here is not used for any other end-user portals.

**Step 3** Use the Language File drop-down menu to export and import language files to use with the portal.

**Step 4** Update the default values for ports, certificate group tags, endpoint identity groups and so on in Portal Settings, and define behavior that applies to the overall portal.

**Step 5** Update the Support Information Page Settings to help employees provide information that the Help Desk can use to troubleshoot network access issues.

**Step 6** On the Portal Page Customization tab, customize the Content Area message text that appears in the Client Provisioning portal during the provisioning process:

a) On the Client Provisioning page:

  • Checking, Scanning and Compliant—When the posture agent is successfully installed and checks, scans and verifies that the device is compliant with posture requirements.
  
  • Non-compliant—When the posture agent determines that the device is not compliant with posture requirements.

b) On the Client Provisioning (Agent Not Found) page:

  • Agent Not Found—When the posture agent is not detected on the device.
  
  • Manual Installation Instructions—When devices do not have Java or Active X software installed on them, instructions on how to manually download and install the posture agent.
  
  • Install, No Java/ActiveX—When devices do not have Java or Active X software installed on them, instructions on how to download and install the Java plug-in.
• Agent Installed—When the posture agent is detected on the device, instructions on how to start the posture agent, which checks the device for compliance with posture requirements.

Step 7  
Click Save and then Close.

What to do next
You must authorize the portal in order to use it. You can also customize your portal either before or after you authorize it for use.

  Customize Device Portals, on page 355

Create an MDM Portal

You can provide a Mobile Device Management (MDM) portal to enable employees to manage their mobile devices that are registered for use on your corporate network.

You can create a new MDM portal, or you can edit or duplicate an existing one. You can delete any MDM portal, including the default portal provided by Cisco ISE. The default portal is for third-party MDM providers.

Any changes that you make to the Page Settings on the Portal Behavior and Flow Settings tab are reflected in the graphical flow in the device portal flow diagram. If you enable a page, such as the Support Information page, it appears in the flow and the employee will experience it in the portal. If you disable it, it is removed from the flow.

Before you begin
Ensure that you have the required certificates and endpoint identity groups configured for use with this portal.

Procedure

Step 1  
Choose Administration > Device Portal Management > MDM Portals > Create, Edit or Duplicate.

Step 2  
Provide a unique Portal Name and a Description for the portal.

Step 3  
Use the Language File drop-down menu to export and import language files to use with the portal.

Step 4  
Update the default values for ports, certificate group tags, endpoint identity groups and so on in Portal Settings, and define behavior that applies to the overall portal.

Step 5  
Update the following settings that apply to each of the specific pages:

  • In Employee Mobile Device Management Settings, access the link provided to configure third-party MDM providers and then define the acceptance policy behavior for employees using the MDM portals.

  • Support Information Page Settings to help guests provide information that the Help Desk can use to troubleshoot network access issues.

Step 6  
On the Portal Page Customization tab, customize the Content Area messages that appears in the MDM portal during the device enrollment process:
• Unreachable—When the selected MDM system cannot be reached.

• Non-compliant—When the device being enrolled is not compliant with the requirements of the MDM system.

• Continue—When the device should try connecting to the network in case of connectivity issues.

• Enroll—When the device requires the MDM agent and needs to be enrolled in the MDM system.

Step 7 Click Save and then Close.

What to do next
You must authorize the portal in order to use it. You can also customize your portal either before or after you authorize it for use. Also see the following topics:

• Add Certificates, on page 344
• Create Endpoint Identity Groups, on page 346
• Create Authorization Profiles, on page 353
• Customize Device Portals, on page 355

Create a My Devices Portal

You can provide a My Devices portal to enable employees to add and register their personal devices that do not support native supplicants and cannot be added using the Bring Your Own Device (BYOD) portal. You can then use the My Devices portal to manage all devices that have been added using either portal.

You can create a new My Devices portal, or you can edit or duplicate an existing one. You can delete any My Devices portal, including the default portal provided by Cisco ISE.

Any changes that you make to the Page Settings on the Portal Behavior and Flow Settings tab are reflected in the graphical flow in the device portal flow diagram. If you enable a page, such as the Support Information page, it appears in the flow and the employee will experience it in the portal. If you disable it, it is removed from the flow.

Before you begin
Ensure that you have the required certificates, external identity stores, identity source sequences, and endpoint identity groups configured for use with this portal.

Procedure

Step 1 Choose Administration > Device Portal Management > My Devices Portals > Create, Edit or Duplicate.

Step 2 Provide a unique Portal Name and a Description for the portal.

Ensure that the portal name that you use here is not used for any other end-user portals.

Step 3 Use the Language File drop-down menu to export and import language files to use with the portal.
**Step 4**  
Update the default values for ports, certificate group tags, identity source sequences, endpoint identity groups, and so on in Portal Settings, and define behavior that applies to the overall portal.

**Step 5**  
Update the following settings that apply to each of the specific pages:
- **Login Page Settings**—Specify employee credential and login guidelines.
- **Acceptable Use Policy (AUP) Page Settings**—Add a separate AUP page and define the acceptable use policy behavior for employees.
- **Post-Login Banner Page Settings**—Notify employees of additional information after they log into the portal.
- **Employee Change Password Settings**—Allow employees to change their own passwords. This option is enabled only if the employee is part of the Internal Users database.

**Step 6**  
In the Portal Page Customization tab, customize the following information that appears in the My Devices portal during registration and management:
- Titles, instructions, content, field and button labels
- Error messages and notification messages

**Step 7**  
Click Save and then Close.

---

**What to do next**
You can customize the portal if you want to change its appearance. See

**Related Topics**
- Customize Device Portals, on page 355
- My Devices Portal, on page 338
- Display Devices Added by an Employee, on page 355

---

**Create Authorization Profiles**

When you authorize a portal, you are setting up the network authorization profiles and rules for network access.

**Before you begin**

You must create a portal before you can authorize it.

**Procedure**

**Step 1**  
Set up a special authorization profile for the portal.

**Step 2**  
Create an authorization policy rule for the profile.

---

**Create Authorization Profiles**

Each portal requires that you set up a special authorization profile for it.
Before you begin

If you do not plan to use a default portal, you must first create the portal so you can associate the portal name with the authorization profile.

Procedure

**Step 1** Choose Policy > Policy Elements > Results > Authorization > Authorization Profiles.

**Step 2** Create an authorization profile using the name of the portal that you want to authorize for use.

What to do next

You should create a portal authorization policy rule that uses the newly created authorization profile.

Create Authorization Policy Rules

To configure the redirection URL for a portal to use when responding to the users' (guests, sponsors, employees) access requests, define an authorization policy rule for that portal.

The url-redirect takes the following form based on the portal type, where:

- \( ip:port \) = the IP address and port number
- \( PortalID \) = the unique portal name

For a Hotspot Guest portal:

https://ip:port/guestportal/gateway?sessionID=SessionIdValue&portal=PortalID&action=cwa&type=drw

For a Mobile Device Management (MDM) portal:

https://ip:port/mdmportal/gateway?sessionID=SessionIdValue&portal=PortalID&action=mdm

Procedure

**Step 1** Choose Policy > Authorization to create a new authorization policy rule under Standard policies.

If you enabled Policy Sets, choose Policy > Policy Set, pick the Policy Set you plan to use for this portal, expand Authorization Policy, and add a new rule.

**Step 2** For Conditions, select an endpoint identity group that you want to use for the portal validation. For example, for the Hotspot Guest portal, select the default **GuestEndpoints** endpoint identity group and, for the MDM portal, select the default **RegisteredDevices** endpoint identity group.

**Note** Because the Hotspot Guest portal only issues a Termination CoA, do not use Network Access:UseCase EQUIALS Guest Flow as one of the validation conditions in the Guest authorization policy. Instead, match the Identity Group that the endpoint belongs to for validation. For example,

- If "GuestEndpoint" + Wireless MAB then Permit Access
- If Wireless MAB then HotSpot Redirect
Step 3  For Permissions, select the portal authorization profile that you created.

Customize Device Portals

You can customize the portal appearance and user (guests, sponsors, or employees as applicable) experience by customizing the portal themes, changing UI elements on the portal pages, and editing error messages and notifications that display to the users. For more information about customizing portals, see Customization of End-User Web Portals, on page 359.

Manage Personal Devices Added by Employees

When employees register a device using the Bring Your Own Device (BYOD) or the My Devices portals, it displays in the Endpoints list. Although employees can disassociate a device from their account by deleting it, the device remains in the Cisco ISE database. As a result, employees might need your assistance in resolving errors they encounter when working with their devices.

Display Devices Added by an Employee

You can locate devices added by a specific employee using the Portal User field displayed on the Endpoints listing page. This might be useful if you need to delete devices registered by a specific user. By default, this field does not display, so you must enable it first before searching.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Administration &gt; Identity Management &gt; Identities &gt; Endpoints.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click the Settings icon and choose Columns.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Select Portal User to display this information in the Endpoints listing.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click the Show drop-down list and choose Quick Filter.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Enter the user’s name in the Portal User field to display only the endpoints that are assigned to that particular user.</td>
</tr>
</tbody>
</table>

Errors When Adding Devices to My Devices Portal

Employees cannot add a device that was already added by another employee, and that device is still in the endpoints database.

If employees attempt to add a device that already exists in the Cisco ISE database:

- And it supports native supplicant provisioning, we recommend adding the device through the BYOD portal. This overwrites any registration details that were created when it was initially added to the network.
- If the device is a MAC Authentication Bypass (MAB) device, such as a printer, then first resolve ownership of the device. If appropriate, you can remove the device from the endpoints database using the Admin portal, so that the new owner can successfully add the device using the My Devices portal.
Devices Deleted from My Devices Portal Remain in Endpoints Database

When an employee deletes a device from the My Devices portal, the device is removed from the employee’s list of registered devices, but the device remains in the Cisco ISE endpoints database and displays in the Endpoints list.

To permanently delete the device from the Endpoints page, choose Administration > Identity Management > Identities > Endpoints.

Limit the Number of Personal Devices Registered by Employees

You can allow employees to register between 1 and 100 personal devices. Regardless of the portal that employees used to register their personal devices, this setting defines the maximum number of devices registered across all portals.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Administration &gt; Device Portal Management &gt; Settings &gt; Employee Registered Devices.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Enter the maximum number of devices that an employee can register in Restrict employees to. By default, this value is set to 5 devices.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click Save. If you do not want to save any updates you made to the settings, click Reset to revert to the last saved values.</td>
</tr>
</tbody>
</table>

Monitor My Devices Portals and Endpoints Activity

Cisco ISE provides various reports and logs that allow you to view endpoint and user management information and guest and sponsor activity. Some of the Cisco ISE 1.2 reports have been deprecated, but the information can be viewed in other reports.

You can run these reports either on demand or on a scheduled basis.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Operations &gt; Reports.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Under the Report Selector, expand the Guest Access Reports and Endpoints and Users selections to view the various guest, sponsor, and endpoint related reports.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Select the report and choose the data with which you want to search using the Filters drop-down list. You can use filters on username, portal name, device name, endpoint identity group and other such data.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Select the Time Range during which you want to view the data.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Click Run.</td>
</tr>
</tbody>
</table>
My Devices Login and Audit Report

The My Devices Login and Audit report is a combined report that tracks:

- Login activity by employees at the My Devices portal.
- Device-related operations performed by the employees in the My Devices portal.

This report is available at: Operations > Reports > Guest Access Reports > My Devices Login and Audit.

Registered Endpoints Report

The Registered Endpoints report provides information about all the endpoints that are registered by employees. This report is available at: Operations > Reports > Endpoints and Users > Registered Endpoints. You can run a query on the following: identity, endpoint ID, identity profile, and the like, and you can generate a report. For information on supplicant provisioning statistics and related data, see Viewing Client Provisioning Reports.

You can query the endpoint database for endpoints that are assigned to the RegisteredDevices endpoint identity group. You can also generate reports for specific users that have the Portal User attribute set to a non-null value.

The Registered Endpoints Report provides information about a list of endpoints that are registered through device registration portals by a specific user for a selected period of time.
End-User Portals

Cisco ISE provides web-based portals for three primary sets of end users:

- Guests who need to temporarily access your enterprise network using the Guest portals (Hotspot and credentialed Guest portals)
- Employees who are designated as sponsors who can create and manage guest accounts using the Sponsor portal.
- Employees who are using their personal devices on the enterprise network using the various non-guest portals such as the Bring Your Own Device (BYOD), Mobile Device Management (MDM), and My Devices portals.

Customization of End-User Web Portals

Cisco provides several default portals, and lets you edit, duplicate, and create extra portals. You can also fully customize the portal appearance and, therefore, the portal experience. You can customize each individual portal without affecting other portals.

You can customize various aspects of the portal interface that apply to the entire portal or to specific pages of the portal, such as:

- Themes, images, colors, banners, and footers
- Languages used for displaying portal text, error messages, and notifications
- Titles, content, instructions, and field and button labels
• Notifications sent to guests via email, SMS, and printer (applies only to the Self-Registered Guest and Sponsor portals)
• Error and informational messages displayed to users
• Custom fields to gather guest information specific to your needs (applies only to the Self-Registered Guest and Sponsor portals)
Customization Methods

There are several different ways to customize the end-user portals pages, which require different levels of knowledge.

- Basic—All modifications are done on the portal Customization page, where you can:
- Upload banners and logos.
- Change some colors (except for buttons).
- Change the text on the screens, and the language used on the entire portal.

- Intermediate
  - Use the mini-editor to add HTML and Javascript.
  - Use the jQuery mobile theme roller to change the color of all page elements.

- Advanced
  - Manually modify properties and CSS files.

After you customize your portal, you can create multiple portals (of the same type) by duplicating it. For example, if you customized your Hotspot Guest portal for one business entity, you can duplicate it and make minor changes to create custom Hotspot Guest portals for other business entities.

Tips for Customizing Portals with the Mini Editors

- Long words in a mini-editor box may scroll off the screen area of the portal. To prevent this, use the HTML paragraph attribute style="word-wrap: break-word". For example:
  
  ```html
  <p style="word-wrap:break-word">
  thisisaverylonglineoftextthatwillexceedthewidthoftheplaceyouwanttoputitsousethisstructure
  </p>
  ```

- When you use HTML or javascript to customize portal pages, make sure that you use valid syntax. The tags and code that you enter into a mini-editor is not validated by ISE. Invalid syntax may cause problems during the portal flow.

Portal Content Types

Cisco ISE provides a default set of portal themes that you can use “as is” or customize by using the existing CSS files as models to create new custom files. However, you can alter the appearance of the portals without using customized CSS files.

For instance, if you want to use unique corporate logos and banner images, you can simply upload and use these new image files. You can customize the default color scheme by changing the color of the different elements and areas of the portals. You can even choose the language in which you want to view the custom changes as you make them.

When you design images to replace the logos and banner, make the images as close to the following pixel size as you can:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Banner</td>
<td>1724 X 133</td>
</tr>
<tr>
<td>Desktop Logo</td>
<td>86 X 45</td>
</tr>
<tr>
<td>Mobile Logo</td>
<td>80 X 35</td>
</tr>
</tbody>
</table>
Note that ISE resizes the images to fit the portal, but images that are too small may not look right after resizing.

To perform advanced customization, such as changing the page layout or adding video clips or advertisements to your portal pages, you can use your own custom CSS files.

These types of changes within a specific portal are applied globally to all the pages of that portal. Changes to the page layout can be applied either globally or to just one specific page in the portal.

**Portal Page Titles, Content, and Labels**

You can customize the titles, text boxes, instructions, field and button labels, and other visual elements that the guest views on the end-user web portal pages. While you are customizing the page, you can even edit the page settings dynamically.

These changes are applied only to the specific page that you are customizing.

---

### Basic Customization of Portals

Select a predefined theme that best suits your needs, and use most of its default settings. You can then do some basic customization, such as:

- Modify the Portal Theme Colors, on page 363
- Change the Portal Icons, Images, and Logos, on page 365
- Update the Portal Banner and Footer Elements, on page 365
- Change the Portal Display Language, on page 364
- Change the Titles, Instructions, Buttons, and Label Text, on page 366
- Format and Style Text Box Content, on page 366

Tip: You can View Your Customization, on page 370 as you make the updates.

---

### Modify the Portal Theme Colors

You can customize the default color scheme in the default portal themes and change the color of the different elements and areas of the portals. These changes apply to the entire portal that you are customizing.

If you plan to change the portal colors, be aware of the following:

- You cannot use this option to change the color scheme in any of the custom portal themes that you may have imported for use with this portal. You must edit the custom theme CSS file to change its color settings.

- After changing the colors in a portal theme, if you select another portal theme from the Portal Theme drop-down menu, the changes are lost in the original portal theme and it reverts to its default colors.

- If you tweak the colors of a portal theme with an already modified color scheme and then reset its colors before saving it, the color scheme reverts to its default colors and any previous modifications are lost.
**Procedure**

**Step 1** Navigate to these portals:
- For Guest portals, choose Guest Access > Guest Portals > Edit > Portal Page Customization.
- For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization.
- For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization.

**Step 2** Select one of the default themes from the Portal Theme drop-down list.

**Step 3** Click Tweaks to override some of the color settings in the selected default portal theme.
- a) Change the color settings for the banner and page backgrounds, text, and labels.
- b) If you want to revert to the theme’s default color scheme, click Reset Colors.
- c) Click OK if you want to view the color changes in Preview.

**Step 4** Click Save.

---

**Change the Portal Display Language**

You can choose the language in which you want to view the custom changes as you make them. This change applies to the entire portal that you are customizing.

**Procedure**

**Step 1** Navigate to these portals:
- For Guest portals, choose Guest Access > Configure > Guest Portals > Edit > Portal Page Customization > Global Customization.
- For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization > Global Customization.
- For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization > Global Customization.

**Step 2** From the View In drop-down list, choose the language in which you want to view the text while customizing the page.

The drop-down list includes all languages in the language file associated with the specific portal.

---

**What to do next**

Make sure that you update any changes made in the selected language while customizing the portal page into all the supported language properties files.
Change the Portal Icons, Images, and Logos

If you want to use unique corporate logos, icons, and banner images, you can simply replace the existing images by uploading your custom images. Supported image formats include .gif, .jpg, .jpeg, and .png. These changes apply to the entire portal that you are customizing.

Before you begin

To include images in the footer of the portal, for instance in an advertisement, you should be able to access an external server that has these images.

Procedure

Step 1
Navigate to these portals:
  • For Guest portals, choose **Guest Access > Configure > Guest Portals > Edit > Portal Page Customization**.
  • For Sponsor portals, choose **Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization**.
  • For Device portals, choose **Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization**.

Step 2
Under **Images**, click any of the logos, icons, and image buttons and upload your custom images.

Step 3
Click **Save**.

Update the Portal Banner and Footer Elements

You can customize the information that appears in the banner and footer sections of every page in the portal. These changes apply to the entire portal that you are customizing.

Procedure

Step 1
Navigate to these portals:
  • For Guest portals, choose **Guest Access > Configure > Guest Portals > Edit > Portal Page Customization**.
  • For Sponsor portals, choose **Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization**.
  • For Device portals, choose **Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization**.

Step 2
Change the **Banner title** that appears on every portal page.

Step 3
Include these links for the guests who use your portals:
  • **Help**—Online help (provided for only the Sponsor and My Devices portals).
  • **Contact**—Technical support (set up the Support Information page to enable this).

Step 4
Add a disclaimer or a copyright notice in the **Footer Elements** to appear on the bottom of every portal page.
Step 5  Click Save.

Change the Titles, Instructions, Buttons, and Label Text

You can update all the text that is displayed in the portal. Each UI element on the page that you are customizing has a minimum and maximum range for the number of characters that you can enter. When available in some of the text blocks, you can use a mini-editor to apply visual styling to the text. These changes apply only to the specific portal page you are customizing. These page elements are different for email, SMS, and print notifications.

Procedure

Step 1  Navigate to these portals:

- For Guest portals, choose Guest Access > Configure > Guest Portals > Edit > Portal Page Customization.
- For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization.
- For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization.

Step 2  Under Pages, choose the page that you want to change.

Step 3  Under Page Customizations, update any of the displayed UI elements. All pages contain Browser Page Title, Content Title, Instructional Text, Content, and two Optional Content text blocks. The fields in the Content area are specific to each page.

Format and Style Text Box Content

Use the mini-editor that is available in the Instructional Text, Optional Content 1, and Optional Content 2 text boxes to do basic formatting of the text. These changes apply only to the specific portal pages that you are customizing.

Use the Toggle Full Screen button to increase and decrease the size of the text boxes as you work in them.

Procedure

Step 1  Navigate to these portals:

- For Guest portals, choose Guest Access > Configure > Guest Portals > Edit > Portal Page Customization.
- For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization.
- For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization.

Step 2  Under Pages, choose the page that you want to change.
Step 3 Under Page Customizations, in the Instructional Text and Optional Content text blocks, you can:

- Change the font, size, and color of the text.
- Style the text as bold, italics, or underlined.
- Create bulleted and numbered lists.

You can also use the Toggle HTML Source button to view the HTML tags that were applied to the text that you formatted using the mini-editor.

Variables for Portal Pages Customization

The navigation paths for these portal page text boxes are:

- For Guest portals, choose Guest Access > Configure > Guest Portals > Edit > Portal Page Customization > Pages.
- For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization > Pages.
- For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization > Pages.

Use these variables when creating templates for portal content and guest notifications to enable consistency in the information presented to the portal users (guests, sponsors, and employees). Substitute text with the variable names listed here for each of the portals in the Instructional Text, Optional Content 1, and Optional Content 2 text boxes.

View Your Customization

You can view how your customization will display to the portal users (guests, sponsors, or employees).

Procedure

• Click Portal test URL to view your changes.

Note

The test portal does not support Radius sessions, so you won't see the entire portal flow for all portals. BYOD and Client Provisioning are examples of portals that depend on Radius sessions.

• Click Preview to dynamically view how your changes appear on various devices:
  • Mobile devices—View your changes under Preview.
  • Desktop devices—Click Preview and then Desktop Preview. A new tab opens, and all the changes that you make are displayed on this tab.

If the changes are not displayed, click Refresh Preview. The portal displayed is only meant for viewing your changes; you cannot click buttons or enter data.

Advanced Customization of Portals

If you do not want to use one of the default portal themes provided by Cisco ISE, you can customize the portal to suit your needs. To do so, you should have experience working with CSS and Javascript files and the jQuery Mobile ThemeRoller application.

You are not allowed to alter the default portal themes, but you can:

• Export a Portal’s Default Theme CSS File, on page 375, and use it as a base for creating a custom portal theme.

• Create a Custom Portal Theme CSS File, on page 376, by editing the default portal theme and saving it as a new file.

• Import the Custom Portal Theme CSS File, on page 386, and apply it to the portal.

Based on the extent of your expertise and requirements, you can perform various types of advanced customization, such as use predefined variables to enable consistency in displayed information, add advertisements to your portal pages, use HTML, CSS and Javascript code to customize your content, and modify the portal page layout.
Configure Portal Customization

Cisco ISE offers you the ability to customize the content that displays on your end-user portals using HTML and Javascript code in the text boxes on the different pages listed under Portal Page Customization.

Procedure

**Step 1** Choose Administration > System > Admin Access > Settings > Portal Customization.

**Step 2** Verify that Enable portal customization with HTML is checked by default. This setting enables you to include HTML tags in the Instructional Text, Optional Content 1 and Optional Content 2 text boxes.

**Step 3** Check Enable portal customization with HTML and Javascript if you want to do advanced JavaScript customization by including <script> tags in the Instructional Text, Optional Content 1 and Optional Content 2 text boxes.

What to do next

You can then access the various portals and enter HTML and Javascript code in the text boxes based on the option you enabled here.

Portal Theme and Structure CSS Files

If you have experience with working with CSS files, you can customize the default portal theme CSS files to alter the portal presentation and manipulate elements such as the page layout, colors, and fonts. Customizing the CSS files provides you with flexibility and control in specifying the presentation characteristics, it enables you to share formatting across multiple pages, and it reduces the complexity and repetition in the structural content.

Cisco ISE end-user portals use two distinct types of CSS files: structure.css and theme.css. Every portal theme has its own theme.css file, but there is only one structure.css file per portal type; for example guest.structure.css for Guest portals, sponsor.structure.css for Sponsor Portals, and mydevices.structure.css for My Devices portals.

The structure.css provides the styling for the page layout and structure. It defines the positioning of elements on each page and also includes jQuery Mobile structure styles. You can only view the structure.css file, but you cannot edit it. However, when you change the page layout within theme.css files, import these files into the portal, and apply them, the most recent changes take priority over the structure.css styles.

The theme.css files specify styles such as fonts, button colors, and header background. You can export the theme.css files, change the theme settings, and import them to use as custom themes for your portal. Any page layout style changes made to the theme.css files take priority over the styles that are defined in the structure.css file.

You cannot alter any of the Cisco provided default portal theme.css files. However, you can edit the settings in the files and save them to a new custom theme.css file. You can make further edits to the custom theme.css file, but when you import it back into Cisco ISE, remember to use the same theme name you originally used for it. You cannot use two different theme names for the same theme.css file.

For example, you can use a default green theme.css file to create a new custom blue theme.css file and name it as Blue. You can then edit the blue theme.css file, but when you import it again, you must reuse the same Blue theme name. You cannot call it Red, since Cisco ISE checks for the relationship between a filename and...
its name and the uniqueness of the theme’s name. You can however edit the blue theme.css file, save it as red theme.css, import the new file, and name it as Red.

About Changing Theme Colors with jQuery Mobile

The color scheme of Cisco's end-user portals is compatible with jQuery ThemeRoller. You can easily edit the colors for an entire portal using the ThemeRoller web site.

ThemeRoller color “swatches” each contain a unique color scheme, which defines the colors, textures, and font settings for the primary UI elements, such as toolbars, content blocks, buttons, list items, and font text-shadow. A color scheme also defines the settings for various interaction states of the buttons: normal, hover, and pressed.

Cisco uses three swatches:

- Swatch A—The default swatch.
- Swatch B—Defines emphasized elements, such as an Accept button.
- Swatch C—Defines critical elements such as alerts, error messages, invalid input fields, and delete buttons.

You cannot apply additional swatches, unless you add HTML code (to the Optional Content, for example) with elements that use the newly added swatches.

To edit the default Cisco-provided CSS files or create new files based on the CSS classes and structures defined in the default themes, use the required version of jQuery Mobile ThemeRoller (Release 1.3.2).

For additional information on swatches and themes in jQuery Mobile ThemeRoller, see "Theming Overview" in Creating a Custom Theme with ThemeRoller. Use the online help in jQuery Mobile ThemeRoller to learn how to download, import, and share your custom themes.

For tutorials on how to use HTML, CSS, and Javascript code to customize the text and content that appears on your portal pages, visit Code Academy.

Example of a Theme That Shows Cisco Swatches

To demonstrate how swatches are used, the default theme for the Guest Portal was edited in ThemeRoller to show the differences in color.
The following screen shows a guest portal logon error (swatch C) along with a button that takes an action from the user (swatch B), and the rest of the screen is Swatch A.

Change Theme Colors with jQuery Mobile

Before you begin

Make sure you are using version 1.3.2 of jQuery Mobile ThemeRoller. The version you are using is displayed in the top-left corner of the screen, as shown below.
Procedure

Step 1  Export an existing theme from the portal you wish to change by clicking the **Configuration** tab on the portal, then **Advanced Customization > Export/Import Themes**.

Step 2  In the Custom Theming dialog, export the theme you want to update.

Step 3  Open that theme in a text editor, select all, and copy.

Step 4  Paste that text (CSS) into the jQuery web site's Import Theme box.

Step 5  Make your changes in the jQuery Mobil web-based application.

Step 6  Export the updated theme from the jQuery website (the export format is ZIP).

Step 7  Unzip the updated theme, and extract the updated theme in themes folder to your PC. The name of the theme is the one you provided on the jQuery website.

Step 8  Import the extracted CSS theme file into your portal in the portal configuration page's Custom Theming dialog.

You can switch back and forth between the old theme and the new theme by clicking the Portal Theme drop-down on the portal configuration page.

---

**Location Based Customization**

When guest accounts are created, you can associate them with a location and specify a Service Set Identifier (SSID) attribute. Both the location and SSID are available as CSS classes that you can use to apply different CSS styles to portal pages, based on the guest's location and SSID.

---

**Note**

This information applies only to the credentialed Guest portals after the guests log in.

For example:
• Guest location—When guests with accounts that have San Jose or Boston as their locations log into a credentialed Guest portal, one of these classes is available on every portal page: guest-location-san-jose or guest-location-boston.

• Guest SSID—For an SSID named Coffee Shop Wireless, the following CSS class is available on every portal page: guest-ssid-coffee-shop-wireless. This SSID is the one you specified on the guest account and not the SSID that the guests connected to when they logged in.

You can also specify locations when you add devices such as switches and Wireless LAN Controllers (WLCs) to a network. This location is also available as a CSS class that you can use to apply different CSS styles to portal pages depending on the network device's location.

For example, if a WLC is assigned to Seattle and guests are redirected to Cisco ISE from the Seattle-WLC, the following CSS class is available on every portal page: device-location-my-locations-usa-seattle.

User Device Type Based Customization

Cisco ISE detects the type of client device (guest, sponsor, or employee) to access your company’s network or end-user web portals (Guest, Sponsor, and Device). It is detected either as a mobile device (Android, iOS, and so on) or a desktop device (Windows, MacOS, and so on). The device type is available as a CSS class that you can use to apply different CSS styles to portal pages based on the user’s device type.

When a user logs in to any of the Cisco ISE end-user web portals, the following class is available on their portal pages: cisco-ise-mobile or cisco-ise-desktop.

Export a Portal’s Default Theme CSS File

You can download a default portal theme provided by Cisco and customize it to suit your needs. You can use it as a base for performing advanced customization.

Procedure

Step 1  Navigate to these portals:
       • For Guest portals, choose Guest Access > Configure > Guest Portals > Edit > Portal Page Customization > Pages.
       • For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization > Pages.
       • For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization > Pages.

Step 2  From the Advanced Customization drop-down list, choose Export/Import Themes.

Step 3  In the Custom Theming dialog box, use the drop-down list to select the theme that you want to customize.

Step 4  Click Export Theme CSS to download a default theme.css file to customize.
Create a Custom Portal Theme CSS File

You can create a custom portal theme by customizing an existing default portal theme and saving the changes in a new portal theme.css file. You can modify the default theme settings and the swatches to make global changes to the selected portal.

**Before you begin**

- Download to your desktop the theme.css file from the portal that you want to customize.
- This task requires experience working with HTML, CSS, and Javascript code.
- Use Release 1.3.2 of jQuery Mobile ThemeRoller.

**Procedure**

**Step 1** Import the downloaded portal theme.css file contents into the jQuery Mobile ThemeRoller tool.

**Tip** You can View Your Customization, on page 387 as you make your changes.

**Step 2** (Optional) Embed Links in Portal Content, on page 376

**Step 3** (Optional) Insert Variables for Dynamic Text Updates, on page 377

**Step 4** (Optional) Use Source Code to Format Text and Include Links, on page 378

**Step 5** (Optional) Add an Image as an Advertisement, on page 379

**Step 6** (Optional) Customize Greetings Based on Guest Location, on page 382

**Step 7** (Optional) Customize Greetings Based on User Device Type, on page 383

**Step 8** (Optional) Set Up Carousel Advertising, on page 380

**Step 9** (Optional) Modify the Portal Page Layout, on page 384

**Step 10** Save the customized file as a new theme.css file.

**Note** You cannot save the edits to the default CSS theme files. You can only create new custom files with any edits you have made.

**Step 11** When your new theme.css file is ready, you can import it into Cisco ISE.

**Embed Links in Portal Content**

You can add links to enable guests to access various websites from the portal pages. These changes apply only to the specific portal page that you are customizing.

Use the ‘Toggle Full Screen’ button to increase and decrease the size of the text boxes as you work in them.
Procedure

Step 1 Navigate to these portals:

- For Guest portals, choose Guest Access > Configure > Guest Portals > Edit > Portal Page Customization.
- For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization.
- For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization.

Step 2 Under Pages, choose the page you want to update.

Step 3 Under Page Customizations, use the mini-editor provided with the Optional Content text blocks to add links to portal pages.

Step 4 Click the Create Link button.

A Link Properties dialog box displays.

Step 5 Enter the URL and the text you want to hyperlink in the Description window for the URL.

For the link to work correctly, include the protocol identifier in the URL. For example, use http://www.cisco.com instead of www.cisco.com.

Step 6 Click Set and then Save.

You can use the Toggle HTML Source button to view the HTML tags that were applied to the text that you formatted using the mini-editor.

Insert Variables for Dynamic Text Updates

You can also create templates for text displayed on the portal by substituting predefined variables ($variable$) that dynamically update the content. This enables consistency in the text and information that you display to guests. These changes apply only to the specific portal pages that you are customizing.

Use the Toggle Full Screen button to increase and decrease the size of the text boxes as you work in them.

Procedure

Step 1 Navigate to these portals:

- For Guest portals, choose Guest Access > Configure > Guest Portals > Edit > Portal Page Customization.
- For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization.
- For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization.

Step 2 Under Pages, choose the page you want to update.

Step 3 Under Page Customizations, use the mini-editor provided with the Instructional Text, Optional Content 1, and Optional Content 2 text boxes to create text templates for the portal pages.
For example, you can create a single welcome message template for multiple guests, but personalize the message that displays to the guests after they successfully log in and connect to the network.

**Step 4** Enter the information in the text boxes as you normally would.

For example, you could enter a welcome message for your portal:

```
Welcome to our company’s Guest portal,
```

**Step 5** At the point where you want to substitute a variable for the text, click the **Insert Variable** button. A list of variables appears in the pop-up menu.

**Step 6** Select the variable that you want to substitute in your text.

In this example, choose **First name** to display each guest’s first name in the welcome message. The variable `$ui_first_name$` is inserted at your cursor position:

```
Welcome to our company’s Guest portal, $ui_first_name$.
```

This is the welcome message that would appear on the portal welcome page for guests whose first name is John: **Welcome to our company’s Guest portal, John.**

**Step 7** Continue to use the list of variables as needed until you have completed entering the information in the text boxes.

**Step 8** Click **Save**.

You can use the **Toggle HTML Source** button to view the HTML tags that were applied to the text that you formatted using the mini-editor.

---

### Use Source Code to Format Text and Include Links

Besides using the mini-editor’s formatting and link icons with plain text, you can also use HTML, CSS, and Javascript code to customize text that displays on the portal pages. These changes apply only to the specific portal pages that you are customizing.

Use the **Toggle Full Screen** button to increase and decrease the size of the text boxes as you work in them.

#### Before you begin

Ensure that **Enable portal customization with HTML** is enabled by default in **Administration > System > Admin Access > Settings > Portal Customization**.

#### Procedure

**Step 1** Navigate to these portals:

- For Guest portals, choose **Guest Access > Configure > Guest Portals > Edit > Portal Page Customization**.
- For Sponsor portals, choose **Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization**.
- For Device portals, choose **Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization**.
Step 2 Under Pages, choose the page that you want to update.

Step 3 Under Page Customizations, use the mini-editor provided with the Instructional Text, Optional Content 1, and Optional Content 2 text boxes to enter and view source code.

Step 4 Click the Toggle HTML Source button.

Step 5 Enter your source code.

For example, to underline your text, enter:

```html
<p style="text-decoration:underline;">Welcome to Cisco!</p>
```

For example, to include a link using HTML code, enter:

```html
<a href="http://www.cisco.com">Cisco</a>
```

Important When inserting an external URL in the HTML code, make sure that you enter the absolute (entire) URL path, including “http” or “https”.

Step 6 Click Save.

Related Topics

Configure Portal Customization, on page 371

Add an Image as an Advertisement

You can include images and advertisements to appear in specific areas of the portal pages.

Use the Toggle Full Screen button to increase and decrease the size of the text boxes as you work in them.

Before you begin

Ensure that Enable portal customization with HTML is enabled in Administration > System > Admin Access > Settings > Portal Customization.

Procedure

Step 1 Navigate to these portals:

- For Guest portals, choose Guest Access > Configure > Guest Portals > Edit > Portal Page Customization.
- For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization.
- For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization.

Step 2 Under Pages, choose the page that you want to update.

Step 3 Under Page Customizations, use the mini-editor provided with the Instructional Text, Optional Content 1, and Optional Content 2 text boxes to enter and view source code.

Step 4 Click the Toggle HTML Source button.

Step 5 Enter your source code.

For example, to include a product advertisement and its image using HTML code on the Hotspot Guest portal post-access banner, enter this code in the Optional Content 1 text box on the Post-Access Banner page:
Set Up Carousel Advertising

Carousel advertising is an advertisement format in which several product images or text descriptions are displayed and rotate in a repeating loop within a banner. Use carousel advertising on your guest portals to promote several related products or a variety of different products offered by your company.

Use the **Toggle Full Screen** button to increase and decrease the size of the text boxes as you work in them.

**Before you begin**

Choose Administration > System > Admin Access > Settings > Portal Customization and check Enable portal customization with HTML and Javascript.

**Procedure**

**Step 1** Navigate to these portals:

- For Guest portals, choose Guest Access > Configure > Guest Portals > Edit > Portal Page Customization.
- For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization.
- For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization.
Step 2  Under Pages, choose the page that you want to update.

Step 3  Under Page Customizations, use the mini-editor provided with the Instructional Text, Optional Content 1, and Optional Content 2 text boxes to enter and view source code.

Step 4  Click the Toggle HTML Source button.

Step 5  Enter your source code.

For example, to implement carousel advertising using product images on the Guest portals, enter the following HTML and Javascript code in the Optional Content 1 textbox on the Post-Access Banner (for Hotspot portals) or Post Login Banner (for credentialed Guest portals) pages:

```html
<script>
var currentIndex = 0;
setInterval(changeBanner, 5000);

function changeBanner()
{
"<img src='http://www.cisco.com/c/en/us/products/routers/index/_jcr_content/content_parsys/overview/layout-overview/gd12v2/gd12v2-left/n21v1_cq_1/n21v1DrawerContainer.img.jpg/1376556883237.jpg' width='100%'/>
];
var div = document.getElementById("image-ads");
if(div){
    currentIndex = (currentIndex<2) ? (currentIndex+1) : 0;
    div.innerHTML = bannersArray[currentIndex];
}
</script>

<style>
.grey{
    color: black;
    background-color: lightgrey;
}
</style>

<div class="grey" id="image-ads">
</div>

For example, to implement carousel advertising using text product descriptions on the Guest portals, enter the following HTML and Javascript code in the Optional Content 2 textbox on the Post-Access Banner (for Hotspot portals) or Post Login Banner (for credentialed Guest portals) pages:

```html
<script>
var currentIndex = 0;
setInterval(changeBanner, 2000);

function changeBanner()
{
var bannersArray = ["Optimize branch services on a single platform while delivering an optimal application experience across branch and WAN infrastructure", "Transform your Network Edge to deliver high-performance, highly secure, and reliable services to unite campus, data center,

"],["Optimize 2", "Transform 2", "Optimize 3", "Transform 3"];
var div = document.getElementById("image-ads");
if(div){
    currentIndex = (currentIndex<2) ? (currentIndex+1) : 0;
    div.innerHTML = bannersArray[currentIndex];
}
</script>

<style>
.grey{
    color: black;
    background-color: lightgrey;
}
</style>

<div class="grey" id="image-ads">
</div>
```
and branch networks", "Differentiate your service portfolio and increase revenues by delivering end-to-end scalable solutions and subscriber-aware services");

var colorsArray = ["grey", "blue", "green"]; var div = document.getElementById("text-ads"); if(div){
currentIndex = (currentIndex<2) ? (currentIndex+1) : 0;
div.innerHTML = bannersArray[currentIndex];
div.className = colorsArray[currentIndex];
}
</script>
<style>
.grey{
color: black;
background-color: lightgrey;
}
.blue{
color: black;
background-color: lightblue;
}
.green{
color: black;
background-color: lightgreen;
}
</style>
<div class="grey" id="text-ads">
Optimize branch services on a single platform while delivering an optimal application experience across branch and WAN infrastructure
</div>

Note  When inserting an external URL in the HTML code, you must enter the absolute (entire) URL path, including “http” or “https”.

---

**Customize Greetings Based on Guest Location**

This example shows how to customize the successful login message that your guests see after they log into a credentialed Guest portal (not Hotspot), based on the locations configured in their guest type.

Use the **Toggle Full Screen** button to increase and decrease the size of the text boxes as you work in them.

**Procedure**

**Step 1**  Navigate to one of these portals:

- For Guest portals, choose **Guest Access > Configure > Guest Portals > Edit > Portal Page Customization.**
- For Sponsor portals, choose **Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization.**

**Step 2**  Under **Pages**, choose the **Authentication Success** page.
Step 3  Under Page Customizations, use the mini-editor provided with the Optional Content 1 text box to enter and view HTML source code.

Step 4  Click the Toggle HTML Source button.

Step 5  Enter your source code.

For example, to include a location-based greeting, enter this code in the Optional Content 1:

```html
<style>
  .custom-greeting {
    display: none;
  }
  .guest-location-san-jose .custom-san-jose-greeting {
    display: block;
  }
  .guest-location-boston .custom-boston-greeting {
    display: block;
  }
</style>
<div class="custom-greeting custom-san-jose-greeting">
  Welcome to The Golden State!
</div>
<div class="custom-greeting custom-boston-greeting">
  Welcome to The Bay State!
</div>

Guests will see a different message after successful logon, depending on their specific location.

---

**Customize Greetings Based on User Device Type**

You can customize the greetings that you send to your users (guest, sponsor, or employee) after they log into any of the Cisco ISE end-user web portals (Guest, Sponsor and Device), based on their client device type (mobile or desktop).

Use the Toggle Full Screen button to increase and decrease the size of the text boxes as you work in them.

**Procedure**

**Step 1**  Navigate to these portals:

- For Guest portals, choose Guest Access > Configure > Guest Portals > Edit > Portal Page Customization.
- For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization.
- For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization.

**Step 2**  Under Pages, choose the page that you want to update.

**Step 3**  Under Page Customizations, use the mini-editor provided with the Optional Content 1 text box to enter and view HTML source code.

**Step 4**  Click the Toggle HTML Source button.

**Step 5**  Enter your source code.

For example, to include a device type-based greeting on the AUP page, enter this code in the Optional Content 1 text box on the AUP page:
Modify the Portal Page Layout

You can manipulate the overall layout of the pages; for example, you can add a sidebar to an AUP page that provides additional information or links to information.

Procedure

Step 1

Add the following CSS code to the bottom of the custom theme.css file that you create and plan to apply to your portal. This changes the AUP page layout so that the Optional Content 1 text box appears as:

- A side bar in the desktop device mode
- A sidebar in the mobile device mode

```css
#page-aup .cisco-ise-optional-content-1 { margin-bottom: 5px; }
@media all and ( min-width: 60em ) { #page-aup .cisco-ise-optional-content-1 { float: left; margin-right: 5px; width: 150px; }
#page-aup .cisco-ise-main-content { float: left; width: 800px; }
#page-aup .cisco-ise-main-content h1, #page-aup .cisco-ise-main-content p { margin-right: auto; margin-left: -200px; }
```
You can then add links using HTML code in the **Optional Content 1** text box for the AUP page for that portal.

**Step 2** Navigate to these portals:

- For Guest portals, choose **Guest Access > Configure > Guest Portals > Edit > Portal Page Customization**.
- For Sponsor portals, choose **Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization**.
- For Device portals, choose **Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization**.

**Step 3** Under **Pages**, choose the page for which you want to include a side bar.

**Step 4** Under **Page Customizations**, use the mini-editor provided with the **Optional Content 1** text box to enter and view source code.

**Step 5** Click the **Toggle HTML Source** button.

**Step 6** Enter your source code.

For example, to include a side bar for the AUP page, enter this code in the **Optional Content 1** text box on the AUP page:

```html
<ul data-role="listview">
  <li>Rent a Car</li>
  <li>Top 10 Hotels</li>
  <li>Free Massage</li>
  <li>Zumba Classes</li>
</ul>
```

*Figure 26: View of a Side Bar on a Sample AUP Page (on a Desktop Device)*
Import the Custom Portal Theme CSS File

You can upload any custom theme.css file that you have created and apply it to any of your end-user portals. These changes apply to the entire portal that you are customizing.

Any time you edit a custom theme.css file and import it back into Cisco ISE, remember to use the same theme name you originally used for it. You cannot use two different theme names for the same theme.css file.

Procedure

Step 1  Navigate to these portals:

- For Guest portals, choose **Guest Access > Guest Portals > Edit > Portal Page Customization**.
- For Sponsor portals, choose **Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization**.

Step 7  Click Save.

What to do next

You can customize other pages by entering different text or HTML code in the Optional Content text boxes.
• For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization.

Step 2  From the Advanced Customization drop-down list, choose Export/Import Themes.
Step 3  In the Custom Theming dialog box, click Browse to find your new theme.css file.
Step 4  Enter a Theme Name for the new file.
Step 5  Click Save.

What to do next
You can apply this custom portal theme to the portal that you want to customize.
1. Choose the updated theme from the Portal Themes drop-down list to apply to the entire portal.
2. Click Save.

Delete a Custom Portal Theme
You can delete any custom portal theme that you have imported into Cisco ISE, unless it is being used by one of your portals. You cannot delete any of the default themes provided by Cisco ISE.

Before you begin
The portal theme that you want to delete should not be used by any of the portals.

Procedure

Step 1  Navigate to these portals:
• For Guest portals, choose Guest Access > Configure > Guest Portals > Edit > Portal Page Customization.
• For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization.
• For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization.

Step 2  From the Advanced Customization drop-down list, choose Delete Themes.
Step 3  Select the portal theme that you want to delete from the Theme Name drop-down list.
Step 4  Click Delete and then Save.

View Your Customization
You can view how your customization will display to the portal users (guests, sponsors, or employees).
Procedure

- Click **Portal test URL** to view your changes.

**Note**

The test portal does not support Radius sessions, so you won’t see the entire portal flow for all portals. BYOD and Client Provisioning are examples of portals that depend on Radius sessions.

- Click **Preview** to dynamically view how your changes appear on various devices:
  - Mobile devices—View your changes under **Preview**.
  - Desktop devices—Click **Preview** and then **Desktop Preview**. A new tab opens, and all the changes that you make are displayed on this tab.

If the changes are not displayed, click **Refresh Preview**. The portal displayed is only meant for viewing your changes; you cannot click buttons or enter data.

**Portal Language Customization**

The Guest, Sponsor, My Devices, and Client Provisioning portals are localized into all supported languages and locales. This includes text, labels, messages, field names, and button labels. If the client browser requests a locale that is not mapped to a template in Cisco ISE, the portals display content using the English template.

Using the Admin portal, you can modify the fields used for the Guest, Sponsor, and My Devices portals for each language individually, and you can add more languages. Currently, you cannot customize these fields for the Client Provisioning portal.

By default, each type of portal supports 15 languages. You select which language a portal uses, and optionally update page content for that language, on the Portal Page Customization page. Note, if you change fonts and content on the page for one language, those changes to not carry over into the other languages. The changes you make on the Portal Page Customization screen are included when you export the Language File.

The supported languages are:

- Chinese Simplified
- Chinese Traditional
- Czech
- Dutch
- English
- French
- German
- Hungarian
- Italian
- Japanese
- Korean
NAC and MAC agent installers and WebAgent pages are not localized.

To Edit the Language Used by a Portal

1. Open the portal you want to edit.
2. On the Portal Page Customization tab, and near the top of the page, select the language you want to edit in the view in drop-down.
3. Change content, headings, and fonts as desired.
4. Save that portal configuration, and repeat this flow for the next languages you want to update.

To Edit the Language File

Each Portal Page Customization page also provides a Language File. The Language File is a ZIP of attribute files that you can use to customize headings and text that are part of the portal flow, but is not available to customize on the Portal Page Customization page.

The Language File also contains the mapping to the particular browser locale setting (for example, for French: fr, fr-fr, fr-ca) along with all of the string settings for the entire portal in that language. If you change the browser locale setting for one language, the change is applied to all the other end-user web portals. For example, if you change the French.properties browser locale from fr,fr-fr,fr-ca to fr,fr-fr in the Hotspot Guest portal, the change is applied to the My Devices portal also.

You can export the zipped language file and make updates to it, including adding new languages or deleting existing ones you do not need.

For instructions about how to update the Language File, see:

- Export the Language File, on page 389
- Add or Delete Languages from the Language File, on page 390
- Import the Updated Language File, on page 391

Export the Language File

You can export the language file available for each portal type to edit and customize the existing values specified in it, and add or delete a language.

Note

Only some of the dictionary keys in the language properties files support HTML in their values (text).
Procedure

Step 1 Navigate to these portals:
• For Guest portals, choose **Guest Access > Configure > Edit**
• For Sponsor portals, choose **Guest Access > Configure > Sponsor Portals > Edit**
• For Device portals, choose **Administration > Device Portal Management > (any Portals) > Edit**

Step 2 Click **Language File** and choose **Export** from the drop-down list.

Step 3 Save the zipped language file to your desktop, for example: Hotspot.zip, Self-Registered.zip, and so on.

Add or Delete Languages from the Language File

If a language you want to use for your portal type is missing from the language file, you can create a new language properties file and add it to the zipped language file. If there are languages you do not need, you can delete their language properties files.

**Before you begin**

Export the zipped language file available with each portal type in order to add or delete language properties files.

**Procedure**

Step 1 Use any editor that displays UTF-8 (such as Notepad++) to open the predefined language file for the portal type to which you want to add or delete languages.

If you want to add or delete languages for more than one portal type, use all the appropriate portal properties files.

Step 2 To add a new language, save an existing language properties file as the new language properties file using the same naming convention of the other files in the zipped language file. For example, to create a new Japanese language properties file, save the file as Japanese.properties (LanguageName.properties).

Step 3 Associate the new language with its browser locale by specifying the browser local value in the first line of the new language properties file. For example, LocaleKeys= ja,ja-jp (LocaleKeys= browser locale value) should be the first line in the Japanese.properties file.

Step 4 Update all the values (text) of the dictionary keys in the new language properties file.

You cannot change the dictionary keys; just their values.

**Note** Only some of the dictionary keys support HTML in their values (text).

**What to do next**

1. Zip all the properties files (new and existing) and create a new zipped language file. Do not include any folders or directories.
When using a Mac, extracting the ZIP file produces a DS store. When you compress the language file after editing, do not include the DS store in the ZIP. To learn methods of extracting the DS store, see https://superuser.com/questions/198569/compressing-folders-on-a-mac-without-the-ds-store.

2. Use a new name or its original name for the zipped language file.
3. Import the zipped language file into the specific portal you exported it from.

**Import the Updated Language File**

You can import an edited language file that you have customized by adding or deleting language properties files or by updating text in existing properties files.

**Procedure**

**Step 1** Navigate to these portals:
- For Guest portals, choose Guest Access > Configure > Guest Portals > Edit.
- For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit.
- For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit.

**Step 2** Click Language File and choose Import from the drop-down list.

**Step 3** Browse to find the new zipped language file on your desktop.

**Step 4** Import it back for the portal type from where you exported it.

**What to do next**

To display the changed text or the new language you added, select the specific language from the View In drop-down list.

**Customization of Guest Notifications, Approvals, and Error Messages**

Within in each portal, you can customize how guests receive notifications via email, SMS text messages, and print. Use these notifications to email, text, or print the login credentials:

- When guests use the Self-Registration Guest portal and successfully register themselves.
- When sponsors create guest accounts and want to provide the details to guests. When you create sponsor groups, you can determine whether to authorize sponsors to use SMS notifications. They can always use email and print notifications, if these facilities are available.
You can also customize email notifications to sponsors requesting that they approve a self-registering guest trying to gain access to the network. Additionally, you can customize the default error messages that display to guests and sponsors.

**Customize Email Notifications**

You can customize the information that is sent via email to guests.

**Before you begin**

- Configure the SMTP server to enable email notifications. Choose **Administration > System > Settings > SMTP Server**.
- Configure support for email notifications to guests. Choose **Guest Access > Settings > Guest Email Settings**. Check **Enable email notifications to guests**.
- Ensure that **Enable portal customization with HTML** is enabled by default in **Administration > System > Admin Access > Settings > Portal Customization**.

**Procedure**

| Step 1 | For Self-Registered Sponsor portals, choose **Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization > Notify Guests > Email Notification**. |
|        | **Step 2** | You can change the default **Logo (Email)** that was specified under **Global Page Customizations**. |
|        | **Step 3** | Specify the **Subject** and **Email body**. Use predefined variables to specify the guest account information to be included in the email message. Use the mini-editor and HTML tags to customize the text. |
|        | **Step 4** | Under **Settings**, you can: |
|        |        | - **Send username and password separately** in different emails. If you select this option, two separate tabs appear in **Page Customizations** for customizing the **Username Email** and **Password Email** notifications. |
|        |        | - **Send Test Email** to your email address to preview your customization on all devices to ensure that the information appears as it should. |
|        | **Step 5** | Click **Save** and then **Close**. |

**Customize SMS Text Message Notifications**

You can customize the information that is sent via SMS text messages to guests.

**Before you begin**

- Configure the SMTP server, which is used to send emails to the SMS gateway to deliver the SMS text message. Choose **Administration > System > Settings > SMTP Server**.
- Configure the sponsor groups to support the SMS text notification.
• Set up an account with a third-party SMS gateway. Choose Administration > Systems > Settings > SMS Gateway. Cisco ISE sends the text messages as email messages to the gateway, which forwards the messages via the SMS provider to the specified user.

• Ensure that Enable portal customization with HTML is enabled by default in Administration > System > Admin Access > Settings > Portal Customization.

Procedure

Step 1 For Self-Registered Guest or Sponsor portals, choose Guest Access > Configure > Guest or Sponsor Portals > Edit > Portal Page Customization > SMS Receipt or SMS Notification.

Step 2 Use the mini-editor and HTML tags to customize the Message Text. Use predefined variables to specify the guest account information to be included in the SMS text message.

Step 3 Under Settings, you can:

• Send username and password separately in different text messages. If you select this option, two separate tabs appear in Page Customizations for customizing the Username Message and Password Message notifications.

• Send Test Message to a cell phone to preview your customization to ensure that the information appears as it should. The supported phone number formats include: +1 ### ####, ###-####-####, (###) ### ####, #######, 1######### and so on.

Step 4 Click Save and then Close.

Customize Print Notifications

You can customize the information that is printed for guests.

Note

Within each portal, the print notification logo is inherited from the email notification logo setting.

Before you begin

Ensure that Enable portal customization with HTML is enabled by default in Administration > System > Admin Access > Settings > Portal Customization.

Procedure

Step 1 For Self-Registered Guest and Sponsor portals, choose Guest Access > Configure > Guest or Sponsor Portals > Edit > Portal Page Customization > Print Receipt or Print Notification.

Step 2 Specify the Print Introduction Text. Use predefined variables to specify the guest account information to be included in the email message. Use the mini-editor and HTML tags to customize the text.

Step 3 Preview your customization in the thumbnail or click Print Preview. You cannot view any HTML customization in the thumbnail.
If you select the Print Preview option, a window appears from which you can print the account details to ensure that the information appears as it should.

**Step 4**
Click Save and then Close.

---

**Customize Approval Request Email Notifications**

You can require sponsors to approve self-registering guests before their accounts are created and before they can obtain their login credentials. You can customize the information that is sent via email to sponsors requesting their approval. This notification only displays if you have specified that self-registering guests using the Self-Registered Guest portals require approval before they are granted network access.

**Before you begin**
- Configure the SMTP server to enable email notifications. Choose Administration > Systems > Settings > SMTP Server.
- Configure support for email notifications to guests. Choose Guest Access > Settings > Guest Email Settings. Check Enable email notifications to guests.
- If you want a Sponsor to approve self-registered account requests, check Require self-registered guests to be approved under Self-Registration Page Settings on the Portal Behavior and Flow Settings tab. That enables the Approval Request Email tab under Notifications in Portal Page Customization, where you can customize the email that goes to the Sponsor.

**Procedure**

**Step 1**
Choose Guest Access > Self-Registered Guest Portals > Edit > Portal Page Customization > Approval Request Email. Here you can:
- Change the default Logo that is specified under Global Page Customizations.
- Specify the Subject and Email body. Use predefined variables to specify the guest account information to be included in the email message. Use the mini-editor and HTML tags to customize the text. For example, to include a link to the Sponsor portal in the request approval email, click the Create a Link button, add the FQDN to the Sponsor portal.
- Preview your customization on all devices using Send Test Email to ensure that it appears as it should.
- Don't forget to click Save and then Close.

**Step 2**
Customize the content of the approval email sent by the Sponsor. Choose Guest Access > Configure > Sponsor Portals, choose Portal Page Customization, and then the Email Notification tab.

---

**Edit Error Messages**

You can fully customize the error messages that appear on the Failure pages displayed for guests, sponsors and employees. Failure pages are available with all end-user web portals, except the Blacklist portal.
Procedure

Step 1
Do one of the following:

- For Guest portals, choose **Guest Access** > **Configure** > **Guest Portals** > **Edit** > **Portal Page Customizations** > **Messages** > **Error Messages**.
- For Sponsor Portals, choose **Guest Access** > **Configure** > **Sponsor Portals** > **Edit** > **Portal Page Customizations** > **Messages** > **Error Messages**.
- For Device portals, choose **Administration** > **Device Portals Management** > (any portals) > **Edit** > **Portal Page Customizations** > **Messages** > **Error Messages**.

Step 2
From the **View In** drop-down list, choose the language in which you want to view the text while customizing the messages.

The drop-down list includes all the languages in the language file associated with a specific portal. Make sure that you update any changes made while customizing the portal page into the supported languages properties files.

Step 3
Update the error message text. You can search for specific error messages by typing in keywords such as **aup** to find AUP related error messages.

Step 4
Click **Save** and **Close**.
Edit Error Messages

Policy Conditions

Cisco ISE is a policy-based, network-access-control solution, which offers the following services: network-access, guest, posture, client provisioning, and profiler services. While configuring Cisco ISE, you create authentication, authorization, guest, posture, and profiler policies. Policy conditions are basic building blocks of policies. There are two types of policy conditions, simple and compound.

This chapter describes the policy conditions and how you can create them for the various services that Cisco ISE offers.

Simple and Compound Conditions

Cisco ISE uses rule-based policies to provide network access, profiler, posture, and guest services. These rule-based policies consist of rules that are made up of conditions. Cisco ISE allows you to create conditions as individual, reusable policy elements that can be referred from other rule-based policies. There are two types of conditions:

- Simple condition—A simple condition consists of an operand (attribute), an operator (equal to, not equal to, greater than, and so on), and a value. You can save simple conditions and use them in other rule-based policies.

  Simple condition takes the form: A operand B, where A can be any attribute from the Cisco ISE dictionary and B can be one of the values that the attribute A can take. The Device Type is used as an attribute for all network devices that can include all device types as its value, which means that A Equals B in the following form:

  DEVICE:Device Type Equals All Device Types
• Compound condition—A compound condition is made up of one or more simple conditions that are connected by the AND or OR operator. Compound conditions are built on top of simple conditions. You can save and reuse compound conditions in other rule-based policies.

Compound condition can take any one of the following forms:

• (X operand Y) AND (A operand B) AND (X operand Z) AND so on
• (X operand Y) OR (A operand B) OR (X operand Z) OR so on

where X and A are attributes from the Cisco ISE dictionary such as the username and device type.

This is an example of a compound condition:

You cannot delete conditions that are used in a policy or are part of a compound condition.

Policy Evaluation

Policies consist of rules, where each rule consists of conditions to be satisfied that allow actions to be performed such as access to network resources. Rule-based conditions form the basis of policies, the sets of rules used when evaluating requests.

At run-time, Cisco ISE evaluates the policy conditions and then applies the result that you define based on whether the policy evaluation returns a true or a false value.

During policy-condition evaluation, Cisco ISE compares an attribute with a value. It is possible that where the attribute specified in the policy condition may not have a value assigned in the request. In such cases, if the operator that is used for comparison is “not equal to,” then the condition will evaluate to true. In all other cases, the condition will evaluate to false.

For example, in the condition Radius.Calling_Station_ID Not Equal to 1.1.1.1, if the Calling Station ID is not present in the RADIUS request, then this condition will evaluate to true. This evaluation is not unique to the RADIUS dictionary and occurs because of the usage of the “Not Equal to” operator.

In ISE, the Policy Sets table provides a list of all policy sets currently configured in the system. The order of the enabled policy sets determines the order by which the system searches for the relevant policy set every time an endpoint requests access. The last row in the Policy page is the default policy that will be applied if none of the rules match the request in any of the other configured policy sets. You can edit the allowed protocols and identity source selection in default policy set, but you cannot delete it.

Create Simple Conditions

You can create simple conditions and reuse them when you define authentication, authorization, or guest policies.

Before you begin

To perform the following task, you must be a Super Admin or Policy Admin.
### Create Compound Conditions

You can create compound conditions and reuse them when you define authentication policies.

**Before you begin**

- Cisco ISE includes predefined compound conditions for some of the most common use cases. You can edit these predefined conditions to suit your requirements.
- To perform the following task, you must be a Super Admin or Policy Admin.

**Procedure**

**Step 1** Choose **Policy > Policy Elements > Conditions**.

**Step 2** Click the arrow next to **Authentication** or **Authorization** or **Guest**, and then click **Simple Conditions**.

**Step 3** Click **Add**.

**Step 4** Enter appropriate values for the Name, Description, Attribute, Operator, and Value fields.

If you specify any Identity Group in simple conditions, ensure that you represented them in FQDN form, like the following: \((\text{InternalUser:IdentityGroup}) \; : \; \text{Equal} \; : \; (\text{UserIdentityGroups: Identity Group Name})\)

Cisco ISE will not accurately resolve Identity Group entries in the following form: \((\text{InternalUser:IdentityGroup}) \; : \; \text{Equal} : \; (\text{Identity Group Name})\).

**Step 5** Click **Submit** to save the condition.

---

**Related Topics**

Profiler Conditions

Profiling conditions are policy elements and are similar to other conditions. However unlike authentication, authorization, and guest conditions, the profiling conditions can be based on a limited number of attributes. The Profiler Conditions page lists the attributes that are available in Cisco ISE and their description.

Profiler conditions can be one of the following:

- **Cisco Provided**—Cisco ISE includes predefined profiling conditions when deployed and they are identified as Cisco Provided in the Profiler Conditions page. You cannot delete Cisco Provided profiling conditions.
  
  You can also find Cisco Provided conditions in the System profiler dictionaries in the following location: Policy > Policy Elements > Dictionaries > System.

  For example, MAC dictionary. For some products, the OUI (Organizationally Unique Identifier) is a unique attribute that you can use it first for identifying the manufacturing organization of devices. It is a component of the device MAC address. The MAC dictionary contains the MACAddress and OUI attributes.

- **Administrator Created**—Profiler conditions that you create as an administrator of Cisco ISE or predefined profiling conditions that are duplicated are identified as Administrator Created. You can create a profiler condition of DHCP, MAC, SNMP, IP, RADIUS, NetFlow, CDP, LLDP, and NMAP types using the profiler dictionaries in the Profiler Conditions page.

Although, the recommended upper limit for the number of profiling policies is 1000, you can stretch up to 2000 profiling policies.

Create a Profiler Condition

Endpoint profiling policies in Cisco ISE allow you to categorize discovered endpoints on your network, and assign them to specific endpoint identity groups. These endpoint profiling policies are made up of profiling conditions that Cisco ISE evaluates to categorize and group endpoints.

**Before you begin**

To perform the following task, you must be a Super Admin or Policy Admin.

**Procedure**

2. Enter values for the fields as described in the Endpoint Profiling Policies Settings, on page 816.
3. Click Submit to save the profiler condition.
4. Repeat this procedure to create more conditions.

Profiler Conditions, on page 402

Posture Conditions

A posture condition can be any one of the following simple conditions: a file, a registry, an application, a service, or a dictionary condition. One or more conditions from these simple conditions form a compound condition, which can be associated to a posture requirement.

When you deploy Cisco ISE on your network for the first time, you can download posture updates from the web for the first time. This process is called the initial posture update.

After an initial posture update, Cisco ISE also creates Cisco defined simple and compound conditions. Cisco defined simple conditions have pc_ as their prefixes and compound conditions have pr_ as their prefixes.

You can also configure Cisco ISE to download the Cisco-defined conditions periodically as a result of dynamic posture updates through the web. You cannot delete or edit Cisco defined posture conditions.

A user defined condition or a Cisco defined condition includes both simple conditions and compound conditions.

Simple Posture Conditions

You can use the Posture Navigation pane to manage the following simple conditions:

- File Conditions—A condition that checks the existence of a file, the date of a file, and the versions of a file on the client.

- Registry Conditions—A condition that checks for the existence of a registry key or the value of the registry key on the client.

- Application Conditions—A condition that checks if an application or process is running or not running on the client.

  Note

  If a process is installed and running, user is compliant. However, the Application condition works in reverse logic; If an application is not installed and not running, the end user is complaint. If an application is installed and running, the end user is non-complaint.

- Service Conditions—A condition that checks if a service is running or not running on the client.

- Dictionary Conditions—A condition that checks a dictionary attribute with a value.

Create Simple Posture Conditions

You can create file, registry, application, service, and dictionary simple conditions that can be used in posture policies or in other compound conditions.

**Before you begin**

To perform the following task, you must be a Super Admin or Policy Admin.

**Procedure**

2. Choose any one of the following: File, Registry, Application, Service, or Dictionary Simple Condition.
3. Click Add.
4. Enter the appropriate values in the fields.
5. Click Submit.

**Compound Posture Conditions**

Compound conditions are made up of one or more simple conditions, or compound conditions. You can make use of the following compound conditions while defining a Posture policy.

- Compound Conditions—Contains one or more simple conditions, or compound conditions of the type File, Registry, Application, or Service condition
- Antivirus Compound Conditions—Contains one or more AV conditions, or AV compound conditions
- Antispyware Compound Conditions—Contains one or more AS conditions, or AS compound conditions
- Dictionary Compound Conditions—Contains one or more dictionary simple conditions or dictionary compound conditions

**Predefined Condition for Enabling Automatic Updates in Windows Clients**

The pr_AutoUpdateCheck_Rule is a Cisco predefined condition, which is downloaded to the Compound Conditions page. This condition allows you to check whether the automatic updates feature is enabled on Windows clients. If a Windows client fails to meet this requirement, then the Network Access Control (NAC) Agents enforce the Windows client to enable (remediate) the automatic updates feature. After this remediation is done, the Windows client becomes posture compliant. The Windows update remediation that you associate in the posture policy overrides the Windows administrator setting, if the automatic updates feature is not enabled on the Windows client.

**Preconfigured Antivirus and Antispyware Conditions**

Cisco ISE loads preconfigured antivirus and antispyware compound conditions in the AV and AS Compound Condition pages, which are defined in the antivirus and antispyware support charts for Windows and Macintosh
operating systems. These compound conditions can check if the specified antivirus and antispyware products exist on all the clients. You can also create new antivirus and antispyware compound conditions in Cisco ISE.

**Antivirus and Antispyware Support Chart**

Cisco ISE uses an antivirus and antispyware support chart, which provides the latest version and date in the definition files for each vendor product. Users must frequently poll antivirus and antispyware support charts for updates. The antivirus and antispyware vendors frequently update antivirus and antispyware definition files, look for the latest version and date in the definition files for each vendor product.

Each time the antivirus and antispyware support chart is updated to reflect support for new antivirus and antispyware vendors, products, and their releases, the NAC Agents receive a new antivirus and antispyware library. It helps NAC Agents to support newer additions. Once the NAC Agents retrieve this support information, they check the latest definition information from the periodically updated se-checks.xml file (which is published along with the se-rules.xml file in the se-templates.tar.gz archive), and determine whether clients are compliant with the posture policies. Depending upon what is supported by the antivirus and antispyware library for a particular antivirus, or antispyware product, the appropriate requirements will be sent to the NAC Agents for validating their existence, and the status of particular antivirus and antispyware products on the clients during posture validation.

The antivirus and antispyware support chart is available on Cisco.com.

**Create Compound Posture Conditions**

You can create compound conditions that can be used in posture policies for posture assessment and validation.

**Before you begin**

To perform the following task, you must be a Super Admin or Policy Admin.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose <strong>Policy</strong> &gt; <strong>Policy Elements</strong> &gt; <strong>Conditions</strong> &gt; <strong>Posture</strong> &gt; <strong>Compound Conditions</strong> &gt; <strong>Add</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Enter appropriate values for the fields.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click <strong>Validate Expression</strong> to validate the condition.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click <strong>Submit</strong>.</td>
</tr>
</tbody>
</table>

Create Time and Date Conditions

Use the Policy Elements Conditions page to display, create, modify, delete, duplicate, and search time and date policy element conditions. Policy elements are shared objects that define a condition that is based on specific time and date attribute settings that you configure.

Time and date conditions let you set or limit permission to access Cisco ISE system resources to specific times and days as directed by the attribute settings you make.

**Before you begin**

To perform the following task, you must be a Super Admin or Policy Admin.

**Procedure**

**Step 1** Choose **Policy > Policy Elements > Conditions > Time and Date > Add.**

**Step 2** Enter appropriate values in the fields.

- In the Standard Settings area, specify the time and date to provide access.
- In the Exceptions area, specify the time and date range to limit access.

**Step 3** Click **Submit.**

Cisco ISE Authentication Policies

Authentication policies define the protocols that Cisco ISE uses to communicate with the network devices, and the identity sources that it uses for authentication. A policy is a set of conditions and a result. A policy condition consists of an operand (attribute), an operator (equal to, not equal to, greater than, and so on), and a value. Compound conditions are made up of one or more simple conditions that are connected by the AND or OR operator. At runtime, Cisco ISE evaluates a policy condition and then applies the result that you have defined based on whether the policy evaluation returns a true or a false value.

An authentication policy consists of the following:

- Network Access Service—This service can be one of the following:
  - An allowed protocols service to choose the protocols to handle the initial request and protocol negotiation.
  - A proxy service that will proxy requests to an external RADIUS server for processing.

- Identity Source—An identity source or an identity source sequence to be used for authentication.

After installation, a default identity authentication policy is available in Cisco ISE that is used for authentications. Any updates to the authentication policy will override the default settings.
Policy Condition Evaluation

During policy condition evaluation, Cisco ISE compares an attribute with a value. It is possible to run into a situation where the attribute specified in the policy condition may not have a value assigned in the request. In such cases, if the operator that is used for comparison is “not equal to,” then the condition will evaluate to true. In all other cases, the condition will evaluate to false.

For example, for a condition Radius.Calling_Station_ID Not Equal to 1.1.1.1, if the Calling Station ID is not present in the RADIUS request, then this condition will evaluate to true. This evaluation is not unique to the RADIUS dictionary and occurs because of the usage of the “Not Equal to” operator.

Supported Authentication Protocols

The following is a list of protocols that you can choose while defining your authentication policy:

- Password Authentication Protocol (PAP)
- Protected Extensible Authentication Protocol (PEAP)
- Microsoft Challenge Handshake Authentication Protocol Version 2 (MS-CHAPv2)
- Extensible Authentication Protocol-Message Digest 5 (EAP-MD5)
- Extensible Authentication Protocol-Transport Layer Security (EAP-TLS)
- Extensible Authentication Protocol-Flexible Authentication via Secure Tunneling (EAP-FAST)
- Protected Extensible Authentication Protocol-Transport Layer Security (PEAP-TLS)

Related Topics

- Supported Authentication Types and Database, on page 408
- Authentication Policy Terminology, on page 410
- Simple Authentication Policies, on page 410
- Rule-Based Authentication Policies, on page 412

Supported Authentication Types and Database

The authentication type is based on the protocols that are chosen. The authentication type is password based, where the authentication is performed against a database with the username and password that is presented in the request.

The identity method, which is the result of the authentication policy, can be any one of the following:

- Deny access—Access to the user is denied and no authentication is performed.
- Identity database—A single identity database that can be any one of the following:
Types of Authentication Failures—Failovers

If you choose the identity method as deny access, a reject message is sent as a response to the request. If you choose an identity database or an identity source sequence and the authentication succeeds, the processing continues to the authorization policy. Some of the authentications fail and these are classified as follows:

- Authentication failed—Received explicit response that authentication has failed such as bad credentials, disabled user, and so on. The default course of action is reject.
- User not found—No such user was found in any of the identity databases. The default course of action is reject.
- Process failed—Unable to access the identity database or databases. The default course of action is drop.

Cisco ISE allows you to configure any one of the following courses of action for authentication failures:

- Reject—A reject response is sent.
- Drop—No response is sent.
- Continue—Cisco ISE continues with the authorization policy.

Even when you choose the Continue option, there might be instances where Cisco ISE cannot continue processing the request due to restrictions on the protocol that is being used. For authentications using PEAP, LEAP, EAP-FAST, EAP-TLS, or RADIUS MSCHAP, it is not possible to continue processing the request when authentication fails or user is not found.

When authentication fails, it is possible to continue to process the authorization policy for PAP/ASCII and MAC authentication bypass (MAB or host lookup). For all other authentication protocols, when authentication fails, the following happens:

- Authentication failed—A reject response is sent.
- User or host not found—A reject response is sent.
- Process failure—No response is sent and the request is dropped.
Authentication Policy Terminology

The following are some of the commonly used terms in the authentication policy pages:

- **Allowed Protocols**—Allowed protocols define the set of protocols that Cisco ISE can use to communicate with the device that requests access to the network resources.

- **Identity Source**—Identity source defines which database Cisco ISE should use for user information. The database could be an internal database or an external identity source, such as Active Directory or LDAP. You can add a sequence of databases to an identity source sequence and list this sequence as the identity source in your policy. Cisco ISE will search for the credentials in the order in which the databases are listed in this sequence.

- **Failover Options**—You can define what course of action Cisco ISE should take if the authentication fails, the user is not found, or if the process fails.

Simple Authentication Policies

A simple authentication policy allows you to statically define the allowed protocols and the identity source or identity source sequence that Cisco ISE should use for communication. You cannot define any condition for simple policies. Cisco ISE assumes that all conditions are met and uses the following definitions to determine the result:

- You can create simple policies in situations where you can statically define the allowed protocols and the identity source that must be used always, and no condition needs to be checked.

- You can also create proxy service-based simple policies. Cisco ISE proxies the request to a policy server to determine which identity source should be used for user authentication. If the request is proxied to a different policy server, the protocol negotiation does not happen. The policy server evaluates which identity source should be used for authentication and returns the response to Cisco ISE.

Related Topics

- Simple Authentication Policy Flow, on page 411
- Guidelines for Configuring Simple Authentication Policies, on page 412
- Define Allowed Protocols for Network Access, on page 420
- Configure a Simple Authentication Policy, on page 426
- Rule-Based Authentication Policies, on page 412
Simple Authentication Policy Flow

The result of a simple policy can be any one of the following:

- Authentication passed
- Authentication failed

An authentication can fail happens due to any of the following reasons:

- Bad credentials or disabled user.
- User not found.
- Authentication process fails.
Guidelines for Configuring Simple Authentication Policies

Follow these guidelines when configuring simple authentication policies:

• If you wish to use the RADIUS server sequence, then you must define this access service before you define the policy.

• If your users are defined in external identity sources, ensure that you have configured these identity sources in Cisco ISE before you define the policy.

• If you want to use an identity source sequence for authenticating users, ensure that you have created the identity source sequence before you define the policy.

• When you switch between simple and rule-based authentication policies, you will lose the policy that you configured earlier. For example, if you configured a simple authentication policy and you want to move to a rule-based authentication policy, you will lose the simple authentication policy. Also, when you move from a rule-based authentication policy to a simple authentication policy, you will lose the rule-based authentication policy.

• Host authentication is performed with the MAC address only (MAB).

Related Topics
Cisco ISE Acting as a RADIUS Proxy Server, on page 423

Rule-Based Authentication Policies

Rule-based authentication policies consist of attribute-based conditions that determine the allowed protocols and the identity source or identity source sequence to be used for processing the requests. In a simple authentication policy, you can define the allowed protocols and identity source statically. In a rule-based policy, you can define conditions that allows Cisco ISE to dynamically choose the allowed protocols and identity sources. You can define one or more conditions using any of the attributes from the Cisco ISE dictionary.

Cisco ISE allows you to create conditions as individual, reusable policy elements that can be referred from other rule-based policies. You can also create conditions from within the policy creation page. The two types of conditions are:

• Simple condition

• Compound condition

Related Topics
Attributes Supported by Dictionaries, on page 414
Configure a Rule-Based Authentication Policy, on page 426

Rule-Based Authentication Policy Flow

In rule-based policies, you can define multiple rules. The identity database is selected based on the first rule that matches the criteria.

You can also define an identity source sequence consisting of different databases. You can define the order in which you want Cisco ISE to look up these databases. Cisco ISE will access these databases in sequence.
until the authentication succeeds. If there are multiple instances of the same user in an external database, the authentication fails. There can only be one user record in an identity source.

We recommend that you use only three, or at most four databases in an identity source sequence.

Figure 29: Rule-Based Authentication Policy Flow

Supported Dictionaries for Rule-Based Authentication Policies

Cisco ISE supports the following dictionaries:

- System-defined dictionaries
  - CERTIFICATE
  - DEVICE
  - RADIUS
Attributes Supported by Dictionaries

The table lists the fixed attributes that are supported by dictionaries, which can be used in policy conditions. Not all of these attributes are available for creating all types of conditions.

For example, while creating a condition to choose the access service in authentication policies, you will only see the following network access attributes: Device IP Address, ISE Host Name, Network Device Name, Protocol, and Use Case.

You can use the attributes listed in the following table in policy conditions.

<table>

Protocol Settings for Authentication

You must define global protocol settings in Cisco ISE before you can use these protocols to create, save and implement a policy set to process an authentication request. You can use the Protocol Settings page to define global options for the Extensible Authentication Protocol-Flexible Authentication via Secure Tunneling (EAP-FAST), Extensible Authentication Protocol-Transport Layer Security (EAP-TLS), and Protected Extensible Authentication Protocol (PEAP) protocols, which communicate with the other devices in your network.

Related Topics

Guidelines for Using EAP-FAST as Authentication Protocol, on page 417
Configure EAP-FAST Settings, on page 418
Generate the PAC for EAP-FAST, on page 418
Configure EAP-TLS Settings, on page 419
Configure PEAP Settings, on page 419
Configure RADIUS Settings, on page 419

Guidelines for Using EAP-FAST as Authentication Protocol

Follow these guidelines when using EAP-FAST as an authentication protocol:

• It is highly recommended to enable EAP-TLS inner method when the EAP-FAST accept client certificate is enabled on authenticated provisioning. EAP-FAST accept client certificate on authenticated provisioning is not a separate authentication method but a shorter form of client certificate authentication that uses the same certificate credentials type to authenticate a user but does not require to run an inner method.

• Accept client certificate on authenticated provisioning works with PAC-less full handshake and authenticated PAC provisioning. It does not work for PAC-less session resume, anonymous PAC provisioning, and PAC-based authentication.

• EAP attributes are displayed per identity (so in EAP chaining displayed twice) are shown in authentication details in monitoring tool in order user then machine even if authentication happens in different order.

• When EAP-FAST authorization PAC is used then EAP authentication method shown in live logs is equal to the authentication method used for full authentication (as in PEAP) and not as Lookup.

• In EAP chaining mode when tunnel PAC is expired then ISE falls back to provisioning and AC requests User and Machine authorization PACs - Machine Authorization PAC cannot be provisioned. It will be provisioned in the subsequent PAC-based authentication conversation when AC requests it.

• When Cisco ISE is configured for chaining and AC for single mode then AC response with IdentityType TLV to ISE. However, the second identity authentication fails. You can see from this conversation that client is suitable to perform chaining but currently is configured for single mode.

• Cisco ISE supports retrieval attributes and groups for both machine and user in EAP-FAST chaining only for AD. For LDAP and Internal DB ISE uses only the last identity attributes.
Configure EAP-FAST Settings

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1 Choose Administration > System > Settings > Protocols > EAP-FAST > EAP Fast Settings.
Step 2 Enter the details as required to define the EAP-FAST protocol.
Step 3 Click Revoke if you want to revoke all the previously generated master keys and PACs.
Step 4 Click Save to save the EAP-FAST settings.

Related Topics

Generate the PAC for EAP-FAST, on page 418

Generate the PAC for EAP-FAST

You can use the Generate PAC option in the Cisco ISE to generate a tunnel or machine PAC for the EAP-FAST protocol.

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1 Choose Administration > System > Settings.
Step 2 From the Settings navigation pane on the left, click Protocols.
Step 3 Choose EAP-FAST > Generate PAC.
Step 4 Enter the details as required to generate machine PAC for the EAP-FAST protocol.
Step 5 Click Generate PAC.
Configure EAP-TLS Settings

**Before you begin**
To perform the following task, you must be a Super Admin or System Admin.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Administration &gt; System &gt; Settings &gt; Protocols &gt; EAP-TLS.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Enter the details as required to define the EAP-TLS protocol.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click <strong>Save</strong> to save the EAP-TLS settings.</td>
</tr>
</tbody>
</table>

Configure PEAP Settings

**Before you begin**
To perform the following task, you must be a Super Admin or System Admin.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Administration &gt; System &gt; Settings.</th>
</tr>
</thead>
<tbody>
<tr>

<td>Choose <strong>RADIUS</strong>.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Enter the details as required to define the RADIUS settings.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Click <strong>Save</strong> to save the settings.</td>
</tr>
</tbody>
</table>
Network Access Service

A network access service contains the authentication policy conditions for requests. You can create separate network access services for different use cases, for example, Wired 802.1X, Wired MAB, and so on. To create a network access service, configure allowed protocols or server sequences.

Related Topics
- Define Allowed Protocols for Network Access, on page 420
- Cisco ISE Acting as a RADIUS Proxy Server, on page 423
- Simple Authentication Policies, on page 410
- Configure a Rule-Based Authentication Policy, on page 426

Define Allowed Protocols for Network Access

Allowed protocols define the set of protocols that Cisco ISE can use to communicate with the device that requests access to the network resources. An allowed protocols access service is an independent entity that you should create before you configure authentication policies. Allowed protocols access service is an object that contains your chosen protocols for a particular use case.

The Allowed Protocols Services page lists all the allowed protocols services that you create. There is a default network access service that is predefined in the Cisco ISE.

Before you begin

Before you begin this procedure, you should have a basic understanding of the protocol services that are used for authentication.

- Review the Cisco ISE Authentication Policies section in this chapter to understand authentication type and the protocols that are supported by various databases.
- Review the PAC Options to understand the functions and options for each protocol service, so you can make the selections that are appropriate for your network.
- Ensure that you have defined the global protocol settings.

To perform the following task, you must be a Super Admin or System Admin.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Policy &gt; Policy Elements &gt; Results &gt; Authentication &gt; Allowed Protocols.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Add.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter the required information.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Select the appropriate authentication protocols and options for your network.</td>
</tr>
<tr>
<td>Step 5</td>
<td>If you choose to use PACs, make the appropriate selections.</td>
</tr>
</tbody>
</table>

To enable Anonymous PAC Provisioning, you must choose both the inner methods, EAP-MSCHAPv2 and Extensible Authentication Protocol-Generic Token Card (EAP-GTC). Also, be aware that Cisco ISE only supports Active Directory as an external identity source for machine authentication.
Click **Submit** to save the allowed protocols service.

The allowed protocols service appears as an independent object in the simple and rule-based authentication policy pages. You can use this object in different rules.

You can now create a simple or rule-based authentication policy.

If you disable EAP-MSCHAP as inner method and enable EAP-GTC and EAP-TLS inner methods for PEAP or EAP-FAST, ISE starts EAP-GTC inner method during inner method negotiation. Before the first EAP-GTC message is sent to the client, ISE executes identity selection policy to obtain GTC password from the identity store. During the execution of this policy, EAP authentication is equal to EAP-GTC. If EAP-GTC inner method is rejected by the client and EAP-TLS is negotiated, identity store policy is not executed again. In case identity store policy is based on EAP authentication attribute, it might have unexpected results since the real EAP authentication is EAP-TLS but was set after identity policy evaluation.

---

**Enable MAB from Non-Cisco Devices**

Configure the following settings sequentially to configure MAB from non-Cisco devices.

### Procedure

**Step 1**

Ensure that the MAC address of the endpoints that are to be authenticated are available in the Endpoints database. You can add these endpoints or have them profiled automatically by the Profiler service.

**Step 2**

Create an Allowed Protocol service based on the type of MAC authentication used by the non-Cisco device (PAP, CHAP, or EAP-MD5).

a) Choose **Policy** > **Policy Elements** > **Results** > **Authentication** > **Allowed Protocols**

b) Enter a name for the Allowed Protocol service. For example, MAB for NonCisco Devices.

c) Select the protocol based on the MAC authentication type used by the non-Cisco device:

- **PAP**—Check the Allow PAP/ASCII check box and check the Detect PAP as Host Lookup check box.

- **CHAP**—Check the Allow CHAP check box and check the Detect CHAP as Host Lookup check box.

- **EAP-MD5**—Check the Allow EAP-MD5 check box and check Detect EAP-MD5 as Host Lookup check box.

For each of the protocol listed above, it is recommended to check the following check boxes:

- **Check Password**—Enable this for checking of the trivial MAB password to authenticate the sending network device.

- **Check Calling-Station-Id equals MAC address**—Enable this as an extra security check, when Calling-Station-Id is being sent.

**Step 3**

Configure an authentication policy rule for enabling MAB from non-Cisco devices.

a) Choose **Policy** > **Authentication**.
b) Select the Rule-Based authentication policy.
c) Insert a new rule for MAB.
d) Select the Allowed Protocol service (MAB for NonCisco Devices) that you created in Step 2 in this rule.
e) Select the Internal Endpoints database as the Identity Source in this rule.
f) Save the authentication policy.

Related Topics

Enable MAB from Cisco Devices

Configure the following settings sequentially to configure MAB from Cisco devices.

Procedure

**Step 1**
Ensure that the MAC address of the endpoints that are to be authenticated are available in the Endpoints database. You can add these endpoints or have them profiled automatically by the Profiler service.

**Step 2**
Create an Allowed Protocol service based on the type of MAC authentication used by the Cisco device (PAP, CHAP, or EAP-MD5).

a) Choose Policy > Policy Elements > Results > Authentication > Allowed Protocols.
b) Enter a name for the Allowed Protocol service. For example, MAB for Cisco Devices.
c) Check the Process Host Lookup check box.
d) Select the protocol based on the MAC authentication type used by the Cisco device:
   - PAP—Check the Allow PAP/ASCII check box and check the Detect PAP as Host Lookup check box.
   - CHAP—Check the Allow CHAP check box and check the Detect CHAP as Host Lookup check box.
   - EAP-MD5—Check the Allow EAP-MD5 check box and check Detect EAP-MD5 as Host Lookup check box.
   For each of the protocol listed above, it is recommended to check the following check boxes:
   - Check Password—Enable this for checking of the trivial MAB password to authenticate the sending network device.
   - Check Calling-Station-Id equals MAC address—Enable this as an extra security check, when Calling-Station-Id is being sent.

e) Save the Allowed Protocol service.

**Step 3**
Configure an authentication policy rule for enabling MAB from Cisco devices.

a) Choose Policy > Authentication.
b) Select the Rule-Based authentication policy.
c) Insert a new rule for MAB.
d) Select the Allowed Protocol service (MAB for Cisco Devices) that you created in Step 2 in this rule.
e) Select the Internal Endpoints database as the Identity Source in this rule.
Cisco ISE Acting as a RADIUS Proxy Server

Cisco ISE can function both as a RADIUS server and as a RADIUS proxy server. When it acts as a proxy server, Cisco ISE receives authentication and accounting requests from the network access server (NAS) and forwards them to the external RADIUS server. Cisco ISE accepts the results of the requests and returns them to the NAS.

Cisco ISE can simultaneously act as a proxy server to multiple external RADIUS servers. You can use the external RADIUS servers that you configure here in RADIUS server sequences. The External RADIUS Server page lists all the external RADIUS servers that you have defined in Cisco ISE. You can use the filter option to search for specific RADIUS servers based on the name or description, or both. In both simple and rule-based authentication policies, you can use the RADIUS server sequences to proxy the requests to a RADIUS server.

The RADIUS server sequence strips the domain name from the RADIUS-Username attribute for RADIUS authentications. This domain stripping is not applicable for EAP authentications, which use the EAP-Identity attribute. The RADIUS proxy server obtains the username from the RADIUS-Username attribute and strips it from the character that you specify when you configure the RADIUS server sequence. For EAP authentications, the RADIUS proxy server obtains the username from the EAP-Identity attribute. EAP authentications that use the RADIUS server sequence will succeed only if the EAP-Identity and RADIUS-Username values are the same.

Configure External RADIUS Servers

You must configure the external RADIUS servers in the Cisco ISE to enable it to forward requests to the external RADIUS servers. You can define the timeout period and the number of connection attempts.

Before you begin

- You cannot use the external RADIUS servers that you create in this section by themselves. You must create a RADIUS server sequence and configure it to use the RADIUS server that you create in this section. You can then use the RADIUS server sequence in authentication policies.
- To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1 Choose Administration > Network Resources > External RADIUS Servers.

The RADIUS Servers page appears with a list of external RADIUS servers that are defined in Cisco ISE.

Step 2 Click Add to add an external RADIUS server.

Step 3 Enter the values as required.
Step 4  Click **Submit** to save the external RADIUS server configuration.

---

**Related Topics**
- RADIUS Server Sequence

---

### Define RADIUS Server Sequences

RADIUS server sequences in Cisco ISE allow you to proxy requests from a NAD to an external RADIUS server that will process the request and return the result to Cisco ISE, which forwards the response to the NAD.

RADIUS Server Sequences page lists all the RADIUS server sequences that you have defined in Cisco ISE. You can create, edit, or duplicate RADIUS server sequences from this page.

**Before you begin**

- Before you begin this procedure, you should have a basic understanding of the Proxy Service and must have successfully completed the task in the first entry of the Related Links.
- To perform the following task, you must be a Super Admin or System Admin.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose <strong>Administration</strong> &gt; <strong>Network Resources</strong> &gt; <strong>RADIUS Server Sequences</strong>.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click <strong>Add</strong>.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter the values as required.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click <strong>Submit</strong> to save the RADIUS server sequence to be used in policies.</td>
</tr>
</tbody>
</table>

### Policy Modes

Cisco ISE provides two types of policy modes, the Simple mode and the Policy Set mode. You can select either one of these to configure authentication and authorization policies. When you change the policy mode, you are prompted to login again to the Cisco ISE interface. If you switch from the Policy Set mode to the Simple mode, all the policy set data is deleted except the default policy. The Policy menu options change based on the policy mode selection.

- Simple Mode—If you select Simple mode, you can define authentication and authorization policies separately in the Policy menu.
Policy Set Mode—If you select Policy Set mode, you can create policy sets and logically group authentication and authorization within the same group. You can have several groups based on what you need.

**Related Topics**

- Guidelines for Changing Policy Modes
- Change Policy Modes, on page 425
- Simple Authentication Policies, on page 410
- Configure a Rule-Based Authentication Policy, on page 426
- Policy Sets, on page 428

### Change Policy Modes

The following are the guidelines for changing policy modes:

- After you do a fresh install or upgrade from Cisco ISE, Release 1.1, the Simple Mode policy model is selected by default.

- If you choose to switch to Policy Set Mode from Simple Mode, the authentication and authorization policies are migrated to the default policy set.

- If you choose to switch to Simple Mode from Policy Set Mode, the authentication and authorization of the default policy set are migrated to be the authentication and authorization policies. All other policy set policies are deleted.

### Procedure

1. Choose **Administration** > **System** > **Settings** > **Policy Sets**.
2. Enable or Disable the Policy Set mode.
3. Click **Save**.
You will be prompted to login again, for the new policy mode to come into effect.

**Related Topics**

## Configure a Simple Authentication Policy

The procedure for configuring a simple authentication policy includes defining an allowed protocols service and configuring a simple authentication policy.

**Before you begin**

- To configure a simple authentication policy using the RADIUS server sequence, you should have a basic understanding of the Cisco ISE authentication policies and proxy service to understand authentication types and the protocols that are supported by various databases.
- You should have defined an allowed protocol access service or RADIUS server sequence.
- To perform the following task, you must be a Super Admin or System Admin.

You can also use this process to configure a simple policy using RADIUS server sequence.

**Procedure**

1. Choose **Policy > Authentication**.
2. Click **OK** on the message that appears.
3. Enter the values as required.
4. Click **Save** to save your simple authentication policy.

**Related Topics**
- [Cisco ISE Authentication Policies](#), on page 407
- [Define Allowed Protocols for Network Access](#), on page 420
- [RADIUS Server Sequence](#)
- [Cisco ISE Acting as a RADIUS Proxy Server](#), on page 423

## Configure a Rule-Based Authentication Policy

In a rule-based policy, you can define conditions that allows Cisco ISE to dynamically choose the allowed protocols and identity sources. You can define one or more conditions using any of the attributes from the Cisco ISE dictionary.
We recommend that you create the allowed protocol access services, conditions, and identity source sequences before you create the rule-based authentication policy. If you want to use the RADIUS server sequence, you can define the RADIUS server sequence before you create the policy.

Before you begin

- You should have a basic understanding of the rule-based authentication policies, defined allowed protocols for network access, created identity source sequence, and RADIUS server sequence (if you want to use the RADIUS server sequence in place of the allowed protocol access service).

- Cisco ISE comes with predefined rule-based authentication policies for the Wired 802.1X, Wireless 802.1X, and Wired MAB use cases.

- To perform the following task, you must be a Super Admin or System Admin.

- If your users are defined in external identity sources, ensure that you have configured these identity sources in Cisco ISE.

Note: When you switch between a simple and a rule-based authentication policy, you will lose the policy that you configured earlier. For example, if you have a simple authentication policy configured and you want to move to a rule-based authentication policy, you will lose the simple authentication policy. Also, when you move from a rule-based authentication policy to a simple authentication policy, you will lose the rule-based authentication policy.

Procedure

Step 1
Choose Policy > Authentication.

Step 2
Click the Rule-Based radio button.

Step 3
Click OK on the message that appears.

Step 4
Click the action icon and click Insert new row above or Insert new row below based on where you want the new policy to appear in this list. The policies will be evaluated sequentially.

Each row in this rule-based policy page is equivalent to the simple authentication policy. Each row contains a set of conditions that determine the allowed protocols and identity sources.

Step 5
Enter the values as required to create a new authentication policy.

Step 6
Click Save to save your rule-based authentication policies.

You cannot specify the “UserName” attribute when configuring an authentication policy when the EAP-FAST client certificate is sent in the outer TLS negotiation. Cisco recommends using certificate fields like “CN” and “SAN,” for example.
ISE does not restrict a user or machine EAP-TLS authentication against Active Directory when the account in Active Directory is set to deny the user or machine using logon hours, locked-out, or workstations attributes. You should not use these attributes to restrict a user or machine for EAP-TLS authentications.

---

**Default Authentication Policy**

The last row in the authentications policy page is the default policy that will be applied if none of the rules match the request. You can edit the allowed protocols and identity source selection for the default policy.

It is a good practice to choose Deny Access as the identity source in the default policy if the request does not match any of the other policies that you have defined.

---

**Policy Sets**

Policy sets enable you to logically group authentication and authorization policies within the same set. You can have several policy sets based on an area, such as policy sets based on location, access type and similar parameters.

Policy sets are first-match policies. Each policy has a condition that can be a simple or a compound condition, and have the following supported dictionaries:

- Airspace
- Cisco
- Cisco-BBSM
- Cisco-VPN3000
- Device, Microsoft
- NetworkAccess
- RADIUS

Once the policy set is matched and selected, its authentication and authorization policies are evaluated. In addition, a global authorization exception policy is available as part of the policy set model.

There is always one policy set defined, which is the default policy set.
Policy Set Evaluation Flow

The sequence of policy set and the authentication and authorization evaluation flow is as follows:

1. Evaluate policy set (by evaluating the policy set condition). As a result, one policy set is selected.
2. Evaluate allowed protocols rules of the selected policy set.
3. Evaluate ID store rules of the selected policy set.
4. Evaluate authorization rules of the selected policy set, based on the following paradigm:
   - Evaluate the local exception policy in case it is defined
   - If no match is found in Step 1 above, evaluate global exception policy if defined
   - If no match is found in Step 2 above, evaluate authorization rules

If none of the policy set matches, the default policy set will be selected.

Guidelines for Creating Policy Sets

Following are the guidelines for creating policy sets:
Rules are configured with names, conditions, and results. You must define authentication and authorization rules in order to implement a policy set. The default pre-configured policy set that is installed automatically with ISE, as well as any new policy sets that you create, are automatically created with the existing default authentication and authorization policy rules which you can then edit or supplement.

- You can duplicate rules that are of the same rule type (either authentication or authorization) and only within the same policy set.
- Rules cannot be shared by different policy sets; each policy set has its own rule, however conditions can be shared in case you use the condition library.

Global Authorization Exception Policy

The global authorization exception policy allows you to define rules that apply to all policy sets. The global authorization exception policy is added to each authorization policy of all the policy set. Global authorization exception policy can be updated by selecting the Global Exceptions option from the policy set list.

Each authorization policy can have local exception rule, global exception rule, and regular rules. Once you configure the local authorization exception rule, (for some authorization policies) the global exception authorization rules are displayed in read-only mode in conjunction to the local authorization exception rule. The local authorization exception rule can overwrite the global exception rule. The authorization rules are processed in the following order: first the local exception rule, then the global exception rule, and finally, the regular rule of the authorization policy.

Configure Policy Sets

You can use this page to configure Policy sets.

Before you begin

You should have selected the policy mode as Policy Set to be able to configure Policy sets. To do this, go to Administration > System > Settings > Policy Sets.

Procedure

</table>
Additional Information

Description
Path in the User Interface
This default policy uses the internal endpoints database as its identity source.

This policy uses the wired MAB compound condition and the default network access allowed protocols service. This policy will evaluate requests that match the criteria specified in the wired MAB compound condition.

View Authentication Results

Cisco ISE provides various ways to view real-time authentication summary.

Before you begin
To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1
Choose Operations > Authentications to view real-time authentication summary.

Step 2
You can view the authentication summary in the following ways:

- Hover your mouse cursor over the Status icon to view the results of the authentication and a brief summary. A pop-up with status details appears.

- Enter your search criteria in any one or more of the text boxes that appear at the top of the list, and press Enter, to filter your results.

- Click the magnifier icon in the Details column to view a detailed report.

Note
As the Authentication Summary report or dashboard collects and displays the latest data corresponding to failed or passed authentications, the contents of the report appear after a delay of a few minutes.
Authentication Dashlet

The Cisco ISE dashboard provides a summary of all authentications that take place in your network and for your devices. It provides at-a-glance information about authentications and authentication failures in the Authentications dashlet.

The RADIUS Authentications dashlet provides the following statistical information about the authentications that Cisco ISE has handled:

- The total number of RADIUS authentication requests that Cisco ISE has handled, including passed authentications, failed authentications, and simultaneous logins by the same user.
- The total number of failed RADIUS authentications requests that Cisco ISE has processed.

You can also view a summary of TACACS+ authentications. The TACACS+ Authentications dashlet provides statistical information for device authentications.

Authentication Reports and Troubleshooting Tools

Apart from the authentication details, Cisco ISE provides various reports and troubleshooting tools that you can use to efficiently manage your network.

There are various reports that you can run to understand the authentication trend and traffic in your network. You can generate reports for historical as well as current data. The following is a list of authentication reports:

- AAA Diagnostics
- RADIUS Accounting
- RADIUS Authentication
- Authentication Summary
Manage Authorization Policies and Profiles

Cisco ISE Authorization Policies

Authorization policies are a component of the Cisco ISE network authorization service. This service allows you to define authorization policies and configure authorization profiles for specific users and groups that access your network resources.

Authorization policies can contain conditional requirements that combine one or more identity groups using a compound condition that includes authorization checks that can return one or more authorization profiles. In addition, conditional requirements can exist apart from the use of a specific identity group (such as in using the default “Any”).

Authorization policies are used when creating authorization profiles in Cisco Identity Services Engine (Cisco ISE). An authorization policy is composed of authorization rules. Authorization rules have three elements: name, attributes, and permissions. The permission element is that maps to an authorization profile.

Cisco ISE Authorization Profiles

Authorization policies associate rules with specific user and group identities to create the corresponding profiles. Whenever these rules match the configured attributes, the corresponding authorization profile that grants permission is returned by the policy and network access is authorized accordingly.

For example, authorization profiles can include a range of permissions that are contained in the following types:

- Standard profiles
- Exception profiles
- Device-based profiles
Profiles consist of attributes chosen from a set of resources, which are stored in any of the available vendor dictionaries, and these are returned when the compound condition for the specific authorization policy matches. Because authorization policies can include compound condition mapping to a single network service rule, these can also include a list of authorization checks.

For simple scenarios, all authorization checks are made using the AND Boolean operator within the rule. For advanced scenarios, any type of authorization verification expression can be used, but all these authorization verifications must comply with the authorization profiles to be returned. Authorization verifications typically comprise one or more conditions, including a user-defined name that can be added to a library, which can then be reused by other authorization policies.

## Authorization Policy Terminology

You can define authorization profiles and policies for network authorization of users to access Cisco ISE network and its resources. Cisco ISE also uses downloadable ACLs (DACLs), which are configured and implemented through authorization profiles. For more information about authorization profiles, see Authorization Profile, on page 437. For more information about DACLs, see Downloadable ACLs, on page 445.

### Network Authorization

Network authorization controls user access to the network and its resources and what each user can do on the system with those resources. Activate network authorization from Cisco ISE by defining sets of permissions that authorize read, write, and execute privileges. Cisco ISE lets you create a number of different authorization policies to suit your network needs. This release supports only RADIUS access to the Cisco ISE network and its resources.

### Policy Elements

Policy elements are components that define an authorization policy and are as follows:

- Rule name
- Identity groups
- Conditions
- Permissions

These policy elements are referenced when you create policy rules and your choice of conditions and attributes can create specific types of authorization profiles.
Authorization Profile

An authorization profile acts as a container where a number of specific permissions allow access to a set of network services. The authorization profile is where you define a set of permissions to be granted for a network access request and can include:

- A profile name
- A profile description
- An associated ACL (Filter-ID)
- An associated DACL
- An associated VLAN
- An associated SGACL
- Any number of other dictionary-based attributes

Authorization Policy

An authorization policy can consist of a single rule or a set of rules that are user-defined. These rules act to create a specific policy. For example, a standard policy can include the rule name using an If-Then convention that links a value entered for identity groups with specific conditions or attributes to produce a specific set of permissions that create a unique authorization profile. There are two authorization policy options you can set:

- First Matched Rules Apply
- Multiple Matched Rule Applies

These two options direct Cisco ISE to use either the first matched or the multiple matched rule type listed in the standard policy table when it matches the user’s set of permissions. These are the two types of authorization policies that you can configure:

- Standard—Standard policies are policies created to remain in effect for long periods of time, to apply to a larger group of users, devices, or groups, and to allow access to specific or all network endpoints. Standard policies are intended to be stable and apply to a large groups of users, devices, and groups that share a common set of privileges.

  Standard policies can be used as templates that you modify to serve the needs of a specific identity group, using specific conditions or permissions, to create another type of standard policy to meet the needs of new divisions, or user groups, devices, or network groups.

- Exception—By contrast, exception policies are appropriately named because this type of policy acts as an exception to the standard policies. Exception polices are intended for authorizing limited access that is based on a variety of factors, such as short-term policy duration, specific types of network devices, network endpoints or groups, or the need to meet special conditions or permissions or an immediate requirement.

  Exception policies are created to meet an immediate or short-term need, such as authorizing a limited number of users, devices, or groups to access network resources. An exception policy lets you create a specific set of customized values for an identity group, condition, or permission that are tailored for one user or a subset of users. This allows you to create different or customized policies to meet your corporate, group, or network needs.
Access Control Lists

An access control list (ACL) in the Cisco ISE system is a list of permissions attached to a specific object or network resource. An ACL specifies which users or groups are granted access to an object, as well as what operations are allowed on a given object or network resource. Each entry in a typical ACL specifies a subject and an operation or provides the state (such as, Permit or Deny).

Authorization Policies and Supported Dictionaries

For authorization policy types, the verification must comply with the authorization profiles to be returned. Verifications typically include one or more conditions that include a user-defined name that can then be added to a library and reused by other policies. You define conditions using the attributes from the Cisco ISE dictionary, which supports the following dictionaries:

- System-defined dictionary:
  - RADIUS

- RADIUS-vendor dictionaries
  - Airespace
  - Cisco
  - Cisco-BBSM
  - Cisco-VPN3000
  - Microsoft

Guidelines for Configuring Authorization Policies and Profiles

Observe the following guidelines when managing or administering authorization polices and profiles:

- Rule names you create must use only the following supported characters:
  - Symbols: plus (+), hyphen (-), underscore (_), period (.), and a space ( ).
  - Alphabetic characters: A-Z and a-z.

- Identity groups default to “Any” (you can use this global default to apply to all users).

- Conditions allow you to set one or more policy values. However, conditions are optional and are not required to create an authorization policy. These are the two methods for creating conditions:
  - Choose an existing condition or attribute from a corresponding dictionary of choices.
  - Create a custom condition that allows you to select a suggested value or use a text box to enter a custom value.

- Condition names you create must use only the following supported characters:
  - Symbols: hyphen (-), underscore (_), and period (.)
• Alphabetic characters: A-Z and a-z.
• Numeric characters: 0-9.

• Permissions are important when choosing an authorization profile to use for a policy. A permission can grant access to specific resources or allow you to perform specific tasks. For example, if a user belongs to a specific identity group (such as Device Admins), and the user meets the defined conditions (such as a site in Boston), then this user is granted the permissions associated with that group (such as access to a specific set of network resources or permission to perform a specific operation on a device).

• Make sure that you click Save to save the new or modified policy or profile in the Cisco ISE database.

Default Authorization Policy, Rule, and Profile Configuration

The Cisco ISE software comes installed with a number of preinstalled default conditions, rules, and profiles that provide common settings that make it easier for you to create the rules and policies required in Cisco ISE authorization policies and profiles.

The table describes built-in configuration defaults that contain specified values in Cisco ISE.

Table 22: Authorization Policy, Profile, and Rule Configuration Defaults

### Configure Authorization Policies

The Authorization Policy page lets you display, create, duplicate, modify, or delete authorization policies. The following authorization policy profile sections reference example actions directed at a standard authorization policy. You can follow the same process for managing an exception authorization policy.

**Before you begin**

Before you begin this procedure, you should have a basic understanding of simple and rule-based conditions, the basic building blocks of identity groups, conditions, and permissions, and how they are used in the Admin portal.
**Procedure**

**Step 1** Choose Policy > Authorization > Standard.

**Step 2** Click the down arrow on the far-right and select either Insert New Rule Above or Insert New Rule Below.

**Step 3** Enter the rule name and select identity group, condition, attribute and permission for the authorization policy. Not all attributes you select will include the “Equals,” “Not Equals,” “Matches,” “Starts With,” or “Not Starts With” operator options.

The “Matches” operator supports and uses regular expressions (REGEX) not wildcards.

**Note** You must use the “equals” operator for straightforward comparison. “Contains” operator can be used for multi-value attributes. “Matches” operator should be used for regular expression comparison. When “Matches” operator is used, regular expression will be interpreted for both static and dynamic values.

**Step 4** Click Done.

**Step 5** Click Save to save your changes to the Cisco ISE system database and create this new authorization policy.

---

---

**Authorization Policy Attributes and Conditions**

To reuse a valid attribute when creating authorization policy conditions, select it from a dictionary that contains the supported attributes. For example, Cisco ISE provides an attribute named AuthenticationIdentityStore, which is located in the NetworkAccess dictionary. This attribute identifies the last identity source that was accessed during the authentication of a user:

- When a single identity source is used during authentication, this attribute includes the name of the identity store in which the authentication succeeded.
- When an identity source sequence is used during authentication, this attribute includes the name of the last identity source accessed.

You can use the AuthenticationStatus attribute in combination with the AuthenticationIdentityStore attribute to define a condition that identifies the identity source to which a user has successfully been authenticated. For example, to check for a condition where a user authenticated using an LDAP directory (LDAP13) in the authorization policy, you can define the following reusable condition:

```
```
The AuthenticationIdentityStore represents a text field that allows you to enter data for the condition. Ensure that you enter or copy the name correctly into this field. If the name of the identity source changes, you must ensure to modify this condition to match the change to the identity source.

To define authorization conditions that are based on an endpoint identity group that has been previously authenticated, Cisco ISE supports authorization that was defined during endpoint identity group 802.1X authentication status. When Cisco ISE performs 802.1X authentication, it extracts the MAC address from the “Calling-Station-ID” field in the RADIUS request and uses this value to look up and populate the session cache for the device's endpoint identity group (defined as an endpointIDgroup attribute).

This process makes the endpointIDgroup attribute available for use in creating authorization policy conditions, and allows you to define an authorization policy based on endpoint identity group information using this attribute, in addition to user information.

The condition for the endpoint identity group can be defined in the ID Groups column of the authorization policy configuration page. Conditions that are based on user-related information need to be defined in the “Other Conditions” section of the authorization policy. If user information is based on internal user attributes, then use the ID Group attribute in the internal user dictionary. For example, you can enter the full value path in the identity group using a value like “User Identity Group:Employee:US”.

### Time and Date Conditions

Use the Policy Elements Conditions page to display, create, modify, delete, duplicate, and search time and date policy element conditions. Policy elements are shared objects that define a condition that is based on specific time and date attribute settings that you configure.

Time and date conditions let you set or limit permission to access Cisco ISE system resources to specific times and days as directed by the attribute settings you make.

**Related Topics**

- [Time and Date Condition Settings](#), on page 834
- [Create Time and Date Conditions](#), on page 406

### Permissions for Authorization Profiles

Before you start configuring permissions for authorization profiles, make sure you:

- Understand the relationship between authorization policies and profiles
- Are familiar with the Authorization Profile page
- Know the basic guidelines to follow when configuring policies and profiles
- Understand what comprises permissions in an authorization profile

To work with Authorization Profiles, choose **Policy > Policy Elements > Results**. From the menu on the left, choose **Authorization > Authorization Profiles**.

Use the Results navigation pane as your starting point in the process for displaying, creating, modifying, deleting, duplicating, or searching policy element permissions for the different types of authorization profiles.
on your network. The Results pane initially displays Authentication, Authorization, Profiling, Posture, Client Provisioning, and Trustsec options.

Authorization profiles let you choose the attributes to be returned when a RADIUS request is accepted. Cisco ISE provides a mechanism where you can configure Common Tasks settings to support commonly-used attributes. You must enter the value for the Common Tasks attributes, which Cisco ISE translates to the underlying RADIUS values.

**Related Topics**

- Authorization Policies and Supported Dictionaries, on page 438
- Guidelines for Configuring Authorization Policies and Profiles, on page 438
- Configure Permissions for New Standard Authorization Profiles, on page 445
- Default Authorization Policy, Rule, and Profile Configuration, on page 439

### Configure Permissions for New Standard Authorization Profiles

**Procedure**

1. **Step 1** Choose Policy > Policy Elements > Results > Authorization > Authorization Profiles.
2. **Step 2** Click Add.
3. **Step 3** Enter values as required to configure a new authorization profile. Supported characters for the name field are: space, ! # $ % & ' ( ) * + , . / ; = ? @ _ { }. Once you configure the profile, you can double-check the RADIUS syntax from the Attributes Details that dynamically appear at the bottom of the screen.
4. **Step 4** Click Submit to save your changes to the Cisco ISE system database to create an authorization profile.

**Related Topics**

- Authorization Profile Settings, on page 844

### Downloadable ACLs

Access control lists (ACLs) are lists of access control entries (ACEs), which may be applied by a Policy Enforcement Point (for example, a switch) to a resource. Each ACE identifies the permissions allowed per user for that object, such as read, write, execute and more. For example, an ACL may be configured for use the Sales area of the network, with an ACE allowing Write permissions for the Sales group and a separate ACE allowing Read permissions for all other employees of the organization. With RADIUS protocol, ACLs grant authorization by filtering source and destination IP addresses, transport protocols, and additional parameters. Static ACLs reside on and are directly configured from the switch and can be applied in your authorization policies from the ISE GUI; downloadable ACLs (DACLs) can be configured, managed and applied in your authorization policies from the ISE GUI.

To implement DACLS in your network authorization policy in ISE:

1. Configure a new or existing DACL from Policy > Policy Elements > Results > Downloadable ACLs. For more information see Configure Permissions for Downloadable ACLs, on page 446.
2. Configure a new or existing authorization profile from Policy > Policy Elements > Results > Authorization Profiles, using any of the DACLS you already configured. For more information, see Configure Permissions for New Standard Authorization Profiles, on page 445.
Configure Permissions for Downloadable ACLs

With ISE, downloadable ACLs (DACLs) can be configured and implemented in your authorization policies for control of how the network is accessed by different users and groups of users. Default authorization DACLs are available with installation of ISE, including the following default profiles:

- DENY_ALL_TRAFFIC
- PERMIT_ALL_TRAFFIC

When working with DACLs, these defaults cannot be changed, but you can duplicate them in order to create additional, similar, DACLs.

Procedure

**Step 1** Choose Policy > Policy Elements > Results > Authorization > Downloadable ACLs.

**Step 2** Click Add from the top of the Downloadable ACLs table or alternatively, choose any of the existing DACLs and click Duplicate from the top of the table.

**Step 3** Enter or edit the desired values for the DACL, keeping in mind the following rules:

- Supported characters for the name field are: alphanumeric, hyphen(-), dot(.) and underscore(_)
- The keyword Any must be the source in all ACEs in the DACL. Once the DACL is pushed, the Any in the source is replaced with the IP address of the client that is connecting to the switch.
- For more information about support DACL syntax, see Supported Downloadable ACL Format for Inline Posture Node, on page 446.

**Step 4** Optionally, when you finish creating the complete list of ACEs, click Check DACL Syntax to validate the list. If there are validation errors, the check returns specific instructions identifying the invalid syntax in the window that opens automatically.

**Step 5** Click Submit.

Configure Permissions for Downloadable ACLs, on page 446

Supported Downloadable ACL Format for Inline Posture Node

The following format is supported for DACLs:

```
ACTION PROTOCOL SOURCE_SUBNET WILDCARD_MASK [OPERATOR [PORT]] DEST_SUBNET WILDCARD_MASK [OPERATOR [PORT]] [ICMP_TYPE_CODE]
```
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTION</td>
<td>Specifies whether the policy element permissions should permit or deny access.</td>
</tr>
<tr>
<td>PROTOCOL</td>
<td>Specifies any one of the following protocols:</td>
</tr>
<tr>
<td></td>
<td>• ICMP</td>
</tr>
<tr>
<td></td>
<td>• UDP</td>
</tr>
<tr>
<td></td>
<td>• TCP</td>
</tr>
<tr>
<td></td>
<td>• IP</td>
</tr>
<tr>
<td>SOURCE_SUBNET</td>
<td>Specifies the source subnet format as ‘any’.</td>
</tr>
<tr>
<td>DEST_SUBNET</td>
<td>Specifies any one of the following destination subnet formats:</td>
</tr>
<tr>
<td></td>
<td>• any</td>
</tr>
<tr>
<td></td>
<td>• host x.x.x.x</td>
</tr>
<tr>
<td></td>
<td>• &lt;subnet&gt;</td>
</tr>
<tr>
<td>WILDCARD_MASK</td>
<td>Specifies the inverse of the subnet mask. For example, 0.0.0.255.</td>
</tr>
<tr>
<td>OPERATOR</td>
<td>Specifies any one of the following operators:</td>
</tr>
<tr>
<td></td>
<td>• eq</td>
</tr>
<tr>
<td></td>
<td>• lt</td>
</tr>
<tr>
<td></td>
<td>• gt</td>
</tr>
<tr>
<td></td>
<td>• neq</td>
</tr>
<tr>
<td></td>
<td>• range</td>
</tr>
<tr>
<td>PORT</td>
<td>Specifies the port. The valid range is from 1 to 65535.</td>
</tr>
<tr>
<td>ICMP_TYPE_CODE</td>
<td>Specifies any one of the following ICMP type codes:</td>
</tr>
<tr>
<td></td>
<td>• 0—Echo reply</td>
</tr>
<tr>
<td></td>
<td>• 8—Echo request</td>
</tr>
<tr>
<td></td>
<td>• 3:[0-15]—Destination unreachable</td>
</tr>
<tr>
<td></td>
<td>• 5:[0-3]—ICMP redirects</td>
</tr>
</tbody>
</table>
Examples of acceptable ACL Format:
permit tcp any host 192.168.1.100 eq 80 — permits www traffic from anywhere to host 192.168.1.100
permit udp any eq 68 any eq 67 — permits dhcp traffic
permit icmp any any 8, permit icmp any any 0 — allows icmp echo-request and echo-reply
deny icmp any any 5:0 — denies icmp network redirects
permit ip any 67.2.2.0 0.0.0.255 — permits all traffic from the host to 67.2.2.0 subnet
permit udp any any range 16384 32767 — permits voice traffic using range of udp ports

Examples of incorrect syntax
permit ip 192.168.2.100 192.168.1.100 — host/wildcard keyword missing
permit tcp host 192.168.2.100 host 192.168.1.100 eq 88 389 636 454 3268 3269 1025 1026 (You cannot club multiple ports using eq operator, and this ACL needs to be split into multiple lines one for each destination port)

The source address for all ACEs must be defined as ANY.

Configure Permissions for Downloadable ACLs, on page 446

Machine Access Restriction for Active Directory User Authorization

Cisco ISE contains a Machine Access Restriction (MAR) component that provides an additional means of controlling authorization for Microsoft Active Directory-authentication users. This form of authorization is based on the machine authentication of the computer used to access the Cisco ISE network. For every successful machine authentication, Cisco ISE caches the value that was received in the RADIUS Calling-Station-ID attribute (attribute 31) as evidence of a successful machine authentication.

Cisco ISE retains each Calling-Station-ID attribute value in cache until the number of hours that was configured in the “Time to Live” parameter in the Active Directory Settings page expires. Once the parameter has expired, Cisco ISE deletes it from its cache.

When a user authenticates from an end-user client, Cisco ISE searches the cache for a Calling-Station-ID value from successful machine authentications for the Calling-Station-ID value that was received in the user authentication request. If Cisco ISE finds a matching user-authentication Calling-Station-ID value in the cache, this affects how Cisco ISE assigns permissions for the user that requests authentication in the following ways:

• If the Calling-Station-ID value matches one found in the Cisco ISE cache, then the authorization profile for a successful authorization is assigned.

• If the Calling-Station-ID value is not found to match one in the Cisco ISE cache, then the authorization profile for a successful user authentication without machine authentication is assigned.
Cisco ISE Profiling Service

The profiling service in Cisco Identity Services Engine (ISE) identifies the devices that connect to your network and their location. The endpoints are profiled based on the endpoint profiling policies configured in Cisco ISE. Cisco ISE then grants permission to the endpoints to access the resources in your network based on the result of the policy evaluation.
The profiling service:

- Facilitates an efficient and effective deployment and ongoing management of authentication by using IEEE standard 802.1X port-based authentication access control, MAC Authentication Bypass (MAB) authentication, and Network Admission Control (NAC) for any enterprise network of varying scale and complexity.
- Identifies, locates, and determines the capabilities of all of the attached network endpoints regardless of endpoint types.
- Protects against inadvertently denying access to some endpoints.

**Endpoint Inventory Using Profiling Service**

You can use the profiling service to discover, locate, and determine the capabilities of all the endpoints connected to your network. You can ensure and maintain appropriate access of endpoints to the enterprise network, regardless of their device types.

The profiling service collects attributes of endpoints from the network devices and the network, classifies endpoints into a specific group according to their profiles, and stores endpoints with their matched profiles in the Cisco ISE database. All the attributes that are handled by the profiling service need to be defined in the profiler dictionaries.

The profiling service identifies each endpoint on your network, and groups those endpoints according to their profiles to an existing endpoint identity group in the system, or to a new group that you can create in the system. By grouping endpoints, and applying endpoint profiling policies to the endpoint identity group, you can determine the mapping of endpoints to the corresponding endpoint profiling policies.

**Cisco ISE Profiler Queue Limit Configuration**

Cisco ISE profiler collects a significant amount of endpoint data from the network in a short period of time. It causes Java Virtual Machine (JVM) memory utilization to go up due to accumulated backlog when some of the slower Cisco ISE components process the data generated by the profiler, which results in performance degradation and stability issues.

To ensure that the profiler does not increase the JVM memory utilization and prevent JVM to go out of memory and restart, limits are applied to the following internal components of the profiler:

- Endpoint Cache—Internal cache is limited in size that has to be purged periodically (based on least recently used strategy) when the size exceeds the limit.
- Forwarder—The main ingress queue of endpoint information collected by the profiler.
- Event Handler—An internal queue that disconnects a fast component, which feeds data to a slower processing component (typically related to a database query).

**Endpoint Cache**

- maxEndPointsInLocalDb = 100000 (endpoint objects in cache)
-:endPointsPurgeIntervalSec = 300 (endpoint cache purge thread interval in seconds)
- numberOfProfilingThreads = 8 (number of threads)
The limit is applicable to all profiler internal event handlers. A monitoring alarm is triggered when queue size limit is reached.

**Cisco ISE Profiler Queue Size Limits**
- forwarderQueueSize = 5000 (endpoint collection events)
- eventHandlerQueueSize = 10000 (events)

**Event Handlers**
- NetworkDeviceEventHandler—For network device events, in addition to filtering duplicate Network Access Device (NAD) IP addresses, which are already cached.
- ARPCacheEventHandler—For ARP Cache events.

## Configure Profiling Service in Cisco ISE Nodes

You can configure the profiling service that provides you a contextual inventory of all the endpoints that are using your network resources in any Cisco ISE-enabled network.

You can configure the profiling service to run on a single Cisco ISE node that assumes all Administration, Monitoring, and Policy Service personas by default.

In a distributed deployment, the profiling service runs only on Cisco ISE nodes that assume the Policy Service persona and does not run on other Cisco ISE nodes that assume the Administration and Monitoring personas.

### Procedure

**Step 1** Choose Administration > System > Deployment.

**Step 2** Choose a Cisco ISE node that assumes the Policy Service persona.

**Step 3** Click Edit in the Deployment Nodes page.

**Step 4** On the General Settings tab, check the Policy Service check box. If the Policy Service check box is unchecked, both the session services and the profiling service check boxes are disabled.

**Step 5** Perform the following tasks:
- a) Check the Enable Session Services check box to run the Network Access, Posture, Guest, and Client Provisioning session services.
- b) Check the Enable Profiling Services check box to run the profiling service.

**Step 6** Click Save to save the node configuration.

## Network Probes Used by Profiling Service

Network probe is a method used to collect an attribute or a set of attributes from an endpoint on your network. The probe allows you to create or update endpoints with their matched profile in the Cisco ISE database.
Cisco ISE can profile devices using a number of network probes that analyze the behavior of devices on the network and determine the type of the device. Network probes help you to gain more network visibility.

**IP Address and MAC Address Binding**

You can create or update endpoints only by using their MAC addresses in an enterprise network. If you do not find an entry in the ARP cache, then you can create or update endpoints by using the L2 MAC address of an HTTP packet and the IN_SRC_MAC of a NetFlow packet in Cisco ISE. The profiling service is dependent on L2 adjacency when endpoints are only a hop away. When endpoints are L2 adjacent, the IP addresses and MAC addresses of endpoints are already mapped, and there is no need for IP-MAC cache mapping. If endpoints are not L2 adjacent and are multiple hops away, mapping may not be reliable. Some of the known attributes of NetFlow packets that you collect include PROTOCOL, L4_SRC_PORT, IPV4_SRC_ADDR, L4_DST_PORT, IPV4_DST_ADDR, IN_SRC_MAC, OUT_DST_MAC, IN_SRC_MAC, and OUT_SRC_MAC. When endpoints are not L2 adjacent and are multiple L3 hops away, the IN_SRC_MAC attributes carry only the MAC addresses of L3 network devices. When the HTTP probe is enabled in Cisco ISE, you can create endpoints only by using the MAC addresses of HTTP packets, because the HTTP request messages do not carry IP addresses and MAC addresses of endpoints in the payload data. Cisco ISE implements an ARP cache in the profiling service, so that you can reliably map the IP addresses and the MAC addresses of endpoints. For the ARP cache to function, you must enable either the DHCP probe or the RADIUS probe. The DHCP and RADIUS probes carry the IP addresses and the MAC addresses of endpoints in the payload data. The dhcp-requested address attribute in the DHCP probe and the Framed-IP-address attribute in the RADIUS probe carry the IP addresses of endpoints, along with their MAC addresses, which can be mapped and stored in the ARP cache.

**NetFlow Probe**

Cisco ISE profiler implements Cisco IOS NetFlow Version 9. We recommend using NetFlow Version 9, which has additional functionality needed to enhance the profiler to support the Cisco ISE profiling service.

You can collect NetFlow Version 9 attributes from the NetFlow-enabled network access devices to create an endpoint, or update an existing endpoint in the Cisco ISE database. You can configure NetFlow Version 9 to attach the source and destination MAC addresses of endpoints and update them. You can also create a dictionary of NetFlow attributes to support NetFlow-based profiling.

For more information on the NetFlow Version 9 Record Format, see Table 6, “NetFlow Version 9 Field Type Definitions” of the NetFlow Version 9 Flow-Record Format document.

In addition, Cisco ISE supports NetFlow versions earlier than Version 5. If you use NetFlow Version 5 in your network, then you can use Version 5 only on the primary network access device (NAD) at the access layer because it will not work anywhere else.

Cisco IOS NetFlow Version 5 packets do not contain MAC addresses of endpoints. The attributes that are collected from NetFlow Version 5 cannot be directly added to the Cisco ISE database. You can discover endpoints by using their IP addresses, and append the NetFlow Version 5 attributes to endpoints, which can be done by combining IP addresses of the network access devices and IP addresses obtained from the NetFlow Version 5 attributes. However, these endpoints must have been previously discovered with the RADIUS or SNMP probe.

The MAC address is not a part of IP flows in earlier versions of NetFlow Version 5, which requires you to profile endpoints with their IP addresses by correlating the attributes information collected from the network access devices in the endpoints cache.
For more information on the NetFlow Version 5 Record Format, see Table 2, “Cisco IOS NetFlow Flow Record and Export Format Content Information” of the NetFlow Services Solutions Guide.

**DHCP Probe**

The Dynamic Host Configuration Protocol probe in your Cisco ISE deployment, when enabled, allows the Cisco ISE profiling service to reprofile endpoints based only on new requests of INIT-REBOOT, and SELECTING message types. Though other DHCP message types such as RENEWING and REBINDING are processed, they are not used for profiling endpoints. Any attribute parsed out of DHCP packets is mapped to endpoint attributes.

**DHCPREQUEST Message Generated During INIT-REBOOT State**

If the DHCP client checks to verify a previously allocated and cached configuration, then the client must not fill in the Server identifier (server-ip) option. Instead it should fill in the Requested IP address (requested-ip) option with the previously assigned IP address, and fill in the Client IP Address (ciaddr) field with zero in its DHCPREQUEST message. The DHCP server will then send a DHCPNAK message to the client if the Requested IP address is incorrect or the client is located in the wrong network.

**DHCPREQUEST Message Generated During SELECTING State**

The DHCP client inserts the IP address of the selected DHCP server in the Server identifier (server-ip) option, fills in the Requested IP address (requested-ip) option with the value of the Your IP Address (yiaddr) field from the chosen DHCPOFFER by the client, and fills in the “ciaddr” field with zero.

**Wireless LAN Controller Configuration in DHCP Bridging Mode**

We recommend that you configure wireless LAN controllers (WLCs) in Dynamic Host Configuration Protocol (DHCP) bridging mode, where you can forward all the DHCP packets from the wireless clients to Cisco ISE. You must uncheck the Enable DHCP Proxy check box available in the WLC web interface: Controller > Advanced > DHCP Master Controller Mode > DHCP Parameters. You must also ensure that the DHCP IP helper command points to the Cisco ISE Policy Service node.

**DHCP SPAN Probe**

The DHCP Switched Port Analyzer (SPAN) probe, when initialized in a Cisco ISE node, listens to network traffic, which are coming from network access devices on a specific interface. You need to configure network access devices to forward DHCP SPAN packets to the Cisco ISE profiler from the DHCP servers. The profiler
receives these DHCP SPAN packets and parses them to capture the attributes of an endpoint, which can be used for profiling endpoints.

For example,

```
switch(config)# monitor session 1 source interface Gi1/0/4
switch(config)# monitor session 1 destination interface Gi1/0/2
```

**HTTP Probe**

In HTTP probe, the identification string is transmitted in an HTTP request-header field User-Agent, which is an attribute that can be used to create a profiling condition of IP type, and to check the web browser information. The profiler captures the web browser information from the User-Agent attribute along with other HTTP attributes from the request messages, and adds them to the list of endpoint attributes.

Cisco ISE listens to communication from the web browsers on both port 80 and port 8080. Cisco ISE provides many default profiles, which are built in to the system to identify endpoints based on the User-Agent attribute.

**HTTP SPAN Probe**

The HTTP probe in your Cisco ISE deployment, when enabled with the Switched Port Analyzer (SPAN) probe, allows the profiler to capture HTTP packets from the specified interfaces. You can use the SPAN capability on port 80, where the Cisco ISE server listens to communication from the web browsers.

HTTP SPAN collects HTTP attributes of an HTTP request-header message along with the IP addresses in the IP header (L3 header), which can be associated to an endpoint based on the MAC address of an endpoint in the L2 header. This information is useful for identifying different mobile and portable IP-enabled devices such as Apple devices, and computers with different operating systems. Identifying different mobile and portable IP-enabled devices is made more reliable because the Cisco ISE server redirects captures during a guest login or client provisioning download. This allows the profiler to collect the User-Agent attribute and other HTTP attributes, from the request messages and then identify devices such as Apple devices.

**Unable to Collect HTTP Attributes in Cisco ISE Running on VMware**

If you deploy Cisco ISE on an ESX server (VMware), the Cisco ISE profiler collects the Dynamic Host Configuration Protocol traffic but does not collect the HTTP traffic due to configuration issues on the vSphere client. To collect HTTP traffic on a VMware setup, configure the security settings by changing the Promiscuous Mode to Accept from Reject (by default) of the virtual switch that you create for the Cisco ISE profiler. When the Switched Port Analyzer (SPAN) probe for DHCP and HTTP is enabled, Cisco ISE profiler collects both the DHCP and HTTP traffic.

**RADIUS Probe**

You can configure Cisco ISE for authentication with RADIUS, where you can define a shared secret that you can use in client-server transactions. With the RADIUS request and response messages that are received from the RADIUS servers, the profiler can collect RADIUS attributes, which can be used for profiling endpoints. Cisco ISE can function as a RADIUS server, and a RADIUS proxy client to other RADIUS servers. When it acts as a proxy client, it uses external RADIUS servers to process RADIUS requests and response messages.
Network Scan (NMAP) Probe

About the NMAP Probe
Cisco ISE enables you to detect devices in a subnet by using the NMAP security scanner. You enable the NMAP probe on the Policy Service node that is enabled to run the profiling service. You use the results from that probe in an endpoint profiling policy.

Each NMAP manual subnet scan has a unique numeric ID that is used to update an endpoint source information with that scan ID. Upon detection of endpoints, the endpoint source information can also be updated to indicate that it is discovered by the Network Scan probe.

The NMAP manual subnet scan is useful for detecting devices such as printers with a static IP address assigned to them that are connected constantly to the Cisco ISE network, and therefore these devices cannot be discovered by other probes.

NMAP Scan Limitations
Scanning a subnet is highly resource intensive. Scanning a subnet is a lengthy process that depends on the size and density of the subnet. Number of active scans is always restricted to one scan, which means that you can scan only a single subnet at a time. You can cancel a subnet scan at any time while the subnet scan is in progress. You can use the Click to see latest scan results link to view the most recent network scan results that are stored in Administration > Identities > Latest Network Scan Results.

Manual NMAP Scan
The following NMAP command scans a subnet and sends the output to nmapSubnet.log:

```
nmap -O -sU -p U:161,162 -oN /opt/CSCOcpm/logs/nmapSubnet.log --append-output -oX <subnet>
```

<table>

</tr>
</tbody>
</table>

SNMP Read Only Community Strings for NMAP Manual Subnet Scan
The NMAP manual subnet scan is augmented with an SNMP Query whenever the scan discovers that UDP port 161 is open on an endpoint that results in more attributes being collected. During the NMAP manual subnet scan, the Network Scan probe detects whether SNMP port 161 is open on the device. If the port is open, an SNMP Query is triggered with a default community string (public) with SNMP version 2c. If the device supports SNMP and the default Read Only community string is set to public, you can obtain the MAC address of the device from the MIB value “ifPhysAddress”. In addition, you can configure additional SNMP Read Only community strings separated by a comma for the NMAP manual network scan in the Profiler Configuration page. You can also specify new Read Only community strings for an SNMP MIB walk with SNMP versions 1 and 2c in the following location: Administration > System > Settings > Profiling.
**Latest Network Scan Results**

The most recent network scan results are stored in Administration > Identity Management > Identities > Latest Network Scan Results.

The Latest Network Scan Results Endpoints page displays only the most recent endpoints that are detected, along with their associated endpoint profiles, their MAC addresses, and their static assignment status as the result of a manual network scan you perform on any subnet. This page allows you to edit points that are detected from the endpoint subnet for better classification, if required.

Cisco ISE allows you to perform the manual network scan from the Policy Service nodes that are enabled to run the profiling service. You must choose the Policy Service node from the primary Administration ISE node user interface in your deployment to run the manual network scan from the Policy Service node. During the manual network scan on any subnet, the Network Scan probe detects endpoints on the specified subnet, their operating systems, and check UDP ports 161 and 162 for an SNMP service.

**DNS Probe**

The Domain Name Service (DNS) probe in your Cisco ISE deployment allows the profiler to lookup an endpoint and get the fully qualified domain name (FQDN). After an endpoint is detected in your Cisco ISE-enabled network, a list of endpoint attributes is collected from the NetFlow, DHCP, DHCP SPAN, HTTP, RADIUS, or SNMP probes.

When you deploy Cisco ISE in a standalone or in a distributed environment for the first time, you are prompted to run the setup utility to configure the Cisco ISE appliance. When you run the setup utility, you will configure the Domain Name System (DNS) domain and the primary nameserver (primary DNS server), where you can configure one or more nameservers during setup. You can also change or add DNS nameservers later after deploying Cisco ISE using the CLI commands.

**DNS FQDN Lookup**

Before a DNS lookup can be performed, one of the following probes must be started along with the DNS probe: DHCP, DHCP SPAN, HTTP, RADIUS, or SNMP. This allows the DNS probe in the profiler to do a reverse DNS lookup (FQDN lookup) against specified name servers that you define in your Cisco ISE deployment. A new attribute is added to the attribute list for an endpoint, which can be used for an endpoint profiling policy evaluation. The FQDN is the new attribute that exists in the system IP dictionary. You can create an endpoint profiling condition to validate the FQDN attribute and its value for profiling. The following are the specific endpoint attributes that are required for a DNS lookup and the probe that collects these attributes:

- The dhcp-requested-address attribute—An attribute collected by the DHCP and DHCP SPAN probes.
- The SourceIP attribute—An attribute collected by the HTTP probe
- The Framed-IP-Address attribute—An attribute collected by the RADIUS probe
- The cdpCacheAddress attribute—An attribute collected by the SNMP probe

**DNS Lookup with an Inline Posture Node Deployment in Bridged Mode**

For the Domain Name Service probe to work with Inline Posture deployment in the Bridged mode, you must configure the callStationIdType information sent in RADIUS messages for the Wireless LAN Controllers (WLCs). The Framed-IP-Address attribute in RADIUS messages does not contain the Call Station ID type in the MAC address format. Therefore RADIUS messages cannot be associated with the MAC address of
endpoints, and the DNS probe is unable to perform the reverse DNS lookup. In order to profile endpoints, you must enable the RADIUS, and DNS probes in Cisco ISE, and then configure the WLCs to send the calling station ID in the MAC address format instead of the current IP address format in RADIUS messages. The WLCs must be configured to send the calling station ID in the MAC address format instead of the current IP address format in RADIUS messages. Once the callStationIdType is configured in the WLCs, the configuration uses the selected calling station ID for communications with RADIUS servers and other applications. It results in endpoints authentication, and then the DNS probe does a reverse DNS lookup (FQDN lookup) against the specified name servers and update the FQDN of endpoints.

**Configure Call Station ID Type in the WLC Web Interface**

You can use the WLC web interface to configure Call Station ID Type information. You can go to the Security tab of the WLC web interface to configure the calling station ID in the RADIUS Authentication Servers page. The MAC Delimiter field is set to Colon by default in the WLC user interface.

For more information on how to configure in the WLC web interface, see Chapter 6, “Configuring Security Solutions” in the Cisco Wireless LAN Controller Configuration Guide, Release 7.2.

For more information on how to configure in the WLC CLI using the `config radius callStationIdType` command, see Chapter 2, “Controller Commands” in the Cisco Wireless LAN Controller Command Reference Guide, Release 7.2.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Log in to your Wireless LAN Controller user interface.</td>
</tr>
<tr>

<td>Choose Colon from the MAC Delimiter drop-down list.</td>
</tr>
</tbody>
</table>

**SNMP Query Probe**

In addition to configuring the SNMP Query probe in the Edit Node page, you must configure other Simple Management Protocol settings in the following location: Administration > Network Resources > Network Devices.

You can configure SNMP settings in the new network access devices (NADs) in the Network Devices list page. The polling interval that you specify in the SNMP query probe or in the SNMP settings in the network access devices query NADs at regular intervals.

You can turn on and turn off SNMP querying for specific NADs based on the following configurations:

- SNMP query on Link up and New MAC notification turned on or turned off
- SNMP query on Link up and New MAC notification turned on or turned off for Cisco Discovery Protocol information
- SNMP query timer for once an hour for each switch by default
For an iDevice, and other mobile devices that do not support SNMP, the MAC address can be discovered by the ARP table, which can be queried from the network access device by an SNMP Query probe.

**Cisco Discovery Protocol Support with SNMP Query**

When you configure SNMP settings on the network devices, you must ensure that the Cisco Discovery Protocol is enabled (by default) on all the ports of the network devices. If you disable the Cisco Discovery Protocol on any of the ports on the network devices, then you may not be able to profile properly because you will miss the Cisco Discovery Protocol information of all the connected endpoints. You can enable the Cisco Discovery Protocol globally by using the cdp run command on a network device, and enable the Cisco Discovery Protocol by using the cdp enable command on any interface of the network access device. To disable the Cisco Discovery Protocol on the network device and on the interface, use the no keyword at the beginning of the commands.

**Link Layer Discovery Protocol Support with SNMP Query**

The Cisco ISE profiler uses an SNMP Query to collect LLDP attributes. You can also collect LLDP attributes from a Cisco IOS sensor, which is embedded in the network device, by using the RADIUS probe. See the default LLDP configuration settings that you can use to configure LLDP global configuration and LLDP interface configuration commands on the network access devices.

<table>

**CDP and LLDP Capability Codes Displayed in a Single Character**

The Attribute List of an endpoint displays a single character value for the lldpCacheCapabilities and lldpCapabilitiesMapSupported attributes. The values are the Capability Codes that are displayed for the network access device that runs CDP and LLDP.

**Example 1**

```
lldpCacheCapabilities S
lldpCapabilitiesMapSupported S
```
Example 2

```
lldpCacheCapabilities B;T
lldpCapabilitiesMapSupported B;T
```

Example 3

```
Switch# show cdp neighbors
Capability Codes:
R - Router, T - Trans Bridge, B - Source Route Bridge, S - Switch, H - Host, I - IGMP,
r - Repeater, P - Phone, D - Remote, C - CVTA, M - Two-port Mac Relay
...
Switch#

Switch# show lldp neighbors
Capability codes:
(R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device
(W) WLAN Access Point, (P) Repeater, (S) Station, (O) Other
...
Switch#
```

SNMP Trap Probe

The SNMP Trap receives information from the specific network access devices that support MAC notification, linkup, linkdown, and informs. The SNMP Trap probe receives information from the specific network access devices when ports come up or go down and endpoints disconnect from or connect to your network, which results in the information received that is not sufficient to create endpoints in Cisco ISE.

For SNMP Trap to be fully functional and create endpoints, you must enable SNMP Query so that the SNMP Query probe triggers a poll event on the particular port of the network access device when a trap is received. To make this feature fully functional you should configure the network access device and SNMP Trap.

---

**Note**

Cisco ISE does not support SNMP Traps that are received from the Wireless LAN Controllers (WLCs) and Access Points (APs).

---

Configure Probes per Cisco ISE Node

You can configure one or more probes on the Profiling Configuration tab per Cisco ISE node in your deployment that assumes the Policy Service persona, which could be:

- A standalone node—If you have deployed Cisco ISE on a single node that assumes all Administration, Monitoring, and Policy Service personas by default.
- Multiple nodes—If you have registered more than one node in your deployment that assume Policy Service persona.
Before you begin

You can configure the probes per Cisco ISE node only from the Administration node, which is unavailable on the secondary Administration node in a distributed deployment.

Procedure

Step 1 Choose Administration > System > Deployment.
Step 2 Choose a Cisco ISE node that assumes the Policy Service persona.
Step 3 Click Edit in the Deployment Nodes page.
Step 4 On the General Settings tab, check the Policy Service check box. If the Policy Service check box is unchecked, both the session services and the profiling service check boxes are disabled.
Step 5 Check the Enable Profiling Services check box.
Step 6 Click the Profiling Configuration tab.
Step 7 Configure the values for each probe.
Step 8 Click Save to save the probe configuration.

Setup CoA, SNMP RO Community, and Endpoint Attribute Filter

Cisco ISE allows a global configuration to issue a Change of Authorization (CoA) in the Profiler Configuration page that enables the profiling service with more control over endpoints that are already authenticated.

In addition, you can configure additional SNMP Read Only community strings separated by a comma for the NMAP manual network scan in the Profiler Configuration page. The SNMP RO community strings are used in the same order as they appear in the Current custom SNMP community strings field.

You can also configure endpoint attribute filtering in the Profiler Configuration page.

Procedure

Step 1 Choose Administration > System > Settings > Profiling.
Step 2 Choose one of the following settings to configure the CoA type:

- **No CoA** (default)—You can use this option to disable the global configuration of CoA. This setting overrides any configured CoA per endpoint profiling policy.

- **Port Bounce**—You can use this option, if the switch port exists with only one session. If the port exists with multiple sessions, then use the Reauth option.

- **Reauth**—You can use this option to enforce reauthentication of an already authenticated endpoint when it is profiled.

If you have multiple active sessions on a single port, the profiling service issues a CoA with the Reauth option even though you have configured CoA with the Port Bounce option. This function avoids disconnecting other sessions, a situation that might occur with the Port Bounce option.
Step 3 Enter new SNMP community strings separated by a comma for the NMAP manual network scan in the Change custom SNMP community strings field, and re-enter the strings in the Confirm custom SNMP community strings field for confirmation.

Step 4 Check the Endpoint Attribute Filter check box to enable endpoint attribute filtering.

Step 5 Click Save.

Global Configuration of Change of Authorization for Authenticated Endpoints

You can use the global configuration option to disable change of authorization (CoA) by using the default No CoA option or enable CoA by using port bounce and reauthentication options. If you have configured Port Bounce for CoA in Cisco ISE, the profiling service may still issue other CoAs as described in the “CoA Exemptions” section.

You can use the RADIUS probe or the Monitoring persona REST API to authenticate the endpoints. You can enable the RADIUS probe, which allows faster performance. If you have enabled CoA, then we recommend that you enable the RADIUS probe in conjunction with your CoA configuration in the Cisco ISE application for faster performance. The profiling service can then issue an appropriate CoA for endpoints by using the RADIUS attributes that are collected.

If you have disabled the RADIUS probe in the Cisco ISE application, then you can rely on the Monitoring persona REST API to issue CoAs. This allows the profiling service to support a wider range of endpoints. In a distributed deployment, your network must have at least one Cisco ISE node that assumes the Monitoring persona to rely on the Monitoring persona REST API to issue a CoA.

Cisco ISE arbitrarily will designate either the primary or secondary Monitoring node as the default destination for REST queries in your distributed deployment, because both the primary and secondary Monitoring nodes have identical session directory information.

Use Cases for Issuing Change of Authorization

The profiling service issues the change of authorization in the following cases:

- Endpoint deleted—When an endpoint is deleted from the Endpoints page and the endpoint is disconnected or removed from the network.

- An exception action is configured—If you have an exception action configured per profile that leads to an unusual or an unacceptable event from that endpoint. The profiling service moves the endpoint to the corresponding static profile by issuing a CoA.

- An endpoint is profiled for the first time—When an endpoint is not statically assigned and profiled for the first time; for example, the profile changes from an unknown to a known profile.

  - An endpoint identity group has changed—When an endpoint is added or removed from an endpoint identity group that is used by an authorization policy.

The profiling service issues a CoA when there is any change in an endpoint identity group, and the endpoint identity group is used in the authorization policy for the following:

- The endpoint identity group changes for endpoints when they are dynamically profiled

- The endpoint identity group changes when the static assignment flag is set to true for a dynamic endpoint
An endpoint profiling policy has changed and the policy is used in an authorization policy—When an endpoint profiling policy changes, and the policy is included in a logical profile that is used in an authorization policy. The endpoint profiling policy may change due to the profiling policy match or when an endpoint is statically assigned to an endpoint profiling policy, which is associated to a logical profile. In both the cases, the profiling service issues a CoA, only when the endpoint profiling policy is used in an authorization policy.

Exemptions for Issuing a Change of Authorization

The profiling service does not issue a CoA when there is a change in an endpoint identity group and the static assignment is already true.

Cisco ISE does not issue a CoA for the following reasons:

- An Endpoint disconnected from the network—When an endpoint disconnected from your network is discovered.
- Authenticated wired (Extensible Authentication Protocol) EAP-capable endpoint—When an authenticated wired EAP-capable endpoint is discovered.
- Multiple active sessions per port—When you have multiple active sessions on a single port, the profiling service issues a CoA with the Reauth option even though you have configured CoA with the Port Bounce option.
- Packet-of-Disconnect CoA (Terminate Session) when a wireless endpoint is detected—If an endpoint is discovered as wireless, then a Packet-of-Disconnect CoA (Terminate-Session) is issued instead of the Port Bounce CoA. The benefit of this change is to support the Wireless LAN Controller (WLC) CoA.
- An Endpoint Created through Guest Device Registration flow—When endpoints are created through device registration for the guests. Even though CoA is enabled globally in Cisco ISE, the profiling service does not issue a CoA so that the device registration flow is not affected. In particular, the PortBounce CoA global configuration breaks the flow of the connecting endpoint.
- Global No CoA Setting overrides Policy CoA—Global No CoA overrides all configuration settings in endpoint profiling policies as there is no CoA issued in Cisco ISE irrespective of CoA configured per endpoint profiling policy.

Note

No CoA and Reauth CoA configurations are not affected, and the profiler service applies the same CoA configuration for wired and wireless endpoints.
Change of Authorization Issued for Each Type of CoA Configuration

Attribute Filters for ISE Database Persistence and Performance

Cisco ISE implements filters for Dynamic Host Configuration Protocol (both DHCP Helper and DHCP SPAN), HTTP, RADIUS, and Simple Network Management Protocol probes except for the NetFlow probe to address performance degradation. Each probe filter contains the list of attributes that are temporal and irrelevant for endpoint profiling and removes those attributes from the attributes collected by the probes.

The isebootstrap log (isebootstrap-yyyyymmdd-xxxxxx.log) contains messages that handle the creation of dictionaries and with filtering of attributes from the dictionaries. You can also configure to log a debug message when endpoints go through the filtering phase to indicate that filtering has occurred.

The Cisco ISE profiler invokes the following endpoint attribute filters:

- A DHCP filter for both the DHCP Helper and DHCP SPAN contains all the attributes that are not necessary and they are removed after parsing DHCP packets. The attributes after filtering are merged with existing attributes in the endpoint cache for an endpoint.

- An HTTP filter is used for filtering attributes from HTTP packets, where there is no significant change in the set of attributes after filtering.

- A RADIUS filter is used once the syslog parsing is complete and endpoint attributes are merged into the endpoint cache for profiling.
- SNMP filter for SNMP Query includes separate CDP and LLDP filters, which are all used for SNMP-Query probe.

Global Setting to Filter Endpoint Attributes with Whitelist

You can reduce the number of persistence events and replication events by reducing the number of endpoint attributes that do not change frequently at the collection point. Enabling the EndPoint Attribute Filter will have the Cisco ISE profiler only to keep significant attributes and discard all other attributes. Significant attributes are those used by the Cisco ISE system or those used specifically in an endpoint profiling policy or rule.

A whitelist is a set of attributes that are used in custom endpoint profiling policies for profiling endpoints, and that are essential for Change of Authorization (CoA), Bring Your Own Device (BYOD), Device Registration WebAuth (DRW), and so on to function in Cisco ISE as expected. The whitelist is always used as a criteria when ownership changes for the endpoint (when attributes are collected by multiple Policy Service nodes) even when disabled.

By default, the whitelist is disabled and the attributes are dropped only when the attribute filter is enabled. The white list is dynamically updated when endpoint profiling policies change including from the feed to include new attributes in the profiling policies. Any attribute that is not present in the whitelist is dropped immediately at the time of collection, and the attribute cannot participate in profiling endpoints. When combined with the buffering, the number of persistence events can be reduced.

You must ensure that the whitelist contains a set of attributes determined from the following two sources:

- A set of attributes that are used in the default profiles so that you can match endpoints to the profiles.
- A set of attributes that are essential for Change of Authorization (CoA), Bring Your Own Device (BYOD), Device Registration WebAuth (DRW), and so on to function as expected.

An IOS sensor integration allows Cisco ISE run time and the Cisco ISE profiler to collect any or all of the attributes that are sent from the switch. You can collect DHCP, CDP, and LLDP attributes directly from the switch by using the RADIUS protocol. The attributes that are collected for DHCP, CDP, and LLDP are then parsed and mapped to attributes in the profiler dictionaries in the following location: Policy > Policy Elements > Dictionaries.

For information about the supported Catalyst platforms for Device sensors, see https://communities.cisco.com/docs/DOC-72932.
Integrating IOS sensor embedded network access devices with Cisco ISE involves the following components:

- An IOS sensor
- Data collector that is embedded in the network access device (switch) for gathering DHCP, CDP, and LLDP data
- Analyzers for processing the data and determining the device-type of endpoints

There are two ways of deploying an analyzer, but they are not expected to be used in conjunction with each other:

- An analyzer can be deployed in Cisco ISE
- Analyzers can be embedded in the switch as the sensor

### Configuration Checklist for IOS Sensor-Enabled Network Access Devices

This section summarizes a list of tasks that you must configure in the IOS sensor-enabled switches and Cisco ISE to collect DHCP, CDP, and LLDP attributes directly from the switch:

- Ensure that the RADIUS probe is enabled in Cisco ISE.
- Ensure that network access devices support an IOS sensor for collecting DHCP, CDP, and LLDP information.
- Ensure that network access devices run the following CDP and LLDP commands to capture CDP and LLDP information from endpoints:

  ```
  cdp enable
  lldp run
  ```

- Ensure that session accounting is enabled separately by using the standard AAA and RADIUS commands.
  
  For example, use the following commands:

  ```
  aaa new-model
  aaa accounting dot1x default start-stop group radius
  radius-server host <ip> auth-port <port> acct-port <port> key <shared-secret>
  radius-server vsa send accounting
  ```

- Ensure that you run IOS sensor-specific commands.

  - Enabling Accounting Augmentation
    
    You must enable the network access devices to add IOS sensor protocol data to the RADIUS accounting messages and to generate additional accounting events when it detects new sensor protocol data. This means that any RADIUS accounting message should include all CDP, LLDP, and DHCP attributes.
    
    Enter the following global command:
    
    `device-sensor accounting`

  - Disabling Accounting Augmentation
To disable (accounting) network access devices and add IOS sensor protocol data to the RADIUS accounting messages for sessions that are hosted on a given port (if the accounting feature is globally enabled), enter the following command at the appropriate port:

```
nodevicesensoraccounting
```

- TLV Change Tracking

By default, for each supported peer protocol, client notifications and accounting events are generated only when an incoming packet includes a type, length, and value (TLV) that has not been received previously in the context of a given session.

You must enable client notifications and accounting events for all TLV changes where there are either new TLVs, or where previously received TLVs have different values. Enter the following command:

```
devicesensornotifyall-changes
```

- Be sure that you disable the IOS Device Classifier (local analyzer) in the network access devices.

Enter the following command:

```
nomacroautomonitor
```

**Note**

This command prevents network access devices from sending two identical RADIUS accounting messages per change.

---

**Profiler Conditions**

Profiling conditions are policy elements and are similar to other conditions. However unlike authentication, authorization, and guest conditions, the profiling conditions can be based on a limited number of attributes. The Profiler Conditions page lists the attributes that are available in Cisco ISE and their description.

Profiler conditions can be one of the following:

- **Cisco Provided**—Cisco ISE includes predefined profiling conditions when deployed and they are identified as Cisco Provided in the Profiler Conditions page. You cannot delete Cisco Provided profiling conditions.

  You can also find Cisco Provided conditions in the System profiler dictionaries in the following location: Policy > Policy Elements > Dictionaries > System.

  For example, MAC dictionary. For some products, the OUI (Organizationally Unique Identifier) is an unique attribute that you can use it first for identifying the manufacturing organization of devices. It is a component of the device MAC address. The MAC dictionary contains the MAC Address and OUI attributes.

- **Administrator Created**—Profiler conditions that you create as an administrator of Cisco ISE or predefined profiling conditions that are duplicated are identified as Administrator Created. You can create a profiler condition of DHCP, MAC, SNMP, IP, RADIUS, NetFlow, CDP, LLDP, and NMAP types using the profiler dictionaries in the Profiler Conditions page.
Although, the recommended upper limit for the number of profiling policies is 1000, you can stretch up to 2000 profiling policies.

Profiling Network Scan Actions

An endpoint scan action is a configurable action that can be referred to in an endpoint profiling policy, and that is triggered when the conditions that are associated with the network scan action are met.

An endpoint scan is used to scan endpoints in order to limit resources usage in the Cisco ISE system. A network scan action scans a single endpoint, unlike resource-intensive network scans. It improves the overall classification of endpoints, and redefines an endpoint profile for an endpoint. Endpoint scans can be processed only one at a time.

You can associate a single network scan action to an endpoint profiling policy. Cisco ISE predefines three scanning types for a network scan action, which can include one or all three scanning types: for instance, an OS-scan, an SNMPPortsAndOS-scan, and a CommonPortsAndOS-scan. You cannot edit or delete OS-scan, SNMPPortsAndOS-scan, and CommonPortsAndOS-scans, which are predefined network scan actions in Cisco ISE. You can also create a new network scan action of your own.

Once an endpoint is appropriately profiled, the configured network scan action cannot be used against that endpoint. For example, scanning an Apple-Device allows you to classify the scanned endpoint to an Apple device. Once an OS-scan determines the operating system that an endpoint is running, it is no longer matched to an Apple-Device profile, but it is matched to an appropriate profile for an Apple device.

Create a New Network Scan Action

A network scan action that is associated with an endpoint profiling policy scans an endpoint for an operating system, Simple Network Management Protocol (SNMP) ports, and common ports. Cisco provides network scan actions for the most common NMAP scans, but you can also create one of your own.

When you create a new network scan, you define the type of information that the NMAP probe will scan for.

Before you begin

The Network Scan (NMAP) probe must be enabled before you can define a rule to trigger a network scan action. The procedure for that is described in Configure Probes per Cisco ISE Node.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Policy &gt; Policy Elements &gt; Results &gt; Profiling &gt; Network Scan (NMAP) Actions.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Add.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter a name and description for the network scan action that you want to create.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Check one or more check boxes when you want to scan an endpoint for the following:</td>
</tr>
<tr>
<td></td>
<td>• Scan OS—To scan for an operating system</td>
</tr>
<tr>
<td></td>
<td>• Scan SNMP Port—To scan SNMP ports (161, 162)</td>
</tr>
<tr>
<td></td>
<td>• Scan Common Port—To scan common ports.</td>
</tr>
</tbody>
</table>
Step 5  
Click Submit.

NMAP Operating System Scan

The operating system scan (OS-scan) type scans for an operating system (and OS version) that an endpoint is running. This is a resource intensive scan.

The NMAP tool has limitations on OS-scan which may cause unreliable results. For example, when scanning an operating system of network devices such as switches and routers, the NMAP OS-scan may provide an incorrect operating-system attribute for those devices. Cisco ISE displays the operating-system attribute, even if the accuracy is not 100%.

You should configure endpoint profiling policies that use the NMAP operating-system attribute in their rules to have low certainty value conditions (Certainty Factor values). We recommend that whenever you create an endpoint profiling policy based on the NMAP:operating-system attribute, include an AND condition to help filter out false results from NMAP.

The following NMAP command scans the operating system when you associate Scan OS with an endpoint profiling policy:

```
nmap -sS -O -F -oN /opt/CSCOcpm/logs/nmap.log -append-output -oX - <IP-address>
```

The following NMAP command scans a subnet and sends the output to nmapSubnet.log:

```
nmap -O -sU -p U:161,162 -oN /opt/CSCOcpm/logs/nmapSubnet.log  
--append-output -oX - <subnet>
```

**NMAP SNMP Port Scan**

The SNMPPortsAndOS-scan type scans an operating system (and OS version) that an endpoint is running and triggers an SNMP Query when SNMP ports (161 and 162) are open. It can be used for endpoints that are identified and matched initially with an Unknown profile for better classification.

The following NMAP command scans SNMP ports (UDP 161 and 162) when you associate the Scan SNMP Port with an endpoint profiling policy:

```
nmap -sU -p U:161,162 -oN /opt/CSCOcpm/logs/nmap.log --append-output -oX - <IP-address>
```

**Table 30: NMAP Commands for an Endpoint SNMP Port Scan**

| `-sU` | UDP scan. |
| `-p <port-ranges>` | Scans only specified ports. For example, scans UDP ports 161 and 16.2 |
| `-oN` | Normal output. |
| `-oX` | XML output. |
| `IP-address` | IP-address of an endpoint that is scanned. |

**NMAP Common Ports Scan**

The CommonPortsAndOS-scan type scans an operating system (and OS version) that an endpoint is running and common ports (TCP and UDP), but not SNMP ports. The following NMAP command scans common ports when you associate Scan Common Port with an endpoint profiling policy:

```
```

**Table 31: NMAP Commands for an Endpoint Common Ports Scan**

| `-sTU` | Both TCP connect scan and UDP scan. |
| `-oN` | Normal output. |
| `-oX` | XML output. |
| `IP address` | IP address of an endpoint that is scanned. |
Common Ports

The following table lists the common ports that NMAP uses for scanning.

Create a Profiler Condition

Endpoint profiling policies in Cisco ISE allow you to categorize discovered endpoints on your network, and assign them to specific endpoint identity groups. These endpoint profiling policies are made up of profiling conditions that Cisco ISE evaluates to categorize and group endpoints.

**Before you begin**

To perform the following task, you must be a Super Admin or Policy Admin.

**Procedure**

**Step 1** Choose **Policy > Policy Elements > Conditions > Profiling > Add**.
**Step 2** Enter values for the fields as described in the Endpoint Profiling Policies Settings, on page 816.
**Step 3** Click **Submit** to save the profiler condition.
**Step 4** Repeat this procedure to create more conditions.
Related Topics
Profiler Conditions, on page 402

Endpoint Profiling Policy Rules

You can define a rule that allows you to choose one or more profiling conditions from the library that are previously created and saved in the policy elements library, and to associate an integer value for the certainty factor for each condition, or associate either an exception action or a network scan action for that condition. The exception action or the network scan action is used to trigger the configurable action while Cisco ISE is evaluating the profiling policies with respect to the overall classification of endpoints.

When the rules in a given policy are evaluated separately with an OR operator, the certainty metric for each rule contributes to the overall matching of the endpoint profiles into a specific category of endpoints. If the rules of an endpoint profiling policy match, then the profiling policy and the matched policy are the same for that endpoint when they are dynamically discovered on your network.

Logically Grouped Conditions in Rules

An endpoint profiling policy (profile) contains a single condition or a combination of multiple single conditions that are logically combined using an AND or OR operator, against which you can check, categorize, and group endpoints for a given rule in a policy.

A condition is used to check the collected endpoint attribute value against the value specified in the condition for an endpoint. If you map more than one attribute, you can logically group the conditions, which helps you to categorize endpoints on your network. You can check endpoints against one or more such conditions with a corresponding certainty metric (an integer value that you define) associated with it in a rule or trigger an exception action that is associated to the condition or a network scan action that is associated to the condition.

Certainty Factor

The minimum certainty metric in the profiling policy evaluates the matching profile for an endpoint. Each rule in an endpoint profiling policy has a minimum certainty metric (an integer value) associated to the profiling conditions. The certainty metric is a measure that is added for all the valid rules in an endpoint profiling policy, which measures how each condition in an endpoint profiling policy contributes to improve the overall classification of endpoints.

The certainty metric for each rule contributes to the overall matching of the endpoint profiles into a specific category of endpoints. The certainty metric for all the valid rules are added together to form the matching certainty. It must exceed the minimum certainty factor that is defined in an endpoint profiling policy. By default, the minimum certainty factor for all new profiling policy rules and predefined profiling policies is 10.

Create Endpoint Profiling Policies

You can use the Profiling Policies page to manage endpoint profiling policies that you create as an administrator of Cisco ISE, and also endpoint profiling profiles that are provided by Cisco ISE when deployed.

You can create new profiling policies to profile endpoints by using the following options in the New Profiler Policy page:

- Policy Enabled
Create an Identity Group for the policy to create a matching endpoint identity group or use the endpoint identity group hierarchy.

- Parent Policy
- Associated CoA Type

---

**Note**

When you choose to create an endpoint policy in the Profiling Policies page, do not use the Stop button on your web browsers. This action leads to the following: stops loading the New Profiler Policy page, loads other list pages and the menus within the list pages when you access them, and prevents you from performing operations on all the menus within the list pages except the Filter menus. You might need to log out of Cisco ISE, and then log in again to perform operations on all the menus within the list pages.

You can create a similar characteristic profiling policy by duplicating an endpoint profiling policy through which you can modify an existing profiling policy instead of creating a new profiling policy by redefining all conditions.

**Procedure**

1. Choose **Policy > Profiling > Profiling Policies**.
2. Click **Add**.
3. Enter a name and description for the new endpoint policy that you want to create. The **Policy Enabled** check box is checked by default to include the endpoint profiling policy for validation when you profile an endpoint.
4. Enter a value for the minimum certainty factor within the valid range 1 to 65535.
5. Click the arrow next to the **Exception Action** drop-down list to associate an exception action or click the arrow next to the **Network Scan (NMAP) Action** drop-down list to associate a network scan action.
6. Choose one of the following options for **Create an Identity Group for the policy**:
   - Yes, create matching Identity Group
   - No, use existing Identity Group hierarchy
7. Click the arrow next to the **Parent Policy** drop-down list to associate a parent policy to the new endpoint policy.
8. Choose a CoA type to be associated in the **Associated CoA Type** drop-down list.
9. Click in the rule to add conditions and associate an integer value for the certainty factor for each condition or associate either an exception action or a network scan action for that condition for the overall classification of an endpoint.
10. Click **Submit** to add an endpoint policy or click the **Profiler Policy List** link from the New Profiler Policy page to return to the Profiling Policies page.
Change of Authorization Configuration per Endpoint Profiling Policy

In addition to the global configuration of change of authorization (CoA) types in Cisco ISE, you can also configure to issue a specific type of CoA associated for each endpoint profiling policy.

The global No CoA type configuration overrides each CoA type configured in an endpoint profiling policy. If the global CoA type is set other than the No CoA type, then each endpoint profiling policy is allowed to override the global CoA configuration.

When a CoA is triggered, each endpoint profiling policy can determine the actual CoA type, as follows:

- **General Setting**—This is the default setting for all the endpoint profiling policies that issues a CoA per global configuration.
- **No CoA**—This setting overrides any global configuration and disables CoA for the profile.
- **Port Bounce**—This setting overrides the global Port Bounce and Reauth configuration types, and issues port bounce CoA.
- **Reauth**—This setting overrides the global Port Bounce and Reauth configuration types, and issues reauthentication CoA.

**Note**

If the profiler global CoA configuration is set to Port Bounce (or Reauth), ensure that you configure corresponding endpoint profiling policies with No CoA, the per-policy CoA option so that the BYOD flow does not break for your mobile devices.

See the summary of configuration below combined for all the CoA types and the actual CoA type issued in each case based on the global and endpoint profiling policy settings.

**Table 33: CoA Type Issued for Various Combination of Configuration**

Import Endpoint Profiling Policies

You can import endpoint profiling policies from a file in XML by using the same format that you can create in the export function. If you import newly created profiling policies that have parent policies associated, then you must have defined parent policies before you define child policies.

The imported file contains the hierarchy of endpoint profiling policies that contain the parent policy first, then the profile that you imported next along with the rules and checks that are defined in the policy.
Export Endpoint Profiling Policies

You can export endpoint profiling policies to other Cisco ISE deployments. Or, you can use the XML file as a template for creating your own policies to import. You can also download the file to your system in the default location, which can be used for importing later.

A dialog appears when you want to export endpoint profiling policies, which prompts you to open the profiler_policies.xml with an appropriate application or save it. This is a file in XML format that you can open in a web browser, or in other appropriate applications.

Predefined Endpoint Profiling Policies

Cisco ISE includes predefined default profiling policies when Cisco ISE is deployed, and their hierarchical construction allows you to categorize identified endpoints on your network, and assign them to a matching endpoint identity groups. Because endpoint profiling policies are hierarchical, you can find that the Profiling Policies page displays the list of generic (parent) policies for devices and child policies to which their parent policies are associated in the Profiling Policies list page.

The Profiling Policies page displays endpoint profiling policies with their names, type, description and the status, if enabled or not for validation.

The endpoint profiling policy types are classified as follows:
• Cisco Provided—Endpoint profiling policies that are predefined in Cisco ISE are identified as the Cisco Provided type.

• Administrator Modified—Endpoint profiling policies are identified as the Administrator Modified type when you modify predefined endpoint profiling policies. Cisco ISE overwrites changes that you have made in the predefined endpoint profiling policies during upgrade.

You can delete administrator-modified policies but Cisco ISE replaces them with up-to-date versions of Cisco-provided policies.

• Administrator Created—Endpoint profiling policies that you create or when you duplicate Cisco-provided endpoint profiling policies are identified as the Administrator Created type.

We recommend that you create a generic policy (a parent) for a set of endpoints from which its children can inherit the rules and conditions. If an endpoint has to be classified, then the endpoint profile has to first match the parent, and then its descendant (child) policies when you are profiling an endpoint.

For example, Cisco-Device is a generic endpoint profiling policy for all Cisco devices, and other policies for Cisco devices are children of Cisco-Device. If an endpoint has to be classified as a Cisco-IP-Phone 7960, then the endpoint profile for this endpoint has to first match the parent Cisco-Device policy, its child Cisco-IP-Phone policy, and then the Cisco-IP-Phone 7960 profiling policy for better classification.

**Predefined Endpoint Profiling Policies Overwritten During Upgrade**

You can edit existing endpoint profiling policies in the Profiling Policies page. You must also save all your configurations in a copy of the predefined endpoint profiles when you want to modify the predefined endpoint profiling policies.

During an upgrade, Cisco ISE overwrites any configuration that you have saved in the predefined endpoint profiles.

**Unable to Delete Endpoint Profiling Policies**

You can delete selected or all the endpoint profiling policies in the Profiling Policies page. By default, you can delete all the endpoint profiling policies from the Profiling Policies page. When you select all the endpoint profiling policies and try to delete them in the Profiling Policies page, some of them may not be deleted when the endpoint profiling policies are a parent policy mapped to other endpoint profiling policies or mapped to an authorization policy and a parent policy to other endpoint profiling policies.

For example,

• You cannot delete Cisco Provided endpoint profiling policies,

• You cannot delete a parent profile in the Profiling Policies page when an endpoint profile is defined as a parent to other endpoint profiles. For example, Cisco-Device is a parent to other endpoint profiling policies for Cisco devices.

• You cannot delete an endpoint profile when it is mapped to an authorization policy. For example, Cisco-IP-Phone is mapped to the Profiled Cisco IP Phones authorization policy, and it is a parent to other endpoint profiling policies for Cisco IP Phones.
Predefined Profiling Policies for Draeger Medical Devices

Cisco ISE contains default endpoint profiling policies that include a generic policy for Draeger medical devices, a policy for Draeger-Delta medical device, and a policy for Draeger-M300 medical device. Both the medical devices share ports 2050 and 2150, and therefore you cannot classify the Draeger-Delta and Draeger-M300 medical devices when you are using the default Draeger endpoint profiling policies.

If these Draeger devices share ports 2050 and 2150 in your environment, you must add a rule in addition to checking for the device destination IP address in the default Draeger-Delta and Draeger-M300 endpoint profiling policies so that you can distinguish these medical devices.

Cisco ISE includes the following profiling conditions that are used in the endpoint profiling policies for the Draeger medical devices:

- Draeger-Delta-PortCheck1 that contains port 2000
- Draeger-Delta-PortCheck2 that contains port 2050
- Draeger-Delta-PortCheck3 that contains port 2100
- Draeger-Delta-PortCheck4 that contains port 2150
- Draeger-M300PortCheck1 that contains port 1950
- Draeger-M300PortCheck2 that contains port 2050
- Draeger-M300PortCheck3 that contains port 2150

Endpoint Profiling Policy for Unknown Endpoints

An endpoint that does not match existing profiles and cannot be profiled in Cisco ISE is an unknown endpoint. An unknown profile is the default system profiling policy that is assigned to an endpoint, where an attribute or a set of attributes collected for that endpoint do not match with existing profiles in Cisco ISE.

An Unknown profile is assigned in the following scenarios:

- When an endpoint is dynamically discovered in Cisco ISE, and there is no matching endpoint profiling policy for that endpoint, it is assigned to the unknown profile.
- When an endpoint is statically added in Cisco ISE, and there is no matching endpoint profiling policy for a statically added endpoint, it is assigned to the unknown profile.

If you have statically added an endpoint to your network, the statically added endpoint is not profiled by the profiling service in Cisco ISE. You can change the unknown profile later to an appropriate profile and Cisco ISE will not reassign the profiling policy that you have assigned.

Endpoint Profiling Policy for Statically Added Endpoints

For the endpoint that is statically added to be profiled, the profiling service computes a profile for the endpoint by adding a new MATCHEDPROFILE attribute to the endpoint. The computed profile is the actual profile of an endpoint if that endpoint is dynamically profiled. This allows you to find the mismatch between the computed profile for statically added endpoints and the matching profile for dynamically profiled endpoints.
**Endpoint Profiling Policy for Static IP Devices**

If you have an endpoint with a statically assigned IP address, you can create a profile for such static IP devices. You must enable the RADIUS probe or SNMP Query and SNMP Trap probes to profile an endpoint that has a static IP address.

**Endpoint Profiling Policy Matching**

Cisco ISE always considers a chosen policy for an endpoint that is the matched policy rather than an evaluated policy when the profiling conditions that are defined in one or more rules are met in a profiling policy. Here, the status of static assignment for that endpoint is set to false in the system. But, this can be set to true after it is statically reassigned to an existing profiling policy in the system, by using the static assignment feature during an endpoint editing.

The following apply to the matched policies of endpoints:

- For statically assigned endpoint, the profiling service computes the MATCHEDPROFILE.
- For dynamically assigned endpoints, the MATCHEDPROFILEs are identical to the matching endpoint profiles.

You can determine a matching profiling policy for dynamic endpoints using one or more rules that are defined in a profiling policy and assign appropriately an endpoint identity group for categorization.

When an endpoint is mapped to an existing policy, the profiling service searches the hierarchy of profiling policies for the closest parent profile that has a matching group of policies and assigns the endpoint to the appropriate endpoint policy.

**Endpoint Profiling Policies Used for Authorization**

You can use an endpoint profiling policy in authorization rules, where you can create a new condition to include a check for an endpoint profiling policy as an attribute, and the attribute value assumes the name of the endpoint profiling policy. You can select an endpoint profiling policy from the EndPoints dictionary, which includes the following attributes: PostureApplicable, EndPointPolicy, LogicalProfile, and BYODRegistration.

You can define an authorization rule that includes a combination of EndPointPolicy, BYODRegistration, and identity groups.

**Endpoint Profiling Policies Grouped into Logical Profiles**

A logical profile is a container for a category of profiles or associated profiles, irrespective of Cisco-provided or administrator-created endpoint profiling policies. An endpoint profiling policy can be associated to multiple logical profiles.

You can use the logical profile in an authorization policy condition to help create an overall network access policy for a category of profiles. You can create a simple condition for authorization, which can be included in the authorization rule. The attribute-value pair that you can use in the authorization condition is the logical profile (attribute) and the name of the logical profile (value), which can be found in the EndPoints systems dictionary.
For example, you can create a logical profile for all mobile devices like Android, Apple iPhone, or Blackberry by assigning matching endpoint profiling policies for that category to the logical profile. Cisco ISE contains IP-Phone, a default logical profile for all the IP phones, which includes IP-Phone, Cisco-IP-Phone, Nortel-IP-Phone-2000-Series, and Avaya-IP-Phone profiles.

**Create Logical Profiles**

You can create a logical profile that you can use to group a category of endpoint profiling policies, which allows you to create an overall category of profiles or associated profiles. You can also remove the endpoint profiling policies from the assigned set moving them back to the available set. For more information about Logical Profiles, see Endpoint Profiling Policies Grouped into Logical Profiles, on page 481.

**Procedure**

2. Click Add.
3. Enter a name and description for the new logical profile in the text boxes for Name and Description.
4. Choose endpoint profiling policies from the Available Policies to assign them in a logical profile.
5. Click the right arrow to move the selected endpoint profiling policies to the Assigned Policies.
6. Click Submit.

**Profiling Exception Actions**

An exception action is a single configurable action that can be referred to in an endpoint profiling policy, and that is triggered when the exception conditions that are associated with the action are met.

Exception Actions can be any one of the following types:

- **Cisco-provided**—You cannot delete Cisco-provided exception actions. Cisco ISE triggers the following noneditable profiling exception actions from the system when you want to profile endpoints in Cisco ISE:
  - Authorization Change—The profiling service issues a change of authorization when an endpoint is added or removed from an endpoint identity group that is used by an authorization policy.
  - Endpoint Delete—An exception action is triggered in Cisco ISE and a CoA is issued when an endpoint is deleted from the system in the Endpoints page, or reassigned to the unknown profile from the edit page on a Cisco ISE network.
  - FirstTimeProfiled—An exception action is triggered in Cisco ISE and a CoA is issued when an endpoint is profiled in Cisco ISE for the first time, where the profile of that endpoint changes from an unknown profile to an existing profile but that endpoint is not successfully authenticated on a Cisco ISE network.
  - Administrator-created—Cisco ISE triggers profiling exception actions that you create.
Create Exception Actions

You can define and associate one or more exception rules to a single profiling policy. This association triggers an exception action (a single configurable action) when the profiling policy matches and at least one of the exception rules matches in the profiling endpoints in Cisco ISE.

Procedure

**Step 1** Choose **Policy** > **Policy Elements** > **Results** > **Profiling** > **Exception Actions**.

**Step 2** Click **Add**.

**Step 3** Enter a name and description for the exception action in the text boxes for **Name** and **Description**.

**Step 4** Check the **CoA Action** check box.

**Step 5** Click the **Policy Assignment** drop-down list to choose an endpoint policy.

**Step 6** Click **Submit**.

Cisco ISE Integration with Cisco NAC Appliance

Cisco ISE supports integration only with the Cisco Network Admission Control (NAC) Appliance Release 4.9 and is available when you have installed an Advanced or Wireless license in Cisco ISE.

The Cisco ISE profiler is similar to the Cisco Network Admission Control (NAC) Profiler that manages endpoints in a Cisco NAC deployment. This integration allows you to replace the existing Cisco NAC Profiler that is installed in a Cisco NAC deployment. It allows you to synchronize profile names from the Cisco ISE profiler and the result of endpoint classification into the Cisco Clean Access Manager (CAM).

Cisco Clean Access Manager Configuration in Administration Nodes

Cisco ISE allows you to register multiple Clean Access Managers (CAMs) on the Primary PAN in a distributed deployment for REST APIs communication settings. The list of CAMs that is registered in Cisco ISE is the list to which all the profiler configuration changes are notified. The Primary PAN is responsible for all the communication between Cisco ISE and the Cisco NAC Appliance. You can configure CAMs only in the Primary PAN in Cisco ISE. The credentials that are used at the time of registering one or more CAMs in the Primary PAN are used to authenticate connectivity with CAMs.

The communication between Cisco ISE and the Cisco NAC Appliance is secure over Secure Sockets Layer (SSL). It is also bidirectional in nature, because Cisco ISE pushes the profiler configuration changes to CAMs, and CAMs periodically pull the list of MAC addresses of endpoints and their corresponding profiles and the list of all the profile names, from Cisco ISE.

You must export the contents of the X509 Certificate from the Clean Access Manager in Administration > Clean Access Manager > SSL, and import it into the Primary PAN under Administration > System > Certificates > Trusted Certificates Store in Cisco ISE for a proper secure communication between Cisco ISE and CAM.

For more information on how to set up a pair of CAMs for high availability, see the link below.
Cisco ISE Profiler and Cisco Clean Access Manager Communication

The Cisco ISE profiler notifies the profiler configuration changes to all the registered Clean Access Managers (CAMs) from the Primary PAN. It avoids duplicating notification in a Cisco ISE distributed deployment. It uses the REST APIs to notify the profiler configuration changes when endpoints are added or removed, and endpoint profiling policies changed, in the Cisco ISE database. During an import of endpoints, the Cisco ISE profiler notifies CAMs only after the import is complete.

The following REST API flow is implemented to push the profiler configuration changes to CAMs:

Cisco ISE profiler endpoint change push—When endpoints are profiled and there are changes in the profiles of endpoints in Cisco ISE, then the Cisco ISE profiler notifies all the registered CAMs about the changes in the endpoint profiles.

You can configure Cisco ISE in CAMs, which allows you to synchronize CAMs with Cisco ISE, depending on your Sync Settings in CAMs. You must create rules, where you can select one or more matching profiles from the list of Cisco ISE profiles and map endpoints to any one of the Access Types in CAMs. CAMs periodically retrieve endpoints and their corresponding profiles and the list of all the profile names, from the Cisco ISE profiler.

The following REST API flows are implemented to pull the profiler configuration changes from the Cisco ISE profiler:

• NAC Manager endpoint pull—Pulls the list of MAC addresses of endpoints and their corresponding profiles of known endpoints.
• NAC Manager profile pull—Pulls the profile names from the Cisco ISE profiler.

The Cisco ISE profiler notifies the Cisco ISE Monitoring persona of all the events that can be used to monitor and troubleshoot Cisco ISE and Cisco NAC Appliance Release 4.9 integration.

The Cisco ISE profiler log captures the following events for monitoring and troubleshooting integration:

• Configuration changes for NAC Settings (Information)
• NAC notification event failure (Error)

Add Cisco Clean Access Managers

Integrating Cisco ISE with the Cisco NAC Appliance, Release 4.9 allows you to utilize the Cisco ISE profiling service in a Cisco NAC deployment. To utilize the Cisco ISE profiling service in a Cisco NAC deployment.

The NAC Managers page allows you to configure multiple Cisco Access Managers (CAMs), which provides an option to filter the CAMs that you have registered. This page lists the CAMs along with their names, descriptions, IP addresses, and the status that displays whether endpoint notification is enabled or not for those CAMs.

Procedure

Step 1 Choose Administration > Network Resources > NAC Managers.
Step 2 Click Add.
Step 3 Enter the name for the Cisco Access Manager.
### Profiling Network Scan Actions

An endpoint scan action is a configurable action that can be referred to in an endpoint profiling policy, and that is triggered when the conditions that are associated with the network scan action are met.

An endpoint scan is used to scan endpoints in order to limit resources usage in the Cisco ISE system. A network scan action scans a single endpoint, unlike resource-intensive network scans. It improves the overall classification of endpoints, and redefines an endpoint profile for an endpoint. Endpoint scans can be processed only one at a time.

You can associate a single network scan action to an endpoint profiling policy. Cisco ISE predefined three scanning types for a network scan action, which can include one or all three scanning types: for instance, an OS-scan, an SNMPPortsAndOS-scan, and a CommonPortsAndOS-scan. You cannot edit or delete OS-scan, SNMPPortsAndOS-scan, and CommonPortsAndOS-scans, which are predefined network scan actions in Cisco ISE. You can also create a new network scan action of your own.

Once an endpoint is appropriately profiled, the configured network scan action cannot be used against that endpoint. For example, scanning an Apple-Device allows you to classify the scanned endpoint to an Apple device. Once an OS-scan determines the operating system that an endpoint is running, it is no longer matched to an Apple-Device profile, but it is matched to an appropriate profile for an Apple device.

### Create a New Network Scan Action

A network scan action that is associated with an endpoint profiling policy scans an endpoint for an operating system, Simple Network Management Protocol (SNMP) ports, and common ports. Cisco provides network scan actions for the most common NMAP scans, but you can also create one of your own.

When you create a new network scan, you define the type of information that the NMAP probe will scan for.

**Before you begin**

The Network Scan (NMAP) probe must be enabled before you can define a rule to trigger a network scan action. The procedure for that is described in Configure Probes per Cisco ISE Node.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Choose Policy &gt; Policy Elements &gt; Results &gt; Profiling &gt; Network Scan (NMAP) Actions.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Click Add.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enter a name and description for the network scan action that you want to create.</td>
</tr>
</tbody>
</table>
| **Step 4** | Check one or more check boxes when you want to scan an endpoint for the following:  
  - Scan OS—To scan for an operating system  
  - Scan SNMP Port—To scan SNMP ports (161, 162) |
Step 5  
Click Submit.

NMAP Operating System Scan

The operating system scan (OS-scan) type scans for an operating system (and OS version) that an endpoint is running. This is a resource intensive scan.

The NMAP tool has limitations on OS-scan which may cause unreliable results. For example, when scanning an operating system of network devices such as switches and routers, the NMAP OS-scan may provide an incorrect operating-system attribute for those devices. Cisco ISE displays the operating-system attribute, even if the accuracy is not 100%.

You should configure endpoint profiling policies that use the NMAP operating-system attribute in their rules to have low certainty value conditions (Certainty Factor values). We recommend that whenever you create an endpoint profiling policy based on the NMAP:operating-system attribute, include an AND condition to help filter out false results from NMAP.

The following NMAP command scans the operating system when you associate Scan OS with an endpoint profiling policy:

```
nmap -sS -O -F -oN /opt/CSCOcpm/logs/nmap.log -append-output -oX - <IP-address>
```

The following NMAP command scans a subnet and sends the output to nmapSubnet.log:

```
nmap -O -sU -p U:161,162 -oN /opt/CSCOcpm/logs/nmapSubnet.log 
--append-output -oX - <subnet>
```

Table 34: NMAP Commands for a Manual Subnet Scan

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-O</td>
<td>Enables OS detection</td>
</tr>
<tr>
<td>-sU</td>

### NMAP SNMP Port Scan

The SNMP PortsAndOS-scan type scans an operating system (and OS version) that an endpoint is running and triggers an SNMP Query when SNMP ports (161 and 162) are open. It can be used for endpoints that are identified and matched initially with an Unknown profile for better classification.

The following NMAP command scans SNMP ports (UDP 161 and 162) when you associate the Scan SNMP Port with an endpoint profiling policy:

```
nmap -sU -pU:161,162 -oN /opt/CSCOcpm/logs/nmap.log --append-output -oX - <IP-address>
```

**Table 35: NMAP Commands for an Endpoint SNMP Port Scan**

<table>

<td>IP-address of an endpoint that is scanned.</td>
</tr>
</tbody>
</table>

### NMAP Common Ports Scan

The Common PortsAndOS-scan type scans an operating system (and OS version) that an endpoint is running and common ports (TCP and UDP), but not SNMP ports. The following NMAP command scans common ports when you associate Scan Common Port with an endpoint profiling policy:

```
```

**Table 36: NMAP Commands for an Endpoint Common Ports Scan**

Create Endpoints with Static Assignments of Policies and Identity Groups

You can create a new endpoint statically by using the MAC address of an endpoint in the Endpoints page. You can also choose an endpoint profiling policy and an identity group in the Endpoints page for static assignment.

The regular and mobile device (MDM) endpoints are displayed in the Endpoints Identities list. In the listing page, columns for attributes like Hostname, Device Type, Device Identifier for MDM endpoints are displayed. Other columns like Static Assignment and Static Group Assignment are not displayed by default.

---

**Note**

You cannot add, edit, delete, import, or export MDM Endpoints using this page.
**Procedure**

**Step 1** Choose [Administration] > [Identity Management] > [Identities] > [Endpoints].

**Step 2** Click Add.

**Step 3** Enter the MAC address of an endpoint in hexadecimal format and separated by a colon.

**Step 4** Choose a matching endpoint policy from the [Policy Assignment] drop-down list to change the static assignment status from dynamic to static.

**Step 5** Check the [Static Assignment] check box to change the status of static assignment that is assigned to the endpoint from dynamic to static.

**Step 6** Choose an endpoint identity group to which you want to assign the newly created endpoint from the [Identity Group Assignment] drop-down list.

**Step 7** Check the [Static Group Assignment] check box to change the dynamic assignment of an endpoint identity group to static.

**Step 8** Click Submit.

---

**Import Endpoints from CSV Files**

You can import endpoints from a CSV file for which you have already exported endpoints from a Cisco ISE server, or a CSV file that you have created from Cisco ISE and updated with endpoint details.

The file format has to be in the format as specified in the default import template so that the list of endpoints appears as follows: MAC, Endpoint Policy, Endpoint Identity Group.

Both endpoint policy and endpoint identity group are optional for importing endpoints in a CSV file. If you want to import the endpoint identity group without the endpoint policy for endpoints, the values are still separated by the comma.

For example,

- MAC1, Endpoint Policy1, Endpoint Identity Group1
- MAC2
- MAC3, Endpoint Policy3
- MAC4, , Endpoint Identity Group4

**Procedure**

**Step 1** Choose [Administration] > [Identity Management] > [Identities] > [Endpoints] > [Import].

**Step 2** Click [Import From File].

**Step 3** Click Browse to locate the CSV file that you have already exported from the Cisco ISE server or the CSV file that you have created and updated with endpoints in the file format as specified.

**Step 4** Click Submit.
Default Import Template Available for Endpoints

You can generate a template in which you can update endpoints that can be used to import endpoints. By default, you can use the Generate a Template link to create a CSV file in the Microsoft Office Excel application and save the file locally on your system. The file can be found in Administration > Identity Management > Identities > Endpoints > Import > Import From File. You can use the Generate a Template link to create a template, and the Cisco ISE server will display the Opening template.csv dialog. This dialog allows you to open the default template.csv file, or save the template.csv file locally on your system. If you choose to open the template.csv file from the dialog, the file opens in the Microsoft Office Excel application. The default template.csv file contains a header row that displays the MAC address, Endpoint Policy, and Endpoint Identity Group, columns.

You must update the MAC addresses of endpoints, endpoint profiling policies, and endpoint identity groups and save the file with a different file name that you can use to import endpoints. See the header row in the template.csv file that is created when you use the Generate a Template link.

Table 38: CSV Template File

<table>
<thead>
<tr>
<th>MAC</th>
<th>Endpoint Policy</th>
<th>Endpoint Identity Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>00:1f:f3:4e:c1:8e</td>
<td>Cisco-Device</td>
<td>RegisteredDevices</td>
</tr>
</tbody>
</table>

Unknown Endpoints Reprofiled During Import

If the file used for import contains endpoints that have their MAC addresses, and their assigned endpoint profiling policies is the Unknown profile, then those endpoints are immediately reprofiled in Cisco ISE to the matching endpoint profiling policies during import. However, they are not statically assigned to the Unknown profile. If endpoints do not have endpoint profiling policies assigned to them in the CSV file, then they are assigned to the Unknown profile, and then reprofiled to the matching endpoint profiling policies. See below how Cisco ISE reprofiles Unknown profiles that match the Xerox_Device profile during import and also how Cisco ISE reprofiles an endpoint that is unassigned.

Table 39: Unknown Profiles: Import from a File

<table>
<thead>
<tr>
<th>MAC Address</th>
<th>Endpoint Profiling Policy Assigned Before Import in Cisco ISE</th>
<th>Endpoint Profiling Policy Assigned After Import in Cisco ISE</th>
</tr>
</thead>
<tbody>
<tr>
<td>00:00:00:00:01:02</td>
<td>Unknown.</td>
<td>Xerox-Device</td>
</tr>
<tr>
<td>00:00:00:00:01:03</td>
<td>Unknown.</td>
<td>Xerox-Device</td>
</tr>
<tr>
<td>00:00:00:00:01:04</td>
<td>Unknown.</td>
<td>Xerox-Device</td>
</tr>
<tr>
<td>00:00:00:00:01:05</td>
<td>If no profile is assigned to an endpoint, then it is assigned to the Unknown profile, and also reprofiled to the matching profile.</td>
<td>Xerox-Device</td>
</tr>
</tbody>
</table>

Static Assignments of Policies and Identity Groups for Endpoints Retained During Import

If the file used for import contains endpoints that have their MAC addresses, and their assigned endpoint profiling policy is the static assignment, then they are not reprofiled during import. See below how Cisco ISE retains the Cisco-Device profile, the static assignment of an endpoint during import.
Table 40: Static Assignment: Import From a File

<table>
<thead>
<tr>
<th>MAC Address</th>
<th>Endpoint Profiling Policy Assigned Before Import in Cisco ISE</th>
<th>Endpoint Profiling Policy Assigned After Import in Cisco ISE</th>
</tr>
</thead>
<tbody>
<tr>
<td>00:00:00:00:01:02</td>
<td>Cisco-Device (static assignment)</td>
<td>Cisco-Device</td>
</tr>
</tbody>
</table>

Endpoints with Invalid Attributes Not Imported

If any of the endpoints present in the CSV file have invalid attributes, then the endpoints are not imported and an error message is displayed.

For example, if endpoints are assigned to invalid profiles in the file used for import, then they are not imported because there are no matching profiles in Cisco ISE. See below how endpoints are not imported when they are assigned to invalid profiles in the CSV file.

Table 41: Invalid Profiles: Import from a File

<table>
<thead>
<tr>
<th>MAC Address</th>
<th>Endpoint Profiling Policy Assigned Before Import in Cisco ISE</th>
<th>Endpoint Profiling Policy Assigned After Import in Cisco ISE</th>
</tr>
</thead>
<tbody>
<tr>
<td>00:00:00:00:01:02</td>
<td>Unknown.</td>
<td>Xerox-Device</td>
</tr>
<tr>
<td>00:00:00:00:01:05</td>
<td>If an endpoint such as 00:00:00:00:01:05 is assigned to an invalid profile other than the profiles that are available in Cisco ISE, then Cisco ISE displays a warning message that the policy name is invalid and the endpoint will not be imported.</td>
<td>The endpoint is not imported because there is no matching profile in Cisco ISE.</td>
</tr>
</tbody>
</table>

Import Endpoints from LDAP Server

You can import the MAC addresses, the associated profiles, and the endpoint identity groups of endpoints securely from an LDAP server.

Before you begin

Before you begin to import endpoints, ensure that you have installed the LDAP server.

You have to configure the connection settings and query settings before you can import from an LDAP server. If the connection settings or query settings are configured incorrectly in Cisco ISE, then the “LDAP import failed:” error message appears.

Procedure

Step 1 Choose Administration > Identity Management > Identities > Endpoints > Import > Import From LDAP.
Step 2 Enter the values for the connection settings.
Step 3 Enter the values for the query settings.
Step 4  Click Submit.

Export Endpoints with Comma-Separated Values File

You can export selected or all endpoints from a Cisco ISE server to different Cisco ISE servers in a comma-separated values (CSV) file in which endpoints are listed with their MAC addresses, endpoint profiling policies, and endpoint identity groups to which they are assigned.

Export All is the default option. If endpoints are filtered in the Endpoints page, only those filtered endpoints are exported when you are using the Export All option. By default, the profiler_endpoints.csv is the CSV file and the Microsoft Office Excel is the default application to open the CSV file from the Opening profiler_endpoints.csv dialog box or to save the CSV file. For example, you can export selected endpoints or all endpoints in the profiler_endpoints.csv file, which you can use to import those endpoints.

Procedure

Step 1  Choose Administration > Identity Management > Identities > Endpoints.

Step 2  Click Export, and choose one of the following:

- Export Selected—You can export only the selected endpoints in the Endpoints page.
- Export All—By default, you can export all the endpoints in the Endpoints page.

Step 3  Click OK to save the profiler_endpoints.csv file.

Identified Endpoints

Cisco ISE displays identified endpoints that connect to your network and use resources on your network in the Endpoints page. An endpoint is typically a network-capable device that connect to your network through wired and wireless network access devices and VPN. Endpoints can be personal computers, laptops, IP phones, smartphones, gaming consoles, printers, fax machines, and so on.

The MAC address of an endpoint, expressed in hexadecimal form, is always the unique representation of an endpoint, but you can also identify an endpoint with a varying set of attributes and the values associated to them, called an attribute-value pair. You can collect a varying set of attributes for endpoints based on the endpoint capability, the capability and configuration of the network access devices and the methods (probes) that you use to collect these attributes.

Dynamically Profiled Endpoints

When endpoints are discovered on your network, they can be profiled dynamically based on the configured profiling endpoint profiling policies, and assigned to the matching endpoint identity groups depending on their profiles.
Statically Profiled Endpoints

An endpoint can be profiled statically when you create an endpoint with its MAC address and associate a profile to it along with an endpoint identity group in Cisco ISE. Cisco ISE does not reassign the profiling policy and the identity group for statically assigned endpoints.

Unknown Endpoints

If you do not have a matching profiling policy for an endpoint, you can assign an unknown profiling policy (Unknown) and the endpoint therefore will be profiled as Unknown. The endpoint profiled to the Unknown endpoint policy requires that you create a profile with an attribute or a set of attributes collected for that endpoint. The endpoint that does not match any profile is grouped within the Unknown endpoint identity group.

Identified Endpoints Locally Stored in Policy Service Nodes Database

Cisco ISE writes identified endpoints locally in the Policy Service node database. After storing endpoints locally in the database, these endpoints are then made available (remote write) in the Administration node database only when significant attributes change in the endpoints, and replicated to the other Policy Service nodes database.

The following are the significant attributes:

- ip
- EndPointPolicy
- MatchedValue
- StaticAssignment
- StaticGroupAssignment
- MatchedPolicyID
- NmapSubnetScanID
- PortalUser
- DeviceRegistrationStatus
- BYODRegistration

When you change endpoint profile definitions in Cisco ISE, all endpoints have to be reprofiled. A Policy Service node that collects the attributes of endpoints is responsible for reprofiling of those endpoints.

When a Policy Service node starts collecting attributes about an endpoint for which attributes were initially collected by a different Policy Service node, then the endpoint ownership changes to the current Policy Service node. The new Policy Service node will retrieve the latest attributes from the previous Policy Service node and reconcile the collected attributes with those attributes that were already collected.

When a significant attribute changes in the endpoint, attributes of the endpoint are automatically saved in the Administration node database so that you have the latest significant change in the endpoint. If the Policy Service node that owns an endpoint is not available for some reasons, then the Administrator ISE node will reprofile an endpoint that lost the owner and you have to configure a new Policy Service node for such endpoints.
Policy Service Nodes in Cluster

Cisco ISE uses Policy Service node group as a cluster that allows to exchange endpoint attributes when two or more nodes in the cluster collect attributes for the same endpoint. We recommend to create clusters for all Policy Service nodes that reside behind a load balancer.

If a different node other than the current owner receives attributes for the same endpoint, it sends a message across the cluster requesting the latest attributes from the current owner to merge attributes and determine if a change of ownership is needed. If you have not defined a node group in Cisco ISE, it is assumed that all nodes are within one cluster.

There are no changes made to endpoint creation and replication in Cisco ISE. Only the change of ownership for endpoints is decided based on a list of attributes (white list) used for profiling that are built from static attributes and dynamic attributes.

Upon subsequent attributes collection, the endpoint is updated on the Administration node, if anyone of the following attributes changes:

- ip
- EndPointPolicy
- MatchedValue
- StaticAssignment
- StaticGroupAssignment
- MatchedPolicyID
- NmapSubnetScanID
- PortalUser
- DeviceRegistrationStatus
- BYODRegistration

When an endpoint is edited and saved in the Administration node, the attributes are retrieved from the current owner of the endpoint.

Create Endpoint Identity Groups

Cisco ISE groups endpoints that it discovers into the corresponding endpoint identity groups. Cisco ISE comes with several system-defined endpoint identity groups. You can also create additional endpoint identity groups from the Endpoint Identity Groups page. You can edit or delete the endpoint identity groups that you have created. You can only edit the description of the system-defined endpoint identity groups; you cannot edit the name of these groups or delete them.

Procedure

Step 1 Choose Administration > Identity Management > Groups > Endpoint Identity Groups.
Step 2 Click Add.
Identified Endpoints Grouped in Endpoint Identity Groups

Cisco ISE groups discovered endpoints into their corresponding endpoint identity groups based on the endpoint profiling policies. Profiling policies are hierarchical, and they are applied at the endpoint identify groups level in Cisco ISE. By grouping endpoints to endpoint identity groups, and applying profiling policies to endpoint identity groups, Cisco ISE enables you to determine the mapping of endpoints to the endpoint profiles by checking corresponding endpoint profiling policies.

Cisco ISE creates a set of endpoint identity groups by default, and allows you to create your own identity groups to which endpoints can be assigned dynamically or statically. You can create an endpoint identity group and associate the identity group to one of the system-created identity groups. You can also assign an endpoint that you create statically to any one of the identity groups that exists in the system, and the profiling service cannot reassign the identity group.

Default Endpoint Identity Groups Created for Endpoints

Cisco ISE creates the following five endpoint identity groups by default: Blacklist, GuestEndpoints, Profiled, RegisteredDevices, and Unknown. In addition, it creates two more identity groups, such as Cisco-IP-Phone and Workstation, which are associated to the Profiled (parent) identity group. A parent group is the default identity group that exists in the system.

Cisco ISE creates the following endpoint identity groups:

- **Blacklist**—This endpoint identity group includes endpoints that are statically assigned to this group in Cisco ISE and endpoints that are blacklisted in the device registration portal. An authorization profile can be defined in Cisco ISE to permit, or deny network access to endpoints in this group.

- **GuestEndpoints**—This endpoint identity group includes endpoints that are used by guest users.

- **Profiled**—This endpoint identity group includes endpoints that match endpoint profiling policies except Cisco IP phones and workstations in Cisco ISE.

- **RegisteredDevices**—This endpoint identity group includes endpoints, which are registered devices that are added by an employee through the devices registration portal. The profiling service continues to profile these devices normally when they are assigned to this group. Endpoints are statically assigned to this group in Cisco ISE, and the profiling service cannot reassign them to any other identity group. These devices will appear like any other endpoint in the endpoints list. You can edit, delete, and blacklist these devices that you added through the device registration portal from the endpoints list in the Endpoints page in Cisco ISE. Devices that you have blacklisted in the device registration portal are assigned to the Blacklist endpoint identity group, and an authorization profile that exists in Cisco ISE redirects blacklisted devices to an URL, which displays “Unauthorised Network Access”, a default portal page to the blacklisted devices.

- **Unknown**—This endpoint identity group includes endpoints that do not match any profile in Cisco ISE.
In addition to the above system created endpoint identity groups, Cisco ISE creates the following endpoint identity groups, which are associated to the Profiled identity group:

- Cisco-IP-Phone—An identity group that contains all the profiled Cisco IP phones on your network.
- Workstation—An identity group that contains all the profiled workstations on your network.

**Endpoint Identity Groups Created for Matched Endpoint Profiling Policies**

If you have an endpoint policy that matches an existing policy, then the profiling service can create a matching endpoint identity group. This identity group becomes the child of the Profiled endpoint identity group. When you create an endpoint policy, you can check the Create Matching Identity Group check box in the Profiling Policies page to create a matching endpoint identity group. You cannot delete the matching identity group unless the mapping of the profile is removed.

**Add Static Endpoints in Endpoint Identity Groups**

You can add or remove statically added endpoints in any endpoint identity group.

You can add endpoints from the Endpoints widget only to a specific identity group. If you add an endpoint to the specific endpoint identity group, then the endpoint is moved from the endpoint identity group where it was dynamically grouped earlier.

Upon removal from the endpoint identity group where you recently added an endpoint, the endpoint is reprofiled back to the appropriate identity group. You do not delete endpoints from the system but only remove them from the endpoint identity group.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Administration &gt; Identity Management &gt; Groups &gt; Endpoint Identity Groups.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Choose an endpoint identity group, and click Edit.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click Add.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Choose an endpoint in the Endpoints widget to add the selected endpoint in the endpoint identity group.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Click the Endpoint Group List link to return to the Endpoint Identity Groups page.</td>
</tr>
</tbody>
</table>

**Dynamic Endpoints Reprofiled After Adding or Removing in Identity Groups**

If an endpoint identity group assignment is not static, then endpoints are reprofiled after you add or remove them from an endpoint identity group. Endpoints that are identified dynamically by the ISE profiler appear in appropriate endpoint identity groups. If you remove dynamically added endpoints from an endpoint identity group, Cisco ISE displays a message that you have successfully removed endpoints from the identity group but reprofiles them back in the endpoint identity group.
Endpoint Identity Groups Used in Authorization Rules

You can effectively use endpoint identity groups in the authorization policies to provide appropriate network access privileges to the discovered endpoints. For example, an authorization rule for all types of Cisco IP Phones is available by default in Cisco ISE in the following location: **Policy > Authorization > Standard**.

You must ensure that the endpoint profiling policies are either standalone policies (not a parent to other endpoint profiling policies), or their parent policies of the endpoint profiling policies are not disabled.

Profiler Feed Service

Profiler conditions, exception actions, and NMAP scan actions are classified as Cisco-provided or administrator-created (see the System Type attribute). Also, the endpoint profiling policies are classified as Cisco provided, administrator created, or administrator modified (see the System Type attribute).

You can perform different operations on the profiler conditions, exception actions, NMAP scan actions, and endpoint profiling policies depending on the System Type attribute. You cannot edit or delete Cisco-provided conditions, exception actions, and nmap scan actions. Endpoint policies that are provided by Cisco cannot be deleted. When policies are edited, they are considered as administrator-modified. When administrator-modified policies are deleted, they are replaced by the up-to-date version of the Cisco-provided policy that it was based on.

You can retrieve new and updated endpoint profiling policies and the updated OUI database as a feed from a designated Cisco feed server through a subscription in to Cisco ISE. You can also receive e-mail notifications to the e-mail address as an administrator of Cisco ISE that you have configured for applied, success, and failure messages. You can also provide additional subscriber information to receive notifications. You can send the subscriber information back to Cisco for maintaining the records and they are treated as privileged and confidential.

By default, the profiler feed service is disabled, and it requires a Plus license to enable the service. When you enable the profiler feed service, Cisco ISE downloads the feed service policies and OUI database updates every day at 1:00 A.M of the local Cisco ISE server time zone. Cisco ISE automatically applies these downloaded feed server policies, which also stores the set of changes so that you can revert these changes back to the previous state. When you revert from the set of changes that you last applied, endpoint profiling policies that are newly added are removed and endpoint profiling policies that are updated are reverted to the previous state. In addition, the profiler feed service is automatically disabled.

When the updates occur, only the Cisco provided profiling policies and the endpoint profiling policies which were modified by the previous update, are updated. Cisco provided disabled profiling policies are also updated but they remain disabled. Administrator Created or Administrator Modified profiling policies are not overwritten. If you want to revert any Administrator Modified endpoint profiling policy to any Cisco Provided endpoint profiling policy, then you must delete or revert the Administrator Modified endpoint profiling policy to the previous Cisco Provided endpoint profiling policy.

OUI Feed Service

The designated Cisco feed server downloads the updated OUI database from [http://standards.ieee.org/develop/regauth/oui/oui.txt](http://standards.ieee.org/develop/regauth/oui/oui.txt), which is the list of vendors associated to the MAC OUI. The updated OUI database is available for any ISE deployment as a feed that Cisco ISE downloads to its own database. Cisco ISE updates endpoints and then starts reprofilining endpoints.
The designated Cisco feed server is located at https://ise.cisco.com:8443/feedserver/. If you have any issues accessing the service, ensure that your network security components (like a firewall or proxy server, for example) allow direct access to this URL.

**Configure Profiler Feed Service**

The Profiler Feed Service retrieves new and updated endpoint profiling policies and MAC OUI database updates from the Cisco Feed server. If the Feed Service is unavailable or other errors have occurred, it is reported in the Operations Audit report.

You can configure Cisco ISE to send the feed service usage report back to Cisco, which sends the following information to Cisco:

- **Hostname** - Cisco ISE hostname
- **MaxCount** - Total number of endpoints
- **ProfiledCount** - Profiled endpoints count
- **UnknownCount** - Unknown endpoints count
- **MatchSystemProfilesCount** - Cisco Provided profiles count
- **UserCreatedProfiles** - User created profiles count

You can change the CoA type in a Cisco-provided profiling policy. When the feed service updates that policy, the CoA type will not be changed, but the rest of that policy's attributes will be still be updated.

**Before you begin**

The Profiler feed service can only be configured from the Cisco ISE Admin portal in a distributed deployment or in a standalone ISE node.

Set up a Simple Mail Transfer Protocol (SMTP) server if you plan to send e-mail notifications from the Admin portal about feed updates (Administration > System > Settings).

**Procedure**

1. **Step 1** Choose Administration > Certificates > Trusted Certificates, and check if Verisign Class 3 Public Primary Certification Authority and Verisign Class 3 Server CA - G3 are enabled.
2. **Step 2** Choose Administration > FeedService > Profiler.
3. **Step 3** Check the Enable Profiler Feed Service check box.
4. **Step 4** Enter time in HH:MM format (local time zone of the Cisco ISE server) in the Feed Service Scheduler section. By default, Cisco ISE feed service is scheduled at 1.00 AM every day.
5. **Step 5** Check the Notify administrator when download occurs check box in the Administrator Notification Options section and enter your e-mail address as an administrator of Cisco ISE in the Administrator email address text box.
6. **Step 6** Check the Provide subscriber information to Cisco check box in the Feed Service Subscriber Information section and enter your details as an administrator of Cisco ISE and an alternate Cisco ISE administrator details.
7. **Step 7** Click Accept.
8. **Step 8** Click Save.
Step 9  Click **Update Now**.

Instructs Cisco ISE to contact Cisco feed server for new and updated profiles created since the last feed service update. This re-profiles all endpoints in the system, which may cause an increase the load on the system. Due to updated endpoint profiling policies, there may be changes in the authorization policy for some endpoints that are currently connected to Cisco ISE.

The **Update Now** button is disabled when you update new and updated profiles created since the last feed service and enabled only after the download is completed. You must navigate away from the profiler feed service Configuration page and return to this page.

Step 10  Click **Yes**.

**Related Topics**
- Configure Profiler Feed Services Offline

---

**Remove Updates to Endpoint Profiling Policies**

You can revert endpoint profiling policies that were updated in the previous update and remove endpoint profiling policies that are newly added through the previous update of the profiler feed service but OUI updates are not changed.

An endpoint profiling policy, if modified after an update from the feed server is not changed in the system.

**Procedure**

**Step 1** Choose **Administration** > **FeedService** > **Profiler**.

**Step 2** Check the **Enable Profiler Feed Service** check box.

**Step 3** Click **Go to Update Report Page** if you want to view the configuration changes made in the Change Configuration Audit report.

**Step 4** Click **Undo Latest**.

---

**Profiler Reports**

Cisco ISE provides you with various reports on endpoint profiling, and troubleshooting tools that you can use to manage your network. You can generate reports for historical as well as current data. You may be able to drill down on a part of the report to view more details. For large reports, you can also schedule reports and download them in various formats.

You can run the following reports for endpoints from Operations > Reports > Endpoints and Users:

- Endpoint Session History
- Profiled Endpoint Summary
- Endpoint Profile Changes
- Top Authorizations by Endpoint
Detect Anomalous Behavior of Endpoints

Cisco ISE protects your network from the illegitimate use of a MAC address. ISE detects the endpoints involved in MAC address spoofing and allows you to restrict the permission of the suspicious endpoints.

The following are the two options in the profiler configuration page for Anomalous Behavior:

- Enable Anomalous Behavior Detection
- Enable Anomalous Behavior Enforcement

If you enable Anomalous Behavior detection, Cisco ISE probes for data, and checks for any contradiction to the existing data with respect to changes in attributes related to NAS-Port-Type, DHCP Class Identifier, and Endpoint Policy. If so, an attribute called AnomalousBehavior set to true is added to the endpoint which helps you to filter and view the endpoints in the Visibility Context page. Audit logs are also generated for the respective MAC address.

When anomalous behavior detection is enabled, Cisco ISE checks if the following attributes of existing endpoints have changed:

1. Port-Type—Determines if the access method of an endpoint has changed. For example, if the same MAC address that connected via Wired Dot1x has been used for Wireless Dot1x and visa-versa.

2. DHCP Class Identifier—Determines whether the type of client or vendor of an endpoint has changed. This only applies when DHCP Class identifier attribute is populated with a certain value and is then changed to another value. If an endpoint is configured with a static IP, the DHCP Class Identifier attribute is empty in Cisco ISE. Later on, if another device spoofs the MAC address of this endpoint and uses DHCP, the Class Identifier changes from an empty value to a specific string. This will not trigger anomalous behavior detection.

3. Endpoint Policy—Determines if there are significant profile changes. For example, if the profile of an endpoint changes from a “Phone” or “Printer” to a “Workstation”.

If you enable Anomalous Behavior Enforcement, a CoA is issued upon detection of the anomalous Behavior, which can be used to re-authorize the suspicious endpoints, based on the authorization rules configured in the Profiler Configuration page.

To set the authorization policy rules for endpoints with anomalous Behavior, see Set Authorization Policy Rules for Endpoints with Anomalous Behavior, on page 503.

Set Authorization Policy Rules for Endpoints with Anomalous Behavior

You can choose the action to be taken against any endpoint with anomalous Behavior by setting the corresponding rules on the Authorization Policy page.

Procedure

Step 1 Choose Policy > Authorization.
View Endpoints with Anomalous Behavior

You can view the endpoints with anomalous behavior by using any of the following options:

- Click Anomalous Behavior from Home > Summary > Metrics. This action opens a new tab with Anomalous Behaviour column in the lower pane of the page.
- Choose Context Visibility > Endpoints > Endpoint Classification. You can view the Anomalous Behaviour column in the lower pane of the page.
- You can create a new Anomalous Behavior column in Authentication view or Compromised Endpoints view in the Context Visibility page as explained in the following steps:

Procedure

Step 1 Choose Context Visibility > Endpoints > Authentication or Context Visibility > Endpoints > Compromised Endpoints.
Step 2 Click the Settings icon in the lower pane of the page and check Anomalous Behavior checkbox.
Step 3 Click Go.
You can view the Anomalous Behavior column in the Authentication or Compromised Endpoints View.

Cisco ISE Integration with Cisco NAC Appliance

Cisco ISE supports integration only with the Cisco Network Admission Control (NAC) Appliance Release 4.9 and is available when you have installed an Advanced or Wireless license in Cisco ISE.

The Cisco ISE profiler is similar to the Cisco Network Admission Control (NAC) Profiler that manages endpoints in a Cisco NAC deployment. This integration allows you to replace the existing Cisco NAC Profiler that is installed in a Cisco NAC deployment. It allows you to synchronize profile names from the Cisco ISE profiler and the result of endpoint classification into the Cisco Clean Access Manager (CAM).
Cisco Clean Access Manager Configuration in Administration Nodes

Cisco ISE allows you to register multiple Clean Access Managers (CAMs) on the Primary PAN in a distributed deployment for REST APIs communication settings. The list of CAMs that is registered in Cisco ISE is the list to which all the profiler configuration changes are notified. The Primary PAN is responsible for all the communication between Cisco ISE and the Cisco NAC Appliance. You can configure CAMs only in the Primary PAN in Cisco ISE. The credentials that are used at the time of registering one or more CAMs in the Primary PAN are used to authenticate connectivity with CAMs.

The communication between Cisco ISE and the Cisco NAC Appliance is secure over Secure Sockets Layer (SSL). It is also bidirectional in nature, because Cisco ISE pushes the profiler configuration changes to CAMs, and CAMs periodically pull the list of MAC addresses of endpoints and their corresponding profiles and the list of all the profile names, from Cisco ISE.

You must export the contents of the X509 Certificate from the Clean Access Manager in Administration > Clean Access Manager > SSL, and import it into the Primary PAN under Administration > System > Certificates > Trusted Certificates Store in Cisco ISE for a proper secure communication between Cisco ISE and CAM.

For more information on how to set up a pair of CAMs for high availability, see the link below.

Cisco ISE Profiler and Cisco Clean Access Manager Communication

The Cisco ISE profiler notifies the profiler configuration changes to all the registered Clean Access Managers (CAMs) from the Primary PAN. It avoids duplicating notification in a Cisco ISE distributed deployment. It uses the REST APIs to notify the profiler configuration changes when endpoints are added or removed, and endpoint profiling policies changed, in the Cisco ISE database. During an import of endpoints, the Cisco ISE profiler notifies CAMs only after the import is complete.

The following REST API flow is implemented to push the profiler configuration changes to CAMs:

Cisco ISE profiler endpoint change push—When endpoints are profiled and there are changes in the profiles of endpoints in Cisco ISE, then the Cisco ISE profiler notifies all the registered CAMs about the changes in the endpoint profiles.

You can configure Cisco ISE in CAMs, which allows you to synchronize CAMs with Cisco ISE, depending on your Sync Settings in CAMs. You must create rules, where you can select one or more matching profiles from the list of Cisco ISE profiles and map endpoints to any one of the Access Types in CAMs. CAMs periodically retrieve endpoints and their corresponding profiles and the list of all the profile names, from the Cisco ISE profiler.

The following REST API flows are implemented to pull the profiler configuration changes from the Cisco ISE profiler:

• NAC Manager endpoint pull—Pulls the list of MAC addresses of endpoints and their corresponding profiles of known endpoints.

• NAC Manager profile pull—Pulls the profile names from the Cisco ISE profiler.

The Cisco ISE profiler notifies the Cisco ISE Monitoring persona of all the events that can be used to monitor and troubleshoot Cisco ISE and Cisco NAC Appliance Release 4.9 integration.

The Cisco ISE profiler log captures the following events for monitoring and troubleshooting integration:

• Configuration changes for NAC Settings (Information)

• NAC notification event failure (Error)
Add Cisco Clean Access Managers

Integrating Cisco ISE with the Cisco NAC Appliance, Release 4.9 allows you to utilize the Cisco ISE profiling service in a Cisco NAC deployment to utilize the Cisco ISE profiling service in a Cisco NAC deployment. The NAC Managers page allows you to configure multiple Cisco Access Managers (CAMs), which provides an option to filter the CAMs that you have registered. This page lists the CAMs along with their names, descriptions, IP addresses, and the status that displays whether endpoint notification is enabled or not for those CAMs.

Procedure

Step 1 Choose Administration > Network Resources > NAC Managers.
Step 2 Click Add.
Step 3 Enter the name for the Cisco Access Manager.
Step 4 Click the Status check box to enable REST API communication from the Cisco ISE profiler that authenticates connectivity to the CAM.
Step 5 Enter the IP address for the CAM except the following IP addresses: 0.0.0.0 and 255.255.255.255.
Step 6 Enter the username and password of the CAM administrator that you use to log in to the user interface of the CAM.
Step 7 Click Submit.

Create Endpoints with Static Assignments of Policies and Identity Groups

You can create a new endpoint statically by using the MAC address of an endpoint in the Endpoints page. You can also choose an endpoint profiling policy and an identity group in the Endpoints page for static assignment.

The regular and mobile device (MDM) endpoints are displayed in the Endpoints Identities list. In the listing page, columns for attributes like Hostname, Device Type, Device Identifier for MDM endpoints are displayed. Other columns like Static Assignment and Static Group Assignment are not displayed by default.

Note

You cannot add, edit, delete, import, or export MDM Endpoints using this page.

Procedure

Step 1 Choose Administration > Identity Management > Identities > Endpoints.
Step 2 Click Add.
Step 3 Enter the MAC address of an endpoint in hexadecimal format and separated by a colon.
Step 4  Choose a matching endpoint policy from the Policy Assignment drop-down list to change the static assignment status from dynamic to static.

Step 5  Check the Static Assignment check box to change the status of static assignment that is assigned to the endpoint from dynamic to static.

Step 6  Choose an endpoint identity group to which you want to assign the newly created endpoint from the Identity Group Assignment drop-down list.

Step 7  Check the Static Group Assignment check box to change the dynamic assignment of an endpoint identity group to static.

Step 8  Click Submit.

Import Endpoints from CSV Files

You can import endpoints from a CSV file for which you have already exported endpoints from a Cisco ISE server, or a CSV file that you have created from Cisco ISE and updated with endpoint details.

The file format has to be in the format as specified in the default import template so that the list of endpoints appears as follows: MAC, Endpoint Policy, Endpoint Identity Group.

Both endpoint policy and endpoint identity group are optional for importing endpoints in a CSV file. If you want to import the endpoint identity group without the endpoint policy for endpoints, the values are still separated by the comma.

For example,

• MAC1, Endpoint Policy1, Endpoint Identity Group1
• MAC2
• MAC3, Endpoint Policy3
• MAC4,, Endpoint Identity Group4

Procedure

Step 1  Choose Administration > Identity Management > Identities > Endpoints > Import.
Step 2  Click Import From File.
Step 3  Click Browse to locate the CSV file that you have already exported from the Cisco ISE server or the CSV file that you have created and updated with endpoints in the file format as specified.
Step 4  Click Submit.

Default Import Template Available for Endpoints

You can generate a template in which you can update endpoints that can be used to import endpoints. By default, you can use the Generate a Template link to create a CSV file in the Microsoft Office Excel application and save the file locally on your system. The file can be found in Administration > Identity Management > Identities > Endpoints > Import > Import From File. You can use the Generate a Template link to create a template, and the Cisco ISE server will display the Opening template.csv dialog. This dialog allows you to
open the default template.csv file, or save the template.csv file locally on your system. If you choose to open
the template.csv file from the dialog, the file opens in the Microsoft Office Excel application. The default
template.csv file contains a header row that displays the MAC address, Endpoint Policy, and Endpoint Identity
Group, columns.
You must update the MAC addresses of endpoints, endpoint profiling policies, and endpoint identity groups
and save the file with a different file name that you can use to import endpoints. See the header row in the
template.csv file that is created when you use the Generate a Template link.

**Table 42: CSV Template File**

<table>
<thead>
<tr>
<th>MAC Address</th>
<th>Endpoint Policy</th>
<th>Endpoint Identity Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>00:1f:3e:4e:c1:8e</td>
<td>Cisco-Device</td>
<td>RegisteredDevices</td>
</tr>
</tbody>
</table>

**Unknown Endpoints Reprofiled During Import**

If the file used for import contains endpoints that have their MAC addresses, and their assigned endpoint
profiling policies is the Unknown profile, then those endpoints are immediately reprofiled in Cisco ISE to the
matching endpoint profiling policies during import. However, they are not statically assigned to the Unknown
profile. If endpoints do not have endpoint profiling policies assigned to them in the CSV file, then they are
assigned to the Unknown profile, and then reprofiled to the matching endpoint profiling policies. See below
how Cisco ISE reprofiles Unknown profiles that match the Xerox_Device profile during import and also how
Cisco ISE reprofiles an endpoint that is unassigned.

**Table 43: Unknown Profiles: Import from a File**

<table>
<thead>
<tr>
<th>MAC Address</th>
<th>Endpoint Profiling Policy Assigned Before Import in Cisco ISE</th>
<th>Endpoint Profiling Policy Assigned After Import in Cisco ISE</th>
</tr>
</thead>
<tbody>
<tr>
<td>00:00:00:00:01:02</td>
<td>Unknown.</td>
<td>Xerox-Device</td>
</tr>
<tr>
<td>00:00:00:00:01:03</td>
<td>Unknown.</td>
<td>Xerox-Device</td>
</tr>
<tr>
<td>00:00:00:00:01:04</td>
<td>Unknown.</td>
<td>Xerox-Device</td>
</tr>
<tr>
<td>00:00:00:00:01:05</td>
<td>If no profile is assigned to an endpoint, then it is assigned to the Unknown profile, and also reprofiled to the matching profile.</td>
<td>Xerox-Device</td>
</tr>
</tbody>
</table>

**Static Assignments of Policies and Identity Groups for Endpoints Retained During Import**

If the file used for import contains endpoints that have their MAC addresses, and their assigned endpoint
profiling policy is the static assignment, then they are not reprofiled during import. See below how Cisco ISE
retains the Cisco-Device profile, the static assignment of an endpoint during import.

**Table 44: Static Assignment: Import From a File**

<table>
<thead>
<tr>
<th>MAC Address</th>
<th>Endpoint Profiling Policy Assigned Before Import in Cisco ISE</th>
<th>Endpoint Profiling Policy Assigned After Import in Cisco ISE</th>
</tr>
</thead>
<tbody>
<tr>
<td>00:00:00:00:01:02</td>
<td>Cisco-Device (static assignment)</td>
<td>Cisco-Device</td>
</tr>
</tbody>
</table>
Endpoints with Invalid Attributes Not Imported

If any of the endpoints present in the CSV file have invalid attributes, then the endpoints are not imported and an error message is displayed.

For example, if endpoints are assigned to invalid profiles in the file used for import, then they are not imported because there are no matching profiles in Cisco ISE. See below how endpoints are not imported when they are assigned to invalid profiles in the CSV file.

Table 45: Invalid Profiles: Import from a File

<table>
<thead>
<tr>
<th>MAC Address</th>
<th>Endpoint Profiling Policy Assigned Before Import in Cisco ISE</th>
<th>Endpoint Profiling Policy Assigned After Import in Cisco ISE</th>
</tr>
</thead>
<tbody>
<tr>
<td>00:00:00:00:01:02</td>
<td>Unknown.</td>
<td>Xerox-Device</td>
</tr>
<tr>
<td>00:00:00:00:01:05</td>
<td>If an endpoint such as 00:00:00:00:01:05 is assigned to an invalid profile other than the profiles that are available in Cisco ISE, then Cisco ISE displays a warning message that the policy name is invalid and the endpoint will not be imported.</td>
<td>The endpoint is not imported because there is no matching profile in Cisco ISE.</td>
</tr>
</tbody>
</table>

Import Endpoints from LDAP Server

You can import the MAC addresses, the associated profiles, and the endpoint identity groups of endpoints securely from an LDAP server.

Before you begin

Before you begin to import endpoints, ensure that you have installed the LDAP server.

You have to configure the connection settings and query settings before you can import from an LDAP server. If the connection settings or query settings are configured incorrectly in Cisco ISE, then the “LDAP import failed:” error message appears.

Procedure

Step 1 Choose Administration > Identity Management > Identities > Endpoints > Import > Import From LDAP.
Step 2 Enter the values for the connection settings.
Step 3 Enter the values for the query settings.
Step 4 Click Submit.
Export Endpoints with Comma-Separated Values File

You can export selected or all endpoints from a Cisco ISE server to different Cisco ISE servers in a comma-separated values (CSV) file in which endpoints are listed with their MAC addresses, endpoint profiling policies, and endpoint identity groups to which they are assigned.

Export All is the default option. If endpoints are filtered in the Endpoints page, only those filtered endpoints are exported when you are using the Export All option. By default, the profiler_endpoints.csv is the CSV file and the Microsoft Office Excel is the default application to open the CSV file from the Opening profiler_endpoints.csv dialog box or to save the CSV file. For example, you can export selected endpoints or all endpoints in the profiler_endpoints.csv file, which you can use to import those endpoints.

Procedure

**Step 1** Choose Administration > Identity Management > Identities > Endpoints.

**Step 2** Click Export, and choose one of the following:

- Export Selected—You can export only the selected endpoints in the Endpoints page.
- Export All—By default, you can export all the endpoints in the Endpoints page.

**Step 3** Click OK to save the profiler_endpoints.csv file.

Identified Endpoints

Cisco ISE displays identified endpoints that connect to your network and use resources on your network in the Endpoints page. An endpoint is typically a network-capable device that connect to your network through wired and wireless network access devices and VPN. Endpoints can be personal computers, laptops, IP phones, smart phones, gaming consoles, printers, fax machines, and so on.

The MAC address of an endpoint, expressed in hexadecimal form, is always the unique representation of an endpoint, but you can also identify an endpoint with a varying set of attributes and the values associated to them, called an attribute-value pair. You can collect a varying set of attributes for endpoints based on the endpoint capability, the capability and configuration of the network access devices and the methods (probes) that you use to collect these attributes.

Dynamically Profiled Endpoints

When endpoints are discovered on your network, they can be profiled dynamically based on the configured profiling endpoint profiling policies, and assigned to the matching endpoint identity groups depending on their profiles.

Statically Profiled Endpoints

An endpoint can be profiled statically when you create an endpoint with its MAC address and associate a profile to it along with an endpoint identity group in Cisco ISE. Cisco ISE does not reassign the profiling policy and the identity group for statically assigned endpoints.
Unknown Endpoints

If you do not have a matching profiling policy for an endpoint, you can assign an unknown profiling policy (Unknown) and the endpoint therefore will be profiled as Unknown. The endpoint profiled to the Unknown endpoint policy requires that you create a profile with an attribute or a set of attributes collected for that endpoint. The endpoint that does not match any profile is grouped within the Unknown endpoint identity group.

Identified Endpoints Locally Stored in Policy Service Nodes Database

Cisco ISE writes identified endpoints locally in the Policy Service node database. After storing endpoints locally in the database, these endpoints are then made available (remote write) in the Administration node database only when significant attributes change in the endpoints, and replicated to the other Policy Service nodes database.

The following are the significant attributes:

- ip
- EndPointPolicy
- MatchedValue
- StaticAssignment
- StaticGroupAssignment
- MatchedPolicyID
- NmapSubnetScanID
- PortalUser
- DeviceRegistrationStatus
- BYODRegistration

When you change endpoint profile definitions in Cisco ISE, all endpoints have to be reprofiled. A Policy Service node that collects the attributes of endpoints is responsible for reprofilong of those endpoints.

When a Policy Service node starts collecting attributes about an endpoint for which attributes were initially collected by a different Policy Service node, then the endpoint ownership changes to the current Policy Service node. The new Policy Service node will retrieve the latest attributes from the previous Policy Service node and reconcile the collected attributes with those attributes that were already collected.

When a significant attribute changes in the endpoint, attributes of the endpoint are automatically saved in the Administration node database so that you have the latest significant change in the endpoint. If the Policy Service node that owns an endpoint is not available for some reasons, then the Administrator ISE node will reprofile an endpoint that lost the owner and you have to configure a new Policy Service node for such endpoints.

Policy Service Nodes in Cluster

Cisco ISE uses Policy Service node group as a cluster that allows to exchange endpoint attributes when two or more nodes in the cluster collect attributes for the same endpoint. We recommend to create clusters for all Policy Service nodes that reside behind a load balancer.
If a different node other than the current owner receives attributes for the same endpoint, it sends a message across the cluster requesting the latest attributes from the current owner to merge attributes and determine if a change of ownership is needed. If you have not defined a node group in Cisco ISE, it is assumed that all nodes are within one cluster.

There are no changes made to endpoint creation and replication in Cisco ISE. Only the change of ownership for endpoints is decided based on a list of attributes (white list) used for profiling that are built from static attributes and dynamic attributes.

Upon subsequent attributes collection, the endpoint is updated on the Administration node, if anyone of the following attributes changes:

- ip
- EndPointPolicy
- MatchedValue
- StaticAssignment
- StaticGroupAssignment
- MatchedPolicyID
- NmapSubnetScanID
- PortalUser
- DeviceRegistrationStatus
- BYODRegistration

When an endpoint is edited and saved in the Administration node, the attributes are retrieved from the current owner of the endpoint.

Create Endpoint Identity Groups

Cisco ISE groups endpoints that it discovers into the corresponding endpoint identity groups. Cisco ISE comes with several system-defined endpoint identity groups. You can also create additional endpoint identity groups from the Endpoint Identity Groups page. You can edit or delete the endpoint identity groups that you have created. You can only edit the description of the system-defined endpoint identity groups; you cannot edit the name of these groups or delete them.

**Procedure**

**Step 1** Choose **Administration > Identity Management > Groups > Endpoint Identity Groups**.

**Step 2** Click **Add**.

**Step 3** Enter the name for the endpoint identity group that you want to create (do not include spaces in the name of the endpoint identity group).

**Step 4** Enter the description for the endpoint identity group that you want to create.

**Step 5** Click the **Parent Group** drop-down list to choose an endpoint identity group to which you want to associate the newly created endpoint identity group.
Step 6  Click Submit.

Identified Endpoints Grouped in Endpoint Identity Groups

Cisco ISE groups discovered endpoints into their corresponding endpoint identity groups based on the endpoint profiling policies. Profiling policies are hierarchical, and they are applied at the endpoint identify groups level in Cisco ISE. By grouping endpoints to endpoint identity groups, and applying profiling policies to endpoint identity groups, Cisco ISE enables you to determine the mapping of endpoints to the endpoint profiles by checking corresponding endpoint profiling policies.

Cisco ISE creates a set of endpoint identity groups by default, and allows you to create your own identity groups to which endpoints can be assigned dynamically or statically. You can create an endpoint identity group and associate the identity group to one of the system-created identity groups. You can also assign an endpoint that you create statically to any one of the identity groups that exists in the system, and the profiling service cannot reassign the identity group.

Default Endpoint Identity Groups Created for Endpoints

Cisco ISE creates the following five endpoint identity groups by default: Blacklist, GuestEndpoints, Profiled, RegisteredDevices, and Unknown. In addition, it creates two more identity groups, such as Cisco-IP-Phone and Workstation, which are associated to the Profiled (parent) identity group. A parent group is the default identity group that exists in the system.

Cisco ISE creates the following endpoint identity groups:

- Blacklist—This endpoint identity group includes endpoints that are statically assigned to this group in Cisco ISE and endpoints that are blacklisted in the device registration portal. An authorization profile can be defined in Cisco ISE to permit, or deny network access to endpoints in this group.
- GuestEndpoints—This endpoint identity group includes endpoints that are used by guest users.
- Profiled—This endpoint identity group includes endpoints that match endpoint profiling policies except Cisco IP phones and workstations in Cisco ISE.
- RegisteredDevices—This endpoint identity group includes endpoints, which are registered devices that are added by an employee through the devices registration portal. The profiling service continues to profile these devices normally when they are assigned to this group.Endpoints are statically assigned to this group in Cisco ISE, and the profiling service cannot reassign them to any other identity group. These devices will appear like any other endpoint in the endpoints list. You can edit, delete, and blacklist these devices that you added through the device registration portal from the endpoints list in the Endpoints page in Cisco ISE. Devices that you have blacklisted in the device registration portal are assigned to the Blacklist endpoint identity group, and an authorization profile that exists in Cisco ISE redirects blacklisted devices to an URL, which displays “Unauthorised Network Access”, a default portal page to the blacklisted devices.
- Unknown—This endpoint identity group includes endpoints that do not match any profile in Cisco ISE.

In addition to the above system created endpoint identity groups, Cisco ISE creates the following endpoint identity groups, which are associated to the Profiled identity group:

- Cisco-IP-Phone—An identity group that contains all the profiled Cisco IP phones on your network.
- Workstation—An identity group that contains all the profiled workstations on your network.
Endpoint Identity Groups Created for Matched Endpoint Profiling Policies

If you have an endpoint policy that matches an existing policy, then the profiling service can create a matching endpoint identity group. This identity group becomes the child of the Profiled endpoint identity group. When you create an endpoint policy, you can check the Create Matching Identity Group check box in the Profiling Policies page to create a matching endpoint identity group. You cannot delete the matching identity group unless the mapping of the profile is removed.

Add Static Endpoints in Endpoint Identity Groups

You can add or remove statically added endpoints in any endpoint identity group.

You can add endpoints from the Endpoints widget only to a specific identity group. If you add an endpoint to the specific endpoint identity group, then the endpoint is moved from the endpoint identity group where it was dynamically grouped earlier.

Upon removal from the endpoint identity group where you recently added an endpoint, the endpoint is reprofiled back to the appropriate identity group. You do not delete endpoints from the system but only remove them from the endpoint identity group.

Procedure

Step 1  Choose Administration > Identity Management > Groups > Endpoint Identity Groups.
Step 2  Choose an endpoint identity group, and click Edit.
Step 3  Click Add.
Step 4  Choose an endpoint in the Endpoints widget to add the selected endpoint in the endpoint identity group.
Step 5  Click the Endpoint Group List link to return to the Endpoint Identity Groups page.

Dynamic Endpoints Reprofiled After Adding or Removing in Identity Groups

If an endpoint identity group assignment is not static, then endpoints are reprofiled after you add or remove them from an endpoint identity group. Endpoints that are identified dynamically by the ISE profiler appear in appropriate endpoint identity groups. If you remove dynamically added endpoints from an endpoint identity group, Cisco ISE displays a message that you have successfully removed endpoints from the identity group but reprofiles them back in the endpoint identity group.

Endpoint Identity Groups Used in Authorization Rules

You can effectively use endpoint identity groups in the authorization policies to provide appropriate network access privileges to the discovered endpoints. For example, an authorization rule for all types of Cisco IP Phones is available by default in Cisco ISE in the following location: Policy > Authorization > Standard.

You must ensure that the endpoint profiling policies are either standalone policies (not a parent to other endpoint profiling policies), or their parent policies of the endpoint profiling policies are not disabled.

Profiler Feed Service

Profiler conditions, exception actions, and NMAP scan actions are classified as Cisco-provided or administrator-created (see the System Type attribute). Also, the endpoint profiling policies are classified as Cisco provided, administrator created, or administrator modified (see the System Type attribute).
You can perform different operations on the profiler conditions, exception actions, NMAP scan actions, and endpoint profiling policies depending on the System Type attribute. You cannot edit or delete Cisco-provided conditions, exception actions, and nmap scan actions. Endpoint policies that are provided by Cisco cannot be deleted. When policies are edited, they are considered as administrator-modified. When administrator-modified policies are deleted, they are replaced by the up-to-date version of the Cisco-provided policy that it was based on.

You can retrieve new and updated endpoint profiling policies and the updated OUI database as a feed from a designated Cisco feed server through a subscription in to Cisco ISE. You can also receive e-mail notifications to the e-mail address as an administrator of Cisco ISE that you have configured for applied, success, and failure messages. You can also provide additional subscriber information to receive notifications. You can send the subscriber information back to Cisco for maintaining the records and they are treated as privileged and confidential.

By default, the profiler feed service is disabled, and it requires a Plus license to enable the service. When you enable the profiler feed service, Cisco ISE downloads the feed service policies and OUI database updates every day at 1:00 A.M of the local Cisco ISE server time zone. Cisco ISE automatically applies these downloaded feed server policies, which also stores the set of changes so that you can revert these changes back to the previous state. When you revert from the set of changes that you last applied, endpoint profiling policies that are newly added are removed and endpoint profiling policies that are updated are reverted to the previous state. In addition, the profiler feed service is automatically disabled.

When the updates occur, only the Cisco provided profiling policies and the endpoint profiling policies which were modified by the previous update, are updated. Cisco provided disabled profiling policies are also updated but they remain disabled. Administrator Created or Administrator Modified profiling policies are not overwritten. If you want to revert any Administrator Modified endpoint profiling policy to any Cisco Provided endpoint profiling policy, then you must delete or revert the Administrator Modified endpoint profiling policy to the previous Cisco Provided endpoint profiling policy.

**OUI Feed Service**

The designated Cisco feed server downloads the updated OUI database from http://standards.ieee.org/develop/regauth/oui/oui.txt, which is the list of vendors associated to the MAC OUI. The updated OUI database is available for any ISE deployment as a feed that Cisco ISE downloads to its own database. Cisco ISE updates endpoints and then starts reprofiling endpoints.

The designated Cisco feed server is located at https://ise.cisco.com:8443/feedserver/ . If you have any issues accessing the service, ensure that your network security components (like a firewall or proxy server, for example) allow direct access to this URL.

**Configure Profiler Feed Service**

The Profiler Feed Service retrieves new and updated endpoint profiling policies and MAC OUI database updates from the Cisco Feed server. If the Feed Service is unavailable or other errors have occurred, it is reported in the Operations Audit report.

You can configure Cisco ISE to send the feed service usage report back to Cisco, which sends the following information to Cisco:

- Hostname - Cisco ISE hostname
- MaxCount - Total number of endpoints
- ProfiledCount - Profiled endpoints count
- UnknownCount - Unknown endpoints count
• MatchSystemProfilesCount - Cisco Provided profiles count
• UserCreatedProfiles - User created profiles count

You can change the CoA type in a Cisco-provided profiling policy. When the feed service updates that policy, the CoA type will not be changed, but the rest of that policy's attributes will be still be updated.

Before you begin

The Profiler feed service can only be configured from the Cisco ISE Admin portal in a distributed deployment or in a standalone ISE node.

Set up a Simple Mail Transfer Protocol (SMTP) server if you plan to send e-mail notifications from the Admin portal about feed updates (Administration > System > Settings).

Procedure

Step 1 Choose Administration > Certificates > Trusted Certificates, and check if Verisign Class 3 Public Primary Certification Authority and Verisign Class 3 Server CA - G3 are enabled.

Step 2 Choose Administration > FeedService > Profiler.

Step 3 Check the Enable Profiler Feed Service check box.

Step 4 Enter time in HH:MM format (local time zone of the Cisco ISE server) in the Feed Service Scheduler section. By default, Cisco ISE feed service is scheduled at 1.00 AM every day.

Step 5 Check the Notify administrator when download occurs check box in the Administrator Notification Options section and enter your e-mail address as an administrator of Cisco ISE in the Administrator email address text box.

Step 6 Check the Provide subscriber information to Cisco check box in the Feed Service Subscriber Information section and enter your details as an administrator of Cisco ISE and an alternate Cisco ISE administrator details.

Step 7 Click Accept.

Step 8 Click Save.

Step 9 Click Update Now.

Instructs Cisco ISE to contact Cisco feed server for new and updated profiles created since the last feed service update. This re-profiles all endpoints in the system, which may cause an increase the load on the system. Due to updated endpoint profiling policies, there may be changes in the authorization policy for some endpoints that are currently connected to Cisco ISE.

The Update Now button is disabled when you update new and updated profiles created since the last feed service and enabled only after the download is completed. You must navigate away from the profiler feed service Configuration page and return to this page.

Step 10 Click Yes.

Related Topics

Configure Profiler Feed Services Offline
Remove Updates to Endpoint Profiling Policies

You can revert endpoint profiling policies that were updated in the previous update and remove endpoint profiling policies that are newly added through the previous update of the profiler feed service but OUI updates are not changed.

An endpoint profiling policy, if modified after an update from the feed server is not changed in the system.

Procedure

Step 1 Choose Adminstration > FeedService > Profiler.
Step 2 Check the Enable Profiler Feed Service check box.
Step 3 Click Go to Update Report Page if you want to view the configuration changes made in the Change Configuration Audit report.
Step 4 Click Undo Latest.

Profiler Reports

Cisco ISE provides you with various reports on endpoint profiling, and troubleshooting tools that you can use to manage your network. You can generate reports for historical as well as current data. You may be able to drill down on a part of the report to view more details. For large reports, you can also schedule reports and download them in various formats.

You can run the following reports for endpoints from Operations > Reports > Endpoints and Users:

- Endpoint Session History
- Profiled Endpoint Summary
- Endpoint Profile Changes
- Top Authorizations by Endpoint
- Registered Endpoints
Configure Client Provisioning in Cisco ISE

Enable client provisioning to allow users to download client provisioning resources and configure agent profiles. You can configure agent profiles for Windows clients, Mac OS X clients, and native supplicant profiles for personal devices. If you disable client provisioning, users attempting to access the network will receive a warning message indicating that they are not able to download client provisioning resources.
Before you begin

If you are using a proxy, and hosting client provisioning resources on a remote system, verify that the proxy allows clients to access that remote location.

Procedure

**Step 1** Choose **Administration > System > Settings > Client Provisioning**.

**Step 2** From the **Enable Provisioning** drop-down list, choose **Enable** or **Disable**.

**Step 3** From the **Enable Automatic Download** drop-down list, choose **Enable**.

Feed downloads include all the available client provisioning resources. Some of these resources may not be pertinent to your deployment. Cisco recommends manually downloading resources whenever possible instead of setting this option.

**Step 4** **Update Feed URL**—Specify the URL where Cisco ISE searches for system updates in the Update Feed URL text box. For example, the default URL for downloading client-provisioning resources is https://www.cisco.com/web/secure/pmbu/provisioning-update.xml. If your network restricts URL-redirection functions (via a proxy server, for example) and you are experiencing difficulty accessing the default URL, try also pointing your Cisco ISE to the following URL: https://www.perfigo.com/ise/provisioning-update.xml.

**Step 5** **Native Supplicant Provisioning Policy Unavailable**—When there is no client provisioning resource for a device, decide here how to proceed in the flow:

- **Allow Network Access**—Users are allowed to register their device on the network without having to install and launch the native supplicant wizard.
- **Apply Defined Authorization Policy**—Users must try to access the Cisco ISE network via standard authentication and authorization policy application (outside of the native supplicant provisioning process). If you enable this option, the user device goes through standard registration according to any client-provisioning policy applied to the user’s ID. If the user’s device requires a certificate to access the Cisco ISE network, you must also provide detailed instructions to the user describing how to obtain and apply a valid certificate using the customizable user-facing text fields, as described in the “Adding a Custom Language Template” section in the Chapter 15, Setting up and Customizing End_User Web Portals.

**Step 6** Click **Save**.

What to do next

Configure client provisioning resource policies.

Client Provisioning Resources

Client provisioning resources are downloaded to endpoints after the endpoint connects to the network. Client provisioning resources consist of compliance and posture agents for desktops, and native supplicant profiles for phones and tablets. Client provisioning policies assign these provisioning resources to endpoints to start a network session.
Client provisioning resources are listed on **Policy Elements > Results > Client Provisioning > Resources**.

The following resource types can be added to the list by clicking the **Add** button:

- **Agent resources from Cisco Site**—Select the NAC, AnyConnect, and Supplicant Provisioning wizards you want to make available for client provisioning policies. Cisco periodically updates this list of resources, adding new ones and updating existing ones. You can also set up ISE to download all the Cisco resources and resource updates automatically, see **Configure Client Provisioning in Cisco ISE**, on page 519 for more information.

- **Agent resources from local disk**—Select resources on your PC that you want to upload to ISE, see **Add Cisco Provided Client Provisioning Resources from a Local Machine**, on page 522.

- **AnyConnect Configuration**—Select the AnyConnect PC clients that you want to make available for client provisioning. See **Create AnyConnect Configuration** for more information.

- **Native Supplicant Profile**—Configure a supplicant profile for phones and tablets that contains settings for your network. For more information, see **Create Native Supplicant Profiles**.

After creating client provisioning resources, create client provisioning policies that apply the client provisioning resources to the endpoints. See **Configure Client Provisioning Resource Policies**, on page 549.

**Related Topics**

- Add Client Provisioning Resources from Cisco, on page 521
- Download Client Provisioning Resources Automatically
- Add Cisco Provided Client Provisioning Resources from a Local Machine, on page 522
- Add Customer Created Resources for AnyConnect from a Local Machine, on page 523

**Add Client Provisioning Resources from Cisco**

You can add client provisioning resources from Cisco.com for AnyConnect and Cisco NAC Agent for Windows and MAC OS x clients, and Cisco Web agent. Depending on the resources that you select and available network bandwidth, Cisco ISE can take a few seconds or even a few minutes to download client provisioning resources to Cisco ISE.

**Before you begin**

- Ensure that you have the correct proxy settings configured in Cisco ISE.
- Enable client provisioning in Cisco ISE.
Procedure

Step 1 Choose Policy > Policy Elements > Results > Client Provisioning > Resources.
Step 2 Choose Add > Agent resources from Cisco site.
Step 3 Select one or more required client provisioning resources from the list available in the Download Remote Resources dialog box.
Step 4 Click Save.

What to do next
After you have successfully added client provisioning resources to Cisco ISE, you can begin to configure client provisioning resource policies.

Add Cisco Provided Client Provisioning Resources from a Local Machine

You can add client provisioning resources from the local disk, which you might have previously downloaded from Cisco.

Before you begin
Be sure to upload only current, supported resources to Cisco ISE. Older, unsupported resources (older versions of the Cisco NAC Agent, for example) will likely cause serious issues for client access.

If you are downloading the resource files manually from the Cisco.com, refer to “Cisco ISE Offline Updates” section in the Release Notes.

Procedure

Step 1 Choose Policy > Policy Elements > Results > Client Provisioning > Resources.
Step 2 Choose Add > Agent resources from local disk.
Step 3 Choose Cisco Provided Packages from the Category drop-down.
Step 4 Click Browse to the directory on your local machine where the resource file that you want to download to Cisco ISE resides.
You can add AnyConnect, Cisco NAC Agent, and Cisco Web Agent resources that you have previously downloaded from Cisco site in your local machine.
Step 5 Click Submit.

What to do next
After you have successfully added client provisioning resources to Cisco ISE, you can begin to configure client provisioning resource policies.
Add Customer Created Resources for AnyConnect from a Local Machine

Add customer created resources like AnyConnect customization and localization packages and AnyConnect profiles from the local machine to Cisco ISE.

Before you begin

Ensure that customer created resources for AnyConnect are zipped files and available in your local disk.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Policy &gt; Policy Elements &gt; Results &gt; Client provisioning &gt; Resources.</td>
</tr>
<tr>

<tr>
<td>Step 3</td>
<td>Choose Agent Resources from local disk.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Choose Customer Created Packages from the Category drop-down.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Enter the name and description for AnyConnect resources.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Click Browse to the directory on your local machine where the resource file that you want to download to Cisco ISE resides.</td>
</tr>
</tbody>
</table>
| Step 7 | Choose the following AnyConnect resources to upload to Cisco ISE:  
  - AnyConnect customization bundle  
  - AnyConnect localization bundle  
  - AnyConnect profile |
| Step 8 | Click Submit.  
The Uploaded AnyConnect Resources table displays AnyConnect resources that you add to Cisco ISE. |

What to do next

Create AnyConnect agent profile

Create Native Supplicant Profiles

You can create native supplicant profiles to enable users to bring their own devices into the Cisco ISE network. When the user signs in, Cisco ISE uses the profile that you associated with that user’s authorization requirements to choose the necessary supplicant provisioning wizard. The wizard runs and sets up the user’s personal device to access the network.

Note

The provisioning wizard only configures interfaces which are active. Because of this, users with Wired and Wireless connections will not be provisioned for both interfaces, unless they are both active.
Before you begin

• If you intend to use a TLS device protocol for remote device registration, set up at least one Simple Certificate Enrollment Protocol (SCEP) profile.

• Open up TCP port 8909 and UDP port 8909 to enable installation of Cisco NAC Agent, Cisco NAC Web Agent, and supplicant provisioning wizard. For more information about port usage, see the “Cisco ISE Appliance Ports Reference” appendix in the Cisco Identity Services Engine Hardware Installation Guide.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Policy &gt; Policy Elements &gt; Results &gt; Client Provisioning &gt; Resources.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Choose Add &gt; Native Supplicant Profile.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Create a profile, using the descriptions described in Native Supplicant Profile Settings, on page 524</td>
</tr>
</tbody>
</table>

What to do next

Enable self-provisioning capabilities that allow employees to directly connect their personal devices to the network, as described in the Support for multiple Guest Portals section.

Native Supplicant Profile Settings

When you choose Policy > Policy Elements > Results > Client Provisioning Resources, and add a Native Supplicant Profile, you will see the following settings.

• Name—Name of the native supplicant profile that you are creating, and select which operating system(s) this profile should apply to. Each profile defines settings for a network connection that ISE will apply to the client's native supplicant.

Wireless Profile(s)

Configure one or more Wireless profiles, one for each SSID that you want to make available to the client.

• SSID Name—Name of the SSID that the client will connect to.

• Security—Configure the client to use WPA or WPA2.

• Allowed Protocol—Configure which protocol the client should use to connect to the authentication server; PEAP or EAP-TLS.

• Certificate Template—For TLS, choose one of the certificate templates defined on Administration > System Certificates > Certificate Authority > Certificate Templates.

Optional Settings are described in the section Optional Settings - for Windows.

iOS Settings

• Enable if target network is hidden
Wired Profile

- **Allowed Protocol**—Configure which protocol the client should use to connect to the authentication server; PEAP or EAP-TLS.
- **Certificate Template**—For TLS, choose one of the certificate templates that defined on Administration System Certificates Certificate Authority Certificate Templates

Optional Settings - for Windows

If you expand Optional, the following fields are also available for Windows clients.

- **Automatically use logon name and password (and domain if any)**—If you selected User for authentication mode, use the logon and password to without prompting the user, if that information is available.
- **Enable Fast Reconnect**—Allow a PEAP session to resume without checking user credentials when the session resume feature is enabled in the PEAP protocol options, which is configured on Administration > System > Settings > Protocols > PEAP.
- **Enable Quarantine Checks**—Check if the client has been quarantined.
- **Disconnect if server does not present cryptobinding TLV**—Disconnect if cryptobinding TLV is not supported for the network connection.
- **Do not prompt user to authorize new servers or trusted certification authorities**—Automatically accept user certificates; do not prompt the user.
- **Connect even if the network is not broadcasting its name (SSID)**—For Wireless profiles only.

Create AnyConnect Configuration

AnyConnect configuration includes AnyConnect software and its associated configuration files. This configuration can be used in the client provisioning policy that allows users to download and install AnyConnect resources on the clients. If you use both ISE and an ASA to deploy AnyConnect, then the configurations must match on both headends.

**Note**

To push the ISE posture module when connected to a VPN, Cisco recommends that you install the AnyConnect agent through Cisco Adaptive Security Appliance (ASA), which uses the Cisco's Adaptive Security Device Manager (ASDM) GUI tool. ASA does the installation using the VPN downloader. With the download, the ISE posture profile is pushed via ASA, and the discovery host needed for later provisioning the profile is available before the ISE posture module contacts ISE. Whereas with ISE, the ISE posture module will get the profile only after ISE is discovered, which could result in errors. Therefore, ASA is recommended to push the ISE posture module when connected to a VPN.

**Before you begin**

You must upload the AnyConnect package, compliance module, profiles, and optionally any customization and localization bundles before configuring an AnyConnect Configuration object.
Create a Posture Agent Profile

Use this procedure to create an AnyConnect or a NAC posture agent profile, where you can specify parameters that define the agent behavior for the posture protocol.

Procedure

Step 1 Choose Policy > Policy Elements > Results > Client Provisioning > Resources.
Step 2 Click Add.
Step 3 Choose NAC AnyConnect Agent Posture Profile.
Step 4 Under Posture Agent Profile Settings, choose AnyConnect or NAC Agent.
Step 5 Configure parameters for the following:
   • Cisco ISE posture agent behavior
   • Client IP Address Changes
   • Cisco ISE posture protocol
Step 6  
Click Submit.

---

### Client IP Address Refresh Configuration

The following table describes the fields in the NAC AnyConnect Posture Profile page, which allows you to configure parameters for the client to renew or refresh its IP address after VLAN change. The navigation path for this page is **Policy > Policy Elements > Results > Client Provisioning > Resources > Add > NAC or AnyConnect Posture Profile.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Default Value</th>
<th>Mode (Applies only to Cisco NAC Agent)</th>
<th>Usage Guidelines</th>
</tr>
</thead>
</table>
| VLAN detection interval| 0, 5          | Merge                                  | This setting is the interval at which the agent checks for the VLAN change.  
For the Windows NAC agent, the default value is 0. By default, the access to authentication VLAN change feature is disabled for Windows. The valid range is 0 to 5 seconds.  
For the Mac OS X agent, the default value is 5. By default, the access to authentication VLAN change feature is enabled with VlanDetectInterval as 5 seconds for Mac OS X. The valid range is 5 to 900 seconds.  
0 — Access to Authentication VLAN change feature is disabled.  
1 to 5 — Agent sends an Internet Control Message Protocol (ICMP) or Address Resolution Protocol (ARP) query every 5 seconds.  
6 to 900 — An ICMP or ARP query is sent every x seconds. |

### Posture Protocol Settings

#### Client Login Session Criteria

Cisco ISE looks at various elements when classifying the type of login session through which users access the internal network, including:

- Client machine operating system and version
- Client machine browser type and version
- Group to which the user belongs
- Condition evaluation results (based on applied dictionary attributes)

After Cisco ISE classifies a client machine, it uses client provisioning resource policies to ensure that the client machine is set up with an appropriate agent version, up-to-date compliance modules for antivirus and antispyware vendor support, and correct agent customization packages and profiles, if necessary.

#### Agent Download Issues on Client Machine

**Problem**

The client machine browser displays a “no policy matched” error message after user authentication and authorization. This issue applies to user sessions during the client provisioning phase of authentication.
Possible Causes
The client provisioning policy is missing required settings.

Posture Agent Download Issues
Remember that downloading the posture agent installer requires the following:

• The user must allow the ActiveX installer in the browser session the first time an agent is installed on the client machine. (The client provisioning download page prompts for this.)

• The client machine must have Internet access.

Resolution

• Ensure that a client provisioning policy exists in Cisco ISE. If yes, verify the policy identity group, conditions, and type of agent(s) defined in the policy. (Also ensure whether or not there is any agent profile configured under Policy > Policy Elements > Results > Client Provisioning > Resources > Add > NAC or AnyConnect Posture Profile, even a profile with all default values.)

• Try re-authenticating the client machine by bouncing the port on the access switch.

Provision Client Machines with the Cisco NAC Agent MSI Installer

You can place the MSI installer in a directory or a zip version of the same installer on the client machine along with an Agent configuration XML file (named NACAgentCFG.xml) containing the appropriate Agent profile information required to coincide with your network.

Procedure

**Step 1** Download the nacagentsetup-win.msi or nacagentsetup-win.zip installer file from the Cisco Software Download site from http://software.cisco.com/download/navigator.html and navigate to Security > Access Control and Policy > Cisco Identityt Services Engine > Cisco Identity Services Engine Software > Release 1.x.

**Step 2** Place the nacagentsetup-win.msi file in a specific directory on the client machine (for example, C:\temp\nacagentsetup-win.msi):

• If you are copying the MSI installer directly over to the client, place the nacagentsetup-win.msi file into a directory on the client machine from which you plan to install the Cisco NAC Agent.

• If you are using the nacagentsetup-win.zip installer, extract the contents of the zip file into the directory on the client machine from which you plan to install the Cisco NAC Agent.

**Step 3** Place an Agent configuration XML file in the same directory as the Cisco NAC Agent MSI package.

If you are not connected to Cisco ISE, you can copy the NACAgentCFG.xml file from a client that has already been successfully provisioned. The file is located at C:\Program Files\Cisco\Cisco NAC Agent\NACAgentCFG.xml.
As long as the Agent configuration XML file exists in the same directory as the MSI installer package, the installation process automatically places the Agent configuration XML file in the appropriate Cisco NAC Agent application directory so that the agent can point to the correct Layer 3 network location when it is first launched.

**Step 4**
Open a Command prompt on the client machine and enter the following to execute the installation:
```
msiexec.exe /i NACAgentSetup-win.msi /qn /l*v c:\temp\agent-install.log
```
(The /qn qualifier installs the Cisco NAC Agent completely silently. The /l*v logs the installation session in verbose mode.)

To uninstall the NAC Agent, you can execute the following command:
```
msiexec /x NACAgentSetup-win-<version>.msi /qn
```
Installing a new version of the Agent using MSI will uninstall the old version and install the new version using the above commands.

**Step 5**
If you are using Altiris/SMS to distribute the MSI installer, place the Agent customization files in a sub-directory named "brand" in the directory "%TEMP%\CCAA". When the Cisco NAC Agent is installed in the client, the customization is applied to the Agent. To remove the customization, send a plain MSI without the customization files.

---

## Cisco ISE Posture Agents

Posture agents are applications that reside on client machines logging into the Cisco ISE network. Agents can be persistent (like the AnyConnect, Cisco NAC Agent for Windows and Mac OS X) and remain on the client machine after installation, even when the client is not logged into the network. Agents can also be temporal (like the Cisco NAC Web Agent), removing themselves from the client machine after the login session has terminated. In either case, the Agent helps the user to log in to the network, receive the appropriate access profile, and even perform posture assessment on the client machine to ensure it complies with network security guidelines before accessing the core of the network.

---

**Note**
Currently Cisco NAC Agent and Cisco NAC Web Agent support Client Provisioning Portal and Native Supplicant Provisioning. Cisco NAC Web Agent supports Central Web Authentication flow (CWA), but Cisco NAC Agent does not support CWA.

---

## Posture Agent Discovery Request and Cisco ISE Response

Cisco ISE supports coexistence of AnyConnect and legacy Cisco ISE NAC agents on Windows and Mac OS X clients. Agents start the posture discovery probe only when there is any change in the network on the clients. Cisco ISE responds to the client's posture discovery probe based on the client provisioning policy and the corresponding agent will get the discovery response, which results in only one agent being active.

Based on the client provisioning policy, Cisco ISE differs in responding to the agents posture discovery probe as below:
• If the endpoint is configured to use the legacy agent (Cisco ISE NAC agent for Windows and Mac OS x), the agent receives the discovery response with a string "X-perfigo-CAS=FQDN" in the existing format. AnyConnect stops discovery, if the discovery response is received for the legacy agent.

• If the endpoint is configured to use AnyConnect, Cisco ISE responds in a different format. This will be the Cisco ISE Policy Service node FQDN and the AnyConnect Configuration URL, AnyConnect package location and version based on the client provisioning policy. The legacy agent stops discovery, if the response is received for AnyConnect.

Web Agent Posture Discovery Request and Cisco ISE Response

The Web agent does not do discovery probe. If an endpoint is configured to use the Web agent, Cisco ISE responds using the format, X-ISE-PDP-WEBAGENT=FQDN". The webagent discovery response is used to invoke the Cisco NAC Agent on the client, if the client provisioning policy is configured to use the Web agent.

Agent Displays “Temporary Access”

Problem

A client machine is granted “Temporary Access” to the network following login and authentication, but administrator and users expect full network access.

Possible Causes

This issue is applicable to any client machine login session using an agent to connect.

If the Cisco NAC Agent is running on the client and:

• The interface on the client machine goes down
• The session is terminated

Resolution

The user must try to verify network connectivity and then try to log in again (and pass through posture assessment, as well) to attempt to reestablish the connection.

Agent Fails to Initiate Posture Assessment

Problem

The user is presented with a “Clean access server not available” message. This issue applies to any agent authentication session from Cisco ISE.

Possible Cause

This error could mean that either the session has terminated or Cisco ISE is no longer reachable on the network.
Resolution

- The user can try to log into the network again.
- The user can try to ping the default gateway or the RADIUS server IP address or FQDN supplied by the network administrator.
- The administrator can check network access attributes for the user (like the assigned VLAN, ACLs, routing, execute the nslookup command on the client, client machine DNS connection, and so on).

AnyConnect

Cisco ISE uses an integrated module in AnyConnect for Cisco ISE posture requirements. AnyConnect is the posture agent that coexists with Cisco ISE NAC Agent on the same endpoint. Based on the client provisioning policy configuration in Cisco ISE, only one of the agents will be active at a time.

Cisco AnyConnect is not supported in CWA flow. It cannot be provisioned from the Guest portal using the Require guest device compliance field in the Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Guest Device Compliance Settings page. Instead, AnyConnect should be provisioned from the Client Provisioning portal as a result of redirection configured in authorization permissions.

To leverage Cisco ISE for integration with AnyConnect agent, Cisco ISE:

- Serves as a staging server to deploy AnyConnect, Version 4.0 and its future releases
- Interacts with AnyConnect posture component for Cisco ISE posture requirements
- Supports deployment of AnyConnect profiles, customization/language packages, and OPSWAT library updates for Windows and Mac OS x operating systems
- Supports AnyConnect and legacy agents at the same time

Cisco NAC Agent XML File Installation Directories

In a system where the Cisco NAC Agent installed at the default location, you can find the following .xml files in the following directories:

- The nac_login.xml file is available in the “C:\Program Files\Cisco\Cisco NAC Agent\UI\nac_divs\login” directory.
- In the nacStrings_xx.xml file, the “xx” indicates the locale. You can find a complete list of the files in the “C:\Program Files\Cisco\Cisco NAC Agent\UI\cues_utility” directory.

If the agent is installed at a different location, then the files would be available at “<Agent Installed path>\Cisco\Cisco NAC Agent\UI\nac_divs\login” and “<Agent Installed path>\Cisco\Cisco NAC Agent\cues_utility”. 
Cisco NAC Agent for Windows Clients

The Cisco NAC Agent provides the posture assessment and remediation for client machines. Users can download and install the Cisco NAC Agent (read-only client software), which can check the host registry, processes, applications, and services. The Cisco NAC Agent can be used to perform Windows updates or antivirus and antispyware definition updates, launch qualified remediation programs, distribute files uploaded to the Cisco ISE server, distribute website links to web sites for users to download files to fix their system, or simply distribute information and instructions.

Cisco strongly recommends that you ensure that the latest Windows hotfixes and patches are installed on Windows XP clients so that the Cisco NAC Agent can establish a secure and encrypted communication with Cisco ISE (via SSL over TCP).

Uninstall the Cisco NAC Agent from Windows 7 and Earlier Clients

The Cisco NAC Agent installs to C:\Program Files\Cisco\Cisco NAC Agent\ on the Windows client. You can uninstall the agent in the following ways:

• By double-clicking the Uninstall Cisco NAC Agent desktop icon.

• By going to Start Menu > Programs > Cisco Systems > Cisco Clean Access > Uninstall Cisco NAC Agent

• By going to Start Menu > Control Panel > Add or Remove Programs > Cisco NAC Agent and uninstall the Cisco NAC Agent.

Uninstall the Cisco NAC Agent in a Windows 8 Client

You can uninstall Cisco NAC Agent in a Windows 8 client in Metro mode.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Switch to Metro Mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Right-Click Cisco NAC Agent tile.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Select Un-Install from the options available at the bottom of the screen.</td>
</tr>
<tr>
<td>Step 4</td>
<td>The system automatically switches to Desktop mode and opens Add/Remove control panel.</td>
</tr>
</tbody>
</table>
| Step 5 | In the Add/Remove control panel, perform one of the following:  
a) Double Click Cisco NAC Agent and click Uninstall.  
b) Select Cisco NAC Agent and click Uninstall.  
c) Right Click Cisco NAC Agent and select Uninstall. |
Windows 8 Metro and Metro App Support — Toast Notifications

The Enable Toast Notification option is available on the Cisco NAC Agent Tray Icon that can send relevant notifications to users on Windows 8 clients.

In Cisco NAC Agent scenarios where the user does not get network access, like "Remediation Failed" or "Network Access expired", the Agent displays the following toast notification: Network not available, Click "OK" to continue.

To get more details, you can select the toast and you will be redirected to Desktop mode and the Cisco NAC agent dialog is displayed.

Toast Notification is displayed for all positive recommended actions that the user needs to perform to gain network access. The following are some examples:

- For Network Acceptance policy, toast will be displayed as: "Click Accept to gain network access"
- For Agent/Compliance Module Upgrade, toast will be displayed as: "Click OK to Upgrade/Update"
- In the "user logged out" event, when "Auto Close" option for Logoff is not enabled in Clean Access Manager (CAM), toast notification is provided. This toast enables the users to know that they have been logged out and that they need to login again to get network access.

Cisco NAC Agent for Macintosh Clients

The Cisco NAC OS X Agent provides the posture assessment and remediation for Macintosh client machines.

Users can download and install the Cisco NAC OS X Agent (read-only client software), which can check antivirus and antispyware definition updates.

After users log in to the Cisco NAC OS X Agent, the agent gets the requirements that are configured for the user role and the operating system from the Cisco ISE server, checks for required packages and sends a report back to the Cisco ISE server. If requirements are met on the client, the user is allowed network access. If requirements are not met, the agent presents a dialog to the user for each requirement that is not satisfied. The dialog provides the user with instructions and the action to take for the client machine to meet the requirement. Alternatively, if the specified requirements are not met, users can choose to accept restricted network access while the user tries to remediate the client system.

Uninstall the Cisco NAC Agent from Macintosh Clients

You can uninstall the Cisco NAC Agent for Mac OS X clients by running the uninstall script as follows:

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Open the navigator pane and navigate to <code>&lt;local drive ID&gt; &gt; Applications</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Highlight and right-click the CCAAgent icon to bring up the selection menu.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Choose Show Package Contents and double-click NacUninstall to uninstall the Cisco NAC Agent on Mac OS X.</td>
</tr>
</tbody>
</table>
Cisco Web Agent

The Cisco Web Agent provides temporal posture assessment for client machines.

Users can launch the Cisco Web Agent executable, which installs the Web Agent files in a temporary directory on the client machine via ActiveX control or Java applet.

After users log into the Cisco Web Agent, the Web Agent gets the requirements that are configured for the user role and the operating system from the Cisco ISE server, checks the host registry, processes, applications, and services for required packages and sends a report back to the Cisco ISE server. If requirements are met on the client machine, the user is allowed network access. If requirements are not met, the Web Agent presents a dialog to the user for each requirement that is not satisfied. The dialog provides the user with instructions and the action to take for the client machine to meet the requirement. Alternatively, if the specified requirements are not met, users can choose to accept the restricted network access while they try to remediate the client system so that it meets requirements for the user login role.

Note

Cisco NAC Agent Logs

In the Cisco NAC Agent for Windows, right-click the Agent Tray Icon and then click Log Packager to run the support package and collect the agent logs.

In the Cisco NAC Agent for Cisco NAC OS X, in the Tools menu, right-click the Agent icon and click the Collect Support Logs option to collect the agent logs and support information. The collected information is available as a zip file. The user can save the file by choosing the file location and filename. By default the file is saved on the desktop with the filename as CiscoSupportReport.zip.

If the agent crashes or hangs, you can run the CCAAgentLogPackager.app to collect the logs. This file is available at /Applications/CCAAgent.app. You can right-click CCAAgent.app, select Show Package Contents and double-click CCAAgentLogPackager to collect the support information.

Create an Agent Customization File for the Cisco NAC Agent

An agent customization file allows you to customize the logo, fields, and message text contained in a Cisco NAC Agent screen dialog to suit your specific Windows client network access requirements.

You can create a customization package as a .zip file that contains an XML descriptor file and another .zip file with the contents comprising the customized options.

Procedure

Step 1

Assemble the files required to comprise your Agent screen customization package:

- Customized nac_login.xml file
Custom nac_login.xml File Template

The nac_login.xml file is one of the files that is required in your Agent screen customization package, which allows you to customize the logo, fields, and message text contained in a Cisco NAC Agent dialog, like the Properties window, to suit your specific Windows client network access requirements.

Use the following template to construct an appropriate “nac_login.xml” file to customize the logo, fields, and message text contained in a Cisco NAC Agent screen.

The following example shows a customized file.

```html
<tr class="nacLoginMiddleSectionContainerInput">
<td colspan="2">
<fieldset width="100%" id="nacLoginCustomAlert" style="display:block" class="nacLoginAlertBox">
<table width="100%">
<tr>
<td id="nacLoginCustomAlert.img" valign="top" width="32px">
<img src="./cues_icons/Status_warning_icon.png" align="absmiddle" onload="cuesFixPNG(null,this)"></img>
</td>
<td id="nacLoginCustomAlert.content" class="nacLoginAlertText">
<cues:localize key="login.customalert" />
</td>
</tr>
</table>
</fieldset>
</td>
</tr>
<tr id="nacLoginRememberMe" style="visibility:hidden">
<td>
<cues:localize key="cd.nbsp" />
</td>
<td class="cuesLoginField">
<nobr>
<input type="checkbox" alt="" title="" name="rememberme" id="rememberme" checked="true"/>
<cues:localize key="login.remember_me" />
</nobr>
</td>
</tr>
```

Step 2

Create a zip file called “brand-win.zip” that contains the assembled files. For example, in a Linux or Unix environment, execute the following:

```bash
zip -r brand-win.zip nac_login.xml nac_logo.gif nacStrings_en.xml nacStrings_cy.xml nacStrings_el.xml
```

Step 3

Create a “custom.zip” file that contains an appropriate updateFeed.xml descriptor file and the .zip file created above. For example, in a Linux or Unix environment, execute the following:

```bash
zip -r custom.zip updateFeed.xml brand-win.zip
```

Step 4

Save the resulting “custom.zip” file to a location on a local machine that you can access when uploading the file to Cisco ISE.

Custom nac_login.xml File Template

The nac_login.xml file is one of the files that is required in your Agent screen customization package, which allows you to customize the logo, fields, and message text contained in a Cisco NAC Agent dialog, like the Properties window, to suit your specific Windows client network access requirements.

Use the following template to construct an appropriate “nac_login.xml” file to customize the logo, fields, and message text contained in a Cisco NAC Agent screen.

The following example shows a customized file.

```html
<tr class="nacLoginMiddleSectionContainerInput">
<td colspan="2">
<fieldset width="100%" id="nacLoginCustomAlert" style="display:block" class="nacLoginAlertBox">
<table width="100%">
<tr>
<td id="nacLoginCustomAlert.img" valign="top" width="32px">
<img src="./cues_icons/Status_warning_icon.png" align="absmiddle" onload="cuesFixPNG(null,this)"></img>
</td>
<td id="nacLoginCustomAlert.content" class="nacLoginAlertText">
<cues:localize key="login.customalert" />
</td>
</tr>
</table>
</fieldset>
</td>
</tr>
<tr id="nacLoginRememberMe" style="visibility:hidden">
<td>
<cues:localize key="cd.nbsp" />
</td>
<td class="cuesLoginField">
<nobr>
<input type="checkbox" alt="" title="" name="rememberme" id="rememberme" checked="true"/>
<cues:localize key="login.remember_me" />
</nobr>
</td>
</tr>
```
Custom nacStrings_xx.xml File Template

This is one of the files that is required in your Agent screen customization package, allows you to customize the logo, fields, and message text contained in a Cisco NAC Agent dialog, like the Properties screen, to suit your specific Windows client network access requirements.

Use the following template to construct a one or more nacStrings_xx.xml files, where xx is a two-character identifier for the specific language.

The following example shows a customized nacStrings_xx.xml file.

```xml
  <cueslookup:name key="nac.brand.legal_name">Cisco Systems, Inc.</cueslookup:name>
  <cueslookup:name key="nac.brand.full_name">Cisco Systems</cueslookup:name>
  <cueslookup:name key="nac.brand.abbreviation">Cisco</cueslookup:name>

    <title>Agent Customization Package</title>
    <updated>2010-06-07T12:00:00Z</updated>
    <summary>This is EF Agent Customization Package 1.1.1.7</summary>
    <link rel="enclosure" type="application/zip" href="brand-win.zip" length="18884" />
    <update:type>AgentCustomizationPackage</update:type>
    <update:version>1.1.1.7</update:version>
    <update:os>WINDOWS_ALL</update:os>
  </entry>
</feed>
```

Note the following points while creating the updateFeed.xml descriptor file:

- `<update:os>`—You must always set this attribute to “WINDOWS_ALL” to include all the Windows OS versions that are supported by Cisco NAC Agent. See Support Information for Cisco NAC Appliance Agents for the list of Windows OS versions that are supported by Cisco NAC Agent.

- `<update:version>`—This refers to the Agent Customization Package version that you want to upgrade to. This value should be four digit <n.n.n.n> and should be greater than the package version that is currently installed.

- `<id>`—This id can be anything, but should be unique for each Agent Customization Package.
Example XML File Generated Using the Create Profile Function

```xml
<?xml version="1.0" ?>
<cfg>
  <VlanDetectInterval>0</VlanDetectInterval>
  <RetryDetection>3</RetryDetection>
  <PingArp>0</PingArp>
  <PingMaxTimeout>1</PingMaxTimeout>
  <EnableVlanDetectWithoutUI>0</EnableVlanDetectWithoutUI>
  <SignatureCheck>0</SignatureCheck>
  <DisableExit>0</DisableExit>
  <PostureReportFilter>displayFailed</PostureReportFilter>
  <BypassSummaryScreen>1</BypassSummaryScreen>
  <LogFileSize>5</LogFileSize>
  <DiscoveryHost></DiscoveryHost>

  <HttpDiscoveryTimeout>30</HttpDiscoveryTimeout>
  <HttpTimeout>120</HttpTimeout>
  <SwissTimeout>1</SwissTimeout>
  <AllowCRLChecks>1</AllowCRLChecks>
  <DiscoveryHostEditable>1</DiscoveryHostEditable>
  <PostureReportFilter>displayFailed</PostureReportFilter>
  <ServerNameRules></ServerNameRules>
</cfg>
```

This file also contains two static (that is, uneditable by the user or Cisco ISE administrator) “AgentCfgVersion” and “AgentBrandVersion” parameters used to identify the current version of the agent profile and agent customization file, respectively, on the client.

Configure Client Provisioning Resource Policies

For clients, the client provisioning resource policies determine which users receive which version (or versions) of resources (agents, agent compliance modules, and/or agent customization packages/profiles) from Cisco ISE upon login and user session initiation.

For AnyConnect, resources can be selected either from the client provisioning resources page to create an AnyConnect configuration that you can use in the client provisioning policy page. AnyConnect configuration is the AnyConnect software and its association with different configuration files that includes AnyConnect binary package for Windows and Mac OS X clients, compliance module. profile, customization and language packages for AnyConnect.

For Cisco ISE NAC agents, resources can be selected from the client provisioning policy page.

Before you begin

- Before you can create effective client-provisioning resource policies, ensure that you have added resources to Cisco ISE. When you download the agent compliance module, it always overwrites the existing one, if any, available in the system.
• Check the native supplicant profile that is used in the client provisioning policy and ensure that the wireless SSID is correct. For iOS devices, if the network that you are trying to connect to is hidden, check the **Enable if target network is hidden** check box from the iOS Settings area.

### Procedure

| Step 1 | Choose **Policy > Client Provisioning**. |
| Step 2 | Choose **Enable, Disable, or Monitor** from the behavior drop-down list: |
|        | • **Enable**—Ensures Cisco ISE uses this policy to help fulfill client-provisioning functions when users log in to the network and conform to the client-provisioning policy guidelines. |
|        | • **Disable**—Cisco ISE does not use the specified resource policy to fulfill client-provisioning functions. |
|        | • **Monitor**—Disables the policy and “watches” the client-provisioning session requests to see how many times Cisco ISE tries to invoke based on the “Monitored” policy. |
| Step 3 | Enter a name for the new resource policy in the Rule Name text box. |
| Step 4 | Specify one or more Identity Groups to which a user who logs into Cisco ISE might belong. |
|        | You can choose to specify the Any identity group type, or choose one or more groups from a list of existing Identity Groups that you have configured. |
| Step 5 | Use the Operating Systems field to specify one or more operating systems that might be running on the client machine or device through which the user is logging into Cisco ISE. |
|        | You can choose to specify a single operating system like "Android", "Mac iOS", and "Mac OS X" or an umbrella operating system designation that addresses a number of client machine operating systems like "Windows XP (All)" or "Windows 7 (All)." |
| Step 6 | In the Other Conditions field, specify a new expression that you want to create for this particular resource policy. |
| Step 7 | For client machines, use **Agent Configuration** to specify which agent type, compliance module, agent customization package, and/or profile to make available and provision on the client machine. |
|        | It is mandatory to include the client provisioning URL in authorization policy, to enable the NAC Agent to popup in the client machines. This prevents request from any random clients and ensures that only clients with proper redirect URL can request for posture assessment. |
| Step 8 | Click **Save**. |

### What to do next

Once you have successfully configured one or more client provisioning resource policies, you can start to configure Cisco ISE to perform posture assessment on client machines during login.

## Configure Cisco ISE Posture Agent in the Client Provisioning Policy

For client machines, configure which agent type, compliance module, agent customization package, and/or profile to make available and provision for users to download and install on the client machine.
Before you begin

You must have added client provisioning resources for AnyConnect and Cisco ISE NAC in Cisco ISE.

Procedure

**Step 1** Choose an available agent from the **Agent** drop-down list and specify whether the agent upgrade (download) defined here is mandatory for the client machine by enabling or disabling the **Is Upgrade Mandatory** option, as appropriate.

The **Is Upgrade Mandatory** setting only applies to agent downloads. Agent profile, compliance module, and Agent customization package updates are always mandatory.

**Step 2** Choose an existing agent profile from the **Profile** drop-down list.

**Step 3** Choose an available compliance module to download to the client machine using the **Compliance Module** drop-down list.

**Step 4** Choose an available agent customization package for the client machine from the **Agent Customization Package** drop-down list.

Configure Native Supplicants for Personal Devices

Employees can connect their personal devices to the network directly using native supplicants, which are available for Windows, Mac OS, iOS, and Android devices. For personal devices, specify which Native Supplicant configuration to make available and provision on the registered personal device.

**Before you begin**

Create native supplicant profiles so that when user log in, based on the profile that you associate with that users authorization requirements, Cisco ISE provides the necessary supplicant provisioning wizard to set up the users personal devices to access the network.

**Procedure**

**Step 1** Choose **Policy > Client Provisioning**.

**Step 2** Choose **Enable, Disable, or Monitor** from the behavior drop-down list:

**Step 3** Enter a name for the new resource policy in the Rule Name text box.

**Step 4** Specify the following:

- Use the Identity Groups field to specify one or more Identity Groups to which a user who logs into Cisco ISE might belong.
- Use the Operating System field to specify one or more operating systems that might be running on the personal device through which the user is logging into Cisco ISE.
- Use the Other Conditions field to specify a new expression that you want to create for this particular resource policy.

**Step 5** For personal devices, use **Native Supplicant Configuration** to choose the specific **Configuration Wizard** to distribute to these personal devices.
Step 6 Specify the applicable **Wizard Profile** for the given personal device type.
Step 7 Click **Save**.

---

**Client Provisioning Reports**

You can access the Cisco ISE monitoring and troubleshooting functions to check on overall trends for successful or unsuccessful user login sessions, gather statistics about the number and types of client machines logging into the network during a specified time period, or check on any recent configuration changes in client provisioning resources.

**Client Provisioning Requests**

The **Operations > Reports > ISE Reports > Endpoints and Users > Client Provisioning** report displays statistics about successful and unsuccessful client provisioning requests. When you choose **Run** and specify one of the preset time periods, Cisco ISE combs the database and displays the resulting client provisioning data.

**Supplicant Provisioning Requests**

The **Operations > Reports > ISE Reports > Endpoints and Users > Supplicant Provisioning** window displays information about recent successful and unsuccessful user device registration and supplicant provisioning requests. When you choose **Run** and specify one of the preset time periods, Cisco ISE combs the database and displays the resulting supplicant provisioning data.

The Supplicant Provisioning report provides information about a list of endpoints that are registered through the device registration portal for a specific period of time, including data like the Logged at Date and Time, Identity (user ID), IP Address, MAC Address (endpoint ID), Server, profile, Endpoint Operating System, SPW Version, Failure Reason (if any), and the Status of the registration.

**Client Provisioning Event Logs**

You can search event log entries to help diagnose a possible problem with client login behavior. For example, you may need to determine the source of an issue where client machines on your network are not able to get client provisioning resource updates upon login. You can use logging entries for Posture and Client Provisioning Audit and Posture and Client Provisioning Diagnostics.
CHAPTER 23

Configure Client Posture Policies

Posture is a service in Cisco Identity Services Engine (Cisco ISE) that allows you to check the state, also known as posture, of all the endpoints that are connecting to a network for compliance with corporate security policies. This allows you to control clients to access protected areas of a network.

Posture Service

Posture is a service in Cisco Identity Services Engine (Cisco ISE) that allows you to check the compliance, also known as posture, of endpoints, before allowing them to connect to your network. A posture agent, such as the AnyConnect ISE Posture Agent or Network Admission Control (NAC) Agent, runs on the endpoint. Client Provisioning ensures that the endpoints receive the appropriate Posture Agent.
The ISE Posture Agent for Cisco ISE does not support Windows Fast User Switching when using the native supplicant, because there is no clear disconnect of the previous user. When a new user is sent, the Agent is hung on the old user process and session ID, so a new posture session cannot start. As per the Microsoft Security policies, it is recommended to disable Fast User Switching.

**Related Topics**

- Posture and Client-Provisioning Policies Workflow, on page 555
- Posture Service Licenses, on page 555

## Components of Posture Services

Cisco ISE posture service primarily includes the posture administration services and the posture run-time services.

### Posture Administration Services

If you have not installed the Apex license in Cisco ISE, then the posture administration services option is not available from the Admin portal.

Administration services provide the back-end support for posture-specific custom conditions and remediation actions that are associated with the requirements and authorization policies that are configured for posture service.

### Posture Run-Time Services

The posture run-time services encapsulate all the interactions that happen between the client agent and the Cisco ISE server for posture assessment and remediation of clients.

Posture run-time services begin with the Discovery Phase. An endpoint session is created after the endpoint passes 802.1x authentication. The client agent then attempts to connect to a Cisco ISE node by sending discovery packets through different methods in the following order:

1. via HTTP to Port 80 on a Cisco ISE server (if configured)
2. via HTTPS to Port 8905 on a Cisco ISE server (if configured)
3. via HTTP to Port 80 on the default gateway
4. via HTTPS to Port 8905 to each previously contact server
5. via HTTP to Port 80 on enroll.cisco.com

The Posture Phase begins when the Acceptable User Policy (if any) is accepted. The Cisco ISE node issues a posture token for the Posture Domain to the client agent. The posture token allows the endpoint to reconnect to the network without going through the posture process again. It contains information such as the Agent GUID, the Acceptable User Policy status, and endpoint operating system information.

The messages used in the Posture Phase are in the NEA PB/PA format (RFC5792).
Posture and Client-Provisioning Policies Workflow

Figure 33: Posture and Client Provisioning Policies Workflow in Cisco ISE

Posture Service Licenses

Cisco ISE provides you with three types of licenses, the Base license, the Plus license, and the Apex license. If you have not installed the Apex license on the Primary PAN, then the posture requests will not be served in Cisco ISE. The posture service of Cisco ISE can run on a single node or on multiple nodes.

Posture Service Deployment

You can deploy Cisco ISE in a standalone environment (on a single node) or in a distributed environment (on multiple nodes).

In a standalone Cisco ISE deployment, you can configure a single node for all the administration services, the monitoring and troubleshooting services, and the policy run-time services.

In a distributed Cisco ISE deployment, you can configure each node as a Cisco ISE node for administration services, monitoring and troubleshooting services, and policy run-time services, or as an inline posture node as needed. A node that runs the administration services is the primary node in that Cisco ISE deployment. The other nodes that run other services are the secondary nodes which can be configured for backup services for one another.
Enable Posture Session Service in Cisco ISE

**Before you begin**

- You must enable session services in Cisco ISE and install the advanced license package to serve all the posture requests received from the clients.
- If you have more than one node that is registered in a distributed deployment, all the nodes that you have registered appear in the Deployment Nodes page, apart from the primary node. You can configure each node as a Cisco ISE node (Administration, Policy Service, and Monitoring personas) or an Inline Posture node.
- The posture service only runs on Cisco ISE nodes that assume the Policy Service persona and does not run on Cisco ISE nodes that assume the administration and monitoring personas in a distributed deployment.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Administration &gt; System &gt; Deployment &gt; Deployment.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Choose a Cisco ISE node from the Deployment Nodes window.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click Edit.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Under the General Settings tab, check the Policy Service check box,</td>
</tr>
<tr>
<td></td>
<td>If the Policy Service check box is unchecked, both the session services and the profiling service check boxes are disabled.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Check the Enable Session Services check box, for the Policy Service persona to run the Network Access, Posture, Guest, and Client Provisioning session services. To stop the session services, uncheck the check box.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Click Save.</td>
</tr>
</tbody>
</table>

**Run the Posture Assessment Report**

You can run the Posture Detail Assessment report to generate a detailed status of compliance of the clients against the posture policies that are used during posture assessment.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Operations &gt; Reports &gt; ISE Reports &gt; Endpoints and Users &gt; Posture Detail Assessment.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>From the Time Range drop-down list, choose the specific time period.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click Run to view the summary of all the end points that were active during the selected time period.</td>
</tr>
</tbody>
</table>
Posture Administration Settings

You can globally configure the Admin portal for posture services. You can download updates automatically to the Cisco ISE server through the web from Cisco. You can also update Cisco ISE manually offline later. In addition, having an agent like AnyConnect, the NAC Agent, or the Web Agent installed on the clients provides posture assessment and remediation services to clients. The client agent periodically updates the compliance status of clients to Cisco ISE. After login and successful requirement assessment for posture, the client agent displays a dialog with a link that requires end users to comply with terms and conditions of network usage. You can use this link to define network usage information for your enterprise network that end users accept before they can gain access to your network.

Related Topics

- Set Posture Status for Nonagent Devices, on page 558
- Posture Lease, on page 559
- Configure Acceptable Use Policies for Posture Assessment, on page 562

Timer Settings for Clients

You can set up timers for users to remediate, to transition from one state to another, and to control the login success screen.

We recommend configuring agent profiles with remediation timers and network transition delay timers as well as the timer used to control the login success screen on client machines so that these settings are policy based. You can configure all these timers for agents in client provisioning resources in the NAC or AnyConnect Posture Profile window (Policy > Policy Elements > Results > Client Provisioning > Resources > Add > NAC or AnyConnect Posture Profile).

However, when there are no agent profiles configured to match the client provisioning policies, you can use the settings in the General Settings configuration window (Administration > System > Settings > Posture > General Settings).

Related Topics
- Set Remediation Timer for Clients to Remediate Within Specified Time, on page 557
- Set Network Transition Delay Timer for Clients to Transition, on page 558
- Set Login Success Window to Close Automatically, on page 558

Set Remediation Timer for Clients to Remediate Within Specified Time

You can configure the timer for client remediation within a specified time. When clients fail to satisfy configured posture policies during an initial assessment, the agent waits for the clients to remediate within the time configured in the remediation timer. If the client fails to remediate within this specified time, then the client agent sends a report to the posture run-time services after which the clients are moved to the noncompliance state.

Procedure

Step 1 Choose Administration > System > Settings > Posture > General Settings.
Step 2 In the Remediation Timer field, enter a time value in minutes.
Set Network Transition Delay Timer for Clients to Transition

You can configure the timer for clients to transition from one state to the other state within a specified time using the network transition delay timer, which is required for Change of Authorization (CoA) to complete. It may require a longer delay time when clients need time to get a new VLAN IP address during success and failure of posture. When successfully postured, Cisco ISE allows clients to transition from unknown to compliant mode within the time specified in the network transition delay timer. Upon failure of posture, Cisco ISE allows clients to transition from unknown to noncompliant mode within the time specified in the timer.

Procedure

Step 1
Choose Administration > System > Settings > Posture > General Settings.

Step 2
Enter a time value in seconds, in the Network Transition Delay field.

Step 3
Click Save.

Set Login Success Window to Close Automatically

After successful posture assessment, the client agent displays a temporary network access screen. The user needs to click the OK button in the login window to close it. You can set up a timer to close this login screen automatically after specified time.

Procedure

Step 1
Choose Administration > System > Settings > Posture > General Settings.

Step 2
Check the Automatically Close Login Success Screen After check box.

Step 3
Enter a time value in seconds, in the field next to Automatically Close Login Success Screen After check box.

Step 4
Click Save.

Set Posture Status for Nonagent Devices

You can configure the posture status of endpoints that run on non-agent devices like Linux or iDevices. When Android devices and Apple iDevices such as an iPod, iPhone, or iPad connect to a Cisco ISE enabled network, these devices assume the Default Posture Status settings. The default value is 4 minutes. The valid range is 1 to 300 minutes.

Step 3
Click Save.
These settings can also be applied to endpoints that run on Windows and Macintosh operating systems when a matching policy is not found during posture runtime.

**Before you begin**

In order to enforce policy on an endpoint, you must configure a corresponding Client Provisioning policy (Agent installation package). Otherwise, the posture status of the endpoint automatically reflects the default setting.

**Procedure**

1. **Step 1** Choose Administration > System > Settings > Posture > General Settings.
2. **Step 2** From the Default Posture Status drop-down list, choose the option as Compliant or Noncompliant.
3. **Step 3** Click Save.

**Posture Lease**

You can configure Cisco ISE to perform posture assessment every time a user logs into your network or perform posture assessment in specified intervals. The valid range is 1 to 365 days.

This configuration applies only for those who use AnyConnect agent for posture assessment.

**Periodic Reassessments**

Periodic reassessment (PRA) can be done only for clients that are already successfully postured for compliance. PRA cannot occur if clients are not compliant on your network.

A PRA is valid and applicable only if the endpoints are in a compliant state. The policy service node checks the relevant policies, and compiles the requirements depending on the client role that is defined in the configuration to enforce a PRA. If a PRA configuration match is found, the policy service node responds to the client agent with the PRA attributes that are defined in the PRA configuration for the client before issuing a CoA request. The client agent periodically sends the PRA requests based on the interval specified in the configuration. The client remains in the compliant state if the PRA succeeds, or the action configured in the PRA configuration is to continue. If the client fails to meet PRA, then the client is moved from the compliant state to the noncompliant state.

The PostureStatus attribute shows the current posture status as compliant in a PRA request instead of unknown even though it is a posture reassessment request. The PostureStatus is updated in the Monitoring reports as well.

When the posture lease has not expired, an endpoint becomes compliant based on the Access Control List (ACL), and PRA is initiated. If PRA fails, the endpoint is deemed noncompliant and the posture lease is reset.

**Configure Periodic Reassessments**

You can configure periodic reassessments only for clients that are already successfully postured for compliance. You can configure each PRA to a user identity group that is defined in the system.
Before you begin

- Ensure that each PRA configuration has a unique group or a unique combination of user identity groups assigned to the configuration.

- You can assign a role_test_1 and a role_test_2, which are the two unique roles to a PRA configuration. You can combine these two roles with a logical operator and assign the PRA configuration as a unique combination of two roles. For example, role_test_1 OR role_test_2.

- Ensure that two PRA configurations do not have a user identity group in common.

- If a PRA configuration already exists with a user identity group “Any”, you cannot create other PRA configurations unless you perform one of the following:
  - Update the existing PRA configuration with the Any user identity group to reflect a user identity group other than Any.
  - Delete the existing PRA configuration with a user identity group “Any”.

Procedure

Step 1 Choose Administration > System > Settings > Posture > Reassessments.
Step 2 Click Add.
Step 3 Modify the values in the New Reassessment Configuration page to create a new PRA.
Step 4 Click Submit to create a PRA configuration.

Related Topics

- Periodic Reassessments, on page 559

Download Posture Updates to Cisco ISE

Posture updates include a set of predefined checks, rules, and support charts for antivirus and antispyware for both Windows and Macintosh operating systems, and operating systems information that are supported by Cisco. You can also update Cisco ISE offline from a file on your local system, which contains the latest archives of updates.

When you deploy Cisco ISE on your network for the first time, you can download posture updates from the web. This process usually takes approximately 20 minutes. After the initial download, you can configure Cisco ISE to verify and download incremental updates to occur automatically.

Cisco ISE creates default posture policies, requirements, and remediations only once during an initial posture updates. If you delete them, Cisco ISE does not create them again during subsequent manual or scheduled updates.

Before you begin

To ensure that you are able to access the appropriate remote location from which you can download posture resources to Cisco ISE, you may be required to verify that you have the correct proxy settings configured for your network as described in Specifying Proxy Settings in Cisco ISE, page 5-2.
You can use the Posture Update page to download updates dynamically from the web.

**Procedure**

**Step 1** Choose Administration > System > Settings > Posture > Updates.

**Step 2** Choose the Web option to download updates dynamically.

**Step 3** Click Set to Default to set the Cisco default value for the Update Feed URL field.

If your network restricts URL-redirection functions (via a proxy server, for example) and you are experiencing difficulty accessing the above URL, try also pointing your Cisco ISE to the alternative URL in the related topics.

**Step 4** Modify the values in the Posture Updates page.

**Step 5** Click Update Now to download updates from Cisco.

**Step 6** Click OK to continue with other tasks on Cisco ISE.

After being updated, the Posture Updates page displays the current Cisco updates version information as a verification of an update under Update Information section in the Posture Updates page.

**Related Topics**

Download Posture Updates Automatically, on page 561

---

**Download Posture Updates Automatically**

After an initial update, you can configure Cisco ISE to check for the updates and download them automatically.

**Before you begin**

- You should have initially downloaded the posture updates to configure Cisco ISE to check for the updates and download them automatically.

**Procedure**

**Step 1** Choose Administration > System > Settings > Posture > Updates.

**Step 2** In the Posture Updates page, check the Automatically check for updates starting from initial delay check box.

**Step 3** Enter the initial delay time in hh:mm:ss format.

Cisco ISE starts checking for updates after the initial delay time is over.

**Step 4** Enter the time interval in hours.

Cisco ISE downloads the updates to your deployment at specified intervals from the initial delay time.

**Step 5** Click Yes to continue.

**Step 6** Click Save.
Configure Acceptable Use Policies for Posture Assessment

After login and successful posture assessment of clients, the client agent displays a temporary network access screen. This screen contains a link to an acceptable use policy (AUP). When users click the link, they are redirected to a page that displays the network-usage terms and conditions, which they must read and accept.

Each Acceptable Use Policy configuration must have a unique user identity group, or a unique combination of user identity groups. Cisco ISE finds the AUP for the first matched user identity group, and then it communicates to the client agent that displays the AUP.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Administration &gt; System &gt; Settings &gt; Posture &gt; Acceptable Use Policy.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Add.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Modify the values in the New Acceptable Use Policy Configuration page.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click Submit.</td>
</tr>
</tbody>
</table>

Posture Conditions

A posture condition can be any one of the following simple conditions: a file, a registry, an application, a service, or a dictionary condition. One or more conditions from these simple conditions form a compound condition, which can be associated to a posture requirement.

When you deploy Cisco ISE on your network for the first time, you can download posture updates from the web for the first time. This process is called the initial posture update.

After an initial posture update, Cisco ISE also creates Cisco defined simple and compound conditions. Cisco defined simple conditions have pc_ as their prefixes and compound conditions have pr_ as their prefixes.

You can also configure Cisco ISE to download the Cisco-defined conditions periodically as a result of dynamic posture updates through the web. You cannot delete or edit Cisco defined posture conditions.

A user defined condition or a Cisco defined condition includes both simple conditions and compound conditions.

Simple Posture Conditions

You can use the Posture Navigation pane to manage the following simple conditions:

- File Conditions—A condition that checks the existence of a file, the date of a file, and the versions of a file on the client.

- Registry Conditions—A condition that checks for the existence of a registry key or the value of the registry key on the client.

- Application Conditions—A condition that checks if an application or process is running or not running on the client.
If a process is installed and running, user is compliant. However, the Application condition works in reverse logic; If an application is not installed and not running, the end user is complaint. If an application is installed and running, the end user is non-complaint.

Note
- Service Conditions—A condition that checks if a service is running or not running on the client.
- Dictionary Conditions—A condition that checks a dictionary attribute with a value.

Related Topics
- File Condition Settings, on page 823
- Registry Condition Settings, on page 825
- Application Condition Settings, on page 827
- Service Condition Settings, on page 827
- Dictionary Simple Condition Settings, on page 832

Create Simple Posture Conditions

You can create file, registry, application, service, and dictionary simple conditions that can be used in posture policies or in other compound conditions.

Before you begin
To perform the following task, you must be a Super Admin or Policy Admin.

Procedure

2. Choose any one of the following: File, Registry, Application, Service, or Dictionary Simple Condition.
3. Click Add.
4. Enter the appropriate values in the fields.
5. Click Submit.

Compound Posture Conditions

Compound conditions are made up of one or more simple conditions, or compound conditions. You can make use of the following compound conditions while defining a Posture policy.

- Compound Conditions—Contains one or more simple conditions, or compound conditions of the type File, Registry, Application, or Service condition
- Antivirus Compound Conditions—Contains one or more AV conditions, or AV compound conditions
Predefined Condition for Enabling Automatic Updates in Windows Clients

The pr_AutoUpdateCheck_Rule is a Cisco predefined condition, which is downloaded to the Compound Conditions page. This condition allows you to check whether the automatic updates feature is enabled on Windows clients. If a Windows client fails to meet this requirement, then the Network Access Control (NAC) Agents enforce the Windows client to enable (remediate) the automatic updates feature. After this remediation is done, the Windows client becomes posture compliant. The Windows update remediation that you associate in the posture policy overrides the Windows administrator setting, if the automatic updates feature is not enabled on the Windows client.

Preconfigured Antivirus and Antispyware Conditions

Cisco ISE loads preconfigured antivirus and antispyware compound conditions in the AV and AS Compound Condition pages, which are defined in the antivirus and antispyware support charts for Windows and Macintosh operating systems. These compound conditions can check if the specified antivirus and antispyware products exist on all the clients. You can also create new antivirus and antispyware compound conditions in Cisco ISE.

Antivirus and Antispyware Support Chart

Cisco ISE uses an antivirus and antispyware support chart, which provides the latest version and date in the definition files for each vendor product. Users must frequently poll antivirus and antispyware support charts for updates. The antivirus and antispyware vendors frequently update antivirus and antispyware definition files, look for the latest version and date in the definition files for each vendor product.

Each time the antivirus and antispyware support chart is updated to reflect support for new antivirus and antispyware vendors, products, and their releases, the NAC Agents receive a new antivirus and antispyware library. It helps NAC Agents to support newer additions. Once the NAC Agents retrieve this support information, they check the latest definition information from the periodically updated se-checks.xml file (which is published along with the se-rules.xml file in the se-templates.tar.gz archive), and determine whether clients are compliant with the posture policies. Depending upon what is supported by the antivirus and antispyware library for a particular antivirus, or antispyware product, the appropriate requirements will be sent to the NAC Agents for validating their existence, and the status of particular antivirus and antispyware products on the clients during posture validation.

The antivirus and antispyware support chart is available on Cisco.com.
Compliance Module

The compliance module contains a list of fields, such as vendor name, product version, product name, and attributes provided by OPSWAT that supports Cisco ISE posture conditions.

Vendors frequently update the product version and date in the definition files, therefore, you must look for the latest version and date in the definition files for each vendor product by frequently polling the compliance module for updates. Each time the compliance module is updated to reflect the support for new vendors, products, and their releases, the AnyConnect agents receives a new library. It helps AnyConnect agent to support newer additions. Once the AnyConnect agents retrieve this support information, they check the latest definition information from the periodically updated se-checks.xml file (which is published along with the se-rules.xml file in the se-templates.tar.gz archive), and determine whether clients are compliant with the posture policies. Depending upon what is supported by the library for a particular antivirus, antispyware, antimalware, disk encryption, or patch management product, the appropriate requirements will be sent to the AnyConnect agents for validating their existence, and the status of the particular products on the clients during posture validation.

The compliance module is available on Cisco.com.

Table given below lists the OPSWAT API versions that support and do not support the ISE posture policy. There are different policy rules for agents that support versions 3 and 4.

Create Compound Posture Conditions

You can create compound conditions that can be used in posture policies for posture assessment and validation.

Before you begin
To perform the following task, you must be a Super Admin or Policy Admin.

Procedure

Step 1  Choose Policy > Policy Elements > Conditions > Posture > Compound Conditions > Add.
Step 2  Enter appropriate values for the fields.
Step 3  Click Validate Expression to validate the condition.
Step 4  Click Submit.

Related Topics
  - Posture Conditions, on page 403
  - Simple Posture Conditions, on page 403
  - Compound Posture Conditions, on page 404
  - Predefined Condition for Enabling Automatic Updates in Windows Clients, on page 404
  - Preconfigured Antivirus and Antispyware Conditions, on page 404

Create Patch Management Conditions

You can create a policy to check the status of a selected vendor's patch management product.
For example, you can create a condition to check if Microsoft System Center Configuration Manager (SCCM), Client Version 4.x software product is installed at an endpoint.

Note
Supported versions of Cisco ISE and AnyConnect:
  - Cisco ISE version 1.4
  - AnyConnect version 4.1 and later
Before you begin

To perform the following task, you must be a Super Admin or Policy Admin.

Procedure

**Step 1** Choose Policy > Policy Elements > Conditions > Posture > Patch Management Condition.
**Step 2** Click Add.
**Step 3** Enter the condition name and description in the Name and Description fields.
**Step 4** Choose the appropriate operating system from the Operating System drop-down field.
**Step 5** Choose the Compliance Module from the drop-down list.
**Step 6** Choose the Vendor Name from the drop-down list.
**Step 7** Choose the Check Type.
**Step 8** Choose the appropriate patch from the Check patches installed drop-down list.
**Step 9** Click Submit.

Related Topics
- Patch Management Condition Settings
- Add a Patch Management Remediation

Create Disk Encryption Conditions

You can create a policy to check if an end point is compliant with the specified data encryption software. For example, you can create a condition to check if the C: drive is encrypted in an end point. If the C: drive is not encrypted then the end point receives a non-compliance notification and ISE logs a message.

Before you begin

To perform the following task, you must be a Super Admin or Policy Admin. You can associate a Disk Encryption condition with a posture requirement only when you use the AnyConnect ISE posture agent.

Procedure

**Step 1** Choose Policy > Policy Elements > Conditions > Posture > Disk Encryption Condition.
**Step 2** Click Add.
**Step 3** In the Disk Encryption Condition page, enter the appropriate values in the fields.
**Step 4** Click Submit.
Configure Posture Policies

A posture policy is a collection of posture requirements that are associated with one or more identity groups, and operating systems. The Dictionary Attributes are optional conditions that can be used along with the identity groups and the operating systems to define different policies for the clients.

See Posture Services on the Cisco ISE Configuration Guide for more information.

Before you begin

- You must have an understanding of the AUP.
- You must have an understanding of periodic reassessments (PRA).

Procedure

<table>
<thead>
<tr>

Custom Conditions for Posture

A posture condition can be any one of the following simple conditions: a file, a registry, an application, a service, or a dictionary condition. One or more conditions from these simple conditions form a compound condition, which can be associated with a posture requirement.

After an initial posture update, Cisco ISE also creates Cisco-defined simple and compound conditions. Cisco-defined simple conditions use the `pc_as` and compound conditions use `pr_as`.

A user-defined condition or a Cisco-defined condition includes both simple and compound conditions.

Posture service makes use of internal checks based on antivirus and antispyware (AV/AS) compound conditions. Hence, posture reports do not reflect the exact AV/AS compound-condition names that you have created. The reports display only the internal check names of AV/AS compound conditions.

For example, if you have created an AV compound condition named "MyCondition_AV_Check" to check any Vendor and any Product, the posture reports will display the internal check, that is “av_def_ANY”, as the condition name, instead of "MyCondition_AV_Check".

Custom Posture Remediation Actions

A custom posture remediation action is a file, a link, an antivirus or antispyware definition updates, launching programs, Windows updates, or Windows Server Update Services (WSUS) remediation types.

Related Topics
- Add a File Remediation, on page 570
- Add a Link Remediation, on page 571
- Add an Antivirus Remediation, on page 571
- Add an Antispyware Remediation, on page 572
- Add a Launch Program Remediation, on page 572
- Add a Windows Update Remediation, on page 573
- Add a Windows Server Update Services Remediation, on page 573

Add a File Remediation

A file remediation allows clients to download the required file version for compliance. The client agent remediates an endpoint with a file that is required by the client for compliance.

You can filter, view, add, or delete file remediations in the File Remediations page, but you cannot edit file remediations. The File Remediations page displays all the file remediations along with their name and description and the files that are required for remediation.
Procedure

Step 1 Choose Policy > Policy Elements > Results > Posture.
Step 2 Click Remediation Actions.
Step 3 Click File Remediation.
Step 4 Click Add.
Step 5 Enter the name and description of the file remediation in the Name and Description fields.
Step 6 Modify the values in the New File Remediation page.
Step 7 Click Submit.

Add a Link Remediation

A link remediation allows clients to click a URL to access a remediation page or resource. The client agent opens a browser with the link and allow the clients to remediate themselves for compliance.

The Link Remediation page displays all the link remediations along with their name and description and their modes of remediation.

Procedure

Step 1 Choose Policy > Policy Elements > Results > Posture.
Step 2 Click Remediation Actions.
Step 3 Click Link Remediation.
Step 4 Click Add.
Step 5 Modify the values in the New Link Remediation page.
Step 6 Click Submit.

Add an Antivirus Remediation

You can create an antivirus remediation, which updates clients with up-to-date file definitions for compliance after remediation.

The AV Remediations page displays all the antivirus remediations along with their name and description and their modes of remediation.

Procedure

Step 1 Choose Policy > Policy Elements > Results > Posture.
Step 2 Click Remediation Actions.
Step 3 Click AV Remediation.
Step 4 Click Add.
Add an Antispyware Remediation

You can create an antispyware remediation, which updates clients with up-to-date file definitions for compliance after remediation.

The AS Remediations page displays all the antivirus remediations along with their name and description and their modes of remediation.

Procedure

Step 1 Choose Policy > Policy Elements > Results > Posture.
Step 2 Click Remediation Actions.
Step 3 Click AS Remediation.
Step 4 Click Add.
Step 5 Modify the values in the New AS Remediation page.
Step 6 Click Submit.

Add a Launch Program Remediation

You can create a launch program remediation, where the client agent remediates clients by launching one or more applications for compliance.

The Launch Program Remediations page displays all the launch program remediations along with their name and description and their modes of remediation.

Procedure

Step 1 Choose Policy > Policy Elements > Results > Posture.
Step 2 Click Remediation Actions.
Step 3 Click Launch Program Remediation.
Step 4 Click Add.
Step 5 Modify the values in the New Launch Program Remediation page.
Step 6 Click Submit.
Troubleshoot Launch Program Remediation

Problem
When an application is launched as a remediation using Launch Program Remediation, the application is successfully launched (observed in the Windows Task Manager), however, the application UI is not visible.

Solution
The Launch program UI application runs with system privileges, and is visible in the Interactive Service Detection (ISD) window. To view the Launch program UI application, ISD should be enabled for the following OS:

- Windows Vista: ISD is in stop state by default. Enable ISD by starting ISD service in services.msc.
- Windows 7: ISD service is enabled by default.
- Windows 8/8.1: Enable ISD by changing "NoInteractiveServices" from 1 to 0 in the registry: \HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Windows.

Add a Windows Update Remediation

The Windows Update Remediations page displays all the Windows update remediations along with their name and description and their modes of remediation.

Procedure

Step 1 Choose Policy > Policy Elements > Results > Posture.
Step 2 Click Remediation Actions.
Step 3 Click Windows Update Remediation.
Step 4 Click Add.
Step 5 Modify the values in the New Windows Update Remediation page.
Step 6 Click Submit.

Add a Windows Server Update Services Remediation

You can configure Windows clients to receive the latest WSUS updates from a locally administered or a Microsoft-managed WSUS server for compliance. A Windows Server Update Services (WSUS) remediation installs latest Windows service packs, hotfixes, and patches from a locally managed WSUS server or a Microsoft-managed WSUS server.

You can create a WSUS remediation where the client agent integrates with the local WSUS Agent to check whether the endpoint is up-to-date for WSUS updates.
Procedure

Step 1 Choose Policy > Policy Elements > Results > Posture.
Step 2 Click Remediation Actions.
Step 3 Click Windows Server Update Services Remediation.
Step 4 Click Add.
Step 5 Modify the values in the New Windows Server Update Services Remediation page.
Step 6 Click Submit.

Posture Assessment Requirements

A posture requirement is a set of compound conditions with an associated remediation action that can be linked with a role and an operating system. All the clients connecting to your network must meet mandatory requirements during posture evaluation to become compliant on the network.

Posture-policy requirements can be set to mandatory, optional, or audit types in posture policies. If requirements are optional and clients fail these requirements, then the clients have an option to continue during posture evaluation of endpoints.

Figure 34: Posture Policy Requirement Types

Mandatory Requirements

During policy evaluation, the agent provides remediation options to clients who fail to meet the mandatory requirements defined in the posture policy. End users must remediate to meet the requirements within the time specified in the remediation timer settings.

For example, you have specified a mandatory requirement with a user-defined condition to check the existence of C:\temp\text.file in the absolute path. If the file does not exist, the mandatory requirement fails and the user will be moved to Non-Compliant state.

Optional Requirements

During policy evaluation, the agent provides an option to clients to continue, when they fail to meet the optional requirements specified in the posture policy. End users are allowed to skip the specified optional requirements.

For example, you have specified an optional requirement with a user-defined condition to check for an application running on the client machine, such as Calc.exe. Although, the client fails to meet the condition,
the agent prompts an option to continue further so that the optional requirement is skipped and the end user is moved to Compliant state.

Audit Requirements

Audit requirements are specified for internal purposes and the agent does not prompt any message or input from end users, regardless of the pass or fail status during policy evaluation.

For example, you are in the process of creating a mandatory policy condition to check if end users have the latest version of the antivirus program. If you want to find out the non-compliant end users before actually enforcing it as a policy condition, you can specify it as an audit requirement.

Client System Stuck in Noncompliant State

If a client machine is unable to remediate a mandatory requirement, the posture status changes to “noncompliant” and the agent session is quarantined. To get the client machine past this “noncompliant” state, you need to restart the posture session so that the agent starts posture assessment on the client machine again. You can restart the posture session as follows:

- In wired and wireless Change of Authorization (CoA) in an 802.1X environment:
  - You can configure the Reauthentication timer for a specific authorization policy when you create a new authorization profile in the New Authorization Profiles page. “Configuring Permissions for Downloadable ACLs” section on page 20-11 for more information. This method is not supported in Inline Posture deployments.
  - Wired users can get out of the quarantine state once they disconnect and reconnect to the network. In a wireless environment, the user must disconnect from the wireless lan controller (WLC) and wait until the user idle timeout period has expired before attempting to reconnect to the network.

- In a VPN environment—Disconnect and reconnect the VPN tunnel.

Create Client Posture Requirements

You can create a requirement in the Requirements page where you can associate user-defined conditions and Cisco defined conditions, and remediation actions. Once created and saved in the Requirements page, user-defined conditions and remediation actions can be viewed from their respective list pages.

Before you begin

- You must have an understanding of acceptable use policies (AUPs) for a posture.

Procedure

| Step 1 | Choose Policy > Policy Elements > Results > Posture > Requirements. |
| Step 2 | Enter the values in the Requirements page. |
| Step 3 | Click Done to save the posture requirement in read-only mode. |
| Step 4 | Click Save. |
Custom Permissions for Posture

A custom permission is a standard authorization profile that you define in Cisco ISE. Standard authorization profiles set access privileges based on the matching compliance status of the endpoints. The posture service broadly classifies the posture into unknown, compliant, and noncompliant profiles. The posture policies and the posture requirements determine the compliance status of the endpoint.

You must create three different authorization profiles for an unknown, compliant, and noncompliant posture status of endpoints that can have different set of VLANs, DACLs and other attribute value pairs. These profiles can be associated with three different authorization policies. To differentiate these authorization policies, you can use the Session:PostureStatus attribute along with other conditions.

Unknown Profile

If no matching posture policy is defined for an endpoint, then the posture compliance status of the endpoint may be set to unknown. A posture compliance status of unknown can also apply to an endpoint where a matching posture policy is enabled but posture assessment has not yet occurred for that endpoint and, therefore no compliance report has been provided by the client agent.

Compliant Profile

If a matching posture policy is defined for an endpoint, then the posture compliance status of the endpoint is set to compliant. When the posture assessment occurs, the endpoint meets all the mandatory requirements that are defined in the matching posture policy. For an endpoint that is postured compliant, it can be granted privileged network access on your network.

Noncompliant Profile

The posture compliance status of an endpoint is set to noncompliant when a matching posture policy is defined for that endpoint but it fails to meet all the mandatory requirements during posture assessment. An endpoint that is postured noncompliant matches a posture requirement with a remediation action, and it should be granted limited network access to remediation resources in order to remediate itself.

Configure Standard Authorization Policies

You can define two types of authorization policies in the Authorization Policy page, standard exceptions authorization policies. The standard authorization policies that are specific to posture are used to make policy decisions based on the compliance status of endpoints.
## Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose <strong>Policy &gt; Authorization.</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Choose one of the matching rule type to apply from the drop-down list shown at the top of the Authorization Policy page.</td>
</tr>
<tr>
<td></td>
<td>• <strong>First Matched Rule Applies</strong> — This option sets access privileges with a single authorization policy that is first matched during evaluation from the list of standard authorization policies. Once the first matching authorization policy is found, the rest of the standard authorization policies are not evaluated.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Multiple Matched Rule Applies</strong> — This option sets access privileges with multiple authorization policies that are matched during evaluation from the list of all the standard authorization policies</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click the down arrow next to <strong>Edit</strong> in the default standard authorization policy row.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click <strong>Insert New Rule Above.</strong></td>
</tr>
<tr>
<td>Step 5</td>
<td>Enter a rule name, choose identity groups and other conditions, and associate an authorization profile in the new authorization policy row that appears above the default standard authorization policy row.</td>

- Configure TrustSec Devices, on page 583
- Configure TrustSec AAA Servers, on page 585
- Security Groups Configuration, on page 586
- Egress Policy, on page 590
- SGT Assignment, on page 595
- TrustSec Configuration and Policy Push, on page 600
- Run Top N RBACL Drops by User Report, on page 609

TrustSec Architecture

The Cisco TrustSec solution establishes clouds of trusted network devices to build secure networks. Each device in the Cisco TrustSec cloud is authenticated by its neighbors (peers). Communication between the devices in the TrustSec cloud is secured with a combination of encryption, message integrity checks, and data-path replay protection mechanisms. The TrustSec solution uses the device and user identity information that it obtains during authentication to classify, or color, the packets as they enter the network. This packet classification is maintained by tagging packets when they enter the TrustSec network so that they can be properly identified for the purpose of applying security and other policy criteria along the data path. The tag, also called the security group tag (SGT), allows Cisco ISE to enforce access control policies by enabling the endpoint device to act upon the SGT to filter traffic.

The following figure shows an example of a TrustSec network cloud.
**TrustSec Components**

The key TrustSec components include:

- **Network Device Admission Control (NDAC)**—In a trusted network, during authentication, each network device (for example Ethernet switch) in a TrustSec cloud is verified for its credential and trustworthiness by its peer device. NDAC uses the IEEE 802.1X port-based authentication and uses Extensible Authentication Protocol-Flexible Authentication via Secure Tunneling (EAP-FAST) as its Extensible Authentication Protocol (EAP) method. Successful authentication and authorization in the NDAC process results in Security Association Protocol negotiation for IEEE 802.1AE encryption.

- **Endpoint Admission Control (EAC)**—An authentication process for an endpoint user or a device connecting to the TrustSec cloud. EAC typically happens at the access level switch. Successful authentication and authorization in EAC process results in SGT assignment to the user or device. EAC access methods for authentication and authorization includes:
  - 802.1X port-based authentication
  - MAC authentication bypass (MAB)
  - Web authentication (WebAuth)

- **Security Group (SG)**—A grouping of users, endpoint devices, and resources that share access control policies. SGs are defined by the administrator in Cisco ISE. As new users and devices are added to the TrustSec domain, Cisco ISE assigns these new entities to the appropriate security groups.

- **Security Group Tag (SGT)**—TrustSec service assigns to each security group a unique 16-bit security group number whose scope is global within a TrustSec domain. The number of security groups in the switch is limited to the number of authenticated network entities. You do not have to manually configure
security group numbers. They are automatically generated, but you have the option to reserve a range of SGTs for IP-to-SGT mapping.

- **Security Group Access Control List (SGACL)**—SGACLs allow you to control the access and permissions based on the SGTs that are assigned. The grouping of permissions into a role simplifies the management of security policy. As you add devices, you simply assign one or more security groups, and they immediately receive the appropriate permissions. You can modify the security groups to introduce new privileges or restrict current permissions.

- **Security Exchange Protocol (SXP)**—SGT Exchange Protocol (SXP) is a protocol developed for TrustSec service to propagate the IP-SGT bindings across network devices that do not have SGT-capable hardware support to hardware that supports SGT/SGACL.

- **Environment Data Download**—The TrustSec device obtains its environment data from Cisco ISE when it first joins a trusted network. You can also manually configure some of the data on the device. The device must refresh the environment data before it expires. The TrustSec device obtains the following environment data from Cisco ISE:
  - Server lists—List of servers that the client can use for future RADIUS requests (for both authentication and authorization)
  - Device SG—Security group to which the device itself belongs
  - Expiry timeout—Interval that controls how often the TrustSec device should download or refresh its environment data

- **SGT Reservation**—An enhancement in Cisco ISE to reserve a range of SGTs to enable IP to SGT mapping.

- **IP-to-SGT Mapping**—An enhancement in Cisco ISE to bind an endpoint IP to an SGT and provision it to a TrustSec-capable device. Cisco ISE supports entering 1000 IP-to-SGT Mappings.

- **Identity-to-Port Mapping**—A method for a switch to define the identity on a port to which an endpoint is connected, and to use this identity to look up a particular SGT value in the Cisco ISE server.

## TrustSec Terminology

The following table lists some of the common terms that are used in the TrustSec solution and their meaning in an TrustSec environment.

### Table 49: TrustSec Terminology

<table>
<thead>
<tr>
<th>Term</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supplicant</td>
<td>A device that tries to join a trusted network.</td>
</tr>
<tr>
<td>Authentication</td>
<td>The process of verifying the identity of each device before allowing it to be part of the trusted network.</td>
</tr>
<tr>
<td>Authorization</td>
<td>The process of deciding the level of access to a device that requests access to a resource on a trusted network based on the authenticated identity of the device.</td>
</tr>
<tr>
<td>Access control</td>
<td>The process of applying access control on a per-packet basis based on the SGT that is assigned to each packet.</td>
</tr>
<tr>
<td>Term</td>
<td>Meaning</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Secure communication</td>
<td>The process of encryption, integrity, and data-path replay protection for securing the packets that flow over each link in a trusted network.</td>
</tr>
<tr>
<td>TrustSec device</td>
<td>Any of the Cisco Catalyst 6000 Series or Cisco Nexus 7000 Series switches that support the TrustSec solution.</td>
</tr>
<tr>
<td>TrustSec-capable device</td>
<td>A TrustSec-capable device will have TrustSec-capable hardware and software. For example, the Nexus 7000 Series Switches with the Nexus operating system.</td>
</tr>
<tr>
<td>TrustSec seed device</td>
<td>The TrustSec device that authenticates directly against the Cisco ISE server. It acts as both the authenticator and supplicant.</td>
</tr>
<tr>
<td>Ingress</td>
<td>When packets first encounter a TrustSec-capable device that is part of a network where the Cisco TrustSec solution is enabled, they are tagged with an SGT. This point of entry into the trusted network is called the ingress.</td>
</tr>
<tr>
<td>Egress</td>
<td>When packets pass the last TrustSec-capable device that is part of a network where the Cisco TrustSec solution is enabled, they are untagged. This point of exit from the trusted network is called the egress.</td>
</tr>
</tbody>
</table>

**Supported Switches and Required Components for TrustSec**

To set up a Cisco ISE network that is enabled with the Cisco TrustSec solution, you need switches that support the TrustSec solution and other components. Apart from the switches, you also need other components for identity-based user access control using the IEEE 802.1X protocol. For a complete up-to-date list of the Trustsec-supported Cisco switch platforms and the required components, see [Cisco TrustSec-Enabled Infrastructure](https://www.cisco.com/c/en/us/solutions/collateral/security/identity-services-engine/ISE-ISE-enabled-infrastructure-white-paper-c11-530860.pdf).

**Configure TrustSec Global Settings**

For Cisco ISE to function as an TrustSec server and provide TrustSec services, you must define some global TrustSec settings.

**Before you begin**

- Before you configure global TrustSec settings, ensure that you have defined global EAP-FAST settings (choose **Administration > System > Settings > Protocols > EAP-FAST > EAP-FAST Settings**).

You may change the Authority Identity Info Description to your Cisco ISE server name. This description is a user-friendly string that describes the Cisco ISE server that sends credentials to an endpoint client. The client in a Cisco TrustSec architecture can be either the endpoint running EAP-FAST as its EAP...
method for IEEE 802.1X authentication or the supplicant network device performing Network Device Access Control (NDAC). The client can discover this string in the protected access credentials (PAC) type-length-value (TLV) information. The default value is Identity Services Engine. You should change the value so that the Cisco ISE PAC information can be uniquely identified on network devices upon NDAC authentication.

- To perform the following task, you must be a Super Admin or System Admin.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>

**OOB TrustSec PAC**

All TrustSec network devices possess a TrustSec PAC as part of the EAP-FAST protocol. This is also utilized by the secure RADIUS protocol where the RADIUS shared secret is derived from parameters carried by the PAC. One of these parameters, Initiator-ID, holds the TrustSec network device identity, namely the Device ID.

If a device is identified using TrustSec PAC and there is no match between the Device ID, as configured for that device on Cisco ISE, and the Initiator-ID on the PAC, the authentication fails.

Some TrustSec devices (for example, Cisco firewall ASA) do not support the EAP-FAST protocol. Therefore, Cisco ISE cannot provision these devices with TrustSec PAC over EAP-FAST. Instead, the TrustSec PAC is
generated on Cisco ISE and manually copied to the device; hence this is called as the Out of Band (OOB) TrustSec PAC generation.

When you generate a PAC from Cisco ISE, a PAC file encrypted with the Encryption Key is generated.

This section describes the following:

**Related Topics**
- Generate a TrustSec PAC from the Settings Screen, on page 584
- Generate a TrustSec PAC from the Network Devices Screen, on page 584
- Generate a TrustSec PAC from the Network Devices List Screen, on page 585

### Generate a TrustSec PAC from the Settings Screen

You can generate a TrustSec PAC from the Settings screen.

**Procedure**

1. Choose **Administration > System > Settings**.
2. From the Settings navigation pane on the left, click **Protocols**.
3. Choose **EAP-FAST > Generate PAC**.
4. Generate TrustSec PAC.

### Generate a TrustSec PAC from the Network Devices Screen

You can generate a TrustSec PAC from the Network Devices screen.

**Procedure**

1. Choose **Administration > Network Resources > Network Devices**.
2. Click **Add**. You can also click **Add new device** from the action icon on the Network Devices navigation pane.
3. If you are adding a new device, provide a device name.
4. Check the **Advanced TrustSec Settings** check box to configure a TrustSec device.
5. Under the **Out of Band (OOB) TrustSec PAC** sub section, click **Generate PAC**.
6. Provide the following details:
   - **PAC Time to Live**—Enter a value in days, weeks, months, or years. By default, the value is one year. The minimum value is one day and the maximum is ten years.
   - **Encryption Key**—Enter an encryption key. The length of the key must be between 8 and 256 characters. The key can contain uppercase or lowercase letters, or numbers, or a combination of alphanumeric characters.

   The Encryption Key is used to encrypt the PAC in the file that is generated. This key is also used to decrypt the PAC file on the devices. Therefore, it is recommended that the administrator saves the Encryption Key for later use.
The Identity field specifies the Device ID of a TrustSec network device and is given an initiator ID by the EAP-FAST protocol. If the Identity string entered here does not match that Device ID defined under TrustSec section in the Network Device creation page, authentication will fail.

The expiration date is calculated based on the PAC Time to Live.

Step 7 Click Generate PAC.

---

**Generate a TrustSec PAC from the Network Devices List Screen**

You can generate a TrustSec PAC from the Network Devices list screen.

**Procedure**

1. Choose **Administration** > **Network Resources** > **Network Devices**.
2. Click **Network Devices**.
3. Check the check box next to a device for which you want to generate the TrustSec PAC and click **Generate PAC**.
4. Provide the details in the fields.
5. Click **Generate PAC**.

**Push Button**

The Push option in the egress policy initiates a CoA notification that calls the TrustSec devices to immediately request for updates from Cisco ISE regarding the configuration changes in the egress policy.

**Related Topics**

- Update SGT Matrix CoA Flow, on page 606

**Configure TrustSec AAA Servers**

You can configure a list of Cisco ISE servers in your deployment in the AAA server list to allow TrustSec devices to be authenticated against any of these servers. When you add Cisco ISE servers to this list, all these server details are downloaded to the TrustSec device. When a TrustSec device tries to authenticate, it chooses any Cisco ISE server from this list and, if the first server is down or busy, the TrustSec device can authenticate itself against any of the other servers from this list. By default, the primary Cisco ISE server is a TrustSec AAA server. We recommend that you configure additional Cisco ISE servers in this AAA server list so that if one server is busy, another server from this list can handle the TrustSec request.

This page lists the Cisco ISE servers in your deployment that you have configured as your TrustSec AAA servers.

You can click the **Push** button to initiate an environment CoA notification after you configure multiple TrustSec AAA servers. This environment CoA notification goes to all TrustSec network devices and provides an update of all TrustSec AAA servers that were changed.
Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

**Step 1** Choose **Administration** > **Network Resources** > **TrustSec AAA Servers**.

**Step 2** Click **Add**.

**Step 3** Enter the values as described:

- **Name**—Name that you want to assign to the Cisco ISE server in this AAA Server list. This name can be different from the hostname of the Cisco ISE server.
- **Description**—An optional description.
- **IP**—IP address of the Cisco ISE server that you are adding to the AAA Server list.
- **Port**—Port over which communication between the TrustSec device and server should take place. The default is 1812.

**Step 4** Click **Submit**.

What to do next

Configure Security Groups.

Security Groups Configuration

A Security Group (SG) or Security Group Tag (SGT) is an element that is used in TrustSec policy configuration. SGTs are attached to packets when they move within a trusted network. These packets are tagged when they enter a trusted network (ingress) and untagged when they leave the trusted network (egress).

SGTs are generated in a sequential manner, but you have the option to reserve a range of SGTs for IP to SGT mapping. Cisco ISE skips the reserved numbers while generating SGTs.

TrustSec service uses these SGTs to enforce the TrustSec policy at egress.

You can configure security groups from the following pages in the Admin portal:

- **Policy** > **Policy Elements** > **Results** > **Trustsec** > **Security Groups**.
- Directly from egress policy page at **Configure** > **Create New Security Group**.

You can click the **Push** button to initiate an environment CoA notification after updating multiple SGTs. This environment CoA notification goes to all TrustSec network devices forcing them to start a policy/data refresh request.

Related Topics

- Add Security Groups, on page 587
- Configure SGT from Egress Policy, on page 594
- Configure NDAC Authorization, on page 596
Add Security Groups

Each security group in your TrustSec solution should be assigned a unique SGT. Even though Cisco ISE supports 65,535 SGTs, having fewer number of SGTs would enable you to deploy and manage the TrustSec solution easily. We recommend a maximum of 4,000 SGTs.

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1  Choose Policy > Policy Elements > Results > TrustSec > Security Groups.
Step 2  Click Add to add a new security group.
Step 3  Enter a name and description (optional) for the new security group.
Step 4  Enter a Tag Value. Tag value can be set to be entered manually or autogenerate. You can also reserve a range for the SGT. You can configure it from the Trustsec global settings page under Administration > System > Settings > TrustSec Settings.
Step 5  Click Save.

What to do next

Configure Security Group Access Control Lists

Import Security Groups into Cisco ISE

You can import security groups into a Cisco ISE node using a comma-separated value (CSV) file. You must first update the template before you can import security groups into Cisco ISE. You cannot run import of the same resource type at the same time. For example, you cannot concurrently import security groups from two different import files.

You can download the CSV template from the Admin portal, enter your security group details in the template, and save the template as a CSV file, which you can then import back into Cisco ISE.

While importing security groups, you can stop the import process when Cisco ISE encounters the first error.

Procedure

Step 1  Choose Policy > Policy Elements > Results > TrustSec > Security Groups.
Step 2  Click Import.
Step 3  Click Browse to choose the CSV file from the system that is running the client browser.
Step 4  Check the Stop Import on First Error check box.
Step 5  Click Import.

Export Security Groups from Cisco ISE

You can export security groups configured in Cisco ISE in the form of a CSV file that you can use to import these security groups into another Cisco ISE node.

Procedure

Step 1  Choose Policy > Policy Elements > Results > TrustSec > Security Groups.
Step 2  Click Export.
Step 3  To export security groups, you can do one of the following:

• Check the check boxes next to the group that you want to export, and choose Export > Export Selected.

• Choose Export > Export All to export all the security groups that are defined.

Step 4  Save the export.csv file to your local hard disk.

Add Security Group Access Control Lists

Before you begin

To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1  Choose Policy > Policy Elements > Results > TrustSec > Security Group ACLs.
Step 2  Click Add to create a new Security Group ACL.
Step 3  Enter the following information:

• Name—Name of the SGACL

• Description—An optional description of the SGACL

• IP Version—IP version that this SGACL supports:

  • IPv4—Supports IP version 4 (IPv4)

  • IPv6—Supports IP version 6 (IPv6)

  • Agnostic—Supports both IPv4 and IPv6

• Security Group ACL Content—Access control list (ACL) commands. For example:

  permit icmp
deny ip

The syntax of SGACL input is not checked within ISE. Make sure you are using the correct syntax so that switches, routers and access points can apply them without errors. The default policy can be configured as **permit IP**, **permit ip log**, **deny ip**, or **deny ip log**. A TrustSec network device attaches the default policy to the end of the specific cell policy.

Here are two examples of SGACLs for guidance. Both include a final catch all rule. The first one denies as the final catch all rule, and the second one permits.

**Permit_Web_SGACL**

```plaintext
permit tcp dst eq 80
permit tcp dst eq 443
deny ip
```

**Deny_JumpHost_Protocols**

```plaintext
deny tcp dst eq 23
deny tcp dst eq 3389
permit ip
```

The following table lists syntax for SGACL for IOS, IOS XE and NS-OS operating systems.

<table>
<thead>
<tr>
<th>SGACL CLI and ACEs</th>
<th>Syntax common across IOS, IOS XE, and NX-OS</th>
</tr>
</thead>
<tbody>
<tr>
<td>config acl</td>
<td>deny, exit, no, permit</td>
</tr>
<tr>
<td>deny</td>
<td>ahp, eigrp, gre, icmp, igmp, ip, nos, ospf, pcp, pim, tcp, udp</td>
</tr>
<tr>
<td>permit</td>
<td>dst, log, src</td>
</tr>
<tr>
<td>deny tcp</td>
<td>&lt;0-65535&gt; port number</td>
</tr>
<tr>
<td>deny tcp src</td>
<td></td>
</tr>
<tr>
<td>deny tcp dst</td>
<td></td>
</tr>
<tr>
<td>deny tcp dst eq</td>
<td></td>
</tr>
<tr>
<td>deny tcp src eq</td>
<td></td>
</tr>
<tr>
<td>deny udp</td>
<td>Dst, log, src</td>
</tr>
<tr>
<td>deny udp src</td>
<td></td>
</tr>
<tr>
<td>deny udp dest</td>
<td></td>
</tr>
<tr>
<td>deny tcp dst eq www</td>
<td>&lt;0-65535&gt; port number</td>
</tr>
<tr>
<td>deny tcp src eq www</td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**  
Click **Submit**.
Cisco ISE has the following predefined SGACLs: Permit IP, Permit IP Log, Deny IP, and Deny IP Log. You can use these SGACLs to configure the TrustSec Matrix using the GUI or ERS API. Though these SGACLs are not listed in the Security Group ACLs listing page in the GUI, these SGACLs will be listed when you use the ERS API to list the available SGACLs (ERS getAll call).

### Egress Policy

The egress table lists the source and destination SGTs, both reserved and unreserved. This page also allows you to filter the egress table to view specific policies and also to save these preset filters. When the source SGT tries to reach the destination SGT, the TrustSec-capable device enforces the SGACLs based on the TrustSec policy as defined in the Egress Policy. Cisco ISE creates and provisions the policy.

After you create the SGTs and SGACLs, which are the basic building blocks required to create a TrustSec policy, you can establish a relationship between them by assigning SGACLs to source and destination SGTs. Each combination of a source SGT to a destination SGT is a cell in the Egress Policy.

You can view the Egress Policy in the Policy > TrustSec > Egress Policy page.

You can view the Egress policy in three different ways:

- Source Tree View
- Destination Tree View
- Matrix View

### Related Topics

- Matrix Operations, on page 592

- Configure SGT from Egress Policy, on page 594
- The Unknown Security Group, on page 595
- Security Groups Configuration, on page 586
- Security Group Access Control Lists Configuration

### Source Tree View

The Source Tree view lists a compact and organized view of source SGTs in a collapsed state. You can expand any source SGT to see the internal table that lists all information related to that selected source SGT. This view displays only the source SGTs that are mapped to destination SGTs. If you expand a specific source SGT, it lists all destination SGTs that are mapped to this source SGT and and the corresponding policy (SGACLs) in a table.

You will see three dots (…) next to some fields. This signifies that there is more information contained in the cell. You can position the cursor over the three dots to view the rest of the information in a quick view popup. When you position the cursor over an SGT name or an SGACL name, a quick view popup opens to display the content of that particular SGT or SGACL.
Destination Tree View

The Destination Tree view lists a compact and organized view of destination SGTs in a collapsed state. You can expand any destination SGTs to see the internal table that lists all information related to that selected destination SGT. This view displays only the destination SGTs that are mapped to source SGTs. If you expand a specific destination SGT, it lists all source SGTs that are mapped to this destination SGT and the corresponding policy (SGACLs) in a table.

You will see three dots (…) next to some fields. This signifies that there is more information contained in the cell. You can position the cursor over the three dots to view the rest of the information in a quick view popup. When you position the cursor over an SGT name or an SGACL name, a quick view popup opens to display the content of that particular SGT or SGACL.

Matrix View

The Matrix View of the Egress policy looks like a spreadsheet. It contains two axis:

- Source Axis—The vertical axis lists all the source SGTs.
- Destination Axis—The horizontal axis lists all the destination SGTs.

The mapping of a source SGT to a destination SGT is represented as a cell. If a cell contains data, then it represents that there is a mapping between the corresponding source SGT and the destination SGT. There are two types of cells in the matrix view:

- Mapped cells—When a source and destination pair of SGTs is related to a set of ordered SGACLs and has a specified status.
- Unmapped cells—When a source and destination pair of SGTs is not related to any SGACLs and has no specified status.

The Egress Policy cell displays the source SGT, the destination SGT, and the Final Catch All Rule as a single list under SGACLs, separated by commas. The Final Catch All Rule is not displayed if it is set to None. An empty cell in a matrix represents an unmapped cell.

In the Egress Policy matrix view, you can scroll across the matrix to view the required set of cells. The browser does not load the entire matrix data at once. The browser requests the server for the data that falls in the area you are scrolling in. This prevents memory overflow and performance issues.

The Matrix view has the same GUI elements as the Source and Destination views. However, it has these additional elements:

**Related Topics**

- [Matrix Operations](#), on page 592

Matrix Dimensions

The **Dimension** drop-down list in the Matrix view enables you to set the dimensions of the matrix.

Condensed View

The Condensed option in the egress policy matrix view allows you to display the matrix without empty cells. Check the **Condensed** check box to hide empty cells.
Import/Export Matrix

The Import and Export buttons enable you to import or export the matrix.

Matrix Operations

Navigating through the Matrix

You can navigate through the matrix either by dragging the matrix content area with the cursor or by using horizontal and vertical scroll bars. You can click and hold on a cell to drag it along with the entire matrix content in any direction. The source and destination bar moves along with the cells. The matrix view highlights the cell and the corresponding row (Source SGT) and column (Destination SGT) when a cell is selected. The coordinates (Source SGT and Destination SGT) of the selected cell are displayed below the matrix content area.

Selecting a Cell in the Matrix

To select a cell in the matrix view, click on it. The selected cell is displayed in different color, and the source and destination SGTs are highlighted. You can deselect a cell either by clicking it again or by selecting another cell. Multiple cell selection is not allowed in the matrix view. Double-click the cell to edit the cell configuration.

Configure SGACL from Egress Policy

You can create Security Group ACLs directly from the Egress Policy page.

Procedure

| Step 1 | Choose Policy > TrustSec > Egress Policy. |
| Step 2 | From the Source or Destination Tree View page, choose Configure > Create New Security Group ACL. |
| Step 3 | Enter the required details and click Submit. |

Egress Policy Table Cells Configuration

Cisco ISE allows you to configure cells using various options that are available in the tool bar. Cisco ISE does not allow a cell configuration if the selected source and destination SGTs are identical to a mapped cell.

Related Topics

Add the Mapping of Egress Policy Cells, on page 592
Configure SGT from Egress Policy, on page 594

Add the Mapping of Egress Policy Cells

You can add the mapping cell for Egress Policy from the Policy page.

Procedure

| Step 1 | Choose Policy > TrustSec > Egress Policy. |
Step 2  To select the matrix cells, do the following:
• In the matrix view, click a cell to select it.
• In the Source and Destination tree view, check the check box of a row in the internal table to select it.

Step 3  Click Add to add a new mapping cell.

Step 4  Select appropriate values for:
• Source Security Group
• Destination Security Group
• Status, Security Group ACLs
• Final Catch All Rule

Step 5  Click Save.

---

Export Egress Policy

Procedure

Step 1  Choose Policy > TrustSec > Egress Policy > Matrix.
Step 2  Click Export.
Step 3  Save the CSV file to your local system.

Import Egress Policy

You can create the egress policy offline and then import it in to Cisco ISE. If you have a large number of security group tags, then creating the security group ACL mapping one by one might take some time. Instead, creating the egress policy offline and importing it in to Cisco ISE saves time for you. During import, Cisco ISE appends the entries from the CSV file to the egress policy matrix and does not overwrite the data.

Egress policy import fails if the:
• Source or destination SGTs do not exist
• SGACL does not exist
• Monitor status is different than what is currently configured in Cisco ISE for that cell

Procedure

Step 1  Choose Policy > TrustSec > Egress Policy > Matrix.
Step 2  Click Generate a Template.
Step 3  Download the template (CSV file) from the Egress Policy page and enter the following information in the CSV file:
Configure SGT from Egress Policy

You can create Security Groups directly from the Egress Policy page.

Procedure

Step 1  Choose Policy > TrustSec > Egress Policy.
Step 2  From the Source or Destination Tree View page, choose Configure > Create New Security Group.
Step 3  Enter the required details and click Submit.

Monitor Mode

The Monitor All option in the egress policy allows you to change the entire egress policy configuration status to monitor mode with a single click. Check the Monitor All check box in the egress policy page to change the egress policy configuration status of all the cells to monitor mode. When you check the Monitor All check box, the following changes take place in the configuration status:

• The cells whose status is Enabled will act as monitored but appears as if they are enabled.
• The cells whose status is Disable will not be affected.
• The cells whose status is Monitor will remain Monitored.

Uncheck the Monitor All check box to restore the original configuration status. It does not change the actual status of the cell in the database. When you deselect Monitor All, each cell in the egress policy regains its original configuration status.

Features of Monitor Mode

The monitoring functionality of the monitor mode helps you to:

• Know how much traffic is filtered but monitored by the monitor mode
• Know that SGT-DGT pair is in monitor mode or enforce mode, and observe if there is any unusual packet drop is happening in the network
• Understand that SGACL drop is actually enforced by enforce mode or permitted by monitor mode
• Create custom reports based on the type of mode (monitor, enforce, or both)
• Identify which SGACL has been applied on NAD and display discrepancy, if any

**Related Topics**

*Run Top N RBACL Drops by User Report*, on page 609

### The Unknown Security Group

The Unknown security group is a pre-configured security group that cannot be modified and represents the Trustsec with tag value 0.

The Cisco security group network devices request for cells that refer to the unknown SGT when they do not have an SGT of either source or destination. If only the source is unknown, the request applies to the \(<\text{unknown}, \text{Destination SGT}\>\) cell. If only the destination is unknown, the request applies to the \(<\text{source SGT}, \text{unknown}\>\) cell. If both the source and destination are unknown, the request applies to the \(<\text{Unknown, Unknown}\>\) cell.

### Default Policy

Default Policy refers to the \(<\text{ANY,ANY}\>\) cell. Any source SGT is mapped to any destination SGT. Here, the ANY SGT cannot be modified and it is not listed in any source or destination SGTs. The ANY SGT can only be paired with ANY SGT. It cannot be paired with any other SGTs. A TrustSec network device attaches the default policy to the end of the specific cell policy.

- If a cell is empty, that means it contains the default policy alone.
- If a cell contains some policy, the resulting policy is a combination of the cell specific policy followed by the default policy.

According to Cisco ISE, the cell policy and the default policy are two separate sets of SGACLs that the devices get in response to two separate policy queries.

Configuration of the default policy is different from other cells:

- Status can take only two values, Enabled or Monitored.
- Security Group ACLs is an optional field for the default policy, so can be left empty.
- Final Catch All Rule can be any of the following: Permit IP, Deny IP, Permit IP log, or Deny IP log. Clearly the None option is not available here because there is no safety net beyond the default policy.

### Push Button

The Push option in the egress policy initiates a CoA notification that calls the Trustsec devices to immediately request for updates from Cisco ISE regarding the configuration changes in the egress policy.

**Related Topics**

*Update SGT Matrix CoA Flow*, on page 606

### SGT Assignment

Cisco ISE allows you to assign an SGT to a TrustSec device if you know the device hostname or IP address. When a device with the specific hostname or IP address joins the network, Cisco ISE will assign the SGT before authenticating it.
Sometimes, devices need to be manually configured to map the security group tags to the endpoint. You can create this mapping from the Security Group Mappings page. Before you perform this action, ensure that you have reserved a range of SGTs.

ISE allows you to create up to 10,000 IP-to-SGT mappings. You can create IP-to-SGT mapping groups to logically group such large scale mappings. Each group of IP-to-SGT mappings contains a list of IP addresses, a single security group it would map to and a network device or network device group which is the deployment target for those mappings.

**NDAC Authorization**

You can configure the TrustSec policy by assigning SGTs to devices. You can assign security groups to devices based on TrustSec device ID attribute.

**Related Topics**

- Configure TrustSec Global Settings, on page 582
- Configure TrustSec AAA Servers, on page 585
- Add Single IP-to-SGT Mappings, on page 597

**Configure NDAC Authorization**

**Before you begin**

- Ensure that you create the security groups for use in the policy.
- To perform the following task, you must be a Super Admin or System Admin.

**Procedure**

**Step 1** Choose Policy > TrustSec > Network Device Authorization.

**Step 2** Click the **Action** icon on the right-hand side of the Default Rule row, and click **Insert New Row Above**.

**Step 3** Enter the name for this rule.

**Step 4** Click the plus sign (+) next to Conditions to add a policy condition.

**Step 5** You can click **Create New Condition (Advance Option)** and create a new condition.

**Step 6** From the **Security Group** drop-down list, select the SGT that you want to assign if this condition evaluates to true.

**Step 7** Click the **Action** icon from this row to add additional rules based on device attributes either above or below the current rule. You can repeat this process to create all the rules that you need for the TrustSec policy. You can drag and drop the rules to reorder them by clicking the icon. You can also duplicate an existing condition, but ensure that you change the policy name.

The first rule that evaluates to true determines the result of the evaluation. If none of the rules match, the default rule will be applied; you can edit the default rule to specify the SGT that must be applied to the device if none of the rules match.

**Step 8** Click **Save** to save your TrustSec policy.
If a TrustSec device tries to authenticate after you have configured the network device policy, the device will get its SGT and the SGT of its peers and will be able to download all the relevant details.

### Configure End User Authorization

Cisco ISE allows you to assign a security group as the result of an authorization policy evaluation. Using this option, you can assign a security group to users and endpoints.

**Before you begin**

- Read the information on authorization policies.
- To perform the following task, you must be a Super Admin or System Admin.

**Procedure**

2. Create a new authorization policy.
3. Select a security group, for Permissions.

   If the conditions specified in this authorization policy is true for a user or endpoint, then this security group will be assigned to that user or endpoint and all data packets that are sent by this user or endpoint will be tagged with this particular SGT.

### Add Single IP-to-SGT Mappings

**Before you begin**

To perform the following task, you must be a Super Admin or System Admin.

**Procedure**

1. Choose Policy > Policy Elements > Results > TrustSec > Security Group Mappings > Hosts.
2. Click Add to add a new single IP-SGT mapping.
3. Choose if you want to enter the Hostname or the IP Address of the device. You can also enter the subnet mask for the IP address.
4. Choose one of the following:
   - Group Mapping—To set the IP mapping to be part of existing Mapping Group.
   - Security Group Tag—To create a flat mapping between this IP and SGT.
5. Choose the destination network device on which you want to deploy this mapping. You can deploy the mappings on all trustsec devices, on selected network device groups, or on selected network devices.
Add Group IP-to-SGT Mappings

Before you begin
To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1 Choose Policy > Policy Elements > Results > TrustSec > Security Group Mappings > Groups.
Step 2 Click Add to add a new group IP-SGT mapping.
Step 3 Enter a Name and a Description for the new group.
Step 4 Enter the Security Group Tag to which this group will be mapped to.
Step 5 Choose the destination network device on which you want to deploy this mapping. You can deploy the mappings on all trustsec devices, on selected network device groups, or on selected network devices.
Step 6 Click Submit.

Import Security Group Mappings Hosts

You can import a list of security group mappings hosts into a Cisco ISE node using a comma-separated value (CSV) file. You cannot run an import of the same resource type at the same time. For example, you cannot concurrently import security group mappings hosts from two different import files.

You can download the CSV template from the Policy > Policy Elements > Results > Trustsec > Security Group Mappings > Hosts > Import page. Enter your security group mappings hosts details in the template, and save it as a CSV file, which you can then import back in to Cisco ISE.

While importing hosts, you can create new records or update existing records. Cisco ISE displays the summary of the number of hosts that are imported and also reports any errors that were found during the import process. When you import hosts, you can also define whether you want Cisco ISE to stop the import process when Cisco ISE encounters the first error.

Procedure

Step 1 Choose Policy > Policy Elements > Results > TrustSec > Security Group Mappings > Hosts.
Step 2 Click Import.
Step 3 Click Browse to choose the CSV file from the system that is running the client browser.
Step 4 Check the Stop Import on First Error check box, if required.
Step 5 Click Import.
Export Security Group Mappings Hosts

You can export security group mappings hosts configured in Cisco ISE in the form of a CSV file that you can use to import these hosts into another Cisco ISE node.

Procedure

Step 1  Choose Policy > Policy Elements > Results > TrustSec > Security Group Mappings > Hosts.

Step 2  Click Export.

Step 3  To export security group mappings hosts, you can do one of the following:
- Check the check boxes next to the hosts that you want to export, and choose Export > Export Selected.
- Choose Export > Export All to export all the security group mappings hosts that are defined.

Step 4  Save the export.csv file to your local hard disk.

Deploy IP-to-SGT Mappings

After you add IP-to-SGT mappings to Cisco ISE you must deploy these to the target network device. You must do this explicitly even though you have saved the mappings earlier. Cisco ISE provides you the option to deploy all or only a subset of the mappings.

Before you begin

You must have added IP-to-SGT mappings to Cisco ISE or created IP-to-SGT mappings groups that contain IP-to-SGT mappings.

Procedure

Step 1  To deploy IP-to-SGT mappings to devices, you can do one of the following:
- Choose Policy > Policy Elements > Results > Trustsec > Security Group Mappings > Groups, if you want to deploy IP-to-SGT mapping groups to devices.
- Choose Policy > Policy Elements > Results > Trustsec > Security Group Mappings > Hosts, if you want to deploy single IP-to-SGT mappings to devices.

Step 2  Do one of the following:
- Check the check box next to the group or mapping that you want to deploy, and choose Deploy to deploy only the selected mappings.
- Choose Deploy to deploy all the IP-to-SGT mappings configured in Cisco ISE.

Cisco ISE deploys the mappings to the specific network devices defined in the group or mapping. It also displays a report with details such as deployed devices, configuration, deployment status and failure reason if any.
**TrustSec Configuration and Policy Push**

Cisco ISE supports Change of Authorization (CoA) which allows Cisco ISE to notify TrustSec devices about TrustSec configuration and policy changes, so that the devices can reply with requests to get the relevant data.

A CoA notification can trigger a TrustSec network device to send either an Environment CoA or a Policy CoA.

You can also push a configuration change to devices that do not intrinsically support the TrustSec CoA feature.

**Related Topics**
- CoA Supported Network Devices, on page 600
- Environment CoA Notification Flow, on page 602
- Update SGAACL Content Flow, on page 604
- Policies Update CoA Notification Flow, on page 606
- Update SGT Matrix CoA Flow, on page 606
- TrustSec CoA Summary, on page 607

**CoA Supported Network Devices**

Cisco ISE sends CoA notifications to the following network devices:

- Network device with single IP address (subnets are not supported)
- Network device configured as a TrustSec device
- Network device set as CoA supported

When Cisco ISE is deployed in a distributed environment where there are several secondaries that interoperate with different sets of devices, CoA requests are sent from Cisco ISE primary node to all the network devices. Therefore, TrustSec network devices need to be configured with the Cisco ISE primary node as the CoA client.

The devices return CoA NAK or ACK back to the Cisco ISE primary node. However, the following TrustSec session coming from the network device would be sent to the Cisco ISE node to which the network devise sends all it's other AAA requests and not necessarily to the primary node.

**Push Configuration Changes to Non-CoA Supporting Devices**

Some platforms do not support Cisco ISE's "Push" feature for Change of Authorization (CoA), for example: some versions of the Nexus network device. For this case, ISE will connect to the network device and make it to trigger an updated configuration request towards ISE. To achieve this, ISE opens an SSHv2 tunnel to the network device, and the Cisco ISE sends a command that triggers a refresh of the TrustSec policy matrix.

This method can also be carried out on network platforms that support CoA pushing.

**Procedure**

**Step 1** Choose **Device Administration > Network Resources > Network Devices**.

**Step 2** Check the checkbox next to the required network device and click **Edit**.
Verify that the network device's name, IP address, RADIUS and TrustSec settings are properly configured.

**Step 3** Scroll down to Advanced TrustSec Settings, and in the TrustSec Notifications and Updates section, check the Send configuration changes to device checkbox, and click the CLI (SSH) radio button.

**Step 4** (Optional) Provide an SSH key.

**Step 5** Check the Include this device when deploying Security Group Tag Mapping Updates check box, for this SGA device to obtain the IP-SGT mappings using device interface credentials.

**Step 6** Enter the username and password of the user having privileges to edit the device configuration in the Exec mode.

**Step 7** (Optional) Enter the password to enable Exec mode password for the device that would allow you to edit its configuration. You can click Show to display the Exec mode password that is already configured for this device.

**Step 8** Click Submit at the bottom of the page.

The network device is now configured to push Trustsec changes. After you change a Cisco ISE policy, click Push to have the new configuration reflected on the network device.

**SSH Key Validation**

You may want to harden security by using an SSH key. Cisco ISE supports this with its SSH key validation feature.

To use this feature, you open an SSHv2 tunnel from the Cisco ISE to the network device, then use the network device's own CLI to retrieve the SSH key. You then copy this key and paste it into Cisco ISE for validation. Cisco ISE terminates the connection if the SSH key is wrong.

**Limitation:** Currently, Cisco ISE can validate only one IP (not on ranges of IP, or subnets within an IP)

**Before you begin**

You will require:

- Login credentials
- CLI command to retrieve the SSH key

for the network device with which you want the Cisco ISE to communicate securely.

**Procedure**

**Step 1** On the network device:

a) Log on to the network device with which you want the Cisco ISE to communicate using SSH key validation.

b) Use the device's CLI to show the SSH key.

**Example:**

For Catalyst devices, the command is: `sho ip ssh`.

c) Copy the SSH key which is displayed.

**Step 2** From the Cisco ISE user interface:
a) Choose **Device Administration** > **Network Resources** > **Network Devices**, and verify the required network device's name, IP address, RADIUS and TrustSec settings are properly configured.
b) Scroll down to **Advanced TrustSec Settings**, and in the **TrustSec Notifications and Updates** section, check the **Send configuration changes to device** checkbox, and click the **CLI (SSH)** radio button.
c) In the **SSH Key** field, paste the SSH key retrieved previously from the network device.
d) Click **Submit** at the bottom of the page.

The network device is now communicating with the Cisco ISE using SSH key validation.

### Environment CoA Notification Flow

The following figure depicts the Environment CoA notification flow.

*Figure 36: Environment CoA Notification Flow*

1. Cisco ISE sends an environment CoA notification to the TrustSec network device.
2. The device returns an environment data request.
3. In response to the environment data request, Cisco ISE returns:
   - The environment data of the device that sent the request—This includes the TrustSec device’s SGT (as inferred from the NDAC policy) and download environment TTL.
   - The name and generation ID of the TrustSec AAA server list.
   - The names and generation IDs of (potentially multiple) SGT tables—These tables list SGT name versus SGT value, and together these tables hold the full list of SGTs.
4. If the device does not hold a TrustSec AAA server list, or the generation ID is different from the generation ID that is received, the device sends another request to get the AAA server list content.

5. If the device does not hold an SGT table listed in the response, or the generation ID is different from the generation ID that is received, the device sends another request to get the content of that SGT table.

**Environment CoA Triggers**

An Environment CoA can be triggered for:

- Network devices
- Security groups
- AAA servers

**Related Topics**

- [Trigger Environment CoA for Network Devices](#), on page 603
- [Trigger Environment CoA for Security Groups](#), on page 603
- [Trigger Environment CoA for TrustSec AAA Servers](#), on page 604

**Trigger Environment CoA for Network Devices**

To trigger an Environment CoA for the Network devices, complete the following steps:

**Procedure**

**Step 1** Choose Administration > Network Resources > Network Devices.

**Step 2** Add or edit a network device.

**Step 3** Update TrustSec Notifications and Updates parameters under the Advanced TrustSec Settings section.

Changing the environment attribute is notified only to the specific TrustSec network device where the change took place.

Because only a single device is impacted, an environmental CoA notification is sent immediately upon submission. The result is a device update of its environment attribute.

**Trigger Environment CoA for Security Groups**

To trigger an Environment CoA for the security groups, complete the following steps.

**Procedure**

**Step 1** Choose Policy > Policy Elements > Results > TrustSec > Security Groups.

**Step 2** In the Security Group page, change the name of an SGT, which will change the name of the mapping value of that SGT. This triggers an environmental change.
Trigger Environment CoA for TrustSec AAA Servers

To trigger an Environment CoA for the TrustSec AAA servers, complete the following steps.

**Procedure**

**Step 1** Choose Administration > Network Resources > TrustSec AAA Servers.
**Step 2** In the TrustSec AAA Servers page create, delete or update the configuration of a TrustSec AAA server. This triggers an environment change.
**Step 3** Click the Push button to initiate an environment CoA notification after you configure multiple TrustSec AAA servers. This environment CoA notification goes to all TrustSec network devices and provides an update of all TrustSec AAA servers that were changed.

Trigger Environment CoA for NDAC Policy

To trigger an Environment CoA for the NDAC Policies, complete the following steps.

**Procedure**

You can initiate an environment CoA notification by clicking the Push button in the NDAC policy page. This environment CoA notification goes to all TrustSec network devices and provides an update of network device own SGT.

Update SGACL Content Flow

The following figure depicts the Update SGACL Content flow.
1. Cisco ISE sends an update SGACL named list CoA notification to a TrustSec network device. The notification contains the SGACL name and the generation ID.

2. The device may replay with an SGACL data request if both of the following terms are fulfilled:
   - If the SGACL is part of an egress cell that the device holds. The device holds a subset of the egress policy data, which are the cells related to the SGTs of its neighboring devices and endpoints (egress policy columns of selected destination SGTs).
   - The generation ID in the CoA notification is different from the generation ID that the device holds for this SGACL.

3. In response to the SGACL data request, Cisco ISE returns the content of the SGACL (the ACE).

### Initiate an Update SGACL Named List CoA

To trigger an Update SGACL Named List CoA, complete the following steps:

**Procedure**

**Step 1** Choose Policy > Policy Elements > Results.

**Step 2** From the Results navigation pane on the left, click the button next to TrustSec and click Security Group ACLs.

**Step 3** Change the content of the SGACL. After you submit a SGACL, it promotes the generation ID of the SGACL.

**Step 4** Click the Push button to initiate an Update SGACL Named List CoA notification after you change the content of multiple SGACLs. This notification goes to all TrustSec network devices, and provides an update of that SGACL content on the relevant devices.

Changing the name or the IP version of an SGACL does not change its generation ID; hence it does not require sending an update SGACL named list CoA notification.
However, changing the name or IP version of an SGACL that is in use in the egress policy indicates a change in the cell that contains that SGACL, and this changes the generation ID of the destination SGT of that cell.

**Policies Update CoA Notification Flow**

The following figure depicts the Policies CoA Notification flow.

*Figure 38: Policies CoA Notification flow*

1. Cisco ISE sends an update policies CoA notification to a TrustSec network device. The notification may contain multiple SGACL names and their generation IDs, and multiple SGT values and their generation IDs.
2. The device may replay with multiple SGACL data requests and/or multiple SGT data.
3. In response to each SGACL data request or SGT data request, Cisco ISE returns the relevant data.

**Update SGT Matrix CoA Flow**

The following figure depicts the Update SGT Matrix CoA flow.
Cisco ISE sends an updated SGT matrix CoA notification to a TrustSec network device. The notification contains the SGT value and the generation ID.

2. The device may replay with an SGT data request if both the following terms are fulfilled:
   - If the SGT is the SGT of a neighboring device or endpoint, the device downloads and hold the cells related to SGTs of neighboring devices and endpoints (a destination SGT).
   - The generation ID in the CoA notification is different from the generation ID that the device holds for this SGT.

3. In response to the SGT data request, Cisco ISE returns the data of all egress cells, such as the source and destination SGTs, the status of the cell, and an ordered list of the SGACL names configured in that cell.

**Initiate Update SGT Matrix CoA from Egress Policy**

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose <strong>Policy &gt; TrustSec &gt; Egress Policy</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>On the Egress Policy page, change the content of a cell (status, SGACLs).</td>
</tr>
<tr>
<td>Step 3</td>
<td>After you submit the changes, it promotes the generation ID of the destination SGT of that cell.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click the <strong>Push</strong> button to initiate the Update SGT matrix CoA notification after you change the content of multiple egress cells. This notification goes to all TrustSec network devices, and provides an update of cells content on the relevant devices.</td>
</tr>
</tbody>
</table>

**TrustSec CoA Summary**

The following table summarizes the various scenarios that may require initiating a TrustSec CoA, the type of CoA used in each scenario, and the related UI pages.
## Table 50: TrustSec CoA Summary

<table>
<thead>
<tr>
<th>UI Page</th>
<th>Operation that triggers CoA</th>
<th>How it is triggered</th>
<th>CoA type</th>
<th>Send to</th>
</tr>

</tbody>
</table>
Run Top N RBACL Drops by User Report

You can run the Top N RBACL Drops by User report to see the policy violations (based on packet drops) by specific users.

**Procedure**

**Step 1**  
From the Cisco ISE Admin dashboard, select *Operations > Reports > ISE Reports > TrustSec*.

**Step 2**  
Click *Top N RBACL Drops by User*.

**Step 3**  
From the *Filters* drop-down menu, add the required monitor modes.

**Step 4**  
Enter the values for the selected parameters accordingly. You can specify the mode from the Enforcement mode drop-down list as Enforce, Monitor, or Both.

**Step 5**  
From the *Time Range* drop-down menu, choose a time period over which the report data will be collected.

**Step 6**  
Click *Run* to run the report for a specific period, along with the selected parameters.
Run Top N RBACL Drops by User Report

Monitoring and Troubleshooting Service in Cisco ISE

The Monitoring and troubleshooting service is a comprehensive identity solution for all Cisco ISE run-time services and uses the following components:

- Monitoring—Provides a real-time presentation of meaningful data representing the state of access activities on a network. This insight allows you to easily interpret and affect operational conditions.

- Troubleshooting—Provides contextual guidance for resolving access issues on networks. You can then address user concerns and provide a resolution in a timely manner.

- Reporting—Provides a catalog of standard reports that you can use to analyze trends and monitor system performance and network activities. You can customize reports in various ways and save them for future use.
Cisco ISE Dashboard

The Cisco ISE dashboard, or home page (Home > Summary), is the landing page that appears after you log in to the Cisco ISE administration console. The dashboard is a centralized management console consisting of metric meters along the top of the window, with dashlets below. The default dashboards are Summary, Endpoints, Guests, Vulnerability, and Threat.

The dashboard’s real-time data provides an at-a-glance status of the devices and users that are accessing your network as well as the system health overview.

Note

You must have Adobe Flash Player installed in your browser to be able to view the dashlets and all the corresponding drill down pages properly.

Network Privilege Framework

The dashboard shows the activity on the Network Privilege Framework (NPF), and provides detailed information on the various components.

The NPF is composed of the three tiers outlined in the following table:

Table 51: NPF Tiers

<table>
<thead>
<tr>
<th>Tier</th>
<th>Specifications</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Access control based on identity using 802.1x, MAC authentication bypass (MAB), the Cisco ISE Profiler service</td>
</tr>
<tr>
<td>2</td>
<td>Access control based on identity using 802.1x, MAB, Profiler, guest provisioning of the Network Admission Control (NAC) manager, central web authentication</td>
</tr>
<tr>
<td>3</td>
<td>Access control based on identity and posture using 802.1x, MAB, Profiler, guest provisioning of the NAC manager, central web authentication</td>
</tr>
</tbody>
</table>

NPF authentication and authorization generates a flow of events. The events from the different sources are then collected by Cisco ISE monitoring and troubleshooting tools and summarized. You can view the authentication and authorization results on the dashboard or choose to run any number of reports.

NPF Event Flow Process

The NPF authentication and authorization event flow uses the process described in the following table:

<table>
<thead>
<tr>
<th>Process Stage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>NAD performs an authorization or flex authorization.</td>
</tr>
<tr>
<td>2</td>
<td>An unknown agentless identity is profiled with web authorization.</td>
</tr>
</tbody>
</table>
### User Roles and Permissions for Monitoring and Troubleshooting Capabilities

Monitoring and troubleshooting capabilities are associated with default user roles. The tasks you are allowed to perform are directly related to your assigned user role.

### Data Stored in Monitoring Database

The Cisco ISE monitoring service collects and stores data in a specialized monitoring database. The rate and amount of data utilized to monitor network functions may require a node dedicated solely to monitoring. If your Cisco ISE network collects logging data at a high rate from Policy Service nodes or network devices, a Cisco ISE node dedicated to monitoring is recommended.

To manage the information stored in the Monitoring database, you are required to perform full and incremental backups of the database. This includes purging unwanted data, and then restoring the database.

**Related Topics**
- [Monitoring Database](#), on page 647

### Device Configuration for Monitoring

The Monitoring node receives and uses data from devices on the network to populate the dashboard display. To enable communication between the Monitoring node and the network devices, switches and Network Access Devices (NADs) must be configured properly.

### Network Process Status

You can view process status for the network from the Cisco ISE dashboard using the System Summary dashlet. For example, when processes like the application server or database fail, an alarm is generated and you can view the results using the System Summary dashlet.

The color of the system status icon indicates the health of your system:

- Green = Healthy
- Yellow = Warning
- Red = Critical
- Gray = No information

<table>
<thead>
<tr>
<th>Process Stage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>RADIUS server authenticates and authorizes the identity.</td>
</tr>
<tr>
<td>4</td>
<td>Authorization is provisioned for the identity at the port.</td>
</tr>
<tr>
<td>5</td>
<td>Unauthorized endpoint traffic is dropped.</td>
</tr>
</tbody>
</table>
Monitor Network Process Status

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Go to the Cisco ISE Dashboard.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Expand the System Summary dashlet. A detailed real-time report appears.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Review the following information for the processes that are running on the network:</td>
</tr>
</tbody>
</table>

• Name of the process

• CPU and memory utilization

• Time since process started running

Network Authentications

You can view the passed and failed network authentications from the Authentications dashlet. It provides data on the user or type of device, location, and the identity group to which the user or device belongs. The sparklines along the top of the dashlet represent distribution over the last 24 hours and the last 60 minutes.

Monitor Network Authentications

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Go to the Cisco ISE Dashboard.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Expand the Authentications dashlet.</td>
</tr>
<tr>
<td></td>
<td>A detailed real-time report appears.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Review the information for the users or devices that are authenticated on the network.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Expand the data categories for more information.</td>
</tr>
</tbody>
</table>

Profiler Activity and Profiled Endpoints

The Profiled Endpoint dashlet focuses on the endpoints on the network that have matched profiles, providing profile data for each endpoint. For example, the statistics allow you to determine the type of device, its location, and its IP address. The sparklines along the top of the dashlet represent endpoint activity over the last 24 hours and last 60 minutes.

The Profiled Endpoint dashlet represents the total number of endpoints that have been profiled on the network for the last 24 hours, including those that are unknown. It is not a representation of how many endpoints are
Determine Profiler Activity and Profiled Endpoints

Procedure

**Step 1**
Go to the Cisco ISE Dashboard.

**Step 2**
In the Profiler Activity dashlet, hover your cursor over a stack bar or sparkline.
A tooltip provides detailed information.

**Step 3**
Expand the data categories for more information.

**Step 4**
Expand the Profiler Activity dashlet.
A detailed real-time report appears.

Troubleshooting the Profiler Feed

If the Test was able to connect to the Cisco Feed server, then you will see a popup that says that the test connection was successful.

If the connection failed, the test button area will contain a response from the server, similar to the following example, where the bold part of the message shows the important part of the message:

Unable to find valid certification path to requested target

Here are some possible error messages and actions to take:

- Unable to find valid certification path to requested target - The certificate that the Feed server used is not valid. Verify that you have enabled the Verisign certificates.

- No route to host - Verify that you have a working connection to an outside network from the ISE server.

- UnknownHostException (at the beginning of the error message) - Verify that you have a working connection to an outside network from the ISE server.

Posture Compliance

The Posture Compliance dashlet provides information on the users who are accessing the network and whether they meet posture compliance. Data is shown on the devices that are currently connected to the network. The stack bars show noncompliance statistics that are arranged according to operating system and other criteria. Sparklines represent the percentage of compliant versus noncompliant posture attempts.
Check Posture Compliance

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Go to the Cisco ISE Dashboard.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>In the Posture Compliance dashlet, hover your cursor over a stack bar or sparkline. A tooltip provides detailed information.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Expand the data categories for more information.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Expand the Posture Compliance dashlet. A detailed real-time report appears.</td>
</tr>
</tbody>
</table>

Cisco ISE Alarms

Alarms notify you of critical conditions on a network and are displayed in the Alarms dashlet. They also provide information on system activities, such as data purge events. You can configure how you want to be notified about system activities, or disable them entirely. You can also configure the threshold for certain alarms.

Most alarms do not have an associated schedule and are sent immediately after an event occurs. At any given point in time, only the latest 15,000 alarms are retained.

If the event re-occurs, then the same alarms are suppressed for a minimum duration of two hours. During the time that the event re-occurs, depending up on the trigger, it may take up to three hours for the alarms to re-appear.

The following table lists all the Cisco ISE alarms, descriptions and their resolution.

<table>
<thead>
<tr>
<th>Alarm Name</th>
<th>Alarm Description</th>
<th>Alarm Resolution</th>
</tr>
</thead>
<tbody>

</table>

Alarms are not triggered when you add users or endpoints to Cisco ISE.
Add Custom Alarms

Cisco ISE contains 12 default alarm types, such as High Memory Utilization and Configuration Changes. Cisco-defined system alarms are listed in the Alarms Settings page (Administration > System > Settings > Alarms Settings). You can only edit the system alarms.

In addition to the existing system alarms, you can add, edit, or delete custom alarms under the existing alarm types.

To add an alarm:

Procedure

**Step 1** Choose Administration > System > Settings > Alarm Settings.

**Step 2** In the Alarm Configuration tab, click Add.

**Step 3** Enter the required details.

Based on the alarm type (High Memory Utilization, Excessive RADIUS Authentication Attempts, and so on), additional attributes are displayed in the Alarm Configuration page. For example, Object Name, Object Type, and Admin Name fields are displayed for Configuration Change alarms. You can add multiple instances of same alarm with different criteria.

**Step 4** Click Submit.

Cisco ISE Alarm Notifications and Thresholds

You can enable or disable Cisco ISE alarms and configure alarm notification behavior to notify you of critical conditions. For certain alarms you can configure thresholds like maximum failed attempts for Excessive Failed Attempts alarm or maximum disk utilization for High Disk Utilization alarm.

Enable and Configure Alarms

Procedure

**Step 1** Choose Administration > System > Settings > Alarm Settings.

**Step 2** Select an alarm from the list of default alarms and click Edit.

**Step 3** Select Enable or Disable.
Cisco ISE Alarms for Monitoring

Cisco ISE provides system alarms which notify you whenever any critical system condition occurs. Alarms that are generated by Cisco ISE are displayed in the Alarm dashlet. These notifications automatically appear in the alarm dashlet.

The Alarm dashlet displays a list of recent alarms, which you can select from to view the alarm details. You can also receive notification of alarms through e-mail and syslog messages.

View Monitoring Alarms

Procedure

Step 1 Go to the Cisco ISE Dashboard.
Step 2 Click on an alarm in the Alarms dashlet. A new window opens with the alarm details and a suggested action.
Step 3 Click Refresh to refresh the alarms.
Step 4 Click Acknowledge to acknowledge selected alarms. You can select the alarms by clicking the check box available prior to the timestamp. This reduces the alarm counters (number of times an alarm is raised) when marked as read.
Step 5 Click the Details link corresponding to the alarm that you select. A new window opens with the details corresponding to the alarm that you select.

Note The Details link corresponding to the previous alarms that were generated prior to persona change shows no data.

Cisco ISE Alarms, on page 618
Add Custom Alarms, on page 628
Cisco ISE Alarm Notifications and Thresholds, on page 628
Cisco ISE Alarms for Monitoring, on page 629

Step 4 Configure alarm threshold if applicable.
Step 5 Click Submit.
Log Collection

Monitoring services collect log and configuration data, store the data, and then process it to generate reports and alarms. You can view the details of the logs that are collected from any of the servers in your deployment.

Alarm Syslog Collection Location

If you configure monitoring functions to send alarm notifications as syslog messages, you need a syslog target to receive the notification. Alarm syslog targets are the destinations where alarm syslog messages are sent. You must also have a system that is configured as a syslog server to be able to receive syslog messages. You can create, edit, and delete alarm syslog targets.

Note

Cisco ISE monitoring requires that the logging-source interface configuration use the network access server (NAS) IP address. You must configure a switch for Cisco ISE monitoring.

Live Authentications

You can monitor recent RADIUS authentications as they happen from the Live Authentications page. The page displays the top 10 RADIUS authentications in the last 24 hours. This section explains the functions of the Live Authentications page.

The Live Authentications page shows the live authentication entries corresponding to the authentication events as they happen. In addition to authentication entries, this page also shows the live session entries corresponding to the events. You can also drill-down the desired session to view a detailed report corresponding to that session.

The Live Authentications page provides a tabular account of recent RADIUS authentications, in the order in which they happen. The last update shown at the bottom of the Live Authentications page shows the date of the server, time, and timezone.

When a single endpoint authenticates successfully, two entries appear in the Live Authentications page: one corresponding to the authentication record and another corresponding to the session record (pulled from session live view). Subsequently, when the device performs another successful authentication, the repeat counter corresponding to the session record is incremented. The Repeat Counter that appears in the Live Authentications page shows the number of duplicate radius authentication success messages that are suppressed.

See the Live Authentication data categories that are shown by default that are described in the Recent RADIUS Authentications section.

You can choose to view all of the columns, or to display only selected data columns. After selecting the columns that you want to appear, you can save your selections.
Monitor Live Authentications

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Choose <strong>Operations</strong> &gt; <strong>Authentications</strong>.</td>
</tr>
<tr>
<td>2</td>
<td>Select a time interval from the <strong>Refresh</strong> drop-down list to change the data refresh rate.</td>
</tr>
<tr>
<td>3</td>
<td>Click the <strong>Refresh</strong> icon to manually update the data.</td>
</tr>
<tr>
<td>4</td>
<td>Choose an option from the <strong>Show</strong> drop-down list to change the number of records that appear.</td>
</tr>
<tr>
<td>5</td>
<td>Choose an option from the <strong>Within</strong> drop-down list to specify a time interval.</td>
</tr>
<tr>
<td>6</td>
<td>Click <strong>Add or Remove Columns</strong> and choose the options from the drop-down list to change the columns that are shown.</td>
</tr>
<tr>
<td>7</td>
<td>Click <strong>Save</strong> at the bottom of the drop-down list to save your modifications.</td>
</tr>
<tr>
<td>8</td>
<td>Click <strong>Show Live Sessions</strong> to view live RADIUS sessions.</td>
</tr>
</tbody>
</table>

You can use the dynamic Change of Authorization (CoA) feature for the Live Sessions that allows you to dynamically control active RADIUS sessions. You can send reauthenticate or disconnect requests to a Network Access Device (NAD).

Filter Data in Live Authentications Page

With the filters in the Live Authentications page, you can filter out information that you need and troubleshoot network authentication issues quickly. You can filter records in the Authentication (live logs) page and view only those records that you are interested in. The authentication logs contain many details and filtering the authentications from a particular user or location helps you scan the data quickly. You can use several operators that are available on various fields in the Live Authentications page to filter out records based on your search criteria.

- `abc` - Contains 'abc'
- `!abc` - Does not contain 'abc'
- `{}` - Is empty
- `{{}}` - Is not empty
- `'abc'` - Starts with 'abc'
- `#abc` - Ends with 'abc'
- `",", ",", ","` - Escape

The Escape option allows you to filter text with special characters (including the special characters used as filters). You must prefix the special character with a backward slash (`\`). For example, if you want to view the authentication records of users with identity "Employee!", enter "Employee\!" in the identity filter text box. In this example, Cisco ISE considers the exclamation mark (!) as a literal character and not as a special character.

In addition, the Status field allows you to filter out only passed authentication records, failed authentications, live sessions, and so on. The green check mark filters all passed authentications that occurred in the past. The
red cross mark filters all failed authentications. The blue i icon filters all live sessions. You can also choose to view a combination of these options.

Procedure

**Step 1** Choose **Operations > Authentications**.

**Step 2** Filter data based on any of the fields in the Show Live Authentications page.

You can filter the results based on passed or failed authentications, or live sessions.

---

**Global Search for Endpoints**

You can use the global search box available at the top of the Cisco ISE home page to search for endpoints. You can use any of the following criteria to search for an endpoint:

- User name
- MAC Address
- IP Address
- Authorization Profile
- Endpoint Profile
- Failure Reason
- Identity Group
- Identity Store
- Network Device name
- Network Device Type
- Operating System
- Posture Status
- Location
- Security Group
- User Type

You should enter at least three characters for any of the search criteria in the Search field to display data.

The search result provides a detailed and at-a-glance information about the current status of the endpoint, which you can use for troubleshooting. Search results display only the top 25 entries. It is recommended to use filters to narrow down the results.

The following figure shows an example of the search result.
You can use any of the properties in the left panel to filter the results. You can also click on any endpoint to see more detailed information about the endpoint, such as:

- Session trace
- Authentication details
- Accounting details
- Posture details
- Profiler details
- Client Provisioning details
- Guest accounting and activity

**Related Topics**

Session Trace for an Endpoint, on page 633

### Session Trace for an Endpoint

You can use the global search box available at the top of the Cisco ISE home page to get session information for a particular endpoint. When you search with a criteria, you get a list of endpoints. Click on any of these endpoints to see the session trace information for that endpoint. The following figure shows an example of the session trace information displayed for an endpoint.

---

**Note**

The dataset used for search is based on Endpoint ID as indexes. Therefore, when authentication occurs, it is mandatory to have Endpoint IDs for the endpoints for those authentications to include them in the search result set.
You can use the clickable timeline at the top to see major authorization transitions. You can also export the results in .csv format by clicking the Export Results button. The report gets downloaded to your browser.

You can click on the Endpoint Details link to see more authentication, accounting, and profiler information for a particular endpoint. The following figure shows an example of endpoint details information displayed for an endpoint.
Related Topics
Global Search for Endpoints, on page 632

Authentication Summary Report
You can troubleshoot network access for a specific user, device, or search criteria based on attributes that are related to the authentication requests. You do this by running an Authentication Summary report.
Troubleshoot Network Access Issues

Procedure

Step 1  Choose Operations > Reports > Authentication Summary Report.
Step 2  Filter the report for Failure Reasons.
Step 3  Review the data in the Authentication by Failure Reasons section of the report to troubleshoot your network access problem.

Note  As the Authentication Summary report collects and displays the latest data corresponding to failed or passed authentications, the contents of the report appear after a delay of a few minutes.

  Troubleshoot Unexpected RADIUS Authentication Results, on page 637

Diagnostic Troubleshooting Tools

Diagnostic tools help you diagnose and troubleshoot problems on a Cisco ISE network and provide a detailed instructions on how to resolve problems. You can use these tools to troubleshoot authentications and evaluate the configuration of any network device on your network, including Trustsec devices.

RADIUS Authentication Troubleshooting Tool

This tool allows you to search and select a RADIUS authentication or an Active Directory related RADIUS authentication for troubleshooting when there is an unexpected authentication result. You might use this tool if you expected an authentication to pass, but it failed or if you expected a user or machine to have a certain level of privileges, and the user or machine did not have those privileges.

- Searching RADIUS authentications based on Username, Endpoint ID, Network Access Service (NAS) IP address, and reasons for authentication failure for troubleshooting, Cisco ISE displays authentications only for the system (current) date.
- Searching RADIUS authentications based on NAS Port for troubleshooting, Cisco ISE displays all NAS Port values since the beginning of the previous month to the current date.

Note  When searching RADIUS authentications based on NAS IP address and Endpoint ID fields, a search is first performed in the operational database, and then in the configuration database.
Troubleshoot Unexpected RADIUS Authentication Results

Procedure

Step 1  Choose Operations > Troubleshoot > Diagnostic Tools > General Tools > RADIUS Authentication Troubleshooting.
Step 2  Specify the search criteria in the fields as needed.
Step 3  Click Search to display the RADIUS authentications that match your search criteria.
        If you are searching for AD related authentication, and an Active Directory server is not configured in your deployment, a message saying 'AD not configured' is displayed.
Step 4  Select a RADIUS authentication record from the table, and click Troubleshoot.
        If you need to troubleshoot AD related authentication, go to the Diagnostics Tool under Administration > Identity Management > External Identity Sources > Active Directory > AD node.
Step 5  Click User Input Required, modify the fields as needed, and then click Submit.
Step 6  Click Done.
Step 7  Click Show Results Summary after the troubleshooting is complete.
Step 8  To view a diagnosis, the steps to resolve the problem, and a troubleshooting summary, click Done.

Execute Network Device Tool

The Execute Network Device Command diagnostic tool allows you to run the show command on any network device. The results are exactly what you would see on a console, and can be used to identify problems in the configuration of the device. You can use it when you suspect that the configuration is wrong, you want to validate it, or if you are just curious about how it is configured.

Execute IOS Show Commands to Check Configuration

Procedure

Step 1  Choose Operations > Troubleshoot > Diagnostic Tools > General Tools > Execute Network Device Command.
Step 2  Enter the information in the appropriate fields.
Step 3  Click Run to execute the command on the specified network device.
Step 4  Click User Input Required, and modify the fields as necessary.
Step 5  Click Submit to run the command on the network device, and view the output.
Evaluate Configuration Validator Tool

You can use this diagnostic tool to evaluate the configuration of a network device and identify any configuration problems. The Expert Troubleshooter compares the configuration of the device with the standard configuration.

Troubleshoot Network Device Configuration Issues

Procedure

Posture Troubleshooting Tool

The Posture Troubleshooting tool helps you find the cause of a posture-check failure to identify the following:

- Which endpoints were successful in posture and which were not.
- If an endpoint failed in posture, what steps failed in the posture process.
- Which mandatory and optional checks passed and failed.

You determine this information by filtering requests based on parameters, such as username, MAC address, and posture status.

Troubleshoot Endpoint Posture Failure

TCP Dump Utility to Validate the Incoming Traffic

This is a tool to sniff the packet, when you want to examine that the expected packet really reached a node. For example, when there is no incoming authentication or log indicated in the report, you may suspect that there is no incoming traffic or that the incoming traffic cannot reach Cisco ISE. In such cases, you can run this tool to validate.

You can configure the TCP Dump options and then collect data from the network traffic to help you troubleshooting a network issue.

Caution

Starting a TCP Dump automatically deletes a previous dump file. To save a previous dump file, perform the task, as described in the Saving a TCP Dump File section before you begin a new TCP Dump session.

Related Topics

Save a TCP Dump File, on page 640

Use TCP Dump to Monitor Network Traffic

Before you begin

• The Network Interface drop-down list in the TCP Dump page displays only the network interface cards (NICs) that have an IPv4 or IPv6 address configured. By default, all NICs are connected on a VMware, and therefore, NICs are configured with an IPv6 address and displayed in the Network Interface drop-down list.

Procedure

Step 1 Choose Operations > Troubleshoot > Diagnostic Tools > General Tools > TCP Dump.

Step 2 Choose a Host Name as the source for the TCP Dump utility. Inline Posture nodes are not supported.

Step 3 Choose a Network Interface to monitor from the drop-down list.

Step 4 Set Promiscuous Mode by clicking the radio button to On or Off. The default is On.

Promiscuous mode is the default packet sniffing mode in which the network interface passes all traffic to the system’s CPU. We recommend that you leave it set to On.

Step 5 In the Filter text box, enter a boolean expression on which to filter.

Supported standard tcpdump filter expressions:

- ip host 10.77.122.123
- ip host 10.77.122.123 and not 10.77.122.119
- ip host ISE123

Step 6 Click Start to begin monitoring the network.
Save a TCP Dump File

**Before you begin**

You should have successfully completed the task, as described in the Using TCP Dump to Monitor network Traffic section.

---

**Note**
You can also access TCPdump through the Cisco ISE CLI. For more information, refer to the *Cisco Identity Services Engine CLI Reference Guide*.

---

**Procedure**

**Step 1** Choose **Operations > Troubleshoot > Diagnostic Tools > General Tools > TCP Dump**.
**Step 2** Choose a Format from the drop-down list. Human Readable is the default.
**Step 3** Click **Download**, navigate to the desired location, and then click **Save**.
**Step 4** To get rid of the previous dump file without saving it first, click **Delete**.

---

Compare Unexpected SGACL for an Endpoint or User

**Procedure**

**Step 1** Choose **Operations > Troubleshoot > Diagnostic Tools > Trustsec Tools > Egress (SGACL) Policy**.
**Step 2** Enter the Network Device IP address of the Trustsec device whose SGACL policy you want to compare.
**Step 3** Click **Run**.
**Step 4** Click **User Input Required** and modify the fields as necessary.
**Step 5** Click **Submit**.
**Step 6** Click **Show Results Summary** to view the diagnosis and suggested resolution steps.
Egress Policy Diagnostic Flow

The egress policy diagnostic tool uses the process described in the following table for its comparison:

<table>
<thead>
<tr>
<th>Process Stage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Connects to the device with the IP address that you provided, and obtains the access control lists (ACLs) for each source and destination SGT pair.</td>
</tr>
<tr>
<td>2</td>
<td>Checks the egress policy that is configured in Cisco ISE and obtains the ACLs for each source and destination SGT pair.</td>
</tr>
<tr>
<td>3</td>
<td>Compares the SGACL policy that is obtained from the network device with the SGACL policy that is obtained from Cisco ISE.</td>
</tr>
<tr>
<td>4</td>
<td>Displays the source and destination SGT pair if there is a mismatch. Also, displays the matching entries as additional information.</td>
</tr>
</tbody>
</table>

Troubleshoot Connectivity Issues in a Trustsec-Enabled Network with SXP-IP Mappings

Procedure

Step 1 Choose Operations > Troubleshoot > Diagnostic Tools > Trustsec Tools > SXP-IP Mappings.
Step 2 Enter the network device IP address of the network device, and click Select.
Step 3 Click Run, and then click User Input Required and modify the necessary fields.

The Expert Troubleshooter retrieves Trustsec SXP connections from the network device and again prompts you to select the peer SXP devices.

Step 4 Click User Input Required, and enter the necessary information.
Step 5 Check the check box of the peer SXP devices for which you want to compare SXP mappings, and enter the common connection parameters.
Step 6 Click Submit.
Step 7 Click Show Results Summary to view the diagnosis and resolution steps.
Troubleshoot Connectivity Issues in a Trustsec-Enabled Network with IP-SGT Mappings

Procedure

Step 1  Choose Operations > Troubleshoot > Diagnostic Tools > Trustsec Tools > IP User SGT.
Step 2  Enter the information in the fields as needed.
Step 3  Click Run.
Step 4  Click User Input Required, modify the fields as necessary, and then click Submit.
Step 5  Click Show Results Summary to view the diagnosis and resolution steps.

Device SGT Tool

For devices that are enabled with the Trustsec solution, each network device is assigned an SGT value through RADIUS authentication. The Device SGT diagnostic tool connects to the network device (with the IP address that you provide) and obtains the network device SGT value. It then checks the RADIUS authentication records to determine the SGT value that was assigned most recently. Finally, it displays the Device-SGT pairs in a tabular format, and identifies whether the SGT values are the same or different.

Troubleshoot Connectivity Issues in a Trustsec-Enabled Network by Comparing Device SGT Mappings

Procedure

Step 1  Choose Operations > Troubleshoot > Diagnostic Tools > Trustsec Tools > Device SGT.
Step 2  Enter the information in the fields as needed.
The default port number for Telnet is 23 and SSH is 22.
Step 3  Click Run.
Step 4  Click Show Results Summary to view the results of the device SGT comparison.

Obtaining Additional Troubleshooting Information

Cisco allows you to download support and troubleshooting information from the Admin portal. You can use the support bundle to prepare diagnostic information for the Cisco Technical Assistance Center (TAC) to troubleshoot problems with Cisco.
The support bundles and debug logs provide advanced troubleshooting information for TAC and are difficult to interpret. You can use the various reports and troubleshooting tools that Cisco provides to diagnose and troubleshoot issues that you are facing in your network.

---

---

## Cisco Support Bundle

You can configure the logs that you want to be part of your support bundle. For example, you can configure logs from a particular service to be part of your debug logs. You can also filter the logs based on dates.

The logs that you can download are categorized as follows:

- **Full configuration database**—The Cisco configuration database is downloaded in a human-readable XML format. When you are trying to troubleshoot issues, you can import this database configuration in another Cisco ISE node to recreate the scenario.

- **Debug logs**—Captures bootstrap, application configuration, run-time, deployment, public key infrastructure (PKI) information and monitoring and reporting.

  Debug logs provide troubleshooting information for specific Cisco ISE components. To enable debug logs, see Chapter 11, “Logging”. If you do not enable the debug logs, all the informational messages (INFO) will be included in the support bundle. For more information, see [Cisco Debug Logs](#), on page 645.

- **Local logs**—Contains syslog messages from the various processes that run on Cisco ISE.

- **Core files**—Contains critical information that would help identify the cause of a crash. These logs are created when the application crashes and includes heap dumps.

- **Monitoring and reporting logs**—Contains information about alerts and reports.

- **System logs**—Contains Cisco Application Deployment Engine (ADE)-related information.

- **Policy configuration**—Contains policies configured in Cisco ISE in human readable format.

You can download these logs from the Cisco ISE CLI by using the `backup-logs` command. For more information, refer to the [Cisco Identity Services Engine CLI Reference Guide](#).

---

For Inline Posture nodes, you cannot download the support bundle from the Admin portal. You must use the `backup-logs` command from the Cisco ISE CLI to download logs for Inline Posture nodes.

---

If you choose to download these logs from the Admin portal, you can do the following:

- Download only a subset of logs based on the log type such as debug logs or system logs.

- Download only the latest “n” number of files for the selected log type. This option allows you to control the size of the support bundle and the time taken for download.
Support Bundle

You can download the support bundle to your local computer as a simple tar.gpg file. The support bundle will be named with the date and time stamps in the format
ise-support-bundle_ise-support-bundle-mm-dd-yyyy--hh-mm.tar.gpg. The browser prompts you to save the support bundle to an appropriate location. You can extract the content of the support bundle and the view the README.TXT file, which describes the contents of the support bundle, as well as how to import the contents of the ISE database if it is included in the support bundle.

Download Cisco Log Files

You can download the Cisco log files to look for more information while troubleshooting issues in your network.

Before you begin

• You must have Super Admin or System Admin privileges to perform the following task.
• Configure debug logs and the debug log levels.

Procedure

Step 1 Choose Operations > Troubleshoot > Download Logs > Appliance node list.
Step 2 Click the node from which you want to download the support bundles.
Step 3 In the Support Bundle tab, choose the parameters that you want to be populated in your support bundle.
If you include all the logs, your support bundle will be excessively large and the download will take a long time. To optimize the download process, choose to download only the most recent n number of files.
Step 4 Enter the From and To dates for which you want to generate the support bundle.
Step 5 Enter and re-enter the encryption key for the support bundle.
Step 6 Click Create Support Bundle.
Step 7 Click Download to download the newly-created support bundle.
The support bundle is a tar.gpg file that is downloaded to the client system that is running your application browser.

What to do next

Download debug Logs for specific components.

Related Topics

Download Debug Logs, on page 647
Cisco Debug Logs

Debug logs provide troubleshooting information for various Cisco components. Debug logs contain critical and warning alarms generated in the last 30 days and info alarms generated in the last 7 days. While reporting problems, you might be asked to enable these debug logs and send them for diagnosis and resolution of your problems.

Obtain Debug Logs

Procedure

Step 1 Configure the components for which you want to obtain the debug logs on the Debug Log Configuration page.

Step 2 Download the debug logs.

Download Debug Logs

Before you begin
To perform the following task, you must be a Super Admin or System Admin.

Procedure

Step 1  Choose Operations > Troubleshoot > Download Logs > Appliance node list.
Step 2  From the Appliance node list, click the node from which you want to download the debug logs.
Step 3  Click the Debug Logs tab.
Step 4  Click the log file that you want to download and save it to the system that is running your client browser.

You can repeat this process to download other log files as needed. The following are additional debug logs that you can download from the Debug Logs page:

- isebootstrap.log—Provides bootstrapping log messages
- monit.log—Provides watchdog messages
- pki.log—Provides the third-party crypto library logs
- iseLocalStore.log—Provides logs about the local store files
- ad_agent.log—Provides Microsoft Active Directory third-party library logs
- catalina.log—Provides third-party logs

Monitoring Database

The rate and amount of data that is utilized by Monitoring functions requires a separate database on a dedicated node that is used for these purposes.

Like Policy Service, Monitoring has a dedicated database that requires you to perform maintenance tasks, such as the topics covered in this section:

Related Topics

Log Collection, on page 630
Back Up and Restore of the Monitoring Database, on page 647
Monitoring Database Purge, on page 648

Back Up and Restore of the Monitoring Database

Monitoring database handles large volumes of data. Over time, the performance and efficiency of the monitoring node depends on how well you manage that data. To increase efficiency, we recommend that you back up the
data and transfer it to a remote repository on a regular basis. You can automate this task by scheduling automatic backups.

---

**Note**

You should not perform a backup when a purge operation is in progress. If you start a backup during a purge operation, the purge operation stops or fails.

If you register a secondary Monitoring node, we recommend that you first back up the primary Monitoring node and then restore the data to the new secondary Monitoring node. This ensures that the history of the primary Monitoring node is in sync with the new secondary node as new changes are replicated.

---

**Monitoring Database Purge**

The purging process allows you to manage the size of the Monitoring database by specifying the number of months to retain data during a purge. The default is three months. This value is utilized when the disk space usage threshold for purging (percentage of disk space) is met. For this option, each month consists of 30 days. A default of three months equals 90 days.

**Related Topics**

- Guidelines for Purging the Monitoring Database, on page 648
- Purge Older Monitoring Data, on page 648

---

**Guidelines for Purging the Monitoring Database**

The following are some guidelines to follow relating to Monitoring database disk usage:

- If the Monitoring database disk usage is greater than 80 percent of the threshold setting, critical alarm is generated indicating that the database size has exceeded the allocated disk size. If the disk usage is greater than 90 percent another alarm is generated.

A purge process runs, creating a status history report that you can view by choosing **Operations > Reports > Deployment Status > Data Purging Audit**. An information (INFO) alarm is generated when the purge completes.

- Purging is also based on the percentage of consumed disk space for the database. When the consumed disk space for the Monitoring database is equal to or exceeds the threshold (the default is 80 percent), the purge process starts. This process deletes only the last seven days of monitoring data, irrespective of what is configured in the Admin portal. It will continue this process in a loop until the disk space is below 80 percent. Purging always checks the Monitoring database disk space limit before proceeding.

---

**Purge Older Monitoring Data**

**Before you begin**

To perform the following task, you must be a Super Admin or System Admin.
Procedure

**Step 1** Choose **Administration > System > Maintenance > Data Purging**.

**Step 2** Specify the time period in months, for which the data will be retained. All the data prior to the specified time period will be purged. For this option, each month consists of 30 days. The default of three months equals 90 days.

**Note** If the configured retention period is less than the existing retention thresholds corresponding to the diagnostics data, then the configured value overrides the existing threshold values. For example, if you configure the retention period as 3 days and this value is less than the existing thresholds in the diagnostics tables (for example, a default of 5 days), then data is purged according to the value that you configure (3 days) in this page.

**Step 3** Click **Submit**.

**Step 4** Verify the success of the data purge by viewing the Data Purging Audit report.

---

**What to do next**

- Cisco ISE Log Collection
- Perform an On-demand Backup

**Related Topics**

- Log Collection, on page 630

---

**Database Crash/File Corruption Issues**

Cisco ISE may crash if the oracle database files are corrupted due to power outage or other reasons resulting in data loss. Based on the incident, follow the steps below to recover from data loss.

- In case of PAN corruption in deployment, you should **promote the Secondary PAN to Primary PAN**.
- If SPAN is promotion is not possible due to small deployment or any other reason, **restore** the most recent available backup.
- In case of PSN corruption, follow the steps to **de-register**, **reset config** and **register** the node again.
- In case of Standalone box, **restore** most recent available backup.

**Note** Obtain backup from the standalone box regularly to avoid loss in the latest configuration changes.
Reports

Cisco ISE Reports

Cisco Identity Services Engine (ISE) reports are used with monitoring and troubleshooting features to analyze trends, and monitor system performance and network activities from a central location.

Cisco ISE collects log and configuration data from across the network. It then aggregates the data into reports for you to view and analyze. Cisco ISE provides a standard set of predefined reports that you can use and customize to fit your needs.

Cisco ISE reports are preconfigured and grouped into logical categories with information related to authentication, session traffic, device administration, configuration and administration, and troubleshooting.

Related Topics
  Run and View Reports, on page 651
  Export Reports, on page 652
  Schedule and Save Cisco ISE Reports, on page 653
  Add Favorite Reports, on page 654
  Available Reports, on page 656

Run and View Reports

This section describes how to run, view, and navigate reports using Reports View. You can specify time increments over which to display data in a report.
Procedure

Step 1  Choose Operations > Reports > ISE Reports.
Step 2  Click a report from the report categories available.
Step 3  Select one or more filters to run a report. Each report has different filters available, of which some are mandatory and some are optional.
Step 4  Enter an appropriate value for the filters.
Step 5  Run the report.

Related Topics

- Export Reports, on page 652
- Schedule and Save Cisco ISE Reports, on page 653
- Add Favorite Reports, on page 654
- Available Reports, on page 656

Reports Navigation

You can get detailed information from the reports output. For example, if you have generated a report for a period of five months, the graph and table will list the aggregate data for the report in a scale of months.

You can click a particular value from the table to see another report related to this particular field. For example, an authentication summary report will display the failed count for the user or user group. When you click the failed count, an authentication summary report is opened for that particular failed count.

Export Reports

You can export report data to an Excel spreadsheet as a comma-separated values (.csv) file. After you export the data, you will receive an email detailing the location of the report.

You cannot export the following reports:

- Authentication Summary
- Health Summary
- RBACL Drop Summary

Note

Flows for RBACL dropped packets are available only with the Cisco Catalyst 6500 series switches.

- Guest Sponsor summary
- End point Profile Changes
- Network Device Session Status
Schedule and Save Cisco ISE Reports

You can customize a report and save the changes as a new report, or restore the default report settings. You can also customize and schedule Cisco ISE reports to run and re-run at specific time or time intervals. You can also send and receive email notifications once the reports are generated.

If a scheduled report is created by an external administrator (Eg: Active Directory Administrator) without filling in the email-id field, then there will be no email notification sent.

You cannot schedule the following reports:

- Authentication Summary
- Health Summary
- RBACL Drop Summary

Flows for RBACL dropped packets are available only with the Cisco Catalyst 6500 series switches.

- Guest Sponsor summary
- End point Profile Changes
Network Device Session Status

You can save or schedule (customize) Cisco ISE reports only from the Primary PAN.

Procedure

Step 1  Run a report as described in the Running and Viewing Reports section.
Step 2  Click Save As in the top right-hand corner of the report summary page.
Step 3  Choose Report or Scheduled Report.
Step 4  Enter the required details in the dialog box.
Step 5  Click Save as New.

After saving a report, when you go back to the saved report all the filter options are checked by default. You need to uncheck the filters that you do not wish to use.

Add Favorite Reports

You can add preconfigured system reports to your favorites list, as well as reports that you have customized. You can add reports that you use frequently to a list of favorites to make them easier to find, similar to how you bookmark favorite websites in a browser. You can view and edit the parameters of your favorite reports, and then save the customized reports for reuse.

Every administrator account is assigned one or more administrative roles. Depending on the roles that are assigned to your account, you may not be able to perform the tasks that are described in this section.

Procedure

Step 1  Run a report, as described in Running and Viewing Reports section.
Step 2  Click Favorite in the top right-hand corner of the report summary page.

The report appears in your Favorites list.

You can add preconfigured system reports to your favorites list only from the PAN.
Cisco ISE Active RADIUS Sessions

Cisco ISE provides a dynamic Change of Authorization (CoA) feature for the Live Sessions that allows you to dynamically control active RADIUS sessions. You can send reauthenticate or disconnect requests to a Network Access Device (NAD) to perform the following tasks:

- Troubleshoot issues related to authentication—You can use the Session reauthentication option to follow up with an attempt to reauthenticate again. However, you must not use this option to restrict access. To restrict access, use the shutdown option.

- Block a problematic host—You can use the Session termination with port shutdown option to block an infected host that sends a lot of traffic over the network. However, the RADIUS protocol does not currently support a method for re-enabling a port that has been shut down.

- Force endpoints to reacquire IP addresses—You can use the Session termination with port bounce option for endpoints that do not have a supplicant or client to generate a DHCP request after a VLAN change.

- Push an updated authorization policy to an endpoint—You can use the Session reauthentication option to enforce an updated policy configuration, such as a change in the authorization policy on existing sessions based on the discretion of the administrator. For example, if posture validation is enabled, when an endpoint gains access initially, it is usually quarantined. After the identity and posture of the endpoint are known, it is possible to send the Session reauthentication command to the endpoint for the endpoint to acquire the actual authorization policy based on its posture.

For CoA commands to be understood by the device, it is important that you configure the options appropriately. For CoA to work properly, you must configure the shared secret of each device that requires a dynamic change of authorization. Cisco ISE uses the shared secret configuration to request access from the device and issue CoA commands to it.

Note
In this release of Cisco ISE, the maximum number of active authenticated endpoint sessions that can be displayed is limited to 100,000.

Related Topics
Change Authorization for RADIUS Sessions, on page 655

Change Authorization for RADIUS Sessions

Some Network Access Devices on your network may not send an Accounting Stop or Accounting Off packet after a reload. As a result, you might find two sessions in the Session Directory reports, one which has expired.

To dynamically change the authorization of an active RADIUS session or disconnect an active RADIUS session, be sure to choose the most recent session.

Procedure

Step 1 Choose Operations > Authentications.
Step 2 Switch the view to Show Live Session.
Step 3 Click the CoA link for the RADIUS session that you want to issue CoA and choose one of the following options:

**Note** For Inline Posture nodes and where wireless LAN controllers (WLC) are in use, only two options are available: Session reauthentication and Session termination.

- **SAnet Session Query**—Use this to query information about sessions from SAnet supported devices.
- **Session reauthentication**—Reauthenticate session. If you select this option for a session established on an ASA device supporting COA, this will invoke a Session Policy Push CoA.
- **Session reauthentication with last**—Use the last successful authentication method for this session.
- **Session reauthentication with rerun**—Run through the configured authentication method from the beginning.

**Note** **Session reauthentication with last** and **Session reauthentication with rerun** options are not currently supported in Cisco IOS software.

- **Session termination**—Just end the session. The switch reauthenticates the client in a different session.
- **Session termination with port bounce**—Terminate the session and restart the port.
- **Session termination with port shutdown**—Terminate the session and shutdown the port.

Step 4 Click **Run** to issue CoA with the selected reauthenticate or terminate option.

If your CoA fails, it could be one of the following reasons:

- Device does not support CoA.
- Changes have occurred to the identity or authorization policy.
- There is a shared secret mismatch.

**Related Topics**

[Schedule and Save Cisco ISE Reports](#), on page 653

**Available Reports**

The following table lists the preconfigured reports, grouped according to their category. Descriptions of the report functionality and logging category are also provided.

<table>
<thead>

<td>Administrator Logins</td>
<td>The Administrator Logins report provides information about all GUI-based administrator login events as well as successful CLI login events.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select Administrative and Operational audit.</td>
</tr>
<tr>
<td>Internal Administrator Summary</td>
<td>The Internal Administrator Summary report enables you to verify the entitlement of administrator users. From this report, you can also access the Administrator Logins and Change Configuration Audit reports, which enables you to view these details for each administrator.</td>
<td></td>
</tr>
<tr>
<td>Change Configuration Audit</td>
<td>The Change Configuration Audit report provides details about configuration changes within a specified time period. If you need to troubleshoot a feature, this report can help you determine if a recent configuration change contributed to the problem.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select Administrative and Operational audit.</td>
</tr>
<tr>
<td>Report Name</td>
<td>Description</td>
<td>Logging Category</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Secure Communications Audit</td>
<td>The Secure Communications Audit report provides auditing details about security-related events in Cisco ISE Admin CLI, which includes authentication failures, possible break-in attempts, SSH logins, failed passwords, SSH logouts, invalid user accounts, and so on.</td>
<td></td>
</tr>
<tr>
<td>Operations Audit</td>
<td>The Operations Audit report provides details about any operational changes, such as: running backups, registering a Cisco ISE node, or restarting an application.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select Administrative and Operational audit.</td>
</tr>
<tr>
<td>System Diagnostics</td>
<td>The System Diagnostic report provides details about the status of the Cisco ISE nodes. If a Cisco ISE node is unable to register, you can review this report to troubleshoot the issue. This report requires that you first enable several diagnostic logging categories. Collecting these logs can negatively impact Cisco ISE performance. So, these categories are not enabled by default, and you should enable them just long enough to collect the data. Otherwise, they are automatically disabled after 30 minutes.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select these logging categories: Internal Operations Diagnostics, Distributed Management, Administrator Authentication and Authorization.</td>
</tr>
<tr>
<td>Health Summary</td>
<td>The Health Summary report provides details similar to the Dashboard. However, the Dashboard only displays data for the past 24 hours, and you can review more historical data using this report. You can evaluate this data to see consistent patterns in data. For example, you would expect heavier CPU usage when most employees start their work days. If you see inconsistencies in these trends, you can identify potential problems.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select these logging categories: System Statistics, System Diagnostics and Administrative and Operational Audit.</td>
</tr>
<tr>
<td>Report Name</td>
<td>Description</td>
<td>Logging Category</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>Network Device Session Status</td>
<td>The Network Device Session Status Summary report enables you to display the switch configuration without logging into the switch directly. Cisco ISE accesses these details using an SNMP query and requires that your network devices are configured with SNMP v1/v2c. If a user is experiencing network issues, this report can help you identify if the issue is related to the switch configuration rather than with Cisco ISE.</td>
<td></td>
</tr>
<tr>
<td>Data Purging Audit</td>
<td>The Data Purging Audit report records when the logging data is purged. This report reflects two sources of data purging. At 4AM daily, Cisco ISE checks whether there are any logging files that meet the criteria you have set on the Administration &gt; Maintenance &gt; Data Purging page. If so, the files are deleted and recorded in this report. Additionally, Cisco ISE continually maintains a maximum of 80% used storage space for the log files. Every hour, Cisco ISE verifies this percentage and deletes the oldest data until it reaches the 80% threshold again. This information is also recorded in this report.</td>
<td></td>
</tr>
<tr>
<td>Report Name</td>
<td>Description</td>
<td>Logging Category</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>pxGrid Administrator Audit</td>
<td>The pxGrid Administrator Audit report provides the details of the pxGrid administration actions such as client registration, client deregistration, client approval, topic creation, topic deletion, publisher-subscriber addition, and publisher-subscriber deletion on the Primary PAN. Every record has the administrator name who has performed the action on the node. You can filter the pxGrid Administrator Audit report based on the administrator and message criteria.</td>
<td>—</td>
</tr>
<tr>
<td>Misconfigured Supplicants</td>
<td>The Misconfigured Supplicants report provides a list of mis-configured supplicants along with the statistics due to failed attempts that are performed by a specific supplicant. If you have taken corrective actions and fix the mis-configured supplicant, the report displays fixed acknowledgment in the report. <strong>Note</strong> RADIUS Suppression should be enabled to run this report.</td>
<td>—</td>
</tr>
<tr>
<td>Misconfigured NAS</td>
<td>The Misconfigured NAS report provides information about NADs with inaccurate accounting frequency typically when sending accounting information frequently. If you have taken corrective actions and fix the mis-configured NADs, the report displays fixed acknowledgment in the report. <strong>Note</strong> RADIUS Suppression should be enabled to run this report.</td>
<td>—</td>
</tr>
<tr>
<td>Endpoints and Users</td>
<td></td>

</tr>
<tr>
<td>Report Name</td>
<td>Description</td>
<td>Logging Category</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client Provisioning</td>
<td>The Client Provisioning report indicates the client provisioning agents applied to particular endpoints. You can use this report to verify the policies applied to each endpoint to verify whether the endpoints have been correctly provisioned.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select Posture and Client Provisioning Audit and Posture and Client Provisioning Diagnostics.</td>
</tr>
<tr>
<td>Current Active Sessions</td>
<td>The Current Active Sessions report enables you to export a report with details about who was currently on the network within a specified time period. If a user isn't getting network access, you can see whether the session is authenticated or terminated or if there is another problem with the session.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select these logging categories: Accounting and Radius Accounting.</td>
</tr>
<tr>
<td>Endpoint Protection Service Audit</td>
<td>The Endpoint Protection Service Audit report is based on the RADIUS accounting. It displays historical reporting of all network sessions for each endpoint.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select Passed Authentications and RADIUS Accounting.</td>
</tr>
<tr>
<td>External Mobile Device Management</td>
<td>The External Mobile Device Management report provides details about integration between Cisco ISE and the external Mobile Device Management (MDM) server. You can use this report to see which endpoints have been provisioned by the MDM server without logging into the MDM server directly. It also displays information such as registration and MDM-compliance status.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select MDM.</td>
</tr>
<tr>
<td>Posture Detail Assessment</td>
<td>The Posture Detail Assessment report provides details about posture compliance for a particular endpoint. If an endpoint previously had network access and then suddenly was unable to access the network, you can use this report to determine if a posture violation occurred.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select Posture and Client Provisioning Audit and Posture and Client Provisioning Diagnostics.</td>
</tr>
<tr>
<td>Report Name</td>
<td>Description</td>
<td>Logging Category</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>

<tr>
<td>Profiled Endpoint Summary</td>
<td>The Profiled Endpoint Summary report provides profiling details about endpoints that are accessing the network.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select Profiler.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> For endpoints that do not register a session time, such as a Cisco IP-Phone, the term Not Applicable is shown in the Endpoint session time field.</td>
<td></td>
</tr>
<tr>
<td>Endpoint Profile Changes</td>
<td>The Endpoint Profile Change report serves two purposes:</td>
<td>—</td>
</tr>
<tr>
<td></td>
<td>• Compares the profile changes for a particular endpoint to verify that the latest and most current profile has been applied.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Displays profile changes initiated by the profiler feed service (which is available with a Cisco ISE Plus license).</td>
<td></td>
</tr>
<tr>
<td>Top Authorizations by Endpoint</td>
<td>The Top Authorization by Endpoint (MAC address) report displays how many times each endpoint MAC address was authorized by Cisco ISE to access the network.</td>
<td>Passed Authentications, Failed Attempts</td>
</tr>
<tr>
<td>Top Authorizations by User</td>
<td>The Top Authorization by User report displays how many times each user was authorized by Cisco ISE to access the network.</td>
<td>Passed Authentications, Failed Attempts</td>
</tr>
<tr>
<td>User Change Password Audit</td>
<td>The User Change Password Audit report displays verification about employee's password changes.</td>
<td>Administrative and Operational audit</td>
</tr>
<tr>
<td>Supplicant Provisioning</td>
<td>The Supplicant Provisioning report provides details about the supplicants provisioned to employee's personal devices.</td>
<td>Posture and Client Provisioning Audit</td>
</tr>
<tr>
<td>Registered Endpoints</td>
<td>The Registered Endpoints report displays all personal devices registered by employees.</td>
<td>—</td>
</tr>
<tr>
<td>Report Name</td>
<td>Description</td>
<td>Logging Category</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Endpoints Purge Activities</td>
<td>The Endpoints Purge Activities report enables the user to review the history of endpoints purge activities. This report requires that the Profiler logging category is enabled. It is enabled by default.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select Profiler.</td>
</tr>
<tr>
<td>Guest Access Reports</td>
<td></td>
<td></td>
</tr>
<tr>
<td>AUP Acceptance Status</td>
<td>The AUP Acceptance Status report provides details of AUP acceptances from all the Guest portals.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select Guest.</td>
</tr>
<tr>
<td>Sponsor Login and Audit</td>
<td>The Sponsor Login and Audit report provides details of guest users' login, add, delete, enable, suspend and update operations and the login activities of the sponsors at the sponsors portal. If guest users are added in bulk, they are visible under the column 'Guest Users.' This column is hidden by default. On export, these bulk users are also present in the exported file.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select Guest.</td>
</tr>
<tr>
<td>My Devices Login and Audit</td>
<td>The My Devices Login and Audit report provides details about the login activities and the operations performed by the users on the devices in My Devices Portal.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select My Devices.</td>
</tr>
<tr>
<td>Report Name</td>
<td>Description</td>
<td>Logging Category</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Master Guest Report</td>
<td>The Master Guest Report combines data from various Guest Access reports and enables you to export data from different reporting sources. The Master Guest report also provides details about the websites that guest users are visiting. You can use this report for security auditing purposes to demonstrate when guest users accessed the network and what they did on it. You must also enable HTTP inspection on the network access device (NAD) used for guest traffic. This information is sent back to Cisco ISE by the NAD. To check when the clients reach the maximum simultaneous sessions limit, from the Admin portal, choose Administration &gt; System &gt; Logging &gt; Logging Categories and do the following: 1. Increase the log level of &quot;Authentication Flow Diagnostics&quot; logging category from WARN to INFO. 2. Change LogCollector Target from Available to Selected under the &quot;Logging Category&quot; of AAA Diagnostics.</td>
<td>Choose Administration &gt; System &gt; Logging &gt; Logging Categories and select Passed Authentications.</td>
</tr>
<tr>
<td>Guest Accounting</td>
<td>The Guest Accounting report is a subset of the RADIUS Accounting report. All users assigned to the Activated Guest or Guest identity groups appear in this report.</td>
<td>—</td>
</tr>
<tr>
<td>TrustSec</td>
<td></td>
<td>—</td>

Deployment and Node Settings

Deployment Settings

The Deployment Nodes page enables you to configure Cisco ISE (Administration, Policy Service, and Monitoring) nodes and Inline Posture nodes and to set up a deployment.

Deployment Nodes List Page

The following table describes the fields on the Deployment Nodes List page, which you can use to configure Cisco ISE and Inline Posture nodes in a deployment. The navigation path for this page is: **Administration > System > Deployment.**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Displays the hostname of the node.</td>
</tr>
<tr>
<td>Node Type</td>
<td>Displays the node type. It can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Cisco ISE (Administration, Policy Service, and Monitoring) nodes</td>
</tr>
<tr>
<td></td>
<td>• Inline Posture node</td>
</tr>
<tr>
<td>Personas</td>
<td>(Only appears if the node type is Cisco ISE) Lists the personas that an Cisco ISE node has assumed. For example, Administration, Policy Service.</td>
</tr>
<tr>
<td><strong>Fields</strong></td>
<td><strong>Usage Guidelines</strong></td>
</tr>
<tr>
<td>------------</td>
<td>----------------------</td>
</tr>
</tbody>
</table>
| Role       | Indicates the role (primary, secondary, or standalone) that the Administration and Monitoring personas have assumed, if these personas are enabled on this node. The role can be any one or more of the following:  
  - PRI(A)—Refers to the Primary PAN  
  - SEC(A)—Refers to the Secondary PAN  
  - PRI(M)—Refers to the Primary Monitoring Node  
  - SEC(M)—Refers to the Secondary Monitoring Node |
| Services   | (Only appears if the Policy Service persona is enabled) Lists the services that run on this Cisco ISE node. Services can include any one of the following:  
  - Session  
  - Profiling  
  - All |
| Node Status| Indicates the status of each ISE node in a deployment for data replication.  
  - Green (Connected)—Indicates that an ISE node, which is already registered in the deployment is in sync with the Primary PAN.  
  - Red (Disconnected)—Indicates that an ISE node is not reachable or is down or data replication is not happening.  
  - Orange (In Progress)—Indicates that an ISE node is newly registered with the Primary PAN or you have performed a manual sync operation or the ISE node is not in sync (out of sync) with the Primary PAN.  
  For more details, click the quick view icon for each ISE node in the Node Status column. |

General Node Settings

The following table describes the fields on the General Node Settings page, which you can use to set up your deployment and configure services to be run on each of the nodes. The navigation path for this tab is: **Administration > System > Deployment > ISE Node > Edit > General Settings.**

**Table 55: General Node Settings**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Displays the hostname of the Cisco ISE node.</td>
</tr>
<tr>
<td>FQDN</td>
<td>Displays the fully qualified domain name of the Cisco ISE node. For example, ise1.cisco.com.</td>
</tr>
<tr>
<td>IP Address</td>
<td>Displays the IP address of the Cisco ISE node.</td>
</tr>
<tr>
<td>Node Type</td>
<td>Displays the node type. Could be any one of the following: Identity Services Engine (ISE), Inline Posture Node</td>
</tr>
<tr>
<td>Personas</td>
<td></td>
</tr>
<tr>
<td>Administration</td>
<td>Check this check box if you want a Cisco ISE node to assume the Administration persona. You can enable the Administration persona only on nodes that are licensed to provide the administrative services.</td>
</tr>
<tr>
<td>Role</td>
<td>Displays the role that the Administration persona has assumed in the deployment. Could take on any one of the following values: Standalone, Primary, Secondary</td>
</tr>
<tr>
<td>Make Primary</td>
<td>Click this button to make this node your primary Cisco ISE node. You can have only one primary Cisco ISE node in a deployment. The other options on this page will become active only after you make this node primary. You can have only two Administration nodes in a deployment. If the node has a Standalone role, a Make Primary button appears next to it. If the node has a Secondary role, a Promote to Primary button appears next to it. If the node has a Primary role and there are no other nodes registered with it, a Make Standalone button appears next to it. You can click this button to make your primary node a standalone node.</td>
</tr>
<tr>
<td>Fields</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>--------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| Monitoring | Check this check box if you want a Cisco ISE node to assume the Monitoring persona and function as your log collector. There must be at least one Monitoring node in a distributed deployment. At the time of configuring your Primary PAN, you must enable the Monitoring persona. After you register a secondary Monitoring node in your deployment, you can edit the Primary PAN and disable the Monitoring persona, if required. To configure a Cisco ISE node on a VMware platform as your log collector, use the following guidelines to determine the minimum amount of disk space that you need: 180 KB per endpoint in your network, per day 2.5 MB per Cisco ISE node in your network, per day. You can calculate the maximum disk space that you need based on how many months of data you want to have in your Monitoring node. If there is only one Monitoring node in your deployment, it assumes the standalone role. If you have two Monitoring nodes in your deployment, Cisco ISE displays the name of the other monitoring node for you to configure the Primary-Secondary roles. To configure these roles, choose one of the following:  
  - Primary—For the current node to be the primary Monitoring node.  
  - Secondary—For the current node to be the secondary Monitoring node.  
  - None—If you do not want the Monitoring nodes to assume the primary-secondary roles. If you configure one of your Monitoring nodes as primary or secondary, the other Monitoring node automatically becomes the secondary or primary node, respectively. Both the primary and secondary Monitoring nodes receive Administration and Policy Service logs. If you change the role for one Monitoring node to None, the role of the other Monitoring node also becomes None, thereby cancelling the high availability pair. After you designate a node as a Monitoring node, you will find this node listed as a syslog target in the following page: Administration > System > Logging > Remote Logging Targets |
<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy Service</td>
<td>Check this check box to enable any one or all of the following services:</td>
</tr>
<tr>
<td></td>
<td>• Enable Session Services—Check this check box to enable network access, posture, guest, and client provisioning services. Choose the group to which this Policy Service node belongs from the Include Node in Node Group drop-down list. Choose &lt;none&gt; if you do not want this Policy Service node to be part of any group. All the nodes within the same node group should be configured on the network access device (NAD) as RADIUS clients and authorized for CoA, because any one of them can issue a CoA request for the sessions that are established through any node in the node group. If you are not using a load balancer, the nodes in a node group should be the same as, or a subset of the RADIUS servers and clients configured on the NAD. These nodes would also be configured as RADIUS servers. While a single NAD can be configured with many ISE nodes as RADIUS servers and dynamic-authorization clients, it is not necessary for all the nodes to be in the same node group. The members of a node group should be connected to each other using high-speed LAN connection such as Gigabit Ethernet. The node group members need not be L2 adjacent, but L2 adjacency is highly recommended to ensure sufficient bandwidth and reachability. See Create a Policy Service Node Group, on page 47 section for more details.</td>
</tr>
<tr>
<td></td>
<td>• Enable Profiling Service—Check this check box to enable the Profiler service. If you enable the Profiling service, you must click the Profiling Configuration tab and enter the details as required. When you enable or disable any of the services that run on the Policy Service node or make any changes to this node, you will be restarting the application server processes on which these services run. You must expect a delay while these services restart. You can determine when the application server has restarted on a node by using the show application status ise command from the CLI.</td>
</tr>
</tbody>
</table>
Check this checkbox to enable pxGrid persona. Cisco pxGrid is used to share the context-sensitive information from Cisco ISE session directory to other policy network systems such as Cisco Adaptive Security Appliance (ASA). The pxGrid framework can also be used to exchange policy and configuration data between nodes like sharing tags and policy objects between ISE and third party vendors, and for non-ISE related information exchanges such as threat information.

### Profiling Node Settings

The following table describes the fields on the Profiling Configuration page, which you can use to configure the probes for the profiler service. The navigation path for this page is: Administration > System > Deployment > ISE Node > Edit > Profiling Configuration.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetFlow</td>
<td>Check this check box if you want to enable NetFlow per Cisco ISE node that has assumed the Policy Service persona to receive Netflow packets sent from the routers. Choose these options:</td>
</tr>
</tbody>
</table>
|          | • Interface—Choose the interface on the ISE node.  
<p>|          | • Port—Enter the NetFlow listener port number on which NetFlow exports are received from the routers. The default port is 9996. |</p>
<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
</table>
| DHCP           | Check this check box if you want to enable DHCP per Cisco ISE node that has assumed the Policy Service persona to listen for DHCP packets from IP helper. Choose these options: Port—Enter the DHCP server UDP port number. The default port is 67.  
  • Interface—Choose the interface on the ISE node.  
  • Port—Enter the DHCP server UDP port number. The default port is 67. |
| DHCP SPAN      | Check this check box if you want to enable DHCP SPAN per Cisco ISE node that has assumed the Policy Service persona to collect DHCP packets.  
  • Interface—Choose the interface on the ISE node. |
| HTTP           | Check this check box if you want to enable HTTP per Cisco ISE node that has assumed the Policy Service persona to receive and parse HTTP packets.  
  • Interface—Choose the interface on the ISE node. |
| RADIUS         | Check this check box if you want to enable RADIUS per ISE node that has assumed the Policy Service persona to collect RADIUS session attributes as well as CDP, LLDP attributes from the IOS Sensor enabled devices. |
| Network Scan (NMAP) | Check this box to enable the NMAP probe.                                      |
| DNS            | Check this check box if you want to enable DNS per Cisco ISE node that has assumed the Policy Service persona to perform a DNS lookup for the FQDN. Enter the timeout period in seconds.  
  **Note** For the DNS probe to work on a particular Cisco ISE node in a distributed deployment, you must enable any one of the following probes: DHCP, DHCP SPAN, HTTP, RADIUS, or SNMP. For DNS lookup, one of the probes mentioned above must be started along with the DNS probe. |
### Inline Posture Node Settings

The following table describes the fields on the Deployment Nodes List page for an Inline Posture node, which you can use to configure the Inline Posture nodes in your deployment. The navigation path for this page is: **Administration > System > Deployment > Inline Posture Node > Edit.**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNMP Query</td>
<td>Check this check box if you want to enable SNMP Query per ISE node that has assumed the Policy Service persona to poll network devices at specified intervals. Enter values for the following fields: Retries, Timeout, Event Timeout, and an optional Description. In addition to configuring the SNMP Query probe, you must also configure other SNMP settings in the following location: Administration &gt; Network Resources &gt; Network Devices. When you configure SNMP settings on the network devices, ensure that you enable the Cisco Device Protocol (CDP) and Link Layer Discovery Protocol (LLDP) globally on your network devices.</td>
</tr>
</tbody>
</table>
| SNMP Trap          | Check this check box if you want to enable SNMP Trap probe per ISE node that has assumed the Policy Service Persona to receive linkUp, linkDown, and MAC notification traps from the network devices. Choose any of the following:  
  - Link Trap Query—Check this check box to receive and interpret linkup and linkdown notifications received through the SNMP Trap.  
  - MAC Trap Query—Check this check box to receive and interpret MAC notifications received through the SNMP Trap.  
  - Interface—Choose an interface on the ISE node.  
  - Port—Enter the UDP port of the host to use. The default port is 162. |
| Active Directory   | Scans the defined Active Directory servers for information about Windows users.                                                                                                                                                                                                                                                                  |

Table 57: Inline Posture Node Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Basic Information</strong></td>
<td></td>
</tr>
<tr>
<td>Time Sync Server</td>
<td>Enter the IP address of the primary, secondary, and tertiary time sync server.</td>
</tr>
<tr>
<td>DNS Server</td>
<td>Enter the IP address of the primary, secondary, and tertiary DNS server.</td>
</tr>
<tr>
<td>Trusted Interface (to protected network)</td>
<td>Enter the Management VLAN ID (all the other information is automatically populated for these options)</td>
</tr>
<tr>
<td>Untrusted Interface (to management network)</td>
<td>Enter the IP Address, Subnet Mask, Default Gateway, and Management VLAN ID for the untrusted interface.</td>
</tr>
<tr>
<td><strong>Deployment Modes</strong></td>
<td></td>
</tr>
<tr>
<td>Routed Mode</td>
<td>Choose this option for this node to provide router (hop in the wire) functionality for Inline Posture.</td>
</tr>
</tbody>
</table>
| Bridged Mode                        | Choose this option for this node to provide VLAN mapping functionality for the subnets to be managed by Inline Posture. After checking the Bridged Mode check box, enter the Untrusted Network and Trusted Network VLAN ID information. For VLAN mapping, you should also do the following:  
  • Add a mapping for management traffic by entering the appropriate VLAN ID for the trusted and untrusted networks.  
  • Add a mapping for client traffic by entering the appropriate VLAN ID for the trusted and untrusted networks. |
<p>| <strong>Filters</strong>                         |                                                                                  |
| MAC Address                         | Enter the MAC Address of the device on which to avoid policies. For security reasons, we recommend that you always include the IP address along with the MAC address in a MAC filter entry. Do not configure the MAC address in a MAC filter for a directly connected ASA VPN device without also entering the IP address. Without the addition of the optional IP address, VPN clients are allowed to bypass policy enforcement. This bypass happens because the VPN is a Layer 3 hop for clients, and the device uses its own MAC address as the source address to send packets along the network toward the Inline Posture node. |</p>

</tbody>
</table>
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
</table>
| HA Peer Node           | Choose the **HA Peer Node** from the drop-down list. A list of eligible standalone Inline Posture nodes appear from which to choose. The secondary node syncs to the primary node.  
  - Replication Status—(Only appears for secondary nodes) Indicates whether incremental replication from the primary node to the secondary node is complete or not. You will see one of the following states:
    - Failed—Incremental database replication has failed.  
    - In-Progress—Incremental database replication is currently in progress.  
    - Complete—Incremental database replication is complete. Not Applicable—Displayed if the Cisco ISE node is a standalone or primary node.  
    - Not Applicable—Displayed if the Cisco ISE node is a standalone or primary node.  
  - Sync Status—(Only appears for secondary Cisco ISE nodes) Indicates whether replication from the primary node to the secondary node is complete or not. A replication happens when a node is registered as secondary or when you click Syncup to force a replication. You will see one of the following states:
    - Sync Completed—Full database replication is complete.  
    - Sync in Progress—Database replication is currently in progress.  
    - Out of Sync—Database was down when the secondary node was registered with the primary Cisco ISE node.  
    - Not Applicable—Displayed if the Cisco ISE node is a standalone node.  |
| Service IP (Trusted)   | Enter the Trusted Service IP address (eth0) for the traffic interface of the primary node.                                                      |
| Service IP (Untrusted) | Enter the Untrusted Service IP address (eth1) for the traffic interface of the primary node. In the bridged mode, the service IP address is the same for both trusted and untrusted networks. |
### Fields

| Usage Guidelines |  
|------------------|------------------|
| **Link Detect (Trusted)** Enter the IP address (optional, but recommended as a best practice) for the Link-Detect system for the trusted and untrusted sides. This address is usually the IP address of the Policy Service node, because both the active and standby nodes should always be able to reach the Policy Service node. |  
| Link Detect (Untrusted) Enter the IP address for the Link-Detect system for the untrusted side. |  
| Link Detect Timeout Enter a Link-Detect Timeout value. The default value of 30 seconds is recommended. However, there is no maximum value. Link-detect ensures that the Inline Posture node maintains communication with the Policy Service node. If the active node does not receive notification (ping) from the Policy Service node at the specified intervals, the active node fails over to the standby node. |  
| Heart Beat Timeout Enter a Heart Beat Timeout value. The default value of 30 seconds is recommended. However, there is no maximum value. The heartbeat is a message that is sent between the two Inline Posture nodes at specified intervals. The heartbeats happen on eth2 and eth3 interfaces. If the heartbeat stops or does not receive a response in the allotted time, failover occurs. |  
| Syncup Peer Node **Note** You must use the Syncup option to force a full replication if the Sync Status is Out of Sync or the Replication Status is Failed. |  

### Certificate Store Settings

The Certificate Store page enables you to configure certificates in Cisco ISE that can be used for authentication.

### Self-Signed Certificate Settings

The following table describes the fields in the Generate Self Signed Certificate page. This page allows you to create system certificates for inter-node communication, EAP-TLS authentication, Cisco ISE web portals, and to communicate with the pxGrid controller. The navigation path for this page is: Administration > System > Certificates > System Certificates > Generate Self Signed Certificate.

### Certificate-Signing Request Settings

Cisco ISE allows you to generate CSRs for all the nodes in your deployment from the Admin portal in a single request. Also, you can choose to generate the CSR for a single node or multiple both nodes in the deployment. If you choose to generate a CSR for a single node, ISE automatically substitutes the Fully Qualified Domain
Name (FQDN) of the particular node in the CN= field of the certificate subject. If you choose to include an entry in the Subject Alternative Name (SAN) field of the certificate, you must enter the FQDN of the ISE node in addition to other SAN attributes. If you choose to generate CSRs for all the nodes in your deployment, check the Allow Wildcard Certificates check box and enter the wildcard FQDN notation in the SAN field (DNS name), for example, *.amer.example.com. If you plan to use the certificate for EAP Authentication, do not enter the wildcard value in the CN= field.

With the use of wildcard certificates, you no longer have to generate a unique certificate for each Cisco ISE node. Also, you no longer have to populate the SAN field with multiple FQDN values to prevent certificate warnings. Using an asterisk (*) in the SAN field allows you to share a single certificate across multiple both nodes in a deployment and helps prevent certificate name mismatch warnings. However, use of wildcard certificates is considered less secure than assigning a unique server certificate for each Cisco ISE node.

The following table describes the fields in the Certificate Signing Request (CSR) page, which you can use to generate a CSR that can be signed by a Certificate Authority (CA). The navigation path for this page is: Administration > System > Certificates > Certificate Management > Certificate Signing Request.
<table>

</tr>
</tbody>
</table>

**Cisco ISE Identity Certificates**

- **Admin**—Used for server authentication (to secure communication with the Admin portal and between ISE nodes in a deployment). The certificate template on the signing CA is often called a Web Server certificate template. This template has the following properties:
  - Key Usage: Digital Signature (Signing)
  - Extended Key Usage: TLS Web Server Authentication (1.3.6.1.5.5.7.3.1)

- **EAP Authentication**—Used for server authentication. The certificate template on the signing CA is often called a Computer or Machine certificate template. This template has the following properties:
  - Key Usage: Digital Signature (Signing)
  - Extended Key Usage: TLS Web Server Authentication (1.3.6.1.5.5.7.3.1)

**Note** Digital signature key usage is required for EAP-TLS client certificates.

- **Portal**—Used for server authentication (to secure communication with all ISE web portals). The certificate template on the signing CA is often called a Computer or Machine certificate template. This template has the following properties:
  - Key Usage: Digital Signature (Signing)
  - Extended Key Usage: TLS Web Server Authentication (1.3.6.1.5.5.7.3.1)

- **pxGrid**—Used for both client and server authentication (to secure communication between the pxGrid client and server). The certificate template on the signing CA is often called a Computer or Machine certificate template. This template has the following properties:
  - Key Usage: Digital Signature (Signing)
  - Extended Key Usage: TLS Web Server Authentication (1.3.6.1.5.5.7.3.1) and TLS Web Client Authentication (1.3.6.1.5.5.7.3.2)

**Note** We recommend that you do not use a certificate that contains the value of 2.5.29.37.0 for the Any Purpose object identifier in the Extended Key Usage attribute. If you use a certificate that contains the value of 2.5.29.37.0 for the Any Purpose object identifier in the Extended Key Usage attribute, the certificate is considered invalid and the following error message is displayed:

```plaintext
source-local ; type=fatal ; message="unsupported certificate"
```

**Cisco ISE Certificate Authority Certificates**

- **ISE Root CA**—(Applicable only for the internal CA service) Used for regenerating the entire internal CA certificate chain including the root CA on
<table>

<td>(Do not abbreviate) State name. For example, California.</td>
</tr>
<tr>
<td>Country (C)</td>
<td>Country name. You must enter the two-letter ISO country code. For example, US.</td>
</tr>
</tbody>
</table>
### Usage Guidelines

**Field: Subject Alternative Name (SAN)**

Available options for SAN include:

- **DNS Name**—If you choose the DNS name, enter the fully qualified domain name of the ISE node. If you have enabled the Allow Wildcard Certificates option, specify the wildcard notation (an asterisk and a period before the domain name). For example, `*.amer.example.com`.

- **IP Address**—IP address of the ISE node to be associated with the certificate.

An IP address or DNS name that is associated with the certificate.

**Key Length**

Choose 2048 or greater if you plan to get a public CA-signed certificate.

**Digest to Sign With**

Choose one of the following hashing algorithm: SHA-1 or SHA-256.

### OCSP Client Profile Settings

The following table describes the fields on the OCSP Client Profile page, which you can use to configure OCSP client profiles. The navigation path for this page is **Administration > Certificates > Certificate Management > OCSP Profile**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the OCSP Client Profile.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description.</td>
</tr>
<tr>
<td>Enable Secondary Server</td>
<td>Check this check box to enable a secondary OCSP server for high availability.</td>
</tr>
<tr>
<td>Field</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Always Access Primary Server First</td>
<td>Use this option to check the primary server before trying to move to the secondary server. Even if the primary was checked earlier and found to be unresponsive, Cisco ISE will try to send a request to the primary server before moving to the secondary server.</td>
</tr>
<tr>
<td>Fallback to Primary Server After Interval $n$ Minutes</td>
<td>Use this option when you want Cisco ISE to move to the secondary server and then fall back to the primary server again. In this case, all other requests are skipped, and the secondary server is used for the amount of time that is configured in the text box. The allowed time range is 1 to 999 minutes.</td>
</tr>
<tr>
<td>URL</td>
<td>Enter the URL of the primary and/or secondary OCSP server.</td>
</tr>
<tr>
<td>Enable Nonce Extension Support</td>
<td>You can configure a nonce to be sent as part of the OCSP request. The Nonce includes a pseudo-random number in the OCSP request. It is verified that the number that is received in the response is the same as the number that is included in the request. This option ensures that old communications cannot be reused in replay attacks.</td>
</tr>
</tbody>
</table>
| Validate Response Signature               | The OCSP responder signs the response with one of the following certificates:  
  • The CA certificate  
  • A certificate different from the CA certificate  
  
  In order for Cisco ISE to validate the response signature, the OCSP responder needs to send the response along with the certificate, otherwise the response verification fails, and the status of the certificate cannot be relied on. According to the RFC, OCSP can sign the response using different certificates. This is true as long as OCSP sends the certificate that signed the response for Cisco ISE to validate it. If OCSP signs the response with a different certificate that is not configured in Cisco ISE, the response verification will fail. |
### Usage Guidelines

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
</table>
| Cache Entry Time To Live \( n \) Minutes   | Enter the time in minutes after which the cache entry expires. Each response from the OCSP server holds a nextUpdate value. This value shows when the status of the certificate will be updated next on the server. When the OCSP response is cached, the two values (one from the configuration and another from response) are compared, and the response is cached for the period of time that is the lowest value of these two. If the nextUpdate value is 0, the response is not cached at all. Cisco ISE will cache OCSP responses for the configured time. The cache is not replicated or persistent, so when Cisco ISE restarts, the cache is cleared. The OCSP cache is used in order to maintain the OCSP responses and for the following reasons:  
  - To reduce network traffic and load from the OCSP servers on an already-known certificate  
  - To increase the performance of Cisco ISE by caching already-known certificate statuses |
| Clear Cache                                 | Click **Clear Cache** to clear entries of all the certificate authorities that are connected to the OCSP service. In a deployment, **Clear Cache** interacts with all the nodes and performs the operation. This mechanism updates every node in the deployment. |

### Internal CA Settings

The following table describes the fields in the internal CA settings page. You can view the internal CA settings and disable the internal CA service from this page. The navigation path for this page is: Administration > System > Certificates > Internal CA Settings.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable Certificate Authority</td>
<td>Click this button to disable the internal CA service.</td>
</tr>
<tr>
<td>Host Name</td>
<td>Host name of the Cisco ISE node that is running the CA service.</td>
</tr>
<tr>
<td>Personas</td>
<td>Cisco ISE node personas that are enabled on the node running the CA service. For example, Administration, Policy Service, etc.</td>
</tr>
</tbody>
</table>
Certificate Template Settings

The following table describes the fields in the CA Certificate Template page, which you can use to define a SCEP RA profile that will be used by the client provisioning policy. The navigation path for this page is: Administration > System > Certificates > Certificate Templates > Add.

We do not support UTF-8 characters in the certificate template fields (Organizational Unit, Organization, City, State, and Country). Certificate provisioning fails if UTF-8 characters are used in the certificate template.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Required) Enter a name for the certificate template. For example, Internal_CA_Template.</td>
</tr>
<tr>
<td>Description</td>
<td>(Optional) Enter a description.</td>
</tr>
<tr>
<td>Common Name (CN)</td>
<td>(Display only) Common name is autopopulated with the username.</td>
</tr>
<tr>
<td>Organizational Unit (OU)</td>
<td>Organizational Unit name. For example, Engineering.</td>
</tr>
<tr>
<td>Organization (O)</td>
<td>Organization name. For example, Cisco.</td>
</tr>
<tr>
<td>City (L)</td>
<td>(Do not abbreviate) City name. For example, San Jose.</td>
</tr>
<tr>
<td>State (ST)</td>
<td>(Do not abbreviate) State name. For example, California.</td>
</tr>
<tr>
<td>Country (C)</td>
<td>Country name. You must enter the two-letter ISO country code. For example, US.</td>
</tr>
<tr>
<td>Subject Alternative Name (SAN)</td>
<td>(Display only) MAC address of the endpoint.</td>
</tr>
<tr>
<td>Key Size</td>
<td>Specify a key size of 1024 or higher.</td>
</tr>
<tr>
<td>SCEP RA Profile</td>
<td>Choose the ISE Internal CA or an external SCEP RA profile that you have created.</td>
</tr>
</tbody>
</table>
**Fields** | **Usage Guidelines**
--- | ---
Valid Period | Enter the number of days after which the certificate expires.

**Logging Settings**

These pages allow you to configure the severity of debug logs, create an external log target, and enable Cisco ISE to send log messages to these external log targets.

**Remote Logging Target Settings**

The following table describes the fields on the Remote Logging Targets page, which you can use to create external locations (syslog servers) to store logging messages. The navigation path for this page is: Administration > System > Logging > Remote Logging Targets.

*Table 61: Remote Logging Target Settings*

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the new target.</td>
</tr>
<tr>
<td>Target Type</td>
<td>Select the target type. By default it is set to UDP Syslog.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a brief description of the new target.</td>
</tr>
<tr>
<td>IP Address</td>
<td>Enter the IP address or hostname of the destination machine where you want to store the logs.</td>
</tr>
<tr>
<td>Port</td>
<td>Enter the port number of the destination machine.</td>
</tr>
<tr>
<td>Facility Code</td>
<td>Choose the syslog facility code to be used for logging. Valid options are Local0 through Local7.</td>
</tr>
<tr>
<td>Maximum Length</td>
<td>Enter the maximum length of the remote log target messages. Valid options are from 200 to 1024 bytes.</td>
</tr>
</tbody>
</table>
Fields | Usage Guidelines
--- | ---
Buffer Message When Server Down | Check this check-box if you want Cisco ISE to buffer the syslog messages when TCP syslog targets and secure syslog targets are unavailable. ISE retries sending the messages to the target when the connection resumes. After the connection resumes, messages are sent by the order from oldest to newest and buffered messages are always sent before new messages. If the buffer is full, old messages are discarded.
Buffer Size (MB) | Set the buffer size for each target. By default, it is set to 100 MB. Changing the buffer size clears the buffer and all existing buffered messages for the specific target are lost.
Reconnect Timeout (Sec) | Give in seconds how long will the TCP and secure syslogs be kept before being discarded, when the server is down.
Select CA Certificate | Select a client certificate.
Ignore Server Certificate Validation | Check this check-box if you want ISE to ignore server certificate authentication and accept any syslog server.

### Maintenance Settings

These pages help you to manage data using the backup, restore, and data purge features.

### Repository Settings

The following table describes the fields on the Repository List page, which you can use to create repositories to store your backup files. The navigation path for this page is: Administration > System > Maintenance > Repository.
### Repository Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repository</td>
<td>Enter the name of the repository. Alphanumeric characters are allowed and the maximum length is 80 characters.</td>
</tr>
<tr>
<td>Protocol</td>
<td>Choose one of the available protocols that you want to use.</td>
</tr>
<tr>
<td>Server Name</td>
<td>(Required for TFTP, HTTP, HTTPS, FTP, SFTP, and NFS) Enter the hostname or IPv4 address of the server where you want to create the repository.</td>
</tr>
<tr>
<td>Path</td>
<td>Enter the path to your repository. The path must be valid and must exist at the time you create the repository. This value can start with two forward slashes (/) or a single forward slash (/) denoting the root directory of the server. However, for the FTP protocol, a single forward slash (/) denotes the FTP user's home directory and not the root directory.</td>
</tr>
<tr>
<td>User Name</td>
<td>(Required for FTP, SFTP, and NFS) Enter the username that has write permission to the specified server. Only alphanumeric characters are allowed.</td>
</tr>
<tr>
<td>Password</td>
<td>(Required for FTP, SFTP, and NFS) Enter the password that will be used to access the specified server. Passwords can consist of the following characters: 0 through 9, a through Z, a through z, -, _, @, #, $, %, ^, &amp;, *, ( ), +, and =.</td>
</tr>
</tbody>
</table>

---

### Repository Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repository</td>
<td>Enter the name of the repository. Alphanumeric characters are allowed and the maximum length is 80 characters.</td>
</tr>
<tr>
<td>Protocol</td>
<td>Choose one of the available protocols that you want to use.</td>
</tr>
<tr>
<td>Host</td>
<td>(Required for TFTP, HTTP, HTTPS, FTP, SFTP, and NFS) Enter the hostname or IPv4 address of the server where you want to create the repository.</td>
</tr>
</tbody>
</table>
### Usage Guidelines

**Fields**

**Path**

Enter the path to your repository. The path must be valid and must exist at the time you create the repository.

This value can start with two forward slashes (//) or a single forward slash (/) denoting the root directory of the server. However, for the FTP protocol, a single forward slash (/) denotes the FTP user’s home directory and not the root directory.

Admin Access Settings

These pages enable you to configure access settings for administrators.
Administrator Password Policy Settings

The following table describes the fields on the Administrator Password Policy page, which you can use to define a criteria that administrator passwords should meet. The navigation path for this page is: **Administration > System > Admin Access > Authentication > Password Policy.**

### Table 67: Administrator Password Policy Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum Length</td>
<td>Specifies the minimum length of the password (in characters). The default is six characters.</td>
</tr>
<tr>
<td>Password should not contain the admin name or its characters in reversed order</td>
<td>Check this check box to restrict the use of the administrator username or its characters in reverse order.</td>
</tr>
<tr>
<td>Password should not contain “cisco” or its characters in reversed order</td>
<td>Check this check box to restrict the use of the word “cisco” or its characters in reverse order.</td>
</tr>
<tr>
<td>Password should not contain _______ or its characters in reversed order</td>
<td>Check this check box to restrict the use of any word that you define or its characters in reverse order.</td>
</tr>
<tr>
<td>Password should not contain repeated characters four or more times consecutively</td>
<td>Check this check box to restrict the use of repeated characters four or more times consecutively.</td>
</tr>
<tr>
<td>Required Characters</td>
<td>Specifies that the administrator password must contain at least one character of the type that you choose from the following choices:</td>
</tr>
<tr>
<td></td>
<td>• Lowercase alphabetic characters</td>
</tr>
<tr>
<td></td>
<td>• Uppercase alphabetic characters</td>
</tr>
<tr>
<td></td>
<td>• Numeric characters</td>
</tr>
<tr>
<td></td>
<td>• Non-alphanumeric characters</td>
</tr>
<tr>
<td>Password History</td>
<td>Specifies the number of previous passwords from which the new password must be different to prevent the repeated use of the same password.</td>
</tr>
<tr>
<td></td>
<td>Also, specifies the number of characters that must be different from the previous password.</td>
</tr>
<tr>
<td></td>
<td>Enter the number of days before which you cannot reuse a password.</td>
</tr>
</tbody>
</table>
**Session Timeout and Session Information Settings**

The following table describes the fields on the Session page, which you can use to define session timeout and terminate an active administrative session. The navigation path for this page is: **Administration > System > Admin Access > Settings > Session**.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Session Timeout</td>
<td>Enter the time in minutes that you want Cisco ISE to wait before it logs out the administrator if there is no activity. The default value is 60 minutes. The valid range is from 6 to 100 minutes.</td>
</tr>
<tr>
<td>Session Idle Timeout</td>
<td></td>
</tr>
<tr>
<td>Session Info</td>
<td></td>
</tr>
<tr>
<td>Invalidate</td>
<td>Check the check box next to the session ID that you want to terminate and click <strong>Invalidate</strong>.</td>
</tr>
</tbody>
</table>

**Related Topics**

These pages enable you to configure general settings for the various services.

### Posture General Settings

The following table describes the fields on the Posture General Settings page, which you can use to configure general posture settings such as remediation time and posture status. The navigation path for this page is: Administration > System > Settings > Posture > General Settings.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remediation Timer</td>
<td>Enter a time value in minutes. The default value is 4 minutes. The valid range is 1 to 300 minutes.</td>
</tr>
<tr>
<td>Network Transition Delay</td>
<td>Enter a time value in seconds. The default value is 3 seconds. The valid range is 2 to 30 seconds.</td>
</tr>
<tr>
<td>Default Posture Status</td>
<td>Choose Compliant or Noncompliant. The non-agent devices like Linux assumes this status while connecting to the network.</td>
</tr>
</tbody>
</table>

**Automatically Close Login Success Screen After**

Check the check box to close the login success screen automatically after the specified time.

Enter a time value in seconds, in the field next to the check box.

You can configure the timer to close the login screen automatically between 0 to 300 seconds. If the time is set to zero, then the NAC Agents and Web Agents do not display the login success screen.

**Posture Lease**

Perform posture assessment every time a user connectsto the network

Select this option to initiate posture assessment every time the user connects to network

Perform posture assessment every \( n \) days

Select this option to initiate posture assessment after the specified number of days although the client is already postured Compliant.

**Related Topics**

- Posture Service, on page 553

Posture Reassessment Configuration Settings

The following table describes the fields in the Posture Reassessment Configurations Page, which you can use to configure posture reassessment. The navigation path for this page is: Administration > System > Settings > Posture > Reassessments.

Table 70: Posture Reassessment Configuration Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Name</td>
<td>Enter the name of PRA configuration.</td>
</tr>
<tr>
<td>Configuration Description</td>
<td>Enter a description for PRA configuration.</td>
</tr>
<tr>
<td>Use Reassessment Enforcement?</td>
<td>Check the check box to apply the PRA configurations for the user identity groups.</td>
</tr>
<tr>
<td>Enforcement Type</td>
<td>Choose the action to be enforced:</td>
</tr>
<tr>
<td></td>
<td>• Continue — The user continues to have the privileged access without any user intervention to remediate the client irrespective of the posture requirement.</td>
</tr>
<tr>
<td></td>
<td>• Logoff — If the client is not compliant, the user is forced to logoff from the network. When the client logs in again, the compliance status is unknown.</td>
</tr>
<tr>
<td></td>
<td>• Remediate — If the client is not compliant, the agent waits for a specified time for the remediation to happen. Once the client has remediated, the agent sends the PRA report to the policy service node. If the remediation is ignored on the client, then the agent sends a logoff request to the policy service node to force the client to logoff from the network.</td>
</tr>
<tr>
<td></td>
<td>If the posture requirement is set to mandatory, then the RADIUS session will be cleared as a result of the PRA failure action and a new RADIUS session has to start for the client to be postured again.</td>
</tr>
<tr>
<td></td>
<td>If the posture requirement is set to optional, then the NAC Agent allows the user to click the continue option from the agent. The user can continue to stay in the current network without any restriction.</td>
</tr>
<tr>
<td>Interval</td>
<td>Enter a time interval in minutes to initiate PRA on the clients after the first successful login.</td>
</tr>
<tr>
<td></td>
<td>The default value is 240 minutes. Minimum value is 60 minutes and maximum is 1440 minutes.</td>
</tr>
</tbody>
</table>
### Posture Acceptable Use Policy Configuration Settings

The following table describes the fields in the Posture Acceptable Use Policy Configurations Page, which you can use to configure an acceptable use policy for posture. The navigation path for this page is: Administration > System > Settings > Posture > Acceptable Use Policy.

**Table 71: Posture AUP Configurations Settings**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Name</td>
<td>Enter the name of the AUP configuration that you want to create.</td>
</tr>
<tr>
<td>Configuration Description</td>
<td>Enter the description of the AUP configuration that you want to create.</td>
</tr>
<tr>
<td>Fields</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>--------</td>
<td>------------------</td>
</tr>
<tr>
<td>Show AUP to Agent users (for NAC Agent and Web Agent on Windows only)</td>
<td>If checked, the Show AUP to Agent users check box displays users (for NAC Agents, and Web Agents on Windows only) the link to network usage terms and conditions for your network and click it to view the AUP upon successful authentication and posture assessment.</td>
</tr>
<tr>
<td>Use URL for AUP message radio button</td>
<td>When selected, you must enter the URL to the AUP message in the AUP URL, which clients must access upon successful authentication and posture assessment.</td>
</tr>
<tr>
<td>Use file for AUP message radio button</td>
<td>When selected, you must browse to the location and upload a file in a zipped format in the AUP File, which contains the index.html at the top level. The .zip file can include other files and subdirectories in addition to the index.html file. These files can reference each other using HTML tags.</td>
</tr>
<tr>
<td>AUP URL</td>
<td>Enter the URL to the AUP, which clients must access upon successful authentication and posture assessment.</td>
</tr>
<tr>
<td>AUP File</td>
<td>In the AUP File, browse to the file and upload it to the Cisco ISE server. It should be a zipped file and the zipped file should contain the index.html file at the top level.</td>
</tr>
</tbody>
</table>
### EAP-FAST Settings

The following table describes the fields on the Protocol Settings page, which you can use to configure the EAP-FAST, EAP-TLS, and PEAP protocols. The navigation path for this page is: Administration > System > Settings > Protocols > EAP-FAST > EAP FAST Settings.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select User Identity Groups</td>
<td>In the Select User Identity Groups drop-down list, choose a unique user identity group, or a unique combination of user identity groups, for your AUP configuration. Note the following while creating an AUP configuration:</td>
</tr>
<tr>
<td></td>
<td>• Posture AUP is not applicable for a guest flow</td>
</tr>
<tr>
<td></td>
<td>• Each configuration must have a unique user identity group, or a unique combination of user identity groups</td>
</tr>
<tr>
<td></td>
<td>• No two configurations have any user identity group in common</td>
</tr>
<tr>
<td></td>
<td>• If you want to create a AUP configuration with a user identity group “Any”, then delete all other AUP configurations first</td>
</tr>
<tr>
<td></td>
<td>• If you create a AUP configuration with a user identity group “Any”, then you cannot create other AUP configurations with a unique user identity group, or user identity groups. To create an AUP configuration with a user identity group other than Any, either delete an existing AUP configuration with a user identity group “Any” first, or update an existing AUP configuration with a user identity group “Any” with a unique user identity group, or user identity groups.</td>
</tr>
<tr>
<td>Acceptable use policy configurations—Configurations list</td>
<td>Lists existing AUP configurations and end user identity groups associated with AUP configurations.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
### EAP-TLS Settings

The following table describes the fields on the EAP-TLS Settings page, which you can use to configure the EAP-TLS protocol settings. The navigation path for this page is: Administration > System > Settings > Protocols > EAP-TLS.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity</td>
<td>(For the Tunnel and Machine PAC identity field) Specifies the username or machine name that is presented as the “inner username” by the EAP-FAST protocol. If the identity string does not match that username, authentication fails. This is the hostname as defined on the Adaptive Security Appliance (ASA). The identity string must match the ASA hostname otherwise, ASA cannot import the PAC file that is generated. If you are generating a Trustsec PAC, the Identity field specifies the Device ID of a Trustsec network device and is provided with an initiator ID by the EAP-FAST protocol. If the Identity string entered here does not match that Device ID, authentication fails.</td>
</tr>
<tr>
<td>PAC Time to Live</td>
<td>(For the Tunnel and Machine PAC) Enter a value in seconds that specifies the expiration time for the PAC. The default is 604800 seconds, which is equivalent to one week. This value must be a positive integer between 1 and 157680000 seconds. For the Trustsec PAC, enter a value in days, weeks, months, or years. By default, the value is one year. The minimum value is one day and the maximum is 10 years.</td>
</tr>
<tr>
<td>Encryption Key</td>
<td>Enter an encryption key. The length of the key must be between 8 and 256 characters. The key can contain uppercase or lowercase letters, or numbers, or a combination of alphanumeric characters.</td>
</tr>
<tr>
<td>Expiration Data</td>
<td>(For Trustsec PAC only) The expiration date is calculated based on the PAC Time to Live.</td>
</tr>
</tbody>
</table>

- Protocol Settings for Authentication, on page 417
- Configure PEAP Settings, on page 419
- Advantages of Using PEAP, on page 878
- Supported Supplicants for the PEAP Protocol, on page 878
The following table describes the fields on the RADIUS Settings page. The navigation path for this page is: Administration > System > Settings > Protocols > RADIUS.

When you enable anomalous client suppression and an endpoint authentication fails twice within the configured detection interval, Cisco ISE marks the supplicant as misconfigured and suppresses additional failed authentications with the same failure reason. You can find more details about the suppression by clicking the Misconfigured Supplicant Counter link on the Live Authentications page. A successful authentication from a suppressed endpoint clears the suppression, and results in a decrease in the Misconfigured Supplicant Counter value on the Live Authentications page. Also, if there is no authentication activity from the suppressed endpoint for a period of six hours, the suppression is cleared automatically.

Cisco ISE allows you to enable strong suppression by enabling the Reject Requests After Detection option. If you check the Reject Requests After Detection check box, and an endpoint authentication fails five times with the same failure reason, Cisco ISE activates strong suppression. All subsequent authentications, whether successful or not, are suppressed, and authentication does not occur. This “strong” suppression is cleared after the configured Request Rejection Interval elapses or after six hours of authentication inactivity from the endpoint.

Table 76: RADIUS Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Suppress Anomalous Clients</td>
<td>Check this check box to detect the clients for which the authentications fail repeatedly. A summary of the failures will be reported every Reporting Interval.</td>
</tr>
<tr>
<td>Detection Interval</td>
<td>Enter the time interval in minutes for the clients to be detected.</td>
</tr>
<tr>
<td>Reporting Interval</td>
<td>Enter the time interval in minutes for the failed authentications to be reported.</td>
</tr>
<tr>
<td>Reject Requests After Detection</td>
<td>Check this check box to reject the requests from a client that is identified as anomalous or misconfigured. The requests from anomalous clients will be rejected during the Request Rejection Interval.</td>
</tr>
<tr>
<td>Request Rejection Interval</td>
<td>Enter the time interval in minutes for which the requests are to be rejected. This option is available only when you have checked Reject Requests After Detection check box.</td>
</tr>
<tr>
<td>Suppress Repeated Successful Authentications</td>
<td>Check this check box to prevent repeated reporting of successful authentication requests in last 24 hours that have no change in identity context, network device, and authorization.</td>
</tr>
<tr>
<td>Accounting Suppression Interval</td>
<td>Enter the time interval in seconds for which the reporting of accounting requests to be suppressed.</td>
</tr>
</tbody>
</table>
**Usable Guidelines**

Fields | Usage Guidelines
---|---
Long Processing Step Threshold Interval | Enter the time interval in milliseconds. The steps are displayed in authentication details reports. If execution of a single step exceeds the specified threshold, then it will be highlighted in the authentication details report.

**TrustSec Settings**

You must define the global TrustSec settings for Cisco ISE to function as a TrustSec server and provide TrustSec services. The following table describes the fields in the TrustSec Settings window *(Administration > System > Settings > TrustSec Settings)*.

**Table 77: Configuring TrustSec Settings**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
</table>
| Tunnel PAC Time to Live | Specify the expiry time for the PAC. The tunnel PAC generates a tunnel for the EAP-FAST protocol. You can specify the time in seconds, minutes, hours, days, or weeks. The default value is 90 days. The following are the valid ranges:
  - 1 - 157680000 seconds
  - 1 - 2628000 minutes
  - 1 - 43800 hours
  - 1 - 1825 days
  - 1 - 260 weeks |
| Proactive PAC Update Will Occur After | Cisco ISE proactively provides a new PAC to a client after successful authentication when a configured percentage of the Tunnel PAC TTL remains. The server initiates the tunnel PAC update if the first successful authentication occurs before the PAC expires. This mechanism allows the client to be updated with a valid PAC. The default value is 10%. |

**SMS Gateway Settings**

The navigation path for these settings is **Guest Access > Settings > SMS Gateway**.

Use these settings to configure sending SMS messages to guests and sponsors via an email server.

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS Gateway Provider Domain</td>
<td>Enter the provider domain, which is used as the host portion and the guest account's mobile number as the user portion of the email address to send the message to the provider's SMS/MMS gateway.</td>
</tr>
<tr>
<td>Provider account address</td>
<td>(Optional)</td>
</tr>
<tr>
<td></td>
<td>Enter the account address, which is used as the FROM address (typically the account address) for the email and overrides the <strong>Default Email Address</strong> global setting in <strong>Guest Access &gt; Settings</strong>.</td>
</tr>
<tr>
<td>SMTP API destination address</td>
<td>(Optional)</td>
</tr>
<tr>
<td></td>
<td>Enter the SMTP API Destination Address, if you are using an SMTP SMS API that requires a specific account recipient address, such as Clickatell SMTP API. This is used as the TO address for the email and the guest account's mobile number is substituted into the message's body template.</td>
</tr>
<tr>
<td>SMTP API body template</td>
<td>(Optional)</td>
</tr>
<tr>
<td></td>
<td>Enter the SMTP API Body Template, if you are using an SMTP SMS API that requires a specific email body template for sending the SMS, such as Clicketell SMTP API. The supported dynamic substitutions are $mobilenumber$, , and $message$</td>
</tr>
</tbody>
</table>
Use these settings to configure sending SMS messages to guests and sponsors via an HTTP API (GET or POST method).

### Table 79: SMS Gateway Settings for SMS HTTP API

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL for the API. This field is not URL encoded. The guest account's mobile number is substituted into the URL. The supported dynamic substitutions are $mobilenumber$ and $message$. If you are using HTTPS with the HTTP API, include HTTPS in the URL string and upload your provider's trusted certificates into Cisco ISE. Choose Administration &gt; System &gt; Certificates &gt; Trusted Certificates.</td>
</tr>
<tr>
<td>Data (Url encoded portion)</td>
<td>Enter the Data (Url encoded portion) for the GET or POST request. This field is URL encoded. If using the default GET method, the data is appended to the URL specified above.</td>
</tr>
<tr>
<td>Use HTTP POST method for data portion</td>
<td>If using the POST method, check this option. The data specified above is used as the content of the POST request.</td>
</tr>
<tr>
<td>HTTP POST data content type</td>
<td>If using the POST method, specify the content type such as &quot;plain/text&quot; or &quot;application/xml&quot;.</td>
</tr>
<tr>
<td>HTTPS Username</td>
<td>Enter this information.</td>
</tr>
<tr>

## Identity Management

These pages enable you to configure and manage identities in Cisco ISE.

## Endpoints

These pages enable you to configure and manage endpoints that connect to your network.
Endpoint Settings

The following table describes the fields on the Endpoints page, which you can use to create endpoints and assign policies for endpoints. The navigation path for this page is: Administration > Identity Management > Identities > Endpoints.

Table 80: Endpoint Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>Enter the MAC address in hexadecimal format to create an endpoint statically. The MAC address is the device identifier for the interface that is connected to the Cisco ISE enabled network.</td>
</tr>
<tr>
<td>Static Assignment</td>
<td>Check this check box when you want to create an endpoint statically in the Endpoints page and the status of static assignment is set to static. You can toggle the status of static assignment of an endpoint from static to dynamic or from dynamic to static.</td>
</tr>
</tbody>
</table>
| Policy Assignment | (Disabled by default unless the Static Assignment is checked) Choose a matching endpoint policy from the Policy Assignment drop-down list. You can do one of the following:  
  • If you do not choose a matching endpoint policy, but use the default endpoint policy Unknown, then the static assignment status is set to dynamic for the endpoint that allows dynamic profiling of an endpoint.  
  • If you choose a matching endpoint policy other than Unknown, then the static assignment status is set to static for that endpoint and the Static Assignment check box is automatically checked. |
### Fields

| Static Group Assignment | (Disabled by default unless the Static group Assignment is checked) Check this check box when you want to assign an endpoint to an identity group statically.

In you check this check box, the profiling service does not change the endpoint identity group the next time during evaluation of the endpoint policy for these endpoints, which were previously assigned dynamically to other endpoint identity groups.

If you uncheck this check box, then the endpoint identity group is dynamic as assigned by the ISE profiler based on policy configuration. If you do not choose the Static Group Assignment option, then the endpoint is automatically assigned to the matching identity group the next time during evaluation of the endpoint policy.

| Identity Group Assignment | Choose an endpoint identity group to which you want to assign the endpoint.

You can assign an endpoint to an identity group when you create an endpoint statically, or when you do not want to use the Create Matching Identity Group option during evaluation of the endpoint policy for an endpoint.

Cisco ISE includes the following system created endpoint identity groups:

- Blacklist
- GuestEndpoints
- Profiled
  - Cisco IP-Phone
  - Workstation
- RegisteredDevices
- Unknown

</thead>
<tbody>
<tr>
<td>Connection Settings</td>
<td></td>
</tr>
<tr>
<td>Host</td>
<td>Enter the hostname, or the IP address of the LDAP server.</td>
</tr>
<tr>
<td>Port</td>
<td>Enter the port number of the LDAP server. You can use the default port 389 to import from an LDAP server, and the default port 636 to import from an LDAP server over SSL.</td>
</tr>
<tr>
<td>Note</td>
<td>Cisco ISE supports any configured port number. The configured value should match the LDAP server connection details.</td>
</tr>
<tr>
<td>Enable Secure Connection</td>
<td>Check the Enable Secure Connection check box to import from an LDAP server over SSL.</td>
</tr>
<tr>
<td>Root CA Certificate Name</td>
<td>Click the drop-down arrow to view the trusted CA certificates.</td>
</tr>
<tr>
<td></td>
<td>The Root CA Certificate Name refers to the trusted CA certificate that is required to connect to an LDAP server. You can add (import), edit, delete, and export trusted CA certificates in Cisco ISE.</td>
</tr>
<tr>
<td>Anonymous Bind</td>
<td>Check the Anonymous Bind check box to enable the anonymous bind.</td>
</tr>
<tr>
<td></td>
<td>You must enable either the Anonymous Bind check box, or enter the LDAP administrator credentials from the slapd.conf configuration file.</td>
</tr>
<tr>
<td>Admin DN</td>
<td>Enter the distinguished name (DN) configured for the LDAP administrator in the slapd.conf configuration file.</td>
</tr>
<tr>
<td></td>
<td>Admin DN format example: cn=Admin, dc=cisco.com, dc=com</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password configured for the LDAP administrator in the slapd.conf configuration file.</td>
</tr>
<tr>
<td>Base DN</td>
<td>Enter the distinguished name of the parent entry.</td>
</tr>
<tr>
<td></td>
<td>Base DN format example: dc=cisco.com, dc=com</td>
</tr>
</tbody>
</table>
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query Settings</td>
<td>Enter the query filter, which is used for importing the MAC address. For example, ieee802Device.</td>
</tr>
<tr>
<td>MAC Address objectClass</td>
<td>Enter the returned attribute name for import. For example, macAddress.</td>
</tr>
<tr>
<td>MAC Address Attribute Name</td>
<td>Enter the name of the LDAP attribute. This attribute holds the policy name for each endpoint entry that is defined in the LDAP server.</td>
</tr>
<tr>
<td>Profile Attribute Name</td>
<td>Enter the name of the LDAP attribute. This attribute holds the policy name for each endpoint entry that is defined in the LDAP server.</td>
</tr>
<tr>
<td>Time Out [seconds]</td>
<td>Enter the time in seconds between 1 and 60 seconds.</td>
</tr>
</tbody>
</table>

### Groups

These pages enable you to configure and manage endpoint identity groups.

### Endpoint Identity Group Settings

The following table describes the fields on the Endpoint Identity Groups page, which you can use to create an endpoint group. The navigation path for this page is: Administration > Identity Management > Groups > Endpoint Identity Groups.
Table 82: Endpoint Identity Group Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the endpoint identity group that you want to create.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for the endpoint identity group that you want to create.</td>
</tr>
</tbody>
</table>
| Parent Group   | Choose an endpoint identity group from the Parent Group drop-down list to which you want to associate the newly created endpoint identity group. Cisco ISE includes the following five endpoint identity groups:  
  • Blacklist  
  • GuestEndpoints  
  • Profiled  
  • RegisteredDevices  
  • Unknown  
In addition, it creates two more identity groups, Cisco-IP-Phone and Workstation, which are associated to the Profiled (parent) identity group. |

External Identity Sources

These pages enable you to configure and manage external identity sources that contain user data that Cisco ISE uses for authentication and authorization.

LDAP Identity Source Settings

The following table describes the fields on the LDAP Identity Sources page, which you can use to create an LDAP instance and connect to it. The navigation path for this page is: Administration > Identity Management > External Identity Sources > LDAP.

LDAP General Settings

The following table describes the fields in the General tab.
### Table 83: LDAP General Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the LDAP instance. This value is used in searches to obtain the subject DN and attributes. The value is of type string and the maximum length is 64 characters.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for the LDAP instance. This value is of type string, and has a maximum length of 1024 characters.</td>
</tr>
<tr>
<td>Schema</td>
<td>You can choose any one of the following built-in schema types or create a custom schema:</td>
</tr>
<tr>
<td></td>
<td>• Active Directory</td>
</tr>
<tr>
<td></td>
<td>• Sun Directory Server</td>
</tr>
<tr>
<td></td>
<td>• Novell eDirectory</td>
</tr>
<tr>
<td></td>
<td>You can click the arrow next to Schema to view the schema details.</td>
</tr>
<tr>
<td></td>
<td>If you edit the attributes of the predefined schema, Cisco ISE automatically creates a Custom schema.</td>
</tr>
<tr>
<td>Note</td>
<td>The following fields can be edited only when you choose the Custom schema.</td>
</tr>
<tr>
<td>Subject Objectclass</td>
<td>Enter a value to be used in searches to obtain the subject DN and attributes. The value is of type string and the maximum length is 256 characters.</td>
</tr>
<tr>
<td>Subject Name Attribute</td>
<td>Enter the name of the attribute containing the username in the request. The value is of type string and the maximum length is 256 characters.</td>
</tr>
<tr>
<td>Certificate Attribute</td>
<td>Enter the attribute that contains the certificate definitions. For certificate-based authentication, these definitions are used to validate certificates that are presented by clients.</td>
</tr>
<tr>
<td>Group Objectclass</td>
<td>Enter a value to be used in searches to specify the objects that are recognized as groups. The value is of type string and the maximum length is 256 characters.</td>
</tr>
<tr>
<td>Group Map Attribute</td>
<td>Specifies the attribute that contains the mapping information. This attribute can be a user or group attribute based on the reference direction that is chosen.</td>
</tr>
</tbody>
</table>

### LDAP Identity Source Settings

<td>Fields</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Access</td>
<td>Anonymous Access—Click to ensure that searches on the LDAP directory occur anonymously. The server does not distinguish who the client is and will allow the client read access to any data that is configured as accessible to any unauthenticated client. In the absence of a specific policy permitting authentication information to be sent to a server, a client should use an anonymous connection. Authenticated Access—Click to ensure that searches on the LDAP directory occur with administrative credentials. If so, enter information for the Admin DN and Password fields.</td>
</tr>
<tr>
<td>Admin DN</td>
<td>Enter the DN of the administrator. The Admin DN is the LDAP account that has permission to search all required users under the User Directory Subtree and to search groups. If the administrator specified does not have permission to see the group name attribute in searches, group mapping fails for users who are authenticated by that LDAP server.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the LDAP administrator account password.</td>
</tr>
<tr>
<td>Secure Authentication</td>
<td>Click to use SSL to encrypt communication between Cisco ISE and the primary LDAP server. Verify that the Port field contains the port number used for SSL on the LDAP server. If you enable this option, you must choose a root CA.</td>
</tr>
<tr>
<td>LDAP Server Root CA</td>
<td>Choose a trusted root certificate authority from the drop-down list to enable secure authentication with a certificate.</td>
</tr>
<tr>
<td>Server Timeout</td>
<td>Enter the number of seconds that Cisco ISE waits for a response from the primary LDAP server before determining that the connection or authentication with that server has failed. Valid values are 1 to 99. The default is 10.</td>
</tr>
<tr>
<td>Max. Admin Connections</td>
<td>Enter the maximum number of concurrent connections (greater than 0) with LDAP administrator account permissions that can run for a specific LDAP configuration. These connections are used to search the directory for users and groups under the User Directory Subtree and the Group Directory Subtree. Valid values are 1 to 99. The default is 20.</td>
</tr>
<tr>
<td>Test Bind to Server</td>
<td>Click to test and ensure that the LDAP server details and credentials can successfully bind. If the test fails, edit your LDAP server details and retest.</td>
</tr>
</tbody>
</table>
### Usage Guidelines

<tbody>
<tr>
<td>Failover</td>
<td>Click this option if you want Cisco ISE to always access the primary LDAP server first for authentications and authorizations.</td>
</tr>
<tr>
<td>Always Access Primary Server First</td>
<td>If the primary LDAP server that Cisco ISE attempts to contact cannot be reached, Cisco ISE attempts to contact the secondary LDAP server. If you want Cisco ISE to use the primary LDAP server again, click this option and enter a value in the text box.</td>
</tr>
</tbody>
</table>

### LDAP Directory Organization Settings

The following table describes the fields in the Directory Organization tab.

**Table 85: LDAP Directory Organization Settings**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject Search Base</td>
<td>Enter the DN for the subtree that contains all subjects. For example:</td>
</tr>
<tr>
<td></td>
<td>o=corporation.com</td>
</tr>
<tr>
<td></td>
<td>If the tree containing subjects is the base DN, enter:</td>
</tr>
<tr>
<td></td>
<td>o=corporation.com</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>dc=corporation,dc=com</td>
</tr>
<tr>
<td></td>
<td>as applicable to your LDAP configuration. For more information, refer to your LDAP database documentation.</td>
</tr>
<tr>
<td>Group Search Base</td>
<td>Enter the DN for the subtree that contains all groups. For example:</td>
</tr>
<tr>
<td></td>
<td>ou=organizational unit, ou=next organizational unit,</td>
</tr>
<tr>
<td></td>
<td>o=corporation.com</td>
</tr>
<tr>
<td></td>
<td>If the tree containing groups is the base DN, type:</td>
</tr>
<tr>
<td></td>
<td>o=corporation.com</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>dc=corporation,dc=com</td>
</tr>
<tr>
<td></td>
<td>as applicable to your LDAP configuration. For more information, refer to your LDAP database documentation.</td>
</tr>
</tbody>
</table>
### Usage Guidelines

#### Search for MAC Address in Format

Enter a MAC Address format for Cisco ISE to use for search in the LDAP database. MAC addresses in internal identity sources are sourced in the format `xx-xx-xx-xx-xx-xx`. MAC addresses in LDAP databases can be sourced in different formats. However, when Cisco ISE receives a host lookup request, Cisco ISE converts the MAC address from the internal format to the format that is specified in this field.

Use the drop-down list to enable searching for MAC addresses in a specific format, where `<format>` can be any one of the following:

- `xxxx.xxxx.xxxx`
- `xxxxxxxxxxxx`
- `xx-xx-xx-xx-xx-xx`

The format you choose must match the format of the MAC address sourced in the LDAP server.

#### Strip Start of Subject Name Up To the Last Occurrence of the Separator

Enter the appropriate text to remove domain prefixes from usernames.

If, in the username, Cisco ISE finds the delimiter character that is specified in this field, it strips all characters from the beginning of the username through the delimiter character. If the username contains more than one of the characters that are specified in the `<start_string>` box, Cisco ISE strips characters through the last occurrence of the delimiter character. For example, if the delimiter character is the backslash (`\`) and the username is `DOMAIN\user1`, Cisco ISE submits `user1` to an LDAP server.

**Note** The `<start_string>` cannot contain the following special characters: the pound sign (`#`), the question mark (`?`), the quotation mark (`"`), the asterisk (`*`), the right angle bracket (`>`), and the left angle bracket (`<`). Cisco ISE does not allow these characters in usernames.
Fields | Usage Guidelines
--- | ---
Strip End of Subject Name from the First Occurrence of the Separator | Enter the appropriate text to remove domain suffixes from usernames.

If, in the username, Cisco ISE finds the delimiter character that is specified in this field, it strips all characters from the delimiter character through the end of the username. If the username contains more than one of the characters that are specified in this field, Cisco ISE strips characters starting with the first occurrence of the delimiter character. For example, if the delimiter character is @ and the username is user1@domain, then Cisco ISE submits user1 to the LDAP server.

Note: The `<end_string>` box cannot contain the following special characters: the pound sign (#), the question mark (?), the quotation mark ("), the asterisk (*), the right angle bracket (>) and the left angle bracket (<). Cisco ISE does not allow these characters in usernames.

### LDAP Group Settings

*Table 86: LDAP Group Settings*

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>Choose <strong>Add &gt; Add Group</strong> to add a new group or choose <strong>Add &gt; Select Groups From Directory</strong> to select the groups from the LDAP directory. If you choose to add a group, enter a name for the new group. If you are selecting from the directory, enter the filter criteria, and click <strong>Retrieve Groups</strong>. Check the check boxes next to the groups that you want to select and click OK. The groups that you have selected will appear in the Groups page.</td>
</tr>
</tbody>

<tr>
<td>Authentication Port</td>
<td>Enter the port number on which the primary RADIUS token server is listening. Valid values are from 1 to 65,535. The default is 1812.</td>
</tr>
<tr>
<td>Server Timeout</td>
<td>Specify the time in seconds that Cisco ISE should wait for a response from the primary RADIUS token server before it determines that the primary server is down. Valid values are 1 to 300. The default is 5.</td>
</tr>
<tr>
<td>Connection Attempts</td>
<td>Specify the number of attempts that Cisco ISE should make to reconnect to the primary server before moving on to the secondary server (if defined) or dropping the request if a secondary server is not defined. Valid values are 1 to 9. The default is 3.</td>
</tr>
</tbody>
</table>

**Secondary Server**

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host IP</td>
<td>Enter the IP address of the secondary RADIUS token server. This field can take as input a valid IP address that is expressed as a string. Valid characters that are allowed in this field are numbers and dot (.).</td>
</tr>
<tr>
<td>Shared Secret</td>
<td>Enter the shared secret configured on the secondary RADIUS token server for this connection.</td>
</tr>
<tr>
<td>Authentication Port</td>
<td>Enter the port number on which the secondary RADIUS token server is listening. Valid values are from 1 to 65,535. The default is 1812.</td>
</tr>
<tr>
<td>Server Timeout</td>
<td>Specify the time in seconds that Cisco ISE should wait for a response from the secondary RADIUS token server before it determines that the secondary server is down. Valid values are 1 to 300. The default is 5.</td>
</tr>
</tbody>
</table>
### RSA SecurID Identity Source Settings

The following table describes the fields on the RSA SecurID Identity Sources page, which you can use to create and connect to an RSA SecurID identity source. The navigation path for this page is: Administration > Identity Management > External Identity Sources > RSA SecurID.

#### RSA Prompt Settings

The following table describes the fields in the RSA Prompts tab.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter Passcode Prompt</td>
<td>Enter a text string to obtain the passcode.</td>
</tr>
<tr>
<td>Enter Next Token Code</td>
<td>Enter a text string to request the next token.</td>
</tr>
<tr>
<td>Choose PIN Type</td>
<td>Enter a text string to request the PIN type.</td>
</tr>
<tr>
<td>Accept System PIN</td>
<td>Enter a text string to accept the system-generated PIN.</td>
</tr>
<tr>
<td>Enter Alphanumeric PIN</td>
<td>Enter a text string to request an alphanumeric PIN.</td>
</tr>
<tr>
<td>Enter Numeric PIN</td>
<td>Enter a text string to request a numeric PIN.</td>
</tr>
<tr>
<td>Re-enter PIN</td>
<td>Enter a text string to request the user to re-enter the PIN.</td>
</tr>
</tbody>
</table>

#### RSA Message Settings

The following table describes the fields in the RSA Messages tab.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display System PIN Message</td>
<td>Enter a text string to label the system PIN message.</td>
</tr>
<tr>
<td>Display System PIN Reminder</td>
<td>Enter a text string to inform the user to remember the new PIN.</td>
</tr>
<tr>
<td>Fields</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Must Enter Numeric Error</td>
<td>Enter a message that instructs users to enter only numbers for the PIN.</td>
</tr>
<tr>
<td>Must Enter Alpha Error</td>
<td>Enter a message that instructs users to enter only alphanumeric characters for PINs.</td>
</tr>
<tr>
<td>PIN Accepted Message</td>
<td>Enter a message that the users see when their PIN is accepted by the system.</td>
</tr>
<tr>
<td>PIN Rejected Message</td>
<td>Enter a message that the users see when the system rejects their PIN.</td>
</tr>
<tr>
<td>User Pins Differ Error</td>
<td>Enter a message that the users see when they enter an incorrect PIN.</td>
</tr>
<tr>
<td>System PIN Accepted Message</td>
<td>Enter a message that the users see when the system accepts their PIN.</td>
</tr>
<tr>
<td>Bad Password Length Error</td>
<td>Enter a message that the users see when the PIN that they specify does not fall within the range specified in the PIN length policy.</td>
</tr>
</tbody>
</table>

<td>An e-mail is sent to the administrator whose account gets locked out. You can enter a custom e-mail remediation message.</td>
</tr>
</tbody>
</table>

**Network Resources**

**Network Devices**

These pages enable you to add and manage network devices.
Network Device Definition Settings

The following table describes the fields in the Network Devices page, which you can use to configure a network access device in Cisco ISE. The navigation path for this page is: Administration > Network Resources > Network Devices.

Network Device Settings

The following table describes the fields in the Network Device section.

Table 92: Network Device Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name for the network device. You can provide a descriptive name to</td>
</tr>
<tr>
<td></td>
<td>the network device that can be different from the hostname of the device.</td>
</tr>
<tr>
<td></td>
<td>The device name is a logical identifier.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a single IP address and a subnet mask. The following are the</td>
</tr>
<tr>
<td></td>
<td>guidelines that must be followed while defining the IP addresses and</td>
</tr>
<tr>
<td></td>
<td>subnet masks:</td>
</tr>
<tr>
<td></td>
<td>- You can define a specific IP address, or a range with a subnet mask.</td>
</tr>
<tr>
<td></td>
<td>If device A has an IP address range defined, you can configure another</td>
</tr>
<tr>
<td></td>
<td>device B with an individual address from the range that is defined in</td>
</tr>
<tr>
<td></td>
<td>device A.</td>
</tr>
<tr>
<td></td>
<td>- You cannot define two devices with the same specific IP addresses.</td>
</tr>
<tr>
<td></td>
<td>- You cannot define two devices with the same IP range. The IP ranges</td>
</tr>
<tr>
<td></td>
<td>must not overlap either partially or completely.</td>
</tr>
<tr>
<td>Model Name</td>
<td>Click the drop-down list to choose the device model, for example.</td>
</tr>
<tr>
<td></td>
<td>You can use the model name as one of the parameters while checking for</td>
</tr>
<tr>
<td></td>
<td>conditions in rule-based policies. This attribute is present in the</td>
</tr>
<tr>
<td></td>
<td>device dictionary.</td>
</tr>
</tbody>
</table>
Click the drop-down list to choose the version of the software running on the network device.

You can use the software version as one of the parameters while checking for conditions in rule-based policies. This attribute is present in the device dictionary.

Click the Location and Device Type drop-down lists to choose a location and device type that can be associated with the network device.

If you do not specifically assign a device to a group when you configure it, it becomes a part of the default device groups (root NDGs), which is All Locations by location and All Device Types by device type and the default device groups (root NDGs) are assigned. For example, All Locations and All Device Groups.

RADIUS Authentication Settings

The following table describes the fields in the RADIUS Authentication Settings section.

Table 93: RADIUS Authentication Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protocol</td>
<td>Displays RADIUS as the selected protocol.</td>
</tr>
<tr>
<td>Shared Secret</td>
<td>Enter a shared secret, which can be up to 127 characters in length.</td>
</tr>
<tr>
<td></td>
<td>The shared secret is the key that you have configured on the network device using the \texttt{radius-host} command with the \texttt{pac} option.</td>
</tr>
<tr>
<td>Enable KeyWrap</td>
<td>Check this check box only when supported on the network device, which increases RADIUS security via an AES KeyWrap algorithm.</td>
</tr>
<tr>
<td></td>
<td>\textbf{Note} When you run Cisco ISE in FIPS mode, you must enable KeyWrap on the network device.</td>
</tr>
<tr>
<td>Key Encryption Key</td>
<td>(Only appears when you enable KeyWrap) Enter an encryption key that is used for session encryption (secrecy).</td>
</tr>
<tr>
<td>Message Authenticator Code Key</td>
<td>(Only appears when you enable KeyWrap) Enter the key that is used for keyed Hashed Message Authentication Code (HMAC) calculation over RADIUS messages.</td>
</tr>
</tbody>
</table>
### Key Input Format

Choose one of the following formats:

- **ASCII**—The Key Encryption Key must be 16 characters (bytes) long, and the Message Authenticator Code Key must be 20 characters (bytes) long.

- **Hexadecimal**—The Key Encryption Key must be 32 bytes long, and the Message Authenticator Code Key must be 40 bytes long.

You can specify the key input format that you want to use to enter the Cisco ISE FIPS encryption key, so that it matches the configuration that is available on the WLC. The value that you specify must be the correct (full) length for the key. Shorter values are not permitted.

### SNMP Settings

The following table describes the fields in the SNMP Settings section.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNMP Version</td>
<td>Choose an SNMP version from the Version drop-down list to be used for requests. Version includes the following:</td>
</tr>
<tr>
<td></td>
<td>• 1—SNMPv1 does not support informs.</td>
</tr>
<tr>
<td></td>
<td>• 2c</td>
</tr>
<tr>
<td></td>
<td>• 3—SNMPv3 is the most secure model because it allows packet encryption when you choose the Priv security level.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>If you have configured your network device with SNMPv3 parameters, you cannot generate the Network Device Session Status Summary report that is provided by the Monitoring service (Operations &gt; Reports &gt; Catalog &gt; Network Device &gt; Session Status Summary). You can generate this report successfully if your network device is configured with SNMPv1 or SNMPv2c parameters.</td>
</tr>
<tr>
<td>Fields</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SNMP RO Community</td>
<td>(Only for SNMP Versions 1 and 2c when selected) Enter the Read Only Community string that provides Cisco ISE with a particular type of access to the device.</td>
</tr>
<tr>
<td>SNMP Username</td>
<td>(Only for SNMP Version 3) Enter SNMP username.</td>
</tr>
<tr>
<td>Security Level</td>
<td>(Only for SNMP Version 3) Choose the security level from the following:</td>
</tr>
<tr>
<td></td>
<td>• Auth—Enables Message Digest 5 or Secure Hash Algorithm (SHA) packet authentication</td>
</tr>
<tr>
<td></td>
<td>• No Auth—No authentication and no privacy security level</td>
</tr>
<tr>
<td></td>
<td>• Priv—Enables Data Encryption Standard (DES) packet encryption</td>
</tr>
<tr>
<td>Auth Protocol</td>
<td>(Only for SNMP Version 3 when the security levels Auth and Priv are selected) Choose the authentication protocol that you want the network device to use. Authentication Protocol includes one of the following for security levels of Auth and Priv:</td>
</tr>
<tr>
<td></td>
<td>• MD5</td>
</tr>
<tr>
<td></td>
<td>• SHA</td>
</tr>
<tr>
<td>Auth Password</td>
<td>(Only for SNMP Version 3 when the security levels Auth and Priv are selected) Enter the authentication key that must be at least 8 characters in length. Click Show to display the Auth Password that is already configured for the device.</td>
</tr>
<tr>
<td>Privacy Protocol</td>
<td>(Only for SNMP Version 3 when the security level Priv is selected) Choose the privacy protocol that you want the network device to use. Privacy Protocols are one of the following:</td>
</tr>
<tr>
<td></td>
<td>• DES</td>
</tr>
<tr>
<td></td>
<td>• AES128</td>
</tr>
<tr>
<td></td>
<td>• AES192</td>
</tr>
<tr>
<td></td>
<td>• AES256</td>
</tr>
<tr>
<td></td>
<td>• 3DES</td>
</tr>
</tbody>
</table>
### Network Device Definition Settings

</tr>
</thead>
<tbody>
<tr>
<td>Privacy Password</td>
<td>(Only for SNMP Version 3 when the security level Priv is selected) Enter the privacy key. Click <strong>Show</strong> to display the Privacy Password that is already configured for the device.</td>
</tr>
<tr>
<td>Polling Interval</td>
<td>Enter the polling interval in seconds. The default is 3600 seconds.</td>
</tr>
<tr>
<td>Link Trap Query</td>
<td>Check this check box to receive and interpret linkup and linkdown notifications received through the SNMP Trap.</td>
</tr>
<tr>
<td>Mac Trap Query</td>
<td>Check this check box to receive and interpret MAC notifications received through the SNMP Trap.</td>
</tr>
<tr>
<td>Originating Policy Service Node</td>
<td>Indicates which ISE server to be used to poll for SNMP data. By default, it is automatic, but you can overwrite the setting by assigning different values.</td>
</tr>
</tbody>
</table>

### Advanced TrustSec Settings

The following table describes the fields in the **Advanced TrustSec Settings** section.

**Table 95: Advanced TrustSec Settings**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>TrustSec Device Notification and Updates Settings</td>
<td>Check this check box if you want the device name to be listed as the device identifier in the <strong>Device ID</strong> field.</td>
</tr>
<tr>
<td>Use Device ID for TrustSec Identification</td>
<td>You can enter the device ID in this field only if you have not checked the <strong>Use Device ID for TrustSec Identification</strong> check box.</td>
</tr>
<tr>
<td>Device ID</td>
<td>Enter the password that you have configured on the TrustSec device CLI to authenticate the TrustSec device. Click <strong>Show</strong> to display the password that is used to authenticate the TrustSec device.</td>
</tr>
<tr>
<td>Password</td>
<td>Specify the time interval at which the device must download its environment data from Cisco ISE. You can specify the time in seconds, minutes, hours, weeks, or days. The default value is 1 day.</td>
</tr>
<tr>
<td>Fields</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>--------</td>
<td>------------------</td>
</tr>
<tr>
<td><strong>Download Peer Authorization Policy Every &lt;...&gt;</strong></td>
<td>Specify the time interval at which the device must download the peer authorization policy from Cisco ISE. You can specify the time in seconds, minutes, hours, weeks, or days. The default value is 1 day.</td>
</tr>
<tr>
<td><strong>Reauthentication Every &lt;...&gt;</strong></td>
<td>Specify the time interval at which the device reauthenticates itself against Cisco ISE after the initial authentication. You can configure the time interval in seconds, minutes, hours, weeks or days. For example, if you enter 1000 seconds, the device will authenticate itself against Cisco ISE every 1000 seconds. The default value is 1 day.</td>
</tr>
<tr>
<td><strong>Download SGACL Lists Every &lt;...&gt;</strong></td>
<td>Specify the time interval at which the device downloads SGACL lists from Cisco ISE. You can configure the time interval in seconds, minutes, hours, weeks or days. The default value is 1 day.</td>
</tr>
<tr>
<td><strong>Other TrustSec Devices to Trust This Device (TrustSec Trusted)</strong></td>
<td>Check this check box if you want all the peer devices to trust this TrustSec device. If you uncheck this check box, the peer devices do not trust this device, and all the packets that arrive from this device are colored or tagged accordingly.</td>
</tr>
<tr>
<td><strong>Notify this device about TrustSec configuration changes</strong></td>
<td>Check this check box if you want Cisco ISE to send TrustSec CoA notifications to this TrustSec device.</td>
</tr>
</tbody>
</table>

**Device Configuration Deployment Settings**

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include this device when deploying Security Group Tag Mapping Updates</td>
<td>Check this check box if you want the TrustSec device to obtain the IP-SGT mappings using device interface credentials.</td>
</tr>
<tr>
<td>EXEC Mode Username</td>
<td>Enter the username that you use to log in to the TrustSec device.</td>
</tr>
<tr>
<td>EXEC Mode Password</td>
<td>Enter the device password.</td>
</tr>
<tr>
<td>Enable Mode Password</td>
<td>(Optional) Enter the enable password that is used to edit the configuration of the TrustSec device in privileged mode.</td>
</tr>
</tbody>
</table>

**Out Of Band TrustSec PAC Display**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issue Date</td>
<td>Displays the issuing date of the last TrustSec PAC that has been generated by Cisco ISE for the TrustSec device.</td>
</tr>
<tr>
<td>Expiration Date</td>
<td>Displays the expiration date of the last TrustSec PAC that has been generated by Cisco ISE for the TrustSec device.</td>
</tr>
</tbody>
</table>
## Default Network Device Definition Settings

The following table describes the fields on the Default Network device page, which allows you to configure a default network device that Cisco ISE can use for RADIUS authentications. The navigation path for this page is: Administration > Network Resources > Network Devices > Default Device.

### Table 96: Default Network Device Definition Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Network Device Status</td>
<td>Choose <strong>Enable</strong> from the Default Network Device Status drop-down list to enable the default network device definition.</td>
</tr>
<tr>
<td>Protocol</td>
<td>Displays RADIUS as the selected protocol.</td>
</tr>
<tr>
<td>Shared Secret</td>
<td>Enter the shared secret that can be up to 128 characters in length.</td>
</tr>
<tr>
<td></td>
<td>The shared secret is the key that you have configured on the network device using the <code>radius-host</code> command with the <code>pac</code> option.</td>
</tr>
<tr>
<td>Enable KeyWrap</td>
<td>Check this check box only when supported on the network device, which increases RADIUS security via an AES KeyWrap algorithm.</td>
</tr>
<tr>
<td>Key Encryption Key</td>
<td>Enter an encryption key that is used for session encryption (secrecy) when you enable KeyWrap.</td>
</tr>
<tr>
<td>Message Authenticator Code Key</td>
<td>Enter the key that is used for keyed Hashed Message Authentication Code (HMAC) calculation over RADIUS messages when you enable KeyWrap.</td>
</tr>
</tbody>
</table>
### Device Security Settings

Specify the minimum length for the RADIUS shared secret. For new installation and upgraded deployment, by default, this value is 4 characters. For the RADIUS server, best practice is to have 22 characters.

#### Note

The length of the shared secret entered in the Network Devices page must be equal to or greater than the value configured in the Minimum RADIUS Shared Secret Length field in the Device Security Settings page.

### Network Device Import Settings

The following table describes the fields on the Network Device Import Page, which you can use to import network device details into Cisco ISE. The navigation path for this page is: Administration > Network Resources > Network Devices.

#### Table 97: Network Devices Import Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate a Template</td>
<td>Click this link to create a comma-separated value (.csv) template file.</td>
</tr>
<tr>
<td></td>
<td>You must update the template with network devices information in the same format, and save it locally to import those network devices into any Cisco ISE deployment.</td>
</tr>
</tbody>
</table>
### Network Device Groups

These pages enable you to configure and manage network device groups.

### Network Device Group Settings

The following table describes the fields on the Network Device Groups Page, which you can use to create network device groups. The navigation path for this page is: **Administration > Network Resources > Network Device Groups > Groups.**
### Table 98: Network Device Group Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
</table>
| Name     | Enter the name for the root Network Device Group (NDG). For all subsequent child network device groups under the root NDG, enter the name of the new network device group.  
The full name of the Network Device Group that can have a maximum of 100 characters. For example, if you are creating a subgroup India under the parent groups Global > Asia, then the full name of the NDG that you are creating would be Global#Asia#India and this full name should not exceed 100 characters. If the full name of the NDG exceeds 100 characters, the NDG creation fails. |
| Description | Enter the description for the root or the child Network Device Group.                                                                                       |
| Type     | Enter the type for the root Network Device Group.  
For all subsequent child network device groups under the root NDG, the type is inherited from the parent NDG and therefore all the child NDGs under a root NDG will be of the same type.  
If this NDG is a root NDG, then the type will be available as an attribute in the device dictionary. You can define conditions based on this attribute. The name of the NDG is one of the values that this attribute can take. |

### Network Device Group Import Settings

The following table describes the fields on the Network Device Group Import Page, which you can use to import network device groups into Cisco ISE. The navigation path for this page is: Administration > Network Resources > Network Device Groups > Groups.
**Table 99: Network Device Groups Import Settings**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate a Template</td>
<td>Click this link to create a comma-separated value (.csv) template file. You must update the template with network device groups information in the same format, and save it locally to import those network device groups into any Cisco ISE deployment.</td>
</tr>
<tr>
<td>File</td>
<td>Click <strong>Browse</strong> to the location of the comma-separated value file that you might have created or previously exported from any Cisco ISE deployment. You can import network device groups in another Cisco ISE deployment with new and updated network device groups information using import.</td>
</tr>
<tr>
<td>Overwrite Existing Data with New Data</td>
<td>Check this check box if you want Cisco ISE to replace existing network device groups with the device groups in your import file. If you do not check this check box, new network device group that are available in the import file are added to the network device group repository. Duplicate entries are ignored.</td>
</tr>
<tr>
<td>Stop Import on First Error</td>
<td>Check this check box if you want Cisco ISE to discontinue import when it encounters an error during import, but Cisco ISE imports network device groups until that time of an error. If this check box is not checked and an error is encountered, the error is reported, and Cisco ISE continues to import device groups.</td>
</tr>
</tbody>
</table>

**External RADIUS Server Settings**

The following table describes the fields on the External RADIUS Server page, which you can use to configure a RADIUS server. For Cisco ISE to act as a RADIUS server, you must configure it in this page. The navigation path for this page is: Administration > Network Resources > External RADIUS Servers.
### Table 10: External RADIUS Server Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the external RADIUS server.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the external RADIUS server.</td>
</tr>
<tr>
<td>Host IP</td>
<td>Enter the IP address of the external RADIUS server.</td>
</tr>
<tr>
<td>Shared Secret</td>
<td>Enter the shared secret between Cisco ISE and the external RADIUS server that is used for authenticating the external RADIUS server. A shared secret is an expected string of text that a user must provide to enable the network device to authenticate a username and password. The connection is rejected until the user supplies the shared secret. The shared secret can be up to 128 characters in length.</td>
</tr>
<tr>
<td>Enable KeyWrap</td>
<td>Enable this option to increase the RADIUS protocol security via an AES KeyWrap algorithm.</td>
</tr>
<tr>
<td>Key Encryption Key</td>
<td>(Only if you check the Enable Key Wrap check box) Enter a key to be used for session encryption (secrecy).</td>
</tr>
<tr>
<td>Message Authenticator Code Key</td>
<td>(Only if you check the Enable Key Wrap check box) Enter a key to be used for keyed HMAC calculation over RADIUS messages.</td>
</tr>
<tr>
<td>Key Input Format</td>
<td>Specify the format you want to use to enter the Cisco ISE encryption key, so that it matches the configuration that is available on the WLAN controller. (The value you specify must be the correct [full] length for the key as defined below—shorter values are not permitted.)</td>
</tr>
<tr>
<td></td>
<td>• ASCII—The Key Encryption Key must be 16 characters (bytes) long, and the Message Authenticator Code Key must be 20 characters (bytes) long.</td>
</tr>
<tr>
<td></td>
<td>• Hexadecimal—The Key Encryption Key must be 32 bytes long, and the Message Authenticator Code Key must be 40 bytes long.</td>
</tr>
<tr>
<td>Authentication Port</td>
<td>Enter the RADIUS authentication port number. The valid range is from 1 to 65535. The default is 1812.</td>
</tr>
<tr>
<td>Accounting Port</td>
<td>Enter the RADIUS accounting port number. The valid range is from 1 to 65535. The default is 1813.</td>
</tr>
</tbody>
</table>
### RADIUS Server Sequences

The following table describes the fields on the RADIUS Server Sequences page, which you can use to create a RADIUS server sequence. The navigation path for this page is: Administration > Network Resources > RADIUS Server Sequences > Add.

**Table 101: RADIUS Server Sequences**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the RADIUS server sequence.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description.</td>
</tr>
<tr>
<td>Host IP</td>
<td>Enter the IP address of the external RADIUS server.</td>
</tr>
<tr>
<td>User Selected Service Type</td>
<td>Choose the external RADIUS servers that you want to use as policy servers from the Available list box and move them to the Selected list box.</td>
</tr>
<tr>
<td>Remote Accounting</td>
<td>Check this check box to enable accounting in the remote policy server.</td>
</tr>
<tr>
<td>Local Accounting</td>
<td>Check this check box to enable accounting in Cisco ISE.</td>
</tr>
<tr>
<td>Advanced Attribute Settings</td>
<td></td>
</tr>
<tr>
<td>Strip Start of Subject Name up to the First Occurrence of the Separator</td>
<td>Check this check box to strip the username from the prefix. For example, if the subject name is acme\userA and the separator is , the username becomes userA.</td>
</tr>
</tbody>
</table>

**Related Topics**

- Cisco ISE Acting as a RADIUS Proxy Server, on page 423
- Configure External RADIUS Servers, on page 423
<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
</table>
| Strip End of Subject Name from the Last Occurrence of the Separator | Check this check box to strip the username from the suffix. For example, if the subject name is userA@abc.com and the separator is @, the username becomes userA.  
  - You must enable the strip options to extract the username from NetBIOS or User Principle Name (UPN) format usernames (user@domain.com or /domain/user), because only usernames are passed to the RADIUS server for authenticating the user.  
  - If you activate both the \ and @ stripping functions, and you are using Cisco AnyConnect, Cisco ISE does not accurately trim the first \ from the string. However, each stripping function that is used individually, however, works as it is designed with Cisco AnyConnect. |
| Modify Attributes in the Request to the External RADIUS Server        | Check this check box to allow Cisco ISE to manipulate attributes that come from or go to the authenticated RADIUS server.  
  The attribute manipulation operations include these:  
  - Add—Add additional attributes to the overall RADIUS request/response.  
  - Update—Change the attribute value (fixed or static) or substitute an attribute by another attribute value (dynamic).  
  - Remove—Remove an attribute or an attribute-value pair.  
  - RemoveAny—Remove any occurrences of the attribute. |
| Continue to Authorization Policy                                      | Check this check box to divert the proxy flow to run the authorization policy for further decision making, based on identity store group and attribute retrieval.  
  If you enable this option, attributes from the response of the external RADIUS server will be applicable for the authentication policy selection. Attributes that are already in the context will be updated with the appropriate value from the AAA server accept response attribute. |
| Modify Attributes before send an Access-Accept                       | Check this check box to modify the attribute just before sending a response back to the device. |
NAC Manager Settings

The following table describes the fields on the New NAC Managers page, which you can use to add a NAC Manager. The navigation path for this page is: Administration > Network Resources > NAC Managers.

Table 102: NAC Manager Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the Cisco Access Manager (CAM).</td>
</tr>
<tr>
<td>Status</td>
<td>Click the Status check box to enable REST API communication from the Cisco ISE profiler that authenticates connectivity to the CAM.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter the description of the CAM.</td>
</tr>
<tr>
<td>IP Address</td>

Device Portal Management

Configure Device Portal Settings

Global Settings for Device Portals

Choose Work Centers > BYOD > Settings > Employee Registered Devices or Administration > Device Portal Management > Settings.

You can configure the following general settings for the BYOD and My Devices portals:

- **Employee Registered Devices**—Enter the maximum number of devices that an employee can register in Restrict employees to. By default, this value is set to 5 devices.

- **Retry URL**—Enter a URL that can be used to redirect the device back to Cisco ISE in Retry URL for onboarding.

Once you configure these general settings, they apply to all BYOD and My Devices portals that you set up for your company.

**Related Topics**

Limit the Number of Personal Devices Registered by Employees, on page 341
Provide a URL to Reconnect with BYOD Registration, on page 342
End-User Device Portals in a Distributed Environment, on page 335

Portal Identification Settings for Device Portals

The navigation path for these settings is Administration > Device Portal Managment > Blacklist Portal, Client Provisioning Portals, BYOD Portals, MDM Portals, or My Device Portals > Create, Edit or Duplicate > Portals Settings and Customization.

- **Portal Name**—Enter a unique portal name to access this portal. Do not use this portal name for any other Sponsor and Guest portals and non-guest portals, such as Blacklist, Bring Your Own Device (BYOD), Client Provisioning, Mobile Device Management (MDM), or My Devices portals.

  This name appears in the authorization profile portal selection for redirection choices, and is used in the list of portals for easy identification among other portals.

- **Description**—Optional.

- **Portal test URL**—A system-generated URL displays as a link after you click Save. Use it to test the portal.

  Click the link to open a new browser tab that displays the URL for this portal. In order for this to work, Policy Services Node (PSN) with Policy Services must be turned on. If Policy Services are not turned on, the PSN only displays the Admin portal.
The test portal does not support RADIUS sessions, so you won't see the entire portal flow for all portals. BYOD and Client Provisioning are examples of portals that depend on RADIUS sessions. For example, a redirect to an external URL will not work.

**Note**

- **Language File**—Each portal type supports 15 languages by default, which are available as individual properties files bundled together in a single zipped language file. Export or import the zipped language file to use with the portal. The zipped language file contains all the individual language files that you can use to display text for the portal.

  The language file contains the mapping to the particular browser locale setting (for example, for French: fr, fr-fr, fr-ca) along with all of the string settings for the entire portal in that language. A single language file contains all the supported languages, so that it can easily be used for translation and localization purposes.

  If you change the browser locale setting for one language, the change is applied to all the other end-user web portals. For example, if you change the French.properties browser locale from fr,fr-fr,fr-ca to fr,fr-fr in the Hotspot Guest portal, the change is applied to the My Devices portal also.

  An alert icon displays when you customize any of the portal page text on the Portal Page **Customizations** tab. The alert message reminds you to update any changes made to one language while customizing the portal into all the supported languages properties files. You can manually dismiss the alert icon using the drop-down list option; or it is automatically dismissed after you import the updated zipped language file.

### Portal Settings for the Blacklist Portal

The navigation path for these settings is **Administration > Device Portal Management > Blacklist Portal > Edit > Portal Behavior and Flow Settings > Portal Settings**

Use these settings to specify values or define behavior that applies to the overall portal; not just to specific portal pages that display to the user (guests, sponsors, or employees as applicable).

- **HTTPS port**—Enter a port value between 8000 to 8999; the default value is 8443 for all the default portals, except the Blacklist Portal, which is 8444. If you upgraded with port values outside this range, they are honored until you modify this page. If you modify this page, update the port setting to comply with this restriction.

  If you assign Ports used by a non-guest (such as My Devices) portal to a guest portal, an error message displays.

  For posture assessments and remediation only, the Client Provisioning portal also uses Ports 8905 and 8909. Otherwise, it uses the same Ports assigned to the Guest portal.
Portals assigned to the same HTTPS port can use the same Gigabit Ethernet interface or another interface. If they use the same port and interface combination, they must use the same certificate group tag. For example:

- Valid combinations include, using the Sponsor portal as an example:
  - Sponsor portal: Port 8443, Interface 0, Certificate tag A and My Devices portal: Port 8443, Interface 0, Certificate group A.
  - Sponsor portal: Port 8443, Interface 0, Certificate group A and My Devices portal: Port 8445, Interface 0, Certificate group B.
  - Sponsor portal: Port 8444, Interface 1, Certificate group A and Blacklist portal: Port 8444, Interface 0, Certificate group B.

- Invalid combinations include:
  - Sponsor portal: Port 8443, Interface 0, Certificate group A and My Devices portal: 8443, Interface 0, Certificate group B.
  - Sponsor portal: Port 8444, Interface 0, Certificate tag A and Blacklist portal: Port 8444, Interface 0, Certificate group A.

- **Allowed interfaces** — Select the PSN interfaces which a PAN can use to run a portal. When a request to open a portal is made on the PAN, the PAN looks for an available allowed Port on the PSN. You must configure the Ethernet interfaces using IP addresses on different subnets. These interfaces must be available on all the PSNs, including VM-based ones, that have Policy Services turned on. This is a requirement because any of these PSNs can be used for the redirect at the start of the guest session.
  - The Ethernet interfaces must use IP addresses on different subnets.
  - The interfaces you enable here must be available on all your PSNs, including VM-based ones when Policy Services turned on. This is required because any of these PSNs can be used for a redirect at the start of the guest session.
  - The portal certificate Subject Name / Alternate Subject Name must resolve to the interface IP.
  - Configure `ip host x.x.x.x yyy.domain.com` in ISE CLI to map secondary interface IP to FQDN, which is used to match Certificate Subject Name / Alternate Subject Name.

- **Certificate group tag** — Pick a certificate group tag that specifies the certificate to use for the portal’s HTTPS traffic.

- **Display Language**
  - **Use browser locale**—Use the language specified in the client browser's locale setting as the display language of the portal. If browser locale's language is not supported by ISE, then the Fallback Language is used as the language portal.
  - **Fallback language**—Choose the language to use when language cannot be obtained from the browser locale, or if the browser locale language is not supported by ISE.
  - **Always use**—Choose the display language to use for the portal. This setting overrides the User browser locale option.
SSIDs available to sponsors—Enter the names or the SSIDs (Session Service Identifiers) of the networks that a sponsor can notify guests as the correct networks to connect to for their visit.

Portal Settings for BYOD and MDM Portals

The navigation path for these settings is Administration > Device Portal Management > BYOD Portals or MDM Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Portal Settings.

Configure these settings to define portal page operations.

- **HTTPS port**—Enter a port value between 8000 to 8999; the default value is 8443 for all the default portals, except the Blacklist Portal, which is 8444. If you upgraded with port values outside this range, they are honored until you modify this page. If you modify this page, update the port setting to comply with this restriction.

  If you assign Ports used by a non-guest (such as My Devices) portal to a guest portal, an error message displays.

  For posture assessments and remediation only, the Client Provisioning portal also uses Ports 8905 and 8909. Otherwise, it uses the same Ports assigned to the Guest portal.

  Portals assigned to the same HTTPS port can use the same Gigabit Ethernet interface or another interface. If they use the same port and interface combination, they must use the same certificate group tag. For example:

  - **Valid combinations include**, using the Sponsor portal as an example:

    - Sponsor portal: Port **8443**, Interface 0, Certificate tag A and My Devices portal: Port **8443**, Interface 0, Certificate group A.

    - Sponsor portal: Port **8443**, Interface 0, Certificate group A and My Devices portal: Port **8445**, Interface 0, Certificate group B.

    - Sponsor portal: Port **8444**, Interface 1, Certificate group A and Blacklist portal: Port **8444**, Interface 0, Certificate group B.

  - **Invalid combinations include**:

    - Sponsor portal: Port **8443**, Interface 0, Certificate group A and My Devices portal: **8443**, Interface 0, Certificate group B.

    - Sponsor portal: Port **8444**, Interface 0, Certificate tag A and Blacklist portal: Port **8444**, Interface 0, Certificate group A.

- **Allowed interfaces** — Select the PSN interfaces which a PAN can use to run a portal. When a request to open a portal is made on the PAN, the PAN looks for an available allowed Port on the PSN. You must configure the Ethernet interfaces using IP addresses on different subnets.

  These interfaces must be available on all the PSNs, including VM-based ones, that have Policy Services turned on. This is a requirement because any of these PSNs can be used for the redirect at the start of the guest session.
• The Ethernet interfaces must use IP addresses on different subnets.

• The interfaces you enable here must be available on all your PSNs, including VM-based ones when Policy Services turned on. This is required because any of these PSNs can be used for a redirect at the start of the guest session.

• The portal certificate Subject Name / Alternate Subject Name must resolve to the interface IP.

• Configure `ip host x.x.x.x yyy.domain.com` in ISE CLI to map secondary interface IP to FQDN, which is used to match Certificate Subject Name / Alternate Subject Name.

• **Certificate group tag**—Pick a certificate group tag that specifies the certificate to use for the portal’s HTTPS traffic.

• **Endpoint identity group**—Choose an endpoint identity group to track guest devices. Cisco ISE provides the GuestEndpoints endpoint identity group to use as a default. You can also create more endpoint identity groups if you choose to not use the default.

  Choose an endpoint identity group to track employee devices. Cisco ISE provides the RegisteredDevices endpoint identity group to use as a default. You can also create more endpoint identity groups if you choose to not use the default.

• **Display Language**

  • **Use browser locale**—Use the language specified in the client browser's locale setting as the display language of the portal. If browser locale's language is not supported by ISE, then the Fallback Language is used as the language portal.

  • **Fallback language**—Choose the language to use when language cannot be obtained from the browser locale, or if the browser locale language is not supported by ISE.

  • **Always use**—Choose the display language to use for the portal. This setting overrides the User browser locale option.

SSIDs available to sponsors—Enter the names or the SSIDs (Session Service Identifiers) of the networks that a sponsor can notify guests as the correct networks to connect to for their visit.

**BYOD Settings for BYOD Portals**

The navigation path for these settings is **Administration > Device Portal Management > BYOD Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > BYOD Settings.**
Use these settings to enable Bring Your Own Device (BYOD) functionality for employees who want to use their personal devices to access your corporate network.

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include an AUP (on page/as link)</td>
<td>Display your company’s network-usage terms and conditions, either as text on the page currently being displayed for the user or as a link that opens a new tab or window with AUP text.</td>
</tr>
<tr>
<td>Require acceptance</td>
<td>Require users to accept an AUP before their account is fully enabled. The Login button is not enabled unless the user accepts the AUP. If users do not accept the AUP, they will not obtain network access.</td>
</tr>
<tr>
<td>Require scrolling to end of AUP</td>
<td>This option displays only if Include an AUP on page is enabled. Ensure that the user has read the AUP completely. The Accept button activates only after the user has scrolled to the end of the AUP.</td>
</tr>
<tr>
<td>Display Device ID field during registration</td>
<td>Display the device ID to the user during the registration process, even though the device ID is pre-configured and cannot be changed while using the BYOD portal.</td>
</tr>
<tr>
<td>Originating URL</td>
<td>After successfully authenticating to the network, redirect the user’s browser to the original website that the user is trying to access, if available. If not available, the Authentication Success page displays. Make sure that the redirect URL is allowed to work on port 8443 of the PSN by the access-control list on the NAD and by authorization profiles configured in ISE for that NAD. For Windows, MAC and Android devices, control is given to the Self-Provisioning Wizard app, which does provisioning. Therefore, these devices are not redirected to the originating URL. However, iOS (dot1X) and unsupported devices (that are allowed network access) are redirected to this URL.</td>
</tr>
<tr>
<td>Success page</td>
<td>Display a page indicating that the device registration was successful.</td>
</tr>
<tr>
<td>URL</td>
<td>After successfully authenticating to the network, redirect the user's browser to the specified URL, such as your company’s website.</td>
</tr>
</tbody>
</table>

**Note**

If you redirect a Guest to an external URL after authentication, there may be a delay while the URL address is resolved and the session is redirected.
Portal Settings for Client Provisioning Portals

The navigation path for these settings is Administration > Device Portal Management > Client Provisioning Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Portal Settings.

- **HTTPS port**—Enter a port value between 8000 to 8999; the default value is 8443 for all the default portals, except the Blacklist Portal, which is 8444. If you upgraded with port values outside this range, they are honored until you modify this page. If you modify this page, update the port setting to comply with this restriction.

If you assign Ports used by a non-guest (such as My Devices) portal to a guest portal, an error message displays.

For posture assessments and remediation only, the Client Provisioning portal also uses Ports 8905 and 8909. Otherwise, it uses the same Ports assigned to the Guest portal.

Portals assigned to the same HTTPS port can use the same Gigabit Ethernet interface or another interface. If they use the same port and interface combination, they must use the same certificate group tag. For example:

- **Valid combinations include**, using the Sponsor portal as an example:
  - Sponsor portal: Port 8443, Interface 0, Certificate tag A and My Devices portal: Port 8443, Interface 0, Certificate group A.
  - Sponsor portal: Port 8443, Interface 0, Certificate group A and My Devices portal: Port 8445, Interface 0, Certificate group B.
  - Sponsor portal: Port 8444, Interface 1, Certificate group A and Blacklist portal: Port 8444, Interface 0, Certificate group B.

- **Invalid combinations include**:
  - Sponsor portal: Port 8443, Interface 0, Certificate group A and My Devices portal: 8443, Interface 0, Certificate group B.
  - Sponsor portal: Port 8444, Interface 0, Certificate tag A and Blacklist portal: Port 8444, Interface 0, Certificate group A.

- **Allowed interfaces** — Select the PSN interfaces which a PAN can use to run a portal. When a request to open a portal is made on the PAN, the PAN looks for an available allowed Port on the PSN. You must configure the Ethernet interfaces using IP addresses on different subnets.

These interfaces must be available on all the PSNs, including VM-based ones, that have Policy Services turned on. This is a requirement because any of these PSNs can be used for the redirect at the start of the guest session.

- The Ethernet interfaces must use IP addresses on different subnets.
• The interfaces you enable here must be available on all your PSNs, including VM-based ones when Policy Services turned on. This is required because any of these PSNs can be used for a redirect at the start of the guest session.

• The portal certificate Subject Name / Alternate Subject Name must resolve to the interface IP.

• Configure ip host x.x.x.x yyy.domain.com in ISE CLI to map secondary interface IP to FQDN, which is used to match Certificate Subject Name / Alternate Subject Name.

• **Certificate group tag**—Pick a certificate group tag that specifies the certificate to use for the portal’s HTTPS traffic.

• **Identity source sequence**—Choose which identity source sequence (ISS) to use for user authentication. The ISS is a list of Identity Stores that are searched in sequence to verify user credentials. Some examples include: Internal Guest Users, Internal Users, Active Directory, LDAP Directory.

Cisco ISE includes a default sponsor Identity Source Sequence for sponsor portals, Sponsor_Portal_Sequence.

To configure an Identity Source Sequence, choose Administration > Identity Management > Identity Source Sequences.

• **Display Language**

  • **Use browser locale**—Use the language specified in the client browser's locale setting as the display language of the portal. If browser locale's language is not supported by ISE, then the Fallback Language is used as the language portal.

  • **Fallback language**—Choose the language to use when language cannot be obtained from the browser locale, or if the browser locale language is not supported by ISE.

  • **Always use**—Choose the display language to use for the portal. This setting overrides the User browser locale option.

SSIDs available to sponsors—Enter the names or the SSIDs (Session Service Identifiers) of the networks that a sponsor can notify guests as the correct networks to connect to for their visit.

Portal Settings for My Devices Portals

The navigation path for these settings is Administration > Device Portal Management > My Devices Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Portal Settings.

- HTTPS port—Enter a port value between 8000 to 8999; the default value is 8443 for all the default portals, except the Blacklist Portal, which is 8444. If you upgraded with port values outside this range, they are honored until you modify this page. If you modify this page, update the port setting to comply with this restriction.

If you assign Ports used by a non-guest (such as My Devices) portal to a guest portal, an error message displays.

For posture assessments and remediation only, the Client Provisioning portal also uses Ports 8905 and 8909. Otherwise, it uses the same Ports assigned to the Guest portal.

Portals assigned to the same HTTPS port can use the same Gigabit Ethernet interface or another interface. If they use the same port and interface combination, they must use the same certificate group tag. For example:

- Valid combinations include, using the Sponsor portal as an example:
  - Sponsor portal: Port 8443, Interface 0, Certificate tag A and My Devices portal: Port 8443, Interface 0, Certificate group A.
  - Sponsor portal: Port 8443, Interface 0, Certificate group A and My Devices portal: Port 8445, Interface 0, Certificate group B.
- Sponsor portal: Port **8444**, Interface 1, Certificate group A and Blacklist portal: Port **8444**, Interface 0, Certificate group B.

- **Invalid combinations include:**
  - Sponsor portal: Port **8443**, Interface 0, Certificate group A and My Devices portal: **8443**, Interface 0, Certificate group B.
  - Sponsor portal: Port **8444**, Interface 0, Certificate tag A and Blacklist portal: Port **8444**, Interface 0, Certificate group A.

- **Allowed interfaces** — Select the PSN interfaces which a PAN can use to run a portal. When a request to open a portal is made on the PAN, the PAN looks for an available allowed Port on the PSN. You must configure the Ethernet interfaces using IP addresses on different subnets.

  These interfaces must be available on all the PSNs, including VM-based ones, that have Policy Services turned on. This is a requirement because any of these PSNs can be used for the redirect at the start of the guest session.

  - The Ethernet interfaces must use IP addresses on different subnets.
  - The interfaces you enable here must be available on all your PSNs, including VM-based ones when Policy Services turned on. This is required because any of these PSNs can be used for a redirect at the start of the guest session.
  - The portal certificate Subject Name / Alternate Subject Name must resolve to the interface IP.
  - Configure `ip host x.x.x.yyyy.domain.com` in ISE CLI to map secondary interface IP to FQDN, which is used to match Certificate Subject Name / Alternate Subject Name.

- **Certificate group tag**—Pick a certificate group tag that specifies the certificate to use for the portal’s HTTPS traffic.

- **Fully Qualified Domain Name (FQDN)**—Enter at least one unique FQDN and/or hostname for your Sponsor or MyDevices portal. For example, you can enter `sponsorenportal.yourcompany.com`, so that when the user enters either of those into a browser, the sponsor portal displays. Separate names with commas, but do not include spaces between entries.

  If you change the default FQDN, then also do the following:
  - Update your DNS so that the FQDN of the new URL resolves to a valid Policy Services Node (PSN) IP address. Optionally, this address could point to a load balancer virtual IP address that serves a pool of PSNs.
  - To avoid certificate warning messages due to name mismatches, include the FQDN of the customized URL, or a wildcard, in the subject alternative name (SAN) attribute of the local server certificate of the Cisco ISE PSN.

- **Identity source sequence**—Choose which identity source sequence (ISS) to use for user authentication. The ISS is a list of Identity Stores that are searched in sequence to verify user credentials. Some examples include: Internal Guest Users, Internal Users, Active Directory, LDAP Directory.

  Cisco ISE includes a default sponsor Identity Source Sequence for sponsor portals, Sponsor_Portal_Sequence.
To configure an Identity Source Sequence, choose Administration > Identity Management > Identity Source Sequences.

- **Endpoint identity group**—Choose an endpoint identity group to track guest devices. Cisco ISE provides the GuestEndpoints endpoint identity group to use as a default. You can also create more endpoint identity groups if you choose to not use the default.

Choose an endpoint identity group to track employee devices. Cisco ISE provides the RegisteredDevices endpoint identity group to use as a default. You can also create more endpoint identity groups if you choose to not use the default.

- **Purge endpoints in this identity group when they reach __ days**—Change the number of days since the registration of a user's device before it is purged from the Cisco ISE database. Purging is done on a daily basis and the purge activity is synchronized with the overall purge timing. The change is applied globally for this endpoint identity group.

  If changes are made to the Endpoint Purge Policy based on other policy conditions, this setting is no longer available for use.

- **Idle timeout**—Enter the time in minutes that you want Cisco ISE to wait before it logs out the user if there is no activity in the portal. The valid range is from 1 to 30 minutes.

**Display Language**

- **Use browser locale**—Use the language specified in the client browser's locale setting as the display language of the portal. If browser locale's language is not supported by ISE, then the Fallback Language is used as the language portal.

- **Fallback language**—Choose the language to use when language cannot be obtained from the browser locale, or if the browser locale language is not supported by ISE.

- **Always use**—Choose the display language to use for the portal. This setting overrides the User browser locale option.

  SSIDs available to sponsors—Enter the names or the SSIDs (Session Service Identifiers) of the networks that a sponsor can notify guests as the correct networks to connect to for their visit.

| Reinstate    | For all devices.  
This action reinstates a blacklisted, lost or stolen device and resets it status to its last known value. This action resets the status of a stolen device to Not Registered, since it has to undergo additional provisioning before it can connect to the network.  
If you want to prevent employees reinstating devices that you have blacklisted, do not enable this option in the My Devices portal. |
| Delete       | For all devices.  
Enable employees to delete a registered device from the My Devices portal or to delete unused and add new devices, once the maximum number of registered devices is reached. This action removes the device from the list of devices displayed in the My Devices portal, but the device remains in the Cisco ISE database and continues to be listed in the Endpoints list.  
To define the maximum number of personal devices that employees can register using either the BYOD or My Devices portals, choose **Administration > Device Portal Management > Settings > Employee Registered Devices**.  
To permanently delete the device from the Cisco ISE database, choose **Administration > Identity Management > Identities > Endpoints**. |
| Stolen       | For all devices.  
Enable employees to indicate that their device is stolen. This action updates the device status in the My Devices portal to Stolen, adds the device to the Blacklist endpoint identity group, and removes its certificate. |
| Device lock  | For MDM enrolled devices only.  
Enable employees to immediately lock their device remotely from the My Devices portal, in the event it is lost or stolen. This action prevents unauthorized use of the device.  
However, the PIN cannot be set in the My Devices portal and should have already been configured by the employee on their mobile device in advance. |
### Usage Guidelines

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unenroll</td>
<td>For MDM enrolled devices only. Enable employees to choose this option if they no longer need to use their device at work. This action removes only those applications and settings installed by your company, while retaining other apps and data on the employee's mobile device.</td>
</tr>
<tr>
<td>Full wipe</td>
<td>For MDM enrolled devices only. Enable employees to choose this option if they have lost their device or are replacing it with a new one. This action resets the employee's mobile device to its default factory settings, removing installed apps and data.</td>
</tr>
</tbody>
</table>

### Add, Edit, and Locate Device Customization for My Devices Portals

The navigation path for these settings are Administration > Device Portal Management > My Devices Portals > Create, Edit or Duplicate > Portal Page Customization > Add Devices, Edit Devices or Locate Devices.

Under Page Customizations, you can customize the messages, titles, content, instructions, and field and button labels that appear on the Add, Edit and Locate tabs of the My Devices portal.

Guest Portal Settings

Portal Identification Settings

The navigation path for these settings is Guest Access > Configure > Guest Ports or Sponsor Ports > Create, Edit or Duplicate > Guest Ports or Sponsor Ports Settings and Customization.

- **Portal Name**—Enter a unique portal name to access this portal. Do not use this portal name for any other Sponsor and Guest portals and non-guest portals, such as Blacklist, Bring Your Own Device (BYOD), Client Provisioning, Mobile Device Management (MDM), or My Devices portals.

  This name appears in the authorization profile portal selection for redirection choices, and is used in the list of portals for easy identification among other portals.

- **Description**—Optional.

- **Portal test URL**—A system-generated URL displays as a link after you click Save. Use it to test the portal.

  Click the link to open a new browser tab that displays the URL for this portal. In order for this to work, Policy Services Node (PSN) with Policy Services must be turned on. If Policy Services are not turned on, the PSN only displays the Admin portal.

  **Note**

  The test portal does not support RADIUS sessions, so you won’t see the entire portal flow for all portals. BYOD and Client Provisioning are examples of portals that depend on RADIUS sessions. For example, a redirect to an external URL will not work.

- **Language File**—Each portal type supports 15 languages by default, which are available as individual properties files bundled together in a single zipped language file. Export or import the zipped language
file to use with the portal. The zipped language file contains all the individual language files that you can use to display text for the portal.

The language file contains the mapping to the particular browser locale setting (for example, for French: fr, fr-fr, fr-ca) along with all of the string settings for the entire portal in that language. A single language file contains all the supported languages, so that it can easily be used for translation and localization purposes.

If you change the browser locale setting for one language, the change is applied to all the other end-user web portals. For example, if you change the French.properties browser locale from fr,fr-fr,fr-ca to fr,fr-fr in the Hotspot Guest portal, the change is applied to the My Devices portal also.

An alert icon displays when you customize any of the portal page text on the Portal Page Customizations tab. The alert message reminds you to update any changes made to one language while customizing the portal into all the supported languages properties files. You can manually dismiss the alert icon using the drop-down list option; or it is automatically dismissed after you import the updated zipped language file.

**Portal Settings for Hotspot Guest Portals**

The navigation path for these settings is Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Portal Settings.

- **HTTPS port**—Enter a port value between 8000 to 8999; the default value is 8443 for all the default portals, except the Blacklist Portal, which is 8444. If you upgraded with port values outside this range, they are honored until you modify this page. If you modify this page, update the port setting to comply with this restriction.

If you assign Ports used by a non-guest (such as My Devices) portal to a guest portal, an error message displays.

For posture assessments and remediation only, the Client Provisioning portal also uses Ports 8905 and 8909. Otherwise, it uses the same Ports assigned to the Guest portal.

Portals assigned to the same HTTPS port can use the same Gigabit Ethernet interface or another interface. If they use the same port and interface combination, they must use the same certificate group tag. For example:

- **Valid combinations include**, using the Sponsor portal as an example:
  - Sponsor portal: Port 8443, Interface 0, Certificate tag A and My Devices portal: Port 8443, Interface 0, Certificate group A.
  - Sponsor portal: Port 8443, Interface 0, Certificate group A and My Devices portal: Port 8445, Interface 0, Certificate group B.
  - Sponsor portal: Port 8444, Interface 1, Certificate group A and Blacklist portal: Port 8444, Interface 0, Certificate group B.

- **Invalid combinations include**:
  - Sponsor portal: Port 8443, Interface 0, Certificate group A and My Devices portal: 8443, Interface 0, Certificate group B.
  - Sponsor portal: Port 8444, Interface 0, Certificate tag A and Blacklist portal: Port 8444, Interface 0, Certificate group A.
• **Allowed interfaces** — Select the PSN interfaces which a PAN can use to run a portal. When a request to open a portal is made on the PAN, the PAN looks for an available allowed Port on the PSN. You must configure the Ethernet interfaces using IP addresses on different subnets.

These interfaces must be available on all the PSNs, including VM-based ones, that have Policy Services turned on. This is a requirement because any of these PSNs can be used for the redirect at the start of the guest session.

  • The Ethernet interfaces must use IP addresses on different subnets.

  • The interfaces you enable here must be available on all your PSNs, including VM-based ones when Policy Services turned on. This is required because any of these PSNs can be used for a redirect at the start of the guest session.

  • The portal certificate Subject Name / Alternate Subject Name must resolve to the interface IP.

  • Configure `ip host x.x.x.y yyyy.domain.com` in ISE CLI to map secondary interface IP to FQDN, which is used to match Certificate Subject Name / Alternate Subject Name.

• **Certificate group tag**—Pick a certificate group tag that specifies the certificate to use for the portal’s HTTPS traffic.

• **Endpoint identity group**—Choose an endpoint identity group to track guest devices. Cisco ISE provides the **GuestEndpoints** endpoint identity group to use as a default. You can also create more endpoint identity groups if you choose to not use the default.

Choose an endpoint identity group to track employee devices. Cisco ISE provides the **RegisteredDevices** endpoint identity group to use as a default. You can also create more endpoint identity groups if you choose to not use the default.

• **Purge endpoints in this identity group when they reach __ days**—Change the number of days since the registration of a user's device before it is purged from the Cisco ISE database. Purging is done on a daily basis and the purge activity is synchronized with the overall purge timing. The change is applied globally for this endpoint identity group.

  If changes are made to the Endpoint Purge Policy based on other policy conditions, this setting is no longer available for use.

• **Display Language**

  • **Use browser locale**—Use the language specified in the client browser's locale setting as the display language of the portal. If browser locale's language is not supported by ISE, then the Fallback Language is used as the language portal.

  • **Fallback language**—Choose the language to use when language cannot be obtained from the browser locale, or if the browser locale language is not supported by ISE.

  • **Always use**—Choose the display language to use for the portal. This setting overrides the User browser locale option.

SSIDs available to sponsors—Enter the names or the SSIDs (Session Service Identifiers) of the networks that a sponsor can notify guests as the correct networks to connect to for their visit.
Acceptable Use Policy (AUP) Page Settings for Hotspot Guest Portals

The navigation path for this page is Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Acceptable Use Policy (AUP) Page Settings

- **Include an AUP page**—Display your company’s network-usage terms and conditions on a separate page to the user.

- **Require an access code**—Assign an access code as the login credential that multiple guests should use to gain access to the network. An access code is primarily a locally known code that is given to physically present guests (either visually via a whiteboard or verbally by a lobby ambassador). It would not be known and used by someone outside the premises to access the network.

  You can use this option in addition to the usernames and passwords that are provided as the login credentials to individual guests.

- **Require scrolling to end of AUP**—Ensure that the user has read the AUP completely. The **Accept** button activates only after the user has scrolled to the end of the AUP. Configure when the AUP appears to the user.

Post-Access Banner Page Settings for Hotspot Portals

The navigation path for this page is Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Post-Access Banner Page Settings.

Use this setting to inform guests of their access status and any other additional actions, if required.

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include a Post-Access Banner page</td>
<td>Display additional information after the guests are successfully authenticated and before they are granted network access.</td>
</tr>
</tbody>
</table>

Portal Settings for Credentialed Guest Portals

The navigation path for these settings is: Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Portal Settings.

- **HTTPS port**—Enter a port value between 8000 to 8999; the default value is 8443 for all the default portals, except the Blacklist Portal, which is 8444. If you upgraded with port values outside this range, they are honored until you modify this page. If you modify this page, update the port setting to comply with this restriction.

  If you assign Ports used by a non-guest (such as My Devices) portal to a guest portal, an error message displays.

  For posture assessments and remediation only, the Client Provisioning portal also uses Ports 8905 and 8909. Otherwise, it uses the same Ports assigned to the Guest portal.

  Portals assigned to the same HTTPS port can use the same Gigabit Ethernet interface or another interface. If they use the same port and interface combination, they must use the same certificate group tag. For example:

  - Valid combinations include, using the Sponsor portal as an example:
• Sponsor portal: Port 8443, Interface 0, Certificate tag A and My Devices portal: Port 8443, Interface 0, Certificate group A.

• Sponsor portal: Port 8443, Interface 0, Certificate group A and My Devices portal: Port 8445, Interface 0, Certificate group B.

• Sponsor portal: Port 8444, Interface 1, Certificate group A and Blacklist portal: Port 8444, Interface 0, Certificate group B.

• Invalid combinations include:

  • Sponsor portal: Port 8443, Interface 0, Certificate group A and My Devices portal: Port 8443, Interface 0, Certificate group B.

  • Sponsor portal: Port 8444, Interface 0, Certificate tag A and Blacklist portal: Port 8444, Interface 0, Certificate group A.

• **Allowed interfaces** — Select the PSN interfaces which a PAN can use to run a portal. When a request to open a portal is made on the PAN, the PAN looks for an available allowed Port on the PSN. You must configure the Ethernet interfaces using IP addresses on different subnets.

  These interfaces must be available on all the PSNs, including VM-based ones, that have Policy Services turned on. This is a requirement because any of these PSNs can be used for the redirect at the start of the guest session.

  • The Ethernet interfaces must use IP addresses on different subnets.

  • The interfaces you enable here must be available on all your PSNs, including VM-based ones when Policy Services turned on. This is required because any of these PSNs can be used for a redirect at the start of the guest session.

  • The portal certificate Subject Name / Alternate Subject Name must resolve to the interface IP.

  • Configure **ip host x.x.x.x yyy.domain.com** in ISE CLI to map secondary interface IP to FQDN, which is used to match Certificate Subject Name / Alternate Subject Name.

• The portal certificate Subject Name / Alternate Subject Name must resolve to the interface IP.

• **Identity source sequence**—Choose which identity source sequence (ISS) to use for user authentication. The ISS is a list of Identity Stores that are searched in sequence to verify user credentials. Some examples include: Internal Guest Users, Internal Users, Active Directory, LDAP Directory.

  Cisco ISE includes a default sponsor Identity Source Sequence for sponsor portals, Sponsor_Portal_Sequence.

  To configure an Identity Source Sequence, choose **Administration > Identity Management > Identity Source Sequences**.

• Employees using this portal as guests inherit login options from—Choose the Guest Type that employees are assigned when they log on to this portal. The employee's endpoint data is stored in the endpoint identity group configured in that guest type for the attribute **Store device information in endpoint identity group**. No other attributes from the associated guest type are inherited.

• Display Language
• **Use browser locale**—Use the language specified in the client browser's locale setting as the display language of the portal. If browser locale's language is not supported by ISE, then the Fallback Language is used as the language portal.

• **Fallback language**—Choose the language to use when language cannot be obtained from the browser locale, or if the browser locale language is not supported by ISE.

• **Always use**—Choose the display language to use for the portal. This setting overrides the User browser locale option.

SSIDs available to sponsors—Enter the names or the SSIDs (Session Service Identifiers) of the networks that a sponsor can notify guests as the correct networks to connect to for their visit.

### Login Page Settings for Credentialed Guest Portals

The navigation path for this page is: Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Login Page Settings

• **Require an access code**—Assign an access code as the login credential that multiple guests should use to gain access to the network. An access code is primarily a locally known code that is given to physically present guests (either visually via a whiteboard or verbally by a lobby ambassador). It would not be known and used by someone outside the premises to access the network.

You can use this option in addition to the usernames and passwords that are provided as the login credentials to individual guests.

• **Maximum failed login attempts before rate limiting**—Specify the number of failed login attempts from a single browser session before Cisco ISE starts to throttle that account. This does not cause an account lockout. The throttled rate is configured in **Time between login attempts when rate limiting**.

• **Time between login attempts when rate limiting**—Set the length of time in minutes that a user must wait before attempting to log in again (throttled rate), after failing to log in the number of times defined in **Maximum failed login attempts before rate limiting**.

• **Include an AUP**—Add a acceptable use policy page to the flow. You can add the AUP to the page, or link to another page. Adding this changes the picture of the flow on the right.

  • **require acceptance**—Force the user to agree to the AUP before continuing the flow.

• **Allow guests to create their own accounts**—Provide an option on this portal’s Login page for guests to register themselves. If this option is not selected, sponsors create guest accounts. Enabling this also enables tabs on this page for you to configure **Self-Registration Page Settings** and **Self-Registration Success Page Settings**.

  If guests choose this option, they are presented with the Self-Registration form where they can enter the requested information to create their own guest accounts.

• **Allow guests to change password after login**—Allow guests to change their password after successfully authenticating and accepting the AUP, if it is required. If guests change their passwords, sponsors cannot provide guests with their login credentials if lost. The sponsor can only reset the guest’s password back to a random password.
Self-Registration Page Settings for Credentialed Guest Portals

The navigation path for this page is **Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Self Registration Page Settings**. Use these settings to enable guests to register themselves and specify the information they need to provide on the Self-Registration form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign self-registered guests to guest type</td>
<td>Choose the guest type to which all the self-registered guests using this portal should be assigned.</td>
</tr>
<tr>
<td>Account valid for</td>
<td>Specify the duration for the account in days, hours, or minutes after which the account will expire unless you or the sponsor extend the account duration in the Sponsor portal.</td>
</tr>
<tr>
<td>Require a registration code for self registration</td>
<td>Assign a code that the self-registering guests must enter to successfully submit their Self-Registration form. Similar to the access code, the registration code is provided to the guest offline to prevent someone who is outside the premises from accessing the system.</td>
</tr>
<tr>
<td>Fields to include / Required</td>
<td>Check the fields that you want to display on the Self-Registration form. Then check which fields are mandatory for the guests to complete in order to submit the form and receive a guest account. You may want to require fields such as <strong>SMS Service Provider</strong> and <strong>Person being Visited</strong> to gather important information from self-registering guests.</td>
</tr>
</tbody>
</table>
| Guests can choose from these locations to set their time zone | Enter locations that the self-registering guests can select at registration time using the list of locations that you have defined. This automatically assigns the related time zones as the valid access times for these guests. The location names should be clear to avoid ambiguity during selection (for example, Boston Office, 500 Park Ave New York, Singapore, etc.)  

If you only provided one location, it is automatically assigned as the default location and does not display in the portal for guests to view. Additionally, **Location** is disabled in the list of **Fields to include**. |
<p>| SMS Service Provider                            | Display SMS providers on the Self-Registration form to enable self-registering guests to choose their own SMS provider. You can then use the guest’s SMS service to send them SMS notifications to minimize expenses for your company. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Guests can choose from these SMS providers</td>
<td>Select the SMS providers that should display on the Self-Registration form. If you only selected one as the default SMS provider for the guest to use, it will not display on the Self-Registration form.</td>
</tr>
<tr>
<td>Custom Fields</td>
<td>Select additional information that you would like collect from the self-registering guests. Then check which fields are mandatory for the guests to complete in order to submit the Self-Registration form and receive a guest account. These fields are listed in alphabetical order by name.</td>
</tr>
<tr>
<td>Include an AUP (on page/as link)</td>
<td>Display your company’s network-usage terms and conditions, either as text on the page currently being displayed for the user or as a link that opens a new tab or window with AUP text.</td>
</tr>
<tr>
<td>Require acceptance</td>
<td>Require users to accept an AUP before their account is fully enabled. The Login button is not enabled unless the user accepts the AUP. If users do not accept the AUP, they will not obtain network access.</td>
</tr>
<tr>
<td>Require scrolling to end of AUP</td>
<td>This option displays only if Include an AUP on page is enabled. Ensure that the user has read the AUP completely. The Accept button activates only after the user has scrolled to the end of the AUP.</td>
</tr>
<tr>
<td>Only allow guests with an email address from</td>
<td>Specify the whitelisted email address domains from which the self-registering guests can enter in Email Address and successfully receive their account credentials; for example, cisco.com, example.com. In this example, if the guests entered <a href="mailto:myname@cisco.com">myname@cisco.com</a> as their email address, after successful account creation, they receive their login credentials. However, if they entered <a href="mailto:myname@hotmail.com">myname@hotmail.com</a> (or any other address not from cisco.com or example.com), no account is created and they do not get credentials. Leaving this field blank allows registration from any domain, unless there are blacklist domains listed in Do not allow guests with email address from.</td>
</tr>
<tr>
<td>Field</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Do not allow guests with an email address from</td>
<td>Specify the blacklisted email address domains from which the self-registering guests cannot enter in Email Address and successfully receive their account credentials; for example, cisco.com, example.com. In this example, if the guests entered <a href="mailto:myname@cisco.com">myname@cisco.com</a> as their email address, no account is created and they do not get credentials.</td>
</tr>
</tbody>
</table>
| Require self-registered guests to be approved | Specify that the self-registering guests using this portal require approval from a sponsor before receiving their guest credentials. Then specify one of the options under After registration submission, direct guest to in this page:  
  - Self-Registration Success page  
  - Login page with instructions about how to obtain login credentials  
  - URL  
  If enabled, you should also enable one or both: Email or SMS under Send credential notification upon approval using in this page.  
  Enabling Require self-registered guests to be approved enables the following extra configuration fields, which have the following attributes:  
  Approve/Deny Link Settings—Additional settings allow you to configure:  
    - Links are valid for, number of days.  
    - Require approver to enter a username and password for authentication—Authenticate sponsors based on the following ordered list of sponsor portals  
    - Authenticate sponsors based on the following ordered list of sponsor portals—If there are multiple sponsors that can approve this account, then chose the portal that the sponsor must log on to in order to approve the account. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
</table>
| Email approval request to | If you select:  
  - **sponsor email addresses listed below**, enter the email addresses of sponsors designated as approvers, or an email address or a mailer to which ALL guest approval requests should be sent.  
  - **person being visited**, the **Person being visited** and **Required** options in Fields to include will also be enabled (if they were previously disabled). These fields will be displayed on the Self-Registration form requesting this information from the self-registering guests.  
  These persons will receive an email notification stating that self-registering guests require approval. |
| Self-Registration Success page | Direct successfully self-registered guests to the Self-Registration Success page, which displays the fields and messages you have specified in **Self Registration Success Page Settings**.  
  It may not be desirable to display all the information, because the system may be awaiting account approval (if enabled on this page) or delivering the login credentials to an email address or phone number based on the whitelisted and blacklisted domains specified in this page.  
  If you enabled **Allow guests to log in directly from the Self-Registration Success page** in **Self-Registration Success Page Settings**, successfully self-registered guests can log in directly from this page. If it is not enabled, they are directed to the portal’s Login page after the Self-Registration Success page is displayed. |
| Login page with instructions about how to obtain login credentials | Direct successfully self-registered guests back to the portal’s Login page and display a message, such as “Please wait for your guest credentials to be delivered either via email, SMS, or print format and proceed with logging in.”  
  To customize the default message, click on the **Portal Page Customization** tab and select **Self-Registration Page Settings**.  
  The system may be awaiting account approval (if enabled on this page) or delivering the login credentials to an email address or phone number based on the whitelisted and blacklisted domains specified in this page. |
### Usage Guidelines

**Field**

- **URL**
  - Direct successfully self-registered guests to the specified URL while waiting for their account credentials to be delivered.
  - The system may be awaiting account approval (if enabled on this page) or delivering the login credentials to an email address or phone number based on the whitelisted and blacklisted domains specified in this page.

- **Email**
  - Choose email as the option by which successfully self-registered guests receive their login credential information. If you choose this option, **Email address** becomes a required field in the list of **Fields to include** and you can no longer disable this option.

- **SMS**
  - Choose SMS as the option by which successfully self-registered guests receive their login credential information. If you choose this option, **SMS Service Provider** becomes a required field in the list of **Fields to include** and you can no longer disable this option.

### Self Registration Success Page Settings

The navigation path for this page is **Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Self Registration Success Page Settings**. Use these settings to notify successfully self-registered guests of the credentials they need to gain access to the network.

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Include this information on the Self-Registration Success page</strong></td>
<td>Check the fields that you want to display for the successfully self-registered guests on the Self-Registration Success page. If sponsor approval of the guest is not required, check <strong>Username</strong> and <strong>Password</strong> to display these credentials for the guest. If sponsor approval is required, these fields are disabled, because the credentials can only be delivered to the guest after they have been approved.</td>
</tr>
<tr>
<td><strong>Allow guest to send information to self using</strong></td>
<td>Check the options by which the successfully self-registered guest can send credential information to themselves: <strong>Print</strong>, <strong>Email</strong>, or <strong>SMS</strong>.</td>
</tr>
<tr>
<td><strong>Include an AUP (on page/as link)</strong></td>
<td>Display your company’s network-usage terms and conditions, either as text on the page currently being displayed for the user or as a link that opens a new tab or window with AUP text.</td>
</tr>
</tbody>
</table>

_Cisco Identity Services Engine Administrator Guide, Release 1.3_
Field | Usage Guidelines
--- | ---
Require acceptance | Require users to accept an AUP before their account is fully enabled. The **Login** button is not enabled unless the user accepts the AUP. If users do not accept the AUP, they will not obtain network access.

Require scrolling to end of AUP | This field displays if you chose the **AUP on page** option.
Ensure that the user has read the AUP completely. The **Accept** button activates only after the user has scrolled to the end of the AUP.

Allow guests to log in directly from the Self-Registration Success page | Display a **Login** button at the bottom of the Self-Registration Success page. This enables the guest to bypass the Login page and automatically deliver the login credentials to the portal and display the next page in the portal flow (for instance, the AUP page).

---

**Acceptable Use Policy (AUP) Page Settings for Credentialed Guest Portals**

The navigation path for this page is **Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Acceptable Use Policy (AUP) Page Settings**.

- **Include an AUP page**—Display your company’s network-usage terms and conditions on a separate page to the user.

- **Use different AUP for employees**—Display a different AUP and network-usage terms and conditions for employees only. If you choose this option, you cannot also choose **Skip AUP for employees**.

- **Skip AUP for employees**—Employees are not required to accept an AUP before accessing the network. If you choose this option, you cannot also choose **Use different AUP for employees**.

- **Require scrolling to end of AUP**—This option displays only if **Include an AUP on page** is enabled.
Ensure that the user has read the AUP completely. The **Accept** button activates only after the user has scrolled to the end of the AUP. Configure when the AUP appears to the user.

  - **On first login only**—Display an AUP the first time the user logs into the network or portal.

  - **On every login**—Display an AUP every time the user logs into the network or portal.

  - **Every ___ days (starting at first login)**—Display an AUP periodically after the user first logs into the network or portal.

---

**Guest Change Password Settings for Credentialed Guest Portals**

**Guest Change Password Settings**
The navigation path for this page is **Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Guest Change Password Settings**.
• **Allow guests to change password after login**—Allow guests to change their password after successfully authenticating and accepting the AUP, if it is required. If guests change their passwords, sponsors cannot provide guests with their login credentials if lost. The sponsor can only reset the guest’s password back to a random password.

### Guest Device Registration Settings for Credentialed Guest Portals

**Guest Device Registration Settings**

The navigation path for this page is **Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Guest Device Registration Settings**

Use these settings to either ensure that Cisco ISE automatically registers guest devices when they log in to or to allow guests to manually register their devices after they log in.

The maximum number of devices is specified for each guest type in **Guest Access > Configure > Guest Types**.

- **Automatically register guest devices**—Automatically create an endpoint for the device from which the guest is accessing this portal. The endpoint is added to the endpoint identity group specified for this portal and is subject to the identity group's purge policy.

  An authorization rule can now be created to allow access to endpoints in that identity group, so that web authentication is no longer required.

  If the maximum number of registered devices is reached, the system automatically deletes the first registered device, registers the device the guest is trying to log in with, and notifies them. Choose **Guest Access > Configure > Guest Types** to change the maximum number of devices with which a guest can register.

- **Allow guests to register devices**—Guests can register their devices manually by providing a name, description and MAC address. The MAC address is associated with an endpoint identity group.

  If the maximum number of registered devices is reached, the guest is required to delete at least one device before being allowed to register another device.

### BYOD Settings for Credentialed Guest Portals

The navigation path for this page is **Guest Access > Portals & Components > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > BYOD Settings.**
Use these settings to enable Bring Your Own Device (BYOD) functionality for non-guests, such as employees, using the Credentialed Guest portals to access your corporate network.

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow employees to use personal devices on the network</td>
<td>Add the Employee Bring Your Own Device (BYOD) Registration page to this portal allowing employees to go through the employee device registration process, and possibly native supplicant and certificate provisioning, depending on the settings for Client Provisioning for the employee’s personal device type (for example, iOS, Android, Windows (excluding RT or mobile), OSX).</td>
</tr>
<tr>
<td>Endpoint identity group</td>
<td>Choose an endpoint identity group to track guest devices. Cisco ISE provides the GuestEndpoints endpoint identity group to use as a default. You can also create more endpoint identity groups if you choose to not use the default.</td>
</tr>
<tr>
<td>Purge endpoints in this identity group when they reach ___ days</td>
<td>Change the number of days since the registration of a user’s device before it is purged from the Cisco ISE database. Purging is done on a daily basis and the purge activity is synchronized with the overall purge timing. The change is applied globally for this endpoint identity group. If changes are made to the Endpoint Purge Policy based on other policy conditions, this setting is no longer available for use.</td>
</tr>
<tr>
<td>Allow employees to choose to get guest access only</td>
<td>Let employees access your guest network and avoid additional provisioning and registration that may be required to access your corporate network.</td>
</tr>
<tr>
<td>Display Device ID field during registration</td>
<td>Display the device ID to the user during the registration process, even though the device ID is pre-configured and cannot be changed while using the BYOD portal.</td>
</tr>
</tbody>
</table>
### Usage Guidelines

**Field**: Originating URL  
**Usage Guidelines**: After successfully authenticating to the network, redirect the user’s browser to the original website that the user is trying to access, if available. If not available, the Authentication Success page displays. Make sure that the redirect URL is allowed to work on port 8443 of the PSN by the access-control list on the NAD and by authorization profiles configured in ISE for that NAD.

For Windows, MAC and Android devices, control is given to the Self-Provisioning Wizard app, which does provisioning. Therefore, these devices are not redirected to the originating URL. However, iOS (dot1X) and unsupported devices (that are allowed network access) are redirected to this URL.

**Success page**  
**Usage Guidelines**: Display a page indicating that the device registration was successful.

**URL**  
**Usage Guidelines**: After successfully authenticating to the network, redirect the user's browser to the specified URL, such as your company’s website.

---

### Post-Login Banner Page Settings for Credentialed Guest Portals

The navigation path for this page is Guest Access > Configure > Guest Portals or Sponsor Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Post-Login Banner Page Settings.

Use this setting to notify users (guests, sponsors or employees as applicable) of additional information after they log in successfully.

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include a Post-Login Banner page</td>
<td>Display additional information after the users successfully log in and before they are granted network access.</td>
</tr>
</tbody>
</table>

---

### Guest Device Compliance Settings for Credentialed Guest Portals

The navigation path for this page is Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Guest Device Compliance Settings. Use these settings to require guests, and employees using the guest portal, to undergo client provisioning of their devices in order to gain access to the network.

- **Require guest device compliance**—Redirect guests to the Client Provisioning page, which requires them to download a posture agent. This adds client provisioning to the Guest flow, where you configure posture policies for guests, such as checking for virus protection software.

If the guest is an employee using the Credentialed Guest portals to access the network and:
If you enabled **Allow employees to use personal devices on the network** in the BYOD Settings, the employee is redirected to the BYOD flow and will not undergo client provisioning.

If you enabled both **Allow employees to use personal devices on the network** and **Allow employees to choose to get guest access only** in the BYOD Settings, and the employee chooses guest access, they are routed to the Client Provisioning page.

### VLAN DHCP Release Page Settings for Guest Portals

The navigation path for this page is **Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > VLAN DHCP Release Page Settings**.

- **Enable VLAN DHCP release**—Refresh a guest’s IP address for Windows and Mac OS devices after a VLAN change in both wired and wireless environments.

  This affects the Central WebAuth (CWA) flow during final authorization, when the network access changes the guest VLAN to a new VLAN. The guest’s old IP address must be released before the VLAN change, and a new guest IP address must be requested through DHCP when the guest connects to the new VLAN. The IP address release renew operation varies by the browser and operating system used; Internet Explorer uses ActiveX controls, and Firefox and Google Chrome use Java applets. For non-Internet Explorer browsers, Java must be installed and enabled on the browser.

  The VLAN DHCP Release option does not work on mobile devices. Instead, guests are requested to manually reset the IP address. This method varies by devices. For example, on Apple iOS devices, guests can select the Wi-Fi network and click the **Renew Lease** button.

- **Delay to release __ seconds**—Enter the delay to release time. We recommend a short value, because the release must occur immediately after the applet is downloaded, and before the Cisco ISE server directs the NAD to re-authenticate with a CoA request.

- **Delay to CoA __ seconds**—Enter the time to delay Cisco ISE from executing the CoA. Provide enough time (use the default value as a guideline) to allow the applet to download and perform the IP release on the client.

- **Delay to renew __ seconds**—Enter the delay to renew value. This time is added to the IP release value and does not begin timing until the control is downloaded. Provide enough time (use the default value as a guideline) so that the CoA is allowed to process and the new VLAN access granted.

### Authentication Success Settings for Guest Portals

The navigation path for this page is **Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Authentication Success Settings**.

These settings notify the users (guests, sponsors, or employees as applicable) of authentication success or display a URL. Under **Once authenticated, take guest to:**; configure the following fields:

- **Originating URL**—After successfully authenticating to the network, redirect the user’s browser to the original website that the user is trying to access, if available. If not available, the Authentication Success page displays. Make sure that the redirect URL is allowed to work on port 8443 of the PSN by the access-control list on the NAD and by authorization profiles configured in ISE for that NAD.
For Windows, MAC and Android devices, control is given to the Self-Provisioning Wizard app, which does provisioning. Therefore, these devices are not redirected to the originating URL. However, iOS (dot1X) and unsupported devices (that are allowed network access) are redirected to this URL.

- **Authentication Success page**—Notification of successful authentication of the user.
- **URL**—After successfully authenticating to the network, redirect the user's browser to the specified URL, such as your company’s website.

---

**Note**

If you redirect a Guest to an external URL after authentication, there may be a delay while the URL address is resolved and the session is redirected. Make sure that the redirect URL is allowed to work on port 8443 of the PSN by the access-control list on the NAD and by authorization profiles configured in ISE for that NAD.

---

### Support Information Page Settings for Guest Portals

The navigation path for this page is Guest Access > Configure > Guest Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Support Information Page Settings.

Use these settings to display the information that your Help Desk can use to troubleshoot access issues experienced by users (guests, sponsors or employees as applicable).

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include a Support Information Page</td>
<td>Display a link to an information page, such as Contact Us, on all enabled pages for the portal.</td>
</tr>
<tr>
<td>MAC address</td>
<td>Include the MAC address of the device on the Support Information page.</td>
</tr>
<tr>
<td>IP address</td>
<td>Include the IP address of the device on the Support Information page.</td>
</tr>
<tr>
<td>Browser user agent</td>
<td>Include the browser details such as the product name and version, layout engine and version of the user agent originating the request on the Support Information page.</td>
</tr>
<tr>
<td>Policy server</td>
<td>Include the IP address of the ISE Policy Service Node (PSN) that is serving this portal on the Support Information page.</td>
</tr>
<tr>
<td>Failure code</td>
<td>If available, include the corresponding number from the log message catalog. You can access and view the message catalog by navigating to Administration &gt; System &gt; Logging &gt; Message Catalog.</td>
</tr>
<tr>
<td>Hide field</td>
<td>Do not display any field labels on the Support Information page if the information that they would contain is non-existent. For example, if the failure code is unknown, and therefore blank, do not display Failure code, even if it is selected.</td>
</tr>
</tbody>
</table>
### Sponsor Portal Application Settings

#### Portal Identification Settings

The navigation path for these settings is **Guest Access > Configure > Guest Portals or Sponsor Portals > Create, Edit or Duplicate > Guest Portals or Sponsor Portals Settings and Customization.**

- **Portal Name**—Enter a unique portal name to access this portal. Do not use this portal name for any other Sponsor and Guest portals and non-guest portals, such as Blacklist, Bring Your Own Device (BYOD), Client Provisioning, Mobile Device Management (MDM), or My Devices portals. This name appears in the authorization profile portal selection for redirection choices, and is used in the list of portals for easy identification among other portals.

- **Description**—Optional.

- **Portal test URL**—A system-generated URL displays as a link after you click **Save**. Use it to test the portal.

  Click the link to open a new browser tab that displays the URL for this portal. In order for this to work, Policy Services Node (PSN) with Policy Services must be turned on. If Policy Services are not turned on, the PSN only displays the Admin portal.

  **Note**
  
  The test portal does not support RADIUS sessions, so you won't see the entire portal flow for all portals. BYOD and Client Provisioning are examples of portals that depend on RADIUS sessions. For example, a redirect to an external URL will not work.

- **Language File**—Each portal type supports 15 languages by default, which are available as individual properties files bundled together in a single zipped language file. Export or import the zipped language file to use with the portal. The zipped language file contains all the individual language files that you can use to display text for the portal.

  The language file contains the mapping to the particular browser locale setting (for example, for French: fr, fr-fr, fr-ca) along with all of the string settings for the entire portal in that language. A single language...
file contains all the supported languages, so that it can easily be used for translation and localization purposes.

If you change the browser locale setting for one language, the change is applied to all the other end-user web portals. For example, if you change the French.properties browser locale from fr-fr,fr-fr-ca to fr-fr in the Hotspot Guest portal, the change is applied to the My Devices portal also.

An alert icon displays when you customize any of the portal page text on the Portal Page Customizations tab. The alert message reminds you to update any changes made to one language while customizing the portal into all the supported languages properties files. You can manually dismiss the alert icon using the drop-down list option; or it is automatically dismissed after you import the updated zipped language file.

### Portal Settings for Sponsor Portals

Configure these settings to identify the portal and select the language files to be used for all the portal pages.

- **HTTPS port**—Enter a port value between 8000 to 8999; the default value is 8443 for all the default portals, except the Blacklist Portal, which is 8444. If you upgraded with port values outside this range, they are honored until you modify this page. If you modify this page, update the port setting to comply with this restriction.

If you assign Ports used by a non-guest (such as My Devices) portal to a guest portal, an error message displays.

For posture assessments and remediation only, the Client Provisioning portal also uses Ports 8905 and 8909. Otherwise, it uses the same Ports assigned to the Guest portal.

Portals assigned to the same HTTPS port can use the same Gigabit Ethernet interface or another interface. If they use the same port and interface combination, they must use the same certificate group tag. For example:

- **Valid combinations include**, using the Sponsor portal as an example:
  - Sponsor portal: Port **8443**, Interface **0**, Certificate tag **A** and My Devices portal: Port **8443**, Interface **0**, Certificate group **A**.
  - Sponsor portal: Port **8443**, Interface **0**, Certificate group **A** and My Devices portal: Port **8445**, Interface **0**, Certificate group **B**.
  - Sponsor portal: Port **8444**, Interface **1**, Certificate group **A** and Blacklist portal: Port **8444**, Interface **0**, Certificate group **B**.

- **Invalid combinations include**:
  - Sponsor portal: Port **8443**, Interface **0**, Certificate group **A** and My Devices portal: **8443**, Interface **0**, Certificate group **B**.
  - Sponsor portal: Port **8444**, Interface **0**, Certificate tag **A** and Blacklist portal: Port **8444**, Interface **0**, Certificate group **A**.

- **Allowed interfaces** — Select the PSN interfaces which a PAN can use to run a portal. When a request to open a portal is made on the PAN, the PAN looks for an available allowed Port on the PSN. You must configure the Ethernet interfaces using IP addresses on different subnets.
These interfaces must be available on all the PSNs, including VM-based ones, that have Policy Services turned on. This is a requirement because any of these PSNs can be used for the redirect at the start of the guest session.

- The Ethernet interfaces must use IP addresses on different subnets.

- The interfaces you enable here must be available on all your PSNs, including VM-based ones when Policy Services turned on. This is required because any of these PSNs can be used for a redirect at the start of the guest session.

- The portal certificate Subject Name / Alternate Subject Name must resolve to the interface IP.

- Configure `ip host x.x.x.x yyy.domain.com` in ISE CLI to map secondary interface IP to FQDN, which is used to match Certificate Subject Name / Alternate Subject Name.

- **Certificate group tag**—Pick a certificate group tag that specifies the certificate to use for the portal’s HTTPS traffic.

- **Fully Qualified Domain Name (FQDN)**—Enter at least one unique FQDN and/or hostname for your Sponsor or MyDevices portal. For example, you can enter `sponsorportal.yourcompany.com, sponsor`, so that when the user enters either of those into a browser, the sponsor portal displays. Separate names with commas, but do not include spaces between entries.

If you change the default FQDN, then also do the following:

- Update your DNS so that the FQDN of the new URL resolves to a valid Policy Services Node (PSN) IP address. Optionally, this address could point to a load balancer virtual IP address that serves a pool of PSNs.

- To avoid certificate warning messages due to name mismatches, include the FQDN of the customized URL, or a wildcard, in the subject alternative name (SAN) attribute of the local server certificate of the Cisco ISE PSN.

- **Identity source sequence**—Choose which identity source sequence (ISS) to use for user authentication. The ISS is a list of Identity Stores that are searched in sequence to verify user credentials. Some examples include: Internal Guest Users, Internal Users, Active Directory, LDAP Directory.

Cisco ISE includes a default sponsor Identity Source Sequence for sponsor portals, Sponsor_Portal_Sequence.

To configure an Identity Source Sequence, choose **Administration > Identity Management > Identity Source Sequences**.

- **Idle timeout**—Enter the time in minutes that you want Cisco ISE to wait before it logs out the user if there is no activity in the portal. The valid range is from 1 to 30 minutes.

- **Allow Kerberos**—Use Kerberos to authenticate a sponsor for access to the sponsor portal. Kerberos SSO is performed inside the secure tunnel after the browser establishes the SSL connection with ISE.
Kerberos authentication requires the following items to be in the same domain:

- Sponsor's PC
- ISE PSN
- FQDN configured for this sponsor portal

Note: Kerberos authentication is NOT supported for the Guest portal.

- Display Language
  - **Use browser locale**—Use the language specified in the client browser's locale setting as the display language of the portal. If browser locale's language is not supported by ISE, then the Fallback Language is used as the language portal.
  
  - **Fallback language**—Choose the language to use when language cannot be obtained from the browser locale, or if the browser locale language is not supported by ISE.
  
  - **Always use**—Choose the display language to use for the portal. This setting overrides the User browser locale option.

SSIDs available to sponsors—Enter the names or the SSIDs (Session Service Identifiers) of the networks that a sponsor can notify guests as the correct networks to connect to for their visit.

- **SSIDs available to sponsors**—Enter the names or the SSIDs (Session Service Identifiers) of the networks that a sponsor can notify guests as the correct networks to connect to for their visit.

## Login Settings for Sponsor Portals

### Login Page Settings for Sponsor Portals

The navigation path for this page is **Guest Access > Configure > Sponsor Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Login Page Settings**

- **Maximum failed login attempts before rate limiting**—Specify the number of failed login attempts from a single browser session before Cisco ISE starts to throttle that account. This does not cause an account lockout. The throttled rate is configured in **Time between login attempts when rate limiting**.

- **Time between login attempts when rate limiting**—Set the length of time in minutes that a user must wait before attempting to log in again (throttled rate), after failing to log in the number of times defined in **Maximum failed login attempts before rate limiting**.

- **Include an AUP**—Add a acceptable use policy page to the flow. You can add the AUP to the page, or link to another page. Adding this changes the picture of the flow on the right.

  - **require acceptance**—Force the user to agree to the AUP before continuing the flow.
Acceptable Use Policy (AUP) Settings for Sponsor Portals

The navigation path for this page is Guest Access > Configure > Sponsor Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Acceptable Use Policy (AUP) Page Settings.

Use these settings to define the AUP experience for the users (guests, sponsors or employees as applicable).

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include an AUP page</td>
<td>Display your company’s network-usage terms and conditions on a separate page to the user.</td>
</tr>
<tr>
<td>Require scrolling to end of AUP</td>
<td>Ensure that the user has read the AUP completely. The Accept button activates only after the user has scrolled to the end of the AUP.</td>
</tr>
<tr>
<td>On first login only</td>
<td>Display an AUP when the user logs into the network or portal for the first time only.</td>
</tr>
<tr>
<td>On every login</td>
<td>Display an AUP each time the user logs into the network or portal.</td>
</tr>
<tr>
<td>Every __ days (starting at first login)</td>
<td>Display an AUP periodically after the user first logs into the network or portal.</td>
</tr>
</tbody>
</table>

Sponsor Change Password Settings for Sponsor Portals

The navigation path for this page is Guest Access > Configure > Sponsor Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Sponsor Change Password Settings. Use these settings to define the password requirements for sponsors using the Sponsor portal.

To set the sponsor password policy, choose Administration > Identity Management > Settings > User Password Policy.

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow sponsors to change their own passwords</td>
<td>Allow sponsors to change their passwords after they log into the Sponsor portal. This option will display a Change Password page only if the sponsors are part of the Internal Users database.</td>
</tr>
</tbody>
</table>

Post-Login Banner Settings for Sponsor Portals

The navigation path for this page is Guest Access > Configure > Guest Portals or Sponsor Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Post-Login Banner Page Settings.
Use this setting to notify users (guests, sponsors or employees as applicable) of additional information after they log in successfully.

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include a Post-Login Banner page</td>
<td>Display additional information after the users successfully log in and before they are granted network access.</td>
</tr>
</tbody>
</table>

### Support Information Page Settings for Sponsor Portals

The navigation path for this page is **Guest Access > Configure > Sponsor Portals > Create, Edit or Duplicate > Portal Behavior and Flow Settings > Support Information Page Settings**.

Use these settings to display the information that your Help Desk can use to troubleshoot access issues experienced by users (guests, sponsors or employees as applicable).

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include a Support Information Page</td>
<td>Display a link to an information page, such as Contact Us, on all enabled pages for the portal.</td>
</tr>
<tr>
<td>MAC address</td>
<td>Include the MAC address of the device on the Support Information page.</td>
</tr>
<tr>
<td>IP address</td>
<td>Include the IP address of the device on the Support Information page.</td>
</tr>
<tr>
<td>Browser user agent</td>
<td>Include the browser details such as the product name and version, layout engine and version of the user agent originating the request on the Support Information page.</td>
</tr>
<tr>
<td>Policy server</td>
<td>Include the IP address of the ISE Policy Service Node (PSN) that is serving this portal on the Support Information page.</td>
</tr>
<tr>
<td>Failure code</td>
<td>If available, include the corresponding number from the log message catalog. You can access and view the message catalog by navigating to Administration &gt; System &gt; Logging &gt; Message Catalog.</td>
</tr>
<tr>
<td>Hide field</td>
<td>Do not display any field labels on the Support Information page if the information that they would contain is non-existent. For example, if the failure code is unknown, and therefore blank, do not display Failure code, even if it is selected.</td>
</tr>
<tr>
<td>Display label with no value</td>
<td>Display all selected field labels on the Support Information page, even if the information that they would contain is non-existent. For example, if the failure code is unknown, display Failure code, even if it is blank.</td>
</tr>
</tbody>
</table>
Notify Guests Customization for Sponsor Portals

The navigation path for these settings is Guest Access > Configure > Sponsor Portals > Create, Edit or Duplicate > Portal Page Customization > Notify Guests.

Under Page Customizations, you can customize the messages, titles, content, instructions, and field and button labels that appear on the notifications that sponsors send to guests from the Sponsor portal.

Under Settings, you can specify whether sponsors can send usernames and passwords separately to guests using email or SMS. You can also specify whether sponsors can display a Support Information page for guests to provide information that a help desk can use to troubleshoot access issues.

Manage and Approve Customization for Sponsor Portals

The navigation path for these settings is Guest Access > Configure > Sponsor Portals > Create, Edit or Duplicate > Portal Page Customization > Manage and Approve.

Under Page Customizations, you can customize the messages, titles, content, instructions, and field and button labels that appear on the Manage and Approve tabs of the Sponsor portal.

These include the accounts (registered and pending) summary and detailed views, the pop-up dialogs that display based on the operations the sponsor performs on guest accounts such as edit, extend, suspend and so on, and also general portal and account action messages.

Global Settings

Global Settings for Guest and Sponsor Portals

Choose Guest Access > Settings. You can configure the following general settings that apply to Guest and Sponsor portals, guest types, and sponsor groups in Cisco ISE:

- Policies for purging guest accounts and generating usernames and passwords.
- SMTP servers and SMS gateways to use when sending email and SMS notifications to guests and sponsors.
- Locations, time zones, SSIDs, and custom fields to select from when creating guest accounts and when registering guests using Self-Registration Guest portals.

Once you configure these global settings, you can use them as needed when configuring specific Guest and Sponsor portals, guest types, and sponsor groups.

The following tabs are on the Portal settings page:

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display label with default value</td>
<td>Display this text in any selected field on the Support Information page, if the information that they would contain is non-existent. For example, if you enter Not Available in this field, and the failure code is unknown, the Failure code displays Not Available.</td>
</tr>
</tbody>
</table>
• **Guest Account Purge Policy**—Schedule when to purge guest accounts that have expired. For more information, see Schedule When to Purge Expired Guest Accounts, on page 296.

• **Custom Fields**—Add custom fields to use in Guest portals, to retrieve additional information from users. For more information, see Add Custom Fields for Guest Account Creation, on page 297.

• **Guest Email Settings**—Decide whether to email notifications to guests about changes in their account. For more information, see Specify Email Addresses and SMTP Servers for Email Notifications, on page 297.

• **Guest Locations and SSIDs**—Configure the Locations and the Service Set Identifiers (SSIDs) of the networks that guests can use at these Locations. For more information, see Assign Guest Locations and SSIDs, on page 298.

• **Guest Username Policy**—Configure how guest user names are created. For more information, see Set the Guest Username Policy, on page 301 and Rules for Guest Password Policies, on page 299.

• **Guest Password Policy**—Define the guest password policies for all Guest and Sponsor portals. For more information, see Set the Guest Password Policy and Expiration, on page 300.

• **SMS Gateway Settings**—Define SMS gateways that will deliver SMS notifications to guests and sponsors. For more information, see Configure SMS Gateways to Send SMS Notifications to Guests, on page 302.

## Guest Type Settings

The navigation path for these settings is **Guest Access > Configure > Guest Types**. Use these settings to create the types of Guests that can access your network and their access privileges. You can also specify which Sponsor Groups can create this type of Guest.

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Guest type name</td>
<td>Provide a name (from 1-256 characters) that distinguishes this Guest Type from the default Guest Types and others that you create.</td>
</tr>
<tr>
<td>Description</td>
<td>Provide additional information (maximum of 2000 characters) about the recommended use of this Guest Type, for example, Use for self-registering Guests, Do NOT use for Guest account creation, etc.</td>
</tr>
<tr>
<td>Language File</td>
<td>Export or Import the language file to use for portals using this Guest Type.</td>
</tr>
<tr>
<td>Collect Additional Data</td>
<td>Select custom fields to collect additional information from Guests. Custom fields are managed on <strong>Guest Access &gt; Settings &gt; Custom Fields</strong>.</td>
</tr>
</tbody>
</table>
### Guest Type Settings

**Field** | **Usage Guidelines**
--- | ---
Maximum account duration | Enter the maximum number of days, hours or minutes that Guests of this Guest Type can access and stay connected to the network.
If you change this setting, your changes will not apply to existing Guest accounts created using this Guest Type.
Value ranges from 1 to 999.

Allow access only on these days and times | Enter the time ranges and select the days of the week to specify when this Guest Type can access the network. If this guest type remains connected outside these time parameters, they will be logged off. The time ranges are related to the time zones defined by the locations assigned to the guests using this Guest Type.
Click the + and - for adding and deleting restricted access times.

Maximum simultaneous logins | Enter the maximum number of user sessions that this Guest Type can have running concurrently.

When guest exceeds limit | When you select **Maximum simultaneous logins**, you also must also select the action to take when a user connects after that limit is reached.

**When the guest exceeds limit**
- **Don't connect**: Do not allow the latest login attempt to be successful.
- **Remove the oldest connection**: Disconnect the oldest user session that is running.

Maximum devices guests can register | Enter the maximum number of devices that can be registered to each Guest. You can set the limit to a number lower than what is already registered for the Guests of this Guest Type. This will only affect newly created Guest accounts.

Store device information in endpoint identity group | Choose an endpoint identity group to track guest devices. Cisco ISE provides the **GuestEndpoints** endpoint identity group to use as a default. You can also create more endpoint identity groups if you choose to not use the default.
<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purge endpoints in this identity group when they reach __ days old</td>
<td>Change the number of days since the registration of a user's device before it is purged from the Cisco ISE database. Purging is done on a daily basis and the purge activity is synchronized with the overall purge timing. The change is applied globally for this endpoint identity group. If changes are made to the Endpoint Purge Policy based on other policy conditions, this setting is no longer available for use.</td>
</tr>
<tr>
<td>Allow guest to bypass the Guest portal</td>
<td>Allows users to bypass the credentialed Guest captive portal (web authentication page) and access the network by providing credentials to wired and wireless (dot1x) supplicants or VPN clients. Guest accounts go to Active state bypassing the Awaiting Initial Login state and the AUP page, even if it is required. If you do not enable this setting, users must first log in through the credentialed Guest captive portal before they will be able to access other parts of the network.</td>
</tr>
<tr>
<td>Send account expiration notification __ days before account expires</td>
<td>Send a notification to Guests before their account expires and specify how many days, hours or minutes in advance of the expiration.</td>
</tr>
<tr>
<td>View messages in</td>
<td>Specify the language to use when displaying email or SMS notifications as you set them up.</td>
</tr>
<tr>
<td>Email</td>
<td>Select email as the method used for account expiry notification.</td>
</tr>
<tr>
<td>Use customization from</td>
<td>Select email customization from another portal.</td>
</tr>
<tr>
<td>Messages</td>
<td>Enter the text to use for account expiry notification.</td>
</tr>
<tr>
<td>Copy text from</td>
<td>Reuse email text that you created for another Guest Type for account expiry notification.</td>
</tr>
<tr>
<td>Send test email to me at</td>
<td>Ensure that the email notification displays as it should by sending it to your email address.</td>
</tr>
<tr>

Sponsor Group Settings

The navigation path for these settings is Guest Access > Configure > Sponsor Groups. Use these settings to add members to the sponsor group, define guest types and location privileges, and set permissions related to creating and managing guest accounts.

- **Disable Sponsor Group**—Disable members of this sponsor group from accessing the Sponsor portal.
  
  For instance, you may want to temporarily prevent sponsors from logging in to the Sponsor portal while configuration changes are being made in the Admin portal. Or, you may want to disable a sponsor group that is involved in infrequent activity, such as sponsoring guests for an annual convention, until the time they need to be activated again.

- **Sponsor group name**—Enter a unique name (from 1 to 256 characters).

- **Description**
  
  —Include useful information (maximum of 2000 characters) such as the guest types used by this sponsor group.

- **Members**—Click to display the Select Sponsor Group Members box, where you can select available user identity groups (from internal and external identity stores) and add them as members of this sponsor group.

- **Sponsor Group Members**—Search and filter the list of selected sponsor groups and delete any groups you do not want to include.

- **This sponsor group can create accounts using these guest types**—Specify the guest types that the members in this sponsor group can use when creating guest accounts. For a sponsor group to be enabled, it must have at least one guest type that it can use.

  If you assign only one guest type to this sponsor group, you can choose not to display it in the Sponsor portal since it is the only valid guest type available for use. Choose Guest Access > Configure > Sponsor Portal > Page Customization > Create Accounts > Guest Types > Settings. Check Hide guest type if only one is available to sponsor to enable this option.

- **Configure Guest Types**
  
  —If the guest type you need is not available, click Guest Access > Configure > Guest Types and create a new guest type or edit an existing one.

- **Select the locations that guests will be visiting**—Select the various locations sponsors in this group can assign to guests when creating their accounts. This helps define the valid time zones for these guest

<table>
<thead>
<tr>
<th>Field</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send test SMS to me at</td>
<td>Ensure that the text notification displays as it should by sending it to your cell phone.</td>
</tr>
<tr>
<td>These sponsor groups can create this guest type</td>
<td>Select which sponsor groups can create Guest accounts with this Guest Type. If you want to disable use of this Guest Type, do not assign it to any sponsor group. If you want to discontinue use of this Guest Type, delete the sponsor groups listed.</td>
</tr>
</tbody>
</table>
accounts and specifies all the time parameters that apply to the guest, such as valid access times, and so on. This does not prevent guests from connecting to the network from other locations.

For a sponsor group to be enabled, it must have at least one location that it can use.

If you assign only one location to this sponsor group, that is the only valid time zone for the guest accounts created by its members. By default, it does not display in the Sponsor portal.

**Sponsor Can Create**

- **Multiple guest accounts assigned to specific guests (Import)**—Enable the sponsor to create multiple guest accounts by importing guest details such as first name and last name from a file.

  If this option is enabled, the **Import** button displays on the Create Accounts page of the Sponsor portal. The Import option is only available on desktop browsers (not mobile), such as Internet Explorer, Firefox, Safari, and so forth

- **Limit to batch of**—If this sponsor group is allowed to create multiple accounts simultaneously, specify the number of guest accounts that can be created in a single import operation.

  Although a sponsor can create a maximum of 10,000 accounts, we recommend that you limit the number of accounts you create, due to potential performance issues.

- **Multiple guest accounts to be assigned to any guests (Random)**—Enable the sponsor to create multiple random guest accounts as placeholders for guests who are not known as yet, or to create many accounts quickly.

  If this option is enabled, the **Random** button displays on the Create Accounts page of the Sponsor portal.

- **Default username prefix**—Specify a username prefix that sponsors can use when creating multiple random guest accounts. If specified, this prefix appears in the Sponsor Portal when creating random guest accounts. In addition, if **Allow sponsor to specify a username prefix** is:

  - **Enabled**—The sponsor can edit the default prefix in the Sponsor portal.

  - **Not enabled**—The sponsor cannot edit the default prefix in the Sponsor portal.

  If you do not specify a username prefix or allow the sponsor to specify one, then the sponsor will not be able to assign username prefixes in the Sponsor portal.

- **Allow sponsor to specify a username prefix**—If this sponsor group is allowed to create multiple accounts simultaneously, specify the number of guest accounts that can be created in a single import operation.

  Although a sponsor can create a maximum of 10,000 accounts, we recommend that you limit the number of accounts you create, due to potential performance issues.

- **Start date can be no more than ___ days into the future**—Enable and specify the number of days within which sponsors have to set as the start date for the multiple guest accounts they have created.

**Sponsor Can Manage**

- **Only accounts sponsor has created**—Sponsors in this group can view and manage only the guest accounts that they have created, which is based on the Sponsor’s email account.

- **Accounts created by members of this sponsor group**—Sponsors in this group can view and manage the guest accounts created by any sponsor in this sponsor group.
• **All guest accounts**—Sponsors view and manage all pending guest accounts.

**Note**

Regardless of the group membership, all sponsors can see all pending accounts, unless you check **Approve and view requests from self-registering guests** with the option **Only pending accounts assigned to this sponsor** under **Sponsor Can**.

**Sponsor Can**

• **View guests’ passwords**—For guest accounts that they can manage, allow the sponsor to view the passwords.

  If the guest password was changed, the sponsor can no longer view it; unless the sponsor reset the password to a random password generated by Cisco ISE.

**Note**

If this option is disabled for a sponsor group, the members of that group cannot send email and SMS notifications regarding the login credentials (guest password) for the guest accounts that they manage.

• **Reset guest account passwords**—For guest accounts that they can manage, allow the sponsor to reset passwords for guests to a random password generated by Cisco ISE.

• **Extend guests’ accounts**—For guest accounts that they can manage, allow the sponsor to extend them beyond their expiration date. The sponsor is automatically copied on email notifications sent to guests regarding their account expiration.

• **Send SMS notifications with guests’ credentials**—For guest accounts that they can manage, allow the sponsor to send SMS (text) notifications to guests with their account details and login credentials.

• **Delete guests’ accounts**—For guest accounts that they can manage, allow the sponsor to delete the accounts, and prevent guests from accessing your company's network.

• **Suspend guests’ accounts**—For guest accounts that they can manage, allow the sponsor to suspend their accounts to prevent guests from logging in temporarily.

  This action also issues a Change of Authorization (CoA) Terminate to remove the suspended guests from the network.

• **Require sponsor to provide a reason**—Require the sponsor to provide an explanation for suspending the guest accounts.

• **Reinstate suspended guest accounts**—For guest accounts that they can manage, allow the sponsor to reinstate suspended accounts.

• **Approve requests from self-registering guests**—For guest accounts that they can manage, allow the sponsor to approve self-registering guests when they receive an email requesting their approval.

• **Approve and view requests from self-registering guests**—Sponsors who are included in this Sponsor Group can either view all pending account requests from self-registering guests (that require approval), or only the requests where the user entered the Sponsor's email address as the person being visited. This feature requires that the portal used by the Self-registering guest has **Require self-registered guests to be approved** checked, and the Sponsor's email is listed as the person to contact.
• **Access Cisco ISE guest accounts using the programmatic interface (Guest REST API)**—For guest accounts that they can manage, allow the sponsor to access guest accounts using the Guest REST API programming interface.
Web Portals Customization Reference

- Portal Pages Titles, Content and Labels Character Limits, on page 797
- Portal Customization, on page 799
- HTML Support for a Portal Language File, on page 800

Portal Pages Titles, Content and Labels Character Limits

There is a maximum and minimum range of characters you can enter in the titles, text boxes, instructions, field and button labels, and other visual elements on the Portal Page Customization tab.

Character Limits for Portal Pages Titles, Content and Labels

The navigation paths for these portal page UI elements are:

- For Guest portals, choose Guest Access > Configure > Guest Portals > Edit > Portal Page Customization > Pages.
- For Sponsor portals, choose Guest Access > Configure > Sponsor Portals > Edit > Portal Page Customization > Pages.
- For Device portals, choose Administration > Device Portal Management > (any Portals) > Edit > Portal Page Customization > Pages.

Use this information when you enter content in the titles, text boxes, instructions, field and button labels, and other visual elements of the portal page the you are customizing. These updates are applied only to the specific page that you are customizing.

Note
Whether you enter single-byte or multi-byte characters, you can only enter the maximum number of characters identified for a field. Multi-byte characters do not affect the character limit.

### Portal Customization

You can customize the appearance of the end-user web portals and the guest experience. If you have experience with the cascading style sheet (CSS) language and with Javascript, you can use the jQuery Mobile ThemeRoller application to customize portal themes by changing the portal page layout.

You can view all the fields by exporting the CSS theme or language properties from the required portal page. Refer to the Export a Portal’s Default Theme CSS File for more information.

### CSS Classes and Descriptions for End-User Portals Page Layout

Use these CSS classes to define and modify the page layout of the Cisco ISE end-user web portals.

<table>
<thead>
<tr>
<th>CSS Class Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cisco-ise-banner</td>
<td>Includes logos, banner image, and banner text. On the Sponsor and My Devices portals, this class also contains buttons that can activate a context menu. For example, the menu can bring up a pop-up window with options to Log Out, Change Password, and so on.</td>
</tr>
<tr>
<td>cisco-ise-body</td>
<td>Contains all page elements that are not part of the banner.</td>
</tr>
<tr>
<td>cisco-ise-optional-content-1</td>
<td>Empty by default. You can add text, links, and HTML and Javascript code.</td>
</tr>
<tr>
<td>cisco-ise-main-content</td>
<td>Includes the main contents of the portal page, such as instructional text, action buttons, and the cisco-ise-footer container.</td>
</tr>
<tr>
<td>cisco-ise-optional-content-2</td>
<td>Empty by default. You can add text, links, and HTML and Javascript code.</td>
</tr>
<tr>
<td>cisco-ise-footer</td>
<td>Part of the footer, it is a placeholder for links such as Contact Support and online Help.</td>
</tr>
<tr>
<td>cisco-ise-footer-text</td>
<td>Empty by default. It is a placeholder for anything that you want to display at the bottom of the portal page, such as a copyright notice or a disclaimer.</td>
</tr>
</tbody>
</table>
HTML Support for a Portal Language File

The zipped language file for each portal includes the default language properties files for that portal. Each properties file includes dictionary keys that define the content that displays on the portal.

You can customize the text that displays on a portal, including the content in the Instructional Text, Content, Optional Content 1, and Optional Content 2 text boxes. Some of these text boxes have default content and some are empty.

Only some of these dictionary keys associated with these text boxes support HTML in their values (text).

HTML Support for the Blacklist Portal Language File

The navigation path to this portal's Instructional Text, Content, Optional Content 1, and Optional Content 2 text boxes is Administration > Device Portal Management > Blacklist Portal > Edit > Portal Page
Customization > Pages. You can use the View HTML Source icon in the mini-editor of the text boxes and add HTML code in your content.

These dictionary keys in the portal’s language properties files support HTML in their text.

**Note**

This is not a complete list of the dictionary keys in the files.

- key.blacklist.ui_reject_message

### HTML Support for Bring Your Own Device Portals Language Files

The navigation path to this portal’s Instructional Text, Content, Optional Content 1, and Optional Content 2 text boxes is Administration > Device Portal Management > BYOD Portals > Edit > Portal Page Customization > Pages. You can use the View HTML Source icon in the mini-editor of the text boxes and add HTML code in your content.

These dictionary keys in the portal’s language properties files support HTML in their text.

**Note**

This is not a complete list of the dictionary keys in the files.

- key.guest.ui_contact_instruction_message
- key.guest.ui_byod_welcome_optional_content_1
- key.guest.ui_byod_welcome_optional_content_2
- key.guest.ui_byod_reg_limit_message
- key.guest.ui_byod_reg_content_message
- key.guest.ui_byod_success_manual_reconnect_message

- Endpoint Profiling Policies Settings, on page 816
- Dictionaries, on page 821
- Conditions, on page 822
- Results, on page 835

Authentication

This section describes the authentication policy page, which allows you to configure simple and rule-based authentication policies.

Simple Authentication Policy Configuration Settings

The following table describes the fields in the simple authentication policy page, which allows you to configure simple authentication policies. The navigation path for this page is: Policy > Authentication.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network Access Service</td>
<td>Choose an allowed protocol that you have already created.</td>
</tr>
<tr>
<td>Identity Source</td>
<td>Choose the identity source that you want to use for authentication. You can also choose an identity source sequence if you have configured it.</td>
</tr>
<tr>
<td></td>
<td>You can edit the default identity source that you want Cisco ISE to use in case none of the identity sources defined in this rule match the request.</td>
</tr>
</tbody>
</table>
Rule-Based Authentication Policy Configuration Settings

The following table describes the fields in the rule-based authentication policy page, which allows you to configure simple authentication policies. The navigation path for this page is: Policy > Authentication > Rule-Based.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Choose the status of this policy. It can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Enabled—This policy condition is active.</td>
</tr>
<tr>
<td></td>
<td>• Disabled—This policy condition is inactive and will not be evaluated.</td>
</tr>
<tr>
<td></td>
<td>• Monitor Only—This policy condition will be evaluated, but the result will not be enforced.</td>
</tr>
<tr>
<td></td>
<td>You can view the results of this policy condition in the Live Log authentication page. In this, see the detailed report which will have the monitored step and attribute. For example, you may want to add a new policy condition, but are not sure if the condition would provide you with the correct results. In this situation, you can create the policy condition in monitored mode to view the results and then enable it if you are satisfied with the results.</td>
</tr>
</tbody>
</table>

Standard Rule  | Enter a name for this policy and select condition and allowed protocol.   |

</thead>
</table>

### Usage Guidelines

Click the plus [+] sign to expand the Conditions anchored overlay, and click the minus [-] sign, or click outside the anchored overlay to close it:

- **Select Existing Condition from Library or Create New Condition (Advanced Option)**

- **Select Existing Condition from Library**—You can define an expression by selecting Cisco predefined conditions from the policy elements library.

- **Create New Condition (Advanced Option)**—You can define an expression by selecting attributes from various system or user-defined dictionaries.
### Fields

| Select Existing Condition from Library |

### Usage Guidelines

You can do the following:

1. You can choose the predefined conditions that you would have defined for authentication in the policy elements, and then use an AND or OR operator to add multiple conditions.

   You cannot select certain predefined conditions that contain the following dictionaries or attributes:

   - Dictionary "Certificate", with any attribute
   - Dictionary "Network Access", with the following attributes:
     - Device IP Address
     - ISE Host Name
     - NetworkDeviceName
     - Protocol
     - UseCase

   In case such conditions are available, the first entry in the select box will be "Only relevant conditions are selectable".

2. Click the Action icon to do the following in the subsequent steps:

   - Add Attribute/Value—You can add ad-hoc attribute/value pairs
   - Add Condition from Library—You can add Cisco predefined conditions
   - Duplicate—Create a copy of the selected condition
   - Add Condition to Library—You can save ad-hoc attribute/value pairs that you create to the policy elements library
   - Delete—Delete the selected condition

Endpoint Profiling Policies Settings

The following table describes the fields in the Endpoint Policies page. The navigation path for this page is: Policy > Profiling > Profiling Policies.
### Table 107: Endpoint Profiling Policies Settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the endpoint profiling policy that you want to create.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter the description of the endpoint profiling policy that you want to create.</td>
</tr>
<tr>
<td>Policy Enabled</td>
<td>By default, the <strong>Policy Enabled</strong> check box is checked to associate a matching profiling policy when you profile an endpoint. When unchecked, the endpoint profiling policy is excluded when you profile an endpoint.</td>
</tr>
<tr>
<td>Minimum Certainty Factor</td>
<td>Enter the minimum value that you want to associate with the profiling policy. The default value is 10.</td>
</tr>
<tr>
<td>Exception Action</td>
<td>Choose an exception action, which you want to associate with the conditions when defining a rule in the profiling policy. The default is NONE. The exception actions are defined in the following location: Policy &gt; Policy Elements &gt; Results &gt; Profiling &gt; Exception Actions.</td>
</tr>
<tr>
<td>Network Scan (NMAP) Action</td>
<td>Choose a network scan action from the list, which you want to associate with the conditions when defining a rule in the profiling policy, if required. The default is NONE. The exception actions are defined in the following location: Policy &gt; Policy Elements &gt; Results &gt; Profiling &gt; Network Scan (NMAP) Actions.</td>
</tr>
</tbody>
</table>
| Create an Identity Group for the policy | Check one of the following options to create an endpoint identity group:  
  - Yes, create matching Identity Group  
  - No, use existing Identity Group hierarchy  |
<p>| Yes, create matching Identity Group | Choose this option to use an existing profiling policy. This option creates a matching identity group for those endpoints and the identity group will be the child of the Profiled endpoint identity group when an endpoint profile matches an existing profiling policy. For example, the Xerox-Device endpoint identity group is created in the Endpoints Identity Groups page when endpoints discovered on your network match the Xerox-Device profile. |</p>
<table>
<thead>
<tr>
<th><strong>Fields</strong></th>
<th><strong>Usage Guidelines</strong></th>
</tr>
</thead>
</table>
| No, use existing Identity Group hierarchy | Check this check box to assign endpoints to the matching parent endpoint identity group using hierarchical construction of profiling policies and identity groups.  
This option allows you to make use of the endpoint profiling policies hierarchy to assign endpoints to one of the matching parent endpoint identity groups, as well as to the associated endpoint identity groups to the parent identity group.  
For example, endpoints that match an existing profile are grouped under the appropriate parent endpoint identity group. Here, endpoints that match the Unknown profile are grouped under Unknown, and endpoints that match an existing profile are grouped under the Profiled endpoint identity group. For example,  
• If endpoints match the Cisco-IP-Phone profile, then they are grouped under the Cisco-IP-Phone endpoint identity group.  
• If endpoints match the Workstation profile, then they are grouped under the Workstation endpoint identity group.  
The Cisco-IP-Phone and Workstation endpoint identity groups are associated to the Profiled endpoint identity group in the system. |
| Parent Policy | Choose a parent profiling policy that are defined in the system to which you want to associate the new endpoint profiling policy.  
You can choose a parent profiling policy from which you can inherit rules and conditions to its child. |
| Associated CoA Type | Choose one of the following CoA types that you want to associate with the endpoint profiling policy:  
• No CoA  
• Port Bounce  
• Reauth  
• Global Settings that is applied from the profiler configuration set in Administration > System > Settings > Profiling |
## Usage Guidelines

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rules</td>
<td>One or more rules that are defined in endpoint profiling policies determine the matching profiling policy for endpoints, which allows you to group endpoints according to their profiles. One or more profiling conditions from the policy elements library are used in rules for validating endpoint attributes and their values for the overall classification.</td>
</tr>
</tbody>
</table>
| Conditions   | Click the plus [+] sign to expand the Conditions anchored overlay, and click the minus [-] sign, or click outside the anchored overlay to close it. Click **Select Existing Condition from Library** or **Create New Condition (Advanced Option)**. **Select Existing Condition from Library**---You can define an expression by selecting Cisco predefined conditions from the policy elements library. **Create New Condition (Advanced Option)**---You can define an expression by selecting attributes from various system or user-defined dictionaries. You can associate one of the following with the profiling conditions:  
  - An integer value for the certainty factor for each condition  
  - Either an exception action or a network scan action for that condition  
Choose one of the following predefined settings to associate with the profiling condition:  
  - Certainty Factor Increases---Enter the certainty value for each rule, which can be added for all the matching rules with respect to the overall classification.  
  - Take Exception Action---Triggers an exception action that is configured in the Exception Action field for this endpoint profiling policy.  
  - Take Network Scan Action---Triggers a network scan action that is configured in the Network Scan (NMAP) Action field for this endpoint profiling policy. |
<table>

# Dictionaries

This section describes RADIUS vendor dictionaries used in Cisco ISE.

The following table describes the fields in the Dictionary page for RADIUS vendors, which allows you to configure dictionary attributes for the RADIUS vendors. The navigation path for this page is: Policy > Policy Elements > Dictionaries > System > RADIUS > RADIUS Vendors.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute Name</td>
<td>Enter the vendor specific attribute name for the selected RADIUS vendor.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description for the vendor specific attribute.</td>
</tr>
<tr>
<td>Internal Name</td>
<td>Enter the name for the vendor specific attribute that refers to it internally in the database.</td>
</tr>
<tr>
<td>Data Type</td>
<td>Choose one of the following data types for the vendor specific attribute:</td>
</tr>
<tr>
<td></td>
<td>• STRING</td>
</tr>
<tr>
<td></td>
<td>• OCTET_STRING</td>
</tr>
<tr>
<td></td>
<td>• UNIT32</td>
</tr>
<tr>
<td></td>
<td>• UNIT64</td>
</tr>
<tr>
<td></td>
<td>• IPV4</td>
</tr>
<tr>
<td>Enable MAC option</td>
<td>Check this check box to enable the comparison of RADIUS attribute as MAC address. By default, for the RADIUS attribute calling-station-id this option is marked as enabled and you cannot disable it. For other dictionary attributes (of string types) within the RADIUS vendor dictionary, you can enable or disable this option. Once you enable this option, while setting the authentication and authorization conditions, you can define whether the comparison is clear string by selecting the Text option or whether it is MAC address by selecting the MAC address option.</td>
</tr>
<tr>
<td>Direction</td>
<td>Choose one of the options that applies to RADIUS messages:</td>
</tr>
<tr>
<td>ID</td>
<td>Enter the vendor attribute ID. The valid range is 0 to 255.</td>
</tr>
</tbody>
</table>
**Conditions**

This section describes policy conditions used for profiling endpoints, posture clients, and to limit or extend permission to access to Cisco ISE system resources.

**Profiler Condition Settings**

The following table describes the fields in the Profiler Condition page. The navigation path for this page is: **Policy > Policy Elements > Conditions > Profiling.**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the profiler condition.</td>
</tr>

Results

This section describes requirements for Cisco ISE services.

Allowed Protocols

The following table describes the fields in the Allowed Protocols page, which allows you to configure the protocols to be used during authentication. The navigation path for this page is: Policy > Policy Elements > Results > Authentication > Allowed Protocols.

In the following table, PAC stands for Protected Access Credentials.

Table 120: Allowed Protocols

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowed Protocols &gt; Authentication Bypass</td>
<td>Check this check box if you want Cisco ISE to process the Host Lookup request. The Host Lookup request is processed for PAP/CHAP protocol when the RADIUS Service-Type equals 10 (Call-Check) and the username is equal to Calling-Station-ID. The Host Lookup request is processed for EAP-MD5 protocol when the Service-Type equals 1 (Framed) and the username is equal to Calling-Station-ID. Uncheck this check box if you want Cisco ISE to ignore the Host Lookup request and use the original value of the system username attribute for authentication. When unchecked, message processing is done according to the protocol (for example, PAP). <strong>Note</strong> Unchecking the Process Host Lookup box could result in the failure of existing MAB authentications.</td>
</tr>
<tr>
<td>Process Host Lookup</td>
<td>This option enables PAP/ASCII. PAP uses cleartext passwords (that is, unencrypted passwords) and is the least secure authentication protocol.</td>
</tr>
<tr>
<td>Allowed Protocols &gt; Authentication Protocols</td>
<td>This option enables CHAP authentication. CHAP uses a challenge-response mechanism with password encryption. CHAP does not work with Microsoft Active Directory.</td>
</tr>
<tr>
<td>Allow PAP/ASCII</td>
<td></td>
</tr>
<tr>
<td>Allow CHAP</td>
<td></td>
</tr>
<tr>
<td>Fields</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow MS-CHAPv1</td>
<td>Check this check box to enable MS-CHAPv1.</td>
</tr>
<tr>
<td>Allow MS-CHAPv2</td>
<td>Check this check box to enable MS-CHAPv2.</td>
</tr>
<tr>
<td>Allow EAP-MD5</td>
<td>Check this check box to enable EAP-based MD5 password hashed authentication.</td>
</tr>
<tr>
<td>Allow EAP-TLS</td>
<td>Check this check box to enable EAP-TLS Authentication protocol and configures EAP-TLS settings. You can specify how Cisco ISE will verify the user identity as presented in the EAP identity response from the end-user client. User identity is verified against information in the certificate that the end-user client presents. This comparison occurs after an EAP-TLS tunnel is established between Cisco ISE and the end-user client. Note EAP-TLS is a certificate-based authentication protocol. EAP-TLS authentication can occur only after you have completed the required steps to configure certificates. • Allow authentication of expired certificates to allow certificate renewal in Authorization Policy—Check this check box, if you want to allow users to renew certificates. If you check this check box, ensure that you configure appropriate authorization policy rules to check if the certificate has been renewed before processing the request any further.</td>
</tr>
<tr>
<td>Allow LEAP</td>
<td>Check this check box to enable Lightweight Extensible Authentication Protocol (LEAP) authentication.</td>
</tr>
<tr>
<td>Fields</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>---------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow PEAP</td>
<td>Check this check box to enable PEAP authentication protocol and PEAP settings. The default inner method is MS-CHAPv2. When you check the Allow PEAP check box, you can configure the following PEAP inner methods:</td>
</tr>
<tr>
<td></td>
<td>• Allow EAP-MS-CHAPv2—Check this check box to use EAP-MS-CHAPv2 as the inner method.</td>
</tr>
<tr>
<td></td>
<td>• Allow Password Change—Check this check box for Cisco ISE to support password changes.</td>
</tr>
<tr>
<td></td>
<td>• Retry Attempts—Specifies how many times Cisco ISE requests user credentials before returning login failure. Valid values are 0 to 3.</td>
</tr>
<tr>
<td></td>
<td>• Allow EAP-GTC—Check this check box to use EAP-GTC as the inner method.</td>
</tr>
<tr>
<td></td>
<td>• Allow Password Change—Check this check box for Cisco ISE to support password changes.</td>
</tr>
<tr>
<td></td>
<td>• Retry Attempts—Specifies how many times Cisco ISE requests user credentials before returning login failure. Valid values are 0 to 3.</td>
</tr>
<tr>
<td></td>
<td>• Allow EAP-TLS—Check this check box to use EAP-TLS as the inner method.</td>
</tr>
<tr>
<td></td>
<td>• Allow Password Change—Check this check box for Cisco ISE to support password changes.</td>
</tr>
<tr>
<td></td>
<td>• Retry Attempts—Specifies how many times Cisco ISE requests user credentials before returning login failure. Valid values are 0 to 3.</td>
</tr>
<tr>
<td></td>
<td>• Allow PEAPv0 only for legacy clients—Check this check box to allow PEAP supplicants to negotiate using PEAPv0. Some legacy clients do not conform to the PEAPv1 protocol standards. To ensure that such PEAP conversations are not dropped, check this check box.</td>
</tr>
<tr>
<td></td>
<td>Check the <strong>Allow authentication of expired certificates to allow certificate renewal in Authorization Policy</strong> check box, if you want to allow users to renew certificates. If you check this check box, ensure that you configure appropriate authorization policy rules to check if the certificate has been renewed before processing the request any further.</td>
</tr>
</tbody>
</table>

**Allowed Protocols**
<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow EAP-FAST</td>
<td></td>
</tr>
<tr>
<td>Fields</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>----------------</td>
<td>------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Check this check box to enable EAP-FAST authentication protocol and EAP-FAST settings. The EAP-FAST protocol can support multiple internal protocols on the same server. The default inner method is MS-CHAPv2. When you check the Allow EAP-FAST check box, you can configure EAP-FAST as the inner method:</td>
</tr>
<tr>
<td>Allow EAP-MS-CHAPv2</td>
<td>• Allow Password Change—Check this check box for Cisco ISE to support password changes.</td>
</tr>
<tr>
<td>Allow EAP-GTC</td>
<td>• Retry Attempts—Specifies how many times Cisco ISE requests user credentials before returning login failure. Valid values are 0-3.</td>
</tr>
<tr>
<td>Allow EAP-TLS</td>
<td>• Use PACs—Choose this option to configure Cisco ISE to provision authorization PACs for EAP-FAST clients. Additional PAC options appear.</td>
</tr>
<tr>
<td>Don't use PACs</td>
<td>• Don't use PACs—Choose this option to configure Cisco ISE to use EAP-FAST without issuing or accepting any tunnel or machine PACs. All requests for PACs are ignored and Cisco ISE responds with a Success-TLV without a PAC. When you choose this option, you can configure Cisco ISE to perform machine authentication.</td>
</tr>
<tr>
<td>Allow EAP Chaining</td>
<td>• Enable EAP Chaining—Check this check box</td>
</tr>
</tbody>
</table>

Check the **Allow authentication of expired certificates to allow certificate renewal in Authorization Policy** check box, if you want to allow users to renew certificates. If you check this check box, ensure that you configure appropriate authorization policy rules to check if the certificate has been renewed before processing the request any further.
to enable EAP chaining.

EAP chaining allows Cisco ISE to correlate the results of user and machine authentication and apply the appropriate authorization policy using the EAPChainingResult attribute.

EAP chaining requires a supplicant that supports EAP chaining on the client device. Choose the User and Machine Authentication option in the supplicant.

EAP chaining is available when you choose the EAP-FAST protocol (both in PAC based and PAC less mode).

For PAC-based authentication, you can use user authorization PAC or machine authorization PAC, or both to skip the inner method.

For certificate-based authentication, if you enable the Accept Client Certificate for Provisioning option for the EAP-FAST protocol (in the Allowed Protocol service), and if the endpoint (AnyConnect) is configured to send the user certificate inside the tunnel, then during tunnel establishment, ISE authenticates the user using the certificate (the inner method is skipped), and machine authentication is done through the inner method. If these options are not configured, EAP-TLS is used as the inner method for user authentication.

After you enable EAP chaining, update your authorization policy and add a condition using the NetworkAccess:EapChainingResult attribute and assign appropriate permissions. For example:

- If EapChainingResult equal User and machine both succeeded - Full access
- If EapChainingResult equal User passed and machine failed - Restricted access
- If EapChainingResult equal User failed and machine passed - Restricted access
- If EapChainingResult equal User and machine both failed - Authentication fails. Cisco ISE does not process the authorization policy and sends a reject access message.
Fields | Usage Guidelines
---|---
Preferred EAP Protocol | Check this check box to choose your preferred EAP protocols from any of the following options: EAP-FAST, PEAP, LEAP, EAP-TLS, EAP-TTLS, and EAP-MD5. If you do not specify the preferred protocol, EAP-TLS is used by default.

**Related Topics**

Define Allowed Protocols for Network Access, on page 420

**PAC Options**

The following table describes the fields after you select Use PACs in the Allowed Protocols Services List page. The navigation path for this page is: Policy > Policy Elements > Results > Authentication > Allowed Protocols.
### Table 121: PAC Options

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use PAC</td>
<td></td>
</tr>
</tbody>
</table>
### PAC Options

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Tunnel PAC Time To Live—the Time to Live (TTL) value restricts the lifetime of the PAC. Specify the lifetime value and units. The default is 90 days. The range is between 1 and 1825 days.</td>
<td></td>
</tr>
<tr>
<td>• Proactive PAC Update When: &lt;n%&gt; of PAC TTL is Left—the Update value ensures that the client has a valid PAC. Cisco ISE initiates an update after the first successful authentication but before the expiration time that is set by the TTL. The update value is a percentage of the remaining time in the TTL. The default is 90%.</td>
<td></td>
</tr>
<tr>
<td>• Allow Anonymous In-band PAC Provisioning—Check this check box for Cisco ISE to establish a secure anonymous TLS handshake with the client and provision it with a PAC by using phase zero of EAP-FAST with EAP-MSCHAPv2. To enable anonymous PAC provisioning, you must choose both of the inner methods, EAP-MSCHAPv2 and EAP-GTC.</td>
<td></td>
</tr>
<tr>
<td>• Allow Authenticated In-band PAC Provisioning—Cisco ISE uses SSL server-side authentication to provision the client with a PAC during phase zero of EAP-FAST. This option is more secure than anonymous provisioning but requires that a server certificate and a trusted root CA be installed on Cisco ISE. When you check this option, you can configure Cisco ISE to return an Access-Accept message to the client after successful authenticated PAC provisioning.</td>
<td></td>
</tr>
<tr>
<td>• Server Returns Access Accept After Authenticated Provisioning—Check this check box if you want Cisco ISE to return an access-accept package after authenticated PAC provisioning.</td>
<td></td>
</tr>
<tr>
<td>• Allow Machine Authentication—Check this check box for Cisco ISE to provision an end-user client with a machine PAC and perform machine authentication (for end-user clients who do not have the machine credentials). The machine PAC can be provisioned to the client by request (in-band) or by the administrator (out-of-band). When Cisco ISE receives a valid machine PAC from the end-user client, the machine identity</td>
<td></td>
</tr>
</tbody>
</table>
### Usage Guidelines

Details are extracted from the PAC and verified in the Cisco ISE external identity source. Cisco ISE only supports Active Directory as an external identity source for machine authentication. After these details are correctly verified, no further authentication is performed.

When you check this option, you can enter a value for the amount of time that a machine PAC is acceptable for use. When Cisco ISE receives an expired machine PAC, it automatically reprovisions the end-user client with a new machine PAC (without waiting for a new machine PAC request from the end-user client).

- **Enable Stateless Session Resume**—Check this checkbox for Cisco ISE to provision authorization PACs for EAP-FAST clients and skip phase two of EAP-FAST (default = enabled).

Uncheck this checkbox in the following cases:

- If you do not want Cisco ISE to provision authorization PACs for EAP-FAST clients
- To always perform phase two of EAP-FAST

When you check this option, you can enter the authorization period of the user authorization PAC. After this period, the PAC expires. When Cisco ISE receives an expired authorization PAC, it performs phase two EAP-FAST authentication.

## Authorization Profile Settings

The following table describes the fields in the Standard Authorization Profiles page. The navigation path for this page is: **Policy** > **Policy Elements** > **Results** > **Authorization** > **Authorization Profiles**.

### Table 122: Authorization Profile settings

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name that identifies the new authorization profile.</td>
</tr>
<tr>
<td>Fields</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the authorization profile.</td>
</tr>
<tr>
<td>Access Type</td>
<td>Choose the access type options (ACCESS_ACCEPT or ACCESS_REJECT).</td>
</tr>
<tr>
<td>Service Template</td>
<td>Check the check box to enable Cisco ISE to support sessions connecting from SAnet capable devices. ISE implements service templates as authorization profiles that contain a special flag that marks them as “Service Template” compatible. This way, the service template, which is also an authorization profile, can be used in a single policy to support connection with SAnet as well as non-SAnet devices.</td>
</tr>
<tr>
<td>Common Tasks</td>
<td></td>
</tr>
<tr>
<td>DACL Name</td>
<td>Check the check box and choose existing downloadable ACL options available (for example, Cisco ISE provides two default values in the drop-down list: PERMIT_ALL_TRAFFIC or DENY_ALL_TRAFFIC). The list will include all current DACLs in the local database.</td>
</tr>
<tr>
<td>VLAN</td>
<td>Check the check box and enter an attribute value that identifies a virtual LAN (VLAN) ID that you want associated with the new authorization profile you are creating (both integer and string values are supported for the VLAN ID). The format for this entry would be Tunnel-Private-Group-ID:VLANnumber. <strong>Note</strong> If you do not select a VLAN ID, Cisco ISE uses a default value of VLAN ID = 1. For example, if you only entered 123 as your VLAN number, the Attributes Details pane reflects the following value: Tunnel-Private-Group-ID = 1:123.</td>
</tr>
<tr>
<td>Voice Domain Permission</td>
<td>Check the check box to enable the vendor-specific attribute (VSA) of “cisco-av-pair” to be associated with a value of “device-traffic-class=voice”. In a multi-domain authorization mode, if the network switch receives this VSA, the endpoint is placed on to a voice domain after authorization.</td>
</tr>
<tr>
<td>Fields</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>--------</td>
<td>------------------</td>
</tr>
<tr>
<td>Posture Discovery</td>
<td>Check the check box to enable a redirection process used for Posture discovery in Cisco ISE, and enter an ACL on the device that you want to associate with this authorization profile. For example, if the value you entered is acl119, this is reflected in the Attributes Details pane as: <code>cisco-av-pair=url-redirect-acl=acl119</code>. The Attributes Details pane also displays: <code>cisco-av-pair=url-redirect=https://ip:8443/guestportal/gateway?sessionid=SessionValueIdValue&amp;action=cpp</code>.</td>
</tr>
<tr>
<td>Centralized Web Authentication</td>
<td>Check the check box to enable a redirection process that is similar to Posture discovery, but it redirects guest user access requests to the Guest server in Cisco ISE. Enter an ACL on the device that you want to associate with this authorization profile, and select Default or Manual as the redirect option. For example, if the value you entered is acl-999, this is reflected in the Attributes Details pane as: <code>cisco-av-pair=url-redirect-acl=acl-999</code>. The Attributes Details pane also displays: <code>cisco-av-pair=url-redirect=https://ip:8443/guestportal/gateway?sessionid=SessionValueIdValue&amp;action=cwa</code>. Check the Static IP/Host Name check box to specify an exact IP address or hostname to which you want the user to be redirected to. If this check box is not checked, the user will be redirected to the FQDN of the policy service node that received this request.</td>
</tr>
<tr>
<td>Web Redirection (CWA, DRW, MDM, NSP, CPP)</td>
<td>Check the check box to enable Auto SmartPort functionality and enter a corresponding event name value in the text box. This enables the VSA <code>cisco-av-pair</code> with a value for this option as “auto-smart-port=event_name”. Your choice is reflected in the Attributes Details pane.</td>
</tr>
<tr>
<td>Auto SmartPort</td>
<td>Check the check box to enable a RADIUS filter attribute that sends the ACL name that you define in the text box (which is automatically appended with “.in”). Your choice is reflected in the Attributes Details pane.</td>
</tr>
<tr>
<td>Fields</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Reauthentication</td>
<td>Check the check box and enter a value in seconds for maintaining connectivity during reauthentication. You can also choose attribute values from the Timer drop-down list. You choose to maintain connectivity during reauthentication by choosing to use either the default (a value of 0) or <strong>RADIUS-Request</strong> (a value of 1). Setting this to the RADIUS-Request value maintains connectivity during the reauthentication process.</td>
</tr>
<tr>
<td>MACSec Policy</td>
<td>Check the check box to enable the MACSec encryption policy whenever a MACSec-enabled client connects to Cisco ISE, and choose one of the following three options: <strong>must-secure</strong>, <strong>should-secure</strong>, or <strong>must-not-secure</strong>. For example, your choice is reflected in the Attributes Details pane as: cisco-av-pair = linksec-policy=must-secure.</td>
</tr>
<tr>
<td>NEAT</td>
<td>Check the check box to enable Network Edge Access Topology (NEAT), a feature that extends identity recognition between networks. Checking this check box displays the following value in the Attributes Details pane: cisco-av-pair = device-traffic-class=switch.</td>
</tr>
<tr>
<td>Web Authentication (Local Web Auth)</td>
<td>Check the check box to enable local web authentication for this authorization profile. This value lets the switch recognize authorization for web authentication by Cisco ISE sending a VSA along with a DACL. The VSA is cisco-av-pair = priv-lvl=15 and this is reflected in the Attributes Details pane.</td>
</tr>
<tr>
<td>Wireless LAN Controller (WLC)</td>
<td>Check the check box and enter an ACL name in the text field. This value is used in a required Airespace VSA to authorize the addition of a locally defined ACL to a connection on the WLC. For example, if you entered rsa-1188, this would be reflected in the Attributes Details pane as: Airespace-ACL-Name = rsa-1188.</td>
</tr>
<tr>
<td>ASA VPN</td>
<td>Check the check box to enable an Adaptive Security Appliances (ASA) VPN group policy. From the Attribute list, choose a value to configure this setting.</td>
</tr>
<tr>
<td>Advanced Attributes Settings</td>
<td></td>
</tr>
<tr>
<td>Dictionaries</td>
<td>Click the down-arrow icon to display the available options in the Dictionaries window. Click to select the desired dictionary and attribute to configure in the first field.</td>
</tr>
</tbody>
</table>
Profiling Exception Action Settings

The following table describes the fields in the New Profiler Exception Action page. The navigation path for this page is: **Policy > Policy Elements > Results > Profiling > Exception Actions**.

### Table 123: Creating an Exception Action

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the exception action that you want to create.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter the description of the exception action that you want to create.</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>CoA Action to enforce CoA</td>
<td>Check the <strong>CoA Action</strong> check box to enforce CoA. When you associate an exception action in the endpoint profiling policy and enforce a CoA, you must configure CoA globally in Cisco ISE that can be done in the following location: <strong>Administration &gt; System &gt; Settings &gt; Profiling.</strong></td>
</tr>
<tr>
<td>Policy Assignment</td>
<td>Click the <strong>Policy Assignment</strong> drop-down list that displays endpoint profiling policies that are configured in Cisco ISE, and choose the profiling policy against which the endpoint will be profiled when the exception action is triggered, regardless of its matched value.</td>
</tr>
</tbody>
</table>
| System Type                   | Exception Actions can be any one of the following types:  
  - Cisco Provided—Includes AuthorizationChange, EndpointDelete, and FirstTimeProfile  
  - Administrator Created—Includes that are created by you as an administrator of Cisco ISE. |

## File Remediation

The following table describes the fields in the File Remediation page. The navigation path is: **Policy > Policy Elements > Results > Posture > Remediation Actions > File Remediation.**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Remediation Name</td>
<td>Enter a name for the file remediation. Once created and saved, you cannot edit the name of the file remediation.</td>
</tr>
<tr>
<td>File Remediation Description</td>
<td>Enter a description for the file remediation.</td>
</tr>
<tr>
<td>Version</td>
<td>Enter the file version.</td>
</tr>
<tr>
<td>File to upload</td>
<td>Click <strong>Browse</strong> to locate the name of the file to be uploaded to the Cisco ISE server. This is the file that will be downloaded to the client when the file remediation action is triggered.</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td>Interval (in seconds)</td>
<td>Enter the time interval in seconds that clients can try to remediate after previous attempts.</td>
</tr>
<tr>
<td>Retry Count</td>
<td>Enter the number of attempts that Windows clients can try for Windows updates.</td>
</tr>
<tr>
<td>Windows Update Setting</td>
<td>Choose from the following:</td>
</tr>
<tr>
<td></td>
<td>- Do not change setting—The Windows Automatic Updates client configuration does not change during or after Windows update remediation.</td>
</tr>
<tr>
<td></td>
<td>- Notify to download and install—Windows only notifies clients, but does not automatically download, or install them.</td>
</tr>
<tr>
<td></td>
<td>- Automatically download and notify to install—Windows downloads updates for clients, and notifies clients to install Windows updates.</td>
</tr>
<tr>
<td></td>
<td>- Automatically download and install—Windows automatically downloads, and installs Windows updates. This is the highly recommended setting for Windows clients.</td>
</tr>
<tr>
<td>Override User’s Windows Update setting with administrator’s</td>
<td>Check this check box to enforce the administrator-specified setting for Windows Automatic Updates on all the clients during, and after Windows update remediation.</td>
</tr>
<tr>
<td></td>
<td>If unchecked, the setting enforces the following:</td>
</tr>
<tr>
<td></td>
<td>- The administrator-specified setting only when Automatic Updates are disabled on Windows clients.</td>
</tr>
<tr>
<td></td>
<td>- The Windows clients-specified setting only when Windows Automatic Updates are enabled on the client.</td>
</tr>
</tbody>
</table>
Windows Server Update Services Remediation

The following table describes the fields in the Windows Update Remediation page. The navigation path is: Policy > Policy Elements > Results > Posture > Remediation Actions > Windows Server Update Services Remediation.

Table 130: WSUS Remediation

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the WSUS remediation.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for the WSUS remediation.</td>
</tr>
<tr>
<td>Remediation Type</td>
<td>Choose from the following:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Automatic</strong>—The NAC Agents automatically updates Windows clients with the latest WSUS updates.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Manual</strong>—If selected, the Interval and Retry Count fields are not editable. The user manually updates the Windows client with the latest WSUS updates from a Microsoft-managed WSUS server, or from the locally administered WSUS server for compliance.</td>
</tr>
<tr>
<td>Interval (in seconds)</td>
<td>Enter the interval in seconds (the default interval is 0) to delay WSUS updates before the NAC Agents and Web Agents attempt to retry after the previous attempt.</td>
</tr>
<tr>
<td>Retry Count</td>
<td>Enter the number of attempts that the NAC Agents and Web Agents retry to update Windows clients with WSUS updates.</td>
</tr>
<tr>
<td>Validate Windows updates using</td>
<td>Choose from the following:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Cisco Rules</strong>—If you choose this option, you can select custom or preconfigured rules as conditions in the posture requirement</td>
</tr>
<tr>
<td></td>
<td>• <strong>Severity Level</strong>—If you choose this option, you can select custom or preconfigured rules as conditions in the posture requirement, but they are not used. The pr_WSUSRule can be used as a placeholder condition (a dummy condition) in the posture requirement that specifies a WSUS remediation.</td>
</tr>
<tr>
<td>Fields</td>
<td>Usage Guidelines</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Windows Updates Severity Level</td>
<td>Choose the severity level:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Critical</strong>—Installs only critical Windows updates</td>
</tr>
<tr>
<td></td>
<td>• <strong>Express</strong>—Installs important and critical Windows updates</td>
</tr>
<tr>
<td></td>
<td>• <strong>Medium</strong>—Installs all critical, important, and moderate Windows updates</td>
</tr>
<tr>
<td></td>
<td>• <strong>All</strong>—Installs all critical, important, moderate, and low Windows updates</td>
</tr>
<tr>
<td>Note</td>
<td>When you associate a WSUS remediation action to a posture requirement to validate Windows updates by using the severity level option, you must choose the pr_WSUSRule (a dummy compound condition) compound condition in the posture requirement. When the posture requirement fails, the NAC Agent enforces the remediation action (Windows updates) based on the severity level that you define in the WSUS remediation.</td>
</tr>
<tr>
<td>Update to latest OS Service Pack</td>
<td>Check this check box to allow WSUS remediation install the latest service pack available for the client's operating system automatically.</td>
</tr>
<tr>
<td>Note</td>
<td>The operating system service packs are updated automatically irrespective of the Medium and All severity level options selected in WSUS remediation.</td>
</tr>
<tr>
<td>Windows Updates Installation Source</td>
<td>Specifies the source from where you install WSUS updates on Windows clients:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Microsoft server</strong>—Microsoft-managed WSUS server</td>
</tr>
<tr>
<td></td>
<td>• <strong>Managed server</strong>—Locally administered WSUS server</td>
</tr>
</tbody>
</table>
### Usage Guidelines

**Fields**

<table>
<thead>
<tr>
<th>Installation Wizard Interface Setting</th>
<th>Allows you to display the installation wizard on the client during WSUS updates:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <strong>Show UI</strong>—Displays the Windows Update Installation Wizard progress on Windows clients. Users must have Administrator privileges on clients to view the installation wizard during WSUS updates.</td>
</tr>
<tr>
<td></td>
<td>• <strong>No UI</strong>—Hides the Windows Update Installation Wizard progress on Windows clients.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> You must select the No UI option, if you want to allow users without Administrator privileges to use WSUS remediation to install Windows updates.</td>
</tr>
</tbody>
</table>

### Client Posture Requirements

The following table describes the fields in the Posture Requirements page. The navigation path is: **Policy > Policy Elements > Results > Posture > Requirements.**

**Table 131: Posture Requirement**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the requirement.</td>
</tr>
</tbody>
</table>
| Operating Systems | Choose an operating system.  
Click plus [+] to associate more than one operating system to the policy.  
Click minus [-] to remove the operating system from the policy. |
### Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Choose a Condition from the list. You can also create any user defined condition by clicking the Action Icon and associate it with the requirement. You cannot edit the associated parent operating system while creating user defined conditions. The pr_WSUSRule is a dummy compound condition, which is used in a posture requirement with an associated Windows Server Update Services (WSUS) remediation. The associated WSUS remediation action must be configured to validate Windows updates by using the severity level option. When this requirement fails, the NAC Agent that is installed on the Windows client enforces the WSUS remediation action based on the severity level that you define in the WSUS remediation. The pr_WSUSRule cannot be viewed in the Compound conditions list page. You can only select the pr_WSUSRule from the Conditions widget.</td>
</tr>
<tr>
<td>Remediation Actions</td>
<td>Choose a Remediation from the list. You can also create a remediation action and associate it with the requirement. You have a text box for all the remediation types that can be used to communicate to the Agent users. In addition to remediation actions, you can communicate to Agent users about the non compliance of clients with messages. The Message Text Only option informs Agent users about the noncompliance. It also provides optional instructions to the user to contact the Help desk for more information, or to remediate the client manually. In this scenario, the NAC Agent does not trigger any remediation action.</td>
</tr>
</tbody>
</table>

Network Access Flows

- Password-Based Authentication, on page 873
- RADIUS Protocol Support in Cisco ISE, on page 874
- Network Access for Users, on page 874

Password-Based Authentication

Authentication verifies user information to confirm user identity. Traditional authentication uses a name and a fixed password. This is the most popular, simplest, and least-expensive method of authentication. The disadvantage is that this information can be told to someone else, guessed, or captured. An approach that uses simple, unencrypted usernames and passwords is not considered a strong authentication mechanism, but it can be sufficient for low-authorization or low-privilege levels such as Internet access.

Secure Authentication Using Encrypted Passwords and Cryptographic Techniques

You should use encryption to reduce the risk of password capture on the network. Client and server access control protocols, such as RADIUS, encrypt passwords to prevent them from being captured within a network. However, RADIUS operates only between the authentication, authorization, and accounting (AAA) client and Cisco ISE. Before this point in the authentication process, unauthorized persons can obtain cleartext passwords such as in the following examples:

- In the communication between an end-user client that dials up over a phone line
- On an ISDN line that terminates at a network access server
- Over a Telnet session between an end-user client and the hosting device

More-secure methods use cryptographic techniques, such as those used inside the Challenge Authentication Handshake Protocol (CHAP), one-time password (OTP), and advanced EAP-based protocols. Cisco ISE supports a variety of these authentication methods.
Authentication Methods and Authorization Privileges

A fundamental implicit relationship exists between authentication and authorization. The more authorization privileges that are granted to a user, the stronger the authentication should be. Cisco ISE supports this relationship by providing various methods of authentication.

RADIUS Protocol Support in Cisco ISE

RADIUS is a client/server protocol through which remote-access servers communicate with a central server to authenticate dial-in users and authorize their access to the requested system or service. You can use RADIUS to maintain user profiles in a central database that all remote servers can share. This protocol provides better security, and you can use it to set up a policy that is applied at a single administered network point.

RADIUS also functions as a RADIUS client in Cisco ISE to proxy requests to a remote RADIUS server, and it provides Change of Authorization (CoA) activities during an active session.

Cisco ISE supports RADIUS protocol flow according to RFC 2865 and generic support for all general RADIUS attributes as described in RFC 2865 and its extension. Cisco ISE supports parsing of vendor-specific attributes only for vendors that are defined in the Cisco ISE dictionary.

RADIUS interface supports the following attribute data types that are defined in RFC 2865:

- Text (Unicode Transformation Format [UTF])
- String (binary)
- Address (IP)
- Integer
- Time

Network Access for Users

For network access, a host connects to the network device and requests to use network resources. The network device identifies the newly connected host, and, using the RADIUS protocol as a transport mechanism, requests Cisco ISE to authenticate and authorize the user.

Cisco ISE supports network access flows depending on the protocol that is transported over the RADIUS protocol.

RADIUS-Based Protocols Without EAP

RADIUS-based protocols that do not include EAP include the following:

- Password Authentication Protocol (PAP)
- CHAP
- Microsoft Challenge Handshake Authentication Protocol version 1 (MS-CHAPv1)
- MS-CHAP version 2 (MS-CHAPv2)
RADIUS-Based Non-EAP Authentication Flow

This section describes RADIUS-based flow without EAP authentication. RADIUS-based flow with PAP authentication occurs in the following process:

1. A host connects to a network device.
2. The network device sends a RADIUS request (Access-Request) to Cisco ISE that contains RADIUS attributes that are appropriate to the specific protocol that is being used (PAP, CHAP, MS-CHAPv1, or MS-CHAPv2).
3. Cisco ISE uses an identity store to validate user credentials.
4. A RADIUS response (Access-Accept or Access-Reject) is sent to the network device that will apply the decision.

The following figure shows a RADIUS-based authentication without EAP.

Figure 44: RADIUS-Based Authentication Without EAP

The non-EAP protocols supported by Cisco ISE are:

Password Authentication Protocol

PAP provides a simple method for users to establish their identity by using a two-way handshake. The PAP password is encrypted with a shared secret and is the least sophisticated authentication protocol. PAP is not a strong authentication method because it offers little protection from repeated trial-and-error attacks.

RADIUS-Based PAP Authentication in Cisco ISE

Cisco ISE checks the username and password pair against the identity stores, until it eventually acknowledges the authentication or terminates the connection.

You can use different levels of security concurrently with Cisco ISE for different requirements. PAP applies a two-way handshaking procedure. If authentication succeeds, Cisco ISE returns an acknowledgment; otherwise, Cisco ISE terminates the connection or gives the originator another chance.

The originator is in total control of the frequency and timing of the attempts. Therefore, any server that can use a stronger authentication method will offer to negotiate that method prior to PAP. RFC 1334 defines PAP.

Cisco ISE supports standard RADIUS PAP authentication that is based on the RADIUS UserPassword attribute. RADIUS PAP authentication is compatible with all identity stores.

The RADIUS-with-PAP-authentication flow includes logging of passed and failed attempts.
Challenge Handshake Authentication Protocol

Challenge Handshake Authentication Protocol (CHAP) uses a challenge-response mechanism with one-way encryption on the response. CHAP enables Cisco Identity Services Engine (ISE) to negotiate downward from the most-secure to the least-secure encryption mechanism, and it protects passwords that are transmitted in the process. CHAP passwords are reusable. If you are using the Cisco ISE internal database for authentication, you can use Password Authentication Protocol (PAP) or CHAP. CHAP does not work with the Microsoft user database. Compared to RADIUS PAP, CHAP allows a higher level of security for encrypting passwords when communicating from an end-user client to the AAA client.

Cisco ISE supports standard RADIUS CHAP authentication that is based on the RADIUS ChapPassword attribute. Cisco ISE supports RADIUS CHAP authentication only with internal identity stores.

Microsoft Challenge Handshake Authentication Protocol Version 1

Cisco ISE supports the RADIUS MS-CHAPv1 authentication and change-password features. RADIUS MS-CHAPv1 contains two versions of the change-password feature: Change-Password-V1 and Change-Password-V2. Cisco ISE does not support Change-Password-V1 based on the RADIUS MS-CHAP-CPW-1 attribute, and supports only Change-Password-V2 based on the MS-CHAP-CPW-2 attribute. The RADIUS MS-CHAPv1 authentication and change-password features are supported with the following identity sources:

- Internal identity stores
- Microsoft Active Directory identity store

Microsoft Challenge Handshake Authentication Protocol Version 2

The RADIUS MS-CHAPv2 authentication and change-password features are supported with the following identity sources:

- Internal identity stores
- Microsoft Active Directory identity store

RADIUS-Based EAP Protocols

EAP provides an extensible framework that supports various authentication types. This section describes the EAP methods supported by Cisco ISE and contains the following topics:

Simple EAP Methods

- EAP-Message Digest 5
- Lightweight EAP

EAP Methods That Use Cisco ISE Server Certificate for Authentication

- PEAP/EAP-MS-CHAPv2
- PEAP/EAP-GTC
- EAP-FAST/EAP-MS-CHAPv2
- EAP-FAST/EAP-GTC
Apart from the methods listed above, there are EAP methods that use certificates for both server and client authentication.

**RADIUS-Based EAP Authentication Flow**

Whenever EAP is involved in the authentication process, the process is preceded by an EAP negotiation phase to determine which specific EAP method (and inner method, if applicable) should be used. EAP-based authentication occurs in the following process:

1. A host connects to a network device.
2. The network device sends an EAP Request to the host.
3. The host replies with an EAP Response to the network device.
4. The network device encapsulates the EAP Response that it received from the host into a RADIUS Access-Request (using the EAP-Message RADIUS attribute) and sends the RADIUS Access-Request to Cisco ISE.
5. Cisco ISE extracts the EAP Response from the RADIUS packet and creates a new EAP Request, encapsulates it into a RADIUS Access-Challenge (again, using the EAP-Message RADIUS attribute), and sends it to the network device.
6. The network device extracts the EAP Request and sends it to the host.

In this way, the host and Cisco ISE indirectly exchange EAP messages (transported over RADIUS and passed through the network device). The initial set of EAP messages that are exchanged in this manner negotiate the specific EAP method that will subsequently be used to perform the authentication.

The EAP messages that are subsequently exchanged are then used to carry the data that is needed to perform the actual authentication. If it is required by the specific EAP authentication method that is negotiated, Cisco ISE uses an identity store to validate user credentials.

After Cisco ISE determines whether the authentication should pass or fail, it sends either an EAP-Success or EAP-Failure message, encapsulated into a RADIUS Access-Accept or Access-Reject message to the network device (and ultimately also to the host).

The following figure shows a RADIUS-based authentication with EAP.

**Figure 45: RADIUS-Based Authentication with EAP**

---

**Extensible Authentication Protocol-Message Digest 5**

Extensible Authentication Protocol-Message Digest 5 (EAP-MD5) provides one-way client authentication. The server sends the client a random challenge. The client proves its identity in a response by encrypting the challenge and its password with MD5. Because a man in the middle could see the challenge and response, EAP-MD5 is vulnerable to dictionary attack when used over an open medium. Because no server authentication
occurs, it is also vulnerable to spoofing. Cisco ISE supports EAP-MD5 authentication against the Cisco ISE internal identity store. Host Lookup is also supported when using the EAP-MD5 protocol.

**Lightweight Extensible Authentication Protocol**

Cisco ISE currently uses Lightweight Extensible Authentication Protocol (LEAP) only for Cisco Aironet wireless networking. If you do not enable this option, Cisco Aironet end-user clients who are configured to perform LEAP authentication cannot access the network. If all Cisco Aironet end-user clients use a different authentication protocol, such as Extensible Authentication Protocol-Transport Layer Security (EAP-TLS), we recommend that you disable this option.

---

**Note**

If users access your network by using a AAA client that is defined in the Network Devices section as a RADIUS (Cisco Aironet) device, then you must enable LEAP, EAP-TLS, or both; otherwise, Cisco Aironet users cannot authenticate.

---

**Protected Extensible Authentication Protocol**

Protected Extensible Authentication Protocol (PEAP) provides mutual authentication, ensures confidentiality and integrity to vulnerable user credentials, protects itself against passive (eavesdropping) and active (man-in-the-middle) attacks, and securely generates cryptographic keying material. PEAP is compatible with the IEEE 802.1X standard and RADIUS protocol. Cisco ISE supports PEAP version 0 (PEAPv0) and PEAP version 1 (PEAPv1) with Extensible Authentication Protocol-Microsoft Challenge Handshake Authentication Protocol (EAP-MS-CHAP), Extensible Authentication Protocol-Generic Token Card (EAP-GTC), and EAP-TLS inner methods. The Cisco Secure Services Client (SSC) supplicant supports all of the PEAPv1 inner methods that Cisco ISE supports.

**Advantages of Using PEAP**

Using PEAP presents these advantages: PEAP is based on TLS, which is widely implemented and has undergone extensive security review. It establishes a key for methods that do not derive keys. It sends an identity within the tunnel. It protects inner method exchanges and the result message. It supports fragmentation.

**Supported Supplicants for the PEAP Protocol**

PEAP supports these supplicants:

- Microsoft Built-In Clients 802.1X XP
- Microsoft Built-In Clients 802.1X Vista
- Cisco Secure Services Client (SSC), Release 4.0
- Cisco SSC, Release 5.1
- Funk Odyssey Access Client, Release 4.72
- Intel, Release 12.4.0.0

**PEAP Protocol Flow**

A PEAP conversation can be divided into three parts:

1. Cisco ISE and the peer build a TLS tunnel. Cisco ISE presents its certificate, but the peer does not. The peer and Cisco ISE create a key to encrypt the data inside the tunnel.
2. The inner method determines the flow within the tunnel:

   • EAP-MS-CHAPv2 inner method—EAP-MS-CHAPv2 packets travel inside the tunnel without their headers. The first byte of the header contains the type field. EAP-MS-CHAPv2 inner methods support the change-password feature. You can configure the number of times that the user can attempt to change the password through the Admin portal. User authentication attempts are limited by this number.

   • EAP-GTC inner method—Both PEAPv0 and PEAPv1 support the EAP-GTC inner method. The supported supplicants do not support PEAPv0 with the EAP-GTC inner method. EAP-GTC supports the change-password feature. You can configure the number of times that the user can attempt to change the password through the Admin portal. User authentication attempts are limited by this number.

   • EAP-TLS inner method—The Windows built-in supplicant does not support fragmentation of messages after the tunnel is established, and this affects the EAP-TLS inner method. Cisco ISE does not support fragmentation of the outer PEAP message after the tunnel is established. During tunnel establishment, fragmentation works as specified in PEAP documentation. In PEAPv0, EAP-TLS packet headers are removed, and in PEAPv1, EAP-TLS packets are transmitted unchanged.

   • Extensible Authentication Protocol-type, length, value (EAP-TLV) extension—EAP-TLV packets are transmitted unchanged. EAP-TLV packets travel with their headers inside the tunnel.

3. There is protected acknowledgment of success and failure if the conversation has reached the inner method.

   The client EAP message is always carried in the RADIUS Access-Request message, and the server EAP message is always carried in the RADIUS Access-Challenge message. The EAP-Success message is always carried in the RADIUS Access-Accept message. The EAP-Failure message is always carried in the RADIUS Access-Reject message. Dropping the client PEAP message results in dropping the RADIUS client message.

   Note

   Cisco ISE requires acknowledgment of the EAP-Success or EAP-Failure message during PEAPv1 communication. The peer must send back a PEAP packet with empty TLS data field to acknowledge the receipt of success or failure message.

### Extensible Authentication Protocol-Flexible Authentication via Secure Tunneling

Extensible Authentication Protocol-Flexible Authentication via Secure Tunneling (EAP-FAST) is an authentication protocol that provides mutual authentication and uses a shared secret to establish a tunnel. The tunnel is used to protect weak authentication methods that are based on passwords. The shared secret, referred to as a Protected Access Credentials (PAC) key, is used to mutually authenticate the client and server while securing the tunnel.

### Benefits of EAP-FAST

EAP-FAST provides the following benefits over other authentication protocols:

   • Mutual authentication—The EAP server must be able to verify the identity and authenticity of the peer, and the peer must be able to verify the authenticity of the EAP server.

   • Immunity to passive dictionary attacks—Many authentication protocols require a password to be explicitly provided, either as cleartext or hashed, by the peer to the EAP server.
• Immunity to man-in-the-middle attacks—In establishing a mutually authenticated protected tunnel, the protocol must prevent adversaries from successfully interjecting information into the conversation between the peer and the EAP server.

• Flexibility to enable support for many different password authentication interfaces such as MS-CHAPv2, Generic Token Card (GTC), and others—EAP-FAST is an extensible framework that allows support of multiple internal protocols by the same server.

• Efficiency—When using wireless media, peers are limited in computational and power resources. EAP-FAST enables the network access communication to be computationally lightweight.

• Minimization of the per-user authentication state requirements of the authentication server—With large deployments, it is typical to have many servers acting as the authentication servers for many peers. It is also highly desirable for a peer to use the same shared secret to secure a tunnel much the same way that it uses the username and password to gain access to the network. EAP-FAST facilitates the use of a single, strong, shared secret by the peer, while enabling servers to minimize the per-user and device state that it must cache and manage.

**EAP-FAST Flow**

The EAP-FAST protocol flow is always a combination of the following phases:

1. **Provisioning phase**—This is phase zero of EAP-FAST. During this phase, the peer is provisioned with a unique, strong secret that is referred to as the PAC that is shared between the Cisco ISE and the peer.

2. **Tunnel establishment phase**—The client and server authenticate each other by using the PAC to establish a fresh tunnel key. The tunnel key is then used to protect the rest of the conversation and provides message confidentiality and with authenticity.

3. **Authentication phase**—The authentication is processed inside the tunnel and includes the generation of session keys and protected termination. Cisco ISE supports EAP-FAST versions 1 and 1a.
CHAPTER 33

Switch and Wireless LAN Controller Configuration Required to Support Cisco ISE Functions

To ensure Cisco ISE is able to interoperate with network switches and functions from Cisco ISE are successful across the network segment, you need to configure network switches with the necessary NTP, RADIUS/AAA, 802.1X, MAB, and other settings for communication with Cisco ISE.

- Enable Your Switch to Support Standard Web Authentication, on page 882
- Local Username and Password Definition for Synthetic RADIUS Transactions, on page 882
- NTP Server Configuration to Ensure Accurate Log and Accounting Timestamps, on page 882
- Command to Enable AAA Functions, on page 882
- RADIUS Server Configuration on the Switch, on page 883
- Configure the Switch to Send RADIUS Accounting Start/Stop to Inline Posture Nodes, on page 884
- Command to Enable RADIUS Change of Authorization (CoA), on page 884
- Command to Enable Device Tracking and DHCP Snooping, on page 884
- Command to Enable 802.1X Port-Based Authentication, on page 885
- Command to Enable EAP for Critical Authentications, on page 885
- Command to Throttle AAA Requests Using Recovery Delay, on page 885
- VLAN Definitions Based on Enforcement States, on page 885
- Local (Default) ACLs Definition on the Switch, on page 886
- Enable Switch Ports for 802.1X and MAB, on page 888
- Command to Enable EPM Logging, on page 890
- Command to Enable SNMP Traps, on page 890
- Command to Enable SNMP v3 Query for Profiling, on page 890
- Command to Enable MAC Notification Traps for Profiler to Collect, on page 891
- RADIUS Idle-Timeout Configuration on the Switch, on page 891
- Wireless LAN Controller Configuration for iOS Supplicant Provisioning, on page 891
- Wireless LAN Controller Support for Apple Devices, on page 892
- Configuring ACLs on the Wireless LAN Controller for MDM Interoperability, on page 892
Enable Your Switch to Support Standard Web Authentication

Ensure that you include the following commands in your switch configuration to enable standard Web Authenticating functions for Cisco ISE, including provisions for URL redirection upon authentication:

```
ip classless

ip route 0.0.0.0 0.0.0.0 10.1.2.3

ip http server
! Must enable HTTP/HTTPS for URL-redirection on port 80/443

ip http secure-server
```

Local Username and Password Definition for Synthetic RADIUS Transactions

Enter the following command to enable the switch to talk to the Cisco ISE node as though it is the RADIUS server for this network segment:

```
username test-radius password 0 abcde123
```

NTP Server Configuration to Ensure Accurate Log and Accounting Timestamps

Ensure that you specify the same NTP server as you have set in Cisco ISE at Administration > System > Settings > System Time by entering the following command:

```
ntp server <IP_address>|<domain_name>
```

Command to Enable AAA Functions

Enter the following commands to enable the various AAA functions between the switch and Cisco ISE, including 802.1X and MAB authentication functions:

```
aaa new-model

! Creates an 802.1X port-based authentication method list

aaa authentication dot1x default group radius

! Required for VLAN/ACL assignment

aaa authorization network default group radius
```
! Authentication & authorization for webauth transactions

aaa authorization auth-proxy default group radius

! Enables accounting for 802.1X and MAB authentications

aaa accounting dot1x default start-stop group radius

!

aaa session-id common

!

aaa accounting update periodic 5

! Update AAA accounting information periodically every 5 minutes

aaa accounting system default start-stop group radius

!

aaa server radius dynamic-author

client 10.0.56.17 server-key cisco

! Enables Cisco ISE to act as a AAA server when interacting with the client at IP address 10.0.56.17

---

**RADIUS Server Configuration on the Switch**

Configure the switch to interoperate with Cisco ISE acting as the RADIUS source server by entering the following commands:

! radius-server attribute 6 on-for-login-auth

! Include RADIUS attribute 8 in every Access-Request

radius-server attribute 8 include-in-access-req

! Include RADIUS attribute 25 in every Access-Request

radius-server attribute 25 access-request include

! Wait 3 x 30 seconds before marking RADIUS server as dead

radius-server dead-criteria time 30 tries 3

! Use RFC-standard ports (1812/1813)

radius-server host <Cisco_ISE_IP_address> auth-port 1812 acct-port 1813 test

username test-radius key 0 <RADIUS-KEY>
Configure the Switch to Send RADIUS Accounting Start/Stop to Inline Posture Nodes

The network access device should be configured to send RADIUS accounting “Start” and “Stop” messages at the beginning and end of a session, respectively, with the remote device’s IP address in those messages to the Inline Posture nodes. The Inline Posture node associates the device IP address to any relevant authorization profiles downloaded over the life of a session. For example, a remote device may have an “unknown-compliance-state” authorization profile at initial login, then switch to a “compliant” authorization profile following CoA (assuming successful device posture assessment).

Command to Enable RADIUS Change of Authorization (CoA)

Specify the settings to ensure the switch is able to appropriately handle RADIUS Change of Authorization behavior supporting Posture functions from Cisco ISE by entering the following commands:

```
aaa server radius dynamic-author
```

```
client <ISE-IP> server-key 0 abcde123
```

Note
Cisco ISE uses port 1700 (Cisco IOS software default) versus RFC default port 3799 for CoA. Existing Cisco Secure ACS 5.x customers may already have this set to port 3799 if they are using CoA as part of an existing ACS implementation.

Command to Enable Device Tracking and DHCP Snooping

To help provide optional security-oriented functions from Cisco ISE, you can enable device tracking and DHCP snooping for IP substitution in dynamic ACLs on switch ports by entering the following commands:

```
Optional

ip dhcp snooping
```
ip device tracking

In RADIUS Accounting, the DHCP attributes are not sent by IOS sensor to Cisco ISE even when dhcp snooping is enabled. In such cases, the dhcp snooping should be enabled on the VLAN to make the DHCP active.

Use the following commands to enable dhcp snooping on VLAN:

```
ip dhcp snooping
ip dhcp snooping vlan 1-100
```

(VLAN range should include used for data and vlan)

---

**Command to Enable 802.1X Port-Based Authentication**

Enter the following commands to turn 802.1X authentication on for switch ports, globally:

```
dot1x system-auth-control
```

**Command to Enable EAP for Critical Authentications**

To support supplicant authentication requests over the LAN, enable EAP for critical authentications (Inaccessible Authentication Bypass) by entering the following command:

```
dot1x critical eapol
```

**Command to Throttle AAA Requests Using Recovery Delay**

When a critical authentication recovery event takes place, you can configure the switch to automatically introduce a delay (in seconds) to ensure Cisco ISE is able to launch services again following recovery by entering the following command:

```
authentication critical recovery delay 1000
```

**VLAN Definitions Based on Enforcement States**

Enter the following commands to define the VLAN names, numbers, and SVIs based on known enforcement states in your network. Create the respective VLAN interfaces to enable routing between networks. This can be especially helpful to handle multiple sources of traffic passing over the same network segments—traffic from both PCs and the IP phone through which the PC is connected to the network, for example.

---

**Note**

The first IP helper goes to the DHCP server and the second IP helper sends a copy of the DHCP request to the inline posture node for profiling.
Local (Default) ACLs Definition on the Switch

Enable these functions on older switches (with Cisco IOS software releases earlier than 12.2(55)SE) to ensure Cisco ISE is able to perform the dynamic ACL updates required for authentication and authorization by entering the following commands:

```
ip access-list extended ACL-ALLOW
    permit ip any any

ip access-list extended ACL-DEFAULT
    remark DHCP
    permit udp any eq bootpc any eq bootps
```
remark DNS
permit udp any any eq domain
remark Ping
permit icmp any any
remark Ping
permit icmp any any
remark PXE / TFTP
permit udp any any eq tftp
remark Allow HTTP/S to ISE and WebAuth portal
permit tcp any host <Cisco_ISE_IP_address> eq www
permit tcp any host <Cisco_ISE_IP_address> eq 443
permit tcp any host <Cisco_ISE_IP_address> eq 8443
permit tcp any host <Cisco_ISE_IP_address> eq 8905
permit udp any host <Cisco_ISE_IP_address> eq 8905
permit udp any host <Cisco_ISE_IP_address> eq 8906
permit tcp any host <Cisco_ISE_IP_address> eq 8080
permit udp any host <Cisco_ISE_IP_address> eq 9996
remark Drop all the rest
deny ip any any log

! The ACL to allow URL-redirection for WebAuth

ip access-list extended ACL-WEBAUTH-REDIRECT

  permit tcp any any eq www
  permit tcp any any eq 443

Note

This configuration on the WLC my increase CPU utilization and raises the risk of system instability. This is an IOS issue and does not adversely affect Cisco ISE.

Enable Switch Ports for 802.1X and MAB

To enable switch ports for 802.1X and MAB:

Procedure

Step 1 Enter configuration mode for all of the access switch ports:

  interface range FastEthernet0/1-8

Step 2 Enable the switch ports for access mode (instead of trunk mode):

  switchport mode access

Step 3 Statically configure the access VLAN. This provides local provisioning of the access VLANs and is required for open-mode authentication:

  switchport access <VLAN_number>

Step 4 Statically configure the voice VLAN:

  switchport voice <VLAN_number>

Step 5 Enable open-mode authentication. Open-mode allows traffic to be bridged onto the data and voice VLANs before authentication is completed. We strongly recommend using a port-based ACL in a production environment to prevent unauthorized access.

    ! Enables pre-auth access before AAA response; subject to port ACL
    authentication open

Step 6 Apply a port-based ACL to determine which traffic should be bridged by default from unauthenticated endpoints onto the access VLAN. Because you should allow all access first and enforce policy later, you should apply ACL-ALLOW to permit all traffic through the switch port. You have already created a default ISE authorization to allow all traffic for now because we want complete visibility and do not want to impact the existing end-user experience yet.

    ! An ACL must be configured to prepend dACLs from AAA server.
ip access-group ACL-ALLOW in

Note Prior to Cisco IOS software Release 12.2(55)SE on DSBU switches, a port ACL is required for dynamic ACLs from a RADIUS AAA server to be applied. Failure to have a default ACL will result in assigned dACLs being ignored by the switch. With Cisco IOS software Release 12.2(55)SE, a default ACL will be automatically generated and applied.

Note We are using ACL-ALLOW at this point in the lab because we want to enable 802.1X port-based authentication, but without any impact to the existing network. In a later exercise, we will apply a different ACL-DEFAULT, which blocks undesired traffic for a production environment.

Step 7 Enable Multi-Auth host mode. Multi-Auth is essentially a superset of Multi-Domain Authentication (MDA). MDA only allows a single endpoint in the data domain. When multi-auth is configured, a single authenticated phone is allowed in the voice domain (as with MDA) but an unlimited number of data devices can be authenticated in the data domain.
! Allow voice + multiple endpoints on same physical access port
  
  authentication host-mode multi-auth

Note Multiple data devices (whether virtualized devices or physical devices connected to a hub) behind an IP phone can exacerbate the access ports’ physical link-state awareness.

Step 8 Enable various authentication method options:

  ! Enable re-authentication
  
  authentication periodic

  ! Enable re-authentication via RADIUS Session-Timeout
  
  authentication timer reauthenticate server

  authentication event fail action next-method

  authentication event server dead action reinitialize <VLAN_number>

  authentication event server alive action reinitialize

  ! IOS Flex-Auth authentication should do 802.1X then MAB
  
  authentication order dot1x mab

  authentication priority dot1x mab

Step 9 Enable 802.1X port control on the switchport:

  ! Enables port-based authentication on the interface
  
  authentication port-control auto

  authentication violation restrict

Step 10 Enable MAC Authentication Bypass (MAB):

  ! Enable MAC Authentication Bypass (MAB)

  mab

Step 11 Enable 802.1X on the switchport

  ! Enables 802.1X authentication on the interface

  dot1x pae authenticator

Step 12 Set the retransmit period to 10 seconds:

  dot1x timeout tx-period 10
**Note**  The dot1x tx-period timeout should be set to 10 seconds. Do not change this unless you understand the implications.

**Step 13**  Enable the portfast feature:

```bash
spanning-tree portfast
```

---

**Command to Enable EPM Logging**

Set up standard logging functions on the switch to support possible troubleshooting/recording for Cisco ISE functions:

```bash
epm logging
```

---

**Command to Enable SNMP Traps**

Ensure the switch is able to receive SNMP trap transmissions from Cisco ISE over the appropriate VLAN in this network segment:

```bash
snmp-server community public RO
snmp-server trap-source <VLAN_number>
```

---

**Command to Enable SNMP v3 Query for Profiling**

Configure the switch to ensure SNMP v3 polling takes place as intended to support Cisco ISE profiling services. First, configure the SNMP settings in Cisco ISE by choosing **Administration > Network Resources > Network Devices > Add | Edit > SNMP Settings**.

```bash
snmp-server user <name> <group> v3 auth md5 <string> priv des <string>

snmp-server group <group> v3 priv

snmp-server group <group> v3 priv context vlan-1
```

**Note**  The `snmp-server group <group> v3 priv context vlan-1` command must be configured for each context. The `snmp show context` command lists all the context information.

If the SNMP Request times out and there is no connectivity issue, then you can increase the Timeout value.
Command to Enable MAC Notification Traps for Profiler to Collect

Configure your switch to transmit the appropriate MAC notification traps so that the Cisco ISE Profiler function is able to collect information on network endpoints:

```
mac address-table notification change
mac address-table notification mac-move
snmp trap mac-notification change added
snmp trap mac-notification change removed
```

RADIUS Idle-Time-Out Configuration on the Switch

To configure the RADIUS Idle-timeout on a switch, use the following command:

```
Switch(config-if)# authentication timer inactivity
```

where `inactivity` is interval of inactivity in seconds, after which client activity is considered unauthorized.

In Cisco ISE, you can enable this option for any Authorization Policies to which such a session inactivity timer should apply from Policy > Policy Elements > Results > Authorization > Authorization Profiles.

Wireless LAN Controller Configuration for iOS Supplicant Provisioning

For Single SSID

To support Apple iOS-based devices (iPhone/iPad) switching from one SSID to another on the same wireless access point, configure the Wireless LAN Controller (WLC) to enable the “FAST SSID change” function. This function helps ensure iOS-based devices are able to more quickly switch between SSIDs.

For Dual SSID BYOD

Fast SSID must be enabled to support dual SSID BYOD. When Fast SSID changing is enabled, the wireless controller allows clients to move faster between SSIDs. When fast SSID is enabled, the client entry is not cleared and the delay is not enforced. For more information about configuring Fast SSID on a Cisco WLC, see the Cisco Wireless Controller Configuration Guide.

Example WLC Configuration

```
WLC (config)# FAST SSID change
```
You might see the following error message while trying to connect to a wireless network for some of the Apple iOS-based devices:

Could not scan for Wireless Networks.

You can ignore this error message because this does not affect the authentication of the device.

Wireless LAN Controller Support for Apple Devices

Apple devices include the Apple Captive Network Assistant (CNA) feature, which detects captive networks (like the Cisco ISE WebAuth page), but it interferes with the portal redirection required to support guests and personal devices.

You can bypass this feature by enabling the `web-auth captive-bypass` command on the Wireless LAN Controller (WLC):

```
WLC > config network web-auth captive-bypass enable
```

Web-auth support for Captive-Bypass will be enabled.

You must reset system for this setting to take effect.

```
WLC > save config
```

Are you sure you want to save? (y/n) y

Configuration Saved!

```
WLC >
```

Configuring ACLs on the Wireless LAN Controller for MDM Interoperability

You must configure ACLs on the wireless LAN controller for use in authorization policy to redirect nonregistered devices and certificate provisioning. Your ACLs should be in the following sequence.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Allow all outbound traffic from server to client.</td>
</tr>
<tr>
<td>Step 2</td>
<td>(Optional) Allow ICMP inbound traffic from client to server for troubleshooting.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Allow access to MDM server for unregistered and noncompliant devices to download the MDM agent and proceed with compliance checks.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Allow all inbound traffic from client to server to ISE for Web Portal and supplicant, and certificate provisioning flows.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Allow inbound DNS traffic from client to server for name resolution.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Allow inbound DHCP traffic from client to server for IP addresses.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Deny all inbound traffic from client to server to corporate resources for redirection to ISE (as per your company policy).</td>
</tr>
</tbody>
</table>
Step 8  (Optional) Permit the rest of the traffic.

Example

The following example shows the ACLs for redirecting a nonregistered device to the BYOD flow. In this example, the Cisco ISE ip address is 10.35.50.165, the internal corporate network ip address is 192.168.0.0 and 172.16.0.0 (to redirect), and the MDM server subnet is 204.8.168.0.
